[Introduction](#)

本文提供配置示例和总指导大纲配置多协议标签交换(MPLS) VPN的组播支持。此功能在Cisco IOS软件版本12.0(23)S和12.2(13)T被介绍了。

[Prerequisites](#)

[Requirements](#)

在尝试此配置前，请保证您符合这些要求：

- 服务提供商必须有一个支持组播的核心为了使用Cisco组播VPN功能。

[Components Used](#)

本文的信息根据Cisco IOS Software Release 12.2(13)T

Note: 要得到关于平台支持的更新信息的此功能，请使用[软件顾问\(仅限注册用户\)](#)。当新的平台支持为功能，被添加软件顾问动态地更新支持的平台列表。

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

[Conventions](#)

有关文档规则的详细信息，请参阅 [Cisco 技术提示规则](#)。

背景信息

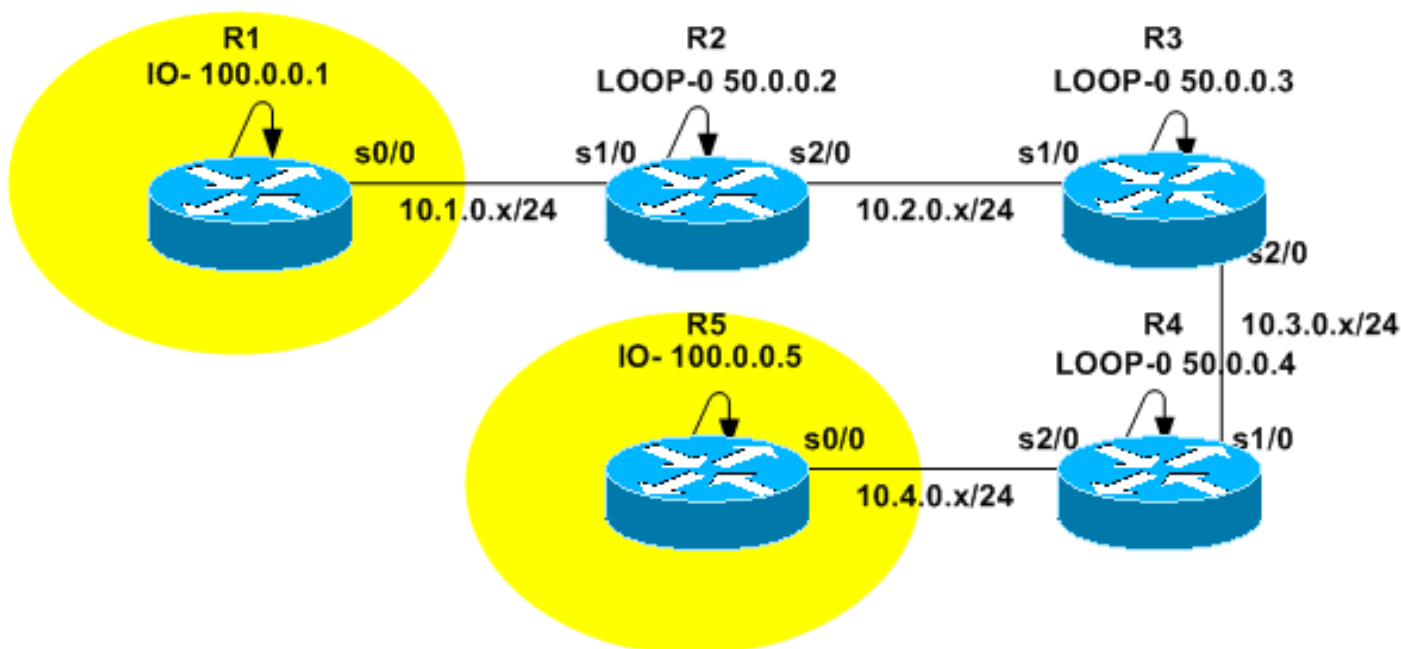

背景信息，请参见[IP组播技术支持的Cisco IOS Software Release 12.2\(13\)T新功能文档的MPLS VPN](#)。

Configure

本部分提供有关如何配置本文档所述功能的信息。

Network Diagram

本文档使用此图所示的网络设置。

配置

[网络图](#)表示服务提供商的骨干网。这包括路由器R2、R3和R4。配置骨干网支持MPLS VPN。当R3是供应商(p)路由器时，R2和R4是服务商边缘路由器。R1和R5表示属于同一个VPN路由和转发的用户边缘(CE)路由器(VRF)实例，黄色。

为了提供多点传送服务器，必须配置骨干网运行组播路由。为此所选的组播协议是独立于协议的组播(PIM)，并且R3被配置作为聚合点(RP)。也配置R2和R4遇到组播路由VRF黄色。PIM sparse-dense模式被配置作为在观点扫描器和CES之间的组播路由协议。配置R2是VRF黄色的RP。

为了测试组播连接，配置R5 s0/0接口参加组播组224.2.2.2。Ping从R1的环回地址被发送到224.2.2.2。互联网控制消息协议(ICMP)响应是组播信息包，而ICMP回复是单播信息包，因为IP目的地地址是R1环回地址。

在本文呈现的配置包括这些：

- [R1-\(CE\)](#)

- [R2-\(PE\)](#)
- [R3-\(P\)](#)
- [R4-\(PE\)](#)
- [R5-\(CE\)](#)

设计技巧

- MPLS VPN的(MVPN)组播被配置在VPN配置顶部。MPLS VPN网络需要仔细设计，首先观察对MPLS VPN网络的所有推荐。
- 必须为本地多点传送服务器配置服务提供商核心。必须为PIM稀疏模式(PIM-SM)，特定源的组播(PIM-SSM)，或者双向PIM (PIM-BIDIR)配置核心。在MVPN配置的密集式PIM (PIM-DM)不支持作为核心协议。配置支持的协议的混合在供应商的核心的是可能的。这可以执行，当一些组播组由一个PIM模式时处理，并且一些其他组由别的处理支持的PIM模式。
- 所有组播协议在组播VRF内支持。除PIM-SM、PIM-SSM和PIM-BIDIR之外，即在组播VRF内您能使用MSDP和PIM-DM
- MVPN服务可以分开被添加根据按VRF的基本类型。即一个PE路由器可能有支持组播的被配置的VRF和仅单播VRF。
- 没有必须为组播配置单个单播VRF的整个场地。是可能的有一些MVPN PE路由器甚而站点(和接口)组播不是启用的地方。您必须保证路由从未被计算指向非多播激活的接口。否则，将中断组播转发。
- 超过一个VRF能属于同一个MVPN组播域。IP编址一定是唯一在组播域内。漏路由和信息包在组播域之间或到一张全局组播路由表里当前不是可能的。
- MDT默认配置对于MVPN是必需工作。配置数据MDT是可选的。如果选择配置一，它是高度推荐的设置数据MDT的阈值。
- 默认MDT的IP地址确定哪个组播域VRF属于。所以，有超过一个VRF的同一个默认MDT地址是可能的。然而，他们将共享在他们之间的组播信息包并且必须观察在组播域的其他需求(例如唯一IP编址方案)。
- 数据MDT可能或也许不配置有IP地址的同一个范围在不同的PE路由器的。这取决于哪个PIM模式用于供应商的核心。如果服务提供商核心使用稀疏模式PIM，则每个PE路由器必须使用一套独特的IP地址数据MDT组。如果服务提供商核心使用特定源组播，则所有PE路由器也许配置有IP地址的同一个范围每个组播域数据MDT的。

Verify

本部分所提供的信息可用于确认您的配置是否正常工作。

[命令输出解释程序工具 \(仅限注册用户 \)](#) 支持某些 **show** 命令，使用此工具可以查看对 **show** 命令输出的分析。

- **show ip igmp groups** —显示组播组用直接地被连接到路由器，并且通过互联网组管理协议 (IGMP)是获知的接受器。
- **show ip pim mdt bgp** —显示路由辨别器(RD)的详细的边界网关协议(BGP)通告MDT默认组的。
- **显示ip pim VRF <vrf-name> mdt发送**—显示路由器在指定的VRF做的数据MDT广告。
- **显示ip pim VRF <vrf-name> mdt接受**—显示在指定的VRF的路由器接收的数据MDT广告。
- **show ip mroute** —显示IP组播路由表的内容在供应商的核心的。
- **show ip mroute VRF <vrf-name>** —显示在客户端的VRF的组播路由表。

完成这些步骤验证您的配置适当地工作。

1. 检查观点扫描器参加了默认MDT隧道的IGMP组。如果配置它，在**default-mdt**命令发出在VRF配置下后，PE也许不能参加默认MDT组。一旦配置环回，从VRF请删除**mdt**命令并且放置它回到解决问题。对于PE-R2，请发出**show ip igmp groups**命令。

```
IGMP Connected Group Membership
Group Address  Interface  Uptime      Expires     Last Reporter
224.0.1.40    Serial2/0  02:21:23    stopped    10.2.0.2
239.1.1.1     Loopback0  02:36:59    stopped    0.0.0.0
```

对于PE-R4，请发出**show ip igmp groups**命令。

```
IGMP Connected Group Membership
Group Address  Interface  Uptime      Expires     Last Reporter
224.0.1.40    Loopback0  02:51:48    00:02:39   50.0.0.4
239.1.1.2     Loopback0  02:51:45    stopped    0.0.0.0
239.1.1.1     Loopback0  02:51:45    stopped    0.0.0.0
239.2.2.0     Loopback0  01:40:03    stopped    0.0.0.0
```

2. 检查接收的BGP通告每个PE。Note: 对于此示例，请检查从对等体观点扫描器PE-R2和PE-R4来源的MDTs。对于PE-R2，请发出**show ip pim mdt bgp**命令。

```
MDT-default group 239.1.1.1
rid: 50.0.0.4 next_hop: 50.0.0.4
```

WAVL tree nodes

```
MDT-default: 239.1.1.1 Tunnel0      source-interface: Loopback0
```

对于PE-R4请发出**show ip pim mdt bgp**命令

```
MDT-default group 239.1.1.1
rid: 50.0.0.2 next_hop: 50.0.0.2
```

WAVL tree nodes

```
MDT-default: 239.1.1.1 Tunnel0      source-interface: Loopback0
```

```
MDT-data : 239.2.2.0 Tunnel0      source-interface: Loopback0
```

3. 检查数据MDTs。Note: 对于此示例，请检查PE-R2和PE-R4来源或加入的数据MDT。对于PE-R2，请发出**show ip pim vrf yellow mdt send**命令。

```
MDT-data send list for VRF: yellow
  (source, group)                MDT-data group      ref_count
  (100.0.0.1, 224.2.2.2)         239.2.2.0           1
```

对于PE-R2，请发出**show ip pim vrf yellow mdt receive**命令。

```
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
       L - Local, P - Pruned, R - RP-bit set, F - Register flag,
       T - SPT-bit set, J - Join SPT, M - MSDP created entry,
       X - Proxy Join Timer Running, A - Candidate MSDP Advertisement,
       U - URD, I - Received Source Specific Host Report, Z - Multicast Tunnel
       Y - Joined MDT-data group, y - Sending to MDT-data group
```

```
Joined MDT-data groups for VRF: yellow
group: 239.2.2.0 source: 0.0.0.0 ref_count: 1
```

检查全局组播路由表默认MDT。 **Note:** 注意此信息：流出的接口列表是在观点扫描器的MVRF。P路由器看到组作为一个正常组播组。每个PE是默认MDT的一个来源，并且仅在PE路由器。一个新的标志位，Z，指示这是组播隧道。对于PE-R2，请发出**show ip mroute 239.1.1.1**命令

```
o
IP Multicast Routing Table

Incoming interface: Serial2/0, RPF nbr 10.2.0.3
Outgoing interface list: Null

(50.0.0.2, 239.2.2.0), 02:13:27/00:03:22, flags: FTZ
Incoming interface: Loopback0, RPF nbr 0.0.0.0
Outgoing interface list:
Serial2/0, Forward/Sparse-Dense, 02:13:27/00:03:26

```

Note: 仅PE路由器与有组播源附有它出现作为组地址数据MDT的组播数据流的来源。

[Troubleshoot](#)

- 发出**show ip pim vrf neighbor**命令检查PE路由器通过动态隧道接口建立了一种PIM邻接关系。如果他们，则默认MDT正常运行。
- 如果默认MDT不作用，发出**show ip pim mdt bgp**命令检查参加MVPN的远程PE路由器环回由本地路由器知道。如果他们不是，请验证PIM在作为MP BGP会话的来源使用的环回接口被启用
- 检查适当配置SP核心提供在PE路由器之间的组播。对于测试目的您也许配置**ip igmp join-group**在一个PE路由器环回接口，并且组播从另一个PE路由器环回来源的ping。
