Introduction

Este documento descreve a Extranet mVPN e fornece exemplos de configuração no Cisco IOS®XR.

Prerequisites

Requirements

Não existem requisitos específicos para este documento.

Componentes Utilizados

Este documento é específico do Cisco IOS XR, mas não está restrito a uma versão de software ou hardware específicos.

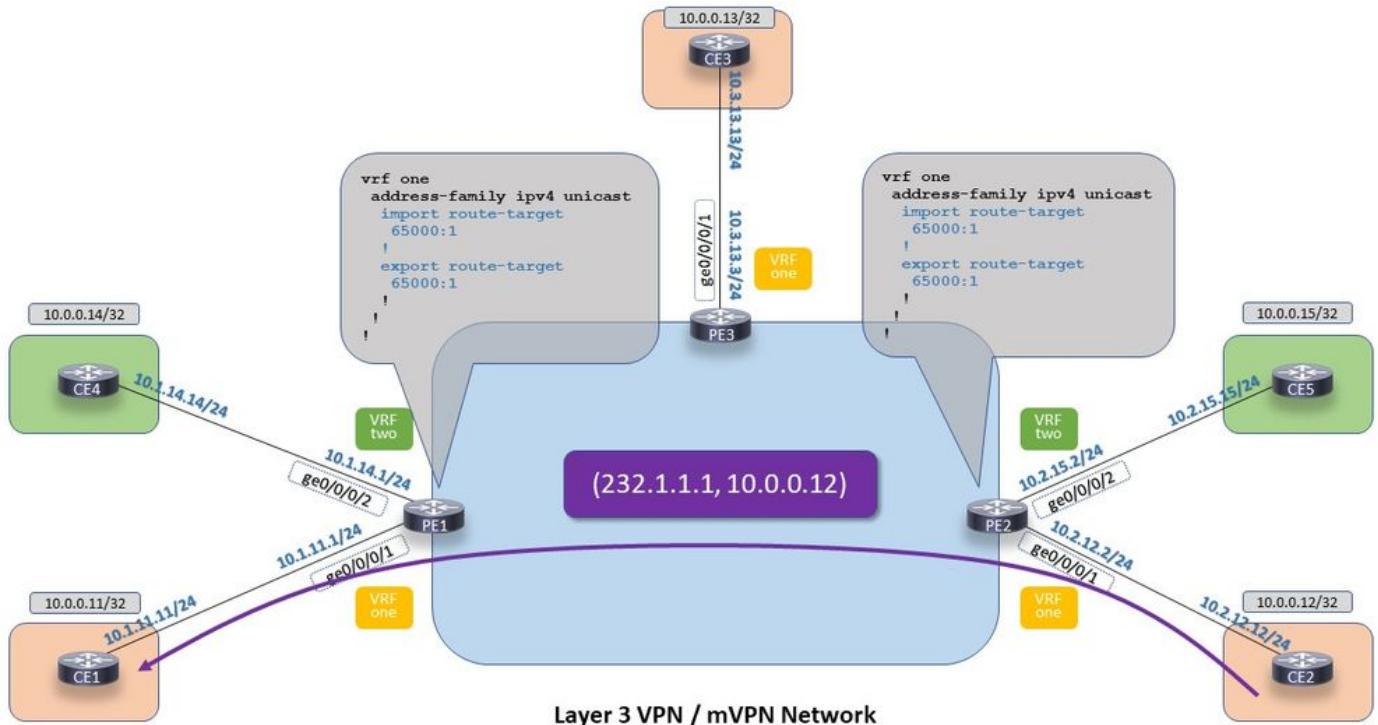

The information in this document was created from the devices in a specific lab environment. All of

the devices used in this document started with a cleared (default) configuration. Se a rede estiver ativa, certifique-se de que você entenda o impacto potencial de qualquer comando.

Introdução ao mVPN

O multicast é suportado em VPNs habilitadas para multicast (mVPN). O mVPN usa os mesmos conceitos de Virtual Routing and Forwarding (VRF) que as redes VPN de Camada 3 unicast usam.

Esta imagem mostra o encaminhamento multicast intra-VRF (usando o perfil 0).

Extranet mVPN no IOS-XR: Fluxo de pacote multicast para MVRF intranet

Imagen 1. Fluxo de pacote multicast para MVRF intranet

O multicast depende do RPF (Reverse Path Forwarding). Isso também se aplica ao tráfego multicast entre VRF. Isso significa que, para que o multicast flua de um VRF para outro VRF, é necessário ter um VRF para RPF para a origem do tráfego multicast para outro VRF. Portanto, a rota para a origem multicast precisa estar disponível na tabela de roteamento VRF do receptor no roteador PE. Há duas maneiras de garantir o sucesso do RPF no contexto do VRF.

1. Baseado em Routing Information Base (RIB). Isso significa que a rota de um VRF - o VRF de origem - precisa ser vazada no outro VRF - o VRF do receptor. Isso será obtido com o uso da função de importação e exportação para RT (Route-Targets).
2. Baseado em RPL (Route Policy Language). Isso significa que o RPF é bem-sucedido graças a uma política de rota forçando o RPF para um VRF e/ou interface (em outro VRF).

Um roteador PE não anuncia novamente uma rota VPN. Se um roteador PE recebeu uma rota VPN de um roteador PE remoto e a importou para o VRF 1, ele não poderá exportar esse prefixo de VPN do VRF 1 para o VRF 2 localmente. Não importa se há uma rota de importação de destino de rota do VRF 1 para o VRF 2 localmente neste roteador PE ou não, a importação para o VRF 2 não ocorre.

O multicast tem tudo a ver com o sucesso do RPF. Fique sempre de olho no RPF. Para que o multicast extranet funcione, o RPF deve ser de um VRF a outro, do receptor ao VRF de origem. Portanto, deve haver uma rota unicast para a origem no VRF receptor de volta para o VRF de origem.

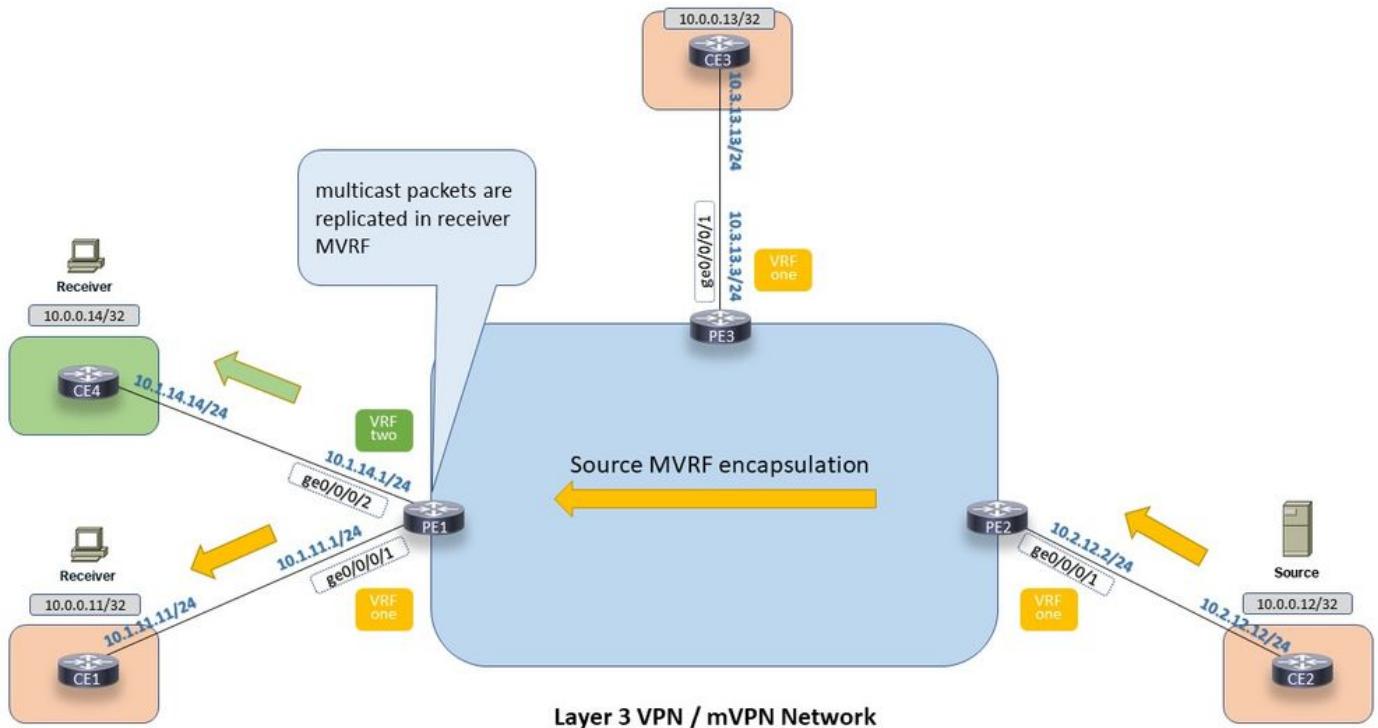

Lmtd: Árvore de distribuição multicast rotulada

Esquemas

O Cisco IOS XE também suporta mVPN extranet. No passado, o IOS (-XE) introduziu dois esquemas para alcançar o mVPN extranet. São referidas como opção 1 e opção 2. O IOS-XR suporta extranet com os mesmos esquemas.

Opção 1: O Multicast Virtual Routing and Forwarding (MVRF) de origem está no MVRF receptor. Isso significa que o VRF (VRF de origem) no roteador PE de entrada para o tráfego multicast também é configurado no roteador PE de saída com os destinos de rota apropriados.

Veja a Imagem 2. Mostra o fluxo de pacotes multicast para a Opção 1.

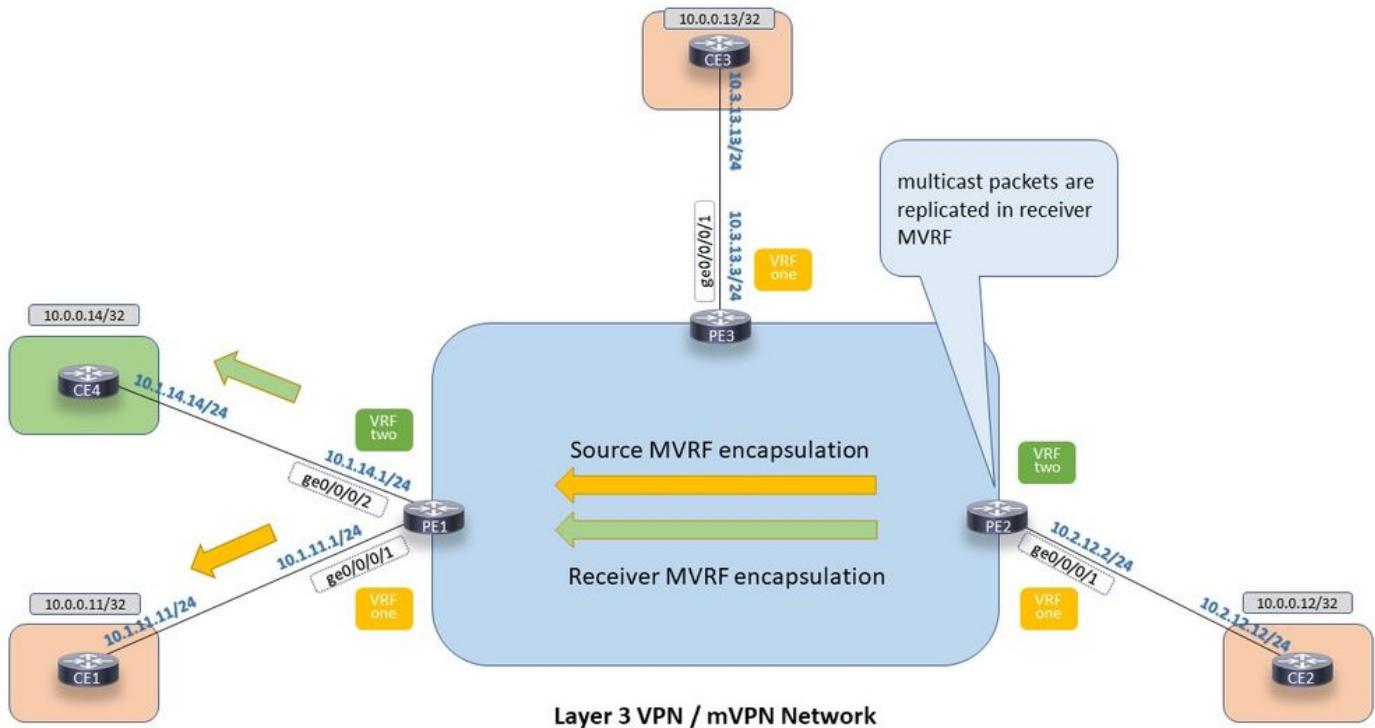

Extranet mVPN no IOS-XR: Fluxo de pacote multicast para a opção de extranet 1

Imagen 2. Fluxo de pacote multicast para a Opção de extranet 1.

O tráfego multicast atravessa a rede central e usa o encapsulamento do MVRF de origem.

Opção 2: O receptor MVRF está no MVRF de origem. Isso significa que o VRF (receptor VRF) no roteador PE de saída para o tráfego multicast também é configurado no roteador PE de entrada com os destinos de rota apropriados.

Veja a Imagem 3. Mostra o fluxo de pacotes multicast para a Opção 2.

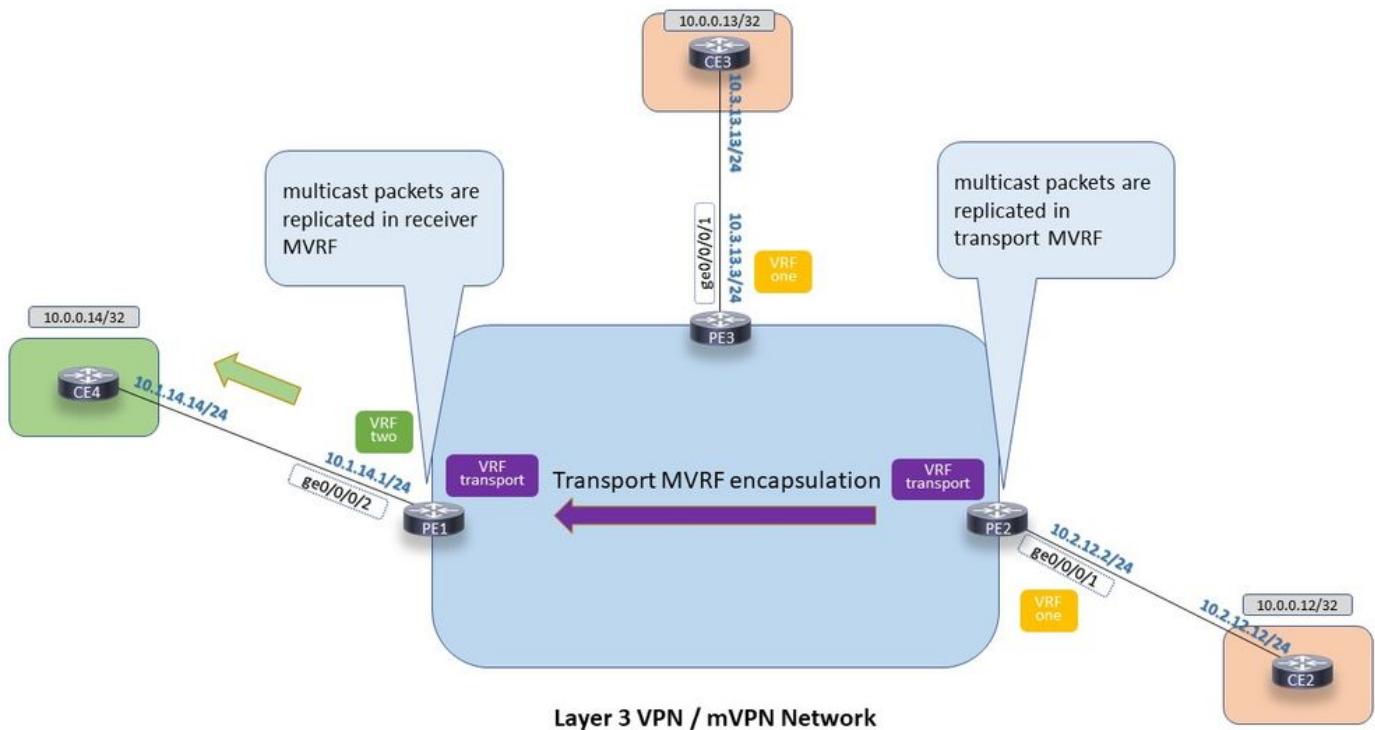

Extranet mVPN no IOS-XR: Fluxo de pacote multicast para a Opção de extranet 2

Imagen 3. Fluxo de pacote multicast para a Opção de extranet 2.

O tráfego multicast atravessa a rede central e usa o encapsulamento do MVRF de origem e do MVRF de receptor. Portanto, o tráfego multicast usa duas vezes a quantidade de largura de banda na rede central.

Há uma terceira opção, uma solução híbrida entre a Opção 1 e a Opção 2.

Opção 3: Um MVRF de transporte é usado. O roteador de entrada PE extranets o tráfego multicast do VRF de origem para o VRF de transporte. O roteador PE de saída extranet o tráfego multicast do VRF de transporte para o VRF receptor. Esse MVRF de transporte não tem interfaces para o cliente associadas a ele.

Extranet mVPN no IOS-XR: Fluxo de pacote multicast para a extranet usando um terceiro VRF, o VRF de transporte

Imagen 4. Fluxo de pacote multicast para extranet usando um terceiro VRF, o VRF de transporte.

Visão geral do suporte

Suporte da Opção 1

Todos os perfis têm suporte baseado em RPL.

Somente os perfis que usam o protocolo multicast core-tree (perfil 0, 3 e 11) suportam mVPN extranet baseada em RIB.

Suporte da Opção 2

Todos os perfis suportam suporte baseado em RPL e em RIB, exceto os perfis que usam a sinalização do cliente com BGP (por exemplo, perfis 2, 11, ...). Estes últimos suportam apenas a opção 2 de forma especial. O exemplo 2.2 ilustra isso.

Procure aqui uma visão geral e uma configuração para os diferentes perfis: [Configurar perfis mVPN no Cisco IOS-XR](#)

Examples

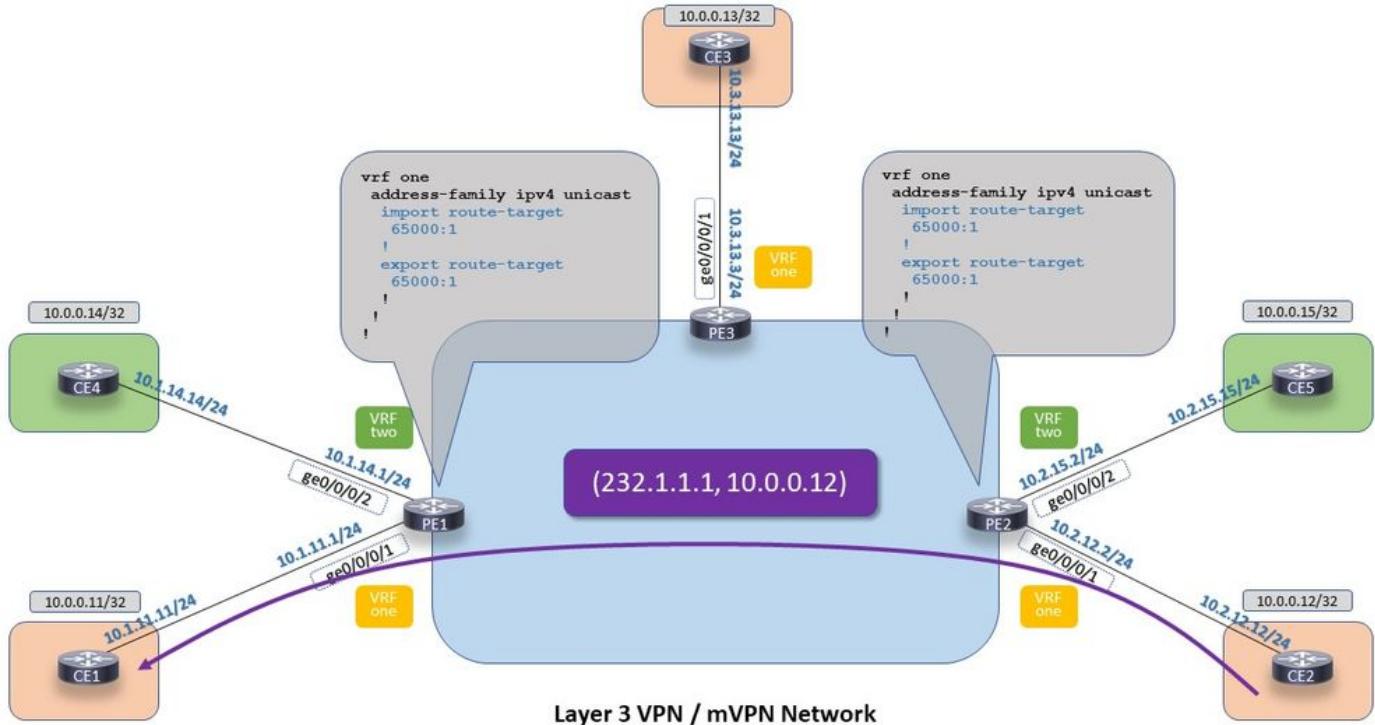

Observe as flags EX ou Extranet nas entradas Multicast RIB (MRIB). Eles estão presentes no VRF de origem e de receptor, nas entradas multicast e nas interfaces.

Perfil 0

O perfil 0 usa o MDT padrão, com sinalização de multicast PIM na parte inferior e na sobreposição (contexto VRF).

Esse perfil suporta as Opções 1 e 2 (e, portanto, 3).

A imagem 5 mostra o tráfego multicast intra-VRF, VRF 1 para VRF 1.

Extranet mVPN no IOS-XR: Perfil 0 - Fluxo de pacote multicast para MVRF intranet

Imagen 5 Perfil 0 - Fluxo de pacote multicast para MVRF intranet

Configuração do perfil 0.

```

multicast-routing
vrf one
address-family ipv4
interface GigabitEthernet0/0/0/1
enable
!
mdt source Loopback0
mdt default ipv4 239.1.1.1
!
!
!
```

```

router pim
vrf one
address-family ipv4
ssm range SSM-range-vrf-one
!
!
!
```

Observe que o perfil 0 é o único perfil que não exige um comando de topologia RPF.

Como alternativa, você pode configurar o comando de topologia RPF para o perfil 0.

```
router pim
vrf one
address-family ipv4
rpf topology route-policy profile-0
ssm range SSM-range-vrf-one
!
!
!

route-policy profile-0
set core-tree pim-default
end-policy
!
```

A saída da entrada MRIB na saída PE 1 é semelhante a esta:

```
RP/0/0/CPU0:PE1#show mrib vrf one route 232.1.1.1 10.0.0.12

 via GigabitEthernet0/0/0/1 with rpf neighbor 10.2.12.12

Exemplo 1.1 . Opção 1. O MVRF de origem está no MVRF do receptor

O perfil 0 suporta a opção 1 baseada em RIB. A rota de volta à origem precisa estar presente no VRF receptor.

Extranet mVPN no IOS-XR: Perfil 0 - Opção 1 O MVRF de origem está no MVRF receptor

Imagen 6. Perfil 0 - Opção 1. O MVRF de origem está no receptor MVRF

A Imagem 6 mostra que o roteador PE de entrada, PE2, anuncia a rota de origem do VRF dois, o VRF de origem, com rota-destino 65000:555. O roteador PE de saída, PE1, importa as rotas com esse destino de rota para o VRF um, o VRF receptor.

O VRF um e o VRF dois usam o perfil 0.

```
multicast-routing
address-family ipv4
interface Loopback0
enable
!
interface GigabitEthernet0/0/0/0
enable
!
!
vrf one
address-family ipv4
interface GigabitEthernet0/0/0/1
enable
!
mdt source Loopback0
mdt default ipv4 239.1.1.1
!
!
vrf two
address-family ipv4
interface GigabitEthernet0/0/0/2
enable
!
mdt source Loopback0
mdt default ipv4 239.1.1.2
!

router pim
address-family ipv4
ssm range SSM-range
!
vrf one
address-family ipv4
ssm range SSM-range-vrf-one
!
!
vrf two
address-family ipv4
ssm range SSM-range-vrf-two
!
!
```

O roteador PE de entrada, PE2, exporta a rota de origem com rota-destino 65000:5555. O roteador PE de saída, PE1, importa essa rota com o rota-alvo 65000:5555 no VRF um.

```
RP/0/0/CPU0:PE1#show mrib vrf one route 232.1.1.3 10.0.0.15

IP Multicast Routing Information Base

Up: 01:36:16
Outgoing Interface List
GigabitEthernet0/0/0/1 Flags: F NS, Up: 01:36:16
```

```
RP/0/0/CPU0:PE1#show pim vrf one rpf 10.0.0.15
Table: IPv4-Unicast-default
* 10.0.0.15/32 [200/0]
  via VRF:two with rpf neighbor 10.0.0.2
  Connector: 65000:2002:10.0.0.2, Nexthop: 10.0.0.2
```

Como o roteador PE de saída, PE1, sabe que o RPF deve ocorrer no VRF dois?

A rota unicast BGP vpn4 em VRF se parece com esta:

```
RP/0/0/CPU0:PE1#show bgp vpnv4 unicast vrf one 10.0.0.15/32
BGP routing table entry for 10.0.0.15/32, Route Distinguisher: 65000:1001
Versions:
Process          bRIB/RIB  SendTblVer
Speaker          65          65
Last Modified: Nov 21 19:09:22.469 for 00:14:33
Paths: (1 available, best #1)
  Not advertised to any peer
  Path #1: Received by speaker 0
  Not advertised to any peer
  65005
    10.0.0.2 (metric 3) from 10.0.0.4 (10.0.0.2)
      Received Label 24006
      Origin IGP, metric 0, localpref 100, valid, internal, best, group-best, import-candidate,
      imported
        Received Path ID 0, Local Path ID 1, version 65
        Extended community: RT:65000:2 RT:65000:5555
        Originator: 10.0.0.2, Cluster list: 10.0.0.4
        Connector: type: 1, Value:65000:2002:10.0.0.2
        Source AFI: VPNv4 Unicast, Source VRF: default, Source Route Distinguisher: 65000:2002
```

Esse diferenciador de rota está vinculado a um VRF. O PE1 localiza o endereço do grupo multicast usado para este RD (Route Distinguisher) por uma pesquisa do RD na tabela mdt ipv4 da família de endereços BGP.

```
RP/0/0/CPU0:PE1#show bgp ipv4 mdt rd 65000:2002 10.0.0.2

```

Não há estado para (10.0.0.15, 232.1.1.3) em PE de entrada, PE2, em VRF um, se VRF um estiver presente mesmo no roteador PE de entrada, PE2.

O método alternativo ao método baseado em RIB é o método baseado em RPL. Isso significa que uma política de rota é usada para alterar o RPF. Veja o exemplo 2.1 para um exemplo dessa política de rota RPF.

Exemplo 1.2 . Opção 2. O MVRF do receptor está no MVRF de origem

Esta é a abordagem baseada em RIB.

Extranet mVPN no IOS-XR: Perfil 0 - Opção 2 O receptor MVRF está no MVRF de origem

Image 7 Profile 0 - Option 2 (Perfil de imagem 0 - Opção 2) O receptor MVRF está no MVRF de origem

Um Route-Target é usado para importar duas rotas de VRF para VRF uma no PE receptor, PE3.

O PE de entrada, PE2, precisa de uma rota estática no VRF um (VRF de receptor) apontado para o VRF dois (VRF de origem) para que o RPF seja bem-sucedido no roteador PE de entrada, PE2.

PE3:

```

vrf one
address-family ipv4 unicast
import route-target
65000:1
65000:3333
!

```

```
export route-target  
65000:1  
!
```

PE2:

```
vrf one  
address-family ipv4 unicast  
import route-target  
65000:1  
!  
export route-target  
65000:1  
!  
  
vrf two  
address-family ipv4 unicast  
import route-target  
65000:2  
!  
export route-target  
65000:2  
65000:3333  
  
router static  
vrf one  
address-family ipv4 unicast  
10.0.0.15/32 vrf two GigabitEthernet0/0/0/2 10.2.15.15  
!
```

Não há necessidade de redistribuir essa rota estática no BGP. Essa rota é anunciada no VRF dois, o VRF de origem. O roteador PE de saída, PE3, recebe essa rota porque é anunciado pelo roteador PE de entrada, PE1, no VRF dois com Route-Target 65000:3333, que é importado para o VRF um em PE3. A rota estática é necessária para que o RPF seja bem-sucedido em VRF no roteador PE de entrada, PE2.

O tráfego multicast usa o MDT do VRF um para cruzar a rede central.

```

Exemplo 1.3 . Opção 3. Um MVRF de transporte é usado

Extranet mVPN no IOS-XR: Perfil 0 - Opção 3 Um MVRF de transporte é usado

Imagen 8. Perfil 0 - Opção 3 Um MVRF de transporte é usado

O MVRF de transporte não precisa de nenhuma interface. No entanto, tudo o resto precisa estar lá: a configuração do VRF, a configuração do BGP, a configuração do roteamento multicast e a configuração do PIM do roteador.

A configuração da opção 1 está no PE de saída, PE1 e a configuração da opção 2 está no PE de entrada, PE2.

Exemplo 1.4 . Extranet local

Há apenas um roteador PE envolvido. Ter uma rota de volta no VRF receptor para o VRF de origem é o único requisito aqui para a solução baseada em RIB.

Uma solução é fazer com que o VRF um (VRF de origem) importe as rotas do VRF dois (VRF de receptor) usando o Route-Target apropriado.

Perfil 14

O perfil 14 usa MDT particionado, com sinalização multicast mLDP na parte inferior e sinalização BGP (cliente) na sobreposição (contexto VRF).

Este perfil suporta a opção 1.

As Opções 2 e 3 podem ser feitas para trabalhar com um truque de roteamento.

A imagem 10 mostra o tráfego multicast intra-VRF, VRF um para VRF um.

Extranet mVPN no IOS-XR: Perfil 14 - Tráfego multicast intra-VRF

Perfil de imagem 10 14 - Tráfego multicast intra-VRF

A saída da entrada MRIB na saída PE 1 é semelhante a esta:

Observe que a interface GE0/0/0/1 está no VRF um.

Exemplo 2.2 . Opção 2. O MVRF do receptor está no MVRF de origem

Essa solução não pode funcionar manipulando as instruções de importação e exportação para os destinos da rota ou por uma alteração da política de rota usada somente pelo RPF.

Um truque ajuda a corrigir o RPF no roteador PE de entrada. O truque é adicionar uma rota estática no VRF do receptor e apontá-la para o VRF de origem no roteador PE de entrada.

A rota estática anuncia o endereço de origem no VRF receptor. Essa rota estática é marcada com um novo Route-Target exclusivo no BGP para que essa rota possa ser diferenciada da mesma rota anunciada no VRF de origem. Isso evita a importação da rota estática do VRF receptor no PE de entrada para o VRF receptor dos outros roteadores PE, o que causa um problema de roteamento.

IP Multicast Routing Information Base

Entry flags: L - Domain-Local Source, E - External Source to the Domain,
C - Directly-Connected Check, S - Signal, IA - Inherit Accept,
IF - Inherit From, D - Drop, ME - MDT Encap, EID - Encap ID,
MD - MDT Decap, MT - MDT Threshold Crossed, MH - MDT interface handle
CD - Conditional Decap, MPLS - MPLS Decap, EX - Extranet
MoFE - MoFRR Enabled, MoFS - MoFRR State, MoFP - MoFRR Primary
MoFB - MoFRR Backup, RPFD - RPF ID Set, X - VXLAN
Interface flags: F - Forward, A - Accept, IC - Internal Copy,
NS - Negate Signal, DP - Don't Preserve, SP - Signal Present,
II - Internal Interest, ID - Internal Disinterest, LI - Local Interest,

LD - Local Disinterest, DI - Decapsulation Interface
EI - Encapsulation Interface, MI - MDT Interface, LVIF - MPLS Encap,
EX - Extranet, A2 - Secondary Accept, MT - MDT Threshold Crossed,
MA - Data MDT Assigned, LMI - mLDP MDT Interface, TMI - P2MP-TE MDT Interface
IRMI - IR MDT Interface, TRMI - TREE SID MDT Interface
