## [Introdução](#)

Os direcionadores do Small Computer Systems Interface over IP (iSCSI) de Cisco são um componente-chave da solução de iSCSI. Esses drivers da iSCSI residem no servidor, onde eles:

- Comandos do iSCSI da interceptação.
- Encapsular os comandos em pacotes IP.
- Reorientar os comandos ao Cisco SN 5420, ao Cisco SN 5428, ao Cisco SN5428-2, ou ao Cisco MDS/IPS-8.

Este original fornece configurações de amostra para o host do iSCSI de Solaris a Cisco MDS/IPS-8.

## [Pré-requisitos](#)

### [Requisitos](#)

Certifique-se de atender a estes requisitos antes de tentar esta configuração:

- Instale o driver iscsi que é compatível com sua versão de Solaris e crie então a configuração de iSCSI no Cisco MDS 9000. Refira [driveres iscsi Cisco \(clientes registrados somente\)](#) para a maioria de versão atual do direcionador (solaris-iscsi-3.3.5.tar.Z). Um arquivo de README.txt é incluído no arquivo do FECHO DE CORRER do direcionador (ALCATRÃO). O

arquivo de README.txt contém: Informação do contrato de licença Instalação de driver e instruções de configuração Uma visão geral técnica da arquitetura do driver

- Refira as seções dos requisitos do sistema no [driver iscsi Cisco para Release Note de Sun Solaris](#) para o operating system (OS) e as exigências da correção de programa.
- O driver iscsi Cisco para Sun Solaris é executado somente em máquinas de SPARC. O direcionador não funciona com nenhuns outros tipos de processamento (por exemplo, x86).

## Componentes Utilizados

As informações neste documento são baseadas nestas versões de software e hardware:

- SunOS 5.9, SPARC Ultra-4 E450

```
#uname -a
```

```
SunOS baboon 5.9 Generic sun4u sparc SUNW,Ultra-4
```

- Driver iscsi Cisco 3.3.3 para Solaris

```
#pkginfo -l CSCoiscsi

As informações neste documento foram criadas a partir de dispositivos em um ambiente de laboratório específico. Todos os dispositivos utilizados neste documento foram iniciados com uma configuração (padrão) inicial. Se a sua rede estiver ativa, certifique-se de que entende o impacto potencial de qualquer comando.

## Convenções

Consulte as [Convenções de Dicas Técnicas da Cisco](#) para obter mais informações sobre convenções de documentos.

## Informações de Apoio

O módulo de armazenamento de IP fornece Host IP alcança ao Fibre Channel (FC) dispositivos de armazenamento. O módulo de armazenamento de IP é um DS-X9308-SMIP que forneça o roteamento transparente do iSCSI. Os Host IP que usam o protocolo iscsi podem transparentemente alcançar alvos do iSCSI ([FCP] do protocolo FC) na rede FC. O Host IP envia os comandos do iSCSI encapsulados nas unidades de dados do protocolo iscsi (PDU) a uma porta do armazenamento IP do Cisco MDS 9000 sobre uma conexão TCP/IP. As relações do gigabit Ethernet que são configuradas apropriadamente no módulo de armazenamento de IP fornecem a Conectividade. O módulo de armazenamento de IP:

- Permite-o de criar destinos de iscsi virtuais e traça-os aos alvos físicos FC disponíveis no FC SAN
- Apresenta os alvos FC aos Host IP como se os alvos físicos são anexados localmente à rede

## IP

Cada host do iSCSI que exige o acesso ao armazenamento através do módulo de armazenamento de IP deve ter um driver iscsi compatível instalado. O driver iscsi permite que um host do iSCSI transporte pedidos e respostas do iSCSI sobre uma rede IP com o protocolo iscsi. Da perspectiva de um OS do host, o driver iscsi parece ser um driver de transporte iSCSI similar a um direcionador FC para um canal periférico no host. Cada Host IP aparece como um host FC da perspectiva do dispositivo de armazenamento.

Termine estas etapas para distribuir o iSCSI do Host IP ao dispositivo de armazenamento FC:

- Transporte pedidos e respostas do iSCSI sobre uma rede IP entre anfitriões e o módulo de armazenamento de IP.
- Use o módulo de armazenamento de IP para distribuir pedidos e respostas do iSCSI entre anfitriões em uma rede IP e o dispositivo de armazenamento FC (iSCSI do converso ao FCP e vice-versa).
- Transporte pedidos ou respostas FCP entre o módulo de armazenamento de IP e dispositivos de armazenamento FC.

O módulo de armazenamento de IP não importa alvos FC ao iSCSI à revelia. Você deve configurar dinâmico ou o mapeamento estático de modo que o módulo de armazenamento de IP faça alvos FC disponíveis aos iniciadores de iSCSI. Os alvos estaticamente traçados FC têm um nome configurado quando ambos são configurados. Esta configuração fornece exemplos do mapeamento estático.

Cada vez que isso que o host do iSCSI conecta ao módulo de armazenamento de IP com o mapeamento dinâmico:

- Uma porta nova FC N é criada.
- Os nomes mundiais do nó (nWWNs) e os nomes mundiais da porta (pWWN) atribuídos para esta porta N podem ser diferentes.

Use o método do mapeamento estático se você deve obter o mesmo nWWNs e os pWWN para o iSCSI hospedam cada vez que conecta ao módulo de armazenamento de IP. Você pode usar o mapeamento estático no módulo de armazenamento de IP para alcançar os arranjos de armazenamento inteligentes FC que têm:

- Controle de acesso
- Mapeamento do número de unidade lógica (LUN) e configuração do mascaramento que é baseada nos pWWN ou no nWWNs do iniciador

Especifique estes artigos para controlar o acesso a cada destino de iscsi estático-traçado:

- Uma lista de armazenamento IP move em qual é anunciado
- Uma lista de nomes de nó do iniciador de iSCSI que é permitido o acesso

O FC Zoneamento-baseou o controle de acesso e o controle de acesso iSCSI-baseado é os dois mecanismos por que o controle de acesso pode ser fornecido para o iSCSI. Você pode usar ambos os métodos simultaneamente. O Zoneamento do padrão foi permitido para uma rede de área específica do Virtual Storage (VSAN) nesta configuração. Os módulos de armazenamento de IP usam listas de controle de acesso nome-baseadas e FC Zoneamento-baseadas do nó de iSCSI para reforçar o controle de acesso durante a descoberta de iSCSI e a criação de sessão iSCSI.

O iniciador de iSCSI pode estaticamente ser definido pelo endereço IP de Um ou Mais Servidores

Cisco ICM NT ou pelo nome qualificado do iSCSI (IQN). Uma opção do proxy-iniciador permite a criação dinâmica dos iniciadores de iSCSI em SAN-IOS 1.3 para o Switches de Cisco MDS.

a descoberta de iSCSI ocorre quando um host do iSCSI cria uma sessão de descoberta de iSCSI e perguntas para todos os destinos de iscsi. O módulo de armazenamento de IP retorna somente a lista de destinos de iscsi que as políticas do controle de acesso permitem que o host do iSCSI alcance.

a criação de sessão iSCSI ocorre quando um Host IP inicia uma sessão de iSCSI. O módulo de armazenamento de IP verifica:

- Se o destino de iscsi especificado (na solicitação de login da sessão) é um alvo traçado estática
- Que o nome de nó de iSCSI do Host IP está permitido alcançar o alvo

O início de uma sessão é rejeitado se o Host IP não tem o acesso.

O módulo de armazenamento de IP então:

- Cria uma porta virtual FC N (a porta N pode já existir) para este Host IP
- Faz uma pergunta do Nome do servidor FC para o Fiber Channel ID (FCID) do alvo pWWN FC esse os acessos do Host IP

O módulo de armazenamento de IP usa o pWWN da porta virtual do Host IP N como o solicitador da pergunta do Nome do servidor. Assim, o Nome do servidor faz uma consulta aplicada por zona para o pWWN e responde à pergunta. A sessão de iSCSI é aceita se o Nome do servidor retorna o FCID. Se não, a solicitação de login é rejeitada.

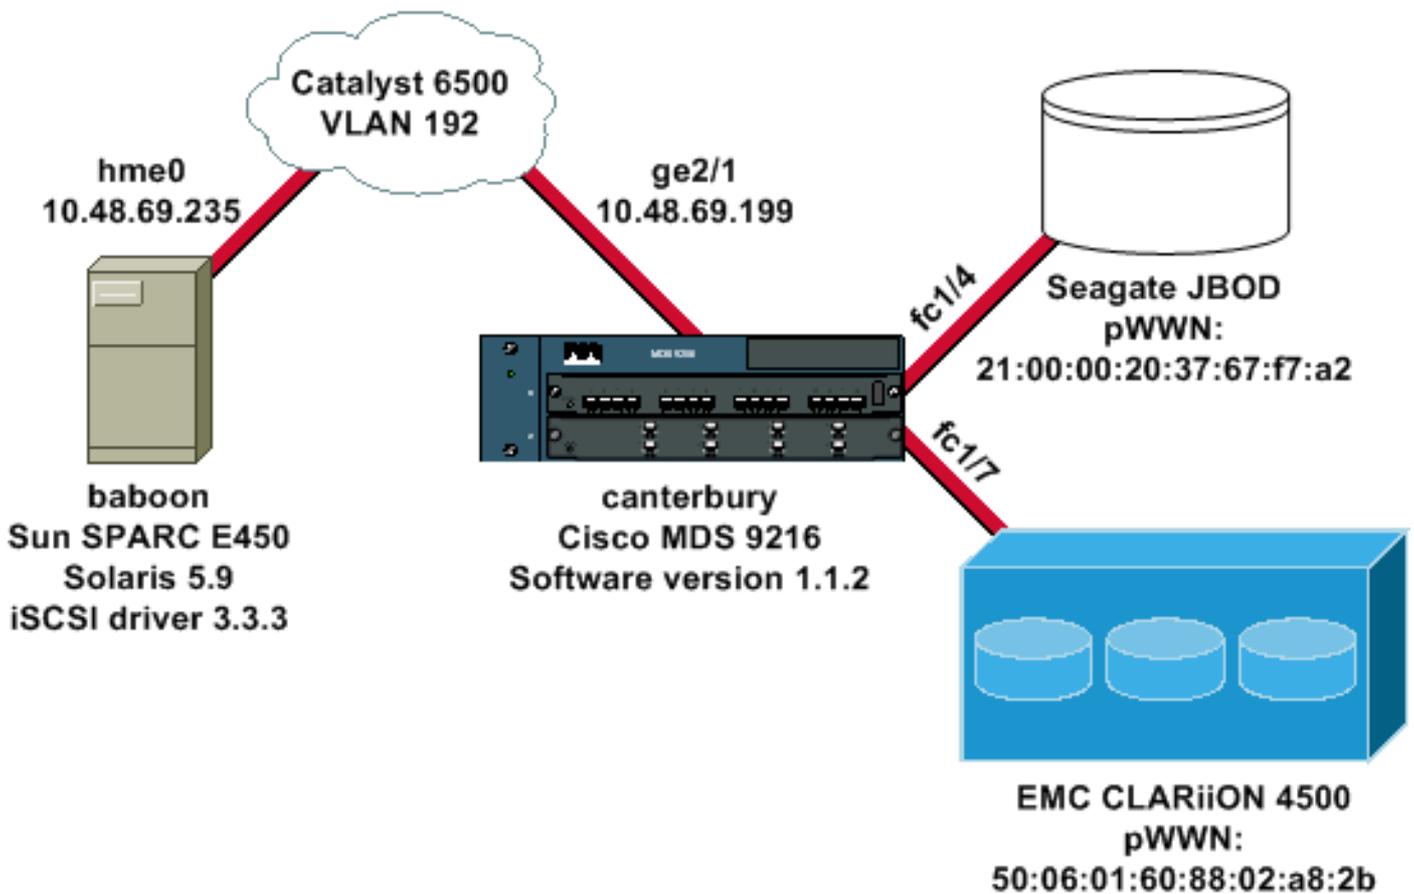

## Configurar

Nesta seção, você encontrará informações para configurar os recursos descritos neste documento.

**Nota:** Use a ferramenta [Command Lookup Tool](#) ([apenas para clientes registrados](#)) para obter mais informações sobre os comandos usados neste documento.

## Diagrama de Rede

Este documento utiliza a seguinte configuração de rede:

## Configurações

Este documento utiliza as seguintes configurações:

- [babuíno \(SunOS 5.9, SPARC E450\)](#)
- [canterbury \(Cisco MDS9216\)](#)

### **babuíno (SunOS 5.9, SPARC E450)**

Altere estes arquivos no host de Solaris:

- /etc/iscsi.conf
- /etc/iscsi.bindings
- /kernel/drv/sd.conf

Isto é configuração de exemplo output:

```
bash-2.05#cat /etc/iscsi.conf

# iSCSI configuration file - see iscsi.conf(4)

# DiscoveryAddress Settings
# -----
# Add "DiscoveryAddress=xxx" entries for each iSCSI
router instance.
# The driver will attempt to discover iSCSI targets at
that address
# and make as many targets as possible available for
use.
# 'xxx' can be an IP address or a hostname. A TCP port
number can be
# specified by appending a colon and the port number to
the address.
# All entries have to start in column one and must not
```

```

contain any
# whitespace.
#
# Example:
#
# DiscoveryAddress=scsirouter1
DiscoveryAddress=10.48.69.199
  !--- Configure the IP address of the GE interface that
accepts iSCSI !--- requests from your host. # The
DiscoveryAddress Settings can take following entry. # #
1) Authentication Settings # 2) ConnectionTimeout
Settings !--- Other required driver parameters can be
changed in the iscsi.conf file. !--- Output is
suppressed. bash-2.05#cat /etc/iscsi.bindings

# iSCSI bindings, file format version 1.0.
# NOTE: this file is automatically maintained by the
iSCSI daemon.
# You should not need to edit this file under most
circumstances.
# If iSCSI targets in this file have been permanently
deleted, you
# may wish to delete the bindings for the deleted
targets.
#
# Format:
# bus  target  iSCSI
# id   id       TargetName
#
0      0        san-fc-jbod-1
0      1        clariion
0      2        clariion-lun-3-4-5
!--- The iSCSI driver discovery daemon process looks up
each discovered target !--- in the /etc/iscsi.bindings
file. !--- The corresponding iSCSI target ID is assigned
to the target if an entry exists in the file for the
target. !--- The smallest available iSCSI target ID !---
is assigned if no entry exists for the target, and an
entry is written to the /etc/iscsi.bindings file for !--
- this target. !--- Note that the /etc/iscsi.bindings
file permanently contains entries !--- for all iSCSI
targets ever logged into from this host. !--- You can
manually edit the file and remove !--- entries so that
the obsolete target no longer consumes an iSCSI target
ID if a target is no longer available to a host. !---
Add an entry manually if you know the iSCSI target name
!--- in advance and want it to be assigned a particular
iSCSI target ID. !--- Stop the iSCSI driver before you
edit the /etc/iscsi.bindings !--- file. Issue the !---
/etc/init.d/iscsi start command to manually start the
iSCSI driver. !--- Issue the /etc/init.d/iscsi stop
command to manually stop the iSCSI driver.

bash-2.05#cat /kernel/drv/sd.conf

**canterbury#show ips stats tcp interface gigabitethernet 2/1 detail**

```
TCP Statistics for port GigabitEthernet2/1
TCP send stats
  28621 segments, 4231096 bytes
  15842 data, 12335 ack only packets
  168 control (SYN/FIN/RST), 0 probes, 210 window
updates
  66 segments retransmitted, 63724 bytes
  66 retransmitted while on ethernet send queue,
1127 packets split
  480 delayed acks sent
TCP receive stats
  36728 segments, 12911 data packets in sequence,
2668162 bytes in sequence
  0 predicted ack, 12050 predicted data
  0 bad checksum, 0 multi/broadcast, 0 bad offset
  0 no memory drops, 0 short segments
  48 duplicate bytes, 1 duplicate packets
  0 partial duplicate bytes, 0 partial duplicate
packets
  0 out-of-order bytes, 164 out-of-order packets
  0 packet after window, 0 bytes after window
  0 packets after close
  12621 acks, 3486850 ack bytes, 0 ack toomuch,
11652 duplicate acks
  0 ack packets left of snd_una, 6 non-4 byte
aligned packets
  8333 window updates, 0 window probe
  624 pcb hash miss, 79 no port, 0 bad SYN, 0 paws
drops
TCP Connection Stats
  0 attempts, 231 accepts, 231 established
  227 closed, 14 drops, 0 conn drops
  0 drop in retransmit timeout, 2 drop in keepalive
timeout
  0 drop in persist drops, 0 connections drained
TCP Miscellaneous Stats
  11761 segments timed, 12027 rtt updated
  51 retransmit timeout, 304 persist timeout
  10452 keepalive timeout, 10450 keepalive probes
TCP SACK Stats
  0 recovery episodes, 0 data packets, 0 data bytes
  0 data packets retransmitted, 0 data bytes
retransmitted
  0 connections closed, 0 retransmit timeouts
TCP SYN Cache Stats
  233 entries, 231 connections completed, 1 entries
timed out
  0 dropped due to overflow, 1 dropped due to RST
  0 dropped due to ICMP unreachable, 0 dropped due to
bucket overflow
  0 abort due to no memory, 4 duplicate SYN, 76 no-
route SYN drop
  0 hash collisions, 0 retransmitted

TCP Active Connections

Codes: C - connected, S - static

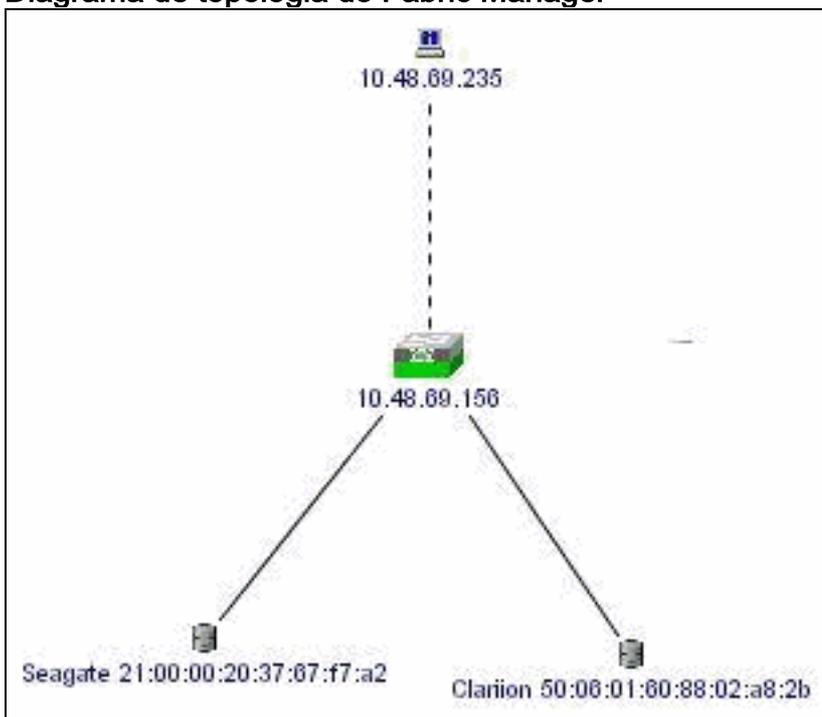

Gateway of last resort is 10.48.69.129

C 10.48.69.192/26 is directly connected,
gigabitethernet2-1
C 10.48.69.128/26 is directly connected, mgmt0
```

## Saída do Fabric Manager e do gerenciador de dispositivo

Esta seção fornece o exemplo de saída do Fabric Manager MDS 1.1(2) e do gerenciador de dispositivo 1.1.(2).

### Diagrama de topologia do Fabric Manager

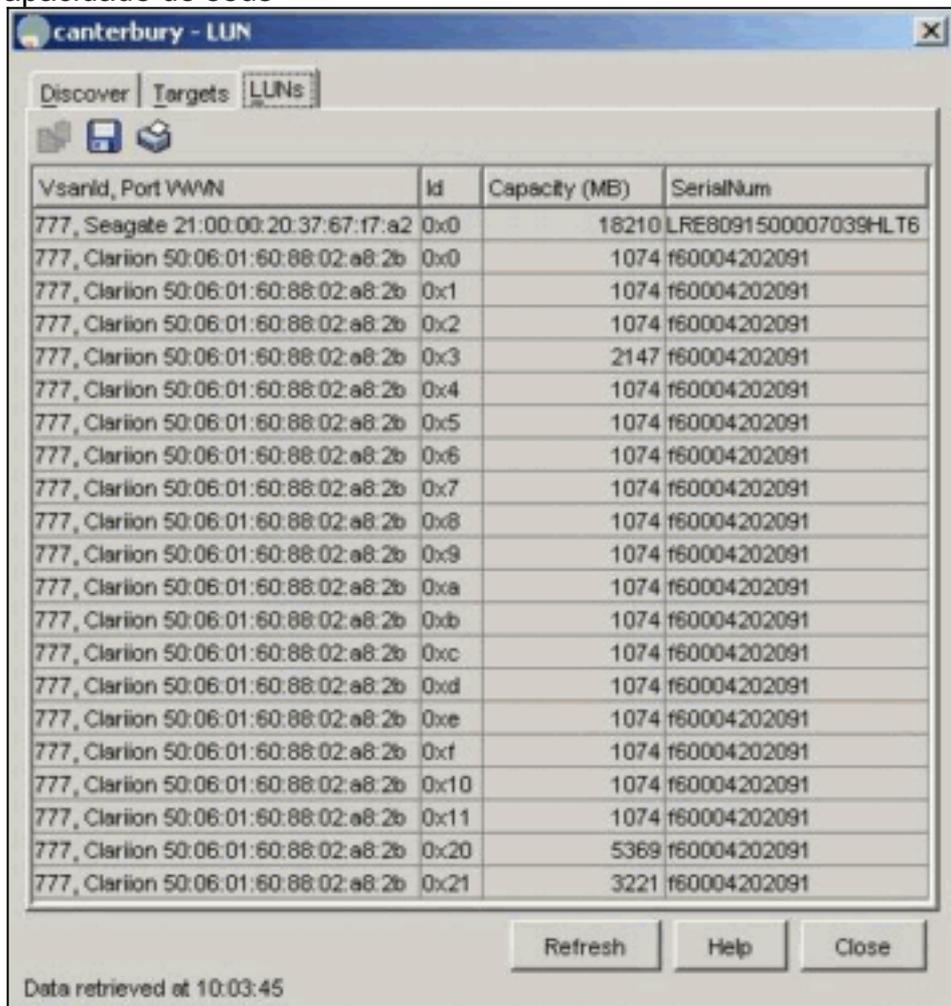

Este é um screen shot da amostra da opinião do gerenciador de dispositivo 1.1(2) em canterbury.

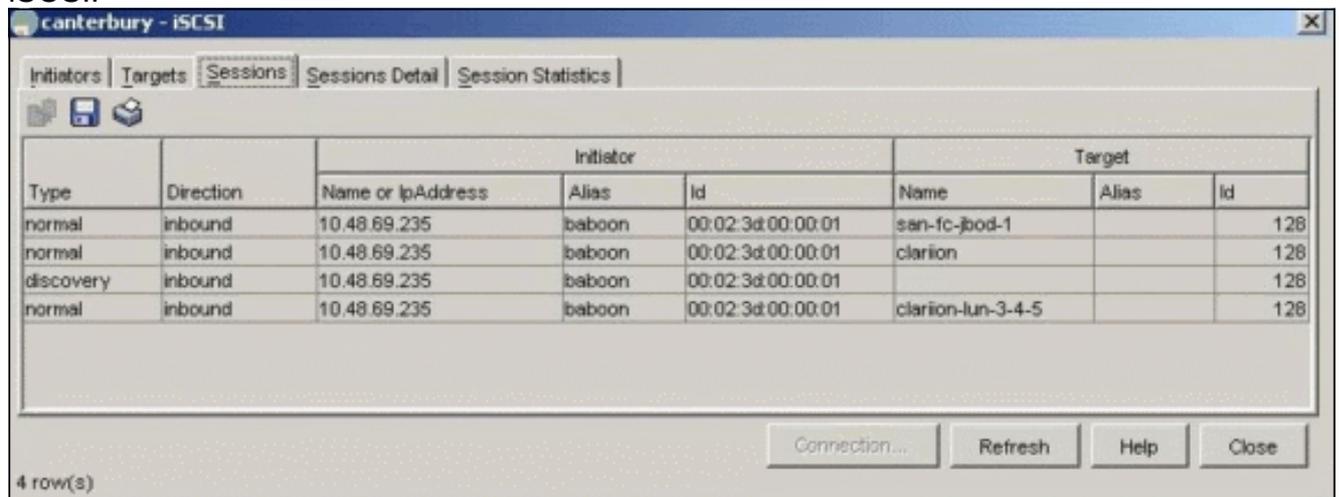

1. Selecione **FC > LUN** na janela de gerenciador do dispositivo para indicar os pWWN, LUN ID,

e a capacidade de seus

LUN.

2. Selecione IP > iSCSI para indicar as sessões de iSCSI.
