CHAPTER 9	Test TCP Utility Commands	435
	ttcp receive	436
	ttcp transmit	438

Preface

From Release 6.1.2 onwards, Cisco introduces support for the 64-bit Linux-based IOS XR operating system. Extensive feature parity is maintained between the 32-bit and 64-bit environments. Unless explicitly marked otherwise, the contents of this document are applicable for both the environments. For more details on Cisco IOS XR 64 bit, refer to the [Release Notes](#) for Cisco ASR 9000 Series Routers, Release 6.1.2 document.

The *System Monitoring Command Reference for Cisco ASR 9000 Series Routers* preface contains these sections:

- [Changes to This Document, on page xi](#)
- [Communications, Services, and Additional Information, on page xi](#)

Changes to This Document

This table lists the technical changes made to this document since it was first published.

Table 1: Changes to this Document

Data	Change Summary
January 2015	Initial release of the cumulative command reference document that covers all updates from Rel. 4.3.0 onwards.
April 2016	Republished with the required documentation updates.
November 2016	Republished with documentation updates for Release 6.1.2 features.
July 2017	Republished for Release 6.2.2

Communications, Services, and Additional Information

- To receive timely, relevant information from Cisco, sign up at [Cisco Profile Manager](#).
- To get the business impact you're looking for with the technologies that matter, visit [Cisco Services](#).
- To submit a service request, visit [Cisco Support](#).

- To discover and browse secure, validated enterprise-class apps, products, solutions and services, visit [Cisco Marketplace](#).
- To obtain general networking, training, and certification titles, visit [Cisco Press](#).
- To find warranty information for a specific product or product family, access [Cisco Warranty Finder](#).

Cisco Bug Search Tool

[Cisco Bug Search Tool](#) (BST) is a web-based tool that acts as a gateway to the Cisco bug tracking system that maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. BST provides you with detailed defect information about your products and software.

Alarm Management and Logging Correlation Commands

This module describes the commands used to manage alarms and configure logging correlation rules for system monitoring on the router.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed information about alarm management and logging correlation concepts, configuration tasks, and examples, see the *Implementing and Monitoring Alarms and Logging Correlation* module in the *System Monitoring Configuration Guide for Cisco ASR 9000 Series Routers*.

For system logging commands, see the *Logging Services Commands* module.

For system logging concepts, see the *Implementing Logging Services* module in the *System Monitoring Configuration Guide for Cisco ASR 9000 Series Routers*.

alarm

To specify a type of alarm to be suppressed by a logging suppression rule, use the **alarm** command in logging suppression rule configuration mode.

alarm *msg-category group-name msg-code*

Syntax Description

msg-category Message category of the root message.

group-name Group name of the root message.

msg-code Message code of the root message.

Command Default

No alarm types are configured by default.

Command Modes

Logging suppression rule configuration

Command History

Release	Modification
Release 3.9.0	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to configure the logging suppression rule “commit” to suppress alarms whose root message are “MBGL”, with group name “commit” and message code “succeeded”:

```
RP/0/RSP0/CPU0:router(config)# logging suppress rule commit
RP/0/RSP0/CPU0:router(config-suppr-rule)# alarm MBGL COMMIT SUCCEEDED
```

Related Commands

Command	Description
logging suppress rule, on page 30	Creates a logging suppression rule.

all-alarms

To configure a logging suppression rule to suppress all types of alarms, use the **all-alarms** command in logging suppression rule configuration mode.

all-alarms

Syntax Description This command has no keywords or arguments.

Command Default No alarm types are configured by default.

Command Modes Logging suppression rule configuration

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task	Operations
	logging	read, write

Examples This example shows how to configure the logging suppression rule commit to suppress all alarms:

```
RP/0/RSP0/CPU0:router(config)# logging suppress rule commit
RP/0/RSP0/CPU0:router(config-suppr-rule)# all-alarms
```

Related Commands	Command	Description
	logging suppress rule, on page 30	Creates a logging suppression rule.

all-of-router

To apply a logging suppression rule to alarms originating from all locations on the router, use the **all-of-router** command in logging suppression apply rule configuration mode.

all-of-router

Syntax Description This command has no keywords or arguments.

Command Default No scope is configured by default.

Command Modes Logging suppression apply rule configuration

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	logging	execute

Examples This example shows how to apply the logging suppression rule “commit” to all locations on the router:

```
RP/0/RSP0/CPU0:router(config)# logging suppress apply rule commit
RP/0/RSP0/CPU0:router(config-suppr-apply-rule)# all-of-router
```

Related Commands	Command	Description
	logging suppress apply rule, on page 29	Applies and activates a logging suppression rule.

clear logging correlator delete

To delete all messages or messages specified by a correlation ID from the logging correlator buffer, use the **clear logging correlator delete** command in EXEC mode.

```
clear logging correlator delete {all-in-buffer correlation-id}
```

Syntax Description

all-in-buffer Clears all messages in the logging correlator buffer.

correlation-id Correlation event record ID. Up to 14 correlation IDs can be specified, separated by a space. Range is 0 to 4294967294.

Command Default

No messages are automatically deleted unless buffer capacity is reached.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the [show logging correlator buffer, on page 50](#) command to confirm that records have been cleared.

Use the [logging correlator buffer-size, on page 17](#) command to configure the capacity of the logging correlator buffer.

Task ID

Task ID	Operations
logging	execute

Examples

This example shows how to clear all records from the logging correlator buffer:

```
RP/0/RSP0/CPU0:router# clear logging correlator delete all-in-buffer
```

Related Commands

Command	Description
show logging correlator buffer, on page 50	Displays messages in the logging correlator buffer.

clear logging events delete

To delete messages from the logging events buffer, use the **clear logging events delete** command in EXEC mode.

clear logging events delete

Syntax Description		
admin-level-only		Deletes only events at the administrative level.
all-in-buffer		Deletes all event IDs from the logging events buffer.
bistate-alarms-set		Deletes bi-state alarms in the SET state.
category <i>name</i>		Deletes events from a specified category.
context <i>name</i>		Deletes events from a specified context.
event-hi-limit <i>event-id</i>		Deletes events with an event ID equal to or lower than the event ID specified with the <i>event-id</i> argument. Range is 0 to 4294967294.
event-lo-limit <i>event-id</i>		Deletes events with an event ID equal to or higher than the event ID specified with the <i>event-id</i> argument. Range is 0 to 4294967294.
first <i>event-count</i>		Deletes events, beginning with the first event in the logging events buffer. For the <i>event-count</i> argument, enter the number of events to be deleted.
group <i>message-group</i>		Deletes events from a specified message group.
last <i>event-count</i>		Deletes events, beginning with the last event in the logging events buffer. For the <i>event-count</i> argument, enter the number of events to be deleted.
location <i>node-id</i>		Deletes messages from the logging events buffer for the specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
message <i>message-code</i>		Deletes events with the specified message code.
severity-hi-limit		Deletes events with a severity level equal to or lower than the severity level specified with the <i>severity</i> argument.

severity	Severity level. Valid values are: <ul style="list-style-type: none">• alerts• critical• emergencies• errors• informational• notifications• warnings <p>Note Settings for the severity levels and their respective system conditions are listed under the “Usage Guidelines” section for the logging events level command. Events of lower severity level represent events of higher importance.</p>
severity-lo-limit	Deletes events with a severity level equal to or higher than the severity level specified with the <i>severity</i> argument.
timestamp-hi-limit	Deletes events with a time stamp equal to or lower than the specified time stamp.

hh : mm : ss [month] [day] [year] Time stamp for the **timestamp-hi-limit** or **timestamp-lo-limit** keyword. The *month*, *day*, and *year* arguments default to the current month, day, and year, if not specified.

Ranges for the *hh : mm : ss month day year* arguments are as follows:

- *hh* :—Hours. Range is 00 to 23. You must insert a colon after the *hh* argument.
- *mm* :—Minutes. Range is 00 to 59. You must insert a colon after the *mm* argument.
- *ss*—Seconds. Range is 00 to 59.
- *month*—(Optional) The month of the year. The values for the *month* argument are:
 - january
 - february
 - march
 - april
 - may
 - june
 - july
 - august
 - september
 - october
 - november
 - december
- *day*—(Optional) Day of the month. Range is 01 to 31.
- *year*—(Optional) Year. Enter the last two digits of the year (for example, **04** for 2004). Range is 01 to 37.

timestamp-lo-limit	Deletes events with a time stamp equal to or higher than the specified time stamp.
---------------------------	--

Command Default	No messages are automatically deleted unless buffer capacity is reached.
------------------------	--

Command Modes	EXEC mode
----------------------	-----------

Command History	<table border="0"> <tr> <td style="text-align: left;">Release</td> <td style="text-align: left;">Modification</td> </tr> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

clear logging events delete**Usage Guidelines**

This command is used to delete messages from the logging events buffer that match the keywords and arguments that you specify. The description is matched if all of the conditions are met.

Use the [show logging events buffer, on page 58](#) command to verify that events have been cleared from the logging events buffer.

Use the [logging events buffer-size, on page 22](#) command to configure the capacity of the logging events buffer.

Task ID

Task ID	Operations
logging	execute

Examples

This example shows how to delete all messages from the logging events buffer:

```
RP/0/RSP0/CPU0:router# clear logging events delete all-in-buffer
```

Related Commands

Command	Description
clear logging events reset, on page 11	Resets bi-state alarms.
show logging events buffer, on page 58	Displays messages in the logging events buffer.

clear logging events reset

To reset bi-state alarms, use the **clear logging events reset** command in EXEC mode.

```
clear logging events reset {all-in-bufferevent-id}
```

Syntax Description

all-in-buffer Resets all bi-state alarm messages in the event logging buffer.

event-id Event ID. Resets the bi-state alarm for an event or events. Up to 32 event IDs can be specified, separated by a space. Range is 0 to 4294967294.

Command Default

None

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

This command clears bi-state alarms messages from the logging events buffer. Bi-state alarms are generated by state changes associated with system hardware, such as a change of interface state from active to inactive, or the online insertion and removal (OIR) of a Modular Service Card (MSC), or a change in component temperature.

Use the [show logging events buffer, on page 58](#) command to display messages in the logging events buffer.

Task ID

Task ID	Operations
logging	execute

Examples

This example shows how to reset all bi-alarms in the logging events buffer:

```
RP/0/RSP0/CPU0:router# clear logging events reset all-in-buffer
```

Related Commands

Command	Description
clear logging events delete, on page 7	Deletes all bi-state alarm messages, or messages specified by correlation ID, from the logging events buffer.
show logging events buffer, on page 58	Displays messages in the logging events buffer.

context-correlation

To enable context-specific correlation, use the **context-correlation** command in either stateful or nonstateful correlation rule configuration mode. To disable correlation on context, use the **no** form of this command.

context-correlation
no context-correlation

Syntax Description This command has no keywords or arguments.

Command Default Correlation on context is not enabled.

Command Modes Stateful correlation rule configuration
 Nonstateful correlation rule configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines This command enables context-specific correlation for each of the contexts in which a given rule is applied. For example, if the rule is applied to two contexts (context1 and context2), messages that have context “context1” are correlated separately from those messages with context “context2”.

Use the [show logging correlator rule, on page 53](#) command to show the current setting for the context-correlation flag.

Task ID	Task	Operations
	logging	read, write

Examples This example shows how to enable correlation on context for a stateful correlation rule:

```
RP/0/RSP0/CPU0:router(config)# logging correlator rule stateful_rule type stateful
RP/0/RSP0/CPU0:router(config-corr-rule-st)# context-correlation
```

Related Commands

Command	Description
logging correlator rule, on page 18	Defines the rules for correlating messages.
show logging correlator rule, on page 53	Displays one or more predefined logging correlator rules.

logging correlator apply rule

To apply and activate a correlation rule and enter correlation apply rule configuration mode, use the **logging correlator apply rule** command in Global Configuration mode. To deactivate a correlation rule, use the **no** form of this command.

```
logging correlator apply rule correlation-rule [{all-of-router | context name | location node-id}]
no logging correlator apply rule correlation-rule [{all-of-router | context name | location node-id}]
```

Syntax Description	
<i>correlation-rule</i>	Name of the correlation rule to be applied.
all-of-router	(Optional) Applies the correlation rule to the entire router.
context name	(Optional) Applies the correlation rule to the specified context. Unlimited number of contexts. The <i>name</i> string is limited to 32 characters.
location node-id	(Optional) Applies the correlation rule to the specified node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation. Unlimited number of locations.

Command Default No correlation rules are applied.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **logging correlator apply rule** command is used to either add or remove apply settings for a given rule. These settings then determine which messages are correlated for the affected rules.

If the rule is applied to **all-of-router**, then correlation occurs for only those messages that match the configured cause values for the rule to be correlated, regardless of the context or location setting of that message.

If a rule is applied to a specific set of contexts or locations, then correlation occurs for only those messages that match both the configured cause values for the rule and at least one of those contexts or locations.

Use the [show logging correlator rule, on page 53](#) command to show the current apply settings for a given rule.

Tip When a rule is applied (or if a rule set that contains this rule is applied), then the rule definition cannot be modified through the configuration until the rule or rule set is once again unapplied.

Tip It is possible to configure apply settings at the same time for both a rule and zero or more rule sets that contain the rule. In this case, the apply settings for the rule are the union of all the apply configurations.

The **logging correlator apply rule** command allows you to enter submode (config-corr-apply-rule) to apply and activate rules:

```
RP/0/RSP0/CPU0:router(config)# logging correlator apply rule statefull
RP/0/RSP0/CPU0:router(config-corr-apply-rule)#?

all-of-router  Apply the rule to all of the router
clear          Clear the uncommitted configuration
clear         Clear the configuration
commit        Commit the configuration changes to running
context       Apply rule to specified context
describe      Describe a command without taking real actions
do           Run an exec command
exit         Exit from this submode
location      Apply rule to specified location
no           Negate a command or set its defaults
pwd          Commands used to reach current submode
root         Exit to the global configuration mode
show         Show contents of configuration
RP/0/RSP0/CPU0:router(config-corr-apply-rule)#
```

While in the submode, you can negate keyword options:

```
RP/0/RSP0/CPU0:router(config-corr-apply-rule)# no all-of-router
RP/0/RSP0/CPU0:router(config-corr-apply-rule)# no context
RP/0/RSP0/CPU0:router(config-corr-apply-rule)# no location
```

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to apply a predefined correlator rule to a location:

```
RP/0/RSP0/CPU0:router(config)# logging correlator apply rule rule1
RP/0/RSP0/CPU0:router(config-corr-apply-rule)# location 0/2/CPU0
```

Related Commands

Command	Description
logging correlator rule, on page 18	Defines the rules for correlating messages.
show logging correlator rule, on page 53	Displays one or more predefined logging correlator rules.
show logging correlator ruleset, on page 56	Displays one or more predefined logging correlator rule sets.

logging correlator apply ruleset

To apply and activate a correlation rule set and enter correlation apply rule set configuration mode, use the **logging correlator apply ruleset** command in Global Configuration mode. To deactivate a correlation rule set, use the **no** form of this command.

```
logging correlator apply ruleset correlation-ruleset [{all-of-router | context name | location node-id}]
no logging correlator apply ruleset correlation-ruleset [{all-of-router | context name | location node-id}]
```

Syntax Description

<i>correlation-ruleset</i>	Name of the correlation rule set to be applied.
all-of-router	(Optional) Applies the correlation rule set to the entire router.
context name	(Optional) Applies the correlation rule set to the specified context. Unlimited number of contexts. The <i>name</i> string is limited to 32 characters.
location node-id	(Optional) Applies the correlation rule to the specified node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation. Unlimited number of locations.

Command Default

No correlation rule sets are applied.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **logging correlator apply ruleset** command is used to either add or remove apply settings for a given rule set. These settings then determine which messages are correlated for the affected rules.

If the rule set is applied to **all-of-router**, then correlation occurs for only those messages that match the configured cause values for the rule to be correlated, regardless of the context or location setting of that message.

If a rule set is applied to a specific set of contexts or locations, then correlation occurs for only those messages that match both the configured cause values for the rule and at least one of those contexts or locations.

Use the [show logging correlator ruleset, on page 56](#) command to show the current apply settings for a given rule set.

Tip When a rule is applied (or if a rule set that contains this rule is applied), then the rule definition cannot be modified through the configuration until the rule or rule set is once again unapplied.

Tip It is possible to configure apply settings at the same time for both a rule and zero or more rule sets that contain the rule. In this case, the apply settings for the rule are the union of all the apply configurations.

The **logging correlator apply ruleset** command allows you to enter the submode (config-corr-apply-ruleset) to apply and activate rule sets:

```
RP/0/RSP0/CPU0:router(config)# logging correlator apply ruleset ruleset1
RP/0/RSP0/CPU0:router(config-corr-apply-ruleset)#?
  all-of-router  Apply the rule to all of the router
  clear          Clear the uncommitted configuration
  clear          Clear the configuration
  commit        Commit the configuration changes to running
  context        Apply rule to specified context
  describe       Describe a command without taking real actions
  do             Run an exec command
  exit           Exit from this submode
  location       Apply rule to specified location
  no             Negate a command or set its defaults
  pwd            Commands used to reach current submode
  root           Exit to the global configuration mode
  show           Show contents of configuration
RP/0/RSP0/CPU0:router(config-corr-apply-ruleset)#
```

While in the submode, you can negate keyword options:

```
RP/0/RSP0/CPU0:router(config-corr-apply-ruleset)# no all-of-router
RP/0/RSP0/CPU0:router(config-corr-apply-ruleset)# no context
RP/0/RSP0/CPU0:router(config-corr-apply-ruleset)# no location
```

Task ID	Task ID	Operations
	logging	read, write

Examples

This example shows how to apply a predefined correlator rule set to the entire router:

```
RP/0/RSP0/CPU0:router(config)# logging correlator apply ruleset ruleset1
RP/0/RSP0/CPU0:router(config-corr-apply-rule)# all-of-router
```

Related Commands

Command	Description
show logging correlator ruleset, on page 56	Displays one or more predefined logging correlator rule sets.

logging correlator buffer-size

To configure the logging correlator buffer size, use the **logging correlator buffer-size** command in Global Configuration mode. To return the buffer size to its default setting, use the **no** form of this command.

logging correlator buffer-size *bytes*
no logging correlator buffer-size *bytes*

Syntax Description	<i>bytes</i> The size, in bytes, of the circular buffer. Range is 1024 to 52428800 bytes.
---------------------------	---

Command Default	<i>bytes</i> : 81920 bytes
------------------------	----------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **logging correlator buffer-size** command configures the size of the correlation buffer. This buffer holds all the correlation records as well as the associated correlated messages. When the size of this buffer is exceeded, older correlations in the buffer are replaced with the newer incoming correlations. The criteria that are used to recycle these buffers are:

- First, remove the oldest nonstateful correlation records from the buffer.
- Then, if there are no more nonstateful correlations present; remove the oldest stateful correlation records.

Use the [show logging correlator info, on page 52](#) command to confirm the size of the buffer and the percentage of buffer space that is currently used. The [show logging events buffer, on page 58](#) **all-in-buffer** command can be used to show the details of the buffer contents.

Task ID	Task ID	Operations
	logging	read, write

Examples This example shows how to set the logging correlator buffer size to 90000 bytes:

```
RP/0/RSP0/CPU0:router(config)# logging correlator buffer-size 90000
```

Related Commands	Command	Description
	show logging correlator info, on page 52	Displays the logging correlator buffer size and the percentage of the buffer occupied by correlated messages.

logging correlator rule

To define the rules for correlating messages, use the **logging correlator rule** command in Global Configuration mode. To delete the correlation rule, use the **no** form of this command.

logging correlator rule *correlation-rule* **type** {stateful | nonstateful}
no logging correlator rule *correlation-rule*

Syntax Description	
<i>correlation-rule</i>	Name of the correlation rule to be applied.
type	Specifies the type of rule.
stateful	Enters stateful correlation rule configuration mode.
nonstateful	Enters nonstateful correlation rule configuration mode.

Command Default No rules are defined.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **logging correlator rule** command defines the correlation rules used by the correlator to store messages in the logging correlator buffer. A rule must, at a minimum, consist of three elements: a root-cause message, one or more non-root-cause messages, and a timeout.

When the root-cause message, or a non-root-cause message is received, the timer is started. Any non-root-cause messages are temporarily held, while the root-cause is sent to syslog. If, after the timer has expired, the root-cause and at least one non-root-cause message was received, a correlation is created and stored in the correlation buffer.

A rule can be of type stateful or nonstateful. Stateful rules allow non-root-cause messages to be sent from the correlation buffer if the bi-state root-cause alarm clears at a later time. Nonstateful rules result in correlations that are fixed and immutable after the correlation occurs.

Below are the rule parameters that are available while in stateful correlation rule configuration mode:

```
RP/0/RSP0/CPU0:router(config-corr-rule-st)# ?
context-correlation Specify enable correlation on context
nonrootcause        nonrootcause alarm
reissue-nonbistate  Specify reissue of non-bistate alarms on parent clear
reparent            Specify reparent of alarm on parent clear
rootcause           Specify root cause alarm: Category/Group/Code combos
timeout             Specify timeout
timeout-rootcause   Specify timeout for root-cause
```

```
RP/0/RSP0/CPU0:router(config-corr-rule-st)#
```

Below are the rule parameters that are available while in nonstateful correlation rule configuration mode:

```
RP/0/RSP0/CPU0:router(config-corr-rule-nonst)# ?
context-correlation Specify enable correlation on context
nonrootcause        nonrootcause alarm
rootcause           Specify root cause alarm: Category/Group/Code combos
timeout             Specify timeout
timeout-rootcause   Specify timeout for root-cause
RP/0/RSP0/CPU0:router(config-corr-rule-nonst)#
```

Note A rule cannot be deleted or modified while it is applied, so the **no logging correlator apply** command must be used to unapply the rule before it can be changed.

Note The name of the correlation rule must be unique across all rule types and is limited to a maximum length of 32 characters.

Use the [show logging correlator buffer, on page 50](#) to display messages stored in the logging correlator buffer.

Use the [show logging correlator rule, on page 53](#) command to verify correlation rule settings.

Task ID

Task Operations

logging read,
write

Examples

This example shows how to enter stateful correlation rule configuration mode to specify a collection duration period time for correlator messages sent to the logging events buffer:

```
RP/0/RSP0/CPU0:router(config)# logging correlator rule state_rule type stateful
RP/0/RSP0/CPU0:router(config-corr-rule-st)# timeout 50000
```

Related Commands

Command	Description
logging correlator apply rule, on page 13	Applies and activates correlation rules.
nonrootcause, on page 31	Enters non-root-cause configuration mode and specifies a non-root-cause alarm.
reissue-nonbistate, on page 33	Reissues non-bistate alarm messages (events) from the correlator log after its root-cause alarm clears.
reparent, on page 34	Reparents non-root-cause messages to the next highest active root-cause in a hierarchical correlation when their immediate parent clears.
rootcause, on page 36	Specifies a root-cause message alarm.
show logging correlator buffer, on page 50	Displays messages in the logging correlator buffer.

Command	Description
show logging correlator rule, on page 53	Displays one or more predefined logging correlator rules.
timeout, on page 71	Specifies the collection period duration time for the logging correlator rule message.
timeout-rootcause, on page 73	Specifies an optional parameter for an applied correlation rule.

logging correlator ruleset

To enter correlation rule set configuration mode and define a correlation rule set, use the **logging correlator ruleset** command in Global Configuration mode. To delete the correlation rule set, use the **no** form of this command.

logging correlator ruleset *correlation-ruleset* **rulename** *correlation-rulename*
no logging correlator ruleset *correlation-ruleset*

Syntax Description

<i>correlation-ruleset</i>	Name of the correlation rule set to be applied.
rulename	Specifies the correlation rule name.
<i>correlation-rulename</i>	Name of the correlation rule name to be applied.

Command Default

No rule sets are defined.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **logging correlator ruleset** command defines a specific correlation rule set. A rule set name must be unique and is limited to a maximum length of 32 characters.

To apply a logging correlator rule set, use the [logging correlator apply ruleset, on page 15](#) command.

Examples

This example shows how to specify a logging correlator rule set:

```
RP/0/RSP0/CPU0:router(config)# logging correlator ruleset ruleset_1
RP/0/RSP0/CPU0:router(config-corr-ruleset)# rulename state_rule
RP/0/RSP0/CPU0:router(config-corr-ruleset)# rulename state_rule2
```

Related Commands

Command	Description
logging correlator apply ruleset, on page 15	Applies and activates a correlation rule set and enters correlation apply rule set configuration mode.
show logging correlator buffer, on page 50	Displays messages in the logging correlator buffer.
show logging correlator ruleset, on page 56	Displays defined correlation rule set names.

logging events buffer-size

To configure the size of the logging events buffer, use the **logging events buffer-size** command in Global Configuration mode. To restore the buffer size to the default value, use the **no** form of this command.

logging events buffer-size *bytes*
no logging events buffer-size *bytes*

Syntax Description	<i>bytes</i> The size, in bytes, of the logging events buffer. Range is 1024 to 1024000 bytes. The default is 43200 bytes.
---------------------------	--

Command Default	<i>bytes</i> : 43200
------------------------	----------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

Note The logging events buffer automatically adjusts to a multiple of the record size that is lower than or equal to the value configured for the *bytes* argument.

Use the [show logging events info, on page 62](#) command to confirm the size of the logging events buffer.

Task ID	Task ID	Operations
	logging read, write	

Examples

This example shows how to increase the logging events buffer size to 50000 bytes:

```
RP/0/RSP0/CPU0:router (config) # logging events buffer-size 50000
```

Related Commands

Command	Description
logging events level, on page 26	Specifies a severity level for logging alarm messages.
logging events threshold, on page 28	Specifies the event logging buffer capacity threshold that, when surpassed, will generate an alarm.
show logging correlator info, on page 52	Displays information about the size of the logging correlator buffer and available capacity.

Command	Description
show logging events buffer, on page 58	Displays messages in the logging events buffer.
show logging events info, on page 62	Displays configuration and operational messages about the logging events buffer.

logging events display-location

To enable the alarm source location display field for bistate alarms in the output of the **show logging** and **show logging events buffer** command, use the **logging events display-location** command in Global Configuration mode.

logging events display-location
no logging events display-location

Syntax Description	This command has no keywords or arguments.				
Command Default	The alarm source location display field in show logging output is not enabled.				
Command Modes	Global Configuration mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.9.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.9.0	This command was introduced.
Release	Modification				
Release 3.9.0	This command was introduced.				

Usage Guidelines The output of the **show logging** command for bistate alarms has been enhanced. Previously, the alarm source field in the output displayed the location of the process that logged the alarm. Use the **logging events display-location** command to configure the output of the **show logging** command to include an additional source field that displays the actual source of the alarm. The alarm source is displayed in a format that is consistent with alarm source identification in other platforms and equipment. The new alarm source display field aids accurate identification and isolation of the source of a fault.

By default, the output of the **show logging** command does not include the new alarm source identification field. If you enable the alarm source location display field in the **show logging** output, the same naming conventions are also used to display hardware locations in the **show diag** and **show inventory** command output.

Note Customer OSS tools may rely on the default output to parse and interpret the alarm output.

Task ID	Task ID	Operations
	logging	read, write

Examples

This example shows the **show logging** command output for bistate alarms before and after enabling the alarm source location display field:

```

Related Commands

Command	Description
show logging events buffer, on page 58	Displays messages in the logging events buffer.

logging events level

To specify a severity level for logging alarm messages, use the **logging events level** command in Global Configuration mode. To return to the default value, use the **no** form of this command.

logging events level *severity*
no logging events level

Syntax Description

severity Severity level of events to be logged in the logging events buffer, including events of a higher severity level (numerically lower). [Table 2: Alarm Severity Levels for Event Logging, on page 26](#) lists severity levels and their respective system conditions.

Command Default

All severity levels (from 0 to 6) are logged.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

This command specifies the event severity necessary for alarm messages to be logged. Severity levels can be specified by the severity level description (for example, **warnings**). When a severity level is specified, events of equal or lower severity level are also written to the logging events buffer.

Note Events of lower severity level represent events of higher importance.

This table lists the system severity levels and their corresponding numeric values, and describes the corresponding system condition.

Table 2: Alarm Severity Levels for Event Logging

Severity Level Keyword	Numeric Value	Logged System Messages
emergencies	0	System is unusable.
alerts	1	Critical system condition exists requiring immediate action.
critical	2	Critical system condition exists.
errors	3	Noncritical errors.
warnings	4	Warning conditions.
notifications	5	Notifications of changes to system configuration.
informational	6	Information about changes to system state.

Task ID	Task ID	Operations
	logging	read, write

Examples

This example shows how to set the severity level for notification to warnings (level 4):

```
RP/0/RSP0/CPU0:router(config)# logging events level warnings
```

Related Commands

Command	Description
logging events buffer-size, on page 22	Specifies the logging events buffer size.
logging events threshold, on page 28	Specifies the logging events buffer capacity threshold that, when surpassed, will generate an alarm.

logging events threshold

To specify the logging events buffer threshold that, when surpassed, generates an alarm, use the **logging events threshold** command in Global Configuration mode. To return to the default value, use the **no** form of this command.

logging events threshold *percent*
no logging events threshold

Syntax Description	<i>percent</i> Minimum percentage of buffer capacity that must be allocated to messages before an alarm is generated. Range is 10 to 100. The default is 80 percent.
---------------------------	--

Command Default	<i>percent</i> : 80 percent
------------------------	-----------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	This command can be configured to generate an alarm when 10 percent or more of the event buffer capacity is available.
-------------------------	--

The logging events buffer is circular; that is, when full it overwrites the oldest messages in the buffer. Once the logging events buffer reaches full capacity, the next threshold alarm is generated when the number of overwritten events surpasses the percentage of buffer capacity allocated to messages.

Use the [show logging events info, on page 62](#) command to display the current threshold setting.

Task ID	Task	Operations
	logging	read, write

Examples	This example shows how to configure the threshold setting to 95 percent of buffer capacity:
-----------------	---

```
RP/0/RSP0/CPU0:router (config) # logging events threshold 95
```

Related Commands	Command	Description
	logging events buffer-size, on page 22	Specifies the logging correlator buffer size.
	logging events level, on page 26	Specifies a severity level for logging alarm messages.
	show logging events info, on page 62	Displays configuration and operational messages about the logging events buffer.

logging suppress apply rule

To apply and activate a logging suppression rule, use the **logging suppress apply rule** command in Global Configuration mode. To deactivate a logging suppression rule, use the **no** form of this command.

```
logging suppress apply rule rule-name [{all-of-router | source location node-id}]
no logging suppress apply rule rule-name [{all-of-router | source location node-id}]
```

Syntax Description		
	<i>rule-name</i>	Name of the logging suppression rule to activate.
	all-of-router	(Optional) Applies the specified logging suppression rule to alarms originating from all locations on the router.
	source location <i>node-id</i>	(Optional) Applies the specified logging suppression rule to alarms originating from the specified node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No logging suppression rules are applied.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task	Operations
	logging read, write	

Examples This example shows how to apply a predefined logging suppression rule to the entire router:

```
RP/0/RSP0/CPU0:router(config)#logging suppress apply rule infobistate
RP/0/RSP0/CPU0:router(config-suppr-apply-rule)# all-of-router
```

Related Commands	Command	Description
	all-of-router, on page 5	Applies a logging suppression rule to suppress alarms originating from all sources on the router.
	source, on page 70	Applies a logging suppression rule to alarms originating from a specific node on the router.

logging suppress rule

To create a logging suppression rule and enter the configuration mode for the rule, use the **logging suppress rule** command in the Global Configuration mode. To remove a logging suppression rule, use the **no** form of this command.

```
logging suppress rule rule-name [{alarm msg-category group-name msg-code | all-alarms}]
no logging suppress rule rule-name
```

Syntax Description	
<i>rule-name</i>	Name of the rule.
alarm	(Optional) Specifies a type of alarm to be suppressed by the logging suppression rule.
<i>msg-category</i>	Message category of the root message.
<i>group-name</i>	Group name of the root message.
<i>msg-code</i>	Message code of the root message.
all-alarms	(Optional) Specifies that the logging suppression rule suppresses all types of alarms.

Command Default No logging suppression rules exist by default.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines If you use the **logging suppress rule** command without specifying a non-root-cause alarm, you can do so afterwards, by entering the **alarm** keyword at the prompt.

Task ID	Task	Operations
	logging	read, write

Examples This example shows how to create a logging suppression rule called infobistate:

```
RP/0/RSP0/CPU0:router(config)# logging suppress rule infobistate
RP/0/RSP0/CPU0:router(config-suppr-rule)#
```

Related Commands	Command	Description
	alarm, on page 3	Specifies a type of alarm to be suppressed by a logging suppression rule.
	all-alarms, on page 4	Configures a logging suppression rule to suppress all types of alarms.

nonrootcause

To enter the non-root-cause configuration mode and specify a non-root-cause alarm, use the **nonrootcause** command in stateful or nonstateful correlation rule configuration modes.

```
nonrootcause alarm msg-category group-name msg-code
no nonrootcause
```

Syntax Description	alarm	Non-root-cause alarm.
	<i>msg-category</i>	(Optional) Message category assigned to the message. Unlimited messages (identified by message category, group, and code) can be specified, separated by a space.
	<i>group-name</i>	(Optional) Message group assigned to the message. Unlimited messages (identified by message category, group, and code) can be specified, separated by a space.
	<i>msg-code</i>	(Optional) Message code assigned to the message. Unlimited messages (identified by message category, group, and code) can be specified, separated by a space.

Command Default Non-root-cause configuration mode and alarm are not specified.

Command Modes Stateful correlation rule configuration
Nonstateful correlation rule configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines This command is used to enter the non-root-cause configuration mode to configure one or more non-root-cause alarms associated with a particular correlation rule.

Use the [show logging events info, on page 62](#) command to display the current threshold setting.

If you use the **nonrootcause** command without specifying a non-root-cause alarm, you can do so afterwards, by entering the **alarm** keyword at the prompt.

Task ID	Task ID	Operations
	logging	read, write

Examples This example shows how to enter non-root-cause configuration mode and display the commands that are available under this mode:

```
RP/0/RSP0/CPU0:router(config)# logging correlator rule state_rule type stateful
RP/0/RSP0/CPU0:router(config-corr-rule-st) # nonrootcause
RP/0/RSP0/CPU0:router(config-corr-rule-st-nonrc) # ?
```

```

alarm      Specify non-root cause alarm: Category/Group/Code combos
clear      Clear the uncommitted configuration
clear      Clear the configuration
commit     Commit the configuration changes to running
describe   Describe a command without taking real actions
do         Run an exec command
exit       Exit from this submode
no         Negate a command or set its defaults
pwd        Commands used to reach current submode
root       Exit to the global configuration mode
show       Show contents of configuration

```

This example shows how to specify a non-root-cause alarm for Layer 2 local SONET messages with an alarm severity of 4. The non-root-cause alarm is associated with the correlation rule named `state_rule`.

```
RP/0/RSP0/CPU0:router(config-corr-rule-st-nonrc)# alarm L2 SONET_LOCAL ALARM
```

Related Commands

Command	Description
logging events buffer-size, on page 22	Specifies the logging correlator buffer size.
logging events level, on page 26	Specifies a severity level for logging alarm messages.
logging events threshold, on page 28	Specifies the logging events buffer capacity threshold that, when surpassed, will generate an alarm.
show logging events info, on page 62	Displays configuration and operational messages about the logging events buffer.

reissue-nonbistate

To reissue non-bistate alarm messages (events) from the correlator log after the root-cause alarm of a stateful rule clears, use the **reissue-nonbistate** command in stateful or nonstateful correlation rule configuration modes. To disable the reissue-nonbistate flag, use the **no** form of this command.

reissue-nonbistate
no reissue-nonbistate

Syntax Description

This command has no keywords or arguments.

Command Default

Non-bistate alarm messages are not reissued after their root-cause alarm clears.

Command Modes

Stateful correlation rule configuration
 Nonstateful correlation rule configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

By default, when the root-cause alarm of a stateful correlation is cleared, any non-root-cause, bistate messages being held for that correlation are silently deleted and are not sent to syslog. If the non-bistate messages should be sent, use the **reissue-nonbistate** command for the rules where this behavior is required.

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to reissue nonbistate alarm messages:

```
RP/0/RSP0/CPU0:router(config)# logging correlator rule state_rule type stateful
RP/0/RSP0/CPU0:router(config-corr-rule-st)# reissue-nonbistate
```

Related Commands

Command	Description
show logging correlator buffer, on page 50	Displays messages in the logging correlator buffer.
show logging events buffer, on page 58	Displays messages in the logging events buffer.

reparent

To reparent non-root-cause messages to the next highest active rootcause in a hierarchical correlation when their immediate parent clears, use the **reparent** command in stateful correlation rule configuration mode. To disable the reparent flag, use the **no** form of this command.

reparent
no reparent

Syntax Description This command has no keywords or arguments.

Command Default A non-root-cause alarm is sent to syslog after a root-cause parent clears.

Command Modes Stateful correlation rule configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **reparent** command to specify what happens to non-root-cause alarms in a hierarchical correlation after their root-cause alarm clears. The following scenario illustrates why you may want to set the reparent flag.

Rule 1 with rootcause A and non-rootcause B

Rule 2 with rootcause B and non-rootcause C

(Alarm B is a non-rootcause for Rule 1 and a rootcause for Rule 2. For the purpose of this example, all the messages are bistate alarms.)

If both Rule 1 and Rule 2 each trigger a successful correlation, then a hierarchy is constructed that links these two correlations. When alarm B clears, alarm C would normally be sent to syslog, but the operator may choose to continue suppression of alarm C (hold it in the correlation buffer); because the rootcause that is higher in the hierarchy (alarm A) is still active.

The reparent flag allows you to specify non-root-cause behavior—if the flag is set, then alarm C becomes a child of rootcause alarm A; otherwise, alarm C is sent to syslog.

Note Stateful behavior, such as reparenting, is supported only for bistate alarms. Bistate alarms are associated with system hardware, such as a change of interface state from active to inactive.

Task ID	Task ID	Operations
	logging	read, write

Examples This example shows how to set the reparent flag for a stateful rule:

```
RP/0/RSP0/CPU0:router(config)# logging correlator rule state_rule type stateful
RP/0/RSP0/CPU0:router(config-corr-rule-st)# reparent
```

Related Commands

Command	Description
logging correlator rule, on page 18	Defines the rules for correlating messages.
show logging correlator buffer, on page 50	Displays messages in the logging correlator buffer.
show logging events info, on page 62	Displays configuration and operational messages about the logging events buffer.

rootcause

To specify the root-cause alarm message, use the **rootcause** command in stateful or nonstateful correlation rule configuration modes.

```
rootcause msg-category group-name msg-code
no rootcause
```

Syntax Description	
	<i>msg-category</i> Message category of the root message.
	<i>group-name</i> Group name of the root message.
	<i>msg-code</i> Message code of the root message.

Command Default Root-cause alarm is not specified.

Command Modes Stateful correlation rule configuration
Nonstateful correlation rule configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines This command is used to configure the root-cause message for a particular correlation rule. Messages are identified by their message category, group, and code. The category, group, and code each can contain up to 32 characters. The root-cause message for a stateful correlation rule should be a bi-state alarm.

Use the [show logging events info, on page 62](#) command to display the root-cause and non-root-cause alarms for a correlation rule.

Task ID	Task ID	Operations
	logging	read, write

Examples This example shows how to configure a root-cause alarm for a stateful correlation rule:

```
RP/0/RSP0/CPU0:router(config)# logging correlator rule state_rule type stateful
RP/0/RSP0/CPU0:router(config-corr-rule-st)# rootcause L2 SONET_LOCAL ALARM
```

Related Commands	Command	Description
	logging events buffer-size, on page 22	Specifies the logging correlator buffer size.
	logging events level, on page 26	Specifies a severity level for logging alarm messages.

Command	Description
logging events threshold, on page 28	Specifies the logging events buffer capacity threshold that, when surpassed, will generate an alarm.
timeout-rootcause, on page 73	Specifies an optional parameter for an applied correlation rule.
show logging events info, on page 62	Displays configuration and operational messages about the logging events buffer.

show alarms

To display alarms related to System Monitoring, use the **show alarms** command in the System Monitoring mode.

show alarms

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes System Monitoring EXEC

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines Use the [show alarms brief](#), on page 45 to view the router alarms in brief.
Use the [show alarms detail](#), on page 47 to view the router alarms in detail.

Task ID	Task ID	Operations
	logging read	

This example displays the output of the **show alarms** command:

Command	Description
show alarms, on page 38	Displays router alarms in brief and detail.
show alarms brief, on page 45	Displays router alarms in brief.

show logging correlator buffer

To display messages in the logging correlator buffer, use the **show logging correlator buffer** command in EXEC mode.

```
show logging correlator buffer {all-in-buffer [ruletype [{nonstateful | stateful}]] | [rulesource
[ {internal | user}]] | rule-name correlation-rule1 . . . correlation-rule14 | correlationID correlation-id1
. . . correlation-id14}
```

Syntax Description	Parameter	Description
	all-in-buffer	Displays all messages in the correlation buffer.
	ruletype	(Optional) Displays the ruletype filter.
	nonstateful	(Optional) Displays the nonstateful rules.
	stateful	(Optional) Displays the stateful rules.
	rulesource	(Optional) Displays the rulesource filter.
	internal	(Optional) Displays the internally defined rules from the rulesource filter.
	user	(Optional) Displays the user-defined rules from the rulesource filter.
	rule-name <i>correlation-rule1...correlation-rule14</i>	Displays a messages associated with a correlation rule name. Up to 14 correlation rules can be specified, separated by a space.
	correlationID <i>correlation-id1...correlation-id14</i>	Displays a message identified by correlation ID. Up to 14 correlation IDs can be specified, separated by a space. Range is 0 to 4294967294.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines This command displays messages from the logging correlator buffer that match the correlation ID or correlation rule name specified. When the **all-in-buffer** keyword is entered, all messages in the logging correlator buffer are displayed.

If the ruletype is not specified, then both stateful and nonstateful rules are displayed.

if the rulesource is not specified, then both user and internal rules are displayed.

Task ID	Task ID	Operations
	logging	read

Examples

This is the sample output from the **show logging correlator buffer** command:

```
RP/0/RSP0/CPU0:router# show logging correlator buffer all-in-buffer

  Interface MgmtEth0/5/CPU0/0, changed state to Down
#14.2 :Rule1:RP/0/5/CPU0: :Aug 22 13:39:13.693 2007:ifmgr[196]: %PKT_INFRA-LINEPROTO-3-UPDOWN
  : Line protocol on Interface MgmtEth0/5/CPU0/0, changed state to Down
```

This table describes the significant fields shown in the display.

Table 3: show logging correlator buffer Field Descriptions

Field	Description
C_id.	Correlation ID assigned to a event that matches a logging correlation rule.
id	An ID number assigned to each event matching a particular correlation rule. This event number serves as index to identify each individual event that has been matched for a logging correlation rule.
Rule Name	Name of the logging correlation rule that filters messages defined in a logging correlation rule to the logging correlator buffer.
Source	Node from which the event is generated.
Time	Date and time at which the event occurred.
Text	Message string that delineates the event.

Related Commands

Command	Description
show logging correlator info, on page 52	Displays the logging correlator buffer size and the percentage of the buffer occupied by correlated messages.
show logging correlator rule, on page 53	Displays one or more predefined logging correlator rules.

show logging correlator info

To display the logging correlator buffer size and the percentage of the buffer occupied by correlated messages, use the **show correlator info** command in EXEC mode.

show logging correlator info

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines This command displays the size of the logging correlator buffer and the percentage of the buffer allocated to correlated messages.

Use the [logging correlator buffer-size, on page 17](#) command to set the size of the buffer.

Task ID	Task ID	Operations
	logging	read

Examples

In this example, the **show logging correlator info** command is used to display remaining buffer size and percentage allocated to correlated messages:

```
RP/0/RSP0/CPU0:router# show logging correlator info

Buffer-Size      Percentage-Occupied
      81920                0.00
```

Related Commands

Command	Description
logging correlator buffer-size, on page 17	Specifies the logging correlator buffer size.
show logging correlator buffer, on page 50	Displays messages in the logging correlator buffer.
show logging correlator rule, on page 53	Displays one or more predefined logging correlator rules.

show logging correlator rule

To display defined correlation rules, use the **show logging correlator rule** command in EXEC mode.

```
show logging correlator rule {all | correlation-rule1 . . . correlation-rule14} [context
context1 . . . context 6] [location node-id1 . . . node-id6] [rulesource {internal | user}] [ruletype
{nonstateful | stateful}] [{summary | detail}]
```

Syntax Description	
all	Displays all rule sets.
<i>correlation-rule1...correlation-rule14</i>	Rule set name to be displayed. Up to 14 predefined correlation rules can be specified, separated by a space.
context <i>context1...context 6</i>	(Optional) Displays a list of context rules.
location <i>node-id1...node-id6</i>	(Optional) Displays the location of the list of rules filter from the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
rulesource	(Optional) Displays the rulesource filter.
internal	(Optional) Displays the internally defined rules from the rulesource filter.
user	(Optional) Displays the user defined rules from the rulesource filter.
ruletype	(Optional) Displays the ruletype filter.
nonstateful	(Optional) Displays the nonstateful rules.
stateful	(Optional) Displays the stateful rules.
summary	(Optional) Displays the summary information.
detail	(Optional) Displays detailed information.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

If the ruletype is not specified, then both stateful and nonstateful rules are displayed as the default.

If the rulesource is not specified, then both user and internally defined rules are displayed as the default.

If the summary or detail keywords are not specified, then detailed information is displayed as the default.

Task ID	Task ID	Operations
	logging	read

Examples

This is sample output from the **show logging correlator rule** command:

```
RP/0/RSP0/CPU0:router# show logging correlator rule test

Rule Name : test
Type : Non Stateful
Source : User
Timeout : 30000 Rule State: RULE_APPLIED_ALL
Rootcause Timeout : None
Context Correlation : disabled
Reissue Non Bistate : N/A
Reparent : N/A
Alarms :
Code Type: Category Group Message
Root: MGBL CONFIG DB_COMMIT
Leaf: L2 SONET ALARM
Apply Locations: None
Apply Contexts: None
Number of buffered alarms : 0
```

This table describes the significant fields shown in the display.

Table 4: show logging correlator rule Field Descriptions

Field	Description
Rule Name	Name of defined correlation rule.
Time out	Configured timeout for the correlation rule.
Rule State	Indicates whether or not the rule has been applied. If the rule applies to the entire router, this field will display "RULE_APPLIED_ALL."
Code Type	Message category, group, and code.
Root	Message category, group and code of the root message configured in the logging correlation rule.
Leaf	Message category, group and code of a non-root-cause message configured in the logging correlation rule.
Apply Locations	Node or nodes where the rule is applied. If the logging correlation rule applies to the entire router, this field will display "None."
Apply Contexts	Context or contexts to which the rule is applied. If the logging correlation rule is not configured to apply to a context, this field will display "None."

Related Commands

Command	Description
logging correlator apply rule, on page 13	Applies and activates correlation rules.
logging correlator rule, on page 18	Defines the rules for correlating messages.
show logging correlator buffer, on page 50	Displays messages in the logging correlator buffer.
show logging correlator info, on page 52	Displays the logging correlator buffer size and the percentage of the buffer occupied by correlated messages.

show logging correlator ruleset

To display defined correlation rule set names, use the **show logging correlator ruleset** command in EXEC mode.

show logging correlator ruleset {**all** | *correlation-ruleset1* . . . *correlation-ruleset14*} [{**detail** | **summary**}]

Syntax Description	
all	Displays all rule set names.
<i>correlation-rule1...correlation-rule14</i>	Rule set name to be displayed. Up to 14 predefined rule set names can be specified, separated by a space.
detail	(Optional) Displays detailed information.
summary	(Optional) Displays the summary information.

Command Default Detail is the default, if nothing is specified.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

- If the ruletype is not specified, then both stateful and nonstateful rules are displayed as the default.
- If the rulesource is not specified, then both user and internally defined rules are displayed as the default.
- If the summary or detail options are not specified, then detailed information is displayed as the default.

Task ID	Task ID	Operations
	logging	read

Examples

This is the sample output from the **show logging correlator ruleset** command:

```
RP/0/RSP0/CPU0:router# show logging correlator RuleSetOne RuleSetTwo

Rule Set Name : RuleSetOne
Rules: Rule1 : Applied
Rule2 : Applied
Rule3 : Applied
Rule Set Name : RuleSetTwo
Rules: Rule1 : Applied
Rule5 : Not Applied
```

This is the sample output from the **show logging correlator ruleset** command when the **all** option is specified:

```
RP/0/RSP0/CPU0:router# show logging correlator ruleset all
```

```
Rule Set Name : RuleSetOne
Rules: Rule1 : Applied
Rule2 : Applied
Rule3 : Applied
Rule Set Name : RuleSetTwo
Rules: Rule1 : Applied
Rule5 : Not Applied
Rule Set Name : RuleSetThree
Rules: Rule2 : Applied
Rule3 : Applied
```

This is sample output from the **show logging correlator ruleset** command when the **all** and **summary** options are specified:

```
RP/0/RSP0/CPU0:router# show logging correlator ruleset all summary
RuleSetOne
RuleSetTwo
RuleSetThree
```

This table describes the significant fields shown in the display.

Table 5: show logging correlator ruleset Field Descriptions

Field	Description
Rule Set Name	Name of the ruleset.
Rules	All rules contained in the ruleset are listed.
Applied	The rule is applied.
Not Applied	The rule is not applied.

Related Commands

Command	Description
logging correlator apply rule, on page 13	Applies and activates correlation rules.
logging correlator rule, on page 18	Defines the rules for correlating messages.
show logging correlator buffer, on page 50	Displays messages in the logging correlator buffer.
show logging correlator info, on page 52	Displays the logging correlator buffer size and the percentage of the buffer occupied by correlated messages.
show logging correlator rule, on page 53	Displays defined correlation rules.

show logging events buffer

To display messages in the logging events buffer, use the **show logging events buffer** command in EXEC mode.

```
show logging events buffer [admin-level-only] [all-in-buffer] [bistate-alarms-set] [category name]
[context name] [event-hi-limit event-id] [event-lo-limit event-id] [first event-count] [group
message-group] [last event-count] [location node-id] [message message-code] [severity-hi-limit
severity] [severity-lo-limit severity] [timestamp-hi-limit hh:mm:ss [month] [day] [year]]
timestamp-lo-limit hh:mm:ss [month] [day] [year]]
```

Syntax Description

admin-level-only	Displays only the events that are at the administrative level.
all-in-buffer	Displays all event IDs in the events buffer.
bistate-alarms-set	Displays bi-state alarms in the SET state.
category name	Displays events from a specified category.
context name	Displays events from a specified context.
event-hi-limit event-id	Displays events with an event ID equal to or lower than the event ID specified with the <i>event-id</i> argument. Range is 0 to 4294967294.
event-lo-limit event-id	Displays events with an event ID equal to or higher than the event ID specified with <i>event-id</i> argument. Range is 0 to 4294967294.
first event-count	Displays events in the logging events buffer, beginning with the first event. For the <i>event-count</i> argument, enter the number of events to be displayed.
group message-group	Displays events from a specified message group.
last event-count	Displays events, beginning with the last event in the logging events buffer. For the <i>event-count</i> argument, enter the number of events to be displayed.
location node-id	Displays events for the specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
message message-code	Displays events with the specified message code.
severity-hi-limit	Displays events with a severity level equal to or lower than the specified severity level.

severity	Severity level. Valid values are: <ul style="list-style-type: none">• emergencies• alerts• critical• errors• warnings• notifications• informational <p>Note Settings for the severity levels and their respective system conditions are listed under the “Usage Guidelines” section for the logging events level command. Events of lower severity level represent events of higher importance.</p>
severity-lo-limit	Displays events with a severity level equal to or higher than the specified severity level.
timestamp-hi-limit	Displays events with a time stamp equal to or lower than the specified time stamp.

hh : mm : ss [month] [day] [year] Time stamp for the **timestamp-hi-limit** or **timestamp-lo-limit** keyword. The *month*, *day*, and *year* arguments default to the current month, day, and year if not specified.

Ranges for the *hh : mm : ss month day year* arguments are as follows:

- *hh* :—Hours. Range is 00 to 23. You must insert a colon after the *hh* argument.
- *mm* :—Minutes. Range is 00 to 59. You must insert a colon after the *mm* argument.
- *ss*—Seconds. Range is 00 to 59.
- *month*—(Optional) The month of the year. The values for the *month* argument are:
 - january
 - february
 - march
 - april
 - may
 - june
 - july
 - august
 - september
 - october
 - november
 - december
- *day*—(Optional) Day of the month. Range is 01 to 31.
- *year*—(Optional) Year. Enter the last two digits of the year (for example, **04** for 2004). Range is 01 to 37.

timestamp-lo-limit Displays events with a time stamp equal to or higher than the specified time stamp.

Command Default None

Command Modes EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines This command displays messages from the logging events buffer matching the description. The description is matched when all of the conditions are met.

Task ID	Task ID	Operations
	logging	read

Examples

This is the sample output from the **show logging events buffer all-in-buffer** command:

```
RP/0/RSP0/CPU0:router# show logging events buffer all-in-buffer

#ID      :C_id:Source      :Time                               :%CATEGORY-GROUP-SEVERITY-MESSAGECODE: Text

#1       :      :RP/0/RSP0/CPU0:Jan  9 08:57:54 2004:nvram[66]: %MEDIA-NVRAM_PLATFORM-3-BAD_N

: Failover has been enabled by config
```

This table describes the significant fields shown in the display.

Table 6: show logging correlator buffer Field Descriptions

Field	Description
#ID	Integer assigned to each event in the logging events buffer.
C_id.	Correlation ID assigned to a event that has matched a logging correlation rule.
Source	Node from which the event is generated.
Time	Date and time at which the event occurred.
%CATEGORY-GROUP-SEVERITY-MESSAGECODE	The category, group name, severity level, and message code associated with the event.
Text	Message string that delineates the event.

Related Commands

Command	Description
show logging events info, on page 62	Displays configuration and operational messages about the logging events buffer.

show logging events info

To display configuration and operational information about the logging events buffer, use the **show logging events info** command in EXEC mode.

show logging events info

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines This command displays information about the size of the logging events buffer, the maximum size of the buffer, the number of records being stored, the maximum allowable number of records threshold for circular filing, and message filtering.

Task ID

Task ID	Operations
logging	read

Examples

This is the sample output from the **show logging events info** command:

```
RP/0/RSP0/CPU0:router# show logging events info

Size (Current/Max)      #Records      Thresh      Filter
16960      /42400      37          90          Not Set
```

This table describes the significant fields shown in the display.

Table 7: show logging events info Field Descriptions

Field	Description
Size (Current/Max)	The current and maximum size of the logging events buffer. The maximum size of the buffer is controlled by the logging events buffer-size, on page 22 command.
#Records	The number of event records stored in the logging events buffer.
Thresh	The configured logging events threshold value. This field is controlled by the logging events threshold, on page 28 command.
Filter	The lowest severity level for events that will be displayed. This field is controlled by the logging events level, on page 26 command.

Related Commands

Command	Description
logging events buffer-size, on page 22	Specifies the logging correlator buffer size.
logging events level, on page 26	Specifies a severity level for logging alarm messages.
logging events threshold, on page 28	Specifies the logging events buffer capacity threshold that, when surpassed, will generate an alarm.
show logging events buffer, on page 58	Displays information about messages in the logging events buffer according to type, time, or severity level.

show logging suppress rule

To display defined logging suppression rules, use the **show logging suppression rule** command in EXEC mode.

show logging suppress rule [{*rule-name1* [. . . [*rule-name14*]] | **all** [**detail**] [**summary**] [**source location** *node-id*]}]

Syntax Description

<i>rule-name1</i> [... <i>rule-name14</i>]]	Specifies up to 14 logging suppression rules to display.
all	Displays all logging suppression rules.
source location <i>node-id</i>	(Optional) Displays the location of the list of rules filter from the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
detail	(Optional) Displays detailed information.
summary	(Optional) Displays the summary information.

Command Default

None

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.9.0	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operations
logging	read

Examples

This example displays information about a logging suppression rule that has been configured but has not been activated:

```
RP/0/RSP0/CPU0:router# show logging suppression rule test_suppression

Rule Name : test_suppression
Rule State: RULE_UNAPPLIED
Severities : informational, critical
Alarms :
  Category      Group          Message
  CAT_C         GROUP_C       CODE_C
  CAT_D         GROUP_D       CODE_D

Apply Alarm-Locations: PLIM-0/2, PowerSupply-0/A/A0
Apply Sources:        0/RP0/CPU0, 1/6/SP
```

Number of suppressed alarms : 0

This example displays information about all logging suppression rules applied to a specific source location on the router:

```
RP/0/RSP0/CPU0:router# show logging suppress rule all source location 0/RP0/CPU0
```

```
Rule Name : test_suppression
Rule State: RULE_APPLIED_ALL
Severities : N/A
Alarms :
  Category      Group      Message
  CAT_E         GROUP_F    CODE_G
```

```
Apply Alarm-Locations: None
Apply Sources:         0/RP0/CPU0
```

Number of suppressed alarms : 0

This example shows summary information about all logging suppression rules:

```
RP/0/RSP0/CPU0:router# show logging suppression rule all summary
Rule Name                                     :Number of Suppressed Alarms
Mike1                                         0
Mike2                                         0
Mike3                                         0
Reall                                         4
```

logging suppress apply rule, on page 29	Applies and activates a logging suppression rule.
logging suppress rule, on page 30	Creates a logging suppression rule.

show snmp correlator buffer

To display messages in SNMP correlator buffer, use the **show snmp correlator buffer** in EXEC mode.

show snmp correlator buffer [{**all** | **correlation ID** | **rule-name name**}]

Syntax Description	all	Displays all messages in the correlator buffer.
	correlation id	Displays a message identified by correlation ID. Range is 0 to 4294967294. Up to 14 correlation rules can be specified, separated by a space.
	rule-name name	Displays a messages associated with a SNMP correlation rule name. Up to 14 correlation rules can be specified, separated by a space.
Command Default	None	
Command Modes	EXEC mode	
Command History	Release	Modification
	Release 3.8.0	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operation
	snmp	read

The sample shows an output from the **show snmp correlator buffer** command:

```
RP/0/RSP0/CPU0:router# show snmp correlator buffer correlationID 10
Correlation ID : 10
Rule : ospf-trap-rule
Rootcause: 1.3.6.1.6.3.1.1.5.3
Time : Dec 14 02:32:05
Varbind(s):
  ifIndex.17 = 17
  ifDescr.17 = POS0/7/0/0
  ifType.17 = other(1)

Release 3.8.0	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>snmp</td> <td>read</td> </tr> </tbody> </table>	Task ID	Operation	snmp	read
Task ID	Operation				
snmp	read				

This sample shows an output from the **show snmp correlator ruleset** command:

```
RP/0/RSP0/CPU0:router# show snmp correlator ruleset test
Rule Set Name : test
Rules: chris1           : Not Applied
      chris2           : Applied
```

source

To apply a logging suppression rule to alarms originating from a specific node on the router, use the **source** command in logging suppression apply rule configuration mode.

```
source location node-id
no source location node-id
```

Syntax Description	location <i>node-id</i> Specifies a node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	--

Command Default	No scope is configured by default.
------------------------	------------------------------------

Command Modes	Logging suppression apply rule configuration
----------------------	--

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--

Task ID	Task ID	Operations
	logging	execute

Examples

This example shows how to configure the logging suppression rule infobistate to suppress alarms from 0/RP0/CPU0:

```
RP/0/RSP0/CPU0:router(config)# logging suppress apply rule infobistate
RP/0/RSP0/CPU0:router(config-suppr-apply-rule)# source location 0/RP0/CPU0
```

Related Commands	Command	Description
	logging suppress apply rule, on page 29	Applies and activates a logging suppression rule.

timeout

To specify the collection period duration time for the logging correlator rule message, use the **timeout** command in stateful or nonstateful correlation rule configuration modes. To remove the timeout period, use the **no** form of this command.

timeout [*milliseconds*]
no timeout

Syntax Description	<i>milliseconds</i> Range is 1 to 600000 milliseconds.
---------------------------	--

Command Default	Timeout period is not specified.
------------------------	----------------------------------

Command Modes	Stateful correlation rule configuration Nonstateful correlation rule configuration
----------------------	---

Command History	Release Modification
	Release 3.7.2 This command was introduced.

Usage Guidelines	<p>Each correlation rule that is applied must have a timeout value, and only those messages captured within this timeout period can be correlated together.</p> <p>The timeout begins when the first matching message for a correlation rule is received. If the root-cause message is received, it is immediately sent to syslog, while any non-root-cause messages are held.</p> <p>When the timeout expires and the rootcause message has not been received, then all the non-root-cause messages captured during the timeout period are reported to syslog. If the root-cause message was received during the timeout period, then a correlation is created and placed in the correlation buffer.</p>
-------------------------	---

Note	The root-cause alarm does not have to appear first. It can appear at any time within the correlation time period.
-------------	---

Task ID	Task ID Operations
	logging read, write

Examples	This example shows how to define a logging correlation rule with a timeout period of 60,000 milliseconds (one minute):
-----------------	--

```
RP/0/RSP0/CPU0:router(config)# logging correlator rule state_rule type stateful
RP/0/RSP0/CPU0:router(config-corr-rule-st)# timeout 60000
```

Related Commands

Command	Description
logging correlator rule, on page 18	Defines the rules by which the correlator logs messages to the logging events buffer.
timeout-rootcause, on page 73	Specifies an optional parameter for an applied correlation rule.

timeout-rootcause

To specify an optional parameter for an applied correlation rule, use the **timeout-rootcause** command in stateful or nonstateful correlation rule configuration modes. To remove the timeout period, use the **no** form of this command.

timeout-rootcause [*milliseconds*]
no timeout-rootcause

Syntax Description *milliseconds* Range is 1 to 600000 milliseconds.

Command Default Root-cause alarm timeout period is not specified.

Command Modes Stateful correlation rule configuration
 Nonstateful correlation rule configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines When a root-cause timeout is configured and a non-root-cause message is received first, the following occurs:

- When a root-cause timeout is configured and a non-root-cause message is received first, the following occurs:
 - When the root-cause message arrives before the root-cause timeout expires, then the correlation continues as normal using the remainder of the main rule timeout.
- When the root-cause message is not received before the root-cause timeout expires, then all the non-root-cause messages held during the root-cause timeout period are sent to syslog and the correlation is terminated.

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to configure a timeout period for a root cause alarm:

```
RP/0/RSP0/CPU0:router(config)# logging correlator rule state_rule type stateful
RP/0/RSP0/CPU0:router(config-corr-rule-st)# timeout-rootcause 50000
```

Related Commands	Command	Description
	logging correlator rule, on page 18	Defines the rules by which the correlator logs messages to the logging events buffer.

timeout-rootcause

Embedded Event Manager Commands

This module describes the commands that are used to set the Embedded Event Manager (EEM) operational attributes and monitor EEM operations.

The Cisco IOS XR software EEM functions as the central clearing house for the events detected by any portion of Cisco IOS XR software High Availability Services. The EEM is responsible for fault detection, fault recovery, and process the reliability statistics in a system. The EEM is policy driven and enables you to configure the high-availability monitoring features of the system to fit your needs.

The EEM monitors the reliability rates achieved by each process in the system. You can use these metrics during testing to identify the components that do not meet their reliability or availability goals, which in turn enables you to take corrective action.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed information about the EEM concepts, configuration tasks, and examples, see the *Configuring and Managing Embedded Event Manager Policies* module in *System Monitoring Configuration Guide for Cisco ASR 9000 Series Routers*.

event manager directory user

To specify a directory name for storing user library files or user-defined Embedded Event Manager (EEM) policies, use the **event manager directory user** command in Global Configuration mode. To disable the use of a directory for storing user library files or user-defined EEM policies, use the **no** form of this command.

```
event manager directory user {library path | policy path}
no event manager directory user {library path | policy path}
```

Syntax Description

library Specifies a directory name for storing user library files.

path Absolute pathname to the user directory on the flash device.

policy Specifies a directory name for storing user-defined EEM policies.

Command Default

No directory name is specified for storing user library files or user-defined EEM policies.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 4.0.0	This command was introduced.

Usage Guidelines

Cisco IOS XR software supports only the policy files that are created by using the Tool Command Language (TCL) scripting language. The TCL software is provided in the Cisco IOS XR software image when the EEM is installed on the network device. Files with the .tcl extension can be EEM policies, TCL library files, or a special TCL library index file named tclindex. The tclindex file contains a list of user function names and library files that contain the user functions (procedures). The EEM searches the user library directory when the TCL starts to process the tclindex file.

User Library

A user library directory is needed to store user library files associated with authoring EEM policies. If you do not plan to write EEM policies, you do not have to create a user library directory.

To create user library directory before identifying it to the EEM, use the **mkdir** command in EXEC mode. After creating the user library directory, use the **copy** command to copy the .tcl library files into the user library directory.

User Policy

A user policy directory is essential to store the user-defined policy files. If you do not plan to write EEM policies, you do not have to create a user policy directory. The EEM searches the user policy directory when you enter the **event manager policy *policy-name* user** command.

To create a user policy directory before identifying it to the EEM, use the **mkdir** command in EXEC mode. After creating the user policy directory, use the **copy** command to copy the policy files into the user policy directory.

Task ID	Task ID	Operations
	eem	read, write

Examples

This example shows how to set the pathname for a user library directory to /usr/lib/tcl on disk0:

```
RP/0/RSP0/CPU0:router(config)# event manager directory user library disk0:/usr/lib/tcl
```

This example shows how to set the location of the EEM user policy directory to /usr/fm_policies on disk0:

```
RP/0/RSP0/CPU0:router(config)# event manager directory user policy disk0:/usr/fm_policies
```

Related Commands

Command	Description
event manager policy, on page 80	Registers an EEM policy with the EEM.
show event manager directory user, on page 87	Displays the directory name for storing user library and policy files.

event manager environment

To set an Embedded Event Manager (EEM) environment variable, use the **event manager environment** command in Global Configuration mode. To remove the configuration, use the **no** form of this command.

```
event manager environment var-name [var-value]  
no event manager environment var-name
```

Syntax Description

var-name Name assigned to the EEM environment configuration variable.

var-value (Optional) Series of characters, including embedded spaces, to be placed in the environment variable *var-name*.

Command Default

None

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 4.0.0	This command was introduced.

Usage Guidelines

Environment variables are available to EEM policies when you set the variables using the **event manager environment** command. They become unavailable when you remove them with the **no** form of this command.

By convention, the names of all the environment variables defined by Cisco begin with an underscore character (`_`) to set them apart, for example, `_show_cmd`.

Spaces can be used in the *var-value* argument. This command interprets everything after the *var-name* argument up to the end of the line in order to be a part of the *var-value* argument.

Use the [show event manager environment, on page 88](#) command to display the name and value of all EEM environment variables before and after they have been set using the **event manager environment** command.

Task ID

Task ID	Operations
eem	read, write

Examples

This example shows how to define a set of EEM environment variables:

```
RP/0/RSP0/CPU0:router(config)# event manager environment _cron_entry 0-59/2 0-23/1 * * 0-7  
RP/0/RSP0/CPU0:router(config)# event manager environment _show_cmd show eem manager policy  
                               registered  
RP/0/RSP0/CPU0:router(config)# event manager environment _email_server alpha@cisco.com  
RP/0/RSP0/CPU0:router(config)# event manager environment _email_from beta@cisco.com  
RP/0/RSP0/CPU0:router(config)# event manager environment _email_to beta@cisco.com  
RP/0/RSP0/CPU0:router(config)# event manager environment _email_cc
```

Related Commands

Command	Description
show event manager environment, on page 88	Displays the name and value for all the EEM environment variables.

event manager policy

To register an Embedded Event Manager (EEM) policy with the EEM, use the **event manager policy** command in Global Configuration mode. To unregister an EEM policy from the EEM, use the **no** form of this command.

```
event manager policy policy-name username username [{persist-time [{seconds | infinite}] | type
{system | user}]
no event manager policy policy-name [username username]
```

Syntax Description		
	<i>policy-name</i>	Name of the policy file.
	username <i>username</i>	Specifies the username used to run the script. This name can be different from that of the user who is currently logged in, but the registering user must have permissions that are a superset of the username that runs the script. Otherwise, the script is not registered, and the command is rejected. In addition, the username that runs the script must have access privileges to the commands issued by the EEM policy being registered.
	persist-time [<i>seconds</i> infinite]	(Optional) The length of the username authentication validity, in seconds. The default time is 3600 seconds (1 hour). The <i>seconds</i> range is 0 to 4294967294. Enter 0 to stop the username authentication from being cached. Enter the infinite keyword to stop the username from being marked as invalid.
	type	(Optional) Specifies the type of policy.
	system	(Optional) Registers a system policy defined by Cisco.
	user	(Optional) Registers a user-defined policy.

Command Default The default persist time is 3600 seconds (1 hour).

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 4.0.0	This command was introduced.

Usage Guidelines The EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When the **event manager policy** command is invoked, the EEM examines the policy and registers it to be run when the specified event occurs. An EEM script is available to be scheduled by the EEM until the **no** form of this command is entered.

Note AAA authorization (such as the **aaa authorization** command with the **eventmanager** and **default** keywords) must be configured before the EEM policies can be registered. The **eventmanager** and **default** keywords must be configured for policy registration. See the *Configuring AAA Services on the Cisco ASR 9000 Series Router* module of *System Security Configuration Guide for Cisco ASR 9000 Series Routers* for more information on AAA authorization configuration.

Username

Enter the username that should execute the script with the **username** *username* keyword and argument. This name can be different from the user who is currently logged in, but the registering user must have permissions that are a superset of the username that runs the script. Otherwise, the script will not be registered, and the command will be rejected. In addition, the username that runs the script must have access privileges to the commands issued by the EEM policy being registered.

Persist-time

When a script is first registered, the configured **username** for the script is authenticated. If authentication fails, or if the AAA server is down, the script registration fails.

After the script is registered, the username is authenticated each time a script is run.

If the AAA server is down, the username authentication can be read from memory. The **persist-time** determines the number of seconds this username authentication is held in memory.

- If the AAA server is down and the **persist-time** has not expired, the username is authenticated from memory, and the script runs.
- If the AAA server is down, and the **persist-time** has expired, user authentication fails, and the script does not run.

Note EEM attempts to contact the AAA server and refresh the username reauthenticate whenever the configured **refresh-time** expires. See the [event manager refresh-time, on page 83](#) command for more information.

These values can be used for the **persist-time**:

- The default **persist-time** is 3600 seconds (1 hour). Enter the **event manager policy** command without the **persist-time** keyword to set the **persist-time** to 1 hour.
- Enter zero to stop the username authentication from being cached. If the AAA server is down, the username is not authenticated and the script does not run.
- Enter **infinite** to stop the username from being marked as invalid. The username authentication held in the cache will not expire. If the AAA server is down, the username is authenticated from the cache.

Type

If you enter the **event manager policy** command without specifying the **type** keyword, the EEM first tries to locate the specified policy file in the system policy directory. If the EEM finds the file in the system policy directory, it registers the policy as a system policy. If the EEM does not find the specified policy file in the system policy directory, it looks in the user policy directory. If the EEM locates the specified file in the user policy directory, it registers the policy file as a user policy. If the EEM finds policy files with the same name in both the system policy directory and the user policy directory, the policy file in the system policy directory takes precedence, and the policy file is registered as a system policy.

Task ID	Task ID	Operations
	eem	read, write

Examples

This example shows how to register a user-defined policy named cron.tcl located in the user policy directory:

```
RP/0/RSP0/CPU0:router (config)# event manager policy cron.tcl username joe
```

Related Commands

Command	Description
event manager environment, on page 78	Specifies a directory for storing user library files.
event manager refresh-time, on page 83	Specifies the time between the system attempts to contact the AAA server and refresh the username reauthentication.
show event manager environment, on page 88	Displays the name and value for all EEM environment variables.
show event manager policy available, on page 95	Displays EEM policies that are available to be registered.
show event manager policy registered, on page 97	Displays the EEM policies that are already registered.

event manager refresh-time

To define the time between user authentication refreshes in Embedded Event Manager (EEM), use the **event manager refresh-time** command in Global Configuration mode. To restore the system to its default condition, use the **no** form of this command.

```
event manager refresh-time seconds
no event manager refresh-time seconds
```

Syntax Description	<i>seconds</i> Number of seconds between user authentication refreshes, in seconds. Range is 10 to 4294967295.				
Command Default	The default refresh time is 1800 seconds (30 minutes).				
Command Modes	Global Configuration mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.0.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.0.0	This command was introduced.
Release	Modification				
Release 4.0.0	This command was introduced.				
Usage Guidelines	EEM attempts to contact the AAA server and refresh the username reauthentication whenever the configured refresh-time expires.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>eem</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	eem	read, write
Task ID	Operations				
eem	read, write				

Examples

This example shows how to set the refresh time:

```
RP/0/RSP0/CPU0:router(config)# event manager refresh-time 1900
```

event manager run

To manually run an Embedded Event Manager (EEM) policy, use the **event manager run** command in EXEC mode.

```
event manager run policy [argument [. . . [argument15]]]
```

Syntax Description

policy Name of the policy file.

[*argument*[...*argument15*]] Argument that you want to pass to the policy. The maximum number of arguments is 15.

Command Default

No registered EEM policies are run.

Command Modes

EXEC mode

Command History

Release	Modification
Release 4.0.0	This command was introduced.

Usage Guidelines

EEM usually schedules and runs policies on the basis of an event specification that is contained within the policy itself. The **event manager run** command allows policies to be run manually.

You can query the arguments in the policy file by using the **TCL** command *event_reqinfo*, as shown in this example:

```
array set arr_einfo [event_reqinfo] set argc $arr_einfo(argc) set arg1
    $arr_einfo(arg1)
```

Use the [event manager policy, on page 80](#) command to register the policy before using the **event manager run** command to run the policy. The policy can be registered with none as the event type.

Task ID

Task ID	Operations
eem	read

Examples

This example of the **event manager run** command shows how to manually run an EEM policy named policy-manual.tcl:

```
RP/0/RSP0/CPU0:router# event manager run policy-manual.tcl parameter1 parameter2 parameter3
```

```
RP/0/RSP0/CPU0:Sep 20 10:26:31.169 : user-plocy.tcl[65724]: The reqinfo of arg2 is parameter2.
```

```
RP/0/RSP0/CPU0:Sep 20 10:26:31.170 : user-plocy.tcl[65724]: The reqinfo of argc is 3.
```

```
RP/0/RSP0/CPU0:Sep 20 10:26:31.171 : user-plocy.tcl[65724]: The reqinfo of arg3 is parameter3.
```

```
RP/0/RSP0/CPU0:Sep 20 10:26:31.172 : user-plocy.tcl[65724]: The reqinfo of event_type_string
is none.
```

```
RP/0/RSP0/CPU0:Sep 20 10:26:31.172 : user-plocy.tcl[65724]: The reqinfo of event_pub_sec
```

```

is 1190283990.
RP/0/RSP0/CPU0:Sep 20 10:26:31.173 : user-plocy.tcl[65724]: The reqinfo of event_pub_time
is 1190283990.
RP/0/RSP0/CPU0:Sep 20 10:26:31.173 : user-plocy.tcl[65724]: The reqinfo of event_id is 3.
RP/0/RSP0/CPU0:Sep 20 10:26:31.174 : user-plocy.tcl[65724]: The reqinfo of arg1 is parameter1.

RP/0/RSP0/CPU0:Sep 20 10:26:31.175 : user-plocy.tcl[65724]: The reqinfo of event_type is
16.
RP/0/RSP0/CPU0:Sep 20 10:26:31.175 : user-plocy.tcl[65724]: The reqinfo of event_pub_msec
is 830
    
```

Related Commands

Command	Description
event manager policy, on page 80	Registers an EEM policy with the EEM.

event manager scheduler suspend

To suspend the Embedded Event Manager (EEM) policy scheduling execution immediately, use the **event manager scheduler suspend** command in Global Configuration mode. To restore a system to its default condition, use the **no** form of this command.

event manager scheduler suspend
no event manager scheduler suspend

Syntax Description This command has no keywords or arguments.

Command Default Policy scheduling is active by default.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 4.0.0	This command was introduced.

Usage Guidelines Use the **event manager scheduler suspend** command to suspend all the policy scheduling requests, and do not perform scheduling until you enter the **no** form of this command. The **no** form of this command resumes policy scheduling and runs pending policies, if any.

It is recommended that you suspend policy execution immediately instead of unregistering policies one by one, for the following reasons:

- Security—If you suspect that the security of your system has been compromised.
- Performance—If you want to suspend policy execution temporarily to make more CPU cycles available for other functions.

Task ID	Task ID	Operations
	eem	read, write

Examples

This example shows how to disable policy scheduling:

```
RP/0/RSP0/CPU0:router(config)# event manager scheduler suspend
```

This example shows how to enable policy scheduling:

```
RP/0/RSP0/CPU0:router(config)# no event manager scheduler suspend
```

Related Commands

Command	Description
event manager policy, on page 80	Registers an EEM policy with the EEM.

show event manager directory user

To display the current value of the EEM user library files or user-defined Embedded Event Manager (EEM) policies, use the **show event manager directory user** command in EXEC mode.

```
show event manager directory user {library | policy}
```

Syntax Description	library Specifies the user library files.
	policy Specifies the user-defined EEM policies.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 4.0.0	This command was introduced.

Usage Guidelines Use the **show event manager directory user** command to display the current value of the EEM user library or policy directory.

Task ID	Task ID	Operations
	eem	read

Examples This is a sample output of the **show event manager directory user** command:

```
RP/0/RSP0/CPU0:router# show event manager directory user library
disk0:/fm_user_lib_dir

RP/0/RSP0/CPU0:router# show event manager directory user policy
disk0:/fm_user_pol_dir
```

Related Commands	Command	Description
	event manager directory user, on page 76	Specifies the name of a directory that is to be used for storing either the user library or the policy files.

show event manager environment

To display the names and values of the Embedded Event Manager (EEM) environment variables, use the **show event manager environment** command in EXEC mode.

```
show event manager environment [{allenvironment-name}]
```

Syntax Description	all (Optional) Specifies all the environment variables.
	<i>environment-name</i> (Optional) Environment variable for which data is displayed.

Command Default All environment variables are displayed.

Command Modes EXEC mode

Command History	Release	Modification
	Release 4.0.0	This command was introduced.

Usage Guidelines Use the **show event manager environment** command to display the names and values of the EEM environment variables.

Task ID	Task ID	Operations
	eem	read

Examples This is a sample output of the **show event manager environment** command:

```
RP/0/RSP0/CPU0:router# show event manager environment

No.  Name                               Value
 1   _email_cc                             mosnerd@cisco.com
 2   _email_to                             show event manager policy registered
 3   _show_cmd                             0-59/2 0-23/1 * * 0-7
 4   _cron_entry                           mosnerd@cisco.com
 5   _email_from                           zeta@cisco.com
 6   _email_server
```

comp id	Component of which the process is a member.
version	Specific software version or release of which the process is a member.

show event manager metric process

Field	Description
last event type	Last event type on the node.
recent end type	Most recent end type.
recent start time	Last time the process was started.
recent normal end time	Last time the process was stopped normally.
recent abnormal end time	Last time the process was terminated abnormally.
recent abnormal end type	Reason for the last abnormal process termination. For example, the process was terminated or crashed.
number of times started	Number of times the process has been started.
number of times ended normally	Number of times the process has been stopped normally.
number of times ended abnormally	Number of times the process has stopped abnormally.
most recent 10 process start times	Times of the last ten process starts.
cumulative process available time	Total time the process has been available.
cumulative process unavailable time	Total time the process has been out of service due to a restart, termination, communication problems, and so on.
process availability	Uptime percentage of the process (time running—the duration of any outage).
number of abnormal ends within the past 60 minutes	Number of times the process has stopped abnormally within the last 60 minutes.
number of abnormal ends within the past 24 hours	Number of times the process has stopped abnormally within the last 24 hours.
number of abnormal ends within the past 30 days	Number of times the process has stopped abnormally within the last 30 days.

Related Commands

Command	Description
show processes	Displays information about active processes.

show event manager policy available

To display Embedded Event Manager (EEM) policies that are available to be registered, use the **show event manager policy available** command in EXEC mode.

```
show event manager policy available [{system | user}]
```

Syntax Description	system (Optional) Displays all the available system policies.
	user (Optional) Displays all the available user policies.

Command Default If this command is invoked with no optional keywords, it displays information for all available system and user policies.

Command Modes EXEC mode

Command History	Release	Modification
	Release 4.0.0	This command was introduced.

Usage Guidelines Use the **show event manager policy available** command to find out what policies are available to be registered just prior to using the **event manager policy** command to register policies.

This command is also useful if you forget the exact name of a policy that is required for the **event manager policy** command.

Task ID	Task ID	Operations
	eem	read

Examples This is a sample output of the **show event manager policy available** command:

```
RP/0/RSP0/CPU0:router# show event manager policy available

No.   Type    Time Created                               Name
1     system  Tue Jan 12 09:41:32 2004                 pr_sample_cdp_abort.tcl
2     system  Tue Jan 12 09:41:32 2004                 pr_sample_cdp_revert.tcl
3     system  Tue Jan 12 09:41:32 2004                 sl_sample_intf_down.tcl
4     system  Tue Jan 12 09:41:32 2004                 tm_sample_cli_cmd.tcl
5     system  Tue Jan 12 09:41:32 2004                 tm_sample_crash_hist.tcl
6     system  Tue Jan 12 09:41:32 2004                 wd_sample_proc_mem_used.tcl
7     system  Tue Jan 12 09:41:32 2004                 wd_sample_sys_mem_used.tcl
```

This table describes the significant fields shown in the display.

Table 11: show event manager policy available Field Descriptions

Field	Description
No.	Number of the policy.
Type	Type of policy.
Time Created	Time the policy was created.
Name	Name of the policy.

Related Commands

Command	Description
event manager policy, on page 80	Registers an EEM policy with the EEM.
show event manager policy registered, on page 97	Displays the EEM policies that are already registered.

show event manager policy registered

To display the Embedded Event Manager (EEM) policies that are already registered, use the **show event manager policy registered** command in EXEC mode.

```
show event manager policy registered[event-type type] [{system | user}] [{time-ordered | name-ordered}]
```

Syntax Description

event-type *type* (Optional) Displays the registered policies for a specific event type, where the valid *type* options are as follows:

- **application**—Application event type
- **counter**—Counter event type
- **hardware**—Hardware event type
- **oir**—Online insertion and removal (OIR) event type
- **process-abort**—Event type for abnormal termination of process
- **process-start**—Process start event type
- **process-term**—Process termination event type
- **process-user-restart**—Process user restart event type
- **process-user-shutdown**—Process user shutdown event type
- **statistics**—Statistics event type
- **syslog**—Syslog event type
- **timer-absolute**—Absolute timer event type
- **timer-countdown**—Countdown timer event type
- **timer-cron**—Clock daemon (cron) timer event type
- **timer-watchdog**—Watchdog timer event type
- **wdsysmon**—Watchdog system monitor event type

system (Optional) Displays the registered system policies.

user (Optional) Displays the registered user policies.

time-ordered (Optional) Displays the policies according to registration time.

name-ordered (Optional) Displays the policies in alphabetical order according to policy name.

Command Default

If this command is invoked with no optional keywords or arguments, it displays the registered EEM policies for all the event types. The policies are displayed according to the registration time.

Command Modes

EXEC mode

Command History

Release	Modification
Release 4.0.0	This command was introduced.

Usage Guidelines

The output of the **show event manager policy registered** command is most beneficial if you are writing and monitoring the EEM policies. The output displays registered policy information in two parts. The first line in each policy description lists the index number assigned to the policy, policy type (system or user), type of

show event manager policy registered

event registered, time at which the policy was registered, and name of the policy file. The remaining lines of each policy description display information about the registered event and how the event is to be handled, and come directly from the Tool Command Language (TCL) command arguments that make up the policy file.

Registered policy information is documented in the Cisco publication *Writing Embedded Event Manager Policies Using Tcl*.

Task ID	Task ID	Operations
	eem	read

Examples

This is a sample output of the **show event manager policy registered** command:

```
RP/0/RSP0/CPU0:router# show event manager policy registered

No.      Type      Event Type      Time Registered      Name
1        system   proc abort      Wed Jan 16 23:44:56 2004  test1.tcl

  timewin_sec 120 timewin_nsec 0 sub1 mem_proc {node {localhost} procname
  {wdsysmon} op gt val 80 is_percent FALSE}
  priority normal maxrun_sec 40 maxrun_nsec 0
```

This table describes the significant fields displayed in the example.

Table 12: show event manager policy registered Field Descriptions

Field	Description
No.	Number of the policy.
Type	Type of policy.
Event Type	Type of the EEM event for which the policy is registered.
Time Registered	Time at which the policy was registered.

Field	Description
Name	Name of the policy.

Related Commands

Command	Description
event manager policy, on page 80	Registers an EEM policy with the EEM.

show event manager refresh-time

To display the time between the user authentication refreshes in the Embedded Event Manager (EEM), use the **show event manager refresh-time** command in EXEC mode.

show event manager refresh-time

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 4.0.0	This command was introduced.

Usage Guidelines The output of the **show event manager refresh-time** command is the refresh time, in seconds.

Task ID	Task ID	Operations
	eem	read

Examples This is a sample output of the **show event manager refresh-time** command:

```
RP/0/RSP0/CPU0:router# show event manager refresh-time
Output:
1800 seconds
```

Related Commands	Command	Description
	event manager refresh-time, on page 83	Specifies the time between the system attempts to contact the AAA server, and refreshes the username reauthentication.

show event manager statistics-table

To display the currently supported statistic counters maintained by the Statistic Event Detector, use the **show event manager statistics-table** command in EXEC mode.

```
show event manager statistics-table {stats-name | all}
```

Syntax Description	
	<p><i>stats-name</i> Specific statistics type to be displayed. There are three statistics types:</p> <ul style="list-style-type: none"> • generic (ifstats-generic) • interface table (ifstats-itable) • data rate (ifstats-datarate)
	<p>all Displays the possible values for the <i>stats-name</i> argument.</p> <p>Displays the output for all the statistics types.</p>

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 4.0.0	This command was introduced.

Usage Guidelines Use the **show event manager statistics-table all** command to display the output for all the statistics types.

Task ID	Task ID	Operations
	eem	read

Examples

This is a sample output of the **show event manager statistics-table all** command:

```
RP/0/RSP0/CPU0:router# show event manager statistics-table all
```

Name	Type	Description
ifstats-generic	bag	Interface generic stats
ifstats-itable	bag	Interface iftable stats
ifstats-datarate	bag	Interface datarate stats

This is a sample output providing more detailed information on the ifstats-itable interface statistics table:

```
RP/0/RSP0/CPU0:router# show event manager statistics-table ifstats-itable
```

Name	Type	Description
PacketsReceived	uint64	Packets rcvd
BytesReceived	uint64	Bytes rcvd
PacketsSent	uint64	Packets sent

show event manager statistics-table

BytesSent	uint64	Bytes sent
MulticastPacketsReceived	uint64	Multicast pkts rcvd
BroadcastPacketsReceived	uint64	Broadcast pkts rcvd
MulticastPacketsSent	uint64	Multicast pkts sent
BroadcastPacketsSent	uint64	Broadcast pkts sent
OutputDropsCount	uint32	Total output drops
InputDropsCount	uint32	Total input drops
InputQueueDrops	uint32	Input queue drops
RuntPacketsReceived	uint32	Received runt packets
GiantPacketsReceived	uint32	Received giant packets
ThrottledPacketsReceived	uint32	Received throttled packets
ParityPacketsReceived	uint32	Received parity packets
UnknownProtocolPacketsReceived	uint32	Unknown protocol pkts rcvd
InputErrorsCount	uint32	Total input errors
CRCErrorCount	uint32	Input crc errors
InputOverruns	uint32	Input overruns
FramingErrorsReceived	uint32	Framing-errors rcvd
InputIgnoredPackets	uint32	Input ignored packets
InputAborts	uint32	Input aborts
OutputErrorsCount	uint32	Total output errors
OutputUnderruns	uint32	Output underruns
OutputBufferFailures	uint32	Output buffer failures
OutputBuffersSwappedOut	uint32	Output buffers swapped out
Applique	uint32	Applique
ResetCount	uint32	Number of board resets
CarrierTransitions	uint32	Carrier transitions
AvailabilityFlag	uint32	Availability bit mask
NumberOfSecondsSinceLastClearCounters	uint32	Seconds since last clear counters
LastClearTime	uint32	SysUpTime when counters were last cleared (in seconds)

This table describes the significant fields displayed in the example.

Table 13: show event manager statistics-table Field Descriptions

Field	Description
Name	Name of the statistic. When the all keyword is specified, there are three types of statistics displayed: <ul style="list-style-type: none"> • ifstats-generic • ifstats-iftable • ifstats-datarate When a statistics type is specified, the statistics for the statistic type are displayed.
Type	Type of statistic.
Description	Description of the statistic.

IP Service Level Agreement Commands

This module describes the Cisco IOS XR software commands to configure IP Service Level Agreements (IP SLAs) on your router.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed information about IP SLA concepts, configuration tasks, and examples, see the *Implementing IP Service Level Agreements* module in the *System Monitoring Configuration Guide for Cisco ASR 9000 Series Routers*.

access-list

To specify an access-list name to filter provider edge (PE) addresses to restrict operations that are automatically created by MPLS LSP monitor (MPLSLM) instance, use the **access-list** command in the appropriate configuration mode. To return to the default value, use the **no** form of this command.

access-list *acl-name*

no access-list

Syntax Description	<i>acl-name</i> Filters an access-list name.
---------------------------	--

Command Default	No access list is configured by default.
------------------------	--

Command Modes	IP SLA MPLS LSP monitor ping configuration IP SLA MPLS LSP monitor trace configuration
----------------------	---

Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

Usage Guidelines	Access-list changes are processed before the scan interval expires to display a planned list of changes in the scan-queue.
-------------------------	--

Note	There is no verification check between the access list and the IPSLA configuration.
-------------	---

Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>monitor</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	monitor	read, write
Task ID	Operations				
monitor	read, write				

Examples	The following example shows how to use the access-list command:
-----------------	--

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-ping)# access-list ipsla
```

Related Commands	<table border="1"> <thead> <tr> <th>Command</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>scan interval, on page 193</td> <td>Specifies the frequency at which the MPLS LSP monitor instance checks the scan queue for updates.</td> </tr> </tbody> </table>	Command	Description	scan interval, on page 193	Specifies the frequency at which the MPLS LSP monitor instance checks the scan queue for updates.
Command	Description				
scan interval, on page 193	Specifies the frequency at which the MPLS LSP monitor instance checks the scan queue for updates.				

Command	Description
type mpls lsp ping, on page 269	Tests connectivity in an LSP path in an MPLS VPN.
type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

action (IP SLA)

To specify what action or combination of actions the operation performs when you configure the **react** command or when threshold events occur, use the **action** command in the appropriate configuration mode. To clear action or combination of actions (no action can happen), use the **no** form of this command.

```
action {logging | trigger}
no action {logging | trigger}
```

Syntax Description	<p>logging Sends a logging message when the specified violation type occurs for the monitored element. The IP SLA agent generates a syslog and informs SNMP. Then, it is up to the SNMP agent to generate a trap or not.</p> <p>trigger Determines that the operation state of one or more target operations makes the transition from pending to active when the violation conditions are met. The target operations to be triggered are specified using the ipsla reaction trigger command. A target operation continues until its life expires, as specified by the lifetime value of the target operation. A triggered target operation must finish its life before it can be triggered again.</p>
---------------------------	---

Command Default	None
------------------------	------

Command Modes	IP SLA reaction condition configuration IP SLA MPLS LSP monitor reaction configuration
----------------------	---

Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

Usage Guidelines	<p>For the action command to occur for threshold events, the threshold type must be defined. Absence of threshold type configuration is considered if the threshold check is not activated.</p> <p>When the action command is used from IP SLA MPLS LSP monitor reaction configuration mode, only the logging keyword is available.</p> <p>If the action command is used in IP SLA operation mode, the action defined applies to the specific operation being configured. If the action command is used in IP SLA MPLS LSP monitor mode, the action defined applies to all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.</p>
-------------------------	--

Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>monitor</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	monitor	read, write
Task ID	Operations				
monitor	read, write				

Examples	The following example shows how to use the action command with the logging keyword:
-----------------	---

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react connection-loss
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)# action logging
```

The following example shows how to use the **action** command from the IP SLA MPLS LSP monitor reaction configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# reaction monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-react)# react connection-loss
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-react-cond)# action logging
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.
reaction monitor, on page 176	Configures MPLS LSP monitoring reactions.
reaction operation, on page 178	Configures certain actions that are based on events under the control of the IP SLA agent.
react, on page 170	Specifies an element to be monitored for a reaction.
threshold, on page 250	Sets the lower-limit and upper-limit values.
threshold type average, on page 252	Takes action on average values to violate a threshold.
threshold type consecutive, on page 254	Takes action after a number of consecutive violations.
threshold type immediate, on page 256	Takes action immediately upon a threshold violation.
threshold type xofy, on page 258	Takes action upon X violations in Y probe operations.

ageout

To specify the number of seconds to keep the operation in memory when it is not actively collecting information, use the **ageout** command in IP SLA schedule configuration mode. To use the default value so that the operation will never age out, use the **no** form of this command.

ageout *seconds*
no ageout

Syntax Description	<i>seconds</i> Age-out interval in seconds. The value 0 seconds means that the collected data is not aged out. Range is 0 to 2073600.
---------------------------	---

Command Default	The default value is 0 seconds (never aged out).
------------------------	--

Command Modes	IP SLA schedule configuration
----------------------	-------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--

Task ID	Task	Operations
	monitor	read, write

Examples The following example shows how to use the **ageout** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# schedule operation 1
RP/0/RSP0/CPU0:router(config-ipsla-sched)# ageout 3600
```

Related Commands	Command	Description
	operation, on page 154	Configures an IP SLA operation.
	schedule operation, on page 196	Schedules an IP SLA operation.

buckets (history)

To set the number of history buckets that are kept during the lifetime of the IP SLA operation, use the **buckets** command in IP SLA operation history configuration mode. To use the default value, use the **no** form of this command.

buckets *buckets*
no buckets

Syntax Description	<i>buckets</i> Number of history buckets that are kept during the lifetime of an IP SLA operation. Range is 1 to 60.				
Command Default	The default value is 15 buckets.				
Command Modes	IP SLA operation history configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	<p>The buckets command is supported only to configure the following operations:</p> <ul style="list-style-type: none"> • IP SLA ICMP path-echo • IP SLA ICMP echo • IP SLA UDP echo 				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>monitor</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	monitor	read, write
Task ID	Operations				
monitor	read, write				
Examples	<p>The following example shows how to use the buckets command in IP SLA UDP echo configuration mode:</p> <pre>RP/0/RSP0/CPU0:router# configure RP/0/RSP0/CPU0:router(config)# ipsla RP/0/RSP0/CPU0:router(config-ipsla)# operation 1 RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp echo RP/0/RSP0/CPU0:router(config-ipsla-udp-echo)# history RP/0/RSP0/CPU0:router(config-ipsla-op-hist)# buckets 30</pre>

Command	Description
schedule operation, on page 196	Schedules an IP SLA operation.

buckets (statistics hourly)

To set the number of hours for which statistics are kept, use the **bucket** command in the appropriate configuration mode. To use the default value, use the **no** form of this command.

buckets *hours*
no buckets

Syntax Description	<i>hours</i> Number of hours for which statistics are maintained for the IP SLA operations. Range is 0 to 25 in IP SLA operation statistics configuration mode, and 0 to 2 in IP SLA MPLS LSP monitor statistics configuration mode.
---------------------------	--

Command Default	The default value is 2.
------------------------	-------------------------

Command Modes	IP SLA operation statistics configuration IP SLA MPLS LSP monitor statistics configuration
----------------------	---

Command History	Release Modification
	Release 3.7.2 This command was introduced.

Usage Guidelines	The buckets command with the <i>hours</i> argument is valid only for the statistics command with the hourly keyword.
-------------------------	---

Task ID	Task ID Operations
	monitor read, write

Examples	The following example shows how to set the number of hours in which statistics are maintained for the IP SLA UDP jitter operation for the buckets command:
-----------------	---

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# statistics hourly
RP/0/RSP0/CPU0:router(config-ipsla-op-stats)# buckets 10
```

Related Commands	Command Description
	statistics, on page 240 Sets the statistics collection parameters for the operation.

buckets (statistics interval)

To specify the maximum number of buckets in which the enhanced history statistics are kept, use the **buckets** command in IP SLA operation statistics configuration mode. To remove the statistics collection of the specified interval, use the **no** form of this command.

buckets *bucket-size*

no buckets

Syntax Description	<i>bucket-size</i> The bucket size is when the configured bucket limit is reached. Therefore, statistics gathering for the operation ends. Range is 1 to 100. Default is 100.
---------------------------	---

Command Default	The default value is 100.
------------------------	---------------------------

Command Modes	IP SLA operation statistics configuration
----------------------	---

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The buckets command with the <i>bucket-size</i> argument is valid only for the statistics command with the interval keyword.
-------------------------	---

Examples	The following example shows how to collect statistics for a given time interval for the IP SLA UDP jitter operation for the buckets command:
-----------------	---

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# statistics interval 60
RP/0/RSP0/CPU0:router(config-ipsla-op-stats)# buckets 50
```

Related Commands	Command	Description
	statistics, on page 240	Sets the statistics collection parameters for the operation.

control disable

To disable the control packets, use the **control disable** command in the appropriate configuration mode. To use the control packets again, use the **no** form of this command.

control disable
no control disable

Syntax Description This command has no keywords or arguments.

Command Default Control packets are enabled by default.

Command Modes IP SLA UDP echo configuration
 IP SLA UDP jitter configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines When you configure the **control disable** command on the agent side, you need to configure a permanent port on the responder side or the operation returns a timeout error. If you configure the **control disable** command, a permanent port of the IP SLA Responder or some other functionality, such as the UDP echo server, is required on the remote device.

The **control disable** command is valid for operations that require a responder.

The IP SLA control protocol is disabled, which is used to send a control message to the IP SLA Responder prior to sending an operation packet. By default, IP SLA control messages are sent to the destination device to establish a connection with the IP SLA Responder.

Task ID	Task ID	Operations
	monitor	read, write

Examples The following example shows how to use the **control disable** command in IP SLA UDP jitter configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# control disable
```

Related Commands	Command	Description
	operation, on page 154	Configures an IP SLA operation.

Command	Description
schedule operation, on page 196	Schedules an IP SLA operation.

datasize request

To set the protocol data size in the request packet in the payload of an operation, use the **datasize request** command in the appropriate configuration mode. To reset the default data size, use the **no** form of this command.

datasize request *size*
no datasize request

Syntax Description

size Specifies the following ranges and default values that are protocol dependent:

- For a UDP jitter operation, range is 16 to 1500 B.
- For a UDP echo operation, range is 4 to 1500 B.
- For an ICMP echo operation, range is 0 to 16384 B.
- For an ICMP path-echo operation, range is 0 to 16384 B.
- For an ICMP path-jitter operation, range is 0 to 16384 B.
- For an MPLS LSP ping operation, range is 100 to 17986 B.

Command Default

For a UDP jitter operation, the default value is 32 B.

For a UDP echo operation, the default value is 16 B.

For an ICMP echo operation, the default value is 36 B.

For an ICMP path-echo operation, the default value is 36 B.

For an ICMP path-jitter operation, the default value is 36 B.

For an MPLS LSP ping operation, the default value is 100 B.

Command Modes

IP SLA UDP echo configuration

IP SLA UDP jitter configuration

IP SLA ICMP path-jitter configuration

IP SLA ICMP path-echo configuration

IP SLA ICMP echo configuration

IP SLA MPLS LSP ping configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **datasize request** command in IP SLA UDP jitter configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# datasize request 512
```

Related Commands

type udp jitter, on page 274	Configures an IP SLA UDP jitter operation.

destination address (IP SLA)

To identify the address of the target device, use the **destination address** command in the appropriate configuration mode. To unset the destination address, use the **no** form of this command.

destination address *ipv4-address*
no destination address

Syntax Description	<i>ipv4-address</i> IP address of the target device.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	IP SLA UDP echo configuration IP SLA UDP jitter configuration IP SLA ICMP path-jitter configuration IP SLA ICMP path-echo configuration IP SLA ICMP echo configuration
----------------------	--

Command History	Release Modification
	Release 3.7.2 This command was introduced.

Usage Guidelines	You must specify the address of the target device. The configuration for the destination address command is mandatory for all operations.
-------------------------	--

Task ID	Task ID Operations
	monitor read, write

Examples	The following example shows how to designate an IP address for the destination address command in IP SLA UDP jitter configuration mode:
-----------------	--

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# destination address 192.0.2.12
```

Related Commands	Command	Description
	operation, on page 154	Configures an IP SLA operation.
	schedule operation, on page 196	Schedules an IP SLA operation.

destination port

To identify the port of the target device, use the **destination port** command in the appropriate configuration mode. To unset the destination port, use the **no** form of this command.

destination port *port*
no destination port

Syntax Description

port Port number of the target device. Range is 1 to 65355.

Command Default

None

Command Modes

IP SLA UDP echo configuration
 IP SLA UDP jitter configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **destination port** command is not supported when you configure an ICMP operation; it is supported only to configure UDP operations.

You must specify the port of the target device. The configuration for the **destination port** command is mandatory for both IP SLA UDP echo and IP SLA UDP jitter configurations.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to designate a port for the **destination port** command in IP SLA UDP jitter configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# destination port 11111
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.

distribution count

To set the number of statistics distributions that are kept for each hop during the lifetime of the IP SLA operation, use the **distribution count** command in IP SLA operation statistics configuration mode. To use the default value, use the **no** form of this command.

distribution count *slot*
no distribution count

Syntax Description	slot Number of statistics distributions that are kept. Range is 1 to 20. Default is 1.
---------------------------	---

Command Default	The default value is 1.
------------------------	-------------------------

Command Modes	IP SLA operation statistics configuration
----------------------	---

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	In most situations, you do not need to change the number of statistics distributions kept or the time interval for each distribution. Only change these parameters when distributions are needed, for example, when performing statistical modeling of your network. To set the statistics distributions interval, use the distribution interval command in IP SLA operation statistics configuration mode. The total number of statistics distributions captured is the value set by the distribution count command times the value set by the maximum hops command times the value set by the maximum path command times the value set by the buckets command.
-------------------------	---

Task ID	Task	Operations
	monitor	read, write

Examples	The following example shows how to set the number of statistics distribution for the distribution count command:
-----------------	---

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# statistics hourly
RP/0/RSP0/CPU0:router(config-ipsla-op-stats)# distribution count 15
```

Related Commands	Command	Description

Task ID	Task	Operations
	monitor	read, write

Examples	The following example shows how to set the time interval for the distribution interval command:
-----------------	--

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# statistics hourly
RP/0/RSP0/CPU0:router(config-ipsla-op-stats)# distribution interval 50
```

Related Commands	Command	Description
	buckets (statistics hourly), on page 113	Sets the number of hours in which statistics are kept.
	distribution count, on page 121	Sets the number of statistics distributions that are kept for each hop during the lifetime of the IP SLA operation.

Command	Description
maximum hops, on page 147	Sets the number of hops in which statistics are maintained for each path for the IP SLA operation.
maximum paths (IP SLA), on page 149	Sets the number of paths in which statistics are maintained for each hour for an IP SLA operation.
statistics, on page 240	Sets the statistics collection parameters for the operation.

exp

To specify the MPLS experimental field (EXP) value in the header of echo request packets, use the **exp** command in the appropriate configuration mode. To return to the default value, use the **no** form of this command.

```
exp exp-bits
no exp
```

Syntax Description	<i>exp-bits</i> Experimental field value in the header of an echo request packet. Valid values are from 0 to 7. Default is 0.				
Command Default	The experimental field value is set to 0.				
Command Modes	IP SLA MPLS LSP ping configuration IP SLA MPLS LSP trace configuration IP SLA MPLS LSP monitor ping configuration IP SLA MPLS LSP monitor trace configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	<p>Use the exp command to set the MPLS experimental field in the headers of echo request packets in an MPLS LSP ping or MPLS LSP trace operation. The experimental (EXP) field allows for eight different quality-of-service (QoS) markings that determine the treatment (per-hop behavior) that a transit LSR node gives to a request packet. You can configure different MPLS EXP levels for different operations to create differentiated levels of response.</p> <p>If the exp command is used in IP SLA operation mode, it acts on the headers of echo request packets for the specific operation being configured. If the exp command is used in IP SLA MPLS LSP monitor mode, it acts on the headers of echo request packets for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.</p>				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>monitor</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	monitor	read, write
Task ID	Operations				
monitor	read, write				
Examples	<p>The following example shows how to use the exp command:</p> <pre>RP/0/RSP0/CPU0:router# configure RP/0/RSP0/CPU0:router(config)# ipsla RP/0/RSP0/CPU0:router(config-ipsla)# operation 1</pre>				

```
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp trace
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-trace)# exp 5
```

The following example shows how to use the **exp** command in MPLS LSP monitor mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp trace
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-trace)# exp 5
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.
type mpls lsp ping, on page 269	Tests connectivity in an LSP path in an MPLS VPN.
type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

filter (IP SLA)

To define the type of information that are kept in the history table for the IP SLA operation, use the **filter** command in IP SLA operation history configuration mode. To unset the history filter, use the **no** form of this command.

```
filter {all | failures}
no filter
```

Syntax Description	all	Stores history data for all operations, if set.
	failures	Stores data for operations that failed, if set.

Command Default The default is not to collect the history unless the **filter** command is enabled.

Command Modes IP SLA operation history configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **filter** command is supported only to configure the following operations:

- IP SLA ICMP path-echo
- IP SLA ICMP echo
- IP SLA UDP echo

If you use the **no** form of the **filter** command, the history statistics are not collected.

Task ID	Task ID	Operations
	monitor	read, write

Examples The following example shows how to use the **filter** command in IP SLA UDP echo configuration mode:

```
Router# configure
Router(config)# ipsla
Router(config-ipsla)# operation 1
Router(config-ipsla-op)# type udp echo
Router(config-ipsla-udp-echo)# history
Router(config-ipsla-op-hist)# filter all
```

Related Commands	Command	Description
	operation, on page 154	Configures an IP SLA operation.

Command	Description
schedule operation, on page 196	Schedules an IP SLA operation.

force explicit-null

To add an explicit null label to the label stack of an LSP when an echo request is sent, use the **force explicit-null** command in the appropriate configuration mode. To return to the default value, use the **no** form of this command.

force explicit-null
no force explicit-null

Syntax Description	This command has no keywords or arguments.				
Command Default	An explicit null label is not added.				
Command Modes	IP SLA MPLS LSP ping configuration IP SLA MPLS LSP trace configuration IP SLA MPLS LSP monitor ping configuration IP SLA MPLS LSP monitor trace configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

Usage Guidelines

Use the **force explicit-null** command to force an unsolicited explicit null label to be added to the MPLS label stack of the LSP when an echo request packet is sent in an MPLS LSP ping or MPLS LSP trace operation.

If the **force explicit-null** command is used in IP SLA operation mode, it acts on the label stack of the LSP for the specific operation being configured. If the **force explicit-null** command is used in IP SLA MPLS LSP monitor mode, it acts on the label stack of all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.

You cannot use the **force explicit-null** command if pseudowire is specified as the target to be used in an MPLS LSP ping operation.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **force explicit-null** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp trace
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-trace)# force explicit-null
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.
type mpls lsp ping, on page 269	Tests connectivity in an LSP path in an MPLS VPN.
type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

frequency (IP SLA)

To set the frequency for probing, use the **frequency** command in the appropriate configuration mode. To use the default value, use the **no** form of this command.

frequency *seconds*
no frequency

Syntax Description

seconds Rate at which the specific IP SLA operation is sent into the network. Range is 1 to 604800.

Command Default

If the **frequency** command is not used, the default value is 60 seconds.

In IP SLA MPLS LSP monitor schedule configuration mode, the default value is equal to the schedule period that is set using the **schedule period** command.

Command Modes

IP SLA UDP echo configuration
 IP SLA UDP jitter configuration
 IP SLA ICMP path-jitter configuration
 IP SLA ICMP path-echo configuration
 IP SLA ICMP echo configuration
 IP SLA MPLS LSP ping configuration
 IP SLA MPLS LSP trace configuration
 IP SLA MPLS LSP monitor schedule configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

If this command is used in IP SLA MPLS LSP monitor schedule configuration mode, it represents the frequency for the schedule period. In other words, if the frequency is set to 1000 seconds and the schedule period is set to 600 seconds, every 1000 seconds the LSP operations are run. Each run takes 600 seconds. Use the **schedule period** command to specify the schedule period.

The frequency value must be greater than or equal to the schedule period.

This configuration is inherited automatically by all LSP operations that are created.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to use the **frequency** command in IP SLA UDP jitter configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# frequency 300
```

The following example shows how to use the **frequency** command in IP SLA MPLS LSP monitor schedule configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplsml)# schedule monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplsml-sched)# frequency 1200
RP/0/RSP0/CPU0:router(config-ipsla-mplsml-sched)# schedule period 600
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.
schedule period, on page 198	Configures the amount of time during which all LSP operations are scheduled to start or run.

history

To configure the history parameters for the IP SLA operation, use the **history** command in the appropriate configuration mode. To use the default value, use the **no** form of this command.

```
history [{buckets buckets | filter {all | failures} | lives lives}]
no history
```

Syntax Description

buckets	Sets the number of history buckets that are kept during the lifetime of the IP SLA operation.
<i>buckets</i>	Number of history buckets that are kept during the lifetime of an IP SLA operation. Range is 1 to 60.
filter	Defines the type of information that is kept in the history table for the IP SLA operation.
all	Stores history data for all operations, if set.
failures	Stores data for operations that failed, if set.
lives	Sets the number of lives that are maintained in the history table for an IP SLA operation.
<i>lives</i>	Number of lives that are maintained in the history table for an IP SLA operation. Range is 0 to 2.

Command Default

None

Command Modes

IP SLA UDP echo configuration
 IP SLA UDP jitter configuration
 IP SLA ICMP path-jitter configuration
 IP SLA ICMP path-echo configuration
 IP SLA ICMP echo configuration
 IP SLA MPLS LSP ping configuration
 IP SLA MPLS LSP trace configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **history** command enters IP SLA operation history configuration mode in which you can configure more history configuration parameters.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to use the **history** command in IP SLA UDP echo configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp echo
RP/0/RSP0/CPU0:router(config-ipsla-udp-echo)# history
RP/0/RSP0/CPU0:router(config-ipsla-op-hist)#
```

hw-timestamp disable

To disable hardware time stamp configuration, use the **hw-timestamp disable** command in the IP SLA configuration mode.

hw-timestamp disable

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes IP SLA configuration

Command History	Release	Modification
	Release 6.0.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	monitor	read, write

Example

The following example shows how to disable hardware time stamping:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# hw-timestamp disable
```

interval (IP SLA)

To configure the refresh interval for MPLS label switched path (LSP) monitoring, use the **interval** command in IP SLA MPLS discovery VPN configuration mode. To use the default value, use the **no** form of this command.

interval *refresh-interval*
no interval

Syntax Description	<i>refresh-interval</i> Specifies the time interval, in minutes, after which routing entries that are no longer valid are removed from the Layer 3 VPN discovery database. Range is 30 to 70560.
---------------------------	--

Command Default	The default refresh interval is 60 minutes.
------------------------	---

Command Modes	IP SLA MPLS discovery VPN configuration
----------------------	---

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

Note If the total number of routes is large, there is a negative impact on the performance during the refresh of the discovery database. Therefore, the value of the *refresh-interval* argument should be large enough that router performance is not affected. If there are a very large number of routes, we recommend that you set the value of the *refresh-interval* argument to be several hours.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **interval** command:

```
Router# configure
Router(config)# ipsla
Router(config-ipsla)# mpls discovery vpn
Router(config-ipsla-mpls-discovery-vpn)# interval 120
```

Related Commands	Command	Description
	mpls discovery vpn, on page 152	Configures MPLS label switched path (LSP) provider edge (PE) router discovery.

ipsla

To enter IP SLA configuration mode and configure IP Service Level Agreements, use the **ipsla** command in Global Configuration mode. To return to the default setting, use the **no** form of this command.

ipsla
no ipsla

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **ipsla** command enters IP SLA configuration mode where you can configure the various IP service level agreement options.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to enter IP SLA configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)#
```

Related Commands

Command	Description
key-chain, on page 139	Configures MD5 authentication for IP SLA control messages.
low-memory, on page 143	Configures a low-water memory mark.
mpls discovery vpn, on page 152	Configures MPLS label switched path (LSP) provider edge (PE) router discovery.
operation, on page 154	Configures an IP SLA operation.
reaction operation, on page 178	Configures certain actions that are based on events under the control of the IP SLA agent.

Command	Description
reaction trigger, on page 179	Defines a second IP SLA operation to make the transition from a pending state to an active state when one of the trigger-type options is defined with the reaction operation command.
responder, on page 180	Enables the IP SLA responder for UDP echo or jitter operations.
schedule operation, on page 196	Schedules an IP SLA operation.

key-chain

To configure the MD5 authentication for the IP SLA control message, use the **key-chain** command in IP SLA configuration mode. To unset the keychain name and not use MD5 authentication, use the **no** form of this command.

```
key-chain key-chain-name
no key-chain
```

Syntax Description

key-chain-name Name of the keychain.

Command Default

No default values are defined. No authentication is used.

Command Modes

IP SLA configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

When you configure the **key-chain** command, you must also configure the **key chain** command in global configuration mode to provide MD5 authentication.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to use the **ipsla key-chain** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# key-chain ipsla-keys
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.

life

To specify the length of time to execute, use the **life** command in IP SLA schedule configuration mode. To use the default value, use the **no** form of this command.

life {**forever***seconds*}

no life

Syntax Description

forever Schedules the operation to run indefinitely.

seconds Determines the number of seconds the operation actively collects information. Range is 1 to 2147483647. Default value is 3600 seconds (one hour).

Command Default

The default value is 3600 seconds.

Command Modes

IP SLA schedule configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to use the **life** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# schedule operation 1
RP/0/RSP0/CPU0:router(config-ipsla-sched)# life forever
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.

lives

To set the number of lives that are maintained in the history table for an IP SLA operation, use the **lives** command in IP SLA operation history configuration mode. To use the default value, use the **no** form of this command.

lives *lives*
no **lives**

Syntax Description	<i>lives</i> Number of lives that are maintained in the history table for an IP SLA operation. Range is 0 to 2.
---------------------------	---

Command Default	The default value is 0 lives.
------------------------	-------------------------------

Command Modes	IP SLA operation history configuration
----------------------	--

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **lives** command is supported only to configure the following operations:

- IP SLA ICMP path-echo
- IP SLA ICMP echo
- IP SLA UDP echo

If you use the **no** form of the **lives** command, the history statistics are not collected.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **lives** command in IP SLA UDP echo configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp echo
RP/0/RSP0/CPU0:router(config-ipsla-udp-echo)# history
RP/0/RSP0/CPU0:router(config-ipsla-op-hist)# lives 2
```

Related Commands	Command	Description
	buckets (history), on page 111	Sets the number of history buckets that are kept during the lifetime of the IP SLA operation.

Command	Description
filter (IP SLA), on page 127	Defines the type of information that are kept in the history table for the IP SLA operation.
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.
samples, on page 189	Sets the number of hop entries that are kept in the history table for an IP SLA ICMP path-echo operation.

low-memory

low-memory *value*

no low-memory

Syntax Description *value* Low-water memory mark *value*. Range is 0 to 4294967295.

Command Default The default value is 20 MB (free memory).

Command Modes IP SLA configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines IP SLA ensures that the system provides the specified memory before adding new operations or scheduling the pending operation.

When the 0 value is used, no memory limitation is enforced.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **low-memory** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# low-memory 102400
```

Related Commands	Command	Description
	operation, on page 154	Configures an IP SLA operation.
	schedule operation, on page 196	Schedules an IP SLA operation.
	show ipsla application, on page 201	Displays the information for the IP SLA application.

lsp selector ipv4

To specify the local host IPv4 address used to select an LSP, use the **lsp selector ipv4** command in the appropriate configuration mode. To clear the host address, use the **no** form of this command.

```
lsp selector ipv4 ip-address
no lsp selector ipv4
```

Syntax Description

ip-address A local host IPv4 address used to select the LSP.

Command Default

The local host IP address used to select the LSP is 127.0.0.1.

Command Modes

IP SLA MPLS LSP ping configuration
 IP SLA MPLS LSP trace configuration
 IP SLA MPLS LSP monitor ping configuration
 IP SLA MPLS LSP monitor trace configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **lsp selector ipv4** command to force an MPLS LSP ping or MPLS LSP trace operation to use a specific LSP when there are multiple equal cost paths between provider edge (PE) routers. This situation occurs when transit label switching routers (LSRs) use the destination address in IP packet headers for load balancing.

The IPv4 address configured with the **lsp selector ipv4** command is the destination address in the User Datagram Protocol (UDP) packet sent as the MPLS echo request. Valid IPv4 addresses are defined in the subnet 127.0.0.0/8 and used to:

- Force the packet to be consumed by the router where an LSP breakage occurs.
- Force processing of the packet at the terminal point of the LSP if the LSP is intact.
- Influence load balancing during forwarding when the transit routers use the destination address in the IP header for load balancing.

If the **lsp selector ipv4** command is used in IP SLA operation mode, it acts on the MPLS echo requests for the specific operation being configured. If the **lsp selector ipv4** command is used in IP SLA MPLS LSP monitor mode, it acts on the MPLS echo requests for all operations associated with the monitored provider edge (PE) routers.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to use the **lsp selector ipv4** command:

```

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp trace
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-trace)# lsp selector ipv4 127.10.10.1

```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.
type mpls lsp ping, on page 269	Tests connectivity in an LSP path in an MPLS VPN.
type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

lsr-path

To specify a loose source routing path in which to measure the ICMP, use the **lsr-path** command in the appropriate configuration mode. To use a path other than the specified one, use the **no** form of this command.

```
lsr-path ipaddress1 [ipaddress2 [. . . [ipaddress8]]]
no lsr-path
```

Syntax Description

ip address IPv4 address of the intermediate node. Up to eight addresses can be entered.

Command Default

No path is configured.

Command Modes

IP SLA ICMP path-jitter configuration
IP SLA ICMP path-echo configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **lsr-path** command applies only to ICMP path-echo and ICMP path-jitter operation types. You can configure up to a maximum of eight hop addresses by using the **lsr-path** command, as shown in the following example:

```
lsr-path ipaddress1 [ipaddress2 [... [ipaddress8]]]
```

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to use the **lsr-path** command in IP SLA ICMP Path-echo configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type icmp path-echo
RP/0/RSP0/CPU0:router(config-ipsla-icmp-path-echo)# lsr-path 192.0.2.40
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.

maximum hops

To set the number of hops in which statistics are maintained for each path for the IP SLA operation, use the **maximum hops** command in IP SLA operation statistics configuration mode. To use the default value, use the **no** form of this command.

```
maximum hops hops
no maximum hops
```

Syntax Description	<i>hops</i> Number of hops for which statistics are maintained for each path. Range is 1 to 30. Default value is 16 for path operations; for example, <i>pathecho</i> .				
Command Default	The default value is 16 hops.				
Command Modes	IP SLA operation statistics configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	The maximum hops command is supported only when you configure path operations and the IP SLA ICMP path-echo operation.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>monitor</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	monitor	read, write
Task ID	Operations				
monitor	read, write				

Examples

The following example shows how to set the number of hops for the statistics for the **maximum** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type icmp path-echo
RP/0/RSP0/CPU0:router(config-ipsla-icmp-path-echo)# statistics hourly
RP/0/RSP0/CPU0:router(config-ipsla-op-stats)# maximum hops 20
```

Related Commands	Command	Description
	buckets (statistics hourly), on page 113	Sets the number of hours in which statistics are kept.
	distribution count, on page 121	Sets the number of statistics distributions that are kept for each hop during the lifetime of the IP SLA operation.
	distribution interval, on page 123	Sets the time interval (in milliseconds) for each statistical distribution.

Command	Description
maximum paths (IP SLA), on page 149	Sets the number of paths in which statistics are maintained for each hour for an IP SLA operation.
statistics, on page 240	Sets the statistics collection parameters for the operation.

maximum paths (IP SLA)

To set the number of paths in which statistics are maintained for each hour for an IP SLA operation, use the **maximum paths** command in IP SLA operation statistics configuration mode. To use the default value, use the **no** form of this command.

maximum paths *paths*
no maximum paths

Syntax Description	<i>paths</i> Number of paths for which statistics are maintained for each hour. Range is 1 to 128. Default value is 5 for path operations; for example, <i>pathecho</i> .				
Command Default	The default value is 5 paths.				
Command Modes	IP SLA operation statistics configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	The maximum paths command is supported only when you configure path operations and the IP SLA ICMP path-echo operation.

Command	Description
maximum hops, on page 147	Sets the number of hops in which statistics are maintained for each path for the IP SLA operation.
statistics, on page 240	Sets the statistics collection parameters for the operation.

monitor

To configure an MPLS LSP monitor instance, use the **monitor** command in IP SLA LSP monitor configuration mode. To remove the monitor instance, use the **no** form of this command.

monitor *monitor-id*
no monitor [*monitor-id*]

Syntax Description	<i>monitor-id</i> Number of the IP SLA LSP monitor instance to be configured. Range is 1 to 2048.
---------------------------	---

Command Default	No monitor instance is configured.
------------------------	------------------------------------

Command Modes	IP SLA LSP monitor configuration
----------------------	----------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The monitor command enters IP SLA MPLS LSP monitor configuration mode so that you can set the desired monitor type for all operations associated with the monitored provider edge (PE) routers.
-------------------------	--

To remove all monitor instances, use the **no monitor** command with no argument.

Task ID	Task ID	Operations
	monitor	read, write

Examples	The following example shows how to use the monitor command:
-----------------	--

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)#
```

Related Commands	Command	Description
	operation, on page 154	Configures an IP SLA operation.
	schedule operation, on page 196	Schedules an IP SLA operation.

mpls discovery vpn

To configure MPLS label switched path (LSP) provider edge (PE) router discovery, use the **mpls discovery vpn** command in IP SLA configuration mode. To use the default value, use the **no** form of this command.

```
mpls discovery vpn [interval interval]
no mpls discovery vpn
```

Syntax Description

interval Configures the refresh interval for MPLS label switched path (LSP) monitoring.

Command Default

None

Command Modes

IP SLA configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **mpls discovery vpn** command to configure provider edge (PE) router discovery. PE Discovery discovers the LSPs used to reach every routing next hop. Routing entities are stored in a Layer 3 VPN discover database.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to enter IP SLA MPLS discovery VPN mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls discovery vpn
RP/0/RSP0/CPU0:router(config-ipsla-mpls-discovery-vpn)#
```

Related Commands

Command	Description
interval (IP SLA), on page 136	Configures the refresh interval for MPLS label switched path (LSP) monitoring.

mpls lsp-monitor

To configure MPLS label switched path (LSP) monitoring, use the **mpls lsp-monitor** command in IP SLA configuration mode. To use the default value, use the **no** form of this command.

mpls lsp-monitor
no mpls lsp-monitor

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes IP SLA configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **mpls lsp-monitor** command to configure MPLS LSP PE monitoring on the router. This provides a means to configure all operations associated with the monitored provider edge (PE) routers. The configuration is inherited by all LSP operations that are created automatically by the PE discovery.

Task ID	Task ID	Operations
	monitor	read, write

Examples The following example shows how to enter IP SLA MPLS LSP monitor mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplsml)#
```

Related Commands	Command	Description
	mpls discovery vpn, on page 152	Configures MPLS label switched path (LSP) provider edge (PE) router discovery.

operation

To configure an IP SLA operation, use the **operation** command in IP SLA configuration mode. To remove the operation, use the **no** form of this command.

operation *operation-number*
no operation *operation-number*

Syntax Description	<i>operation-number</i> Operation number. Range is 1 to 2048.
---------------------------	---

Command Default	None
------------------------	------

Command Modes	IP SLA configuration
----------------------	----------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--

Task ID	Task	Operations
	monitor	read, write

Examples The following example shows how to use the IP SLA **operation** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)#
```

Related Commands	Command	Description
	schedule operation, on page 196	Schedules an IP SLA operation.

output interface

To specify the echo request output interface to be used for LSP ping or LSP trace operations, use the **output interface** command in IP SLA MPLS LSP ping or IP SLA MPLS LSP trace configuration mode. To return the output interface to the default, use the **no** form of this command.

```
output interface type interface-path-id
no output interface
```

Syntax Description	<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
	<i>interface-path-id</i>	Physical interface or virtual interface.
	Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.

Command Default No default behavior or values.

Command Modes

- IP SLA MPLS LSP ping configuration
- IP SLA MPLS LSP trace configuration
- IP SLA MPLS LSP monitor ping configuration
- IP SLA MPLS LSP monitor trace configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **output interface** command to help monitor path-to-target over the path if there are some ECMP routes in a topology.

You cannot use the **output interface** command if pseudowire is specified as the target to be used in an MPLS LSP ping operation.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **output interface** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
```

output interface

```
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls ls output interface pos 0/1/0/0
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
output nexthop, on page 157	Configures the next-hop address to be used for LSP ping or LSP trace operations.
schedule operation, on page 196	Schedules an IP SLA operation.
type mpls lsp ping, on page 269	Tests connectivity in an LSP path in an MPLS VPN.
type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

output nexthop

To specify the next-hop address to be used for a Label Switched Path (LSP) ping or LSP trace operations, use the **output nexthop** command in the appropriate configuration mode. To return the output next hop to the default, use the **no** form of this command.

```
output nexthop ip-address
no output nexthop
```

Syntax Description	<i>ip-address</i> IP address of the next hop.
Command Default	No default behavior or values
Command Modes	IP SLA MPLS LSP ping configuration IP SLA MPLS LSP trace configuration IP SLA MPLS LSP monitor ping configuration IP SLA MPLS LSP monitor trace configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines When LSP Path Discovery (LPD) is enabled, the next-hop IP address is also used to filter out the paths that are not associated with the specified next-hop address.

Note After you configure the output next hop, you must also configure the output interface.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **output nexthop** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp trace
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-trace)# output nexthop 10.1.1.1
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
output interface, on page 155	Configures the echo request output interface to be used for LSP ping or LSP trace operations.

type mpls lsp ping, on page 269	Tests connectivity in an LSP path in an MPLS VPN.
type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

packet count

To specify the number of packets that are to be transmitted during a probe, such as a sequence of packets being transmitted for a jitter probe, use the **packet count** command in the appropriate configuration mode. To use the default value, use the **no** form of this command.

packet count *count*
no packet count

Syntax Description	<i>count</i> Number of packets to be transmitted in each operation. Range for a UDP jitter operation is 1 to 60000. Range for an ICMP path-jitter operation is 1 to 100.
---------------------------	--

Command Default	The default packet count is 10.
------------------------	---------------------------------

Command Modes	IP SLA UDP jitter configuration IP SLA ICMP path-jitter configuration
----------------------	--

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--

Task ID	Task ID	Operations
	monitor	read, write

Examples The following example shows how to use the **packet count** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# packet count 30
```

Related Commands	Command	Description
	operation, on page 154	Configures an IP SLA operation.
	schedule operation, on page 196	Schedules an IP SLA operation.
	packet interval, on page 160	Specifies the interval between packets.

packet interval

To specify the interval between packets, use the **packet interval** command in the appropriate configuration mode. To use the default value, use the **no** form of this command.

packet interval *interval*
no packet interval

Syntax Description	<i>interval</i> Interpacket interval in milliseconds. Range is 1 to 60000 (in milliseconds).
---------------------------	--

Command Default	The default packet interval is 20 ms.
------------------------	---------------------------------------

Command Modes	IP SLA UDP jitter configuration IP SLA ICMP path-jitter configuration
----------------------	--

Command History	Release Modification
	Release 3.7.2 This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--

Task ID	Task ID Operations
	monitor read, write

Examples The following example shows how to use the **packet interval** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# packet interval 30
```

Related Commands	Command	Description

Task ID	Operations				
monitor	read, write				

Examples

The following example shows how to enter path discover submode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-ping)# path discover
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lpd)#
```

path discover echo

To configure MPLS LSP echo parameters, use the **path discover** command in the appropriate configuration mode. To use the default value, use the **no** form of this command.

```
path discover echo {interval time | maximum lsp selector ipv4 host address | multipath bitmap
size size | retry count | timeout value}
no path discover echo {interval time | maximum lsp selector ipv4 host address | multipath
bitmap size size | retry count | timeout value}
```

Syntax Description

interval <i>time</i>	Configures the interval (in milliseconds) between MPLS LSP echo requests sent during path discovery. Range is 0 to 3600000. Default is 0.
maximum lsp selector ipv4 <i>host-address</i>	Configures a local host IP address (127.x.x.x) that is the maximum selector value to be used during path discovery. Default is 127.255.255.255.
multipath bitmap size <i>size</i>	Configures the maximum number of selectors sent in the downstream mapping of an MPLS LSP echo request during path discovery. Range is 1 to 256. Default is 32.
retry <i>count</i>	Configures the number of timeout retry attempts for MPLS LSP echo requests sent during path discovery. Range is 0 to 10. Default is 3.
timeout <i>value</i>	Configures the timeout value (in seconds) for MPLS LSP echo requests sent during path discovery. Range is 1 to 3600. Default is 5.

Command Default

```
interval time: 0
maximum lsp selector ipv4 host address: 127.255.255.255
multipath bitmap size size : 32
retry count: 3
timeout value: 5
```

Command Modes

Path discover configuration
MPLS LSP ping configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

A retry occurs when either an echo reply was not received on time for an outstanding echo request, or when no selectors are found for a given path by a transit router.

When a selector value is configured in MPLSLM configuration mode, the maximum selector specified must be larger than that value. In such a scenario, the range of selectors used for path discovery is set by the two values.

When the **interval** *time* is zero, a new echo request is sent after the previous echo retry was received.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to configure the path discover echo interval:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-ping)# path discover
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-lpd)# echo interval 777
```

Related Commands

Command	Description
path discover path, on page 164	Configures MPLS LSP path parameters.
path discover scan, on page 166	Configures MPLS LSP scan parameters.
path discover session, on page 168	Configures MPLS LSP session parameters.

path discover path

To configure MPLS LSP path parameters, use the **path discover path** command in MPLS LSP monitor (MPLSLM) LPD configuration submode. To use the default value, use the **no** form of this command.

path discover path {**retry** *range* | **secondary frequency** {**both** | **connection-loss** | **timeout**} *value*}
no path-discover path

Syntax Description

retry <i>range</i>	Configures the number of attempts to be performed before declaring a path as down. Default is 1 (LSP group will not retry to perform the echo request if the previous attempt fails). Range is 1 to 16.
secondary frequency	Configures a secondary frequency to use after a failure condition (that is, a connection-loss or timeout) occurs.
both	Enable secondary frequency for a timeout and connection loss.
connection-loss	Enable secondary frequency for only a connection loss.
timeout	Enable secondary frequency for only a timeout.
<i>value</i>	Frequency value range is 1 to 604800.

Command Default

None

Command Modes

MPLSLM LPD configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

In the event of a path failure, the secondary frequency value is used instead of the normal frequency value. The normal frequency value is determined by a frequency value or schedule period value, and the LSP operations are scheduled to start periodically at this interval. By default, the secondary frequency value is disabled. When failure condition disappears, probing resumes at the regular frequency.

Note The **secondary** command works in tandem with the **retry** keyword. Both must be configured.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to configure MPLS LSP path parameters:

```

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplsmlm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplsmlm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplsmlm-lsp-ping)# path discover
RP/0/RSP0/CPU0:router(config-ipsla-mplsmlm-lsp-lpd)# path retry 12
RP/0/RSP0/CPU0:router(config-ipsla-mplsmlm-lsp-lpd)# path secondary frequency both 10

```

Related Commands

Command	Description
path discover echo, on page 162	Configures MPLS LSP echo parameters.
path discover scan, on page 166	Configures MPLS LSP scan parameters.
path discover session, on page 168	Configures MPLS LSP session parameters.

path discover scan

To configure MPLS LSP scan parameters, use the **path discover scan** command in MPLS LSP monitor (MPLSLM) LPD configuration submode. To use the default value, use the **no** form of this command.

path discover scan period *value*
no path discover scan period *value*

Syntax Description	period <i>value</i>	Configures the time (in minutes) between consecutive cycles of path discovery requests per MPLSLM instance. Range is 0 to 7200. Default is 5.
Command Default	period <i>value</i> : 5	
Command Modes	MPLSLM LPD configuration submode	
Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

MPLSLM instances periodically trigger path discovery requests for LSP groups. At certain intervals, an MPLSLM instance begins triggering path discovery requests for each group in ascending order (determined by group ID). By default, the path discovery requests are triggered sequentially, although some concurrency may occur if the session limit value is greater than 1. The cycle concludes when the last LSP group finishes path discovery.

If the duration of the discovery cycle is larger than the scan period, a new cycle starts as soon as the previous one completes.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to configure the path discovery scan period value:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-ping)# path discover
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-lpd)# scan period 2
```

Related Commands	Command	Description
	path discover echo, on page 162	Configures MPLS LSP echo parameters.

Command	Description
path discover path, on page 164	Configures MPLS LSP path parameters.
path discover session, on page 168	Configures MPLS LSP session parameters.

path discover session

To configure MPLS LSP session parameters, use the **path discover session** command in MPLS LSP monitor (MPLSLM) LPD configuration submode. To use the default value, use the **no** form of this command.

```
path discover session {limit value | timeout value}
no path discover session {limit value | timeout value}
```

Syntax Description

limit <i>value</i>	Configures the number of concurrent active path discovery requests the MPLSLM instance submits to the LSPV server. Range is 1 to 15. Default is 1.
timeout <i>value</i>	Configures the time (in seconds) the MPLSLM instance will wait for the result of a path discovery request submitted to the LSPV server. Range is 1 to 900. Default is 120.

Command Default

```
limit value : 1
timeout value : 120
```

Command Modes

MPLSLM LPD configuration submode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

An MPLSLM instance considers the path discovery as a failure when it receives no response within the configured timeout configuration value.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to configure the path discovery session timeout value:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-ping)# path discover
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-lpd)# session timeout 22
```

react

To specify an element to be monitored for a reaction, use the **react** command in the appropriate configuration mode. To remove the specified reaction type, use the **no** form of this command.

```
react {connection-loss | jitter-average [{dest-to-source | source-to-dest}] | packet-loss {dest-to-source
| source-to-dest} | rtt | timeout | verify-error}
no react {connection-loss | jitter-average [{dest-to-source | source-to-dest}] | packet-loss {dest-to-source
| source-to-dest} | rtt | timeout | verify-error}
```

Syntax Description

connection-loss	Specifies that a reaction occurs if there is a connection-loss for the monitored operation.
jitter-average [dest-to-source source-to-dest]	Specifies that a reaction occurs if the average round-trip jitter value violates the upper threshold or lower threshold. The following options are listed for the jitter-average keyword: <ul style="list-style-type: none"> • dest-to-source—(Optional) Specifies the jitter average destination to source (DS). • source-to-dest—(Optional) Specifies the jitter average source to destination (SD).
packet-loss { dest-to-source source-to-dest }	Specifies the reaction on packet loss value violation. The following options are listed for the packet-loss keyword: <ul style="list-style-type: none"> • dest-to-source—(Optional) Specifies the packet loss destination to source (DS) violation. • source-to-dest—(Optional) Specifies the packet loss source to destination (SD) violation.
rtt	Specifies that a reaction occurs if the round-trip value violates the upper threshold or lower threshold.
timeout	Specifies that a reaction occurs if there is a timeout for the monitored operation.
verify-error	Specifies that a reaction occurs if there is an error verification violation.

Command Default

If there is no default value, no reaction is configured.

Command Modes

IP SLA reaction configuration
IP SLA MPLS LSP monitor reaction configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

For the **connection-loss** keyword, **jitter-average** keyword, and **rtt** keyword, the reaction does not occur when the value violates the upper or the lower threshold. The reaction condition is set when the upper threshold is passed, and it is cleared when values go below the lower threshold.

For the **connection-loss** keyword and **verify-error** keyword, thresholds do not apply to the monitored element.

For the **jitter-average** keyword, **packet-loss** keyword, and **rtt** keyword, if the upper threshold for react threshold type average 3 is configured as 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average is $6000 + 6000 + 5000 = 17000 / 3 = 5667$ —therefore violating the 5000-ms upper threshold. The threshold type average must be configured when setting the type. These keywords are not available if connection-loss, timeout, or verify-error is specified as the monitored element, because upper and lower thresholds do not apply to these options.

In IP SLA MPLS LSP monitor reaction configuration mode, only the **connection-loss** and **timeout** keywords are available. If the **react** command is used in IP SLA MPLS LSP monitor reaction configuration mode, it configures all operations associated with the monitored provider edge (PE) routers. The configuration is inherited by all LSP operations that are created automatically by the PE discovery.

This table lists the Supported Reaction Configuration, by IP SLA Operation.

Table 14: Supported Reaction Configuration, by IP SLA Operation

Operation	ICMP Echo	Path Echo	UDP Jitter	UDP Echo	ICMP Path Jitter	MPLS LSP Ping	MPLS LSP Trace
Failure	--	--	--	--	--	--	--

Examples

The following example shows how to use the **react** command with the **connection-loss** keyword:

```
RP/0/RSP0/CPU0:router# configure
```

```
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react connection-loss
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)#
```

The following example shows how to use the **react** command with the **jitter-average** keyword:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react jitter-average
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)#
```

The following example shows how to use the **react** command with the **packet-loss** keyword:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react packet-loss dest-to-source
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)#
```

The following example shows how to use the **react** command with the **rtt** keyword:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react rtt
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)#
```

The following example shows how to use the **react** command with the **timeout** keyword:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react timeout
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)#
```

The following example shows how to use the **react** command with the **verify-error** keyword:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react verify-error
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)#
```

Related Commands

Command	Description

threshold type xofy, on page 258	Takes action upon X violations in Y probe operations.

react lpd

To specify that a reaction should occur if there is an LSP Path Discovery (LPD) violation, use the **react lpd** command in the appropriate configuration mode. To use the default value, use the **no** form of this command.

```
react lpd {lpd-group | tree-trace} action logging
no react lpd {lpd-group | tree-trace}
```

Syntax Description

lpd-group	Specifies that a reaction should occur if there is a status violation for the monitored LPD group.
tree-trace	Specifies that a reaction should occur if there is a path discovery violation for the monitored LPD group.
action	Configures the action to be taken on threshold violation.
logging	Specifies the generation of a syslog alarm on threshold violation.

Command Default

None

Command Modes

IP SLA MPLS LSP monitor configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

A status violation for a monitored LPD group happens when the Label Switched Path (LSP) group status changes (with the exception of the status change from the initial state).

A path discovery violation for the monitored LPD group happens when path discovery to the target PE fails, or successful path discovery clears such a failure condition.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to specify that a reaction should occur if there is a status violation for the monitored LPD group:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplsml)# reaction monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplsml-react)# react lpd lpd-group action logging
```

reaction monitor

To configure MPLS label switched path (LSP) monitoring reactions, use the **reaction monitor** command in IP SLA MPLS LSP monitor configuration mode. To remove the reaction so that no reaction occurs, use the **no** form of this command.

```
reaction monitor monitor-id
no reaction monitor [monitor-id]
```

Syntax Description	<i>monitor-id</i> Number of the IP SLA MPLS LSP monitor instance for the reactions to be configured. Range is 1 to 2048.
---------------------------	--

Command Default	No reaction is configured.
------------------------	----------------------------

Command Modes	IP SLA MPLS LSP monitor configuration
----------------------	---------------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The reaction monitor command enters IP SLA LSP monitor reaction configuration mode so that you can set the desired threshold and action in the event of a connection loss or timeout.
-------------------------	--

To remove all reactions, use the **no reaction monitor** command with no *monitor-id* argument.

The **reaction monitor** command configures reactions for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.

Task ID	Task	Operations
	monitor ID	read, write

Examples	The following example shows how to use the reaction operation command:
-----------------	---

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router (config)# ipsla
RP/0/RSP0/CPU0:router (config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router (config-ipsla-mplslm)# reaction monitor 1
RP/0/RSP0/CPU0:router (config-ipsla-mplslm-react)#
```

Related Commands	Command	Description
	action (IP SLA), on page 108	Specifies what action or combination of actions the operation performs when you configure the react command or when threshold events occur.

RP/0/RSP0/CPU0:router(config-ipsla-react)#
```

Related Commands	Command	Description
	operation, on page 154	Configures an IP SLA operation.
	schedule operation, on page 196	Schedules an IP SLA operation.

reaction trigger

To define a second IP SLA operation to make the transition from a pending state to an active state when one of the trigger-type options is defined with the **reaction operation** command, use the **reaction trigger** command in IP SLA configuration mode. To remove the reaction trigger when the *triggering-operation* argument does not trigger any other operation, use the **no** form of this command.

```
reaction trigger triggering-operation triggered-operation
no reaction trigger triggering-operation triggered-operation
```

Syntax Description

triggering-operation Operation that contains a configured action-type trigger and can generate reaction events. Range is 1 to 2048.

triggered-operation Operation that is started when the *triggering-operation* argument generates a trigger reaction event. Range is 1 to 2048.

Command Default

No triggered operation is configured.

Command Modes

IP SLA configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Both the *triggering-operation* and *triggered-operation* arguments must be configured. The triggered operation must be in the pending state.

responder

To enable the IP SLA responder for UDP echo or jitter operations, use the **responder** command in IP SLA configuration mode. To disable the responder, use the **no** form of this command.

responder
no responder

Syntax Description This command has no keywords or arguments.

Command Default The IP SLA **responder** command is disabled.

Command Modes IP SLA configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines An IP address and port are configured and identified as a permanent port (for example, a port to which the responder is permanently listening). If no IP address and port are configured, the responder handles only dynamic ports (for example, ports that are listened to when requested by a remote operation).

Task ID	Task	Operations
	monitor	read, write

Examples The following example shows how to enable the IP SLA responder:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# responder
RP/0/RSP0/CPU0:router(config-ipsla-resp)#
```

type udp ipv4 address, on page 275	Configures a permanent port in the IP SLA Responder for UDP echo or jitter operations.

recurring

To indicate that the operation starts automatically at the specified time and for the specified duration every day, use the **recurring** command in IP SLA schedule configuration mode. To not start the operation everyday, use the **no** form of this command.

recurring
no recurring

Syntax Description This command has no keywords or arguments.

Command Default Recurring is disabled.

Command Modes IP SLA schedule configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task	Operations
	monitor	read, write

Examples The following example shows how to use the **recurring** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# schedule operation 1
RP/0/RSP0/CPU0:router(config-ipsla-sched)# recurring
```

Related Commands	Command	Description
	operation, on page 154	Configures an IP SLA operation.
	schedule operation, on page 196	Schedules an IP SLA operation.

reply dscp

To specify the differentiated services codepoint (DSCP) value used in echo reply packets, use the **reply dscp** command in the appropriate configuration mode. To return to the default value, use the **no** form of this command.

reply dscp *dscp-bits*
no reply dscp

Syntax Description	<i>dscp-bits</i> Differentiated services codepoint (DSCP) value for an echo reply packet. Valid values are from 0 to 63. Reserved keywords such as EF (expedited forwarding) and AF11 (assured forwarding class AF11) can be specified instead of numeric values.
---------------------------	--

Command Default	No default behavior or values
------------------------	-------------------------------

Command Modes	IP SLA MPLS LSP ping configuration IP SLA MPLS LSP trace configuration IP SLA MPLS LSP monitor ping configuration IP SLA MPLS LSP monitor trace configuration
----------------------	--

Command History	Release Modification
	Release 3.7.2 This command was introduced.

Usage Guidelines	Use the reply dscp command to set the DSCP value used in the headers of IPv4 UDP packets sent as echo replies in an MPLS LSP ping or MPLS LSP trace operation.
-------------------------	---

The DSCP value consists of the six most significant bits of the 1-byte IP type of service (ToS) field. These bits determine the quality-of-service (QoS) treatment (per-hop behavior) that a transit LSR node gives to an echo reply packet. For information about how packets are classified and processed depending on the value you assign to the 6-bit DSCP field, refer to “The Differentiated Services Model (DiffServ)” at the following URL:

http://www.cisco.com/en/US/products/ps6610/products_data_sheet09186a00800a3e30.html

If the **reply dscp** command is used in IP SLA operation mode, it acts on the headers of echo replies for the specific operation being configured. If the **reply dscp** command is used in IP SLA MPLS LSP monitor mode, it acts on the headers of echo replies for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.

Task ID	Task ID Operations
	monitor read, write

Examples

The following example shows how to use the **reply dscp** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-ping)# reply dscp 5
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.
type mpls lsp ping, on page 269	Tests connectivity in an LSP path in an MPLS VPN.
type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

reply mode

To specify how to reply to echo requests, use the **reply mode** command in the appropriate configuration mode. To return to the default value, use the **no** form of this command.

reply mode {**control-channel** | **router-alert**}
no reply mode

Syntax Description

control-channel Sets echo requests to reply by way of a control channel.

Note This option is available only in IP SLA MPLS LSP ping configuration mode.

router-alert Sets echo requests to reply as an IPv4 UDP packet with IP router alert.

Command Default

The default reply mode for an echo request packet is an IPv4 UDP packet without IP router alert set.

Command Modes

IP SLA MPLS LSP ping configuration
 IP SLA MPLS LSP trace configuration
 IP SLA MPLS LSP monitor ping configuration
 IP SLA MPLS LSP monitor trace configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **reply mode** command with the **control-channel** keyword to send echo reply packets by way of a control channel in an MPLS LSP ping operation. If the target is not set to pseudowire, the configuration of the **control-channel** keyword is rejected. Refer to the **target pseudowire** command for information about setting the target.

Use the **reply mode** command with the **router-alert** keyword to set the reply mode of echo reply packets in an MPLS LSP ping or MPLS LSP trace operation. After you enter this command, echo reply packets are set to reply as an IPv4 UDP packet with the IP router alert option in the UDP packet header.

If the **reply mode** command is used in IP SLA operation mode, it sets the reply mode of echo reply packets for the specific operation being configured. If the **reply mode** command is used in IP SLA MPLS LSP monitor mode, it sets the reply mode of echo reply packets for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.

The router-alert reply mode forces an echo reply packet to be specially handled by the transit LSR router at each intermediate hop as it moves back to the destination. Because this reply mode is more expensive, it is recommended only if the headend router does not receive echo replies using the default reply mode.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **reply mode** command with the **router-alert** keyword:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp trace
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-trace)# reply mode router-alert
```

The following example shows how to use the **reply mode** command with the **control-channel** keyword:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-ping)# target pseudowire 192.168.1.4 4211
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-ping)# reply mode control-channel
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.

responder twamp

To configure the TWAMP responder, use the **responder twamp** command in the appropriate mode. To remove the set configuration, use the **no** form of the command.

```
responder twamp [ timeout value ]
no responder twamp [ timeout value ]
```

Syntax Description

timeout *value* Inactivity timeout period (in seconds). Range is 1 to 604800.

Command Default

Default timeout is 900 seconds.

Command Modes

IPSLA configuration mode

Command History

Release	Modification
Release 5.1.1	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operation
monitor	read, write

Example

This example shows how to run the **responder twamp** command:

```
RP/0/RSP0/CPU0:router (config-ipsla) # responder twamp timeout 100
```

responder twamp-light

To configure the TWAMP-light responder, use the **responder twamp-light** command in the **ipsla** configuration mode.

```
responder twamp-light test-session test-session-id [ local-ip { local-ip-address | any { ipv4 | ipv6 } } local-port local-port-number remote-ip { remote-ip-address | any { ipv4 | ipv6 } } remote-port { remote-port-number | any } vrf { vrf-name | any | default } | timeout timeout-value ]
```

Syntax Description

test-session <i>test-session-id</i>	Configure TWAMP-light test-session id. Range: 1 - 65535
local-ip { <i>local-ip-address</i> any { ipv4 ipv6 } }	Configure the local ip-address or allow any local IPv4 or IPv6 address
local-port <i>local-port-number</i>	Configure the local UDP port number. Range: 1 - 65535
remote-ip { <i>remote-ip-address</i> any { ipv4 ipv6 } }	Configure the remote client's ip-address or allow connection from any remote IPv4 or IPv6 address
remote-port { <i>remote-port-number</i> any }	Configure the UDP port number of the remote client or allow connection from any remote port. Range: 1 - 65535
vrf { <i>vrf-name</i> any default }	Configure vrf for the local ip-address. Possible values for vrf: <ul style="list-style-type: none"> <i>vrf-name</i> of the vrf of the local ip-address any: use this only when local-ip is configured as any default: use this when the local ip-address belongs to default vrf
timeout <i>timeout-value</i>	Configure the inactivity timeout period (in seconds) For TWAMP-light, the range is 60 - 86400

Command Default

Default timeout is 900 seconds.

Command Modes

IPSLA configuration mode

Command History

Release	Modification
Release 7.4.1	The any option was included for local-ip, remote-ip, remote-port and vrf .

Release	Modification
6.6.1	This command was introduced.

Usage Guidelines

- Caution must be taken by the administrator when using **any** option as this configuration opens up the specified **local-port** for packets from any IP address.
- Configure **vrf** as **any** only when you configure **local-ip** as **any**.
- Configure **vrf** with a valid vrf value, when you configure **local-ip** with a valid IPv4/IPv6 address.

Task ID

Task ID	Operation
monitor	read, write

Example

This example shows how to configure the twamp-light responder:

```
Router# configure
Router(config)# ipsla
Router(config-ipsla)# responder twamp-light test-session 1 local-ip 192.0.2.10 local-port
13001 remote-ip 192.0.2.186 remote-port 13002 vrf default
Router(config-ipsla)# responder twamp-light test-session 1 timeout 60
Router(config-ipsla)# commit
```

samples

To set the number of hop entries that are kept in the history table for an IP SLA ICMP path-echo operation, use the **samples** command in IP SLA operation ICMP path-echo history configuration mode. To use the default value, use the **no** form of this command.

```
samples sample-count
no samples
```

Syntax Description	<i>sample-count</i> Number of history samples that are kept in the history table for an IP SLA ICMP path-echo operation. Range is 1 to 30.				
Command Default	The default value is 16.				
Command Modes	IP SLA operation ICMP path-echo history configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	The samples command is supported only when you configure an IP SLA ICMP path-echo operation.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>monitor</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	monitor	read, write
Task ID	Operations				
monitor	read, write				

Examples

The following example shows how to use the **samples** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type icmp path-echo
RP/0/RSP0/CPU0:router(config-ipsla-icmp-path-echo)# history
RP/0/RSP0/CPU0:router(config-ipsla-op-hist)# samples 30
```

Related Commands	Command	Description
	buckets (history), on page 111	Sets the number of history buckets that are kept during the lifetime of the IP SLA operation.
	filter (IP SLA), on page 127	Defines the type of information that are kept in the history table for the IP SLA operation.
	history, on page 133	Configures the history parameters for the IP SLA operation.
	operation, on page 154	Configures an IP SLA operation.

Command	Description
schedule operation, on page 196	Schedules an IP SLA operation.

scan delete-factor

To specify the frequency with which the MPLS LSP monitor (MPLSLM) instance searches for provider edge (PE) routers to delete, use the **scan delete-factor** command in the appropriate configuration mode. To return to the default value, use the **no** form of this command.

scan delete-factor *factor-value*
no scan delete-factor

Syntax Description	<i>factor-value</i> Specifies a factor that is multiplied by the scan interval to determine the frequency at which the MPLS LSP monitor instance deletes the provider edge (PE) routers that are no longer valid. Range is 0 to 2147483647.
---------------------------	---

Command Default	<i>factor-value</i> : 1
------------------------	-------------------------

Command Modes	IP SLA MPLS LSP monitor ping configuration IP SLA MPLS LSP monitor trace configuration
----------------------	---

Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

Usage Guidelines	The scan delete-factor command specifies a factor value for automatic PE deletion. The specified <i>factor-value</i> is multiplied by the scan interval to acquire the frequency at which the MPLS LSP monitoring instance deletes not-found PEs. A scan delete factor of zero (0) means that provider edge (PE) routers that are no longer valid are never removed.
-------------------------	---

Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>monitor</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	monitor	read, write
Task ID	Operations				
monitor	read, write				

Examples	The following example shows how to use the scan delete-factor command:
-----------------	---

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-ping)# scan delete-factor 214
```

Related Commands	<table border="1"> <thead> <tr> <th>Command</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>monitor, on page 151</td> <td>Configures an IP SLA MPLS LSP monitor instance.</td> </tr> </tbody> </table>	Command	Description	monitor, on page 151	Configures an IP SLA MPLS LSP monitor instance.
Command	Description				
monitor, on page 151	Configures an IP SLA MPLS LSP monitor instance.				

Command	Description
scan interval, on page 193	Specifies the frequency at which the MPLSLM instance checks the scan queue for updates.
type mpls lsp ping, on page 269	Tests connectivity in an LSP path in an MPLS VPN.
type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

scan interval

To specify the frequency at which the MPLS LSP monitor (MPLSLM) instance checks the scan queue for updates, use the **scan interval** command in the appropriate configuration mode. To return to the default value, use the **no** form of this command.

```
scan interval scan-interval
no scan interval
```

Syntax Description	<i>scan-interval</i> Time interval between provider edge (PE) router updates. Range is 1 to 70560.
---------------------------	--

Command Default	<i>interval</i> : 240 minutes
------------------------	-------------------------------

Command Modes	IP SLA MPLS LSP monitor ping configuration IP SLA MPLS LSP monitor trace configuration
----------------------	---

Command History	Release Modification
	Release 3.7.2 This command was introduced.

Usage Guidelines	Use the scan interval command to specify a frequency value in minutes at which the MPLS LSP monitoring instance checks the scan queue for PE updates. Updates from PE discovery are not processed immediately, but rather stored in a scan queue for batched processing at periodic intervals, specified by this value.
-------------------------	--

Task ID	Task ID Operations
	monitor read, write

Examples	The following example shows how to use the scan command:
-----------------	---

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-ping)# scan interval 120
```

Related Commands	Command	Description
	operation , on page 154	Configures an IP SLA operation.
	scan delete-factor , on page 191	Specifies the frequency with which the MPLSLM instance searches for PE routers to delete.

Command	Description
schedule operation, on page 196	Schedules an IP SLA operation.
type mpls lsp ping, on page 269	Tests connectivity in an LSP path in an MPLS VPN.
type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

schedule monitor

To schedule MPLS LSP monitoring instances, use the **schedule monitor** command in IP SLA LSP monitor configuration mode. To unschedule the monitoring instances, use the **no** form of this command.

```
schedule monitor monitor-id
no schedule monitor [monitor-id]
```

Syntax Description	<i>monitor-id</i> Number of the monitoring instance to schedule. Range is 1 to 2048.
---------------------------	--

Command Default	No schedule is configured.
------------------------	----------------------------

Command Modes	IP SLA MPLS LSP monitor configuration
----------------------	---------------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The schedule monitor command enters IP SLA MPLS LSP monitor schedule configuration mode so that you can set the desired schedule parameters for the MPLS LSP monitor instance. This schedules the running of all operations created for the specified monitor instance.
-------------------------	--

To remove all configured schedulers, use the **no schedule monitor** command with no *monitor-id* argument.

Task ID	Task ID	Operations
	monitor	read, write

Examples	The following example shows how to access and use the schedule monitor command:
-----------------	--

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# schedule monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-sched)#
```

Related Commands	Command	Description
	frequency (IP SLA), on page 131	Configures the frequency interval during which LSP groups and operations are scheduled to start.
	schedule period, on page 198	Configures the amount of time during which all LSP operations are scheduled to start or run.
	start-time , on page 238	Determines the time when an operation starts.

schedule operation

To enter schedule configuration mode, use the **schedule operation** command in IP SLA configuration mode. To remove the scheduler, use the **no** form of this command.

schedule operation *operation-number*
no schedule operation *operation-number*

Syntax Description

operation-number Configuration number or schedule number that is used to schedule an IP SLA operation. Range is 1 to 2048.

Command Default

None

Command Modes

IP SLA configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **schedule operation** command enters the IP SLA schedule configuration mode. You can configure more schedule configuration parameters to schedule the operation. When an operation is scheduled, it continues collecting information until the configured life expires.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to use the **ipsla schedule operation** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# schedule operation 1
RP/0/RSP0/CPU0:router(config-ipsla-sched)#
```

Related Commands

Command	Description
ageout, on page 110	Specifies the number of seconds to keep the operation in memory when it is not actively collecting information.
operation, on page 154	Configures an IP SLA operation.
life, on page 140	Specifies the length of time to execute.
recurring, on page 181	Indicates that the operation starts automatically at the specified time and for the specified duration every day.

Command	Description
start-time , on page 238	Determines the time when the operation starts.

schedule period

To configure the amount of time during which all LSP operations are scheduled to start or run, use the **schedule period** command in IP SLA MPLS LSP monitor schedule configuration mode. To remove the scheduler, use the **no** form of this command.

schedule period *seconds*
no schedule period

Syntax Description	<i>seconds</i> Amount of time in seconds for which label switched path (LSP) operations are scheduled to run. Range is 1 to 604800.
---------------------------	---

Command Default	None
------------------------	------

Command Modes	IP SLA MPLS LSP monitor schedule configuration
----------------------	--

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the schedule period command to specify the amount of time in seconds during which all LSP operations are scheduled to start running. All LSP operations are scheduled equally spaced throughout the schedule period.
-------------------------	---

For example, if the schedule period is 600 seconds and there are 60 operations to be scheduled, they are scheduled at 10-second intervals.

Use the **frequency** command to specify how often the entire set of operations is performed. The frequency value must be greater than or equal to the schedule period.

You must configure the schedule period before you can start MPLS LSP monitoring. Start MPLS LSP monitoring using the **start-time** command.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **schedule period** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplsml)# schedule monitor 20
RP/0/RSP0/CPU0:router(config-ipsla-mplsml-sched)# schedule period 6000
```

Related Commands

```

show ipsla application

To display the information for the IP SLA application, use the **show ipsla application** command in EXEC mode.

show ipsla application

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	monitor	read

Examples

The following sample output is from the **show ipsla application** command:

```
RP/0/RSP0/CPU0:router# show ipsla application
```

```
Estimated system max number of entries: 2048
Number of Entries configured: 1
Number of active Entries      : 0
Number of pending Entries     : 0
Number of inactive Entries    : 1
```

```
Supported Operation Types: 7
```

```
    Type of Operation: ICMP ECHO
    Type of Operation: ICMP PATH JITTER
    Type of Operation: ICMP PATH ECHO
    Type of Operation: UDP JITTER
    Type of Operation: UDP ECHO
    Type of Operation: MPLS LSP PING
    Type of Operation: MPLS LSP TRACE
```

```
Number of configurable probes : 2047
SA Agent low memory water mark: 20480 (KB)
```

This table describes the significant fields shown in the display.

Table 15: show ipsla application Field Descriptions

Field	Description
Estimated system max number of entries	Maximum number of operations that are configured in the system. The low-memory configured parameter and the available memory in the system are given.
Number of Entries configured	Total number of entries that are configured, such as active state, pending state, and inactive state.
Number of active Entries	Number of entries that are in the active state. The active entries are scheduled and have already started a life period.
Number of pending Entries	Number of entries that are in pending state. The pending entries have a start-time scheduled in the future. These entries either have not started the first life, or the entries are configured as recurring and completed one of its life.
Number of inactive Entries	Number of entries that are in the inactive state. The inactive entries do not have a start-time scheduled. Either the start-time has never been scheduled or life has expired. In addition, the entries are not configured as recurring.
Supported Operation Types	Types of operations that are supported by the system.
Number of configurable probes	Number of remaining entries that can be configured. The number is just an estimated value and it may vary over time according to the available resources.
SA Agent low memory water mark	Available memory for the minimum system below which the IP SLA feature does not configure any more operations.

Related Commands

Command	Description
low-memory, on page 143	Configures a low-water memory mark.
operation, on page 154	Configures an IP SLA operation.

show ipsla history

To display the history collected for all IP SLA operations or for a specified operation, use the **show ipsla history** command in EXEC mode.

```
show ipsla history [operation-number]
```

Syntax Description	<i>operation-number</i> (Optional) Number of the IP SLA operation.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines By default, history statistics are not collected. To have any data displayed by using the **show ipsla history** command, you must configure the history collection.

This table lists the response return values that are used in the **show ipsla history** command.

Table 16: Response Return Values for the show ipsla history Command

Code	Description
1	Okay
2	Disconnected
3	Over Threshold
4	Timeout
5	Busy
6	Not Connected
7	Dropped
8	Sequence Error
9	Verify Error
10	Application Specific

If the default tabular format is used, the response return description is displayed as code in the Sense column. The Sense field is always used as a return code.

show ipsla history

Task ID	Task ID	Operations
	monitor	read

Examples

The following sample output is from the **show ipsla history** command:

```
RP/0/RSP0/CPU0:router# show ipsla history 1

Point by point History
Multiple Lines per Entry
Line 1:

```

This table describes the significant fields shown in the display.

Table 17: show ipsla history Field Descriptions

Field	Description
Entry number	Entry number.
LifeI	Life index.
BucketI	Bucket index.
SampleI	Sample index.
SampleT	Sample start time.
CompT	Completion time in milliseconds.
Sense	Response return code.
TargetAddr	IP address of intermediate hop device or destination device.

Related Commands

Command	Description
show ipsla statistics aggregated, on page 219	Displays the statistical errors for all the IP SLA operations or for a specified operation.

show ipsla mpls discovery vpn

To display routing information relating to the BGP next-hop discovery database in the MPLS VPN network, use the **show ipsla mpls discovery vpn** command in EXEC mode.

show ipsla mpls discovery vpn

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values

Command Modes EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID

Task ID	Operations
monitor	read

Examples

The following sample output is from the **show ipsla mpls discovery vpn** command:

```
RP/0/RSP0/CPU0:router# show ipsla mpls discovery vpn

Next refresh after: 46 seconds

BGP next hop      Prefix                VRF                PfxCount
192.255.0.4       192.255.0.4/32       red                10
                  blue                  5
                  green                 7
192.255.0.5       192.255.0.5/32       red                5
                  green                 3
192.254.1.6       192.254.1.0/24       yellow             4
```

This table describes the significant fields shown in the display.

Table 18: show ipsla mpls discovery vpn Field Descriptions

Field	Description
BGP next hop	Identifier for the BGP next-hop neighbor.
Prefix	IPv4 Forward Equivalence Class (FEC) of the BGP next-hop neighbor to be used by the MPLS LSP ping or trace operation.

Field	Description
VRF	Names of the virtual routing and forwarding instances (VRFs) that contain routing entries for the specified BGP next-hop neighbor.
PfxCount	Count of the routing entries that participate in the VRF for the specified BGP next-hop neighbor.

show ipsla mpls lsp-monitor lpd

To display LSP Path Discovery (LPD) operational status, use the **show ipsla mpls lsp-monitor lpd** command in EXEC mode.

show ipsla mpls lsp-monitor lpd {**statistics** [{*group-ID* | **aggregated** *group-ID*}] | **summary** *group*}

statistics <i>group-ID</i>	Displays statistics for the specified LPD group, including the latest LPD start time, return code, completion time, and paths.
aggregated <i>group-ID</i>	Displays the aggregated statistics of the LPD group.
summary <i>group-ID</i>	Displays the current LPD operational status, which includes LPD start time, return code, completion time, and all ECMP path information.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines For the aggregated group ID, a maximum of two buckets are allowed.

Task ID	Task ID	Operations
	monitor	read

Examples

The following sample output is from the **show ipsla mpls lsp-monitor lpd statistics** command:

```
RP/0/RSP0/CPU0:router# show ipsla mpls lsp-monitor lpd statistics 10001

Group ID: 100001
Latest path discovery start time           : 00:41:01.129 UTC Sat Dec 10 2005
Latest path discovery return code          : OK
Latest path discovery completion time (ms): 3450
Completion Time Values:
  NumOfCompT: 1      CompTMin: 3450      CompTMax : 3450      CompTAvg: 3450
Number of Paths Values:
  NumOfPaths: 10    MinNumOfPaths: 10    MaxNumOfPaths: 10
```

This table describes the significant fields shown in the display.

Table 19: show ipsla mpls lsp-monitor lpd statistics Field Descriptions

Field	Description
Group ID	LPD group ID number.
Latest path discovery start time	LPD start time.
Latest path discovery return code	LPD return code.
Latest path discovery completion time	LPD completion time.
Completion Time Values	Completion time values, consisting of Number of Completion Time samples and Minimum Completion Time.
Number of Paths Values	Number of paths values, consisting of Minimum number of paths and Maximum number of paths.

show ipsla mpls lsp-monitor scan-queue

To display information about BGP next-hop addresses that are waiting to be added to or deleted from the MPLS label switched path (LSP) monitor instance, use the **show ipsla mpls lsp-monitor scan-queue** command in EXEC mode.

```
show ipsla mpls lsp-monitor scan-queue [monitor-id]
```

Syntax Description	<i>monitor-id</i> (Optional) Number of the IP SLA MPLS LSP monitor instance.				
Command Default	None				
Command Modes	EXEC mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	If the <i>monitor-id</i> argument is not specified, the scan-queue is displayed for all MPLS LSP monitor instances.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>monitor</td> <td>read</td> </tr> </tbody> </table>	Task ID	Operations	monitor	read
Task ID	Operations				
monitor	read				

Examples

The following sample output is from the **show ipsla mpls lsp-monitor scan-queue** command:

```
RP/0/RSP0/CPU0:router# show ipsla mpls lsp-monitor scan-queue 1

IPSLA MPLS LSP Monitor : 1

  Next scan Time after      : 23 seconds
  Next Delete scan Time after: 83 seconds

BGP Next hop   Prefix           Add/Delete?
192.255.0.2    192.255.0.2/32    Add
192.255.0.3    192.255.0.5/32    Delete
```

This table describes the significant fields shown in the display.

Table 20: show ipsla responder statistics port Field Descriptions

Field	Description
IPSLA MPLS LSP Monitor	Monitor identifier.
Next scan Time after	Amount of time before the MPLS LSP monitor instance checks the scan queue for adding BGP next-hop neighbors. At the start of each scan time, IP SLA operations are created for all newly discovered neighbors.

Field	Description
Next delete Time after	Amount of time left before the MPLS LSP monitor instance checks the scan queue for deleting BGP next-hop neighbors. At the start of each delete scan time, IP SLAs operations are deleted for neighbors that are no longer valid.
BGP next hop	Identifier for the BGP next-hop neighbor.
Prefix	IPv4 Forward Equivalence Class (FEC) of the BGP next-hop neighbor to be used.
Add/Delete	Indicates that the specified BGP next-hop neighbor will be added or removed.

show ipsla mpls lsp-monitor summary

To display the list of operations that have been created automatically by the specified MPLS LSP monitor (MPLSLM) instance, use the **show ipsla mpls lsp-monitor summary** command in EXEC mode.

```
show ipsla mpls lsp-monitor summary [monitor-id [group [group id]]]
```

Syntax Description	<i>monitor-id</i>	(Optional) Displays a list of LSP group, ping, and trace operations created automatically by the specified MPLSLM instance.
	group <i>group-id</i>	(Optional) Displays the ECMP LSPs found through ECMP path discovery within the specified LSP group.
Command Default	None	
Command Modes	EXEC mode	
Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

The **show ipsla mpls lsp-monitor summary** command shows the list of LSP operations that were created automatically by the specified MPLS LSP monitor instance. It also shows the current status and the latest operation time of each operation.

If the *monitor-id* argument is not specified, the list of operations is displayed for all MPLS LSP monitor instances.

The **show ipsla mpls lsp-monitor summary** command with the **group** option shows the list of ECMP paths that are found automatically by the specified LSP path discovery (LPD). In addition, this command with option shows the current status; the number of successes, failures; the most recent round trip time (RTT); and the latest operation time of each path.

If the *group-id* argument is not specified, the list of paths is displayed for all operations created by the MPLS LSP monitor instance.

Task ID	Task ID	Operations
	monitor	read

Examples

The following sample output is from the **show ipsla mpls lsp-monitor summary** command. This output shows a pending status when an MPLS LSP ping operation is waiting to receive the timeout response from the LSP Verification (LSPV) process.

```
RP/0/RSP0/CPU0:router# show ipsla mpls lsp-monitor summary 1

MonID Op/GrpID TargetAddress      Status Latest Operation Time
1      100001    192.255.0.4/32      up      19:33:37.915 EST Mon Feb 28 2005
```

show ipsla mpls lsp-monitor summary

```

1      100002  192.255.0.5/32    down    19:33:47.915 EST Mon Feb 28 2005
1      100003  192.255.0.6/32    pending 19:33:35.915 EST Mon Feb 28 2005

```

The following sample output shows that a down status is displayed after a timeout response is received.

```
RP/0/RSP0/CPU0:router# show ipsla mpls lsp-monitor summary 1
```

```

MonID  Op/GrpID  TargetAddress      Status  Latest Operation Time
1      100001    193.100.0.1/32    down    12:47:16.417 PST Tue Oct 23 2007
1      100002    193.100.0.2/32    partial 12:47:22.418 PST Tue Oct 23 2007
1      100003    193.100.0.3/32    partial 12:47:22.429 PST Tue Oct 23 2007
1      100004    193.100.0.4/32    down    12:47:16.429 PST Tue Oct 23 2007
1      100005    193.100.0.5/32    down    12:47:21.428 PST Tue Oct 23 2007

```

This table describes the significant fields shown in the display.

Table 21: show ipsla mpls lsp-monitor summary Field Descriptions

Field	Description
MonID	Monitor identifier.
Op/GrpID	Operation identifiers that have been created by this MPLS LSP monitor instance.
TargetAddress	IPv4 Forward Equivalence Class (FEC) to be used by this operation.
Status	Status of the paths. Values can be as follows: <ul style="list-style-type: none"> • up—Indicates that the latest operation cycle was successful. • down—Indicates that the latest operation cycle was not successful. • pending—Indicates that the latest operation cycle is waiting for an LSP ping or trace response.
Latest Operation Time	Time the latest operation cycle was issued.

The following sample output is from the **show ipsla mpls lsp-monitor summary group** command:

```
RP/0/RSP0/CPU0:router# show ipsla mpls lsp-monitor summary 1 group 100001
```

```

GrpID  LSP-Selector  Status  Failure  Success  RTT  Latest Operation Time
100001 127.0.0.13    up      0        78       32   20:11:37.895 EST Feb 28 2005
100001 127.0.0.15    retry   1        77       0    20:11:37.995 EST Feb 28 2005
100001 127.0.0.16    up      0        78       32   20:11:38.067 EST Feb 28 2005
100001 127.0.0.26    up      0        78       32   20:11:38.175 EST Feb 28 2005

```

This table describes the significant fields shown in the display.

Table 22: show ipsla mpls lsp-monitor summary group Field Descriptions

Field	Description
GrpID	Group identifier that has been created by this MPLS LSP monitor instance.
LSP-Selector	LSP selector address.

Field	Description
Status	Status of the paths. Values can be as follows: <ul style="list-style-type: none">• up—Indicates that all the paths were successful.• down—Indicates that all the paths were not successful.• partial—Indicates that only some paths were successful.• unknown—Indicates that some (or all) of the paths did not complete a single LSP echo request so the group status could not be identified.
Failure	Number of failures.
Success	Number of successes.
RTT	Round Trip Time (RTT) in milliseconds of the latest LSP echo request for the path.
Latest Operation Time	Time the latest operation cycle was issued for the path.

show ipsla responder statistics

To display the number of probes that are received or handled by the currently active ports on the responder, use the **show ipsla responder statistics ports** command in EXEC mode.

show ipsla responder statistics {all | permanent} ports

Syntax Description	all	Port statistics is displayed for all ports.
	permanent	Port statistics is displayed only for permanent ports.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The output of the **show ipsla responder statistics port** command is available only for specific intervals of time in which only nonpermanent ports are being used at the responder. The reason is that the responder closes the nonpermanent ports after each operation cycle. However, if both permanent and nonpermanent ports are used, the output always contains rows for the permanent ports. The rows for the nonpermanent ports are displayed only if those nonpermanent ports are enabled at the instant the command is issued.

Task ID	Task ID	Operations
	monitor	read

Examples The following sample output is from the **show ipsla responder statistics port** command:

```
RP/0/RSP0/CPU0:router# show ipsla responder statistics all port

Port Statistics
-----

Local Address  Port  Port Type  Probes  Drops  CtrlProbes  Discard
172.16.5.1    3001  Permanent  0       0      0           0
172.16.5.1    10001 Permanent  728160  0      24272       0
172.16.5.5    8201  Dynamic    12132   0      12135       ON
172.16.5.1    4441  Dynamic    207216  0      3641        ON
```

This table describes the significant fields shown in the display.

Table 23: show ipsla responder statistics port Field Descriptions

Field	Description
Local Address	Local IP address of the responder device used to respond to IPSLA probes.
Port	UDP socket local to the responder device used to respond to IPSLA probes.
Port Type	It could be "permanent" or "dynamic"; depends upon whether a permanent port configuration is done.
Probes	Number of probe packets the responder has received.
Drops	Number of probes dropped.
CtrlProbes	Number of control packets the responder has received.
Discard	If the state is ON, the responder will not respond to probes.

show ipsla statistics

To display the operational data and the latest statistics for the IP SLA operation in tabular format, use the **show ipsla statistics** command in EXEC mode.

show ipsla statistics [*operation-number*]

Syntax Description	<i>operation-number</i> (Optional) Operation for which the latest statistics are to be displayed. Range is 1 to 2048.
---------------------------	---

Command Default	None
------------------------	------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--

Task ID	Task	Operations
	monitor	read

Examples

The output of the **show ipsla statistics** command varies depending on the operation type.

The following sample output is from the **show ipsla statistics** command for an ICMP echo operation:

```
RP/0/RSP0/CPU0:router# show ipsla statistics 100025

Entry number: 100025
  Modification time: 00:36:58.602 UTC Sat Dec 10 2007
  Start time       : 00:36:58.605 UTC Sat Dec 10 2007
  Number of operations attempted: 5
  Number of operations skipped  : 0
  Current seconds left in Life  : Forever
  Operational state of entry    : Active
  Connection loss occurred      : FALSE
  Timeout occurred              : FALSE
  Latest RTT (milliseconds)     : 3
  Latest operation start time   : 00:41:01.129 UTC Sat Dec 10 2007
  Latest operation return code  : OK
  RTT Values:
    RTTAvg  : 71          RTTMin: 71          RTTMax : 71
    NumOfRTT: 1          RTTSum: 71          RTTSum2: 729
  Path Information:
    Path Path  LSP          Outgoing  Nexthop  Downstream
    Idx  Sense Selector      Interface Address   Label Stack
    1    1    127.0.0.13        PO0/2/5/0 192.12.1.2 38
    2    1    127.0.0.6          PO0/2/5/0 192.12.1.2 38
    3    1    127.0.0.1          PO0/2/5/0 192.12.1.2 38
    4    1    127.0.0.2          PO0/2/5/0 192.12.1.2 38
```

5	1	127.0.0.13	PO0/2/5/1	192.12.2.2	38
6	1	127.0.0.6	PO0/2/5/1	192.12.2.2	38
7	1	127.0.0.1	PO0/2/5/1	192.12.2.2	38
8	1	127.0.0.2	PO0/2/5/1	192.12.2.2	38
9	1	127.0.0.4	Gi0/2/0/0	192.15.1.2	38
10	1	127.0.0.5	Gi0/2/0/0	192.15.1.2	38

This table describes the significant fields shown in the display.

Table 24: show ipsla statistics Field Descriptions

Field	Description
Entry number	Entry number.
Modification time	Latest time the operation was modified.
Start time	Time the operation was started.
Number of operations attempted	Number of operation cycles that were issued.
Number of operations skipped	Number of operation cycles that were not issued because one of the cycles extended over the configured time interval.
Current seconds left in Life	Time remaining until the operation stops execution.
Operational state of entry	State of the operation, such as active state, pending state, or inactive state.
Connection loss occurred	Whether or not a connection-loss error happened.
Timeout occurred	Whether or not a timeout error happened.
Latest RTT (milliseconds)	Value of the latest RTT sample.
Latest operation start time	Time the latest operation cycle was issued.
Latest operation return code	Return code of the latest operation cycle
RTTAvg	Average RTT value that is observed in the last cycle.
RTTMin	Minimum RTT value that is observed in the last cycle.
RTTMax	Maximum RTT value that is observed in the last cycle.
NumOfRTT	Number of successful round trips.
RTTSum	Sum of all successful round-trip values in milliseconds.
RTTSum2	Sum of squares of the round-trip values in milliseconds.
Path Idx	Path index number.
Path Sense	Response return code for the path. (See Table 16: Response Return Values for the show ipsla history Command , on page 203, in show ipsla history command.)
LSP Selector	LSP selector address of the path.

show ipsla statistics

Field	Description
Outgoing Interface	Outgoing interface of the path.
Nexthop Address	Next hop address of the path.
Downstream Label Stack	MPLS label stacks of the path.

Related Commands

Command	Description
show ipsla statistics aggregated, on page 219	Displays the statistical errors for all the IP SLA operations or for a specified operation.

show ipsla statistics aggregated

To display the hourly statistics for all the IP SLA operations or specified operation, use the **show ipsla statistics aggregated** command in EXEC mode.

```
show ipsla statistics aggregated [detail] [operation-number]
```

Syntax Description	detail	Displays detailed information.
	<i>operation-number</i>	(Optional) Number of IP SLA operations. Range is 1 to 2048.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **show ipsla statistics aggregated** command displays information such as the number of failed operations and the reason for failure. Unless you configured a different amount of time for the **buckets** command (**statistics** command with **hourly** keyword), the **show ipsla statistics aggregated** command displays the information collected over the past two hours.

For one-way delay and jitter operations to be computed for UDP jitter operations, the clocks on local and target devices must be synchronized using NTP or GPS systems. If the clocks are not synchronized, one-way measurements are discarded. If the sum of the source to destination (SD) and the destination to source (DS) values is not within 10 percent of the round-trip time, the one-way measurement values are assumed to be faulty, and are discarded.

Task ID	Task ID	Operations
	monitor	read

Examples

The output of the **show ipsla statistics aggregated** command varies depending on operation type. The following sample output shows the aggregated statistics for UDP echo operation from the **show ipsla statistics aggregated** command:

```
RP/0/RSP0/CPU0:router# show ipsla statistics aggregated 1

Entry number: 1
Hour Index: 0
  Start Time Index: 21:02:32.510 UTC Mon Dec 12 2005
  Number of Failed Operations due to a Disconnect      : 0
  Number of Failed Operations due to a Timeout         : 0
  Number of Failed Operations due to a Busy           : 0
  Number of Failed Operations due to a No Connection  : 0
  Number of Failed Operations due to an Internal Error: 0
```

show ipsla statistics aggregated

```

Number of Failed Operations due to a Sequence Error : 0
Number of Failed Operations due to a Verify Error   : 0
RTT Values:
  RTTAvg   : 6           RTTMin: 4           RTTMax : 38
  NumOfRTT : 36         RTTSum: 229         RTTSum2: 2563

```

The following sample output is from the **show ipsla statistics aggregated** command in which operation 10 is a UDP jitter operation:

```
RP/0/RSP0/CPU0:router# show ipsla statistics aggregated 10
```

```

Entry number: 10
Hour Index: 0
  Start Time Index: 00:35:07.895 UTC Thu Mar 16 2006
  Number of Failed Operations due to a Disconnect      : 0
  Number of Failed Operations due to a Timeout        : 0
  Number of Failed Operations due to a Busy           : 0
  Number of Failed Operations due to a No Connection  : 0
  Number of Failed Operations due to an Internal Error: 0
  Number of Failed Operations due to a Sequence Error : 0
  Number of Failed Operations due to a Verify Error   : 0
  RTT Values:
    RTTAvg   : 14           RTTMin: 2           RTTMax : 99
    NumOfRTT : 70         RTTSum: 1034         RTTSum2: 60610
  Packet Loss Values:
    PacketLossSD      : 0           PacketLossDS: 0
    PacketOutOfSequence: 0         PacketMIA   : 0
    PacketLateArrival : 0
    Errors            : 0           Busies      : 0
  Jitter Values :
    MinOfPositivesSD: 1           MaxOfPositivesSD: 19

```

This table describes the significant fields shown in the display.

Table 25: show ipsla statistics aggregated Field Descriptions

Field	Description
Busies	Number of times that the operation cannot be started because the previously scheduled run was not finished.
Entry Number	Entry number.
Hop in Path Index	Hop in path index.

Field	Description
Errors	Number of internal errors.
Jitter Values	Jitter statistics appear on the specified lines. Jitter is defined as interpacket delay variance.
NumOfJitterSamples	Number of jitter samples that are collected. The number of samples are used to calculate the jitter statistics.
Number of Failed Operations due to a Disconnect	Number of failed operations due to a disconnect.
Number of Failed Operations due to a Timeout	Number of failed operations due to a timeout.
Number of Failed Operations due to a Busy	Number of failed operations due to a busy error.
Number of Failed Operations due to a No Connection	Error that refers to the case in which the control connection cannot be established.
Number of Failed Operations due to an Internal Error	Number of failed operations due to an internal error.
Number of Failed Operations due to a Sequence Error	Number of failed operations due to a sequence error.
Number of Failed Operations due to a Verify Error	Number of failed operations due to a verify error.
MaxOfNegativesSD	Maximum negative jitter values from the source to the destination. The absolute value is given.
MaxOfPositivesSD	Maximum jitter values from the source to the destination in milliseconds.
MaxOfPositivesDS	Maximum jitter values from the destination to the source in milliseconds.
MaxOfNegativesDS	Maximum negative jitter values from destination-to-source. The absolute value is given.
MinOfPositivesDS	Minimum jitter values from the destination to the source in milliseconds.
MinOfNegativesSD	Minimum negative jitter values from the source to the destination. The absolute value is given.
MinOfPositivesSD	Minimum jitter values from the source to the destination in milliseconds.
MinOfNegativesDS	Minimum negative jitter values from the destination to the source. The absolute value is given.

show ipsla statistics aggregated

Field	Description
NumOfOW	Number of successful one-way time measurements.
NumOfNegativesDS	Number of jitter values from the destination to the source that are negative; for example, network latency decreases for two consecutive test packets.
NumOfNegativesSD	Number of jitter values from the source to the destination that are negative; for example, network latency decreases for two consecutive test packets.
NumOfPositivesDS	Number of jitter values from the destination to the source that are positive; for example, network latency increases for two consecutive test packets.
NumOfPositivesSD	Number of jitter values from the source to the destination that are positive; for example, network latency increases for two consecutive test packets.
NumOfRTT	Number of successful round trips.
One Way Values	One-way measurement statistics appear on the specified lines. One Way (OW) values are the amount of time that it took the packet to travel from the source router to the target router or from the target router to the source router.
OWMaxDS	Maximum time from the destination to the source.
OWMaxSD	Maximum time from the source to the destination.
OWMinDS	Minimum time from the destination to the source.
OWMinSD	Minimum time from the source to the destination.
OWSumDS	Sum of one-way delay values from the destination to the source.
OWSumSD	Sum of one-way delay values from the source to the destination.
OWSum2DS	Sum of squares of one-way delay values from the destination to the source.
OWSum2SD	Sum of squares of one-way delay values from the source to the destination.
PacketLateArrival	Number of packets that arrived after the timeout.
PacketLossDS	Number of packets lost from the destination to the source (DS).
PacketLossSD	Number of packets lost from the source to the destination (SD).
PacketMIA	Number of packets lost in which the SD direction or DS direction cannot be determined.
PacketOutOfSequence	Number of packets that are returned out of order.

Field	Description
Path Index	Path index.
Port Number	Target port number.
RTTSum	Sum of all successful round-trip values in milliseconds.
RTTSum2	Sum of squares of the round-trip values in milliseconds.
RTT Values	Round-trip time statistics appear on the specified lines.
Start Time	Start time, in milliseconds.
Start Time Index	Statistics that are aggregated for over 1-hour intervals. The value indicates the start time for the 1-hour interval that is displayed.
SumOfPositivesDS	Sum of the positive jitter values from the destination to the source.
SumOfPositivesSD	Sum of the positive jitter values from the source to the destination.
SumOfNegativesDS	Sum of the negative jitter values from the destination to the source.
SumOfNegativesSD	Sum of the negative jitter values from the source to the destination.
Sum2PositivesDS	Sum of squares of the positive jitter values from the destination to the source.
Sum2PositivesSD	Sum of squares of the positive jitter values from the source to the destination.
Sum2NegativesDS	Sum of squares of the negative jitter values from the destination to the source.
Sum2NegativesSD	Sum of squares of the negative jitter values from the source to the destination.
Target Address	Target IP address.

The output of the **show ipsla statistics aggregated detail** command varies depending on operation type. The following sample output is from the **show ipsla statistics aggregated detail** command in tabular format, when the output is split over multiple lines:

```
RP/0/RSP0/CPU0:router# show ipsla statistics aggregated detail 2
```

```
Captured Statistics
    Multiple Lines per Entry
Line1:
Entry      = Entry number
StartT     = Start time of entry (hundredths of seconds)
Pth        = Path index
Hop        = Hop in path index
Dst        = Time distribution index
Comps     = Operations completed
SumCmp    = Sum of RTT (milliseconds)

Line2:
```

show ipsla statistics aggregated

SumCmp2H = Sum of RTT squared high 32 bits (milliseconds)
 SumCmp2L = Sum of RTT squared low 32 bits (milliseconds)
 TMax = RTT maximum (milliseconds)
 TMin = RTT minimum (milliseconds)

Entry	StartT	Pth	Hop	Dst	Comps	SumCmp
	SumCmp2H	SumCmp2L	TMax	TMin		
2	1134423910701	1	1	0	12	367
	0	1231	6			6
2	1134423851116	1	1	1	2	129

Table 27: show ipsla statistics aggregated (with Path Discovery enabled) Field Descriptions

Field	Description
Entry Number	Entry number.
Start Time Index	Start time.
Number of Failed Operations due to a Disconnect	Number of failed operations due to a disconnect.

show ipsla statistics aggregated

Field	Description
Number of Failed Operations due to a Timeout	Number of failed operations due to a timeout.
Number of Failed Operations due to a Busy	Number of failed operations due to a busy error.
Number of Failed Operations due to a No Connection	Error that refers to the case in which the control connection cannot be established.
Number of Failed Operations due to an Internal Error	Number of failed operations due to an internal error.
Number of Failed Operations due to a Sequence Error	Number of failed operations due to a sequence error.
Number of Failed Operations due to a Verify Error	Number of failed operations due to a verify error.
RTT Values	Round-trip time statistics appear on the specified lines.
RTT Min/Avg/Max	Maximum values of the RTT that are observed in the latest cycle (*).
NumOfRTT	Number of successful round trips.
RTT Sum	Sum of all successful round-trip values, in milliseconds.
RTT Sum2	Sum of squares of the round-trip values, in milliseconds.
RTT Min/Avg/Max	Maximum values of the RTT that are observed in the latest cycle (*).
NumOfRTT	Number of successful round trips.
Path Idx	Path index number.
Path Sense	Response return code for the path. (See Table 16: Response Return Values for the show ipsla history Command , on page 203, in show ipsla history command.)
LSP Selector	LSP selector address of the path.
Outgoing Interface	Outgoing interface name of the path.
Nexthop Address	Next hop address of the path.
Downstream Label Stack	MPLS label stacks of the path.

Related Commands

Command	Description
show ipsla statistics , on page 216	Displays the operational data for the IP SLA operation.

Command	Description
show ipsla statistics enhanced aggregated, on page 228	Displays the statistical errors for all the IP SLA operations or for a specified operation.

show ipsla statistics enhanced aggregated

To display the enhanced history statistics for all collected enhanced history buckets for the specified IP SLA operation, use the **show ipsla statistics enhanced aggregated** command in EXEC mode.

show ipsla statistics enhanced aggregated [*operation-number*] [*interval seconds*]

Syntax Description

operation-number (Optional) Operation number for which to display the enhanced history distribution statistics.

interval seconds (Optional) Specifies the aggregation interval in seconds for which to display the enhanced history distribution statistics.

Command Default

None

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **show ipsla statistics enhanced aggregated** command displays data for each bucket of enhanced history data shown individually; for example, one after the other. The number of buckets and the collection interval is set using the **interval** keyword, *seconds* argument, **buckets** keyword, and *number-of-buckets* argument.

Task ID

Task ID	Operations
monitor	read

Examples

The output of the **show ipsla statistics enhanced aggregated** command varies depending on the operation type.

The following sample output is from the **show ipsla statistics enhanced aggregated** command for the UDP echo operation:

```
RP/0/RSP0/CPU0:router# show ipsla statistics enhanced aggregated 20
```

```
Entry number: 20
Interval : 300 seconds
Bucket : 1 (0 - 300 seconds)
  Start Time Index: 00:38:14.286 UTC Thu Mar 16 2006
  Number of Failed Operations due to a Disconnect      : 0
  Number of Failed Operations due to a Timeout        : 0
  Number of Failed Operations due to a Busy           : 0
  Number of Failed Operations due to a No Connection  : 0
  Number of Failed Operations due to an Internal Error: 0
  Number of Failed Operations due to a Sequence Error : 0
  Number of Failed Operations due to a Verify Error   : 0
  RTT Values:
```

```

RTTAvg : 2          RTTMin: 2          RTTMax : 5
NumOfRTT: 5        RTTSum: 13         RTTSum2: 41
Bucket : 2 (300 - 600 seconds)
Start Time Index: 00:43:12.747 UTC Thu Mar 16 2006
Number of Failed Operations due to a Disconnect : 0
Number of Failed Operations due to a Timeout : 0
Number of Failed Operations due to a Busy : 0
Number of Failed Operations due to a No Connection : 0
Number of Failed Operations due to an Internal Error: 0
Number of Failed Operations due to a Sequence Error : 0
Number of Failed Operations due to a Verify Error : 0
RTT Values:
RTTAvg : 2          RTTMin: 2          RTTMax : 2
NumOfRTT: 1        RTTSum: 2          RTTSum2: 4

```

This table describes the significant fields shown in the display.

Table 28: show ipsla statistics enhanced aggregated Field Descriptions

Field	Description
Entry Number	Entry number.
Interval	Multiple of the frequency of the operation. The Enhanced interval field defines the interval in which statistics displayed by the show ipsla statistics enhanced aggregated command are aggregated. This field must be configured so that the enhanced aggregated statistics are displayed.
Bucket	Bucket index.
Start Time Index	Statistics that are aggregated depend on the interval configuration mode. The value depends on the interval configuration that is displayed.
RTT Values	Round-trip time statistics appear on the specified lines.
RTT Min/Avg/Max	Maximum values of the RTT that are observed in the latest cycle (*).
NumOfRTT	Number of successful round trips.
RTT Sum	Sum of all successful round-trip values, in milliseconds.
RTT Sum2	Sum of squares of the round-trip values, in milliseconds.
Number of Failed Operations due to a Disconnect	Number of failed operations due to a disconnect.
Number of Failed Operations due to a Timeout	Number of failed operations due to a timeout.
Number of Failed Operations due to a Busy	Number of failed operations due to a busy error.
Number of Failed Operations due to a No Connection	Error that refers to the case in which the control connection cannot be established.

 **show ipsla statistics enhanced aggregated**

Field	Description
Number of Failed Operations due to an Internal Error	Number of failed operations due to an internal error.
Number of Failed Operations due to a Sequence Error	Number of failed operations due to a sequence error.
Number of Failed Operations due to a Verify Error	Number of failed operations due to a verify error.

Related Commands

Command	Description
show ipsla statistics, on page 216	Displays the operational data for the IP SLA operation.
show ipsla statistics aggregated, on page 219	Displays the statistical errors for all the IP SLA operations or for a specified operation.

show ipsla twamp connection

To display the Two-Way Active Management Protocol (TWAMP) connections, use the **show ipsla twamp connection** command in the EXEC mode.

show ipsla twamp connection [**detail***source-ip* | **requests**]

Syntax Description	detail <i>source-ip</i>	Displays details of the connection for a specified source-ip.
	requests	Displays request details.
Command Default	None	
Command Modes	EXEC mode	
Command History	Release	Modification
	Release 5.1.1	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operation
	ip-services	read

Example

This example shows how to run the **show ipsla twamp connection** command with the **requests** keyword:

```
RP/0/RSP0/CPU0:router # show ipsla twamp connection requests
```

show ipsla twamp session

To display the Two-way Active Management Protocol (TWAMP) sessions, use the **show ipsla twamp session** command in the EXEC mode.

show ipsla twamp session [**source-ip** *host-name* | **brief**]

Syntax Description	source-ip <i>host-name</i>	Displays session information for the specified source-ip and hostname.
	brief	Displays the session details in brief in tabular format

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 5.1.1	This command was introduced.
	Release 7.4.1	A new keyword, brief , was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	monitor	read

Example

This example shows how to run **show ipsla twamp session** command:

```
Router# show ipsla twamp session
IP SLAs Responder TWAMP is: Enabled
Recv Addr: 10.5.139.11
Recv Port: 7222
Sender Addr: 172.27.111.233
Sender Port: 33243
Session Id: 10.5.139.11:70929508:88F7A620
Connection Id: 0
```

The sample output of **show ipsla twamp session brief** command:

```
Router# show ipsla twamp session brief
* M - Mode of authentication      U - Unauthenticated
  D - DSCP value                  PL - Pad Length
  RX - Packets Received           TX - Packets Sent
  T - TWAMP                       TWL - TWAMP Light
  > - field trimmed

S.No Receiver Address_Port/      VRF Name      M/D  PL  RX/TX  Type  Sender
```

```
Address_Port
-----
1 10.0.88.23_11232 / default U/24 80 3150/3150 T

10.173.125.230_11337
```

show ipsla twamp standards

To display the Two-way Active Management Protocol (TWAMP) standards, use the **show ipsla twamp standards** command in the EXEC mode.

The relevant RFC standards for the TWAMP server and TWAMP reflector are indicated.

show ipsla twamp standards

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 5.1.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	read

Example

This example shows how to use the **show ipsla twamp standards** command:

```
RP/0/RSP0/CPU0:router # show ipsla twamp standards
Feature                Organization          Standard
TWAMP Server           IETF                 RFC5357
TWAMP Reflector        IETF                 RFC5357
```

source address

To identify the address of the source device, use the **source address** command in the appropriate configuration mode. To use the best local address, use the **no** form of this command.

```
source address ipv4-address
no source address
```

Syntax Description

ipv4-address IP address or hostname of the source device.

Command Default

IP SLA finds the best local address to the destination and uses it as the source address.

Command Modes

IP SLA UDP echo configuration
 IP SLA UDP jitter configuration
 IP SLA ICMP path-jitter configuration
 IP SLA ICMP path-echo configuration
 IP SLA ICMP echo configuration
 IP SLA MPLS LSP ping configuration
 IP SLA MPLS LSP trace configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to designate an IP address for the **source address** command in IP SLA UDP jitter configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# source address 192.0.2.9
```

source address

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.

source port

To identify the port of the source device, use the **source port** command in the appropriate configuration mode. To use the unused port number, use the **no** form of this command.

source port *port*
no source port

Syntax Description

port Identifies the port number of the source device. Range is 1 to 65535.
port

Command Default

IP SLA uses an unused port that is allocated by system.

Command History

Releas	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **source port** command is not supported to configure ICMP operations; it is supported only to configure UDP operations.

The specified source port should not be used in other IPSLA operations configured on the same source IP address and source VRF.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to designate a port for the **source port** command in IP SLA UDP jitter configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# source port 11111
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.

start-time

To determine the time when the operation or MPLS LSP monitor instance starts, use the **start-time** command in the appropriate configuration mode. To stop the operation and place it in the default state, use the **no** form of this command.

start-time *{hh:mm:ss [{day | month day year}] | after hh:mm:ss | now | pending}*
no start-time

Syntax Description	
<i>hh:mm:ss</i>	Absolute start time in hours, minutes, and seconds. You can use the 24-hour clock notation. For example, the start-time <i>01:02</i> is defined as 1:02 am, or start-time <i>13:01:30</i> is defined as start at 1:01 pm. and 30 seconds. The current day is used; unless, you specify a <i>month</i> and <i>day</i> .
<i>month</i>	(Optional) Name of the month to start the operation. When you use the <i>month</i> argument, you are required to specify a day. You can specify the month by using the full English name or the first three letters of the month.
<i>day</i>	(Optional) Number of the day, in the range of 1 to 31, to start the operation. In addition, you must specify a month.
<i>year</i>	(Optional) Year in the range of 1993 to 2035.
after <i>hh:mm:ss</i>	Specifies that the operation starts at <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after the start-time command is used.
now	Specifies that the operation should start immediately.
pending	Specifies that no information is collected. The default value is the pending keyword.

Command Default If a month and day are not specified, the current month and day are used.

Command Modes IP SLA schedule configuration
 IP SLA MPLS LSP monitor schedule configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If the **start-time** command is used in IP SLA operation mode, it configures the start time for the specific operation being configured. If the **start-time** command is used in IP SLA MPLS LSP monitor mode, it configures the start time for all monitor instances associated with the monitored provider edge (PE) routers.

Task ID	Task	Operations
	monitor	read, write

Examples

The following example shows how to use the **start-time** command option for the schedule operation:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# schedule operation 1
RP/0/RSP0/CPU0:router(config-ipsla-sched)# start-time after 01:00:00
```

The following example shows how to use the **start-time** command in IP SLA MPLS LSP monitor schedule configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# schedule monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-sched)# start-time after 01:00:00
```

The following example shows how to use the **start-time** command and specify a year for a scheduled operation:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla operation 2
RP/0/RSP0/CPU0:router(config-ipsla-op)# type icmp echo
RP/0/RSP0/CPU0:router(config-ipsla-icmp-echo)# destination address 192.0.2.9
RP/0/RSP0/CPU0:router(config-ipsla-icmp-echo)# exit
RP/0/RSP0/CPU0:router(config-ipsla-op)# exit

RP/0/RSP0/CPU0:router(config-ipsla)# schedule operation 2
RP/0/RSP0/CPU0:router(config-ipsla-sched)# start 20:0:0 february 7 2008
RP/0/RSP0/CPU0:router(config-ipsla-sched)#
```

Related Commands

Command	Description
life, on page 140	Specifies the length of time to execute.
operation, on page 154	Configures an IP SLA operation.
recurring, on page 181	Indicates that the operation starts automatically at the specified time and for the specified duration every day.
schedule monitor, on page 195	Schedules an IP SLA MPLS LSP monitoring instance.
schedule operation, on page 196	Schedules an IP SLA operation.

statistics

To set the statistics collection parameters for the operation, use the **statistics** command in the appropriate configuration mode. To remove the statistics collection or use the default value, use the **no** form of this command.

```
statistics {hourly | interval seconds}
no statistics {hourly | interval seconds}
```

Syntax Description	hourly	interval seconds
	Sets the distribution for statistics configuration that is aggregated for over an hour.	Collects statistics over a specified time interval. Interval (in seconds) over which to collect statistics. Range is 1 to 3600 seconds.

Command Default None

Command Modes

- IP SLA operation UDP jitter configuration
- IP SLA MPLS LSP ping configuration
- IP SLA MPLS LSP trace configuration
- IP SLA MPLS LSP monitor ping configuration
- IP SLA MPLS LSP monitor trace configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **statistics interval** command is not supported for the configuration of ICMP path-echo and ICMP path-jitter operations, nor for the configuration of MPLS LSP monitor instances.

If the **statistics** command is used in IP SLA operation mode, it configures the statistics collection for the specific operation being configured. If the **statistics** command is used in IP SLA MPLS LSP monitor mode, it configures the statistics collection for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to set the number of hours in which statistics are maintained for the IP SLA UDP jitter operation for the **statistics** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
```

```
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# statistics hourly
RP/0/RSP0/CPU0:router(config-ipsla-op-stats)#
```

The following example shows how to collect statistics for a specified time interval, using the **statistics** command in an IP SLA UDP jitter operation:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# statistics interval 60
RP/0/RSP0/CPU0:router(config-ipsla-op-stats)#
```

The following example shows how to set the number of hours in which statistics are maintained for the IP SLA MPLS LSP monitor ping operation, using the **statistics** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-ping)# statistics hourly
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-stats)#
```

buckets (statistics interval), on page 114	Refers to the data buckets in which the enhanced history statistics are kept.
distribution count, on page 121	Sets the number of statistics distributions that are kept for each hop during the lifetime of the IP SLA operation.
distribution interval, on page 123	Sets the time interval (in milliseconds) for each statistical distribution.
monitor, on page 151	Configures an IP SLA MPLS LSP monitor instance.
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.
maximum hops, on page 147	Sets the number of hops in which statistics are maintained for each path for the IP SLA operation.
maximum paths (IP SLA), on page 149	Sets the number of paths in which statistics are maintained for each hour for an IP SLA operation.

tag (IP SLA)

To create a user-specified identifier for an IP SLA operation, use the **tag** command in the appropriate configuration mode. To unset the tag string, use the **no** form of this command.

```
tag [text]
no tag
```

Syntax Description

text (Optional) Specifies a string label for the IP SLA operation.

Command Default

No tag string is configured.

Command Modes

IP SLA UDP echo configuration
 IP SLA UDP jitter configuration
 IP SLA ICMP path-jitter configuration
 IP SLA ICMP path-echo configuration
 IP SLA ICMP echo configuration
 IP SLA MPLS LSP ping configuration
 IP SLA MPLS LSP trace configuration
 IP SLA MPLS LSP monitor ping configuration
 IP SLA MPLS LSP monitor trace configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

If the **tag** command is used in IP SLA operation mode, it configures the user-defined tag string for the specific operation being configured. If the **tag** command is used in IP SLA MPLS LSP monitor mode, it configures the user-defined tag string for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to use the **tag** command in IP SLA UDP jitter configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
```

```
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# tag ipsla
```

The following example shows how to use the **tag** command in IP SLA MPLS LSP monitor ping configuration mode:

```
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplsml)# monitor 1
RP/0/RSP0/CPU0:router(config-ipsla-mplsml-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplsml-lsp-ping)# tag mplsml-tag
```

Related Commands

target ipv4

To specify the IPv4 address of the target router to be used in an MPLS LSP ping or MPLS LSP trace operation, use the **target ipv4** command in the appropriate configuration mode. To unset the address, use the **no** form of this command.

target ipv4 *destination-address destination-mask*
no target ipv4

Syntax Description

destination-address IPv4 address of the target device to be tested.

destination-mask Number of bits in the network mask of the target address. The network mask can be specified in either of two ways:

- The network mask can be a four-part dotted decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means the corresponding address bit belongs to the network address.
- The network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are ones, and the corresponding bits of the address are network address.

Command Default

None

Command Modes

IP SLA MPLS LSP ping configuration
 IP SLA MPLS LSP trace configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **target ipv4** command to specify the IPv4 address of the target router at the end of the LSP to be tested or traced and to indicate the destination as an Label Distribution Protocol (LDP) IPv4 address. The target IPv4 address identifies the appropriate label stack associated with the LSP.

Note Using the **target ipv4** command, you can configure only one LDP IPv4 address as the target in an MPLS LSP ping or trace operation. If you enter the command a second time and configure a different IPv4 target address, you overwrite the first IPv4 address.

An MPLS LSP ping operation tests connectivity in the LSP using verification on the specified Forwarding Equivalence Class (FEC)— in this case, LDP IPv4 prefix—between the ping origin and the egress node identified with the **target ipv4** command. This test is carried out by sending an MPLS echo request along the same data path as other packets belonging to the FEC. When the ping packet reaches the end of the path, it is sent to the control plane of the egress label switching router (LSR), which then verifies that it is indeed an egress for the LSP. The MPLS echo request contains information about the LSP that is being verified.

In an MPLS network, an MPLS LSP trace operation traces LSP paths to the target router identified with the **target ipv4** command. In the verification of LSP routes, a packet is sent to the control plane of each transit

LSR, which performs various checks, including one that determines if it is a transit LSR for the LSP path. Each transit LSR also returns information related to the LSP being tested (that is, the label bound to the LDP IPv4 prefix).

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **target ipv4** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-ping)# target ipv4 192.168.1.4 255.255.255.255
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.

target pseudowire

To specify the pseudowire as the target to be used in an MPLS LSP ping operation, use the **target pseudowire** command in IP SLA MPLS LSP ping configuration mode. To unset the target, use the **no** form of this command.

target pseudowire *destination-address* *circuit-id*
no target pseudowire

Syntax Description

destination-address IPv4 address of the target device to be tested.

circuit-id Virtual circuit identifier. Range is 1 to 4294967295.

Command Default

No default behavior or values

Command Modes

IP SLA MPLS LSP ping configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **target pseudowire** command to specify a target router and to indicate the destination as a Layer 2 VPN pseudowire in an MPLS LSP ping operation. The **target pseudowire** command identifies the target address and the virtual circuit (VC) identifier.

Note Using the **target pseudowire** command, you can configure only one pseudowire address as the target in an MPLS LSP ping operation. If you use the command a second time and configure a different pseudowire target address, the first pseudowire address is overwritten.

A pseudowire target of the LSP ping operation allows active monitoring of statistics on Pseudowire Edge-to-Edge (PWE3) services across an MPLS network. PWE3 connectivity verification uses the Virtual Circuit Connectivity Verification (VCCV).

For more information on VCCV, refer to the VCCV draft, “Pseudowire Virtual Circuit Connectivity Verification (VCCV)” on the IETF web page.

target traffic-eng

To specify the target MPLS traffic engineering tunnel to be used in an MPLS LSP ping or MPLS LSP trace operation, use the **target traffic-eng** command in the appropriate configuration mode. To unset the tunnel, use the **no** form of this command.

target traffic-eng tunnel *tunnel-interface*
no target traffic-eng

Syntax Description	tunnel <i>tunnel-interface</i> Tunnel ID of an MPLS traffic-engineering tunnel (for example, tunnel 10) configured on the router. Range is 0 to 65535.				
Command Default	No default behavior or values				
Command Modes	IP SLA MPLS LSP ping configuration IP SLA MPLS LSP trace configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	Use the target traffic-eng command to specify a target router and to indicate the destination as an MPLS traffic-engineering (TE) tunnel in an MPLS LSP ping or MPLS LSP trace operation. The target traffic-eng command identifies the tunnel interface and the appropriate label stack associated with the LSP to be pinged or traced. An LSP tunnel interface is the head-end of a unidirectional virtual link to a tunnel destination.				

Note Using the **target traffic-eng** command, you can configure only one MPLS TE tunnel as the target in an MPLS LSP ping or trace operation. If you enter the command a second time and configure a different tunnel interfaces, you overwrite the first tunnel ID.

An IP SLA ping operation tests connectivity in the LSP using verification on the specified Forwarding Equivalence Class (FEC)—in this case, MPLS TE tunnel—between the ping origin and the egress node identified with the **target traffic-eng** command. This test is carried out by sending an MPLS echo request along the same data path as other packets belonging to the tunnel. When the ping packet reaches the end of the path, it is sent to the control plane of the egress label switching router (LSR), which then verifies that it is indeed an egress for the MPLS TE tunnel. The MPLS echo request contains information about the tunnel whose LSP path is being verified.

In an MPLS network, an IP SLA trace operation traces the LSP paths to a target router identified with the **target traffic-eng** command. In the verification of LSP routes, a packet is sent to the control plane of each transit LSR, which performs various checks, including one that determines if it is a transit LSR for the LSP path. Each transit LSR also returns information related to the MPLS TE tunnel to see if the local forwarding information matches what the routing protocols determine as the LSP path.

MPLS traffic engineering automatically establishes and maintains LSPs across the backbone. The path that an LSP uses is determined by the LSP resource requirements and network resources, such as bandwidth.

For more information on MPLS traffic-engineering tunnels, refer to *MPLS Traffic Engineering and Enhancements*.

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **target traffic-eng tunnel** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp trace
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-trace)# target traffic-eng tunnel 101
```

threshold

To set the lower-limit and upper-limit values, use the **threshold** command in IP SLA reaction condition configuration mode. To use the default value, use the **no** form of this command.

threshold lower-limit *value* **upper-limit** *value*
no threshold lower-limit *value* **upper-limit** *value*

Syntax Description

lower-limit *value* Specifies the threshold lower-limit value. Range is 1 to 4294967295 ms. Default **lower-limit** value is 3000 ms.

upper-limit *value* Specifies the threshold upper-limit value. Range is 5000 to 4294967295 ms. Default **upper-limit** value is 5000 ms.

Command Default

lower-limit *value*: 3000 ms

upper-limit *value*: 5000 ms

Command Modes

IP SLA reaction condition configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **threshold** command is supported only when used with the **react** command and **jitter-average** and **packet-loss** keywords.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to set the lower-limit and upper-limit values for the **react** command with the **jitter-average** keyword for the **threshold** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react jitter-average
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)# threshold lower-limit 8000 upper-limit 10000
```

The following example shows how to set the lower-limit and upper-limit values for the **react** command with the **packet-loss** keyword for the **threshold** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
```

```
RP/0/RSP0/CPU0:router(config-ipsla-react)# react packet-loss dest-to-source
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)# threshold lower-limit 8000 upper-limit 10000
```

Related Commands	Command	Description
	operation, on page 154	Configures an IP SLA operation.
	schedule operation, on page 196	Schedules an IP SLA operation.

	threshold type immediate, on page 256	Takes action immediately upon a threshold violation.
	threshold type xofy, on page 258	Takes action upon X violations in Y probe operations.

threshold type average

To take action on average values to violate a threshold, use the **threshold type average** command in IP SLA reaction condition configuration mode. To clear the threshold type (reaction will never happen), use the **no** form of this command.

threshold type average *number-of-probes*
no threshold type

Syntax Description	<i>number-of-probes</i> When the average of the last five values for the monitored element exceeds the upper threshold or the average of the last five values for the monitored element drops below the lower threshold, the action is performed as defined by the action command. Range is 1 to 16.
---------------------------	---

Command Default	If there is no default value, no threshold type is configured.
------------------------	--

Command Modes	IP SLA reaction condition configuration
----------------------	---

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The threshold type average command is supported only when used with the react command and jitter-average , packet-loss , and rtt keywords.
-------------------------	---

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to set the number of probes for the **react** command with the **jitter-average** keyword for the **threshold type average** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react jitter-average
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)# threshold type average 8
```

The following example shows how to set the number of probes for the **react** command with the **packet-loss** keyword for the **threshold type average** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react packet-loss dest-to-source
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)# threshold type average 8
```

Related Commands	Command	Description
	action (IP SLA), on page 108	Specifies what action or combination of actions the operation performs.
	operation, on page 154	Configures an IP SLA operation.

	threshold type xofy, on page 258	Takes action upon X violations in Y probe operations.

threshold type consecutive

To take action after a number of consecutive violations, use the **threshold type consecutive** command in the appropriate configuration mode. To clear the threshold type (reaction will never happen), use the **no** form of this command.

threshold type consecutive *occurrences*
no threshold type

Syntax Description	<i>occurrences</i> When the reaction condition is set for a consecutive number of occurrences, there is no default value. The number of occurrences is set when specifying the threshold type. The number of consecutive violations is 1 to 16.
---------------------------	---

Command Default	No default behavior or values
------------------------	-------------------------------

Command Modes	IP SLA reaction condition configuration IP SLA MPLS LSP monitor reaction condition configuration
----------------------	---

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	If the threshold type consecutive command is used in IP SLA reaction condition mode, it configures the threshold for the specific operation being configured. If the threshold type consecutive command is used in IP SLA MPLS LSP monitor reaction condition configuration mode, it configures the threshold for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.
-------------------------	--

Task ID	Task ID	Operations
	monitor	read, write

Examples The following example shows how to use the **threshold type consecutive** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react jitter-average
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)# threshold type consecutive 8
```

The following example shows how to use the **threshold type consecutive** command in IP SLA MPLS LSP monitor reaction condition configuration mode:

```
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lm)# reaction monitor 2
```

```
RP/0/RSP0/CPU0:router(config-ipsla-mplsmlm-react)# react connection-loss
RP/0/RSP0/CPU0:router(config-ipsla-mplsmlm-react-cond)# threshold type consecutive 2
```

threshold type average, on page 252	Takes action on average values to violate a threshold.
threshold type immediate, on page 256	Takes action immediately upon a threshold violation.
threshold type xofy, on page 258	Takes action upon X violations in Y probe operations.

threshold type immediate

To take action immediately upon a threshold violation, use the **threshold type immediate** command in the appropriate configuration mode. To clear the threshold type (reaction will never happen), use the **no** form of this command.

threshold type immediate
no threshold type

Syntax Description	This command has no keywords or arguments.				
Command Default	If there is no default value, no threshold type is configured.				
Command Modes	IP SLA reaction condition configuration IP SLA MPLS LSP monitor reaction condition configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

Usage Guidelines When the reaction conditions, such as threshold violations, are met for the monitored element, the action is immediately performed as defined by the **action** command.

If the **threshold type immediate** command is used in IP SLA reaction condition mode, it configures the threshold for the specific operation being configured. If the **threshold type immediate** command is used in IP SLA MPLS LSP monitor reaction condition configuration mode, it configures the threshold for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.

Task ID	Task ID	Operations
	monitor	read, write

Examples The following example shows how to use the **threshold type immediate** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# reaction operation 432
RP/0/RSP0/CPU0:router(config-ipsla-react)# react jitter-average
RP/0/RSP0/CPU0:router(config-ipsla-react-cond)# threshold type immediate
```

The following example shows how to use the **threshold type immediate** command in IP SLA MPLS LSP monitor reaction condition configuration mode:

```
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
```

```
RP/0/RSP0/CPU0:router(config-ipsla-mplsml)# reaction monitor 2
RP/0/RSP0/CPU0:router(config-ipsla-mplsml-react)# react connection-loss
RP/0/RSP0/CPU0:router(config-ipsla-mplsml-react-cond)# threshold type immediate
```

Related Commands	Command	Description
	action (IP SLA), on page 108	Specifies what action or combination of actions the operation performs.
	operation, on page 154	Configures an IP SLA operation.
	schedule operation, on page 196	Schedules an IP SLA operation.
	reaction monitor, on page 176	Configures MPLS LSP monitoring reactions.
	reaction operation, on page 178	Configures certain actions that are based on events under the control of the IP SLA agent.
	react, on page 170	Specifies an element to be monitored for a reaction.
	threshold, on page 250	Sets the lower-limit and upper-limit values.
	threshold type average, on page 252	Takes action on average values to violate a threshold.
	threshold type consecutive, on page 254	Takes action after a number of consecutive violations.
	threshold type xofy, on page 258	Takes action upon X violations in Y probe operations.

threshold type xofy

To take action upon X violations in Y probe operations, use the **threshold type xofy** command in IP SLA reaction condition configuration mode. To clear the threshold type (reaction will never happen), use the **no** form of this command.

threshold type xofy *x-value y-value*
no threshold type

Syntax Description	<i>x-value y-value</i> When the reaction conditions, such as threshold violations, are met for the monitored element after some <i>x</i> number of violations within some other <i>y</i> number of probe operations (for example, <i>x</i> of <i>y</i>), the action is performed as defined by the action command. Default is 5 for both <i>x-value</i> and <i>y-value</i> ; for example, xofy 5 5 . Range is 1 to 16.
---------------------------	---

Command Default	If there is no default value, no threshold type is configured.
------------------------	--

Command Modes	IP SLA reaction condition configuration
----------------------	---

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--

Task ID	Task ID	Operations

threshold type consecutive, on page 254	Takes action after a number of consecutive violations.
threshold type immediate, on page 256	Takes action immediately upon a threshold violation.

timeout (IP SLA)

To set the probe or control timeout interval, use the **timeout** command in the appropriate configuration mode. To use the default value, use the **no** form of this command.

timeout *milliseconds*
no timeout

Syntax Description	<i>milliseconds</i> Sets the amount of time (in milliseconds) that the IP SLA operation waits for a response from the request packet. Range is 1 to 604800000.
---------------------------	--

Command Default	None.
------------------------	-------

Command Modes	IP SLA UDP echo configuration IP SLA UDP jitter configuration IP SLA ICMP path-jitter configuration IP SLA ICMP path-echo configuration IP SLA ICMP echo configuration IP SLA MPLS LSP ping configuration IP SLA MPLS LSP trace configuration IP SLA MPLS LSP monitor ping configuration IP SLA MPLS LSP monitor trace configuration
----------------------	--

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	If the timeout command is used in IP SLA operation mode, it configures the amount of time that a specific IP SLA operation waits for a response from the request packet. If the timeout command is used in IP SLA MPLS LSP monitor mode, it configures the amount of time that all operations associated with the monitored provider edge (PE) routers wait for a response from the request packet. This configuration is inherited by all LSP operations that are created automatically.
-------------------------	---

Note	The IP SLA responder needs at least one second to open a socket and program Local Packet Transport Services (LPTS). Therefore, configure the IP SLA timeout to at least 2000 milli seconds.
-------------	---

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **timeout** command in IP SLA UDP jitter configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# timeout 10000
```

The following example shows how to use the **timeout** command in IP SLA MPLS LSP monitor configuration mode:

```
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 2
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-ping)# timeout 10000
```

schedule operation, on page 196	Schedules an IP SLA operation.

tos

To set the type of service (ToS) in a probe packet, use the **tos** command in the appropriate configuration mode. To use the default value, use the **no** form of this command.

tos *number*

no **tos**

Syntax Description	<i>number</i> Type of service number. Range is 0 to 255.
---------------------------	--

Command Default	The type of service number is 0.
------------------------	----------------------------------

Command Modes	IP SLA UDP echo configuration IP SLA UDP jitter configuration IP SLA ICMP path-jitter configuration IP SLA ICMP path-echo configuration IP SLA ICMP echo configuration
----------------------	--

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The ToS value is an 8-bit field in IP headers. The field contains information, such as precedence and ToS. The information is useful for policy routing and for features like Committed Access Rate (CAR) in which routers examine ToS values. When the type of service is defined for an operation, the IP SLA probe packet contains the configured tos value in the IP header.
-------------------------	--

Task ID	Task ID	Operations
	monitor	read, write

Examples	The following example shows how to use the tos command in IP SLA UDP jitter configuration mode:
-----------------	--

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# tos 60
```

ttl

To specify the time-to-live (TTL) value in the MPLS label of echo request packets, use the **ttl** command in the appropriate configuration mode. To return to the default value, use the **no** form of this command.

ttl *time-to-live*
no ttl

Syntax Description

time-to-live Maximum hop count for an echo request packet. Valid values are from 1 to 255.

Command Default

For an MPLS LSP ping operation, the default time-to-live value is 255.
 For an MPLS LSP trace operations, the default time-to-live value is 30.

Command Modes

IP SLA MPLS LSP ping configuration
 IP SLA MPLS LSP trace configuration
 IP SLA MPLS LSP monitor ping configuration
 IP SLA MPLS LSP monitor trace configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **ttl** command to set the maximum number of hops allowed for echo request packets in an MPLS LSP ping or MPLS LSP trace operation. Note that the number of possible hops differs depending the type of IP SLA operation:

- For MPLS LSP ping operations, valid values are from 1 to 255 and the default is 255.
- For MPLS LSP trace operations, valid values are from 1 to 30 and the default is 30.

If the **ttl** command is used in IP SLA operation mode, it configures the time-to-live value for the specific operation being configured. If the **ttl** command is used in IP SLA MPLS LSP monitor mode, it configures the time-to-live value for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.

Task ID

Task ID	Operations
monitor	read, write

Examples

The following example shows how to use the **ttl** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
```

```
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp ping  
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-ping)# ttl 200
```

type mpls lsp ping

To verify the end-to-end connectivity of a label switched path (LSP) and the integrity of an MPLS network, use the **type mpls lsp ping** command in the appropriate configuration mode. To remove the operation, use the **no** form of this command.

type mpls lsp ping
no type mpls lsp ping

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values

Command Modes IP SLA operation configuration
 IP SLA MPLS LSP monitor definition configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **type mpls lsp ping** command to configure parameters for an IP SLA LSP ping operation. After you enter the command, you enter IP SLA MPLS LSP Ping configuration mode.

An MPLS LSP ping operation tests connectivity between routers along an LSP path in an MPLS network and measures round-trip delay of the LSP by using an echo request and echo reply.

The MPLS LSP ping operation verifies LSP connectivity by using one of the supported Forwarding Equivalence Class (FEC) entities between the ping origin and egress node of each FEC. The following FEC types are supported for an MPLS LSP ping operation:

- IPv4 LDP prefixes (configured with the [target ipv4, on page 244](#) command)
- MPLS TE tunnels (configured with the [target traffic-eng , on page 248](#) command)
- Pseudowire (configured with the [target pseudowire, on page 246](#) command)

For MPLS LSP monitor ping operations, only IPv4 LDP prefixes are supported.

If the **type mpls lsp ping** command is used in IP SLA operation configuration mode, it configures the parameters for the specific operation being configured. If the **type mpls lsp ping** command is used in IP SLA MPLS LSP monitor configuration mode, it configures the parameters for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.

Task ID	Task ID	Operations
	monitor	read, write

Examples The following example shows how to use the **type mpls lsp ping** command:

type mpls lsp ping

```

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mpls-lsp-ping)#

```

The following example shows how to use the **type mpls lsp ping** command in IP SLA MPLS LSP monitor configuration mode:

```

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 2
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp ping
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-ping)#

```

type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

type mpls lsp trace

To trace LSP paths and localize network faults in an MPLS network, use the **type mpls lsp trace** command in the appropriate configuration mode. To remove the operation, use the **no** form of this command.

```
type mpls lsp trace
no type mpls lsp trace
```

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes IP SLA operation configuration
IP SLA MPLS LSP monitor definition configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **type mpls lsp trace** command to configure parameters for an IP SLA LSP trace operation. After you enter the command, you enter IP SLA MPLS LSP Trace configuration mode.

An MPLS LSP trace operation traces the hop-by-hop route of LSP paths to a target router and measures the hop-by-hop round-trip delay for IPv4 LDP prefixes and TE tunnel FECs in an MPLS network. Echo request packets are sent to the control plane of each transit label switching router (LSR). A transit LSR performs various checks to determine if it is a transit LSR for the LSP path. A trace operation allows you to troubleshoot network connectivity and localize faults hop-by-hop.

In an MPLS LSP trace operation, each transit LSR returns information related to the type of Forwarding Equivalence Class (FEC) entity that is being traced. This information allows the trace operation to check if the local forwarding information matches what the routing protocols determine as the LSP path.

An MPLS label is bound to a packet according to the type of FEC used for the LSP. The following FEC types are supported for an MPLS LSP trace operation:

- LDP IPv4 prefixes (configured with the [target ipv4, on page 244](#) command)
- MPLS TE tunnels (configured with the [target traffic-eng , on page 248](#) command)

For MPLS LSP monitor trace operations, only IPv4 LDP prefixes are supported.

If the **type mpls lsp trace** command is used in IP SLA operation configuration mode, it configures the parameters for the specific operation being configured. If the **type mpls lsp trace** command is used in IP SLA MPLS LSP monitor configuration mode, it configures the parameters for all operations associated with the monitored provider edge (PE) routers. This configuration is inherited by all LSP operations that are created automatically.

Task ID	Task ID	Operations

Release	Modification				
Release 3.7.2	This command was introduced.				

Usage Guidelines Use the **vrf** command to configure a non-default VPN routing and forwarding (VRF) table for an IP SLA operation. A VPN is commonly identified using the name of a VRF table. If you use the **vrf** command in the configuration of an IP SLA operation, the *vrf-name* value is used to identify the VPN for the particular operation.

The default VRF table is used if no value is specified with the **vrf** command. If you enter a VPN name for an unconfigured VRF, the IP SLA operation fails and the following information is displayed in the results for the [show ipsla statistics, on page 216](#) command:

```
Latest operation return code : VrfNameError
```

The **vrf** command is supported only to configure the following IP SLA operations:

- IP SLA ICMP echo
- IP SLA ICMP path-echo
- IP SLA ICMP path-jitter
- IP SLA UDP echo
- IP SLA UDP jitter
- IP SLA MPLS LSP ping

- IP SLA MPLS LSP trace

Task ID	Task ID	Operations
	monitor	read, write

Examples

The following example shows how to use the **vrf** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type udp jitter
RP/0/RSP0/CPU0:router(config-ipsla-udp-jitter)# vrf vpn2
```

Related Commands

Command	Description
operation, on page 154	Configures an IP SLA operation.
schedule operation, on page 196	Schedules an IP SLA operation.
type udp jitter, on page 274	Configures an IP SLA UDP jitter operation.
type icmp echo, on page 266	Configures an IP SLA ICMP echo operation.
type icmp path-echo, on page 267	Configures an IP SLA ICMP path-echo operation.
type icmp path-jitter, on page 268	Configures an IP SLA ICMP path-jitter operation.
type udp echo, on page 273	Configures an IP SLA UDP echo operation.

vrf (IP SLA MPLS LSP monitor)

To specify which virtual routing and forwarding instance (VRF) is monitored in an IP SLA MPLS LSP monitor ping or trace, use the **vrf** command in the appropriate configuration mode. To revert to the monitoring of all VRFs, use the **no vrf** form of this command.

```
vrf vrf-name
no vrf
```

Syntax Description	<i>vrf-name</i> Name of the VRF. Maximum length is 32 alphanumeric characters.
---------------------------	--

Command Default	All VRFs are monitored.
------------------------	-------------------------

Command Modes	IP SLA MPLS LSP monitor ping configuration IP SLA MPLS LSP monitor trace configuration
----------------------	---

Command History	Release Modification
	Release 3.7.2 This command was introduced.

Usage Guidelines	The vrf command in IP SLA MPLS LSP monitor configuration mode specifies to monitor a specific VRF in ping and trace operations. The default is that all VRFs are monitored.
-------------------------	--

Task ID	Task ID Operations
	monitor read, write

Examples	The following example shows how to use the vrf command in IP SLA MPLS LSP monitor configuration mode:
-----------------	--

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# mpls lsp-monitor
RP/0/RSP0/CPU0:router(config-ipsla-mplslm)# monitor 2
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-def)# type mpls lsp trace
RP/0/RSP0/CPU0:router(config-ipsla-mplslm-lsp-trace)# vrf vpn-lsp
```

Related Commands	Command	Description
	monitor, on page 151	Configures an IP SLA MPLS LSP monitor instance.
	type mpls lsp ping, on page 269	Tests connectivity in an LSP path in an MPLS VPN.
	type mpls lsp trace, on page 271	Traces the hop-by-hop route of an LSP path in an MPLS VPN.

Logging Services Commands

This module describes the Cisco IOS XR software commands to configure system logging (syslog) for system monitoring on the router.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed information about logging concepts, configuration tasks, and examples, see the *Implementing Logging Services* module in the *System Monitoring Configuration Guide for Cisco ASR 9000 Series Routers*.

For alarm management and logging correlation commands, see the *Alarm Management and Logging Correlation Commands* module in the *System Monitoring Command Reference for Cisco ASR 9000 Series Routers*.

For detailed information about alarm and logging correlation concepts, configuration tasks, and examples, see the *Implementing Alarm Logs and Logging Correlation* module in the *System Monitoring Configuration Guide for Cisco ASR 9000 Series Routers*.

archive-length

To specify the length of time that logs are maintained in the logging archive, use the **archive-length** command in logging archive configuration mode. To return to the default, use the **no** form of this command.

archive-length *weeks*
no archive-length

Syntax Description	<i>weeks</i> Length of time (in weeks) that logs are maintained in the archive. Range is 0 to 4294967295.
---------------------------	---

Command Default	<i>weeks</i> : 4 weeks
------------------------	------------------------

Command Modes	Logging archive configuration
----------------------	-------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the archive-length command to specify the maximum number of weeks that the archive logs are maintained in the archive. Any logs older than this number are automatically removed from the archive.
-------------------------	---

Task ID	Task ID	Operations
	logging	read, write

Examples	This example shows how to set the log archival period to 6 weeks:
-----------------	---

```
RP/0/RSP0/CPU0:router(config)# logging archive
RP/0/RSP0/CPU0:router(config-logging-arch)# archive-length 6
```

archive-size

To specify the amount of space allotted for syslogs on a device, use the **archive-size** command in logging archive configuration mode. To return to the default, use the **no** form of this command.

archive-size *size*
no archive-size

Syntax Description	<i>size</i> Amount of space (in MB) allotted for syslogs. The range is 0 to 4294967295
---------------------------	--

Command Default	<i>size</i> : 20 MB
------------------------	---------------------

Command Modes	Logging archive configuration
----------------------	-------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the archive-length command to specify the maximum total size of the syslog archives on a storage device. If the size is exceeded, then the oldest file in the archive is deleted to make space for new logs.
-------------------------	---

Task ID	Task ID	Operations
	logging	read, write

Examples	This example shows how to set the allotted space for syslogs to 50 MB:
-----------------	--

```
RP/0/RSP0/CPU0:router(config)# logging archive
RP/0/RSP0/CPU0:router(config-logging-arch)# archive-size 50
```

clear logging

To clear system logging (syslog) messages from the logging buffer, use the **clear logging** command in EXEC mode.

clear logging

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **clear logging** command to empty the contents of the logging buffer. When the logging buffer becomes full, new logged messages overwrite old messages.

Use the [logging buffered, on page 296](#) command to specify the logging buffer as a destination for syslog messages, set the size of the logging buffer, and limit syslog messages sent to the logging buffer based on severity.

Use the [show logging, on page 329](#) command to display syslog messages stored in the logging buffer.

Task ID	Task ID	Operations
	logging	execute

Examples This example shows how to clear the logging buffer:

```
RP/0/RSP0/CPU0:router# clear logging
Clear logging buffer [confirm] [y/n] :y
```

Related Commands	Command	Description
	logging buffered, on page 296	Specifies the logging buffer as a destination for syslog messages, sets the size of the logging buffer, and limits syslog messages sent to the logging buffer based on severity.
	show logging, on page 329	Displays syslog messages stored in the logging buffer.

device

To specify the device to be used for logging syslogs, use the **device** command in logging archive configuration mode. To return to the default, use the **no** form of this command.

```
device {disk0 | disk1 | harddisk}
no device
```

Syntax Description	
disk0	Uses disk0 as the archive device.
disk1	Uses disk1 as the archive device.
harddisk	Uses the harddisk as the archive device.

Command Default	None
------------------------	------

Command Modes	Logging archive configuration
----------------------	-------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **device** command to specify where syslogs are logged. The logs are created under the directory <device>/var/log. If the device is not configured, then all other logging archive configurations are rejected. Similarly, the configured device cannot be removed until the other logging archive configurations are removed.

It is recommended that the syslogs be archived to the harddisk because it has more capacity.

Task ID	Task	Operations
	logging	read, write

Examples

This example shows how to specify disk1 as the device for logging syslog messages:

```
RP/0/RSP0/CPU0:router(config)# logging archive
RP/0/RSP0/CPU0:router(config-logging-arch)# device disk1
```

discriminator (logging)

To create a syslog message discriminator, use the **discriminator** command in Global Configuration mode. To disable the syslog message discriminator, use the **no** form of this command.

discriminator {**match1** | **match2** | **match2** | **match3** | **nomatch1** | **nomatch2** | **nomatch3**} *value*

Syntax Description	
match1	Specifies the first match keyword to filter the syslog messages.
match2	Specifies the second match keyword to filter the syslog messages.
match3	Specifies the third match keyword to filter the syslog messages.
nomatch1	Specifies the first keyword that does not match the syslog messages.
nomatch2	Specifies the second keyword that does not match the syslog messages.
nomatch3	Specifies the third keyword that does not match the syslog messages.
<i>value</i>	A string when matched in the syslog message, is included as the discriminator. If the pattern contains spaces, you must enclose it in quotes (" "). Regular expressions can also be used for value.

Command Default None

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 5.3.2	This command was introduced.
	Release 6.0.1	Discriminator for logging file was added.

Usage Guidelines The discriminator can be set to system log messages which is sent to different destination like logging buffer, logging console, logging monitor and remote server.

Task ID	Task ID	Operation
	logging	read, write

Example

This example shows how to set the discriminator for logging buffer:

```
RP/0/RSP0/CPU0:router(config)# logging buffered discriminator match1 sample
```

This example shows how to set the discriminator for logging console:

```
RP/0/RSP0/CPU0:router(config)# logging console discriminator match1 sample
```

This example shows how to set the discriminator for logging monitor:

```
RP/0/RSP0/CPU0:router(config)# logging monitor discriminator match1 sample
```

This example shows how to set the discriminator for logging file:

```
RP/0/RSP0/CPU0:router(config)# logging file file1 discriminator match1 sample
```

This example shows how to set the discriminator for remote server:

```
RP/0/RSP0/CPU0:router(config)# logging 10.0.0.0 vrf vrf1 discriminator match1 sample
```

file-size

To specify the maximum file size for a log file in the archive, use the **file-size** command in logging archive configuration mode. To return to the default, use the **no** form of this command.

file-size *size*
no file-size

Syntax Description

size Maximum file size (in MB) for a log file in the logging archive. The range is 1 to 2047.

Command Default

size: 1 MB

Command Modes

Logging archive configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **file-size** command to specify the maximum file size that a single log file in the archive can grow to. Once this limit is reached, a new file is automatically created with an increasing serial number.

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to set the maximum log file size to 10 MB:

```
RP/0/RSP0/CPU0:router(config)# logging archive
RP/0/RSP0/CPU0:router(config-logging-arch)# file-size 10
```

frequency (logging)

To specify the collection period for logs, use the **frequency** command in logging archive configuration mode. To return to the default, use the **no** form of this command.

```
frequency {daily | weekly}
no frequency
```

Syntax Description

daily Logs are collected daily.

weekly Logs are collected weekly.

Command Default

Logs are collected daily.

Command Modes

Logging archive configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **frequency** command to specify if logs are collected daily or weekly.

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to specify that logs are collected weekly instead of daily:

```
RP/0/RSP0/CPU0:router(config)# logging archive
RP/0/RSP0/CPU0:router(config-logging-arch)# frequency weekly
```

logging

To specify a system logging (syslog) server host as the recipient of syslog messages, use the **logging** command in Global Configuration mode. To remove the **logging** command from the configuration file and delete a syslog server from the list of syslog server hosts, use the **no** form of this command.

```
logging { IP-address | hostname } { [ severity { alerts | all | none | critical | debugging | emergencies
| error | facility | info | notifications } ] [ operator operation ] [ port number source-address ] [ vrf name
] }
```

```
no logging { IP-address | hostname } { [ severity { alerts | all | none | critical | debugging | emergencies
| error | info | notifications } ] [ operator operation ] [ port number ] [ vrf name ] }
```

Syntax Description

<i>IP-address hostname</i>	IP address or hostname of the host to be used as a syslog server.
severity	Set severity of messages for particular remote host/vrf.
{ all none } [port number] [vrf name]	All or no severity logs are logged to the syslog server, respectively. This set of options is added under severity . <ul style="list-style-type: none">• port number - For the <i>number</i> argument, you can use default option or the port number.
alerts	Specifies Immediate action needed
critical	Specifies Critical conditions
debugging	Specifies Debugging messages
emergencies	Specifies System is unusable
error	Specifies Error conditions
facility	Modifies message logging facilities.
info	Specifies Informational messages
notifications	Specifies Normal but significant conditions
source-address	Specifies source address of the logging host.
warning	Specifies Warning conditions
vrf <i>vrf-name</i>	Name of the VRF. Maximum length is 32 alphanumeric characters.

Command Default

No syslog server hosts are configured as recipients of syslog messages.

Command Modes

Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.1.0	The vrf keyword was added.
	Release 4.3	The severity keyword was added.
	Release 7.4.1	The all and none keywords were added under the logging severity command form.
	Release 7.10.1	The facility and source-address options per remote syslog server were introduced.

Usage Guidelines

Use the **logging** command to identify a syslog server host to receive messages. By issuing this command more than once, you build a list of syslog servers that receive messages.

When syslog messages are sent to a syslog server, the Cisco IOS XR software includes a numerical message identifier in syslog messages. The message identifier is cumulative and sequential. The numerical identifier included in syslog messages sent to syslog servers provides a means to determine if any messages have been lost.

Use the [logging trap, on page 323](#) command to limit the messages sent to snmp server.

Amongst other options, **all** and **none** are provided under the **logging severity** command form. If you enable **all** or **none**, all or no severity logs are logged to the syslog server, respectively. This configuration persists even when you enable a specific operator type.

The configurations for **facility** and **source-address** per remote syslog server takes priority over global configuration.

Examples

This example shows how to log messages to a host named host1:

```
RP/0/RSP0/CPU0:router(config)# logging host1
RP/0/RSP0/CPU0:router(config)#logging A.B.C.D
  severity Set severity of messages for particular remote host/vrf
  vrf      Set VRF option
RP/0/RSP0/CPU0:router(config)#logging A.B.C.D
RP/0/RSP0/CPU0:router(config)#commit
Wed Nov 14 03:47:58.976 PST

RP/0/RSP0/CPU0:router(config)#do show run logging
Wed Nov 14 03:48:10.816 PST
logging A.B.C.D vrf default severity info
```

Note Default level is severity info.

Configuration Example for Facility and Source-address Per Remote Syslog Server

This example shows how to configure **facility** and **source-address** per remote syslog server:

```
Router#configure
Router(config)#
Router(config)#logging 209.165.201.1 source-address 209.165.201.2
Router(config)#logging 209.165.201.1 facility local2
Router(config)#commit
```

Related Commands

Command	Description
logging trap, on page 323	Limits the messages sent to snmp server.

logging archive

To configure attributes for archiving syslog, use the **logging archive** command in Global Configuration mode. To exit the **logging archive** submode, use the **no** form of this command.

logging archive {**archive-length** | **archive-size** | **device** | **file-size** | **frequency** | **severity** | **threshold**}
no logging archive

Syntax Description

archive-length	Maximum no of weeks that the log is maintained. Minimum number of week is 1 and the maximum number of weeks are 256. Recommended is 4 weeks.
archive-size	Total size of the archive. Value range from 1 MB to 2047 MB. Recommended is 20 MB.
device	Use configured devices (disk0 disk1 haddisk) as the archive device. Recommended is haddisk.
file-size	Maximum file size for a single log file. Value range from 1 MB to 2047 MB. Recommended is 1 MB.
frequency	Collection interval (daily or weekly) for logs. Recommend is daily.
severity	Specifies the filter levels for log messages to archive. <ul style="list-style-type: none"> • alerts - Immediate action needed (severity=1) • critical - Critical conditions (severity=2) • debugging - Debugging messages (severity=7) • emergencies - System is unusable (severity=0) • errors - Error conditions (severity=3) • informational - Informational messages (severity=6) • notifications - Normal but significant conditions (severity=5) • warnings Warning conditions (severity=4) <p>Recommended is informational (severity=6).</p>
threshold	Percentage threshold at which a syslog is generated.

Command Default None

Command Modes Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 5.3.2	The threshold keyword was added.

Usage Guidelines

Use the **logging archive** command to configure attributes for archiving syslogs. This command enters logging archive configuration mode and allows you to configure the commands.

Note The configuration attributes must be explicitly configured in order to use the logging archive feature.

Task ID

Task ID	Operations
---------	------------

logging	read, write
---------	----------------

Examples

This example shows how to enter logging archive configuration mode and change the device to be used for logging syslogs to disk1:

```
RP/0/RSP0/CPU0:router(config)# logging archive
RP/0/RSP0/CPU0:router(config-logging-arch)# device disk1
```

logging buffered

To send system logging (syslog) messages to logging buffer, use the **logging buffered** command in Global Configuration mode. To return to the default, use the **no** form of the **logging buffered** command.

```
logging buffered { buffer-size | | alerts | critical | | debugging | | discriminator | | emergencies
| errors | | informational | | notifications | | warnings | | entries-count count }
```

Syntax Description

<i>buffer-size</i>	Size of the buffer, in bytes. Range is 2097152-125000000 bytes. The default is 2097152 bytes.
entries-count <i>count</i>	Specifies the buffer entries-count of syslog messages you want to see. The default value is 2545. The range is 2545-151699.
alerts	Specifies if any immediate action is needed
critical	Specifies critical conditions
debugging	Specifies debugging messages
discriminator	Sets logging buffer discriminator
emergencies	Specifies system is unusable
informational	Specifies informational messages
notifications	Specifies normal but significant conditions
warnings	Specifies warning conditions

Command Default

None

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.0.0	The value of size argument is changed from 4096 to 307200.
Release 7.11.1	This command was modified to include entries-count option.

Usage Guidelines

Use the **logging buffered** command to copy messages to the logging buffer. The logging buffer is circular, so newer messages overwrite older messages after the buffer is filled. This command is related to the **show logging buffer** command, which means that when you execute a **logging buffered warnings** command, it enables the logging for all the levels below the configured level, including log for LOG_ERR, LOG_CRIT, LOG_ALERT, LOG_EMERG, and LOG_WARNING messages. Use the **logging buffersize** to specify the size of the buffer. Use the **logging buffer entries-count** command to specify the count of syslog entries.

If both the **logging buffered bytes** and **logging buffered entries-count** commands are present, then the maximum configured value is taken to display the number of system log messages.

Task ID	Task ID	Operations
	logging	read, write

Examples

This example shows the configuration for sending syslog messages to the logging buffer:

```
RP/0/RSP0/CPU0:router(config)# logging buffered 3000000
```

This example shows how to specify the count of syslog entries.

```
Router# configure
Router(config)# logging buffered entries-count 3000
Router(config)# commit
```

Related Commands	Command	Description
	archive-size, on page 284	Clears messages from the logging buffer.
	show logging, on page 329	Displays syslog messages stored in the logging buffer.

logging console

To enable logging of system logging (syslog) messages logged to the console by severity level, use the **logging console** command in Global Configuration mode. To return console logging to the default setting, use the **no** form of this command.

```
logging console { severity | disable }
no logging console
```

Syntax Description	<p><i>severity</i> Severity level of messages logged to the console, including events of a higher severity level (numerically lower). The default is informational. Settings for the severity levels and their respective system conditions are listed in the table under the “Usage Guidelines” section.</p> <p>disable Removes the logging console command from the configuration file and disables logging to the console terminal.</p>
---------------------------	---

Command Default	By default, logging to the console is enabled. <i>severity</i> : informational
------------------------	--

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

Usage Guidelines	<p>Use the logging console command to prevent debugging messages from flooding your screen.</p> <p>The logging console is for the console terminal. The value specified for the <i>severity</i> argument causes messages at that level and at numerically lower levels (higher severity levels) to be displayed on the console.</p> <p>Use the logging console disable command to disable console logging completely.</p> <p>Use the no logging console command to return the configuration to the default setting.</p> <p>Use the show logging command to display syslog messages stored in the logging buffer.</p> <p>The value specified for the <i>severity</i> argument causes messages at that level and at numerically lower levels to be displayed on the console terminal. See the table for a list of the possible severity level keywords for the <i>severity</i> argument.</p> <p>This table describes the acceptable severity levels for the <i>severity</i> argument.</p>
-------------------------	--

Table 29: Severity Levels for Messages

Level Keywords	Level	Description	Syslog Definition
emergencies	0	Unusable system	LOG_EMERG
alerts	1	Need for immediate action	LOG_ALERT
critical	2	Critical condition	LOG_CRIT

Level Keywords	Level	Description	Syslog Definition
errors	3	Error condition	LOG_ERR
warnings	4	Warning condition	LOG_WARNING
notifications	5	Normal but significant condition	LOG_NOTICE
informational	6	Informational message only	LOG_INFO
debugging	7	Debugging message	LOG_DEBUG

Task ID**Task Operations ID**

logging read,
write

Examples

This example shows how to change the level of messages displayed on the console terminal to **alerts** (1), which means that **alerts** (1) and **emergencies** (0) are displayed:

```
RP/0/RSP0/CPU0:router(config)# logging console alerts
```

This example shows how to disable console logging:

```
RP/0/RSP0/CPU0:router(config)# logging console disable
```

This example shows how to return console logging to the default setting (the console is enabled, *severity*: **informational**):

```
RP/0/RSP0/CPU0:router# no logging console
```

Related Commands

Command	Description
show logging, on page 329	Displays syslog messages stored in the logging buffer.

logging console disable

To disable logging of system logging (syslog) messages logged to the console, use the **logging console disable** command in Global Configuration mode. To return logging to the default setting, use the **no** form of this command.

logging consoledisable
no logging consoledisable

Syntax Description This command has no keywords or arguments.

Command Default By default, logging is enabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **logging console disable** command to disable console logging completely.
 Use the **no logging console disable** command to return the configuration to the default setting.

Task ID	Task ID	Operations
	logging	read, write

Examples This example shows how to disable syslog messages:

```
RP/0/RSP0/CPU0:router(config)# logging console disable
```

logging events link-status

To enable the logging of link-status system logging (syslog) messages for logical and physical links, use the **logging events link-status** command in Global Configuration mode. To disable the logging of link status messages, use the **no** form of this command.

```
logging events link-status {disable | software-interfaces}
no logging events link-status [{disable | software-interfaces}]
```

Syntax Description	disable	Disables the logging of link-status messages for all interfaces, including physical links.
	software-interfaces	Enables the logging of link-status messages for logical links as well as physical links.

Command Default The logging of link-status messages is enabled for physical links.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines When the logging of link-status messages is enabled, the router can generate a high volume of link-status up and down system logging messages.

Use the **no logging events link-status** command to enable the logging of link-status messages for physical links only, which is the default behavior.

Note Enabling the [logging events link-status \(interface\), on page 302](#) command on a specific interface overrides the global configuration set using the **logging events link-status** command described in this section.

Task ID	Task ID	Operations
	logging	read, write

Examples This example shows how to disable the logging of physical and logical link-status messages:

```
RP/0/RSP0/CPU0:router(config)# logging events link-status disable
```

Related Commands	Command	Description
	logging events link-status (interface), on page 302	Enables the logging of link-status system logging (syslog) messages on a specific interface for virtual interfaces and subinterfaces.

logging events link-status (interface)

To enable the logging of link-status system logging (syslog) messages on a specific interface for virtual interfaces and subinterfaces, use the **logging events link-status** command in the appropriate interface or subinterface mode. To disable the logging of link status messages, use the **no** form of this command.

logging events link-status
no logging events link-status

Syntax Description	This command has no keywords or arguments.				
Command Default	The logging of link-status messages is disabled for virtual interfaces and subinterfaces.				
Command Modes	Interface configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

Usage Guidelines When the logging of link-status messages is enabled, the router can generate a high volume of link-status up and down system logging messages. The **logging events link-status** command enables messages for virtual interfaces and subinterfaces only.

The **logging events link-status** command allows you to enable and disable logging on a specific interface for bundles, tunnels, and VLANs.

Use the **no logging events link-status** command to disable the logging of link-status messages.

Note Enabling the **logging events link-status** command on a specific interface overrides the global configuration set using the [logging events link-status, on page 301](#) command in global configuration mode.

Task ID	Task ID	Operations
	logging	read, write

Examples

This example shows the results of turning on logging for a bundle interface:

```
RP/0/RSP0/CPU0:router(config)# int bundle-GigabitEthernet 1
RP/0/RSP0/CPU0:router(config-if)# logging events link-status
RP/0/RSP0/CPU0:router(config-if)# no shutdown
RP/0/RSP0/CPU0:router(config-if)# commit

LC/0/4/CPU0:Jun 29 12:51:26.887 : ifmgr[142]:
%PKT_INFRA-LINK-3-UPDOWN : Interface GigabitEthernet0/4/0/0, changed state to Up

LC/0/4/CPU0:Jun 29 12:51:26.897 : ifmgr[142]:
```

```

%PKT_INFRA-LINEPROTO-6-UPDOWN : Line protocol on Interface GigabitEthernet0/4/0/0, changed
state to Up

RP/0/RSP0/CPU0:router(config-if)#
RP/0/RSP0/CPU0:router(config-if)# shutdown
RP/0/RSP0/CPU0:router(config-if)# commit

LC/0/4/CPU0:Jun 29 12:51:32.375 : ifmgr[142]:
%PKT_INFRA-LINK-3-UPDOWN : Interface GigabitEthernet0/4/0/0, changed state to Down

LC/0/4/CPU0:Jun 29 12:51:32.376 : ifmgr[142]:
%PKT_INFRA-LINEPROTO-6-UPDOWN : Line protocol on Interface GigabitEthernet0/4/0/0, changed
state to Down

```

This example shows a sequence of commands for a tunnel interface with and without logging turned on:

```

RP/0/RSP0/CPU0:router(config)# int tunnel-te 1
RP/0/RSP0/CPU0:router(config-if)# commit
RP/0/RSP0/CPU0:router(config-if)# shutdown
RP/0/RSP0/CPU0:router(config-if)# commit
RP/0/RSP0/CPU0:router(config-if)# no shutdown
RP/0/RSP0/CPU0:router(config-if)# commit
RP/0/RSP0/CPU0:router(config-if)# logging events link-status
RP/0/RSP0/CPU0:router(config-if)# commit
RP/0/RSP0/CPU0:router(config-if)# shutdown
RP/0/RSP0/CPU0:router(config-if)# commit

RP/0/RSP0/CPU0:Jun 29 14:05:57.732 : ifmgr[176]:
%PKT_INFRA-LINK-3-UPDOWN : Interface tunnel-te1, changed state to Administratively Down

RP/0/RSP0/CPU0:Jun 29 14:05:57.733 : ifmgr[176]:
%PKT_INFRA-LINEPROTO-6-UPDOWN : Line protocol on Interface tunnel-te1, changed state to
Administratively Down

RP/0/RSP0/CPU0:router(config-if)# no shutdown
RP/0/RSP0/CPU0:router(config-if)# commit

RP/0/RSP0/CPU0:Jun 29 14:06:02.104 : ifmgr[176]:
%PKT_INFRA-LINK-3-UPDOWN : Interface tunnel-te1, changed state to Down

RP/0/RSP0/CPU0:Jun 29 14:06:02.109 : ifmgr[176]:
%PKT_INFRA-LINEPROTO-6-UPDOWN : Line protocol on Interface tunnel-te1, changed state to
Down

```

This example shows the same process for a subinterface:

```

RP/0/RSP0/CPU0:router(config)# int gigabitEthernet 0/5/0/0.1
RP/0/RSP0/CPU0:router(config-subif)# commit
RP/0/RSP0/CPU0:router(config-subif)# shutdown
RP/0/RSP0/CPU0:router(config-subif)# commit
RP/0/RSP0/CPU0:router(config-subif)# no shutdown
RP/0/RSP0/CPU0:router(config-subif)# commit
RP/0/RSP0/CPU0:router(config-subif)# logging events link-status
RP/0/RSP0/CPU0:router(config-subif)# commit
RP/0/RSP0/CPU0:router(config-subif)# shutdown
RP/0/RSP0/CPU0:router(config-subif)# commit

LC/0/5/CPU0:Jun 29 14:06:46.710 : ifmgr[142]:
%PKT_INFRA-LINEPROTO-6-UPDOWN : Line protocol on Interface GigabitEthernet0/5/0/0.1, changed

state to Down
```

logging facility

To configure the type of syslog facility in which system logging (syslog) messages are sent to syslog servers, use the **logging facility** command in Global Configuration mode. To remove the **logging facility** command from the configuration file and disable the logging of messages to any facility type, use the **no** form of this command.

logging facility [*type*]
no logging facility

Syntax Description	<i>type</i> (Optional) Syslog facility type. The default is local7 . Possible values are listed under Table 30: Facility Type Descriptions , on page 305 in the “Usage Guidelines” section.				
Command Default	<i>type</i> : local7				
Command Modes	Global Configuration mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	This table describes the acceptable options for the <i>type</i> argument.				

Table 30: Facility Type Descriptions

Facility Type	Description
auth	Authorization system
cron	Cron/at facility
daemon	System daemon
kern	Kernel
local0	Reserved for locally defined messages
local1	Reserved for locally defined messages
local2	Reserved for locally defined messages
local3	Reserved for locally defined messages
local4	Reserved for locally defined messages
local5	Reserved for locally defined messages
local6	Reserved for locally defined messages
local7	Reserved for locally defined messages

Facility Type	Description
lpr	Line printer system
mail	Mail system
news	USENET news
sys9	System use
sys10	System use
sys11	System use
sys12	System use
sys13	System use
sys14	System use
syslog	System log
user	User process
uucp	UNIX-to-UNIX copy system

Use the [logging, on page 291](#) command to specify a syslog server host as a destination for syslog messages.

Task ID	Task ID	Operations
	logging	read, write

Examples

This example shows how to configure the syslog facility to the **kern** facility type:

```
RP/0/RSP0/CPU0:router(config)# logging facility kern
```

Related Commands

Command	Description
logging, on page 291	Specifies a syslog server host as a destination for syslog messages.

logging file

To specify the file logging destination, use the **logging file** command in Global Configuration mode. To remove the file logging destination, use the **no** form of this command.

logging file *filename* [**discriminator** {**match** | **nomatch**}] [**path** *pathname* {**maxfilesize** | **severity**}]
no logging file

Syntax Description	
<i>filename</i>	Specifies the filename of the file to display.
discriminator	Specifies the match or nomatch syslog discriminator. See discriminator (logging), on page 287
path <i>pathname</i>	Specifies the location to save the logging file.
maxfilesize	(optional) Specifies the maximum file size of the logging file in bytes. Range is from 1 to 2097152 (in KB). Default is 2 GB.
severity	(optional) Specifies the severity level for the logging file. Default is informational. <ul style="list-style-type: none"> • alerts Immediate action needed (severity=1) • critical Critical conditions (severity=2) • debugging Debugging messages (severity=7) • emergencies System is unusable (severity=0) • errors Error conditions (severity=3) • informational Informational messages (severity=6) • notifications Normal but significant conditions (severity=5) • warnings Warning conditions (severity=4)

Command Default None

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 6.0.1	This command was introduced.

Usage Guidelines Use the **logging file** command to set the logging file destination. To set the logging file discriminator you have to specify the file name. If it exceeds the maximum file size, then a wrap occurs.

Task ID	Task ID	Operation
	logging	read, write

Example

This example shows how to set the maximum file size for the defined file destination:

```
RP/0/RSP0/CPU0:router(config)# logging file file1 path /harddisk:/logfiles/ maxfilesize  
2048
```

logging format bsd

To send system logging messages to a remote server in Berkeley Software Distribution (BSD) format, use the **logging format bsd** command in Global Configuration mode. To return console logging to the default setting, use the **no** form of this command.

logging format bsd

Syntax Description

format Specifies the format of the syslog messages sent to the server.

bsd Configures the format of the syslog messages according to the BSD format.

Command Default

By default, this feature is disabled.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 7.1.2	This command was introduced.

Usage Guidelines

None.

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to log messages to a server, in the BSD format:

```
Router(config)#logging 209.165.200.225 vrf default severity info
Router(config)#logging format bsd
Router(config)#commit
```

```
Router(config)#do show run logging
logging format bsd
logging 209.165.200.225 vrf default severity info
```

logging history

To change the severity level of system logging (syslog) messages sent to the history table on the router and a Simple Network Management Protocol (SNMP) network management station (NMS), use the **logging history** command in Global Configuration mode. To remove the **logging history** command from the configuration and return the logging of messages to the default level, use the **no** form of this command.

logging history *severity*

no logging history

Syntax Description

severity Severity level of messages sent to the history table on the router and an SNMP NMS, including events of a higher severity level (numerically lower). Settings for the severity levels and their respective system conditions are listed in [#unique_165 unique_165_Connect_42_tab_1365648](#) under the “Usage Guidelines” section for the **logging buffered** command.

Command Default

severity: **warnings**

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Logging of messages to an SNMP NMS is enabled by the **snmp-server enable traps** command. Because SNMP traps are inherently unreliable and much too important to lose, at least one syslog message, the most recent message, is stored in a history table on the router.

Use the **logging history** command to reflect the history of last 500 syslog messages. For example, when this command is issued, the last 500 syslog messages with severity less than warning message are displayed in the output of **show logging history** command.

Use the [show logging history, on page 333](#) command to display the history table, which contains table size, message status, and message text data.

Use the [logging history size, on page 312](#) command to change the number of messages stored in the history table.

The value specified for the *severity* argument causes messages at that severity level and at numerically lower levels to be stored in the history table of the router and sent to the SNMP NMS. Severity levels are numbered 0 to 7, with 1 being the most important message and 7 being the least important message (that is, the lower the number, the more critical the message). For example, specifying the level critical with the **critical** keyword causes messages at the severity level of **critical** (2), **alerts** (1), and **emergencies** (0) to be stored in the history table and sent to the SNMP NMS.

The **no logging history** command resets the history level to the default.

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to change the level of messages sent to the history table and to the SNMP server to **alerts** (1), which means that messages at the severity level of **alerts** (1) and **emergencies** (0) are sent:

```
RP/0/RSP0/CPU0:router(config)# logging history alerts
```

Related Commands

Command	Description
logging history size, on page 312	Changes the number of messages stored in the history table.
show logging history, on page 333	Displays information about the state of the syslog history table.

logging history size

To change the number of system logging (syslog) messages that can be stored in the history table, use the **logging history size** command in Global Configuration mode. To remove the **logging history size** command from the configuration and return the number of messages to the default value, use the **no** form of this command.

logging history size *number*

no logging history *number*

Syntax Description	<i>number</i> Number from 1 to 500 indicating the maximum number of messages that can be stored in the history table. The default is 1 message.
---------------------------	---

Command Default	<i>number</i> : 1 message
------------------------	---------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	<p>Use the logging history size command to change the number of messages that can be stored in this history table. When the history table is full (that is, when it contains the maximum number of messages specified with the command), the oldest message is deleted from the table to allow the new message to be stored.</p> <p>Use the logging history, on page 310 command to change the severity level of syslog messages stored in the history file and sent to the SNMP server.</p>
-------------------------	---

Task ID	Task ID	Operations
	logging	read, write

Examples	This example shows how to set the number of messages stored in the history table to 20:
-----------------	---

```
RP/0/RSP0/CPU0:router(config)# logging history size 20
```

Related Commands	Command	Description
	logging history, on page 310	Changes the severity level of syslog messages stored in the history file and sent to the SNMP server.
	show logging history, on page 333	Displays information about the state of the syslog history table.

logging hostnameprefix

To append a hostname prefix to system logging (syslog) messages logged to syslog servers, use the **logging hostnameprefix** command in Global Configuration mode. To remove the **logging hostnameprefix** command from the configuration file and disable the logging host name prefix definition, use the **no** form of this command.

```
logging hostnameprefix hostname
no logging hostnameprefix
```

Syntax Description

hostname Hostname that appears in messages sent to syslog servers.

Command Default

No hostname prefix is added to the messages logged to the syslog servers.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **logging hostnameprefix** command to append a hostname prefix to messages sent to syslog servers from the router. You can use these prefixes to sort the messages being sent to a given syslog server from different networking devices.

Use the [logging, on page 291](#) command to specify a syslog server host as a destination for syslog messages.

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to add the hostname prefix host1 to messages sent to the syslog servers from the router:

```
RP/0/RSP0/CPU0:router(config)# logging hostnameprefix host1
```

Related Commands

Command	Description
logging, on page 291	Specifies a syslog server host as a destination for syslog messages.

logging ipv4/ipv6

To configure the differentiated services code point (DSCP) or the precedence value for the IPv4 or IPv6 header of the syslog packet in the egress direction, use the **logging** {**ipv4** | **ipv6**} command in EXEC mode. To remove the configured DSCP or precedence value, use the **no** form of this command.

```
logging {ipv4 | ipv6} {dscp dscp-value | precedence {numbername}}
```

```
no logging {ipv4 | ipv6} {dscp dscp-value | precedence {numbername}}
```

Syntax Description	ipv4 / ipv6	Sets the DSCP or precedence bit for IPv4 or IPv6 packets.
	dscp <i>dscp-value</i>	Specifies differentiated services code point value or per hop behavior values (PHB). For more information on PHB values, see Usage Guideline section below. The range is from 0 to 63. The default value is 0.
	precedence { <i>number</i> <i>name</i> }	Sets Type of Service (TOS) precedence value. You can specify either a precedence number or name. The range of argument <i>number</i> is between 0 to 7. The <i>name</i> argument has following keywords: <ul style="list-style-type: none"> • routine—Match packets with routine precedence (0) • priority—Match packets with priority precedence (1) • immediate—Match packets with immediate precedence (2) • flash—Match packets with flash precedence (3) • flash-override—Match packets with flash override precedence (4) • critical—Match packets with critical precedence (5) • internet—Match packets with internetwork control precedence (6) • network—Match packets with network control precedence (7)
Command Default	None.	
Command Modes	EXEC mode	
Command History	Release	Modification
	Release 5.1.1	The ipv4 and ipv6 keywords were added.
Usage Guidelines	By specifying PHB values you can further control the format of locally generated syslog traffic on the network. You may provide these PHB values: <ul style="list-style-type: none"> • af11—Match packets with AF11 DSCP (001010) • af12—Match packets with AF12 dscp (001100) 	

- af13—Match packets with AF13 dscp (001110)
- af21— Match packets with AF21 dscp (010010)
- af22—Match packets with AF22 dscp (010100)
- af23—Match packets with AF23 dscp (010110)
- af31—Match packets with AF31 dscp (011010)
- af32—Match packets with AF32 dscp (011100)
- af33—Match packets with AF33 dscp (011110)
- af41—Match packets with AF41 dscp (100010)
- af42—Match packets with AF42 dscp (100100)
- af43— Match packets with AF43 dscp (100110)
- cs1—Match packets with CS1(precedence 1) dscp (001000)
- cs2—Match packets with CS2(precedence 2) dscp (010000)
- cs3—Match packets with CS3(precedence 3) dscp (011000)
- cs4—Match packets with CS4(precedence 4) dscp (100000)
- cs5—Match packets with CS5(precedence 5) dscp (101000)
- cs6—Match packets with CS6(precedence 6) dscp (110000)
- cs7—Match packets with CS7(precedence 7) dscp (111000)
- default—Match packets with default dscp (000000)
- ef—Match packets with EF dscp (10111)

Assured Forwarding (AF) PHB group is a means for a provider DS domain to offer different levels of forwarding assurances for IP packets. The Assured Forwarding PHB guarantees an assured amount of bandwidth to an AF class and allows access to additional bandwidth, if obtainable.

For example AF PHB value af11 - Match packets with AF11 DSCP (001010), displays the DSCP values as 10 and 11. The DSCP bits are shown as 001010 and 001011 .

AF11 stands for:

- Assured forwarding class 1 (001)
- Drop priority 100 (1)
- Dropped last in AF1 class

Similarly AF PHB value af12 - Match packets with AF12 dscp (001100), displays the DSCP values as 12 and 13. The DSCP bits are shown as 001100 and 001101.

AF12 stands for:

- Assured forwarding class 1 (001)
- Drop priority 100 (2)

- Dropped second in AF1 class

Class Selector (CS) provides backward compatibility bits,

CS PHB value cs1 - Match packets with CS1(precedence 1) dscp (001000)

CS1 stands for:

- CS1 DSCP bits are displayed as 001000 and 001001
- priority stated as 1

Expedited Forwarding (EF) PHB is defined as a forwarding treatment to build a low loss, low latency, assured bandwidth, end-to-end service. These characteristics are suitable for voice, video and other realtime services.

EF PHB Value ef - Match packets with EF dscp (101110) - this example states the recommended EF value (used for voice traffic).

Task ID	Task ID	Operation
	logging	read, write

Example

This example shows how to configure DSCP value as 1 for IPv4 header of syslog packet.

```
RP/0/RSP0/CPU0:router(config)#logging ipv4 dscp 1
```

This example shows how to configure DSCP value as 21 for IPv6 header of syslog packet.

```
RP/0/RSP0/CPU0:router(config)#logging ipv6 dscp 21
```

This example shows how to configure precedence value as 5 for IPv6 header of syslog packet.

```
RP/0/RSP0/CPU0:router(config)#logging ipv6 precedence 5
```

logging localfilesize

To specify the size of the local logging file, use the **logging localfilesize** command in Global Configuration mode. To remove the **logging localfilesize** command from the configuration file and restore the system to the default condition, use the **no** form of this command.

logging localfilesize *bytes*
no logging localfilesize *bytes*

Syntax Description	<i>bytes</i> Size of the local logging file in bytes. Range is 0 to 4294967295. Default is 32000 bytes.
---------------------------	---

Command Default	<i>bytes</i> : 32000 bytes
------------------------	----------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the logging localfilesize command to set the size of the local logging file.
-------------------------	---

Task ID	Task	Operations
	logging	read, write

Examples	This example shows how to set the local logging file to 90000 bytes:
-----------------	--

```
RP/0/RSP0/CPU0:router(config)# logging localfilesize 90000
```

Related Commands	Command	Description
	show logging, on page 329	Displays syslog messages stored in the logging buffer.

logging monitor

To specify terminal lines other than the console terminal as destinations for system logging (syslog) messages and limit the number of messages sent to terminal lines based on severity, use the **logging monitor** command in Global Configuration mode. To remove the **logging monitor** command from the configuration file and disable logging to terminal lines other than the console line, use the **no** form of this command.

logging monitor [*severity*]

no logging monitor

Syntax Description

severity (Optional) Severity level of messages logged to the terminal lines, including events of a higher severity level (numerically lower). The default is **debugging**. Settings for the severity levels and their respective system conditions are listed under [#unique_165 unique_165_Connect_42_tab_1365648](#) in the “Usage Guidelines” section for the **logging buffered** command.

Command Default

severity: **debugging**

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **logging monitor** is for the terminal monitoring. Use the **logging monitor** command to restrict the messages displayed on terminal lines other than the console line (such as virtual terminals). The value set for the *severity* argument causes messages at that level and at numerically lower levels to be displayed on the monitor.

Use the [terminal monitor, on page 335](#) command to enable the display of syslog messages for the current terminal session.

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to set the severity level of messages logged to terminal lines to errors:

```
RP/0/RSP0/CPU0:router(config)# logging monitor errors
```

Related Commands

Command	Description
terminal monitor, on page 335	Enables the display of syslog messages for the current terminal session.

logging source-interface

To set all system logging (syslog) messages being sent to syslog servers to contain the same IP address, regardless of which interface the syslog message uses to exit the router, use the **logging source-interface** command in Global Configuration mode. To remove the **logging source-interface** command from the configuration file and remove the source designation, use the **no** form of this command.

logging source-interface *type interface-path-id*
no logging source-interface

Syntax Description	<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
	<i>interface-path-id</i>	Physical interface or virtual interface.
	Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.

Command Default No source IP address is specified.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Normally, a syslog message contains the IP address of the interface it uses to leave the networking device. Use the **logging source-interface** command to specify that syslog packets contain the IP address of a particular interface, regardless of which interface the packet uses to exit the networking device.

Use the [logging, on page 291](#) command to specify a syslog server host as a destination for syslog messages.

Task ID	Task ID	Operations
	logging	read, write

Examples This example shows how to specify that the IP address for GigabitEthernet interface 0/1/0/1 be set as the source IP address for all messages:

```
RP/0/RSP0/CPU0:router(config)# logging source-interface GigabitEthernet 0/1/0/1
```

Related Commands

Command	Description
logging, on page 291	Specifies a syslog server host as a destination for syslog messages.

logging suppress deprecated

To prevent the logging of messages to the console to indicate that commands are deprecated, use the **logging suppress deprecated** command in Global Configuration mode. To remove the **logging suppress deprecated** command from the configuration file, use the **no** form of this command.

logging suppress deprecated
no logging suppress deprecated

Syntax Description	This command has no keywords or arguments.				
Command Default	Console messages are displayed when deprecated commands are used.				
Command Modes	Global Configuration mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	The logging suppress deprecated command affects messages to the console only.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>logging</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	logging	read, write
Task ID	Operations				
logging	read, write				

Examples

This example shows how to suppress the consecutive logging of deprecated messages:

```
RP/0/RSP0/CPU0:router(config)# logging suppress deprecated
```

logging suppress duplicates

To prevent the consecutive logging of more than one copy of the same system logging (syslog) message, use the **logging suppress duplicates** command in Global Configuration mode. To remove the **logging suppress duplicates** command from the configuration file and disable the filtering process, use the **no** form of this command.

logging suppress duplicates
no logging suppress duplicates

Syntax Description This command has no keywords or arguments.

Command Default Duplicate messages are logged.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you use the **logging suppress duplicates** command during debugging sessions, you might not see all the repeated messages and could miss important information related to problems that you are attempting to isolate and resolve. In such a situation, you might consider disabling this command.

Task ID	Task	Operations
	logging	read, write

Examples This example shows how to suppress the consecutive logging of duplicate messages:

```
RP/0/RSP0/CPU0:router(config)# logging suppress duplicates
```

Related Commands	Command	Description
	logging, on page 291	Specifies a syslog server host as a destination for syslog messages.
	logging buffered, on page 296	Specifies the logging buffer as a destination for syslog messages, sets the size of the logging buffer, and limits the syslog messages sent to the logging buffer based on severity.
	logging monitor, on page 318	Specifies terminal lines other than the console terminal as destinations for syslog messages and limits the number of messages sent to terminal lines based on severity.

logging trap

To specify the severity level of messages logged to snmp server, use the **logging trap** command in Global Configuration mode. To restore the default behavior, use the **no** form of this command.

logging trap [*severity*]
no logging trap

Syntax Description

severity (Optional) Severity level of messages logged to the snmp server, including events of a higher severity level (numerically lower). The default is **informational**. Settings for the severity levels and their respective system conditions are listed under Table 1 in the “Usage Guidelines” section for the [logging console](#) command.

Command Default

severity: **informational**

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.3	Change in the behavior of logging trap and logging severity for snmp and syslog servers.

Usage Guidelines

Use the **logging trap** command to limit the logging of messages sent to snmp servers to only those messages at the specified level.

The “Usage Guidelines” section for the logging console command lists the syslog definitions that correspond to the debugging message levels.

Use the [logging](#) command to specify a syslog server host as a destination for syslog messages.

The **logging trap disable** will disable the logging of messages to both snmp server and syslog servers.

Task ID

Task ID	Operations
logging	read, write

Examples

This example shows how to restrict messages to **notifications** (5) and numerically lower levels.

```
RP/0/RSP0/CPU0:router(config)# logging trap notifications
```

Related Commands

Command	Description
logging, on page 291	Specifies a syslog server host as a destination for syslog messages.

process shutdown pam_manager

To disable platform automated monitoring (PAM) by shutting down the required process agents, use the **process shutdown pam_manager** command in EXEC mode.

```
process shutdown pam_manager [location {node-id | all}]
```

Syntax Description	location all Disables PAM agents for all RPs.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 6.1.2	This command was introduced.

Usage Guidelines	Because PAM tool process (pam_manager) is not a mandatory process, it does not restart automatically if it was manually disabled (unless in the case of a system reload). You can re-enable PAM using the process start pam_manager command.
-------------------------	---

If you use **process shutdown pam_manager** without any keywords, it disables PAM agents for the local RP.

Task ID	Task ID	Operation
	network	read, write

This example shows how to disable PAM for all RPs:

```
RP/0/RSP0/CPU0:router# process shutdown pam_manager location all
```

Related Commands	Command	Description
	process start pam_manager, on page 325	Re-enables platform automated monitoring (PAM) by restarting the required process agents.

process start pam_manager

To re-enable platform automated monitoring (PAM) by restarting the required process agents, use the **process start pam_manager** command in EXEC mode.

```
process start pam_manager [location {node-id | all}]
```

Syntax Description	location all Restarts PAM agents for all RPs.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 6.1.2	This command was introduced.

Usage Guidelines If you use **process start pam_manager** without any keywords, it restarts PAM agents for the local RP. You can use these commands to check if PAM is installed in the router:

- **show processes pam_manager location all** (from Cisco IOS XR command line interface):
- **run ps auxw | egrep perl** (from router shell prompt)

Task ID	Task ID	Operation
	network	read, write

This example shows how to re-enable PAM for all RPs:

```
RP/0/RSP0/CPU0:router# process start pam_manager location all
```

Related Commands	Command	Description
	process shutdown pam_manager, on page 324	

service timestamps

To modify the time-stamp format for system logging (syslog) and debug messages, use the **service timestamps** command in Global Configuration mode. To revert to the default timestamp format, use the **no** form of this command.

```
service timestamps [{debug | log}] {datetime [localtime] [msec] [show-timezone] [year] | disable | uptime}
no service timestamps [{debug | log}] {datetime [localtime] [msec] [show-timezone] [year] | disable | uptime}
```

Syntax Description	
debug	(Optional) Specifies the time-stamp format for debugging messages.
log	(Optional) Specifies the time-stamp format for syslog messages.
datetime	(Optional) Specifies that syslog messages are time-stamped with date and time.
localtime	(Optional) When used with the datetime keyword, includes the local time zone in time stamps.
msec	(Optional) When used with the datetime keyword, includes milliseconds in the time stamp.
show-timezone	(Optional) When used with the datetime keyword, includes time zone information in the time stamp.
year	(Optional) Adds year information to timestamp.
disable	(Optional) Causes messages to be time-stamped in the default format.
uptime	(Optional) Specifies that syslog messages are time-stamped with the time that has elapsed since the networking device last rebooted.

Command Default Messages are time-stamped in the month day hh:mm:ss by default.

The default for the **service timestamps log datetime localtime** and **service timestamps debug datetime localtime** forms of the command with no additional keywords is to format the time in the local time zone, without milliseconds and time zone information.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.3	The keyword year was added.

Usage Guidelines Time stamps can be added to either debugging or syslog messages independently. The **uptime** keyword adds time stamps in the format hhhh:mm:ss, indicating the elapsed time in hours:minutes:seconds since the networking device last rebooted. The **datetime** keyword adds time stamps in the format mmm dd hh:mm:ss, indicating the date and time according to the system clock. If the system clock has not been set, the date and

time are preceded by an asterisk (*), which indicates that the date and time have not been set and should be verified.

The **no** form of the **service timestamps** command causes messages to be time-stamped in the default format.

Entering the **service timestamps** form of this command without any keywords or arguments is equivalent to issuing the **service timestamps debug uptime** form of this command.

Task ID	Task ID	Operations
	logging	read, write

Examples

This example shows how to enable time stamps on debugging messages, which show the elapsed time since the networking device last rebooted:

```
RP/0/RSP0/CPU0:router(config)# service timestamps debug uptime
```

This example shows how to enable time stamps on syslog messages, which show the current time and date relative to the local time zone, with the time zone name included:

```
RP/0/RSP0/CPU0:router(config)# service timestamps log datetime localtime show-timezone
```

```
RP/0/RSP0/CPU0:router(config)# service timestamps log datetime year
```

severity (logging)

To specify the filter level for logs, use the **severity** command in logging archive configuration mode. To return to the default, use the **no severity** form of this command.

```
severity {severity}
no severity
```

Syntax Description	<i>severity</i> Severity level for determining which messages are logged to the archive. Possible severity levels and their respective system conditions are listed under #unique_165 unique_165_Connect_42_tab_1365648 in the “Usage Guidelines” section. The default is informational .				
Command Default	Informational				
Command Modes	Logging archive configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	<p>Use the severity command to specify the filter level for syslog messages. All syslog messages higher in severity or the same as the configured value are logged to the archive.</p> <p>#unique_165 unique_165_Connect_42_tab_1365648 describes the acceptable severity levels for the <i>severity</i> argument.</p>				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>logging</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	logging	read, write
Task ID	Operations				
logging	read, write				
Examples	<p>This example shows how to specify that warning conditions and higher-severity messages are logged to the archive:</p> <pre>Router(config)# logging archive Router(config-logging-arch)# severity warnings</pre>				

show logging

To display the contents of the logging buffer, use the **show logging** command in EXEC mode.

```
show logging [{local location node-id | [location node-id] [start month day hh : mm : ss]
[process name] [string string] [end month day hh : mm :ss]]]
```

Syntax Description

end month day hh : mm : ss

(Optional) Displays syslog messages with a time stamp equal to or lower than the time stamp specified with the *monthday hh : mm : ss* argument.

The ranges for the *month day hh : mm : ss* arguments are as follows:

- *month*—The month of the year. The values for the *month* argument are:
 - january
 - february
 - march
 - april
 - may
 - june
 - july
 - august
 - september
 - october
 - november
 - december
- *day*—Day of the month. Range is 01 to 31.
- *hh* :—Hours. Range is 00 to 23. You must insert a colon after the *hh* argument.
- *mm* :—Minutes. Range is 00 to 59. You must insert a colon after the *mm* argument.
- *ss*—Seconds. Range is 00 to 59.

local location node-id

(Optional) Displays system logging (syslog) messages from the specified local buffer. The *node-id* argument is entered in the *rack/slot/module* notation.

location node-id

(Optional) Displays syslog messages from the designated node. The *node-id* argument is entered in the *rack/slot/module* notation.

start *month day hh : mm : ss*

(Optional) Displays syslog messages with a time stamp equal to or higher than the time stamp specified with the *month day mm : hh : ss* argument.

The ranges for the *month day hh : mm : ss* arguments are as follows:

- *month*—The month of the year. The values for the *month* argument are:
 - january
 - february
 - march
 - april
 - may
 - june
 - july
 - august
 - september
 - october
 - november
 - december
- *day*—Day of the month. Range is 01 to 31.
- *hh* :—Hours. Range is 00 to 23. You must insert a colon after the *hh* argument.
- *mm* :—Minutes. Range is 00 to 59. You must insert a colon after the *mm* argument.
- *ss*—Seconds. Range is 00 to 59.

process *name*

(Optional) Displays syslog messages related to the specified process.

string *string*

(Optional) Displays syslog messages that contain the specified string.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **show logging** command to display the state of syslog error and event logging on the processor console. The information from the command includes the types of logging enabled and the size of the buffer.

Task ID**Task Operations ID**

logging read

Examples

This is the sample output from the **show logging** command with the **process** keyword and *name* argument. Syslog messages related to the **init** process are displayed in the sample output.

```
RP/0/RSP0/CPU0:router# show logging process init

Syslog logging: enabled (24 messages dropped, 0 flushes, 0 overruns)
Console logging: level warnings, 59 messages logged
Monitor logging: level debugging, 0 messages logged
Trap logging: level informational, 0 messages logged
Buffer logging: level debugging, 75 messages logged

Log Buffer (16384 bytes):

LC/0/1/CPU0:May 24 22:20:13.043 : init[65540]: %INIT-7-INSTALL_READY : total time 47.522
seconds
SP/0/1/SP:May 24 22:18:54.925 : init[65541]: %INIT-7-MBI_STARTED : total time 7.159 seconds

SP/0/1/SP:May 24 22:20:16.737 : init[65541]: %INIT-7-INSTALL_READY : total time 88.984
seconds
SP/0/SM1/SP:May 24 22:18:40.993 : init[65541]: %INIT-7-MBI_STARTED : total time 7.194 seconds

SP/0/SM1/SP:May 24 22:20:17.195 : init[65541]: %INIT-7-INSTALL_READY : total time 103.415
seconds
SP/0/2/SP:May 24 22:18:55.946 : init[65541]: %INIT-7-MBI_STARTED : total time 7.152 seconds

SP/0/2/SP:May 24 22:20:18.252 : init[65541]: %INIT-7-INSTALL_READY : total time 89.473
seconds
```

This is the sample output from the **show logging** command using both the **processname** keyword argument pair and **location node-id** keyword argument pair. Syslog messages related to the “init” process emitted from node 0/1/CPU0 are displayed in the sample output.

```
RP/0/RSP0/CPU0:router# show logging process init location 0/1/CPU0

Syslog logging: enabled (24 messages dropped, 0 flushes, 0 overruns)
Console logging: level warnings, 59 messages logged
Monitor logging: level debugging, 0 messages logged
Trap logging: level informational, 0 messages logged
Buffer logging: level debugging, 75 messages logged

Log Buffer (16384 bytes):
LC/0/1/CPU0:May 24 22:20:13.043 : init[65540]: %INIT-7-INSTALL_READY : total time 47.522
seconds
```

This table describes the significant fields shown in the display.

Table 31: show logging Field Descriptions

Field	Description
Syslog logging	If enabled, system logging messages are sent to a UNIX host that acts as a syslog server; that is, the host captures and saves the messages.
Console logging	If enabled, the level and the number of messages logged to the console are stated; otherwise, this field displays “disabled.”
Monitor logging	If enabled, the minimum level of severity required for a log message to be sent to the monitor terminal (not the console) and the number of messages logged to the monitor terminal are stated; otherwise, this field displays “disabled.”
Trap logging	If enabled, the minimum level of severity required for a log message to be sent to the syslog server and the number of messages logged to the syslog server are stated; otherwise, this field displays “disabled.”
Buffer logging	If enabled, the level and the number of messages logged to the buffer are stated; otherwise, this field displays “disabled.”

Related Commands

Command	Description
clear logging, on page 285	Clears messages from the logging buffer.

show logging history

To display information about the state of the system logging (syslog) history table, use the **show logging history** command in EXEC mode mode.

show logging history

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show logging history** command to display information about the syslog history table, such as the table size, the status of messages, and the text of messages stored in the table. Simple Network Management Protocol (SNMP) configuration parameters and protocol activity also are displayed.

Use the [logging history, on page 310](#) command to change the severity level of syslog messages stored in the history file and sent to the SNMP server.

Use the [logging history size, on page 312](#) to change the number of syslog messages that can be stored in the history table.

Task ID	Task	Operations
	logging	read

Examples

This is the sample output from the **show logging history** command:

```
RP/0/RSP0/CPU0:router# show logging history

Syslog History Table: '1' maximum table entries
saving level 'warnings' or higher
137 messages ignored, 0 dropped, 29 table entries flushed
SNMP notifications disabled
```

This table describes the significant fields shown in the display.

Table 32: show logging history Field Descriptions

Field	Description
maximum table entries	Number of messages that can be stored in the history table. Set with the logging history size command.

show logging history

Field	Description
saving level	Level of messages that are stored in the history table and sent to the SNMP server (if SNMP notifications are enabled). Set with the logging history command.
messages ignored	Number of messages not stored in the history table because the severity level is greater than that specified with the logging history command.
SNMP notifications	Status of whether syslog traps of the appropriate level are sent to the SNMP server. Syslog traps are either enabled or disabled through the snmp-server enable command.

Related Commands

Command	Description
logging history, on page 310	Changes the severity level of syslog messages stored in the history file and sent to the SNMP server.
logging history size, on page 312	Changes the number of syslog messages that can be stored in the history table.

terminal monitor

To enable the display of debug command output and system logging (syslog) messages for the current terminal session, use the **terminal monitor** command in EXEC mode.

terminal monitor [**disable**]

Syntax Description	disable (Optional) Disables the display of syslog messages for the current terminal session.
---------------------------	---

Command Default	None
------------------------	------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the terminal monitor command to enable the display of syslog messages for the current terminal session.
-------------------------	--

Note Syslog messages are not sent to terminal lines unless the [logging monitor, on page 318](#) is enabled.

Use the **terminal monitor disable** command to disable the display of logging messages for the current terminal session. If the display of logging messages has been disabled, use the **terminal monitor** command to re-enable the display of logging messages for the current terminal session.

The **terminal monitor** command is set locally, and does not remain in effect after a terminal session has ended; therefore, you must explicitly enable or disable the **terminal monitor** command each time that you would like to monitor a terminal session.

Task ID	Task ID	Operations
	logging	execute

Examples	This example shows how to enable the display syslog messages for the current terminal session:
-----------------	--

```
RP/0/RSP0/CPU0:router# terminal monitor
```

Related Commands	Command	Description
	logging monitor, on page 318	Specifies terminal lines other than console terminal as destinations for syslog messages and limits the number of messages sent to terminal lines based on severity.

threshold (logging)

To specify the threshold percentage for archive logs, use the **threshold** command in logging archive configuration mode. To return to the default, use the **no** form of this command.

threshold *percent*
no threshold

Syntax Description	<i>percent</i> Threshold percentage. The range is from 1 to 99.
---------------------------	---

Command Default	100 percent
------------------------	-------------

Command Modes	Logging archive configuration
----------------------	-------------------------------

Command History	Release	Modification
	Release 5.3.2	This command was introduced.

Usage Guidelines	Use this threshold command to specify the percentage threshold. When the total archived files' size exceeds the percentage threshold of the configured archive-size, then the syslog of critical severity is generated. If the size is exceeded, then the oldest file in the archive is deleted to make space for new logs.
-------------------------	--

Task ID	Task ID	Operation
	logging	read, write

Example

This example shows how to set the threshold percent:

```
RP/0/RSP0/CPU0:router(config)# logging archive
RP/0/RSP0/CPU0:router(config-logging-arch)# threshold 70
```

Onboard Failure Logging Commands

This module describes the Cisco IOS XR software commands used to configure onboard failure logging (OBFL) for system monitoring on the router. OBFL gathers boot, environmental, and critical hardware failure data for field-replaceable units (FRUs), and stores the information in the nonvolatile memory of the FRU. This information is used for troubleshooting, testing, and diagnosis if a failure or other error occurs.

Because OBFL is on by default, data is collected and stored as soon as the card is installed. If a problem occurs, the data can provide information about historical environmental conditions, uptime, downtime, errors, and other operating conditions.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

Caution OBFL is activated by default in all cards and should not be deactivated. OBFL is used to diagnose problems in FRUs and to display a history of FRU data.

- [show logging onboard, on page 338](#)
- [clear logging onboard, on page 341](#)
- [hw-module logging onboard , on page 343](#)

show logging onboard

To display the onboard failure logging (OBFL) messages, use the **show logging onboard** command in Admin EXEC mode.

```
show logging onboard [{all | cbc common {dump-all | dump-range {start-address end-address} |
most-recent {fans fan-tray-slot | [location node-id]} | diagnostic | environment | error | genstr |
temperature | uptime | voltage}}] [{all | continuous | historical | static-data}] [{detail | raw | summary}]
[location node-id] [verbose]
```

Syntax Description

all	Displays all file information.
cbc	Displays Can Bus Controller (CBC) OBFL commands.
common	Displays the generic OBFL message logging output of multiple clients from string application.
dump-all	Displays all OBFL records.
dump-range {start-address end-address}	Displays OBFL EEPROM data for a given range. Start and end address ranges are from 0 to 4294967295.
most-recent	Displays the last five OBFL data records.
fans fan-tray-slot	Displays a specific fan tray slot.
location node-id	Displays OBFL messages from the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
diagnostic	Displays diagnostic information.
environment	Displays system environment information.
error	Displays output from the message application.
temperature	Displays temperature information.
uptime	Displays the OBFL uptime.
voltage	Displays voltage information.
continuous	Displays continuous information.
historical	Displays historical information.
static-data	Display system descriptor data.
detail	Displays detailed logging information.
raw	Displays raw OBFL data.
summary	Displays a summary of OBFL logging information.

verbose	Displays internal debugging information.
----------------	--

Command Default	None
------------------------	------

Command Modes	Admin EXEC mode
----------------------	-----------------

Command History	Release	Modification
	Release 3.7.1	This command was introduced.

Usage Guidelines

Use the **show logging onboard** command to display all logging messages for OBFL.

To narrow the output of the command, enter the **show logging onboard** command with one of the optional keywords.

Use the **location** *node-id* keyword and argument to display OBFL messages for a specific node.

Task ID	Task	Operations
	logging read	

Examples

This example displays uptime information from the OBFL feature:

```
RP/0/RSP0/CPU0:router(admin)# show logging onboard uptime detail location 0/7/cpu0

-----
UPTIME CONTINUOUS DETAIL INFORMATION (Node: node0_7_CPU0)
-----
The first record      : 01/05/2007 00:58:41
The last record      : 01/17/2007 16:07:13
Number of records    :          478
File size            :       15288 bytes
Current reset reason : 0x00
Current uptime       :    0 years  0 weeks 0 days  3 hours  0 minutes
-----
Time Stamp           |
MM/DD/YYYY HH:MM:SS | Users operation
-----
01/05/2007 01:44:35  File cleared by user request.
-----
```

This example displays continuous information about the temperature:

```
RP/0/RSP0/CPU0:router(admin)# show logging onboard temperature continuous

RP/0/RSP1/CPU0:ios(admin)#show logging onboard temperature continuous
Fri Dec 11 02:22:16.247 UTC

-----
TEMPERATURE CONTINUOUS INFORMATION (Node: node0_RSP0_CPU0)
-----
```

show logging onboard

```

Sensor                                     | ID |
-----|-----
Inlet0                                     0x1
Hotspot0                                   0x2
-----|-----
Time Stamp           |Sensor Temperature C
MM/DD/YYYY HH:MM:SS | 1   2   3   4   5   6   7   8   9  10
-----|-----
11/24/2009 20:55:28    23  36
11/24/2009 21:08:47    22  36
+32 minutes            22  37
+32 minutes            22  37

```

This example displays raw information about the temperature:

```

RP/0/RSP0/CPU0:router(admin)# show logging onboard temperature raw

Feature: Temperature
node: node0_2_CPU0, file name: nvram:/temp_cont, file size: 47525
00000000: 00 29 01 02 45 79 d8 a8 00 00 00 00 00 00 ba 37  )..Ey.....7

Related Commands

Command	Description
clear logging onboard, on page 341	Clears OBFL logging messages from a node or from all nodes.
hw-module logging onboard, on page 343	Enables or disables OBFL.

clear logging onboard

To clear OBFL logging messages from a node or from all nodes, use the **clear logging onboard** command in Admin EXEC mode.

```
clear logging onboard [{all | cbc common {obfl {fans fan-tray-slot | [location node-id]} |
corrupted-files | diagnostic | environment | error | poweron-time | temperature | uptime | voltage}}]
[location node-id]
```

Syntax	Description
all	Clears all OBFL logs.
cbc	Clears commands for Can Bus Controller (CBC).
common	Clears the generic OBFL message logging output of multiple clients from string application.
obfl	Clears OBFL EEPROM.
fans <i>fan-tray-slot</i>	Clears a specific fan tray slot.
location <i>node-id</i>	(Optional) Clears OBFL messages from the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
corrupted-files	Clears corrupted file information.
diagnostic	Clears the online diagnostics information from the OBFL logs.
environment	Clears the environmental information from the OBFL logs.
error	Clear syslog information.
poweron-time	Clears time of first customer power on.
temperature	Clears temperature information.
uptime	Clears uptime information.
voltage	Clears voltage information.
continuous	Clears continuous information.
historical	Clears historical information.

Command Default All OBFL logging messages are cleared from all nodes.

Command Modes Admin EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 5.2.2	The keyword common was added for the OBFL generic message logging feature.

Usage Guidelines

Use the **clear logging onboard** command to clear OBFL messages from all nodes. Use the **clear logging onboard** command with the **location** *node-id* keyword and argument to clear OBFL messages for a specific node. If the specified node is not present, an error message is displayed.

**Caution**

The **clear logging onboard** command permanently deletes all OBFL data for a node or for all nodes. Do not clear the OBFL logs without specific reasons, because the OBFL data is used to diagnose and resolve problems in FRUs.

**Caution**

If OBFL is actively running on a card, issuing the **clear logging onboard** command can result in a corrupt or incomplete log at a later point in time. OBFL should always be disabled before this command is issued.

Task ID

Task ID	Operations
logging read	

Examples

In the following example, the OBFL data is cleared for all nodes in the system:

```
RP/0/RSP0/CPU0:router (admin) # clear logging onboard
```

Related Commands

Command	Description
hw-module logging onboard , on page 343	Enables or disables OBFL.
show logging onboard , on page 338	Displays the OBFL messages.

hw-module logging onboard

To disable onboard failure logging (OBFL), use the **hw-module logging onboard** command in Admin Configuration mode. To enable OBFL again, use the **no** form of this command.

```
hw-module {all | subslot node-id} logging onboard [{disable | severity {alerts | emergencies}}]
no hw-module {all | subslot node-id} logging onboard [disable]
```

Syntax Description

all	Enables or disables OBFL for all nodes.
subslot <i>node-id</i>	Enables or disables OBFL for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
disable	Enables or disables OBFL. See the Usage Guidelines for more information.
severity	(Optional) Specifies the severity level for the syslog message that is logged into the OBFL storage device.
alerts	Specifies that both emergency and alert syslog messages are logged. The default is the alerts keyword.
emergencies	Specifies that only the emergency syslog messages are logged.

Command Default

By default, OBFL logging is enabled.
severity: 1 (alerts) and 0 (emergencies)

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **hw-module logging onboard** command to enable or disable OBFL.

- To disable OBFL use the **disable** keyword. OBFL is enabled by default.

```
hw-module {all | subslot node-id} logging onboard disable
```

- To enable OBFL, use the **no** form of the **hw-module logging onboard** command with the **disable** keyword. OBFL is enabled by default. Use this command only if you disabled OBFL:

```
no hw-module {all | subslot node-id} logging onboard disable
```

- To enable OBFL and return the configuration to the default message severity level, use the **no** form of the **hw-module logging onboard** command with the **severity** keyword:

```
no hw-module {all | subslot node-id} logging onboard severity
```

When the OBFL feature is disabled, existing OBFL logs are preserved. To resume OBFL data collection, enable the OBFL feature again.

Note If a new node is inserted, and OBFL is enabled for that slot, then OBFL is enabled for the new node. If a card is removed from a router and inserted into a different router, the card assumes the OBFL configuration for the new router.

Task ID	Task ID	Operations
	logging	read, write

Examples

The following example shows how to disable OBFL for all cards:

```
RP/0/RSP0/CPU0:router(admin-config)# hw-module all logging onboard disable
```

The following example shows how to disable OBFL for a card:

```
RP/0/RSP0/CPU0:router(admin-config)# hw-module subslot 0/2/CPU0 logging onboard disable
```

The following example shows how to enable OBFL again:

```
RP/0/RSP0/CPU0:router(admin-config)# no hw-module all logging onboard disable
```

The following example shows how to save only the syslog message in which the severity level is set to 0 (emergency) to a storage device:

```
RP/0/RSP0/CPU0:router(admin-config)# hw-module subslot 0/2/CPU0 logging onboard severity emergencies
```

The following example shows how to save the syslog message in which the severity level is set to 0 (emergency) and 1 (alert) to a storage device:

```
RP/0/RSP0/CPU0:router(admin-config)# hw-module subslot 0/2/CPU0 logging onboard severity alerts
```

Performance Management Commands

This module describes the performance management and monitoring commands available on the router. These commands are used to monitor, collect, and report statistics, and to adjust statistics gathering for Border Gateway Protocol (BGP), Open Shortest Path First (OSPF) protocol, generic interfaces, and individual nodes.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed information about performance management concepts, configuration tasks, and examples, see the *Implementing Performance Management* module in the *System Monitoring Configuration Guide for Cisco ASR 9000 Series Routers*.

monitor controller fabric

To monitor controller fabric counters in real time, use the **monitor controller fabric** command in EXEC mode.

monitor controller fabric {*plane-id* | **all**}

Syntax Description	<i>plane-id</i> Plane ID number of the fabric plane to be monitored. The range is 0 to 7.
	all Monitors all fabric planes.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **monitor controller fabric** command to display controller fabric counters. The display refreshes every 2 seconds.

The interactive commands that are available during a controller fabric monitoring session are described in this table.

Table 33: Interactive Commands Available for the monitor controller fabric Command

Command	Description
c	Resets controller fabric counters to 0.
f	Freezes the display screen, thereby suspending the display of fresh counters.
t	Thaws the display screen, thereby resuming the display of fresh counters.
q	Terminates the controller fabric monitoring session.
s	Enables you to jump to a nonsequential fabric plane. You are prompted to enter the plane ID of the fabric to be monitored.

Task ID	Task ID	Operations
	fabric	read
	basic-services	execute
	monitor	read

Examples

This is sample output from the **monitor controller fabric** command. The output in this example displays fabric controller counters from fabric plane 0.

```
RP/0/RSP0/CPU0:router# monitor controller fabric 0

rack3-3 Monitor
Time: 00:00:24 SysUptime: 03:37:57 Controller fabric for 0x0 Controller Fabric Stats:
Delta In Cells 0 ( 0 per-sec) 0 Out Cells 0 ( 0 per-sec) 0 CE Cells 0 ( 0 per-sec) 0 UCE
Cells 0 ( 0 per-sec) 0 PE Cells 0 ( 0 per-sec) 0 Quit='q', Freeze='f', Thaw='t',
Clear='c', Select controller='s'
```

monitor controller sonet

To monitor SONET controller counters, use the **monitor controller sonet** command in EXEC mode.

monitor controller sonet *interface-path-id*

Syntax Description

interface-path-id Physical interface or virtual interface.

Note Use the **show interfaces** command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **monitor controller sonet** command to display SONET controller counters. The display refreshes every 2 seconds.

The interactive commands that are available during a controller monitoring session are described in this table.

Table 34: Interactive Commands for the monitor controller sonet Command

Command	Description
c	Resets controller SONET counters to 0.
f	Freezes the display screen, thereby suspending the display of fresh counters.
t	Thaws the display screen, thereby resuming the display of fresh counters.
q	Terminates the controller SONET monitoring session.
s	Enables you to jump to a nonsequential SONET controller. You are prompted to enter the SONETcontroller to be monitored.

Task ID

Task ID	Operations
fabric	read
basic-services	execute
monitor	read

Examples

This is the sample output from the **monitor controller sonet** command. The output in this example displays counters from SONET controller 0/3/0/0.

```
RP/0/RSP0/CPU0:router# monitor controller sonet 0/3/0/0 rack3-3

monitor interface

To monitor interface counters in real time, use the **monitor interface** command in EXEC mode or Admin EXEC mode.

```
monitor interface [ type1 interface-path-id1 [ . . . [ type32 interface-path-id32 ] ] [ wide ] [ full-name ] ]
```

Syntax Description

<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	Physical interface or virtual interface. Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
<i>wide</i>	Display detailed statistics of the interfaces.
<i>full-name</i>	Display full name of the interfaces. For more information, use the question mark (?) online help function.

Command Default

Use the **monitor interface** command without an argument to display statistics for all interfaces in the system.

Command Modes

EXEC mode
Admin EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 7.5.4	The argument <i>full-name</i> was introduced.

Usage Guidelines

The argument *full-name* is applicable only for Release 7.5.4

Use the **monitor interface** command without any keywords or arguments to display interface counters for all interfaces. The display refreshes every 2 seconds.

Use the **monitor interface** command with the *type interface-path-id* arguments to display counters for a single interface. For example: **monitor interface** *pos0/2/0/0*

To display more than one selected interface, enter the **monitor interface** command with multiple *type interface-path-id* arguments. For example: **monitor interface** *pos0/2/0/0 pos0/5/0/1 pos0/5/0/2*

To display a range of interfaces, enter the **monitor interface** command with a wildcard. For example: **monitor interface** *pos0/5/**

You can display up to 32 specific interfaces and ranges of interfaces.

The interactive commands that are available during an interface monitoring session are described in this table.

Use the **monitor interface** command with the *wide* argument to display detailed statistics of the interfaces. For example: **monitor interface** *HundredGigE0/0/0/0 HundredGigE0/0/0/1 HundredGigE0/0/0/2 wide*

Use the **monitor interface** command with the *full-name* argument to display full name of the interfaces. Full name is more useful especially for Named interfaces, which has large character lengths. For example: **monitor interface** *HundredGigE0/0/0/0 HundredGigE0/0/0/1 tunnel-te FROM-INDBGL-AAA-TO-USASJC-BBB-TO-CANAD-CCC full-name*

Use the **monitor interface** command with the *wide* and *full-name* arguments to display detailed statistics of the interfaces with its full name. For example: **monitor interface** *HundredGigE0/0/0/0 HundredGigE0/0/0/1 tunnel-te FROM-INDBGL-AAA-TO-USASJC-BBB-TO-CANAD-CCC wide full-name*

Table 35: Interactive Commands Available for the monitor interface Command (Functional Summary)

Command	Description
Use the following keys to suspend or resume the counter refresh:	
f	Freezes the display screen, thereby suspending the display of fresh counters.
t	Thaws the display screen, thereby resuming the display of fresh counters.
Use the following key to reset the counters:	
c	Resets interface counters to 0.
Use the following keys when displaying statistics for a single interface. These keys display counters in normal or detailed view.	
d	Changes the display mode for the interface monitoring session to display detailed counters. Use the b interactive command to return to the regular display mode.
r	Displays the protocol divided by IPv4 or IPv6, and multicast and unicast. When the statistics are displayed using the r option, you can also use the k , y , or o keys to display statistics in packets (“ k ”), bytes (“ y ”) or packets and (“ o ”).
b	Returns the interface monitoring session to the regular display mode for counters. Statistics are not divided by protocol.
Use the following keys when displaying statistics for multiple interfaces. These keys modify the display to show statistics in bytes, packets, or bytes and packets.	
k	Displays statistics in packets (“ k ”).
y	(Default) Displays statistics in bytes (“ y ”).
o	Displays statistics in both bytes and packets (“ o ”).

Use the following keys to display statistics for a different interface:	
i	Enables you to jump to a nonsequential interface. You are prompted to enter the interface type and interface path ID to be monitored.
p	Displays the previous sequential interface in the list of available interfaces.
n	Displays the next sequential interface in the list of available interfaces.
q	Terminates the interface monitoring session.

Task ID	Task ID	Operations
	basic-services	execute
	monitor	read

Examples

When more than one interface is specified, the statistics for each interface are displayed on a separate line. This display format appears anytime more than one interface is specified. For example:

- To display statistics for all interfaces, enter the command **monitor interface** .
- To display all the interfaces for an interface type, such as all HundredGigE interface, enter the command and wildcard **monitor interface HundredGigE *** .
- To display statistics for three specified interfaces, enter the command **monitor interface HundredGigE 0/0/0/0 HundredGigE 0/0/0/1 HundredGigE 0/0/0/0** .

This is the sample output for the **monitor interface** command entered without an argument. This command displays statistics for all interfaces in the system.

performance-mgmt apply monitor

To apply a statistics template to gather a sampling-size set of samples for a particular instance, use the **performance-mgmt apply monitor** command in Global Configuration mode. To stop monitoring statistics, use the **no** form of this command.

```
performance-mgmt apply monitor entity {ip-address type interface-path-id node-id | node-id process-id process-name} {template-name | default}
```

```
no performance-mgmt apply monitor
```

Syntax Description

<i>entity</i>	Specifies an entity for which you want to apply the statistics template: <ul style="list-style-type: none"> • bgp—Applies a template for monitoring a Border Gateway Protocol (BGP) neighbor. • interface basic-counters—Applies a template for monitoring basic counters on an interface. If you enter this keyword, supply values for the <i>type</i> and <i>interface-path-id</i> arguments. • interface data-rates—Applies a template for monitoring data rates on an interface. If you enter this keyword, supply values for the <i>type</i> and <i>interface-path-id</i> arguments. • interface generic-counters—Applies a template for monitoring generic counters on an interface. If you enter this keyword, supply values for the <i>type</i> and <i>interface-path-id</i> arguments. • mpls ldp—Applies a template for monitoring an MPLS Label Distribution Protocol (LDP) neighbor. • node cpu—Applies a template for monitoring the central processing unit (CPU) on a node. Use the <i>node-id</i> argument with this entity. • node memory—Applies a template for monitoring memory utilization on a node. Use the location keyword and <i>node-id</i> argument with this entity. • node process—Applies a template for monitoring a process on a node. Use the <i>node-id</i> and <i>process-id</i> arguments with this entity. • ospf v2protocol—Applies a template for monitoring an Open Shortest Path First v2 (OSPFv2) process instance. • ospf v3protocol—Applies a template for monitoring an OSPFv3 process instance.
<i>ip-address</i>	IP or neighbor address. Used with the bgp or ldp keyword.
<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	Physical interface or virtual interface. <p>Note Use the show interfaces command to see a list of all interfaces currently configured on the router.</p> <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
<i>node-id</i>	Designated node. Used with the node cpu or node memory keyword. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
<i>node-id process-id</i>	Designated node and process ID. Used with the node process keyword. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

<i>process-name</i>	Process name of the OSPF instance. Used with the ospfv2protocol and ospfv3protocol keywords.
<i>template-name</i>	Name of a predefined template used for statistics collection. A template name can be any combination of alphanumeric characters, and may include the underscore character (_). Use the show running performance-mgmt command to display a list of available templates.
default	Applies the default template.

Command Default Monitoring is disabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.0.1	The interface basic-counters keyword was added to support the monitoring of basic counters on the interface.

Usage Guidelines Use the **performance-mgmt apply monitor** command to apply a statistics template and enable monitoring. This command captures one cycle of a sample to analyze an instance of an entity. Rather than collect statistics for all instances, which is the purpose of the **performance-mgmt apply statistics** command, the **performance-mgmt apply monitor** command captures statistics for a specific entity instance for one sampling period.

The *type* and *interface-path-id* arguments are only to be used with the **interface data-rates** or **interface generic-counter** keyword.

For information about creating templates, see the [performance-mgmt apply statistics, on page 359](#) command.

Task ID	Task ID	Operations
	monitor	read, write, execute

Examples This example shows how to enable the BGP protocol monitoring using the criterion set in the default template:

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt apply monitor bgp 10.0.0.0 default
```

This example shows how to enable monitoring for data rates according to the criterion set in the default template:

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt apply monitor interface data-rates pos 0/2/0/0 default
```

This example shows how to enable memory monitoring based on the criterion set in the default template:

performance-mgmt apply monitor

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt apply monitor node memory location 0/1/cpu0
default
```

This example shows how to enable monitoring for counters according to the criterion set in the default template:

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt apply monitor interface basic-counters
hundredGigE 0/2/0/0 default
```

Related Commands

Command	Description
performance-mgmt apply statistics, on page 359	Applies a statistics template and enables statistics collection.
performance-mgmt statistics, on page 369	Creates a template to use for collecting performance management statistics.
show running performance-mgmt, on page 392	Displays a list of templates and the template being applied.

performance-mgmt apply statistics

To apply a statistics template and enable statistics collection, use the **performance-mgmt apply statistics** command in Global Configuration mode. To stop statistics collection, use the **no** form of this command.

```
performance-mgmt apply statistics entity location {all node-id} {template-name | default}
no performance-mgmt apply statistics
```

Syntax Description

<i>entity</i>	Specifies an entity for which you want to apply a statistics template: <ul style="list-style-type: none"> • bgp—Applies a statistics collection template for Border Gateway Protocol (BGP). • interface basic-counters—Applies a statistics collection template for basic counters. • interface data-rates—Applies a statistics collection template for data rates. • interface generic-counters—Applies a statistics collection template for generic counters. • mpls ldp—Applies a template for monitoring an MPLS Label Distribution Protocol (LDP) neighbor. • node cpu—Applies a statistics collection template for the central processing unit (CPU). Use the location keyword with the all keyword or <i>node-id</i> argument when enabling a statistics collection template for this entity. • node memory—Applies a statistics collection template for memory utilization. Use the location keyword with the all keyword or <i>node-id</i> argument when enabling a statistics collection template for this entity. • node process—Applies a statistics collection template for processes. Use the location keyword with the all keyword or <i>node-id</i> argument when enabling a statistics collection template for this entity. • ospf v2protocol—Applies a statistics collection template for Open Shortest Path First v2 (OSPFv2) process instances. • ospf v3protocol—Applies a statistics collection template for OSPFv3 process instances.
location { all <i>node-id</i> }	Specifies all nodes or a particular node. Specify the location all keywords for all nodes, or the <i>node-id</i> argument to specify a particular node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation. You must specify either the location all keywords or the location keyword and <i>node-id</i> argument with the node cpu , node memory , or node process entity.
<i>template-name</i>	Name of a predefined template used for statistics collection. A template name can be any combination of alphanumeric characters, and may include the underscore character (_). Use the show running performance-mgmt, on page 392 command to display a list of available templates.
default	Applies the default template.

Command Default

Statistics collection is disabled.

Command Modes

Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.0.1	The interface basic-counters keyword was added to support the enabling of statistics collection template for the basic counters.

Usage Guidelines

Use the **performance-mgmt apply statistics** command to apply a statistics template and enable statistics collection. Only one template for each entity can be enabled at a time. After samples are taken, the data is sent to a directory on an external TFTP server, and a new collection cycle starts. The directory where data is copied to is configured using the [performance-mgmt resources tftp-server, on page 367](#) command. The statistics data in the directory contains the type of entity, parameters, instances, and samples. They are in binary format and must be viewed using a customer-supplied tool, or they can be queried as they are being collected using XML.

Use the **performance-mgmt apply statistics** command to collect data for all the instances on a continuous basis. To analyze a particular instance for a limited period of time, use the [performance-mgmt apply monitor, on page 356](#) command.

Use the **no** form of the command to disable statistics collection. Because only one performance management statistics collection can be enabled for any given entity at any given time, you are not required to specify the template name with the **default** keyword or **template** keyword and *template-name* argument when disabling a performance management statistics collection.

For information about creating templates, see the [performance-mgmt statistics, on page 369](#) command.

Caution Each particular collection enabled requires a certain amount of resources. These resources are allocated for as long as the collection is enabled.

Task ID

Task ID	Operations
monitor	read, write, execute

Examples

This example shows how to start statistics collection for BGP using the template named bgp1:

```
RP/0/RSP0/CPU0:router (config) #performance-mgmt apply statistics bgp template bgp1
```

This example shows how to enable statistics collection for generic counters using the default template:

```
RP/0/RSP0/CPU0:router (config) #performance-mgmt apply statistics interface generic-counters default
```

This example shows how to enable CPU statistics collection based on the settings set in the default template:

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt apply statistics node cpu location all default
```

This example shows how to enable statistics collection for basic counters using the default template:

Related Commands	Command	Description
	performance-mgmt apply monitor, on page 356	Applies a statistics template to gather one sampling-size set of samples for a particular instance.
	performance-mgmt apply thresholds, on page 362	Applies a threshold template and enables threshold monitoring.
	performance-mgmt resources tftp-server, on page 367	Configures a destination TFTP server for statistics collections.
	performance-mgmt statistics, on page 369	Creates a template to use for collecting performance management statistics.

performance-mgmt apply thresholds

To apply a thresholds template and enable threshold collection, use the **performance-mgmt apply thresholds** command in Global Configuration mode. To stop threshold collection, use the **no** form of this command.

performance-mgmt apply thresholds *entity* **location** {**all** *node-id*} {*template-name* | **default**}
no performance-mgmt apply thresholds

Syntax Description

entity	Specifies an entity for which you want to apply a threshold template: <ul style="list-style-type: none"> • bgp—Applies a threshold monitoring template for Border Gateway Protocol (BGP). • interface basic-counters—Applies a threshold monitoring template for basic counters. • interface data-rates—Applies a threshold monitoring template for data rates. • interface generic-counters—Applies a threshold monitoring template for generic counters. • mpls ldp—Applies a template for monitoring an MPLS Label Distribution Protocol (LDP) neighbor. • node cpu—Applies a threshold monitoring template for central processing unit (CPU) utilization. Use the location keyword in conjugation with the all keyword or <i>node-id</i> argument when enabling a statistics collection template for this entity. • node memory—Applies a threshold monitoring template for memory utilization. Use the location keyword in conjugation with the all keyword or <i>node-id</i> argument when enabling a statistics collection template for this entity. • node process—Applies a threshold monitoring template for processes. Use the location keyword in conjugation with the all keyword or <i>node-id</i> argument when enabling a statistics collection template for this entity. • ospf v2protocol—Applies a threshold monitoring template for OSPFv2. • ospf v3protocol—Applies a threshold monitoring template for OSPFv3.
location { all <i>node-id</i> }	Specifies all nodes or a particular node. Specify the location all keywords for all nodes, or the <i>node-id</i> argument to specify a particular node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation. You must specify either the location all keywords or the location keyword and <i>node-id</i> argument with the node cpu , node memory , or node process entity.
template-name	Name of a predefined template used for threshold collection. A template name can be any combination of alphanumeric characters, and may include the underscore character (_). Use the show running performance-mgmt, on page 392 command to display a list of available templates.
default	Applies the default template.

Command Default

Threshold collection is disabled.

Command Modes

Global Configuration mode

Command History**Release Modification**

Release 3.7.2 This command was introduced.

Release 4.0.1 The **interface basic-counters** keyword was added to support the enabling of threshold monitoring template for the basic counter.

Usage Guidelines

Use the **performance-mgmt apply thresholds** command to apply a threshold template and enable threshold collection. Several templates can be configured, but only one template for each entity can be enabled at a time.

Use the **no** form of the command to disable threshold collection. Because only one performance management threshold monitoring template can be enabled for any given entity at any given time, you are not required to specify the template name with the **default** keyword or **template** keyword and *template-name* argument when disabling a performance management statistics collection.

For information about creating threshold templates, see the [performance-mgmt thresholds, on page 372](#) command.

Task ID**Task Operations
ID**

monitor read, write, execute

Examples

This example shows how to start threshold collection for BGP using a template named stats1:

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt apply thresholds bgp stats1
```

This example shows how to enable threshold collection for generic counters using a template named stats2:

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt apply thresholds interface generic-counters stats2
```

This example shows how to enable CPU threshold collection using the template named cpu12:

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt apply thresholds node cpu global cpu12
```

This example shows how to enable threshold checking for basic counters using a template named stats3:

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt apply thresholds interface basic-counters stats3
```

Related Commands

Command	Description
performance-mgmt thresholds, on page 372	Creates a template to use for threshold collection.
show running performance-mgmt, on page 392	Displays a list of templates and the template being applied.

performance-mgmt regular-expression

To apply a defined regular expression group to one or more statistics or threshold template, use the **performance-mgmt regular-expression** *regular-expression-name* command in Global Configuration mode. To stop the usage of regular expression, use the **no** form of this command.

performance-mgmt regular-expression *regular-expression-name* **index** *number* *regular-expression-string*
no performance-mgmt regular-expression *regular-expression-name*

Syntax Description	<i>regular-expression-string</i>	Specifies a defined regular expression group to one or more statistics or threshold template.
	index	Specifies a regular expression index. Range is 1 to 100.

Command Default No regular expression is configured by default.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 4.0.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	monitor	read, write

This is the sample output from the **performance-mgmt regular-expression** command:

```
RP/0/RSP0/CPU0:router# performance-mgmt regular-expression reg1 index 10
```

performance-mgmt resources dump local

To configure the local filesystem on which the statistics data is dumped, use the **performance-mgmt resources dumplocal** command in Global Configuration mode. To stop dumping of statistics data on the local filesystem, use the **no** form of this command.

performance-mgmt resources dump local
no performance-mgmt resources dump local

Syntax Description	<p>dump Configures data dump parameters.</p> <p>local Sets the local filesystem on which statistics data is dumped.</p> <p>Note You can also dump the statistics data on the TFTP server location. But the configuration is rejected if you configure both local dump and TFTP server at the same time.</p>				
Command Default	Local filesystem is disabled.				
Command Modes	Global Configuration mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.0.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.0.1	This command was introduced.

Release 4.0.1	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>monitor</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	monitor	read, write
Task ID	Operation				
monitor	read, write				

This is the sample output for the **performance-mgmt resources dumplocal** command:

```
RP/0/RSP0/CPU0:router# performance-mgmt resources dump local
```

performance-mgmt resources memory

To configure memory consumption limits for performance management (PM), use the **performance-mgmt resources memory** command in Global Configuration mode. To restore the default memory consumption limits, use the **no** form of this command.

```
performance-mgmt resources memory max-limit kilobytes min-reserved kilobytes
no performance-mgmt resources memory
```

Syntax Description	
max-limit <i>kilobytes</i>	Specifies the maximum amount of memory (specified with the <i>kilobytes</i> argument) that the PM statistics collector can use for serving data collection requests. Range is 0 to 4294967295 kilobytes. The default is 50000 kilobytes.
min-reserved <i>kilobytes</i>	Specifies a minimum amount of memory (specified with the <i>kilobytes</i> argument) that must remain available in the system after allowing a new PM data collection request. Range is 0 to 4294967295 kilobytes. The default is 10000 kilobytes.

Command Default	
max-limit	50000 <i>kilobytes</i>
min-reserved	10000 <i>kilobytes</i>

Command Modes	
	Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	
	Use the performance-mgmt resource memory command to ensure that the total memory consumed by data buffers in PM does not exceed a maximum limit and that any new PM data request does not cause available memory in the system to fall below a certain threshold.

Task ID	Task ID	Operations
	monitor	read, write

Examples	
	This example shows how to ensure that the total memory consumed by PM data buffers does not exceed 30,000 kilobytes and that any new PM data request does not cause available memory in the system to fall below 5000 kilobytes:

```
RP/0/RSP0/CPU0:router(config)# performance-mgmt resources memory max-limit 30000 min-reserved
5000
```

performance-mgmt resources tftp-server

To configure a destination TFTP server for PM statistics collections, use the **performance-mgmt resources tftp-server** command in Global Configuration mode. To disable the resource, use the **no** form of this command.

```
performance-mgmt resources tftp-server ip-address {directorydir-name} {vrf | {vrf_name | default}
| {directorydir-name}}
no performance-mgmt resources tftp-server
```

Syntax Description	tftp-server <i>ip-address</i> Specifies the IP address of the TFTP server.				
	directory <i>dir-name</i> Specifies the directory where performance management statistics will be copied.				
	vrf <i>vrf_name</i> Specifies the name of the VRF instance.				
	default Specifies the default VRF.				
Command Default	A destination TFTP server is not configured and data is not copied out of the system after a collection cycle (sampling-size) ends.				
Command Modes	Global Configuration mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

Usage Guidelines Use the **performance-mgmt resources tftp-server** command to configure a TFTP resource for performance management. By creating a directory name on the TFTP server, you create a place where statistics can be collected when statistics collection is enabled.

Use the **no** form of this command to disable the TFTP resource.

Note Files copied to the TFTP server contain a timestamp in their name, which makes them unique. For that reason the TFTP server used should support creation of files as data is transferred, without requiring users to manually create them at the TFTP server host in advance.

Task ID	Task ID	Operations
	monitor	read, write

Examples

This example shows how to specify a TFTP server with the IP address 192.168.134.254 as the performance management resource and a directory named /user/perfmgmt/tftpdump as the destination for PM statistic collections:

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt resources tftp-server 192.168.134.254 directory  
/user/perfmgmt/tftpdump
```

Related Commands

Command	Description
performance-mgmt apply statistics, on page 359	Applies a statistics template and enables statistics collection.
performance-mgmt apply thresholds, on page 362	Applies a threshold template and enables threshold monitoring.

performance-mgmt statistics

To create a template to use for collecting performance management statistics, use the **performance-mgmt statistics** command in Global Configuration mode. To remove a template, use the **no** form of this command.

```
performance-mgmt statistics entity {template template-name | default} [sample-size size]
[sample-interval minutes]history-persistent regular-expression
no performance-mgmt statistics
```

Syntax Description

entity

Specify an entity for which you want to create a statistics template:

- **bgp**—Creates a statistics collection template for Border Gateway Protocol (BGP).
- **interface basic-counters**—Creates a statistics collection template for basic counters.
- **interface data-rates**—Creates a statistics collection template for data rates.
- **interface generic-counters**—Creates a statistics collection template for generic counters.
- **mpls ldp**—Applies a template for monitoring an MPLS Label Distribution Protocol (LDP) neighbor.
- **node cpu**—Creates a statistics collection template for the central processing unit (CPU).
- **node memory**—Creates a statistics collection template for memory utilization.
- **node process**—Creates a statistics collection template for processes.
- **ospf v2protocol**—Creates a statistics template for Open Shortest Path First v2 (OSPFv2) protocol instances.
- **ospf v3protocol**—Creates a statistics template for OSPFv3 protocol instances.

template

Specifies that a template will be used for collection.

template-name

A template name can be any combination of alphanumeric characters, and may include the underscore character (_).

Use the [show running performance-mgmt](#), on page 392 to display information about templates, and to display the templates that are being used.

default	Applies the settings of the default template. The default template contains the following statistics and values. Values are in minutes. Each entity has a default template. In each default template, the sample interval is 10 minutes, and the default sample count is 5.
sample-size <i>size</i>	(Optional) Sets the number of samples to be taken.
sample-interval <i>minutes</i>	(Optional) Sets the frequency of each sample, in minutes.
history-persistent	(Optional) Maintains the history of statistics collections persistently.
regular-expression <i>regular-expression-group-name</i>	(Optional) Sets instance filtering by regular expression.

Command Default Statistics collections for all entities is disabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.0.1	The interface basic-counters keyword was added to support the creation of statistics collection templates for the basic counters. The history-persistent and regular-expression keywords were added.

Usage Guidelines If you have not yet created a directory for the statistics, use the [performance-mgmt resources tftp-server](#), on [page 367](#) command to create a directory on an external TFTP server. When you apply the template and enable statistics collection with the [performance-mgmt apply statistics](#), on [page 359](#) command, the samples are collected and sent to that directory for later retrieval.

The statistics collected contain type of entity, parameters, instances, and samples. The collection files on the TFTP server are in binary format and must be viewed using a customer-supplied tool or they can be queried as they are being collected using XML.

Task ID	Task	Operations
	monitor	read, write

Examples This example shows how to create a template named `int_data_rates` for data rate statistics collection, how to set the sample size to 25, and how to set the sample interval to 5 minutes:

```
RP/0/RSP0/CPU0:router(config)#performance-mgmt statistics interface data-rates int_data_rates
RP/0/RSP0/CPU0:router(config_stats-if-rate)# sample-size 25
```

```
RP/0/RSP0/CPU0:router(config_stats-if-rate)# sample-interval 5
```

Related Commands

Command	Description
performance-mgmt apply statistics, on page 359	Applies a statistics template and enables statistics collection.
performance-mgmt resources tftp-server, on page 367	Configures resources for the performance management system that are independent of any particular entity.
performance-mgmt thresholds, on page 372	Configures a template for collecting threshold statistics.
show running performance-mgmt, on page 392	Displays a list of templates and the template being applied.

performance-mgmt thresholds

To configure a template for threshold checking, use the **performance-mgmt thresholds** command in Global Configuration mode. To remove a threshold template, use the **no** form of this command.

```
performance-mgmt thresholds entity { template template-name | default } attribute operation
value [value2] [percent] [delta] [rearm { toggle | window window-size } ] [delta ]
no performance-mgmt thresholds
```

Syntax Description

<i>entity</i>	Specify an entity for which you want to create a template: <ul style="list-style-type: none"> • bgp —Creates a template for threshold collection for Border Gateway Protocol (BGP). • interface basic-counters —Creates a threshold monitoring template for basic counters. • interface data-rates —Creates a threshold monitoring template for data rates. • interface generic-counters —Creates a threshold monitoring template for generic counters. • mpls ldp —Applies a template for monitoring an MPLS Label Distribution Protocol (LDP) neighbor. • node cpu —Creates a threshold monitoring template for the central processing unit (CPU). • node memory —Creates a threshold monitoring template for memory utilization. • node process —Creates a threshold monitoring template for processes. • ospf v2protocol —Creates a threshold monitoring template for Open Shortest Path First v2 (OSPFv2) process instances. • ospf v3protocol —Creates a threshold monitoring template for OSPFv3 process instances.
template	Specifies that a template will be used for collection.
<i>template-name</i>	Name of a predefined template used for threshold collection. A template name can be any combination of alphanumeric characters, and may include the underscore character (_). Use the show running performance-mgmt, on page 392 to display information about templates, and to display the templates that are being used.
default	Applies the settings of the default template.
<i>attribute</i>	The attributes for the entity. See Table 37: Attribute Values, on page 374 for a list of attributes.

<i>operation</i>	A limiting operation for thresholding that includes: <ul style="list-style-type: none"> • EQ —Equal to. • GE —Greater than or equal to. • GT —Greater than. • LE —Less than or equal to. • LT —Less than. • NE —Not equal to. • RG —Not in range.
<i>value</i>	The base value against which you want to sample.
<i>value2</i>	(Optional) This value can only be used with the operator RG . For example, if you use RG for the operation argument value, you create a range between <i>value</i> and <i>value2</i> .
<i>percent</i>	(Optional) Specifies a value relative to the previous sample interval value. See the “Usage Guidelines” section for more information.
<i>delta</i>	(Optional) The feature invokes an alarm when the difference between the current and the previous counter value satisfies the threshold condition.
rearm {toggle window}	<p>(Optional) It can be used to reduce the number of events by suppressing redundant events from being reported. Normally, every time a condition is met in a sample interval, a syslog error is generated. Using the toggle keyword works in this manner: If a condition is true, a syslog error message is generated, but it is not generated again until the condition becomes false, and then true again. In this way, only “fresh” events are seen when the threshold is crossed.</p> <p>Use the window keyword to specify that an event be sent only once for each window. If a condition is true, a syslog error message is generated. You set your window size by using the window keyword and specify the number of intervals. With a window size, you specify that you want event notification at that number of intervals. For example, if you window size is 2 and your sample interval is 10, you would want notification of the event (for each instance in an entity) only every 20 minutes when the condition has been met.</p>
<i>window-size</i>	The number of intervals to use with the rearm keyword.

Command Default

None

Command Modes

Command History

Release	Modification
Release 7.7.1	The argument delta was introduced.
Release 3.7.2	This command was introduced.
Release 4.0.1	The interface basic-counters keyword was added to support the creation of threshold monitoring template for the basic counter.

Usage Guidelines

Use the *percent* argument to specify a value that is relative to the previous sample's interval value. When you use the *percent* argument with a *value* of 50, the calculation is performed in this manner, assuming that your current sampled value is sample1 (S1) and the value sampled in the previous sampling period is sample 0 (S0):

```
(S1 - S0) GT 50% of S0
```

For example, if you wanted to check for an increase of 50 percent in the counter BGPInputErrors, you could use the following *attribute* and *operation* with the *percent* argument:

```
BGPInputErrors GT 50
```

This table shows threshold behavior, assuming the values for BGPInputErrors are at consecutive samplings.

Table 36: Threshold Behavior

Value	Calculation	Event
10	—	—
16	16 - 10 = 6, which is > than 50 percent of 10	Generate event
20	20 - 16 = 4, which is not > than 50 percent of 16	No event generated
35	35 - 20 = 15, which is > than 50 percent of 20	Generate event

This table shows the attribute values supported by the entities.

Table 37: Attribute Values

Entity	Attributes	Description
bgp	ConnDropped	Number of times the connection was dropped.
	ConnEstablished	Number of times the connection was established.
	ErrorsReceived	Number of error notifications received on the connection.
	ErrorsSent	Number of error notifications sent on the connection.
	InputMessages	Number of messages received.
	InputUpdateMessages	Number of update messages received.
	OutputMessages	Number of messages sent.
	OutputUpdateMessages	Number of update messages sent.
interface basic-counters	InOctets	Bytes received (64-bit).
	InPackets	Packets received (64-bit).

Entity	Attributes	Description
	InputQueueDrops	Input queue drops (64-bit).
	InputTotalDrops	Inbound correct packets discarded (64-bit).
	InputTotalErrors	Inbound incorrect packets discarded (64-bit).
	OutOctets	Bytes sent (64-bit).
	OutPackets	Packets sent (64-bit).
	OutputQueueDrops	Output queue drops (64-bit).
	OutputTotalDrops	Outbound correct packets discarded (64-bit).
	OutputTotalErrors	Outbound incorrect packets discarded (64-bit).
interface data-rates	Bandwidth	Bandwidth, in kbps.
	InputDataRate	Input data rate in kbps.
	InputPacketRate	Input packets per second.
	InputPeakRate	Peak input data rate.
	InputPeakPkts	Peak input packet rate.
	OutputDataRate	Output data rate in kbps.
	OutputPacketRate	Output packets per second.
	OutputPeakPkts	Peak output packet rate.
	OutputPeakRate	Peak output data rate.

Entity	Attributes	Description
interface generic-counters	InBroadcastPkts	Broadcast packets received.
	InMulticastPkts	Multicast packets received.
	InOctets	Bytes received.
	InPackets	Packets received.
	InputCRC	Inbound packets discarded with incorrect CRC.
	InputFrame	Inbound framing errors.
	InputOverrun	Input overruns.
	InputQueueDrops	Input queue drops.
	InputTotalDrops	Inbound correct packets discarded.
	InputTotalErrors	Inbound incorrect packets discarded.
	InUcastPkts	Unicast packets received.
	InputUnknownProto	Inbound packets discarded with unknown proto.
	OutBroadcastPkts	Broadcast packets sent.
	OutMulticastPkts	Multicast packets sent.
	OutOctets	Bytes sent.
	OutPackets	Packets sent.
	OutputTotalDrops	Outbound correct packets discarded.
	OutputTotalErrors	Outbound incorrect packets discarded.
	OutUcastPkts	Unicast packets sent.
	OutputUnderrun	Output underruns.

Entity	Attributes	Description
mpls ldp	AddressMsgsRcvd	Address messages received.
	AddressMsgsSent	Address messages sent.
	AddressWithdrawMsgsRcvd	Address withdraw messages received.
	AddressWithdrawMsgsSent	Address withdraw messages sent.
	InitMsgsSent	Initial messages sent.
	InitMsgsRcvd	Initial messages received.
	KeepaliveMsgsRcvd	Keepalive messages received.
	KeepaliveMsgsSent	Keepalive messages sent.
	LabelMappingMsgsRcvd	Label mapping messages received.
	LabelMappingMsgsSent	Label mapping messages sent.

	NotificationMsgsRcvd	Notification messages received.
	NotificationMsgsSent	Notification messages sent.
	TotalMsgsRcvd	Total messages received.
TotalMsgsSent	Total messages sent.	
node cpu	AverageCPUUsed	Average system percent CPU utilization.
	NoProcesses	Number of processes.
node memory	CurrMemory	Current application memory (in bytes) in use.
	PeakMemory	Maximum system memory (in MB) used since bootup.
node process	AverageCPUUsed	Average percent CPU utilization.
	NumThreads	Number of threads.
	PeakMemory	Maximum dynamic memory (in KB) used since startup time.

Entity	Attributes	Description
ospf v2protocol	InputPackets	Total number of packets received
	OutputPackets	Total number of packets sent
	InputHelloPackets	Number of Hello packets received
	OutputHelloPackets	Number of Hello packets sent
	InputDBDs	Number of DBD packets received
	InputDBDsLSA	Number of LSA received in DBD packets
	OutputDBDs	Number of DBD packets sent.
	OutputDBDsLSA	Number of LSA sent in DBD packets
	InputLSRequests	Number of LS requests received.
	InputLSRequestsLSA	Number of LSA received in LS requests.
	OutputLSRequests	Number of LS requests sent.
	OutputLSRequestsLSA	Number of LSA sent in LS requests.
	InputLSAUpdates	Number of LSA updates received.
	InputLSAUpdatesLSA	Number of LSA received in LSA updates.
	OutputLSAUpdates	Number of LSA updates sent.
	OutputLSAUpdatesLSA	Number of LSA sent in LSA updates.
	InputLSAAcks	Number of LSA acknowledgements received.
	InputLSAAcksLSA	Number of LSA received in LSA acknowledgements.
	OutputLSAAcks	Number of LSA acknowledgements sent.
	OutputLSAAcksLSA	Number of LSA sent in LSA acknowledgements.
ChecksumErrors	Number of packets received with checksum errors.	

Entity	Attributes	Description
ospf v3protocol	InputPackets	Total number of packets received.
	OutputPackets	Total number of packets sent.
	InputHelloPackets	Number of Hello packets received.
	OutputHelloPackets	Number of Hello packets sent.
	InputDBDs	Number of DBD packets received.
	InputDBDsLSA	Number of LSA received in DBD packets.
	OutputDBDs	Number of DBD packets sent.
	OutputDBDsLSA	Number of LSA sent in DBD packets.
	InputLSRequests	Number of LS requests received.
	InputLSRequestsLSA	Number of LSA received in LS requests.
	OutputLSRequests	Number of LS requests sent.
	OutputLSRequestsLSA	Number of LSA sent in LS requests.
	InputLSAUpdates	Number of LSA updates received.
	InputLSRequestsLSA	Number of LSA received in LS requests.
	OutputLSAUpdates	Number of LSA updates sent.
	OutputLSAUpdatesLSA	Number of LSA sent in LSA updates.
	InputLSAAcks	Number of LSA acknowledgements received.
	InputLSAAcksLSA	Number of LSA received in LSA acknowledgements.
	OutputLSAAcks	Number of LSA acknowledgements sent
	OutputLSAAcksLSA	Number of LSA sent in LSA acknowledgements.

	monitor	read, write

Examples

This example shows how to create a template for monitoring BGP thresholds, which checks if the number of connections dropped exceeds 50 for any BGP peers. The **toggle rearm** keywords are included so that once the threshold is passed, the event will not be reported unless the value of ConnDropped is reset:

```
RP/0/RSP0/CPU0:router(config)# performance-mgmt thresholds bgp template bgp_thresh1
RP/0/RSP0/CPU0:router(config-threshold-bgp)# ConnDropped GT 50 rearm toggle
```

This example shows how to create a template for monitoring node CPU utilization that checks if there is a 25 percent increase at any given interval:

```
RP/0/RSP0/CPU0:router(config)# performance-mgmt thresholds node cpu template cpu_thresh1
RP/0/RSP0/CPU0:router(config-threshold-bgp)# AverageCPUUsed GT 25
```

This example shows how to create a template for monitoring the input CRC errors for interfaces. The rule checks whether the number of errors reach or exceed 1000 for any given interface:

```
RP/0/RSP0/CPU0:router(config)# performance-mgmt thresholds interface generic_ctr template
intf_crc_thresh1
RP/0/RSP0/CPU0:router(config-threshold-bgp)# InputCRC GE 1000
```

This example shows how to create a template for monitoring interface generic counters. The template named **ge_delta** is configured to check if the value of InPackets counter exceeds 10.

```
RP/0/0/CPU0:ios(config)#performance-mgmt thresholds interface generic-counters template
ge_delta InPackets ge 10 delta
RP/0/0/CPU0:ios(config)#commit
```

Related Commands

Command	Description
performance-mgmt apply thresholds, on page 362	Enables threshold monitoring for BGP.
performance-mgmt resources tftp-server, on page 367	Configures a TFTP resource for performance management.
show running performance-mgmt, on page 392	Displays a list of templates and the template being applied.

show performance-mgmt bgp

To display performance management (PM) data from Border Gateway Protocol (BGP) entity instance monitoring or statistics collections, use the **show performance-mgmt bgp** command in EXEC mode.

show performance-mgmt {**monitor** | **statistics**} **bgp** {*ip-address* | **all**} {*sample-id* | **all-samples** | **last-sample**}

Syntax Description	monitor	Displays the data collected for an entity instance monitoring collection. The data gathered is from one sample cycle of a BGP statistics collection template. The data is available only as the monitor data is enabled.
	statistics	Displays the data collected from statistics collection samples.
	<i>ip-address</i>	IP address of a BGP peer.
	all	Displays all BGP peer instances. Note This option is available only with the statistics keyword. It is not available with the monitor keyword because an entity instance monitoring collection captures data from an entity instance for one sampling cycle.
	<i>sample-id</i>	Sample ID of the monitoring or statistics collection to be displayed.
	all-samples	Displays all collected samples.
	last-sample	Displays the last collected samples.

Command Default None

Examples

This is the sample output from the **show performance-mgmt bgp** command:

```
RP/0/RSP0/CPU0:router# show performance-mgmt monitor bgp 10.0.0.0 all-samples
BGP Neighbor: 10.0.0.0 Sample no: 1
-----
InputMessages: 0 OutputMessages: 0
```

```

InputUpdateMessages: 0 OutputUpdateMessages: 0 ConnEstablished: 0 ConnDropped: 0
ErrorsReceived: 0 ErrorsSent: 0 BGP Neighbor: 10.0.0.0 Sample no: 2
----- InputMessages: 0 OutputMessages: 0
InputUpdateMessages: 0 OutputUpdateMessages: 0 ConnEstablished: 0 ConnDropped: 0
ErrorsReceived: 0 ErrorsSent: 0 BGP Neighbor: 10.0.0.0 Sample no: 3
----- InputMessages: 0 OutputMessages: 0
InputUpdateMessages: 0 OutputUpdateMessages: 0 ConnEstablished: 0 ConnDropped: 0
ErrorsReceived: 0 ErrorsSent: 0

```

This table describes the significant fields in the display.

Table 38: show performance-mgmt bgp Field Descriptions

Field	Description
ConnDropped	Number of times the connection was dropped.
ConnEstablished	Number of times the connection was established.
ErrorsReceived	Number of error notifications received on the connection.
ErrorsSent	Number of error notifications sent on the connection.
InputMessages	Number of messages received.
InputUpdateMessages	Number of update messages received.
OutputMessages	Number of messages sent.
OutputUpdateMessages	Number of update messages sent.

show performance-mgmt interface

To display performance management (PM) data from interface entity instance monitoring or statistics collections, use the **show performance-mgmt interface** command in EXEC mode.

```
show performance-mgmt {monitor | statistics} interface {basic-counters | data-rates |
generic-counters} {type interface-path-id | all} {sample-id | all-samples | last-sample}
```

Syntax Description					
monitor	Displays the data collected for an entity instance monitoring collection. The data gathered is from one sample cycle from one instance of an interface data entity collection template. Note The data is available to be display only as the monitor data is collected.				
statistics	Displays the data collected from statistics collection samples.				
basic-counters	Displays data from interface basic counters entity collections.				
data-rates	Displays data from interface data rates entity collections.				
generic-counters	Displays data from interface generic counters entity collections.				
<i>type</i>	(Optional) Interface type. For more information, use the question mark (?) online help function.				
<i>interface-path-id</i>	(Optional) Physical interface or virtual interface. Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.				
all	Displays all interface instances. Note This option is available only with the statistics keyword. It is not available with the monitor keyword because a entity instance monitoring collection captures data from an entity instance for one sampling cycle.				
<i>sample-id</i>	Sample ID of the monitoring collection or statistics collection to be displayed.				
all-samples	Displays all collected samples.				
last-sample	Displays the last collected samples.				
Command Default	None				
Command Modes	EXEC mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

show performance-mgmt interface

Release	Modification
Release 4.0.1	The basic-counters keyword was added to support basic counters entity collections.

Usage Guidelines

No specific guidelines impact the use of this command.

Table 39: show performance-mgmt interface Field Descriptions

Field	Description
InBroadcastPkts	Broadcast packets received.
InMulticast Pkts	Multicast packets received.

Field	Description
InOctets	Bytes received.
InPackets	Packets received.
InputCRC	Inbound packets discarded with incorrect CRC.
InputFrame	Inbound framing errors.
InputOverrun	Input overruns.
InputQueueDrops	Input queue drops.
InputTotalDrops	Inbound correct packets discarded.
InputTotalErrors	Inbound incorrect packets discarded.
InUcastPkts	Unicast packets received.
InputUnknownProto	Inbound packets discarded with unknown proto.
OutBroadcastPkts	Broadcast packets sent.
OutMulticastPkts	Multicast packets sent.
OutOctets	Bytes sent.
OutPackets	Packets sent.
OutputTotalDrops	Outbound correct packets discarded.
OutputTotalErrors	Outbound incorrect packets discarded.
OutUcastPkts	Unicast packets sent.
OutputUnderrun	Output underruns.

show performance-mgmt mpls

To display performance management (PM) data for Multiprotocol Label Switching (MPLS) entity instance monitoring and statistics collections, use the **show performance-mgmt mpls** command in EXEC mode.

show performance-mgmt {**monitor** | **statistics**} **mpls ldp** {*ip-address* | **all**} {*first-sample-id* | **all-samples** | **last-sample**}

Syntax Description

monitor	Displays the data collected for an entity instance monitoring collection. The data gathered is from one sample cycle from one instance of an MPLS entity collection template. Note The data is available to be displayed only as the monitor data is collected.
statistics	Displays the data collected from statistics collection samples.
ldp	Displays data from MPLS Label Distribution Protocol (LDP) collections.
<i>ip-address</i>	IP address of LDP session instance.
all	Displays data from all LDP session instances. Note This option is available only with the statistics keyword. It is not available with the monitor keyword because a entity instance monitoring collection captures data from an entity instance for one sampling cycle.
<i>first-sample-id</i>	Sample ID of the monitoring or statistics collection to be displayed.
all-samples	Displays all collected samples.
last-sample	Displays the last collected samples.

InitMsgsRcvd	Initial messages received.
TotalMsgsSent	Total messages sent.
TotalMsgsRcvd	Total messages received.
AddressMsgsSent	Address messages sent.

show performance-mgmt node

To display performance management (PM) data for node entity monitoring and statistics collections, use the **show performance-mgmt node** command in EXEC mode.

show performance-mgmt {**monitor** | **statistics**} **node** {**cpu** | **memory** | **process**} **location** {*node-id* | **all**} {*sample-id* | **all-samples** | **last-sample**}

Syntax Description

monitor	Displays the data collected for an entity instance monitoring collection. The data gathered is from one sample cycle from one instance of a node entity collection template. Note The data is only available to be displayed as the monitor data is collected.
statistics	Displays the data collected from statistics collection samples.
cpu	Displays data from the central processing unit (CPU).
memory	Displays data from memory.
process	Displays data from processes.
location	Specifies the location of data origination.
<i>node-id</i>	Location of the node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
all	Displays data from all LDP session instances. Note This option is available only with the statistics keyword. It is not available with the monitor keyword because a entity instance monitoring collection captures data from an entity instance for one sampling cycle.
<i>sample-id</i>	Sample ID of the monitoring or statistics collection to be displayed.
all-samples	Displays all collected samples.
last-sample	Displays the last collected samples.

Command Default

None

Command Modes

EXEC mode

Command History

This is sample output from the **show performance-mgmt node** command:

```
RP/0/RSP0/CPU0:router# show performance-mgmt monitor node process location 0/RSP1/CPU0
process
        614587 last-sample
Node ID: 0_RSP1_CPU0
Sample no: 1 ----- Process ID: 614587
----- PeakMemory: 908 AverageCPUUsed: 0
NoThreads: 5
```

This table describes the significant fields shown in the display.

Table 41: show performance-mgmt node Field Descriptions

Field	Description
PeakMemory	Maximum system memory (in MB) used since bootup.
AverageCPUUsed	Average system percent CPU utilization.
NoThreads	Number of threads.

show performance-mgmt ospf

To display performance management (PM) data for Open Shortest Path First (OSPF) entity instance monitoring and statistics collections, use the **show performance-mgmt ospf** command in EXEC mode.

show performance-mgmt {**monitor** | **statistics**} **ospf** {**v2protocol** | **v3protocol**} *instance* {*sample-id* | **all-samples** | **last-sample**}

Syntax Description

monitor Displays the data collected for an entity instance monitoring collection. The data gathered is from one sample cycle from one instance of an OSPF entity collection template.

Note The data is available to be displayed only as the monitor data is collected.

statistics Displays the data collected from statistics collection samples.

v2protocol Displays counters for an OSPF v2 protocol instance.

v3protocol Displays counters for an OSPF v3 protocol instance.

sample-id Sample ID of the monitoring or statistics collection to be displayed.

all-samples Displays all collected samples.

last-sample Displays the last collected samples.

Command Default

None

```

show running performance-mgmt

To display a list of configured templates and the template being applied, use the **show running performance-mgmt** command in EXEC mode.

show running performance-mgmt [{**apply** | **resources** | **statistics** | **thresholds**}]

Syntax Description	
apply	(Optional) Displays the list of apply template commands in the current configuration.
resources	(Optional) Displays the existing resource configuration commands applied.
statistics	(Optional) Displays the list of configured statistics templates.
thresholds	(Optional) Displays the list of configured threshold templates.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	monitor	read, write

Examples

This example shows the list of statistic and threshold templates, the configuration of each template, and at the end, which templates are enabled for collection:

```
RP/0/RSP0/CPU0:router(config)#show running performance-mgmt

performance-mgmt resources tftp-server 192.168.134.254 directory muckier/jagrelo/pmtest

performance-mgmt apply thresholds node cpu global template20
```

show health sysdb

To display the abstract view of the overall health of the system database (SysDB), use the **show health sysdb** command in EXEC mode.

XML schema is supported for the CLI commands.

- SysDB
 - ConfigurationSpace
 - IPCSpace
 - CPU
 - Memory
- SysdbConnections
 - NodeTable
 - Node

show health sysdb | **location** <node-id> | **memory** | **cpu** | **ipc** | **config** | **conn location** <node-id>

Syntax Description	location <i>node-id</i>	Displays the SysDB health information for a specified node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
	memory	Displays the amount of memory consumed by the SysDB processes.
	cpu	Displays the health of CPU consumed by the SysDB processes.
	ipc	Displays an abstract view of the health of SysDB interprocess communication (IPC) operational space.
	config	Displays an abstract view of the health of SysDB configurational space.
	con location <node-id>	Displays an internal breakdown of Lightweight Messaging (LWM) connections for the node.
Command Default	None	
Command Modes	EXEC mode	
Command History	Release	Modification
	Release 6.4.1	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID **Operations**

cisco-support read

interface read

Examples

The following is sample output from the **show health sysdb** command to display the health of the SysDB:

```
RP/0/RSP0/CPU0:router# show health sysdb location 0/2/cpu0
sysdb memory is 32MB, memory is healthy
sysdb cpu time is 0%, cpu is healthy
sysdb operational space is healthy
sysdb configuration space is healthy
```

show health sysdb

Statistics Service Commands

This module describes the Cisco IOS XR software commands related to the collection of interface statistics (StatsD) for system monitoring on the router. Interface statistics on the router are found in hardware (most of the time) and software (exception packets). The counters are always local (relative to the CPU) to the node on which the interface is homed. The Cisco IOS XR software provides an efficient mechanism to collect these counters from various application-specific integrated circuits (ASICs) or NetIO and assemble an accurate set of statistics for an interface. After the statistics are produced, they can be exported to interested parties (command-line interface [CLI], Simple Network Management Protocol [SNMP], and so forth).

The Cisco IOS XR software statistics collection system provides a common framework to be used by all interface owners to export the statistics for interfaces they own. The system also defines a common set of statistics that are relevant to all interfaces and thereby provides a consistent and constant set of counters that are always associated and maintained with any interface on the router.

The statistics collection system includes the statistics manager, the statistics server, one or more statistics collectors, and the necessary libraries. Each node on a router houses one statistics server.

In addition to the statistics server, each node (that has interfaces) has one or more statistics collectors. Statistics collectors are platform specific and can obtain various hardware and software counters to satisfy requests from the statistics server.

The statistics manager does not attempt to produce statistics for interfaces for which no statistics collector has registered. Requests for statistics on interfaces for which no statistics collector has registered results in an error returned to the requestor by the statistics manager.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

- [clear counters](#), on page 398
- [load-interval](#), on page 400

clear counters

To clear the interface counters, use the **clear countersinterface** command in EXEC mode mode.

clear counters interface [{**all** | *type interface-path-id*}]

Syntax Description

interface	Specifies interfaces.
all	(Optional) Clears counters on all interfaces.
<i>type</i>	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	(Optional) Physical interface or virtual interface.
Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
	For more information about the syntax for the router, use the question mark (?) online help function.

Command Default

Counters for all interfaces are cleared.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 6.0.x	This command was was modified. The interface was introduced

Usage Guidelines

Use the **clear counters** command to clear all the statistics counters displayed by the **show interfaces** command. If no optional arguments are supplied or if the **all** keyword is specified, then the counters for all interfaces are cleared. If an interface type is specified, then only the counters for that interface are cleared.

The **clear counters** command with the **all** option clears counters on all interfaces. When you enter this command, the system prompts you for confirmation. You must then press Enter or the y key for the **clear counters** command to take effect.

Note This command does not clear counters retrieved using Simple Network Management Protocol (SNMP), but only those counters displayed with the **show interfaces** command.

Task ID

Task ID	Operations
	interface execute

Examples

This example shows how to clear counters on all interfaces:

```
RP/0/RSP0/CPU0:router# clear counters interface all  
Clear "show interface" counters on all interfaces [confirm]
```

This example shows how to clear the interface counters for Packet-over-SONET/SDH (POS) interface 0/1/0/0:

```
RP/0/RSP0/CPU0:router# clear counters interface POS 0/1/0/0  
Clear "show interface" counters on this interface [confirm]
```

Related Commands

Command	Description
show interfaces	Displays statistics for all interfaces configured on the networking device.

load-interval

To specify the interval for load calculation of an interface, use the **load-interval** command in interface configuration mode. To reset the load interval to the default setting, use the **no** form of this command.

load-interval *seconds*
no load-interval *seconds*

Syntax Description	<i>seconds</i> Number of seconds for load calculation of an interface. The value range is from 0 to 600 seconds and in increments of 30 (such as 30, 60, 90, and so on). The default is 300 seconds.
---------------------------	--

Command Default	<i>seconds</i> : 300 seconds (5 minutes)
------------------------	--

Command Modes	Interface configuration
----------------------	-------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	When load interval is set to zero, load calculation is disabled. If you set the load interval, you must use a multiple of 30 (up to 600 seconds).
-------------------------	---

Task ID	Task ID	Operations
	interface	read/write

Examples This example shows how to configure the load interval to 30 seconds:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface pos 0/1/0/0
RP/0/RSP0/CPU0:router(config-if)# load-interval 30
```

Diagnostics Commands

This module provides command line interface (CLI) commands for configuring diagnostics on your router.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

The command modes mentioned in this chapter is applicable for Cisco IOS XR. If you are running Cisco IOS XR 64 bit, which is supported from Release 6.1.1 onwards, then the command modes has to be changed from Admin EXEC mode to XR EXEC mode, and Administration configuration mode to XR Config mode respectively.

For example,

Command Name	Cisco IOS XR	Cisco IOS XR 64 bit
diagnostic monitor	Administration configuration mode	XR Config mode
diagnostic start	Admin EXEC mode	XR EXEC mode

Note Online diagnostics for Ethernet Out of Band Channel (EOBC) is not supported on Cisco IOS XR 64 bit.

diagnostic monitor

To configure the health-monitoring diagnostic testing for a specified location, use the **diagnostic monitor** command in administration configuration mode. To remove the specified command from the configuration file and restore the system to its default condition, use the **no** form of this command.

diagnostic monitor location *node-id* **test** {*idtest-name*} [**disable**]

no diagnostic monitor location *node-id* **test** {*idtest-name*} [**disable**]

Syntax Description

node-id Location to enable diagnostic monitoring. The *node-id* argument is entered in the *rack/slot/module* notation.

test {*id* | *test-name*} Specifies diagnostic test selection. The following test selections are available:

- *id*—Test ID, as shown in the **show diagnostic content** command .
- *test-name*—Name of the test.

disable Disables diagnostic monitoring for a specified location.

Command Default

To view the default value for each test, use the **show diagnostic content** command when the diagnostic image is first installed. The default may be different for each test.

Command Modes

Administration configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

Use the **diagnostic monitor** command to enable or disable health-monitoring diagnostic testing for a specified test at the specified location.

Use the **disable** keyword to disable a health-monitoring diagnostic test that is enabled by default. For example, if test 1 is enabled by default, the **disable** keyword disables the diagnostic test. If the **no** form of the command is used, the test is set to the default condition, which is enabled.

Note To specify a node using the *node-id* argument, use the *rack/slot/module* notation. For example, 0/0/CPU0 is a fully qualified location specification for a line card, 0/2/CPU0 is a fully qualified location specification for a line card, 0/7/CPU0 is a fully qualified location specification for a line card, 0/RSP0/CPU0 is a fully qualified location specification for a Route Switch Processor.

Task ID

Task ID	Operations
diag	read, write

Examples

The following example shows how to enable health-monitoring diagnostic testing for 0/1/cpu0:

```
RP/0/RSP0/CPU0:router (admin-config) # diagnostic monitor location 0/1/cpu0 test 1
```

Related Commands

Command	Description
show diagnostic content, on page 421	Displays test information including test ID, test attributes, and supported coverage test levels for each test and for all components.

diagnostic monitor interval

To configure the health-monitoring diagnostic testing for a specified interval for a specified location, use the **diagnostic monitor interval** command in administration configuration mode. To remove the specified command from the configuration file and restore the system to its default condition, use the **no** form of this command.

diagnostic monitor interval location *node-id* **test** {*idtest-name*} *number-of-days* *hour* : *minutes* : *seconds* . *milliseconds*
no diagnostic monitor interval location *node-id* **test** {*idtest-name*} *number-of-days* *hour* : *minutes* : *seconds* . *milliseconds*

Syntax Description		
location <i>node-id</i>		Specifies a location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
test { <i>id</i> <i>test-name</i> }		Specifies diagnostic test selection. The following test selections are available: <ul style="list-style-type: none"> • <i>id</i>—Test ID. • <i>test-name</i>—Test name , as shown in the show diagnostic content command..
<i>number-of-days</i> <i>hour:minutes.seconds.milliseconds</i>		Interval between each test run. The <i>number-of-days</i> argument specifies the number of days between testing. The <i>hour:minutes.seconds.milliseconds</i> argument specifies the interval, where <i>hour</i> is a number in the range from 0 through 23, <i>minutes</i> is a number in the range from 0 through 59, <i>seconds</i> is a number in the range from 0 through 59, and <i>milliseconds</i> is a number in the range from 0 through 999.

Command Default To view the default value for each test, use the **show diagnostic content** command when the diagnostic image is first installed. The default may be different for each test.

Command Modes Administration configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **diagnostic monitor interval** command to set the health-monitoring interval of a specified test at the specified location. The **no** version of the command resets the interval to the default setting. The **diagnostic monitor** command is used to enable health-monitoring.

Note To specify a node using the *node-id* argument, use the *rack/slot/module* notation. For example, 0/0/CPU0 is a fully qualified location specification for a line card, 0/2/CPU0 is a fully qualified location specification for a line card, 0/7/CPU0 is a fully qualified location specification for a line card, 0/RSP0/CPU0 is a fully qualified location specification for a Route Switch Processor, and 0/RSP0/CPU0 is also a fully qualified location specification for a Route Switch Processor.

Task ID	Task ID	Operations
	diag	read, write

Examples

The following example shows how to set the health-monitoring diagnostic testing at an interval of 1 hour, 2 minutes, 3 seconds, and 4 milliseconds for 0/1/cpu0:

```
RP/0/RSP0/CPU0:router(admin-config)# diagnostic monitor interval location 0/1/cpu0 test 1
0 1:2:3.4
```

Related Commands	Command	Description
	diagnostic monitor, on page 403	Configures the health-monitoring diagnostic testing for a specified location.
	show diagnostic content, on page 421	Displays test information including test ID, test attributes, and supported coverage test levels for each test and for all components.

diagnostic monitor syslog

To enable the generation of a syslog message when any health monitoring test fails, use the **diagnostic monitor syslog** command in administration configuration mode. To remove the specified command from the configuration file and restore the system to its default condition, use the **no** form of this command.

diagnostic monitor syslog
no diagnostic monitor syslog

Syntax Description This command has no keywords or arguments.

Command Default Syslog is disabled.

Command Modes Administration configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **diagnostic monitor syslog** command to enable the generation of a syslog message when a health-monitoring test fails.

Task ID	Task ID	Operations
	diag	read, write

Examples The following example shows how to enable the generation of syslog messages:

```
RP/0/RSP0/CPU0:router(admin-config)# diagnostic monitor syslog
```

Related Commands	Command	Description
	show diagnostic content, on page 421	Displays test information including test ID, test attributes, and supported coverage test levels for each test and for all components.

diagnostic monitor threshold

To configure the health-monitoring diagnostic testing failure threshold, use the **diagnostic monitor threshold** command in administration configuration mode. To remove the specified command from the configuration file and restore the system to its default condition, use the **no** form of this command.

diagnostic monitor threshold location *node-id* **test** {*id*test-name} **failure count** *failures*
no diagnostic monitor threshold location *node-id* **test** {*id*test-name} **failure count** *failures*

Syntax Description	location <i>node-id</i>	Specifies a location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
	test { <i>id</i> <i>test-name</i> }	Specifies diagnostic test selection. The following test selections are available: <ul style="list-style-type: none"> • <i>id</i>—Test ID. • <i>test-name</i>—Test name , as shown in the show diagnostic content command. .
	failure count <i>failures</i>	Specifies the number of allowable test failures. Range is 1 to 99.

Command Default To view the default value for each test, use the **show diagnostic content** command when the diagnostic image is first installed. The default can be different for each test.

Command Modes Administration configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **diagnostic monitor threshold** command to specify health-monitoring diagnostic testing failure threshold.

Note To specify a node using the *node-id* argument, use the *rack/slot/module* notation. For example, 0/0/CPU0 is a fully qualified location specification for a line card, 0/2/CPU0 is a fully qualified location specification for a line card, 0/7/CPU0 is a fully qualified location specification for a line card, 0/RSP0/CPU0 is a fully qualified location specification for a Route Switch Processor, and 0/RSP0/CPU0 is also a fully qualified location specification for a Route Switch Processor.

Task ID	Task ID	Operations
	diag	read, write

Examples The following example shows how to set the failure threshold to 35 test failures for test 1 for 0/1/cpu0:

```
RP/0/RSP0/CPU0:router(admin-config)# diagnostic monitor threshold location 0/1/cpu0 test 1
failure count 35
```

Related Commands

Command	Description
show diagnostic content, on page 421	Displays test information including test ID, test attributes, and supported coverage test levels for each test and for all components.

diagnostic ondemand action-on-failure

To set when to stop test execution for a **diagnostic start** command, use the **diagnostic ondemand action-on-failure** command in Admin EXEC mode. This command is used in conjunction with the **diagnostic ondemand iteration** command.

diagnostic ondemand action-on-failure {**continue** *failure-count* | **stop**}

Syntax Description

continue <i>failure-count</i>	Specifies that test execution continue until the number of failures reaches the specified <i>failure-count</i> . Range is 0 to 65534. A <i>failure-count</i> of 0 indicates to not stop execution until all iterations are complete, no matter how many failures are encountered.
stop	Stops execution immediately when the first test failure occurs.

Command Default

failure-count: 0

Command Modes

Admin EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **diagnostic ondemand action-on-failure** command to specify whether or when to stop test execution if a test fails. This command is used in conjunction with the **diagnostic ondemand iterations** command.

Task ID

Task ID	Operations
diag	read, write

Examples

The following example shows how to set the test failure action to stop:

```
RP/0/RSP0/CPU0:router (admin) # diagnostic ondemand action-on-failure stop
```

Related Commands

Command	Description
diagnostic ondemand iterations, on page 411	Sets the number of times to repeat execution of the diagnostic test.
diagnostic start, on page 414	Runs a specified diagnostic test.

diagnostic ondemand iterations

To set the number of times to repeat execution of the tests specified by the **diagnostic start** command, use the **diagnostic ondemand iterations** command in Admin EXEC mode.

diagnostic ondemand iterations *count*

Syntax Description	<i>count</i> Number of times to repeat the specified on-demand tests. Range is 1 to 999.
---------------------------	--

Command Default	<i>count</i> : 1
------------------------	------------------

Command Modes	Admin EXEC mode
----------------------	-----------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the diagnostic ondemand iterations command to specify the number of times the specified on-demand tests run. The on-demand tests are specified using the diagnostic start command.
-------------------------	--

Task ID	Task ID	Operations
	diag	read, write

Examples	The following example shows how to set the number of iterations to 12:
-----------------	--

```
RP/0/RSP0/CPU0:router(admin)# diagnostic ondemand iterations 12
```

Related Commands	Command	Description
	diagnostic ondemand action-on-failure, on page 410	Sets when to stop test execution for a diagnostic test.
	diagnostic start, on page 414	Runs a specified diagnostic test.

diagnostic schedule

To configure a diagnostic schedule, use the **diagnostic schedule** command in Admin Configuration mode. To disable the diagnostic schedule, use the **no** form of this command.

```
diagnostic schedule location node-id test {id | all | non-disruptive} {daily | on month day year | weekly day-of-week} hour:minute
no diagnostic schedule location node-id test {id | all} {daily | on month day year | weekly day-of-week} hour:minute
```

Syntax Description

location <i>node-id</i>	Schedules a diagnostic test for a specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
test	Specifies a specific diagnostic test, or all diagnostic tests.
id	Test ID or list of test IDs, as shown in the show diagnostic content command. Multiple tests can be listed if separated by semicolons (;) and a range of dates can be listed if separated by a hyphen (-), as follows: <ul style="list-style-type: none"> x;y-z (for example: 1; 3-4 or 1;3;4)
all	Specifies all tests.
non-disruptive	Specifies the nondisruptive test suite [Attribute = N].
daily	Specifies a daily schedule.
on <i>month day year</i>	Schedules an exact date.
weekly <i>day-of-week</i>	Specifies a weekly schedule with a set day of the week. Enter the name of a day of the week or a number that specifies a day of the week in the range from 0 through 6, where 0 is today.
<i>hour:minute</i>	Scheduled start time, where <i>hour</i> is a number in the range from 0 through 23, and <i>minute</i> is a number in the range from 0 through 59.

Command Default

No default behavior or values

Command Modes

Admin Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Note To specify a node using the *node-id* argument, use the *rack/slot/module* notation. For example, 0/0/CPU0 is a fully qualified location specification for a line card, 0/2/CPU0 is a fully qualified location specification for a line card, 0/7/CPU0 is a fully qualified location specification for a line card, 0/RSP0/CPU0 is a fully qualified location specification for a Route Switch Processor, and 0/RSP0/CPU0 is also a fully qualified location specification for a Route Switch Processor.

For more information about running Cisco IOS XR diagnostics, refer to *Cisco IOS XR Diagnostics*.

Task ID	Task ID	Operations
	diag	read, write

Examples

The following example shows how to schedule a diagnostic test:

```
RP/0/RSP0/CPU0:router# admin
RP/0/RSP0/CPU0:router(admin)# configure
RP/0/RSP0/CPU0:router(admin-config)# diagnostic schedule location 0/0/CPU0 test all daily
complete device 1 weekly 12:30
```

Related Commands	Command	Description
	show diagnostic schedule, on page 429	Displays the current scheduled diagnostic tasks.

diagnostic start

To run a specified diagnostic test, use the **diagnostic start** command in Admin EXEC mode.

diagnostic start location node-id test {id | all | non-disruptive}

Syntax Description	location node-id	Runs diagnostic testing for a specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
	test	Specifies a specific diagnostic test, or all diagnostic tests.
	id	Test ID or list of test IDs, as shown in the show diagnostic content command. Multiple tests can be listed if separated by semicolons (;) a range of dates can be listed if separated by a hyphen (-), as follows: <ul style="list-style-type: none"> • x;y-z (for example: 1; 3-4 or 1;3;4)
	all	Specifies all tests.
	non-disruptive	Specifies the nondisruptive test suite [Attribute = N].

Command Default No default behavior or values

Command Modes Admin EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **diagnostic start** command to run a diagnostic test on a specified card.

Note To specify a node using the *node-id* argument, use the *rack/slot/module* notation. For example, 0/0/CPU0 is a fully qualified location specification for a line card, 0/2/CPU0 is a fully qualified location specification for a line card, 0/7/CPU0 is a fully qualified location specification for a line card, 0/RSP0/CPU0 is a fully qualified location specification for a Route Switch Processor, and 0/RSP0/CPU0 is also a fully qualified location specification for a Route Switch Processor.

For more information about running Cisco IOS XR diagnostics, refer to *Cisco IOS XR Diagnostics*.

Task ID	Task ID	Operations
	diag	execute

Examples The following example shows how to run a complete suite of diagnostic tests for a specified location:

```
RP/0/RSP0/CPU0:router# admin
RP/0/RSP0/CPU0:router(admin)# diagnostic start location 0/0/CPU0 test all
```

Related Commands

Command	Description
diagnostic stop, on page 416	Stops the diagnostic testing in progress on a node.

diagnostic stop

To stop the diagnostic testing in progress on a node, use the **diagnostic stop** command in Admin EXEC mode.

diagnostic stop location *node-id*

Syntax Description	location <i>node-id</i>	Stops diagnostic testing for a specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	-----------------------------------	--

Command Default No default behavior or values

Command Modes Admin EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **diagnostic stop** command to stop a diagnostic test on a specified node. The command is used for scheduled tests, a test that is causing errors, or a test that does not finish.

Note To specify a node using the *node-id* argument, use the *rack/slot/module* notation. For example, 0/0/CPU0 is a fully qualified location specification for a line card, 0/2/CPU0 is a fully qualified location specification for a line card, 0/7/CPU0 is a fully qualified location specification for a line card, 0/RSP0/CPU0 is a fully qualified location specification for a Route Switch Processor, and 0/RSP0/CPU0 is also a fully qualified location specification for a Route Switch Processor.

Task ID

Examples

The following example shows how to stop the diagnostic test process:

Related Commands	Command	Description
	diagnostic start, on page 414	Runs a specified diagnostic test.

show diag

To display details about the hardware and software on each node in a router, use the **show diag** command in the appropriate mode.

EXEC Mode

```
show diag [node-id] [{details | eeprom-info | power-regs | summary}]
```

Administration EXEC Mode

```
show diag [node-id] [{chassis | fans | power-supply}] [{details | eeprom-info | power-regs | summary}]
```

Syntax Description

node-id (Optional) Identifies the node whose information you want to display. The *node-id* argument is expressed in the *rack/slot/module* notation.

Follow the *node-id* argument with one of the following optional keywords to specify specific test results:

- details
- eeprom-info
- power-regs
- summary

details (Optional) Displays detailed diagnostics information for the current node.

eeprom-info (Optional) Displays field diagnostics results from the EEPROM.

power-regs (Optional) Displays field diagnostics results from the power registers.

summary (Optional) Displays summarized diagnostics results for all nodes in the system.

chassis-info (Optional) Displays information about the chassis.

fans (Optional) Displays information about the fans tray.

power-supply (Optional) Displays information about the power supply.

Command Default

Diagnostics for all nodes installed in the router are displayed.

Command Modes

EXEC

Administration EXEC

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **show diag** command displays detailed information on the hardware components for each node, and on the status of the software running on each node.

Task ID	Task ID	Operations
	sysmgr	read

Examples

The following example shows excerpts of output from the **show diag details** command:

```
RP/0/RSP0/CPU0:router# show diag details

This table describes the significant fields shown in the display.

Table 42: show diag Field Descriptions

Field	Description
MAIN	Provides the following general information about the hardware: <ul style="list-style-type: none"> • Board type • Revision • Device identifier • Serial number
PCA	Cisco printed circuit assembly (PCA) hardware and revision number.
PID	Displays the product identifier (PID) revision for the specified node.
VID	Displays the version identifier (VID) for the specified node.
CLEI	Displays the common language equipment identifier (CLEI) for the specified node.
ECI	Displays the equipment catalog item (ECI) for the specified node.
Board State	Displays the current software on the board and whether or not the board is running.
PLD	Displays the information about the following programmable logic device (PLD) components on the current module: <ul style="list-style-type: none"> • Processor • Power • MONLIB

Field	Description
SPEED	Displays speed information for the various components of the specified node, in megahertz.
MEM Size	Displays the memory size of the specified node, in megabytes.
RMA	Displays returned material adjustment (RMA) information for the specified node.
DIAGNOSTICS RESULTS	Provides the following information about the last diagnostics test that was run on the specified node: <ul style="list-style-type: none"> • ENTRY 1 • TIMESTAMP—Time stamp for the last diagnostic test that was run on the node. • VERSION • PARAM1 • PARAM2 • TESTNUM—Identifies the test that was run on the node. • RESULT—Displays whether the last diagnostic test passed or failed. • ERRCODE

The following example shows how to display EEPROM information:

```
RP/0/RSP15/CPU0:router# show diag chassis eeprom-info

Related Commands

Command	Description
show platform	Displays information and status for each node in the system.
show version	Displays details on the hardware and software status of the system.

show diagnostic bootup level

To display the current diagnostic bootup level, use the **show diagnostic bootup level** command in Admin EXEC mode.

show diagnostic bootup level location *node-id*

Syntax Description	location <i>node-id</i>	Specifies a card. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	--------------------------------	---

Command Default No default behavior or values.

Command Modes Admin EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show diagnostic bootup level** command to display the current diagnostic bootup level for a specified card.

Note To specify a node using the *node-id* argument, use the *rack/slot/module* notation. For example, 0/0/CPU0 is a fully qualified location specification for a line card, 0/2/CPU0 is a fully qualified location specification for a line card, 0/7/CPU0 is a fully qualified location specification for a line card, 0/RSP0/CPU0 is a fully qualified location specification for a Route Switch Processor, and 0/RSP0/CPU0 is also a fully qualified location specification for a Route Switch Processor.

Task ID	Task ID	Operations
	diag	read

Examples

The following example shows how to display the current diagnostic bootup level for 0/1/cpu0:

```
RP/0/RSP0/CPU0:router(admin)# show diagnostic bootup level location 0/1/cpu0
```

```
Current bootup diagnostic level for LC 0/1/CPU0: minimal
```

show diagnostic content

To display test information including test ID, test attributes, and supported coverage test levels for each test and for all components, use the **show diagnostic content** command in Admin EXEC mode.

show diagnostic content location *node-id*

Syntax Description	location <i>node-id</i>	Displays the diagnostic content for a specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	-----------------------------------	---

Command Default No default behavior or values

Command Modes Admin EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show diagnostic content** command to display diagnostic test information for a specific location. The test information includes the supported tests and attributes.

Note To specify a node using the *node-id* argument, use the *rack/slot/module* notation. For example, 0/0/CPU0 is a fully qualified location specification for a line card, 0/2/CPU0 is a fully qualified location specification for a line card, 0/7/CPU0 is a fully qualified location specification for a line card, 0/RSP0/CPU0 is a fully qualified location specification for a Route Switch Processor, and 0/RSP0/CPU0 is also a fully qualified location specification for a Route Switch Processor.

For more information about running Cisco IOS XR diagnostics, refer to *Cisco IOS XR Diagnostics*.

Task ID	Task ID	Operations
	diag	read

Examples

The following example shows how to display the test information for a specified location:

For a route switch processor:

```
RP/0/RSP0/CPU0:router(admin)# show diagnostic content location 0/rsp0/cpu0

Table 43: show diagnostic content Field Descriptions, on page 423 describes the significant fields shown in the display.

Table 43: show diagnostic content Field Descriptions

Field	Description
M/C/* - Minimal bootup level test / Complete bootup level test / NA	Minimal bootup test or complete bootup test.
B/* - Basic ondemand test / NA	Basic on-demand test.
P/V/* - Per port test / Per device test / NA	Test is per port or device.
D/N/* - Disruptive test / Non-disruptive test / NA	Test is disruptive or nondisruptive.
S/* - Only applicable to standby unit / NA	Test is available for standby node only.
X/* - Not a health monitoring test / NA	Test is not a health-monitoring test.
F/* - Fixed monitoring interval test / NA	Test is a fixed monitoring interval test.
E/* - Always enabled monitoring test / NA	Test is an always enabled monitoring test.
A/I - Monitoring is active / Monitoring is inactive	Test is active or inactive.
ID	ID of the test.
Test Name	Name of the test.
Attributes	Attributes for the test.
Test Interval	Interval of the test.
Threshold	Failure threshold of the text.

Related Commands

Command	Description
diagnostic monitor interval, on page 405	Configures the health-monitoring diagnostic testing for a specified interval for a specified location.
diagnostic schedule, on page 412	Configures a diagnostic schedule.
diagnostic start, on page 414	Runs a specified diagnostic test.

show diagnostic ondemand settings

To display the current on-demand settings, use the **show diagnostic ondemand settings** command in Admin EXEC mode .

show diagnostic ondemand settings

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values

Command Modes Admin EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	diag	read

Examples

The following example shows how to display the on-demand settings:

```
RP/0/RSP0/CPU0:router(admin)# show diagnostic ondemand settings
```

```
Test iterations = 45
```

```
Action on test failure = continue until test failure limit reaches 25
```

show diagnostic result

To display diagnostic test results, use the **show diagnostic result** command in Admin EXEC mode.

show diagnostic result location *node-id*[test {*id* | **all**}] [**detail**]

Syntax Description	location <i>node-id</i>	Displays the diagnostic test results for a specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
	test { <i>id</i> all }	(Optional) Specifies diagnostic test selection. The following test selections are available: <ul style="list-style-type: none"> <i>id</i>—Test ID or list of test IDs , as shown in the show diagnostic content command . Multiple tests can be listed if separated by semicolons (;) as follows: <ul style="list-style-type: none"> x;y-z (for example: 1; 3-4 or 1;3;4) all—Specifies all tests.
	detail	(Optional) Specifies detailed results.

Command Default No default behavior or values

Command Modes Admin EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show diagnostic result** command to display diagnostic results for a specific location.

Note To specify a node using the *node-id* argument, use the *rack/slot/module* notation. For example, 0/0/CPU0 is a fully qualified location specification for a line card, 0/2/CPU0 is a fully qualified location specification for a line card, 0/7/CPU0 is a fully qualified location specification for a line card, 0/RSP0/CPU0 is a fully qualified location specification for a Route Switch Processor, and 0/RSP0/CPU0 is also a fully qualified location specification for a Route Switch Processor.

For more information about running Cisco IOS XR diagnostics, refer to *Cisco IOS XR Diagnostics*.

Task ID	Task ID	Operations
	diag	read

Examples

The following example shows how to display detailed diagnostic test results:

```
RP/0/RSP0/CPU0:router(admin)# show diagnostic result loc 0/RSP0/CPU0 test 1
Current bootup diagnostic level for RP 0/RSP0/CPU0: minimal
```

```

Test results: (. = Pass, F = Fail, U = Untested)
1 ) PuntFPGAScratchRegister -----> .
RP/0/RSP0/CPU0:router(admin)#
RP/0/RSP0/CPU0:router(admin)# show diagnostic result loc 0/RSP0/CPU0 test all
Current bootup diagnostic level for RP 0/RSP0/CPU0: minimal
Test results: (. = Pass, F = Fail, U = Untested)
1 ) PuntFPGAScratchRegister -----> .
2 ) XbarInterfaceScratchRegister ----> .
3 ) ClkCtrlScratchRegister -----> .
4 ) IntCtrlScratchRegister -----> .
5 ) CPUCtrlScratchRegister -----> .
6 ) XbarSwitchIdRegister -----> .
7 ) EccSbeTest -----> U
8 ) SrspStandbyEobcHeartbeat -----> U
9 ) SrspActiveEobcHeartbeat -----> U
10 ) FabricLoopback -----> .
11 ) PuntFabricDataPath -----> .
12 ) FPDImageVerify -----> .

```

Here is an example of the **show diagnostic results detail** command run on the route switch processor labeled RSP0:

```
RP/0/RSP0/CPU0:router(admin)# show diagnostic result loc 0/RSP0/CPU0 detail
```

```
Current bootup diagnostic level for RP 0/RSP0/CPU0: minimal
```

```

Table 44: show diagnostic result Field Descriptions

Field	Description
Test results	Test result options: <ul style="list-style-type: none"> • .—Pass • F—Fail • U—Untested
Error code	Code for the error. DIAG_SUCCESS is indicated if there were no code errors. DIAG_FAILURE is indicated for any failure. DIAG_SKIPPED is indicated if the test was stopped.
Total run count	Number of times the test has run.
Last test execution time	Last time the test was run.

Field	Description
First test failure time	First time the test failed.
Last test failure time	Last time the test failed.
Last test pass time	Last time the test passed.
Total failure count	Number of times the test has failed.
Consecutive failure count	Number of consecutive times the test has failed.

Related Commands

Command	Description
diagnostic schedule, on page 412	Configures a diagnostic schedule.
diagnostic start, on page 414	Runs a specified diagnostic test.

show diagnostic schedule

To display the current scheduled diagnostic tasks, use the **show diagnostic schedule** command in Admin EXEC mode.

show diagnostic schedule location *node-id*

Syntax Description	location <i>node-id</i>	Displays the diagnostic schedule for a specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	-----------------------------------	--

Command Default No default behavior or values

Command Modes Admin EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show diagnostic schedule** command to display scheduled diagnostic tasks for a specific location.

Note To specify a node using the *node-id* argument, use the *rack/slot/module* notation. For example, 0/0/CPU0 is a fully qualified location specification for a line card, 0/2/CPU0 is a fully qualified location specification for a line card, 0/7/CPU0 is a fully qualified location specification for a line card, 0/RSP0/CPU0 is a fully qualified location specification for a Route Switch Processor, and 0/RSP0/CPU0 is also a fully qualified location specification for a Route Switch Processor.

For more information about running Cisco IOS XR diagnostics, refer to *Cisco IOS XR Diagnostics*.

Task ID	Task ID	Operations
	diag	read

Examples

The following example shows how to display scheduled diagnostic tasks:

```
RP/0/RSP0/CPU0:router# admin
RP/0/RSP0/CPU0:router(admin)# show diagnostic schedule location 0/3/CPU0

Current Time = Tue Sep 27 12:41:24 2005
Diagnostic for LC 0/3/CPU0:

Schedule #1:
  To be run daily 14:40
  Test ID(s) to be executed: 1 .
```

Table 45: show diagnostic schedule Field Descriptions

Field	Description
Current Time	Current system time.
Diagnostic for	Card for which the diagnostic is scheduled.
Schedule	Schedule number.
To be run	Time at which the diagnostics are scheduled to run.
Test ID(s) to be executed	Tests to be run at scheduled time.

Related Commands

Command	Description
diagnostic schedule, on page 412	Configures a diagnostic schedule.

show diagnostic status

To display the current running tests, use the **show diagnostic status** command in Admin EXEC mode.

show diagnostic status

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values

Command Modes Admin EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

RP 0/RSP0/CPU0 N/A N/A
-----
RP 0/RSP1/CPU0 N/A N/A
-----
A9K-8T/4-B 0/2/CPU0 N/A N/A
-----
A9K-40GE-E 0/7/CPU0 N/A N/A
-----
A9K-40GE-B 0/0/CPU0 N/A N/A
=====
```

show diag (Cisco IOS XR 64-bit)

To display details about the hardware and software on each node in a router, use the **show diag** command in the System Admin EXEC mode.

System Admin EXEC Mode
show diag [**details** | **location** *node-id*]

Syntax Description	<i>node-id</i> (Optional) Identifies the node whose information you want to display. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.
	details It displays detailed diagnostics information for the current node.
	location It displays hardware components for the current node.

Command Default Diagnostics for all nodes installed in the router are displayed.

Command Modes System Admin EXEC

Command History	Release	Modification
	Release 7.0.1	This command was introduced.

Usage Guidelines The command is only applicable for IOS XR 64 Bit software on ASR 9000 Enhanced XR (eXR).
 The **show diag** command displays detailed information on the hardware components for each node, and on the status of the software running on each node.

Task ID	Task Operations ID
	system read

The following example shows excerpts of output from the **show diag details** command:

```

show diag (Cisco IOS XR 64-bit)

Test TCP Utility Commands

This module describes the Cisco IOS XR software commands to configure the Test TCP utility (TTCP) to measure TCP throughput through an IP path.

For detailed information about the TTCP utility see the *Using Test TCP (TTCP) to Test Throughput* module in the *System Monitoring Configuration Guide for Cisco ASR 9000 Series Routers*.

- [tcp receive, on page 436](#)
- [tcp transmit, on page 438](#)

ttcp receive

To start the TTCP utility on the host, running as a receiver use the **ttcp receive source** command in EXEC mode.

```
ttcp receive [{align} | [buflen] | [debug] | [format] | [fullblocks] | [host] | [multi] | [nofilter] | [nonblock]
| [offset] | [password] | [port] | [sockbuf] | [source] | [timeout] | [touch] | [transmit] | [udp] | [verbose] |
[vrfid]}
```

Syntax Description	
align	(Optional) Aligns the start of buffers to this modulus. The default value is 16384.
buflen	(Optional) Indicates the length of buffers read from or written to the network. The default value is 8192.
debug	(Optional) Enable socket debug mode.
format	(Optional) Format for rate: k,K = kilo{bit,byte}; m,M = mega; g,G = giga.
fullblocks	(Optional) Displays the full blocks of output as specified by buflen.
host	(Optional) Host name or IP address.
multi	(Optional) Indicates the number of connections.
nofilter	(Optional) Indicates not to filter ICMP errors.
nonblock	(Optional) Indicates the use of non-blocking sockets.
offset	(Optional) Starts buffers at this offset from the modulus. The default value is 0.
password	(Optional) Indicates the MD5 password to be used for the TCP connection .
port	(Optional) Indicates the port number to send to or listen at. The default value is 5001.
sockbuf	(Optional) Indicates the socket buffer size.
source	(Optional) Source a pattern to or from the network.
timeout	(Optional) Stop listening after timeout seconds.
touch	(Optional) Access each byte as it is read.
transmit	(Optional) Indicates transmit mode.
udp	(Optional) Indicates to use UDP instead of TCP.
verbose	(Optional) Indicates that detailed statistics be printed.
vrfid	(Optional) Indicates the ID of the VRF to connect.
Command Default	No default behavior or values.
Command Modes	EXEC mode

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines TCP is a connection-oriented protocol, so you must have a receiver listening before a transmitter can connect. You must ensure that there is IP connectivity between the two devices involved in the test. First start up a TTCP receiver, and the transmitter. TTCP uses the time and the amount of data transferred, to calculate the throughput between the transmitter and the receiver.

Task ID	Task ID	Operation
	ttcp	Read

TTCP utility results at receiver end

This section displays the results using the **ttcp receive source verbose** command.

```
RP/0/0/CPU0:ios#ttcp receive source verbose
Tue Feb 25 06:57:39.935 IST
ttcp-r: thread = 1, buflen=8192, nbuf=2048, align=16384/0, port=5001 tcp
ttcp-r: socket
ttcp-r: accept from 5.1.1.3
thread 0: read 1460 bytes
thread 0: read 2920 bytes
thread 0: read 4380 bytes
thread 0: read 5840 bytes
thread 0: read 7300 bytes
thread 0: read 8192 bytes

thread 1: recv 8192 bytes

TTCP: +++ all threads terminated +++
ttcp-r: 8192 bytes in 0.21 real useconds = 37.91 KB/sec +++
ttcp-r: 8192 bytes in 0.00 CPU seconds = 8000.00 KB/cpu sec
ttcp-r: 7 I/O calls, msec/call = 30.87, calls/sec = 33.17
ttcp-r:
RP/0/0/CPU0:ios#
```

ttcp transmit

To start the TTCP utility on the host running as a transmitter use the **ttcp transmit source** command in EXEC mode.

```
ttcp transmit[{{align} | [buflen] | [debug] | [format] | [host] | [multi] | [nbufs] | [nobuffering] | [nofilter]
| [nonblock] | [offset] | [password] | [port] [receive] | [sockbuf] | [source] | [timeout] | [touch] | [udp] |
[verbose] | [vrfid]}}
```

Syntax Description

align	(Optional) Aligns the start of buffers to this modulus. The default value is 16384.
buflen	(Optional) Indicates the length of buffers read from or written to the network. The default value is 8192.
debug	(Optional) Enable socket debug mode.
format	(Optional) Format for rate: k,K = kilo{bit,byte}; m,M = mega; g,G = giga.
host	(Mandatory) Host name or IP address.
multi	(Optional) Indicates the number of connections.
nbufs	(Optional) Indicates the number of source buffers written to the network. The default value is 2048.
nobuffering	(Optional) Indicates not to buffer TCP writes (sets TCP_NODELAY socket option).
nofilter	(Optional) Indicates not to filter ICMP errors.
nonblock	(Optional) Indicates the use of non-blocking sockets.
offset	(Optional) Starts buffers at this offset from the modulus. The default value is 0.
password	(Optional) Indicates the MD5 password to be used for the TCP connections.
port	(Optional) Indicates the port number to send to or listen at. The default value is 5001.
receive	(Optional) Indicates receive mode.
sockbuf	(Optional) Indicates the socket buffer size.
source	(Optional) Source a pattern to or from the network.
timeout	(Optional) Stop listening after timeout seconds.
udp	(Optional) Indicates to use UDP instead of TCP.
verbose	(Optional) Indicates that detailed statistics be printed.
vrfid	(Optional) Indicates the ID of the VRF to connect.

Command Default

No default behavior or values.

Command Modes EXEC mode

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines To use TTCP, start a copy of TTCP in receive mode at one place within the network, then start a second copy in transmit mode at another place within the network. The results of the transfer of data from the transmitter to the receiver indicate the approximate performance of the path between the source and destination. By selecting the source and destination at various points with the network, you can analyze critical portions of the path. You must ensure that there is IP connectivity between the two devices involved in the test.

Task ID	Task ID	Operation
	ttcp	Read

TTCP utility results at the transmitter end

This section displays the results using the **ttcp transmit source verbose** command.

```
RP/0/0/CPU0:ios#ttcp transmit source nbufs 1 verbose host 5.1.1.2
Tue Feb 25 06:57:47.904 IST
