[Inleiding](#)

Dit document biedt een voorbeeldconfiguratie voor het uitgebreide Fibre Channel over TCP/IP (FCIP) Multilayer Director Switch (MDS) naar MDS.

FCIP beschrijft mechanismes die de onderlinge verbinding van eilanden van Fibre Channel (FC) Storage Area Networks (SAN's) via IP-gebaseerde netwerken mogelijk maken om een verenigd SAN in één FC-structuur te vormen. FCIP is gebaseerd op IP-gebaseerde netwerkservices om de connectiviteit tussen de SAN-eilanden te bieden via lokale gebiedsnetwerken, metropolitane gebiedsnetwerken of brede gebiedsnetwerken.

Afbeelding 1 - Fibre Channel SAN's verbonden door FCIP

FCIP gebruikt Transmission Control Protocol (TCP) op poort 3225 als een netwerklaagtransport.

[Voorwaarden](#)

[Vereisten](#)

Zorg ervoor dat u aan deze vereisten voldoet voordat u deze configuratie probeert:

- De IP-backbone moet operationeel zijn en de gewenste bandbreedte leveren om de toepassingen te ondersteunen die op de FCIP-koppelingen draaien: dit kan een Layer 2 (L2) of Layer 3 (L3) topologie zijn.
- Als het een L3-topologie is, moeten de intermediaire routers of meerlaagse switches worden ingesteld en ingesteld om IP-verkeer tussen bron- en doeladressen van de FCIP-tunnels correct door te sturen. Als Quality of Service (QoS) of traffic shaping op elk netwerkapparaat in het pad tussen de FCIP-peers wordt afgedwongen, moet de netwerkbeheerder die de IP-infrastructuren beheert worden geraadpleegd om de benodigde details te verkrijgen voordat hij TCP-gerelateerde parameters en functies configureren in het FCIP-profiel (MDS) van de Multilayer Director-Switch (MDS).
- De Ethernet switches die naast de MDS's staan, moeten ondersteuning bieden en worden geconfigureerd voor 802.1Q trunking als subinterfaces zijn geconfigureerd op de MDS IP Storage (IPS) servicemodule.

Gebruikte componenten

De informatie in dit document is gebaseerd op de volgende software- en hardware-versies:

- MDS 9509 met IPS-servicemodule (DS-X9308-SMIP) voor versie 1.2.2(2a)
- MDS 9216 met IPS-servicemodule (DS-X9308-SMIP) voor versie 1.2.2(2a)
- Catalyst 6509 met Catalyst OS (CatOS) 7.4(3)
- Win2030 Server (HPQ Pro-Liant-P4) met Emulex LP9K HBA
- IBM-opslagarray (ESS-2105-F20)

De informatie in dit document is gebaseerd op de apparaten in een specifieke laboratoriumomgeving. Alle apparaten die in dit document worden beschreven, hadden een opgeschoonede (standaard)configuratie. Als uw netwerk live is, moet u de potentiële impact van elke opdracht begrijpen.

Conventies

Raadpleeg [Cisco Technical Tips Conventions \(Conventies voor technische tips van Cisco\)](#) voor meer informatie over documentconventies.

Achtergrondinformatie

FCIP bestaat uit deze specificaties:

ANSI T11

1. FC-SW-2 beschrijft de werking en interactie van FC-switches, waaronder E_Port- en fabricagebewerkingen.
2. FC-BB-2 is een mapping die betrekking heeft op de uitbreiding van FC-geschakelde netwerken over een TCP-netwerkbackbone, en definieert referentiemodellen die E_Port en B_Port ondersteunen.

IETF IPS-werkgroep

1. FC over TCP bestrijkt de TCP/IP-vereisten voor het transport van FC-frames via een IP-netwerk.
2. FC de kaderinsluiting definieert het gebruikelijke insluitingsformaat voor glasvezel.

Een verbinding tussen twee SAN-switches of weefsels via FCIP wordt een FCIP-link genoemd en kan een of meer TCP-verbindingen bevatten. Elk eind van een verbinding van FCIP wordt geassocieerd met een Virtuele haven E (VE_port) of een B_port, afhankelijk van de implementatie. FC-BB en FC-BB-2 beschrijven de verschillen tussen beide benaderingen. De IPS-servicemodule (DS-X9308-SMIP) ondersteunt beide modi maar is standaard gericht op VE_Port, wat ook de aanbevolen modus is om te draaien als alle relevante peers DS-X9308-SMIP-modules zijn. In deze voorbeeldtopologie, wordt FCIP over PortChannel, te configureren TCP parameters en de FSF (speciaal frame) configuratieparameters besproken.

Configureren

Deze sectie bevat informatie over het configureren van de functies die in dit document worden beschreven.

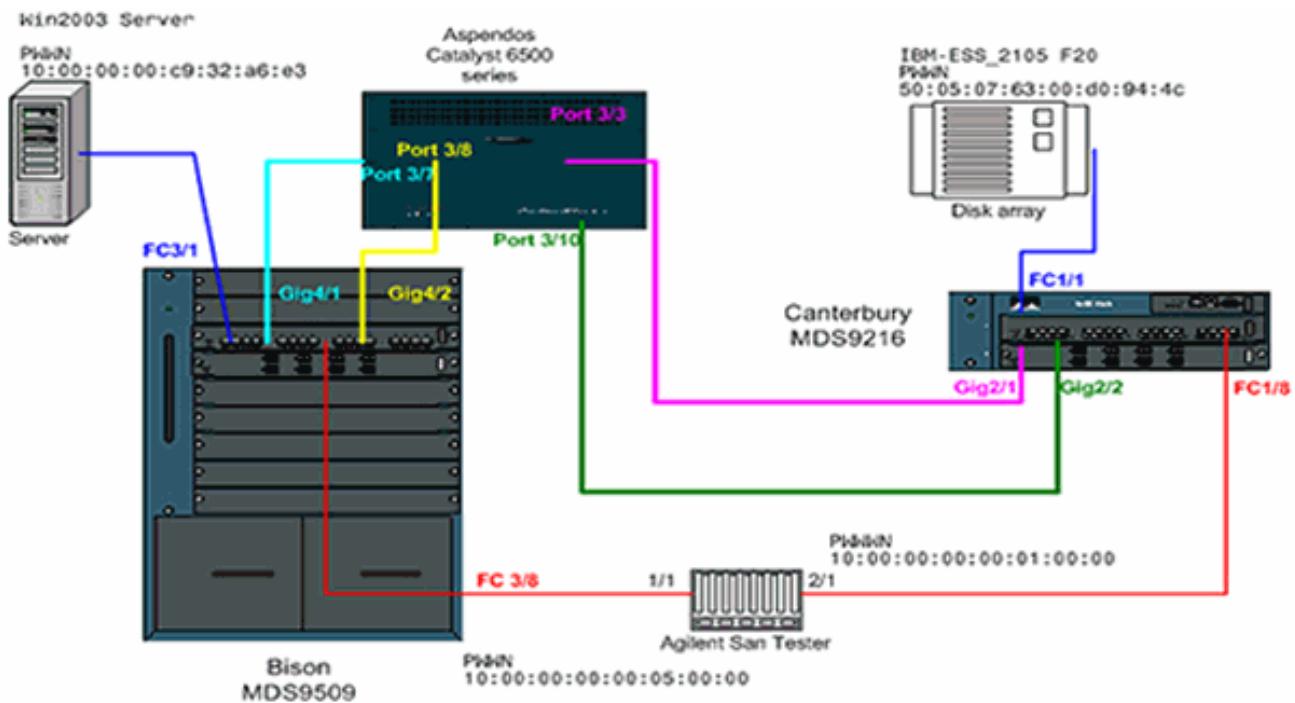

Op de MDSs, moet u jezelf met de IPS configuratiegidsen voor beide platforms vertrouwd maken. U vindt de meest recente versie van de handleidingen bij het [configureren van IP-opslag](#) op Cisco.com.

N.B.: Gebruik het [Opdrachtupgereedschap \(alleen geregistreerde klanten\)](#) om meer informatie te vinden over de opdrachten die in dit document worden gebruikt.

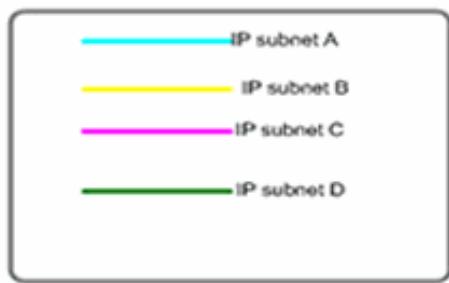

Netwerkdiagram

Het netwerk in dit document is als volgt opgebouwd:

Afbeelding 2 - Topologie 3

Topology 3 - PortChannel of two FCIP interfaces

Topologie 3 toont één FCIP-poortkanaal gevormd door twee afzonderlijke FCIP-tunnels; De peer interfaces zijn over een IP-cloud verspreid. De IP wolk wordt ingestort in één meerlaagse switch (Catalyst 6500) die verkeer van netto A naar Subnet C en van Subnet C naar Subnet A (en van Subnet B naar Subnet D en van Subnet D naar Subnet A) leidt. Subnetten zijn als volgt gedefinieerd:

- Subnet A : 100.100.100.0/30 - Bison int Gig4/1
- Subnet B: 100.100.100.4/30 - Bison int Gig4/2
- Subnet C: 200.200.200.0/30- Canterbury Gig2/1
- Subnet D: 200.200.200.4/30 - Canterbury Gig2/2

De topologie biedt een bekende **maximale bandbreedte van 100 Mbps** en een **minimale bandbreedte van 100 Mbps**, het profiel dat voor ons relevante IP-verkeer door deze IP-cloud wordt uitgevoerd. De eerste configuratie toont de aspecten van op FCIP gebaseerde poortkanalisatie en TCP-traffic conditionering. In volgende secties FSF, passieve TCP interfaces, en FCIP timestamp zullen verder worden uitgelegd.

Configuraties

Dit document gebruikt deze configuraties:

- [MDS 9509 \(Bison\) met IPS-8 module](#)
- [MDS 9612 \(Canterbury\) met IPS-8 module](#)

100.100.100.2 distance 2 ip route 200.200.200.4
255.255.255.252 100.100.100.6 distance 2 !--- FCIP
interfaces are on separate IP subnets, so in order to
reach the FCIP !--- peer IP address, you need adequate
static routes to an L3 device that !--- knows how to
forward the packets to the final destination. Multiple
routes !--- to the same destination IP subnet are
allowed, and the distance parameter !--- can be used to
specify a preferred next hop. Multiple next hops would
!--- require a subnet mask providing for a larger number
of host; for example, !--- a 28-bit subnet mask. ssh key
dsa 768 force ssh server enable switchname bison zone
default-zone permit vsan 600-601 interface
GigabitEthernet4/1 ip address 100.100.100.1
255.255.255.252 switchport mtu 3000 no shutdown !--- MTU
size is defined as 3000 bytes. Make sure that all
intermediate network !--- devices between this interface
and the peer IP address are capable of !--- switching
and routing Jumbo frames. In order to avoid FC Frame
split, !--- an MTU value of 2300 is required; 3000 is
used in the configuration example !--- for simplicity.
FCIP TCP segments will normally never exceed 2264 bytes
for !--- TE ports or 2256 bytes for E ports, regardless
of the configured MTU size. interface GigabitEthernet4/2
ip address 100.100.100.5 255.255.255.252 switchport mtu
3000 no shutdown interface fc3/1 interface fc3/2
interface fc3/3 interface fc3/4 interface fc3/5

interface fc3/9 interface fc3/10 interface fc3/11
interface fc3/12 interface fc3/13 interface fc3/14
interface fc3/15 interface fc3/16 interface mgmt0 ip
address 10.48.69.151 255.255.255.128 !--- Note on TCP
Parameters !--- The following TCP parameters can be
individually configured per FCIP profile:
```

```

bison(config-profile)# tcp ?

cwm Enable congestion window monitoring
keepalive-timeout Set keep alive timeout in sec
max-bandwidth-kbps Configure maximum available path
bandwidth in Kbps
max-bandwidth-mbps Configure maximum available path
bandwidth in Mbps
max-retransmissions Maximum number of retransmissions
min-retransmit-time Set minimum retransmit time in
millisecond
pmtu-enable Enable PMTU Discovery
sack-enable Enable SACK option for TCP
send-buffer-size Send buffer size in KBytes
!--- The CWM parameter default value is 10K and should
be left untouched under !--- normal conditions.
Congestion window monitoring (CWM) is a way of !---
controlling burstiness after long idle times or loss of
Acks.
```

!--- **The keepalive-timeout** is the TCP keepalive timeout value and is !--- set to 60 seconds by default, though it can range between 1 and 7200 seconds.

!--- **The max-** and **min-bandwidth** parameters program the TCP Maximum Window Size !--- (scaling factor) and engages an internal "shaper" functionality. !--- These values should be carefully chosen and requires understanding of the !--- intermediate network's end-to-end topology. The default values are to be !--- changed according to the aforementioned requirements. !--- The Round-trip-time can be derived once you have your FCIP tunnel up and !--- running by issuing the following command:

```
bison# ips measure 200.200.200.1 interface  
gigabitethernet 4/1
```

Round trip time is 53 micro seconds (0.05 milliseconds)
!--- Always add an additional margin of at least a few microseconds to this value. !--- **The max-retransmissions counter** is set to 4 by default. In a healthy network !-- environment, this value should be left unchanged.

!--- **The max-retransmission timer** is set to 200 milliseconds. If you experience !--- extremely high retransmission counters, this value can be increased; but, !--- in general, changing this parameter is not required unless the RTT is !--- above 200 milliseconds.

!--- **The PMTU** (Path MTU discovery) is enabled by default. Best practice is to know !--- what is the maximum MTU size supported by all interfaces along the logical !--- path between both peers.

!--- **The SACK** feature (Selective Acknowledgment) is not enabled by default. !--- Consider enabling it when you have a lot of retransmissions occurring between !--- the two peers. SACK allows selective retransmissions of your window, which is !--- beneficial if larger maximum window sizes are configured and retransmissions !--- occur frequently. It is enabled in this sample configuration; when you do so, !--- make sure that it is enabled at both sides of the link.

!--- **The send-buffer-size** is the amount of buffers in addition to the TCP window !--- that are allowed to be transmitted out before starting to flow control the FC !--- sources. The default value is set to 0.

- Raadpleeg voor meer informatie over PMTU [RFC 1191 - Path MTU discovery](#) .
- Voor meer informatie over SACK, raadpleeg [RFC 2018 - TCP-selectieopties](#) en [RFC 2883 - Een uitbreiding van de optie Selectieve Erkenning \(SACK\) voor TCP](#)

Verifiëren

Gebruik dit gedeelte om te bevestigen dat de configuratie correct werkt.

Het [Uitvoer Tolk](#) ([uitsluitend geregistreerde](#) klanten) (OIT) ondersteunt bepaalde **show** opdrachten. Gebruik de OIT om een analyse van **tonen** opdrachtoutput te bekijken.

- **Geef de interface x/y-status weer** van de relevante Gigabit-interface die aan het FCIP-profiel is gebonden.
- **toon IPS stats tcp int gig x/y**—Hiermee geeft u TCP-statistieken en actieve verbindingen weer voor de relevante Gigabit-interface.
- **tonen IPS arp int gig x/y**—Hiermee geeft u alle ARP-items van de adresresolutie weer voor de relevante Gigabit-interface; de volgende hop of peer moet in deze lijst voorkomen .
- **tonen IP route om x/y te geven** - Hiermee geeft u de specifieke routes die over de relevante Gigabit-interface gaan weer.
- **toon interface fcip x**—Hiermee geeft u de FCIP-interfacestatus en alle informatie die betrekking heeft op deze FCIP-tunnel weer.
- **Geef het profiel fcip x** - weer geeft het IP-adres weer waaraan het profiel is gebonden en alle geconfigureerde TCP-parameters.
- **Laat fcip x tellers zien** - gebruikt om te controleren of er frames zijn die door de FCIP tunnel gaan.
- **fcdomain vsan x**—Toont alle domeingerelateerde details; gebruikt om te controleren of het materiaal gevormd wordt door de FCIP-tunnel(s).
- **Fcns da vsan x**-displays alle poot, FC4-types en FCID's van de betreffende VSAN's laten zien; gebruikt om te verifiëren dat alle verwachte items zijn verdeeld over de FCIP-tunnel(s).

[**Problemen oplossen**](#)

Gebruik dit gedeelte om de configuratie van het probleem op te lossen.

Vergeet niet de opdrachten van de **show** meerdere keren uit te geven om een tegengeschiedenis te bouwen. Tellers die niet op een bepaald moment in de tijd zitten en slechts één keer worden verzameld, zijn meestal nutteloos.

Gebruik de onderstaande configuraties voor meer informatie over de probleemoplossing.
