

Edições sem fio comuns da cábula

Índice

[Introdução](#)

[Componentes usados](#)

[Breve estado PEM na saída do cliente da mostra](#)

[Cenário 1: Frase de passagem desconfigurado para a autenticação WPA/WPA2 PSK no cliente](#)

[Cenário 2: O telefone sem fio Handsets\(792x/9971\) não associa com das “a área de serviço sem fio folhas”](#)

[Cenário 3: Cliente configurado para o WPA mas o AP configurados somente para o WPA2](#)

[Encenação 4: Análise gramaticalmente códigos do retorno ou da resposta AAA.](#)

[Encenação 5: O cliente não associa ao AP](#)

[Encenação 6: Desassociação do cliente devido ao idle timeout](#)

[Encenação 7: Desassociação do cliente devido ao timeout de sessão](#)

[Encenação 8: Desassociação do cliente devido às mudanças WLAN](#)

[Encenação 9: Desassociação do cliente devido ao supressão manual de WLC](#)

[Encenação 10: Desassociação do cliente devido ao intervalo da autenticação](#)

[Encenação 11: Desassociação do cliente devido ao rádio AP restaurado \(potência/canal\)](#)

[Encenação 12: Problemas de cliente de Symantec com 802.1X “timeoutEvt”](#)

[Encenação 13: O serviço da cópia do ar não aparece para clientes com mDNS que a espião girou sobre](#)

[Encenação 14: O cliente de Apple IO “incapaz de juntar-se à rede” devida desabilitou a mudança rápida SSID](#)

[Encenação 15: Associação bem sucedida do cliente LDAP](#)

[Encenação 16: Autenticação do cliente falhada no LDAP](#)

[Encenação 17: As edições da associação do cliente devido ao LDAP são desconfigurados em WLC](#)

[Encenação 18: Edições da associação do cliente quando o servidor ldap for inacessível](#)

[Encenação 19: Edições vagueando do cliente de Apple devido a configuração vagueando pegajosa faltante](#)

[Encenação 20: Verifique Rápido-Seguro-vaguear \(FSR\) com CCKM](#)

[Encenação 21: Verifique Rápido-Seguro-vaguear \(FSR\) com esconderijo WPA2 PMKID](#)

[Encenação 22: Verificando vaguear Rápido-seguro com esconderijo chave dinâmico](#)

[Encenação 23: Verifique Rápido-Seguro-vaguear \(FSR\) com 802.11r](#)

Introdução

Este original descreve uma cábula que analise gramaticalmente debugue completamente (geralmente “debugar o cliente < o >”) do MAC address para edições sem fio comuns. Para analisar gramaticalmente através da “do cliente mostra” e debuga exigir-nos-á a primeiramente compreendem alguns estados PEM e estados APF.

Contribuído por Shankar Ramanathan, engenheiro de TAC da Cisco.

Componentes usados

A informação neste document é baseada em todos os controladores de "AireOS".

- Controladores 440x, os 5508, 5520, 75xx,85xx, 2504 e vWLC assim como Wisms.
- Embora muitos conceitos sejam idênticos em controladores e no Switches convergidos do acesso IOS-XE, este original não se aplica lhes como saídas e debuga-se é radicalmente diferente.

As informações neste documento foram criadas a partir de dispositivos em um ambiente de laboratório específico. Todos os dispositivos utilizados neste documento foram iniciados com uma configuração (padrão) inicial. Se sua rede está viva, assegure-se de que você compreenda o impacto potencial do comando any.

Informe o estado PEM na saída do cliente da mostra

- **COMEÇO** — Estado inicial para a entrada de cliente nova.
- **AUTHCHECK** — O WLAN tem uma política de autenticação L2 a reforçar.
- **8021X_REQD** — O cliente deve terminar a autenticação do 802.1x.
- **L2AUTHCOMPLETE** — O cliente terminou com sucesso a política L2. O processo pode agora continuar às políticas L3 (aprendizagem de endereço, AUTH da Web, etc.). O controlador envia aqui o anúncio da mobilidade para aprender a informação L3 de outros controladores se este é um cliente vagueando no mesmo grupo da mobilidade.
- **WEP_REQD** — O cliente deve terminar a autenticação WEP.
- **DHCP_REQD** — O controlador precisa de aprender o endereço L3 do cliente, que é feito pelo pedido ARP, requisição DHCP ou renova, ou pela informação aprendida do outro controlador no grupo da mobilidade. Se o DHCP exigido é marcado no WLAN, simplesmente a informação DHCP ou de mobilidade está usada.
- **WEBAUTH_REQD** — O cliente deve terminar a autenticação da Web. (Política L3)
- **CENTRAL_WEBAUTH_REQD** -- O cliente deve terminar o início de uma sessão CWA, esperas WLC para receber o CoA
- **SEJA EXECUTADO** — O cliente terminou com sucesso as políticas L2 e L3 exigidas e pode agora transmitir o tráfego à rede.

A chave dada das mostras das encenações debuga as linhas para faltas de configuração comum em instalações sem fio, essas os parâmetros chaves dos destaques em **corajoso**.

Cenário 1: Frase de passagem desconfigurado para a autenticação WPA/WPA2 PSK no cliente

!--- MIC error due to wrong preshared key
```

Conclusão tirada

Embora o “timeoutEvt” para a chave M2 poderia igualmente ser devido aos erros driver/NIC, um da maioria de problema comum é o usuário que incorpora credenciais incorretas para cahracters da senha PSK (diferenciando maiúsculas e minúsculas faltado/especial etc...) e incapaz de conectar.

```

Conclusão

Debugar no WLC mostra que o 7925G falha a associação como o AP returns um código de status da associação de 201.

Isto é devido a um pedido TSPEC (especificação do tráfego) do monofone que é recusado devido à configuração WLAN. As tentativas WLAN 7925G de conectar são configuradas com um perfil de QoS da prata (ACIMA de 0,3), um pouco do que a platina (ACIMA de 6,7) como necessário. Isto conduz a uma má combinação TSPEC para a troca do quadro do tráfego de voz/ação do monofone através do WLAN, e finalmente a uma rejeição do AP.

Crie um WLAN novo com um perfil de QoS da platina especificamente para os monofones 7925G e configurada conforme melhores prática estabelecidos, e como definido no guia de distribuição 7925G:

http://www.cisco.com/en/US/docs/voice_ip_comm/cuipph/7925g/7_0/english/deployment/guide/7925dply.pdf

Uma vez que configurada, a edição é resolved.

Cenário 3: Cliente configurado para o WPA mas o AP configurados somente para o WPA2

```

Returning AAA Error 'Success' (0) for mobile

Successful Authentication happened, AAA returns access-accept prior to Success (0) to confirm the same.

Returning AAA Error 'Out of Memory' (-2) for mobile

it's the rare reason. [CSCud12582](#) Processing AAA Error 'Out of Memory' Returning AAA Error 'Authentication Failed' (-4) for mobile
its the most common reason seen

Razões possíveis:

1. Conta de usuário e/ou senha inválidas
2. Computador não um membro do domínio, edição no lado AD.
3. Serviços certificados que não trabalham corretamente
4. O certificado de servidor expirou ou não no uso
5. RAIO configurado incorretamente
6. Alcance a chave incorporada incorretamente - É diferenciando maiúsculas e minúsculas (assim que é o SSID)
7. patch do microsoft da atualização.
8. Temporizadores EAP.
9. Método incorreto do eap configurado no cliente/server.
10. O certificado de cliente é expirado ou não no uso.

Retorne o erro "intervalo" AAA (-5) para o móbil

Servidor AAA inacessível, seguido pelo deauth do cliente.

Exemplo:

```
Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41 Max retransmission of Access-Request (id 100) to 155.43.129.216 reached for mobile 00:13:ce:1a:92:41
Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41 [Error] Client requested no retries for mobile 00:13:CE:1A:92:41
Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41 Returning AAA Error 'Timeout' (-5) for mobile 00:13:ce:1a:92:41
Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41 Processing AAA Error 'Timeout' (-5) for mobile 00:13:ce:1a:92:41
Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41 Sent Deauthenticate to mobile on BSSID 00:0b:85:76:d3:e0 slot 1(caller 1x_auth_pae.c:1033) Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41 Scheduling deletion of Mobile Station: (callerId: 65) in 10 seconds
```

Retorne o erro "erro interno" AAA (-6) para o móbil

Atribua a má combinação. O AAA envia atributo incorreto/impróprio (comprimento errado) que não está compreendido/compatível com WLC. WLC envia a mensagem de Deauth seguida pela mensagem do "erro interno". Ex: [CSCum83894](#) AAA "erro interno" e atributos da falha w/unknown do AUTH no acesso aceitam.

Exemplo:

```
Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41 Max retransmission of Access-Request (id 100) to
155.43.129.216 reached for mobile 00:13:ce:1a:92:41
Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41 [Error] Client requested no retries for mobile
00:13:CE:1A:92:41
Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41 Returning AAA Error 'Timeout' (-5) for mobile

Condições

O AP dissocia clientes mas WLC não suprime da entrada.

Solução

Comportamento esperado.

Encenação 12: Problemas de cliente de Symantec com 802.1X “timeoutEvt”

Edição

Os clientes que executa o software de Symantec dissociam-se com o temporizador do
“timeoutEvt” do 802.1X da mensagem expiraram para a estação e para a mensagem = o M3

Os idoes não g do processo EAP/Eapol terminados, independentemente do rádio A/G são usados
no intel/cartão de Broadcom. nenhuma edição quando for wep usado, WPA-PSK.

Condição

O código WLC não importa.

APs - todo o modelo - tudo no modo local.

3 wlan - WPA2+802.1X PEAP + mshcapv2

o ssid é transmitido.

Nps 2008 do servidor Radius

O antivírus de Symantec é instalado em todos os PCes

usando Asus, Braodcom, Intel - win7, vitória-XP

Ósmio afetado - indicadores 7 e xp

Adaptador Wireless afetado - Intel(6205) e Broadcom

Direcionador/suplicante afetados - 15.2.0.19, usando o suplicante nativo.

Reparo/Workaround: Desabilite a proteção e o Firewall da rede de Symantec em win7 e em xp. É
uma edição de Symantec com vitória 7 e ósmio XP.

Resultado do debug

```
Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41 Max retransmission of Access-Request (id 100) to

Scheduling deletion of Mobile Station: (callerId: 65) in 10 seconds

Nota:

Há uma síndrome em 15.2 (igualmente visto nas versões anterior) que vai como:

- o cliente obtém M1 do AP
- o cliente envia o M2
- o cliente obtém o M3 do AP
- o cliente sonda por pares a chave nova antes que mande M4
- o cliente transmite o M4 cifrado com a chave nova AP, deixa cair a mensagem M4 como do “um erro decrypt”
- Mostra do cliente WLC “debugar” que nós estamos cronometrando para fora nas retransmissões M3. Evidentemente, este é um problema entre Microsoft e Symantec, não específico de Intel. O Workaround é remover Symantec. Este é realmente um erro que esteja provavelmente nos indicadores, provocado por Symantec. Tweaking o temporizador EAP não fixa esta edição

Em relação a esta edição, o tac Cisco enviará os clientes afetados a Symantec e a Microsoft.

Encenação 13: O serviço da cópia do ar não aparece para clientes com mDNS que a espião girou sobre

Cliente não capaz de ver dispositivos que proporciona o serviço de AirPrint em dispositivos do cliente handheld de Apple quando a espião do mDNS for girada sobre.

Condições

5508 WLC que executam 7.6.100.0.

Com a espião do mDNS girada sobre, nós temos os dispositivos que proporciona os serviços de AirPrint alistados sob a seção dos serviços no WLC.

O perfil respectivo do mDNS foi traçado corretamente ao WLAN & à relação.

Capaz ainda incapaz de ver os dispositivos de AirPrint no cliente.

Debugar foi executado

debugar o addr> do <mac do cliente

00:0b:85:76:d3:e0 slot 1(caller 1x_auth_pae.c:1033) Wed Oct 26 20:08:50 2011: 00:13:ce:1a:92:41

Scheduling deletion of Mobile Station: (callerId: 65) in 10 seconds

Explicação

O cliente pediria para “. os _ipps _universal. _tcp.local do _sub.” ou “. _ipp _universal. _tcp.local do _sub.” em vez do “_ipp. _tcp.local.” ou “_ipp. _tcp.local.” corda.

Assim o serviço adicionado de AirPrint não trabalharia. Foi identificado a corda pedida do serviço a ser traçada a 'HP_Photosmart_Printer_1

O mesmo serviço foi adicionado no perfil traçado ao WLAN e ainda não havia nenhum serviço alistado para o dispositivo.

Encontrou-se que devido ao Domain Name que estão sendo adicionados e ao cliente que pergunta para “dns-SD. _udp.YVG.local.” com o Domain Name adicionado o WLC não podia processar o pacote de Bonjour como “dns-SD. _udp.YVG.local.” não existe no base de dados.

Identificou o erro dado do realce no que diz respeito ao mesmos - [CSCuj32157](#)

Solução

O único trabalho era ao redor desabilitar a opção de DHCP 15 (Domain Name) ou remover o Domain Name do cliente.

Encenação 14: O cliente de Apple IO “incapaz de juntar-se à rede” devida desabilitou a mudança rápida SSID

Condição

A maioria de dispositivos iOS de Apple têm as edições a mover-se de um WLAN para outro em mesmo Cisco WLC com o padrão “mudança rápida do ssid desabilitada”.

O ajuste causa ao controlador ao deauthenticate o cliente do WLAN que existe uma vez as tentativas do cliente de associar a outras.

O resultado típico é “incapaz de juntar-se uma mensagem à rede” no dispositivo iOS

Solução

Permita a mudança rápido-SSID de WLC GUI>>Controller>>General

Encenação 15: Associação bem sucedida do cliente LDAP

Ajudas seguras LDAP para fixar a conexão entre o controlador e o servidor ldap que usa o TLS. Esta característica é apoiada com versão de software 7.6 do controlador e acima.

Há dois tipos de perguntas que podem ser enviadas pelo controlador ao servidor ldap:

1. Anônimo:

Neste tipo o controlador envia um pedido de autenticação ao servidor ldap quando um cliente precisa de obter authenticated. O servidor ldap responde com o o resultado da pergunta. Durante esta troca toda a informação que inclui o username do cliente/senha está sendo enviada no texto claro. O servidor ldap responderá a uma pergunta de qualquer um enquanto o username do ligamento/senha é adicionado.

2. Autenticado:

Neste método o controlador é configurado com um nome de usuário e senha que se use para autenticar próprio com o servidor ldap. A senha é cifrada com MD5 SASL e enviada ao servidor ldap durante o processo de autenticação. Isto ajuda o servidor ldap corretamente a identificar a fonte dos pedidos de autenticação. Contudo mesmo que a identidade do controlador seja protegida os detalhes do cliente são enviados no texto claro.

A necessidade real para o LDAP sobre o TLS veio devido à vulnerabilidade de segurança levantada por ambos estes dois métodos onde os dados da autenticação do cliente e o resto da transação estão acontecendo na claro.

Solução

Verifique WLC e questões de conectividade de rede do servidor ldap.

Encenação 19: Edições vagueando do cliente de Apple devido a configuração vagueando pegajosa faltante

Condições

AIR-CT5508-K9/7.4.100.0

Disconexão dos dispositivos de Apple da rede Wireless que utiliza o seguinte:

Política WPA2

WPA2 criptografia AES

802.1X da autenticação permitido

Authentication e autorização através de Cisco ISE

De Apple dos dispositivos desconexões periodicamente do SSID transmitido. Um exemplo é um Iphone esse gotas quando um outro telefone no mesmo lugar permanecer conectado. , Ocorre consequentemente aleatoriamente (tempo e telefone).

Clientes do portátil sem edições. Conectam ao mesmo SSID.

Esta edição acontece durante a operação normal, nenhum vaguear, nenhum modo standby.

O WLAN tem removido já todos os ajustes possíveis que poderiam causar edições (aironet ext).

Debugar foi executado

debugar o addr> do <mac do cliente

***apfMsConnTask_5: Jun 11 16:12:56.342: f0:d1:a9:bb:2d:fa Received RSN IE with 0 PMKIDs from mobile f0:d1:a9:bb:2d:fa**

At 16:12:56 in the debugs we see a client re-association. From there the AP is expecting the client to present its old PMKID (Pairwise Master Key Identifiers).

At this point it doesn't! From the above message the AP/WLC didn't receive a PMKID from the iPhone.

This is kind of expected from this type of client.

Apple devices do not use the opportunistic key caching which allows clients to use the SAME PMKID at all Aps.

Apple devices use a key cache method of Sticky Key Caching.

This in turn means that the client has to build a PMKID at EACH AP in order to successfully roam to the AP.

As we can see the client didn't present a PMKID to use so we sent it through layer 2 security/EAP again.

The client then hits a snag in the EAP process where the client fails to respond to the EAP ID or request for credentials until the second attempt *dot1xMsgTask: Jun 11 16:12:56.345: f0:d1:a9:bb:2d:fa Sending EAP-Request/Identity to mobile f0:d1:a9:bb:2d:fa (EAP Id 1) *osapiBsnTimer: Jun 11 16:13:26.288: f0:d1:a9:bb:2d:fa 802.1x 'txWhen' Timer expired for station f0:d1:a9:bb:2d:fa and for message = M0 After this snag the client is allowed back onto the network all in approx. 1.5 seconds.

This is going to be normal and EXPECTED behavior currently with Sticky key cache clients.

Solução

O que nós podemos agora fazer para os clientes que têm clientes SKC (chave pegajosa que põe em esconderijo) e igualmente para ter o código 7.2 WLC e mais alto é permitem vagueiam o apoio para SKC (esconderijo chave pegajoso).

À revelia o WLC apoia somente OKC (chave oportunista que põe em esconderijo). A fim permitir que o cliente use seu PMKIDs velho que gerou em cada AP nós temos que permiti-lo através do WLC CLI.

o Sticky do esconderijo do wpa wpa2 da Segurança de WLAN da configuração permite <1>

Mantenha por favor na mente que isto não melhorará a inicial vagueia devido à natureza de SKC; contudo, melhorará subsequente vagueia aos mesmos Aps (até 8 pelo livro). Imagine que anda abaixo de um corredor com 8 Aps. O primeiro procedimento consistirá em associations completos em cada AP com aproximadamente uma segundo retardação 1-2. Quando você alcança a extremidade e a caminhada para trás o cliente apresentará a 8 PMKIDs original como se move de volta aos mesmos Aps e não terá que atravessar uma autenticação completa se o apoio SKC é permitido. Assim remover a retardação e o cliente parecerá ficar conectada.

Encenação 20: Verifique Rápido-Seguro-vaguear (FSR) com CCKM

```

Como mostrado no início do debuga, o PMKID deve ser computado depois que o pedido da reassociação do cliente é recebido. Isto é precisado a fim validar o PMKID e confirmar que o PMK posto em esconderijo está usado com o aperto de mão WPA2 4-Way para derivar as chaves de criptografia e para terminar vaguear rápido-seguro. Não confunda as entradas CCKM no debuga; isto não é usado a fim executar o CCKM, mas o PKC/OKC, como explicado previamente. O CCKM aqui é simplesmente um nome usado pelo WLC para aquelas saídas, tais como o nome de uma função que segure os valores a fim computar o PMKID.
