Introdução

Este documento mostra como configurar o Multiprotocol Label Switching (MPLS) da Virtual Private Network (VPN) em Modo de Transferência Assíncrona (Asynchronous Transfer Mode) com roteadores Cisco 7500 como Label Edge Routers (LERs) e roteadores LightStream 1010 como Label Switch Routers (LSRs). Dois roteadores conectados por Ethernet, cada um em um site de cliente remoto, são parte de uma VPN. Neste documento, nós olhamos as configurações de dispositivo de ponta a ponta e os comandos show úteis.

Pré-requisitos

Requisitos

Não existem requisitos específicos para este documento.

Convenções

Consulte as Convenções de Dicas Técnicas da Cisco para obter mais informações sobre convenções de documentos.

Configurar

Nesta seção, você encontrará informações para configurar os recursos descritos neste documento.

Diagrama de Rede

Este documento utiliza a seguinte configuração de rede:

Descrição da rede

A instalação atual contém estes elementos na terminologia VPN:

- CE = roteador de ponta do cliente
- PE = roteador de extremidade do provedor
- Roteador de P=Provider

A instalação atual contém estes elementos na terminologia de MPLS:

- LER = roteador de borda de rótulo
- LSR = Label Switch Router
- TDP/LDP = protocolo de distribuição da etiqueta/protocolo da distribuição de rótulo

Configurações

Este documento utiliza as seguintes configurações:

- O PE1 e o PE2 são os LER em nossa rede ATM.
- O P1 e o P2 são os LSR.
- O CE1 e o CE2 são os roteadores de ponta do cliente que são inconscientes e não realizam o VPN ou o MPLS.
- O CE1 e o CE2 são Ethernet conectado ao PE1 e ao PE2 respectivamente, e realizam o Routing Information Protocol (RIP).
- O PE1, o PE2, o P1 e o P2 fazem o Open Shortest Path First (OSPF) e são todos na área 0. OSPF são o Interior Gateway Protocol (IGP) usado na rede ATM. O tag-switching é usado nas interfaces ATM em todos os quatro dispositivos ATM. O protocolo de distribuição de etiquetas (TDP) atribui etiquetas às rotas de OSPF.
- O PE1 e o PE2 são pares do protocolo de gateway de borda multiprotocolo (MP-BGP).
- As rotas RIP são redistribuídas no MP-BGP. Rotas MP-BGP redistribuídas no RASGO no Roteadores PE1 e PE2.
- A instalação mantém tabelas de roteamento separadas VRF no Roteadores PE1 e PE2.
- O nome do VPN usado neste exemplo é NOVO.

comandos show

Use esses comandos para testar se a rede funciona adequadamente:

- show ip route - Exibe entradas de tabela de IP Routing.
- exibir vrf de banco de dados ip rip – Exibe informações contidas no banco de dados RIP para um determinado VRF.
- show ip bgp vpnv4 vrf – Exibe informações do endereço VPN da tabela BGP.
- **show tag-switching interfaces detail** - Indica a informação sobre umas ou várias relações que têm a característica MPLS permitida.
- **mostre emperramentos do tdp do tag-switching** - Indica as entradas pedidas do base de dados de ligação de rótulo ATM LDP.
- **show tag-switching forwarding-table vrf** - Verifica a pilha de rótulo usada para uma rota particular.

A saída mostrada abaixo é um resultado destes comandos entered nos dispositivos mostrados no diagrama da rede. Esta saída mostra que a rede está funcionando adequadamente.
