[問題](#)  
[解決方案](#)  
[單線自動](#)

## 簡介

本文描述如何在安全網路分析管理器上將單點登入(SSO)設定為空/預設值。

## 必要條件

### 需求

本文件沒有特定需求。

### 採用元件

本檔案中的資訊是根據安全網路分析管理員(SMC)版本7.1和更新版本。

本文建議使用具有複製和貼上功能的SSH客戶端/應用程式。

本文中的資訊是根據特定實驗室環境內的裝置所建立。文中使用到的所有裝置皆從已清除（預設）的組態來啟動。如果您的網路運作中，請確保您瞭解任何指令可能造成的影響。

## 問題

配置的SSO設定無效或過時，或者中央管理顯示 Configuration Changes Failed 在儲存無效或過時的SSO配置之後。

## 解決方案

SSO配置包括中央管理和聯邦管理器兩個部分。如果需要比較原始配置和最終配置，請運行所有列出的步驟。如果不需要比較，則僅運行未標籤為（可選）的命令。本文結尾處的一行命令將為您執行這些步驟。

步驟1。（可選）如果要將當前中央管理配置與最終結果進行比較，請運行 `jq '.configurableElements.sso' /lancope/var/services/cm/configuration/$(awk -F\" '{print $8}' /lancope/var/services/cm-agent/configuration/managementChannel.json)/config.json > jqdoldcm.json` 指令。

```
741smc:~# jq '.configurableElements.sso' /lancope/var/services/cm/configuration/$(awk -F\"'{print $8}' /lancope/var/services/cm-agent/configuration/managementChannel.json)/config.json > jqdoldcm.json  
741smc:~#
```

步驟2. ( 可選 ) 如果要將當前配置與最終結果進行比較 , 請運行 jq ./lancope/var/fedlet-manager/conf/fedlet-manager.json > jqdoldfm.json 指令。

```
741smc:~# jq . /lancope/var/fedlet-manager/conf/fedlet-manager.json > jqdoldfm.json  
741smc:~#
```

步驟3. 建立臨時變數 tmpfile=\$(mktemp) 指令。

```
741smc:~# tmpfile=$(mktemp)  
741smc:~#
```

步驟4. 建立臨時變數 cm\_file=\$(echo /lancope/var/services/cm/configuration/\$(awk -F\"'{print \$8}' /lancope/var/services/cm-agent/configuration/managementChannel.json)/config.json) 指令。

```
741smc:~# cm_file=$(echo /lancope/var/services/cm/configuration/$(awk -F\"'{print $8}' /lancope/var/services/cm-agent/configuration/managementChannel.json)/config.json)  
741smc:~#
```

步驟5. 使用CLI確定 echo \$SWINFO\_version 指令。

```
741smc:~# echo $SWINFO_version  
7.4.1
```

如果SMC版本為7.4.1 , 請運行以下命令 :

```
741smc:~# cp $cm_file $tmpfile && jq --arg foo "" --argjson bar false  
.configurableElements.sso.ssoEnabled = $bar|.configurableElements.sso.ssoDescription =  
$foo|.configurableElements.sso.idpXml = $foo|.configurableElements.sso.ssoProxy =  
$foo|.configurableElements.sso.ssoOnly = $bar|.configurableElements.sso.downloadIdpXml = $bar'  
"$tmpfile" > $cm_file && rm -f -- $tmpfile  
741smc:~# cp /lancope/var/fedlet-manager/conf/fedlet-manager.json $tmpfile && jq --arg foo "" --  
argjson bar false '.ssoEnabled = $bar|.ssoDescription = $foo|.idpXml = $foo|.ssoProxy =  
$foo|.state = "NO_CONFIGURATION" |.message="Single Sign-On is not configured."' $tmpfile  
>/lancope/var/fedlet-manager/conf/fedlet-manager.json && rm -f -- $tmpfile  
741smc:~#
```

如果SMC版本低於7.4.1 , 請運行以下命令 :

```
711smc:~# cp $cm_file $tmpfile && jq --arg foo "" --argjson bar false  
.configurableElements.sso.ssoEnabled = $bar|.configurableElements.sso.ssoDescription =  
$foo|.configurableElements.sso.idpXml = $foo|.configurableElements.sso.ssoOnly =  
$bar|.configurableElements.sso.downloadIdpXml = $bar' "$tmpfile" > $cm_file && rm -f -- $tmpfile  
711smc:~# cp /lancope/var/fedlet-manager/conf/fedlet-manager.json $tmpfile && jq --arg foo "" --  
argjson bar false '.ssoEnabled = $bar|.ssoDescription = $foo|.idpXml = $foo|.state =  
"NO_CONFIGURATION" |.message="Single Sign-On is not configured."' $tmpfile >/lancope/var/fedlet-  
manager/conf/fedlet-manager.json && rm -f -- $tmpfile  
711smc:~#
```

步驟6. ( 可選 ) 如果要將最終結果配置與原始配置進行比較 , 請運行以下命令 :

```
741smc:~# jq '.configurableElements.sso' $cm_file > jqdnewcm.json  
741smc:~# jq . /lancope/var/fedlet-manager/conf/fedlet-manager.json > jqdnewfm.json
```

```
741smc:~# diff -y jqdoldcm.json jqdnewcm.json  
741smc:~# diff -y jqdoldfm.json jqdnewfm.json
```

步驟7. (可選) 刪除 json 在上一步驟中作為比較過程的一部分而建立的檔案。

```
741smc:~# rm -f jqdoldcm.json jqdnewcm.json  
741smc:~# rm -f jqdoldfm.json jqdnewfm.json
```

步驟8. 取消設定在本文檔開頭建立的變數。

```
711smc:~# unset tmpfile  
711smc:~# unset cm_file  
711smc:~#
```

使用 docker central-management 指令。

```
741smc:~# docker restart svc-central-management  
svc-central-management  
741smc:~#
```

## 單線自動

運行此命令可執行本文中介紹的所有步驟。輸出包含一些附加格式。

```
bash <(base64 -d <<<
