CHAPTER 1

Cisco Unified CME Features Roadmap 1

Obtaining Documentation, Obtaining Support, and Security Guidelines 63

CHAPTER 2

Cisco Unified CME Overview 65

Important Information about Cisco IOS XE 16 Denali 65

Unified CME Graphical User Interface Deprecation 65

CTI CSTA Protocol Suite Deprecation 66

Simple Network Management Protocol (SNMP) Support for Unified CME 67

Introduction 67

Licensing 69

Cisco Smart Licensing 69

Smart License Operation 70

Cisco IOS XE Everest 16.5.1 Release to Cisco IOS XE Fuji 16.9.1 Release 70

Cisco IOS XE Gibraltar 16.10.1 Release Onwards 70

Cisco IOS XE Everest 16.5.1 Release to Cisco IOS XE Amsterdam 17.3.1a Release 70

Cisco IOS XE Gibraltar 16.12.1 Release to Cisco IOS XE Amsterdam 17.3.1a Release 71

Cisco IOS XE Amsterdam 17.3.2 Release Onwards 71

PBX or Keyswitch 74

PBX Model 74

Keyswitch Model 74

Hybrid Model 75

Call Detail Records 76

Additional References 76

Management Information Base 78

CHAPTER 3

Virtual CME 79

Overview	79
Prerequisites for Virtual CME	79
Hardware Requirements for Virtual CME	80
Software Requirements for Virtual CME	81
Protocol Support	81
Feature Support for Virtual CME	81
CLI Support on Virtual CME	82
Restrictions of Virtual CME	82
Install Virtual CME	83
Licensing Requirements	83
Enable Virtual CME	84
Example for Cisco VG300 Series Registration as SCCP Endpoint with Virtual CME	85
Feature Information for Virtual CME	87

CHAPTER 4
Before You Begin 89

Prerequisites for Configuring Cisco Unified CME	89
Restrictions for Configuring Cisco Unified CME	90
Information About Planning Your Configuration	90
System Design	90
Toll Fraud Prevention	92
Cisco Unified CME Workflow	93
Install Cisco Voice Services Hardware	97
Install Cisco IOS Software	99
Configure VLANs on a Cisco Switch	100
Network Assistant	100
Cisco IOS Commands	101
Internal Cisco Ethernet Switching Module	104
Using Cisco IOS Commands	105
Voice Bundles	106

CHAPTER 5
Install and Upgrade Cisco Unified CME Software 109

Prerequisites for Installing Cisco Unified CME Software	109
Cisco Unified CME Software	109
Basic Files	109

Phone Firmware Files	110
XML Template	111
Music-on-Hold (MOH) File	112
Script Files	112
Bundled TSP Archive	112
File Naming Conventions	112
Install and Upgrade Cisco Unified CME Software	113
Install Cisco Unified CME Software	113
Upgrade or Downgrade SCCP Phone Firmware	114
Upgrade or Downgrade SIP Phone Firmware	116
Phone Firmware Conversion from SCCP to SIP	120
Phone Firmware Conversion from SIP to SCCP	123
Remove SIP Configuration Profile	124
Generate SCCP XML Configuration File to Upgrade from SIP to SCCP	124
Example	126
What to Do Next	127
Verify SCCP Phone Firmware Version	127
Troubleshooting Tips for Cisco Phone Firmware	127

CHAPTER 6

Network Parameters	129
Prerequisites for Defining Network Parameters	129
Restrictions for Defining Network Parameters	129
Information About Defining Network Parameters	130
DHCP Service	130
Network Time Protocol for the Cisco Unified CME Router	130
Olson Timezones	130
DTMF Relay	131
SIP Register Support	132
Define Network Parameters	132
Enable Calls in Your VoIP Network	132
Configure DHCP	135
Configure Single DHCP IP Address Pool	135
Configure Separate DHCP IP Address Pool for Each DHCP Client	137
Configure DHCP Relay	139

Enable Network Time Protocol	140
Set Olson Timezone for SCCP Phones	142
Set Olson Timezone for SIP Phones	145
Configure DTMF Relay for H.323 Networks in Multisite Installations	148
Configure SIP Trunk Support	149
Verify SIP Trunk Support Configuration	151
Change the TFTP Address on a DHCP Server	152
Configuration Examples for Network Parameters	153
NTP Server	153
DTMF Relay for H.323 Networks	153
Where to Go Next	154
Feature Information for Network Parameters	154

CHAPTER 7
System-Level Parameters 155

Prerequisites for System-Level Parameters	155
Information About Configuring System-Level Parameters	155
Bulk Registration Support for SIP Phones	155
Register Transaction	156
Phone Status Update Transaction	159
DSCP	161
Maximum Ephones in Cisco Unified CME 4.3 and Later Versions	161
Network Time Protocol for SIP Phones	161
Per-Phone Configuration Files	162
HFS Download Support for IP Phone Firmware and Configuration Files	162
Redundant Cisco Unified CME Router for SCCP Phones	165
Redundant Cisco Unified CME Router for SIP Phones	166
Timeouts	167
IPv6 Support for Cisco Unified CME SCCP Endpoints	168
Support for IPv4-IPv6 (Dual-Stack)	168
Media Flow Through and Flow Around	168
Media Flow Around Support for SIP-SIP Trunk Calls	169
Overlap Dialing Support for SIP and SCCP IP Phones	170
Unsolicited Notify for Shared Line and Presence Events for Cisco Unified SIP IP Phones	170
Interface Support for Unified CME and Unified SRST	171

Configure System-Level Parameters	172
Configure IP Phones in IPv4, IPv6, or Dual Stack Mode	172
Example	173
Configure IPv6 Source Address for SCCP IP Phones	174
Verify IPv6 and Dual-Stack Configuration	175
Configure Bulk Registration	177
Configure Bulk Registration for SIP IP Phones	179
Verify Phone Registration Type and Status	180
Set Up Cisco Unified CME for SCCP Phones	181
Set Date and Time Parameters for SCCP Phones	184
Block Automatic Registration for SCCP Phones	185
Define Per-Phone Configuration Files and Alternate Location for SCCP Phones	187
Modify Defaults for Timeouts for SCCP Phones	188
Configure Redundant Router for SCCP Phones	190
Configure Redundant Router for SIP Phones	192
Configure Version Stamp Synchronization on the Primary Router	193
Configure the XML Interface for the Secondary Backup Router	194
Configure Overlap Dialing on SCCP IP Phones	196
Set Up Cisco Unified CME for SIP Phones	197
Set Up Cisco Unified CME for SIP Phones	200
Set Date and Time Parameters for SIP Phones	202
Set Network Time Protocol for SIP Phones	204
Enable HFS Download Service for SIP Phones	205
Troubleshooting HFS Download Service	207
Configure HFS Home Path for SIP Phone Firmware Files	207
Change Session-Level Application for SIP Phones	208
Enable Media Flow Mode on SIP Trunks	209
Configure Overlap Dialing on SIP Phones	211
Configuration Examples for System-Level Parameters	213
Example for Bulk Registration Support for SIP Phones	213
Example for IPv6 Support on Cisco Unified CME	213
Example for System-Level Parameters	216
Example for Blocking Automatic Registration	218
Example for Enabling the HFS Download Service for Cisco Unified SIP IP Phone	219

Example for Configuring an HFS Home Path for Cisco Unified SIP IP Phone Firmware Files	219
Example for Verifying the HFS File Bindings of Cisco Unified SIP IP Phone Configuration and Firmware Files	220
Example for Redundant Router for SCCP Phones	220
Example for Redundant Router for SIP Phones	221
Example for Media Flow Around Mode for SIP Trunks	222
Example for Configuring Overlap Dialing for SCCP IP Phones	223
Example for Configuring Overlap Dialing for SIP IP Phones	225
Where to Go Next	225
Feature Information for System-Level Parameters	226

CHAPTER 8
Configuring Phones to Make Basic Calls 229

Prerequisites for Configuring Phones to Make Basic Calls	229
Restrictions for Configuring Phones to Make Basic Calls	230
Information About Configuring Phones to Make Basic Calls	230
Phones in Cisco Unified CME	230
Directory Numbers	230
Single-Line	231
Dual-Line	231
Octo-Line	232
SIP Shared-Line (Nonexclusive)	234
Two Directory Numbers with One Telephone Number	234
Dual-Number	235
Shared Line (Exclusive)	236
Shared Lines with Voice Class Codec Support	236
Mixed Shared Lines	237
Overlaid Directory Numbers	240
Auto Registration of SIP Phones on Cisco Unified CME	240
Syslog Messages	242
Monitor Mode for Shared Lines	243
Watch Mode for Phones	244
PSTN FXO Trunk Lines	245
Codecs for Cisco Unified CME Phones	246
Analog Phones	247

Cisco ATAs in SCCP Mode	247
Cisco ATAs in SIP Mode	247
FXS Ports in SCCP Mode	250
FXS Ports in H.323 Mode	250
Fax Support	250
Cisco VG202, VG204, and VG224 Auto Configuration	251
Internet Protocol - Secure Telephone Equipment Support	251
Secure Communications Between STU, STE, and IP-STE	252
SCCP Media Control for Secure Mode	252
Secure Communication Between STE, STU, and IP-STE Across SIP Trunk	253
Remote Teleworker Phones	253
Media Termination Point for Remote Phones	254
G.729r8 Codec on Remote Phones	254
Busy Trigger and Channel Huntstop for SIP Phones	254
Multiple Calls Per Line	255
Cisco Unified 8941 and 8945 SCCP IP Phones	255
Cisco Unified 6921, 6941, 6945, 6961, 8941, and 8945 SIP IP Phones	255
Digit Collection on SIP Phones	256
Key Press Markup Language Digit Collection	256
SIP Dial Plans	256
Session Transport Protocol for SIP Phones	257
Real-Time Transport Protocol Call Information Display Enhancement	257
Ephone-Type Configuration	258
7926G Wireless SCCP IP Phone Support	258
Enhanced Line Mode	259
KEM Support for Cisco Unified SIP IP Phones	260
Key Mapping	261
Call Control	261
XML Updates	262
Restrictions for KEM Support	262
Fast-Track Configuration Approach for Cisco Unified SIP IP Phones	262
Configure Phones for a PBX System	264
Create Directory Numbers for SCCP Phones	264
Configure Ephone-Type Templates for SCCP Phones	267

Ephone-Type Parameters for Supported Phone Types	269
Assign Directory Numbers to SCCP Phones	270
Create Directory Numbers for SIP Phones	275
Assign Directory Numbers to SIP Phones	277
Configure Dial Plans for SIP Phones	280
Troubleshooting Tips for Configuring Dial Plans for SIP	283
Verify SIP Dial Plan Configuration	284
Enable KPML on a SIP Phone	285
Select Session-Transport Protocol for a SIP Phone	286
Disable SIP Proxy Registration for a Directory Number	288
Modify the Global Codec	289
Configure Codecs of Individual Phones for Calls Between Local Phones	291
Configure Phones for a Key System	293
Creating Directory Numbers for a Simple Key System on SCCP Phone	293
Configure Trunk Lines for a Key System on SCCP Phone	296
Configure a Simple Key System Phone Trunk Line Configuration on SCCP Phone	296
Configure an Advanced Key System Phone Trunk Line Configuration on SCCP Phone	300
Configure Individual IP Phones for Key System on SCCP Phone	304
Configure Cisco ATA, Analog Phone Support, Remote Phones, Cisco IP Communicator, and Secure IP Phone (IP-STE)	306
Configure Cisco ATA Support in SCCP Mode	306
Configure Cisco ATA Support in SIP Mode	308
Configure Firmware Upgrade for ATA in SIP Mode	308
Verify Cisco ATA Support	309
Troubleshooting Cisco ATA Support	310
Call Pickup and Group Call Pickup with Cisco ATA	310
Configure Voice and T.38 Fax Relay on Cisco ATA-187	310
Auto-Configuration for Cisco VG202, VG204, and VG224	314
Configure Phones on SCCP Controlled Analog (FXS) Ports	316
Verify Analog Phone Support	319
Enable Remote Phone	319
Verify Remote Phones	322
Configure Cisco IP Communicator Support on SCCP Phone	322
Verify Cisco IP Communicator Support on SCCP Phone	323

Troubleshooting Cisco IP Communicator Support on SCCP Phone	323
Configure Secure IP Phone (IP-STE) on SCCP Phone	323
Configure Phone Services XML File for Cisco Unified Wireless Phone 7926G	325
Configure Phones to Make Basic Call	327
Configure Auto Registration for SIP Phones	327
Configure a Mixed Shared Line	329
Troubleshooting Tips for Mixed Shared Line	331
Configure the Maximum Number of Calls on SCCP Phone	331
Configure the Busy Trigger Limit on SIP Phone	333
Configure KEMs on SIP Phones	335
Provision SIP Phones to Use the Fast-Track Configuration Approach	338
SIP Phone Models Validated for CME using Fast-track Configuration	340
Configuration Examples for Making Basic Calls	341
Example for Configuring SCCP Phones for Making Basic Calls	341
Example for Configuring SIP Phones for Making Basic Calls	345
Example for Disabling a Bulk Registration for a SIP Phone	348
Examples for Configuring VCC with Shared Lines	348
Example for Configuring a Mixed Shared Line on a Second Common Directory Number	349
Example for Cisco ATA	349
Example for Cisco ATA in SIP Mode	349
Example for SCCP Analog Phone	350
Example for Remote Teleworker Phones	351
Example for Secure IP Phone (IP-STE)	351
Example for Configuring Phone Services XML File for Cisco Unified Wireless Phone 7926G	351
Example for Monitoring the Status of Key Expansion Modules	352
Cisco IOS Commands for Monitoring and Maintaining Cisco Unified CME	352
Example for Fast-Track Configuration Approach	354
Example for Configuring Key Expansion Module for Cisco 8800 Series IP Phones on Unified CME	355
Example for Configuring Enhanced Line Mode on Unified CME	355
Where To Go Next	355
Feature Information for Configuring Phones to Make Basic Calls	356

Prerequisites for Extension Assigner	361
Restrictions for Extension Assigner	361
Information About Extension Assigner	362
Extension Assigner Overview	362
Procedure for System Administrators	362
Procedures for Installation Technicians	366
Files Included in this Release	367
Extension Assigner Synchronization	368
Configure Extension Assigner	368
Determine Extension Numbers to Assign to the New Phones and Plan Your Configuration	368
Download the Tcl Script and Audio Prompt Files	368
Configure the Tcl Script	369
Specify the Extension for Accessing Extension Assigner Application	371
Configure Provision-Tags for the Extension Assigner Feature	373
Configure Temporary Extension Numbers for SCCP Phones That Use Extension Assigner	374
Configure Temporary Extension Numbers for SIP Phones That Use Extension Assigner	376
Configure Extension Numbers That Installation Technicians Can Assign to SCCP Phones	377
Configure Extension Numbers That Installation Technicians Can Assign to SIP Phones	379
Configure Ephones with Temporary MAC Addresses	380
Configure Voice Register Pools with Temporary MAC Addresses	382
Configure the Router to Automatically Save Your Configuration	384
Provide the Installation Technician with the Required Information	386
Configure Extension Assigner Synchronization	387
Configure the XML Interface for the Secondary Backup Router	387
Configure Extension Assigner Synchronization on the Primary Router	388
Assign Extension Numbers Onsite by Using Extension Assigner	389
Assign New Extension Numbers	389
Unassign an Extension Number	390
Reassign the Current Extension Number	391
Verify Extension Assigner Configuration for SCCP Phones	392
Verify Extension Assigner Configuration for SIP Phones	392
Configuration Examples for Extension Assigner	392
Example for Extension Assigner on SCCP Phone	392
Example for Extension Assigner on SIP Phone	396

Example for Extension Assigner Synchronization	397
Feature Information for Extension Assigner	397

CHAPTER 10

Configuration Files for Phones 399

Information About Configuration Files	399
Configuration Files for Phones	399
Per-Phone Configuration Files	400
Generate Configuration Files for Phones	400
Generate Configuration Files for SCCP Phones	400
Verify Configuration Files for SCCP Phones	402
Generate Configuration Profiles for SIP Phones	403
Verify Configuration Profiles for SIP Phones	404
Where To Go Next	407

CHAPTER 11

Reset and Restart Cisco Unified IP Phones 409

Information About Resetting and Restarting Phones	409
Differences between Resetting and Restarting IP Phones	409
Cisco Unified CME TAPI Enhancement	410
Reset and Restart Phones	410
Use the reset Command on SCCP Phones	410
Use the restart Command on SCCP Phones	412
Reset a Session Between a TAPI Application and an SCCP Phone	413
Use the reset Command on SIP Phones	414
Use the restart Command on SIP Phones	415
Verify Basic Call	416
Feature Information for Reset and Restart Phones	416

CHAPTER 12

Localization Support 419

Information About Localization	419
Localization Enhancements in Cisco Unified CME	419
System-Defined Locales	420
Localization Support for Cisco Unified SIP IP Phones	421
User-Defined Locales	421
Localization Support for Phone Displays	421

Multiple Locales	422
Locale Installer for Cisco Unified SCCP IP Phones	422
Locale Installer for Cisco Unified SIP IP Phones	423
Configure Localization Support on SCCP Phones	423
Install System-Defined Locales for Cisco Unified IP Phone 6921, 6945, 7906, 7911, 7921, 7931, 7941, 7961, 7970, 7971, and Cisco IP Communicator	423
Install User-Defined Locales	427
Use the Locale Installer in Cisco Unified CME 7.0(1) and Later Versions	430
Verify User-Defined Locales	433
Configure Multiple Locales on SCCP Phones	433
Verify Multiple Locales on SCCP Phones	437
Configure Localization Support on SIP Phones	438
Install System-Defined Locales for Cisco Unified IP Phone 8961, 9951, and 9971	438
Use the Locale Installer in Cisco Unified CME 9.0 and Later Versions	441
Configure Multiple Locales on SIP Phones	444
Verify Multiple Locales on SIP Phones	446
Configuration Examples for Localization	447
Example for Configuring Multiple User and Network Locales	447
Example for Configuring User-Defined Locales	448
Example for Configuring Chinese as the User-Defined Locale	449
Example for Configuring Swedish as the System-Defined Locale	449
Configuration Examples for Locale Installer on SCCP Phones	450
System-Defined Locale is the Default Applied to All Phones	450
User-Defined Locale is Default Language to be Applied to All Phones	450
Locale on a Non-default Locale Index	451
Examples for Configuring Multiple User and Network Locales on SIP Phones	452
Example for Configuring Locale Installer on SIP Phones	453
Where to Go Next	453
Feature Information for Localization Support	454

CHAPTER 13
Dial Plans 455

Information About Dial Plans	455
Phone Number Plan	455
Dial Plan Patterns	456

Direct Inward Dialing Trunk Lines	457
Voice Translation Rules and Profiles	457
Secondary Dial Tone	458
E.164 Enhancements	458
Phone Registration with Leading + E164 Number	458
Callback and Calling Number Display	461
Configure Dial Plans	461
Configure SCCP Dial Plan Patterns	461
Configure SIP Dial Plan Patterns	462
Verify Dial Plan Patterns	463
Define Voice Translation Rules in Cisco CME 3.2 and Later Versions	464
Apply Voice Translation Rules on SCCP Phones in Cisco Unified CME 3.2 and Later Versions	467
Apply Translation Rules on SCCP Phones Before Cisco Unified CME 3.2	468
Apply Voice Translation Rules on SIP Phones in Cisco Unified CME 4.1 and Later	469
Apply Voice Translation Rules on SIP Phones Before Cisco Unified CME 4.1	470
Verify Voice Translation Rules and Profiles	471
Activate Secondary Dial Tone For SCCP Phones	473
Activate Secondary Dial Tone for SIP Phones	474
Define Translation Rules for Callback-Number on SIP Phones	475
Configuration Examples for Dial Plan Features	478
Example for Configuring Secondary Dial Tone on SCCP Phones	478
Example for Configuring Secondary Dial Tone on SIP Phones	479
Example for Configuring Voice Translation Rules	479
Feature Information for Dial Plan Features	480

CHAPTER 14
Transcoding Resources 483

Prerequisites for Configuring Transcoding Resources	483
Restrictions for Configuring Transcoding Resources	483
Information About Transcoding Resources	484
Transcoding Support	484
Local Transcoding Interface (LTI) Based Transcoding	487
Transcoding When a Remote Phone Uses G.729r8	488
Secure DSP Farm Transcoding	488
Configure Transcoding Resources	489

Determine DSP Resource Requirements for Transcoding	489
Provision Network Modules or PVDMs for Transcoding	489
Configure DSP Farms for NM-HDs and NM-HDV2s	490
Configure DSP Farms for NM-HDVs	495
Configure the Cisco Unified CME Router to Act as the DSP Farm Host	496
Determine the Maximum Number of Transcoder Sessions	496
Set the Cisco Unified CME Router to Receive IP Phone Messages	497
Configure the Cisco Unified CME Router to Host a Secure DSP Farm	499
Modify DSP Farms for NM-HDVs After Upgrading Cisco IOS Software	499
Modify the Number of Transcoding Sessions for NM-HDVs	501
Tune DSP-Farm Performance on an NM-HDV	502
Verify DSP Farm Operation	503
Register the DSP Farm with Cisco Unified CME 4.2 or a Later Version in Secure Mode	506
Obtain Digital Certificate from a CA Server	506
Copy the CA Root Certificate of the DSP Farm Router to the Cisco Unified CME Router	511
Copy CA Root Certificate of the Cisco Unified CME Router to the DSP Farm Router	513
Configure Cisco Unified CME to Allow the DSP Farm to Register	513
Verify DSP Farm Registration with Cisco Unified CME	514
Configure LTI-based Transcoding	515
Configuration Examples for Transcoding Resources	517
Example for Setting up DSP Farms for NM-HDVs	517
Example for Setting Up DSP Farms for NM-HDs and NM-HDV2s	517
Example for Configuring Cisco Unified CME Router as the DSP Farm Host	518
Example for Configuring LTI-based Transcoding	518
Example for Configuring Voice Class Codec	519
Where to go Next	519
Feature Information for Transcoding Resources	519

CHAPTER 15

Toll Fraud Prevention	521
Prerequisites	521
Overview	521
Toll Fraud Prevention for SIP Line Side on Unified CME	522
IP Address Trusted Authentication	524
Direct Inward Dial for Incoming ISDN Calls	525

Disconnect ISDN Calls With No Matching Dial-peer	525
Block Two-stage Dialing Service on Analog and Digital FXO Ports	525
Configure Toll Fraud Prevention	525
Configure IP Address Trusted Authentication for Incoming VoIP Calls	525
Add Valid IP Addresses For Incoming VoIP Calls	527
Configure Direct Inward Dial for Incoming ISDN Calls	529
Block Secondary Dial tone on Analog and Digital FXO Ports	530
Troubleshooting Tips for Toll Fraud Prevention	532
Feature Information for Toll Fraud Prevention	533

CHAPTER 16

Voice Mail Integration 535

Prerequisites for Voice Mail Integration	535
Information About Voice-Mail Integration	536
Cisco Unity Connection Integration	536
Cisco Unity Express Integration	536
Cisco Unity Integration	537
DTMF Integration for Legacy Voice-Mail Applications	537
Mailbox Selection Policy	537
RFC 2833 DTMF MTP Pass through	538
MWI Line Selection	538
AMWI	539
SIP MWI Prefix Specification	539
SIP MWI - QSIG Translation	539
VMWI	540
Transfer to Voice Mail	541
Live Record	541
Cisco Unity Express AXL Enhancement	541
Configure Voice-Mail Integration	542
Configure a Voice Mailbox Pilot Number on a SCCP Phone	542
Configure a Mailbox Selection Policy on SCCP Phone	543
Set a Mailbox Selection Policy for Cisco Unity Express or a PBX Voice-Mail Number	543
Set a Mailbox Selection Policy for Cisco Unity	545
Transfer to Voice Mail	546
Configure Live Record on SCCP Phones	549

Configure a Voice Mailbox Pilot Number on a SIP Phone	552
Enable DTMF Integration	554
Enable DTMF Integration for Analog Voice-Mail Applications	555
Enable DTMF Integration Using RFC 2833	557
Enable DTMF Integration Using SIP NOTIFY	559
Configure a SCCP Phone for MWI Outcall	561
Enable MWI at the System-Level on SIP Phones	563
Configure a Directory Number for MWI on SIP Phones	564
Define Pilot Call Back Number for MWI Outcall	564
Configure a Directory Number for MWI NOTIFY	565
Enable SIP MWI Prefix Specification	567
Configure VMWI on SIP Phones	568
Verify Voice-Mail Integration	570
Configuration Examples for Voice-Mail Integration	570
Example for Setting up a Mailbox Selection Policy for SCCP Phones	570
Example for Configuring Voice Mailbox for SIP Phones	570
Example for Configuring DTMF Integration Using RFC 2833	571
Example for Configuring DTMF Integration Using SIP Notify	571
Example for Configuring DTMF Integration for Legacy Voice-Mail Applications	571
Example for Enabling SCCP Phone Line for MWI	571
Example for Configuring SIP MWI Prefix Specification	572
Example for Configuring SIP Directory Number for MWI Outcall	573
Example for Configuring SIP Directory Number for MWI Unsolicited Notify	573
Example for Configuring SIP Directory Number for MWI Subscribe/NOTIFY	573
Feature Information for Voice-Mail Integration	573

CHAPTER 17
Security 575

Prerequisites for Security	575
Restrictions for Security	576
Information About Security	576
Unified CME Password Policy	576
Guidelines for Password Configuration and Encryption	577
Downgrade Consideration for Password Encryption	579
Removal of Passwords and Keys from Logs	579

Deprecation of CLI Commands	580
Phone Authentication Overview	580
Phone Authentication	580
File Authentication	581
Signaling Authentication	581
Public Key Infrastructure	581
Phone Authentication Components	581
Phone Authentication Process	584
Startup Messages	585
Configuration File Maintenance	585
CTL File Maintenance	586
CTL Client and Provider	586
Manually Importing MIC Root Certificate	586
Feature Design of Media Encryption	587
Secure Cisco Unified CME	587
Secure Supplementary Services	589
Secure SIP Trunk Support on Cisco Unified CME	589
Secure Cisco Unified CME in an H.450 Environment	590
Secure Cisco Unified CME in a Non H.450 Environment	590
Secure Transcoding for Remote Phones with DSP Farm Transcoding Configured	591
Secure Cisco Unified CME with Cisco Unity Express	592
Secure Cisco Unified CME with Cisco Unity	592
HTTPS Provisioning For Cisco Unified IP Phones	592
HTTPS support for an External Server	592
HTTPS Support in Cisco Unified CME	593
Configure Security	593
Configure the Cisco IOS Certification Authority	593
Obtain Certificates for Server Functions	597
Configure Telephony-Service Security Parameters	600
Verify Telephony-Service Security Parameters	603
Configure the CTL Client	603
Configure the CTL Client on a Cisco Unified CME Router	603
Configure the CTL Client on a Router That is Not a Cisco Unified CME Router	606
Configure the CAPF Server	608

Verify the CAPF Server	611
Configure Ephone Security Parameters	612
Verify Ephone Security Parameters	615
Configure the CTL Provider	615
Verify the CTL Provider	617
Configure the Registration Authority	618
Enter the Authentication String on the Phone	621
Manually Import the MIC Root Certificate	622
Configure Media Encryption (SRTP) in Cisco Unified CME	625
Configure Cisco Unified CME SRTP Fallback for H.323 Dial Peers	628
Configure Cisco Unity for Secure Cisco Unified CME Operation	629
Prerequisites for Configuring Cisco Unity for Secure Cisco Unified CME Operation	630
Configure Integration Between Cisco Unified CME and Cisco Unity	630
Import the Cisco Unity Root Certificate to Cisco Unified CME	630
Configure Cisco Unity Ports for Secure Registration	632
Verify that Cisco Unity are Registering Securely	632
HTTPS Provisioning for Cisco Unified IP Phones	632
Configuration Examples for Security	638
Example for Password and Key Removal from Logs	638
Example for Configuring Unified CME for Password Policy	639
Example for Configuring Cisco IOS CA	640
Example for Manually Importing MIC Root Certificate on the Cisco Unified CME Router	640
Example for Configuring Telephony-Service Security Parameters	643
Example for Configuring CTL Client Running on Cisco Unified CME Router	643
Example for Secure Unified CME	646
Example for Configuring HTTPS Support for Cisco Unified CME	653
Where to Go Next	654
Feature Information for Security	655

CHAPTER 18
Directory Services 657

Information About Directory Services	657
Local Directory	657
External Directory	658
Called-Name Display	658

Directory Search	659
Configure Directory Services	659
Configure Local Directory Service	659
Define a Name for a Directory Number on SCCP Phone	660
Add an Entry to a Local Directory on SCCP Phone	661
Configure External Directory Service on SCCP Phone	662
Called-Name Display	664
Verify Called-Name Display	666
Define a Name for a Directory Number on SIP Phone	667
Configure External Directory Service on SIP Service	668
Verify Directory Services	669
Configuration Examples for Directory Services	670
Example for Configuring Local Directory	670
Example for Configuring Called-Name Display	670
Example for Called-Name Display for Voice Hunt Group	670
Example for Configuring First Ephone-dn in the Overlay Set	671
Example for Configuring Directory Name for an Overlaid Ephone-dn Set	671
Example for Configuring Directory Name for a Hunt Group with Overlaid Ephone-dns	672
Example for Configuring Directory Name for Non-Overlaid Ephone-dns	673
Example for Configuring Ephone-dn Name for Overlaid Ephone-dns	673
Feature Information for Directory Services	674

CHAPTER 19
Do Not Disturb 677

Information About Do Not Disturb	677
Do Not Disturb on SCCP Phone	677
Do Not Disturb on SIP Phone	678
Configure Do Not Disturb	679
Blocking Do Not Disturb on SCCP Phone	679
Verify Do Not Disturb on SCCP Phones	680
Configure Do Not Disturb on SIP Phones	681
Where to Go Next	683
Feature Information for Do Not Disturb	684

CHAPTER 20
Enhanced 911 Services 685

Prerequisites for Enhanced 911 Services	685
Restrictions for Enhanced 911 Services	685
Information About Enhanced 911 Services	686
Overview of Enhanced 911 Services	686
Call Processing for E911 Services	688
Precautions for Mobile Phones	691
Plan Your Implementation of Enhanced 911 Services	691
Interactions with Existing Cisco Unified CME Features	693
Multiple Usages of an ELIN	693
Number Translation	693
Call Transfer	694
Call Forward	694
Call Blocking Features	694
Call Waiting	695
Three-Way Conference	695
Dial-Peer Rotary	695
Dial Plan Patterns	695
Caller ID Blocking	695
Shared Line	695
Configure Enhanced 911 Services	696
Configure the Emergency Response Location	696
Configure Locations under Emergency Response Zones	697
Configure Outgoing Dial Peers for Enhanced 911 Services	699
Configure Dial Peers for Emergency Calls	699
Configure Dial Peers for Emergency Response Zones	700
Configure a Dial Peer for Callbacks from the PSAP	701
Assign ERLs to Phones	702
Prerequisites for Assigning ERLs to Phones	703
Assign an ERL to a Phone's IP Subnet	703
Assign an ERL to a SIP Phone	704
Assign an ERL to a SCCP Phone	705
Assign an ERL to a Dial Peer	706
Customize E911 Settings	707
Using the Address Command for Two ELINS	709

Enable Call Detail Records	709
Output from a RADIUS Accounting Server	709
Output from a Syslog Server	710
Output from the show call history voice Command	710
Verify E911 Configuration	710
Troubleshooting Enhanced 911 Services	712
Error Messages	712
Configuration Examples for Enhanced 911 Services	713
Example for Configuring Enhanced E911 Services with Cisco Unified CME 4.2	713
Example for Configuring Enhanced E911 Services with Cisco Unified CME 4.1 in SRST Fallback Mode	714
Feature Information for Enhanced 911 Services	720

CHAPTER 21

Extension Mobility 723

Prerequisites for Configuring Extension Mobility	723
Restrictions for Configuring Extension Mobility	723
Information About Configuring Extension Mobility	724
Extension Mobility	724
Personal Speed Dials on an Extension Mobility Phone	724
Cisco Unified CME Extension Mobility Enhancements	725
Privacy on an Extension Mobility Phone	725
Extension Mobility for SIP Phones Enhancement	726
MIB Support for Extension Mobility in Cisco Unified SCCP IP Phones	726
Enable Extension Mobility	728
Configure Cisco Unified CME for Extension Mobility	728
Configure a Logout Profile for an IP Phone	731
Enable an IP Phone for Extension Mobility	733
Configure Extension Mobility for SIP Phones	735
Enable SIP Phones for Extension Mobility	737
Configure a User Profile	738
Configuration Examples for Extension Mobility	741
Example for Configuring Extension Mobility for Use with SIP Phones	741
Example for Configuring SIP Phones for Use with Extension Mobility	742
Example for Configuring Logout Profile	742

Example for Enabling an IP Phone for Extension Mobility	742
Example for Configuring User Profile	743
Where to Go Next	743
Feature Information for Extension Mobility	743

CHAPTER 22
Fax Relay 745

Prerequisites for Fax Relay	745
Restrictions for Fax Relay	746
Information About Fax Relay	746
Fax Relay and Equipment	746
Feature Design of Cisco Fax Relay	746
Supported Gateways, Modules, and Voice Interface Cards for Fax Relay	747
Configure Fax Relay	748
Configure Fax Relay on SCCP Phones	748
Verify and Troubleshoot Fax Relay Configuration	749
Configuration Examples for Fax Relay	750
Example for Configuring Fax Relay	750
Feature Information for Fax Relay	750

CHAPTER 23
Feature Access Codes 751

Information About Feature Access Codes	751
Feature Access Codes	751
Configure Feature Access Codes	753
Verify Feature Access Codes	755
Configuration Examples for Feature Access Codes	756
Example for Enabling Standard FACs for All Phones	756
Feature Information for Feature Access Codes	756

CHAPTER 24
Forced Authorization Code 757

Information About Forced Authorization Code	757
Forced Authorization Code Overview	757
FAC Call Flow	758
Forced Authorization Code Specification	759
FAC Requirement for Different Types of Calls	759

Configure Forced Authorization Code	762
Enable Forced Authorization Code (FAC) on LPCOR Groups	762
Define Parameters for Authorization Package	764
Configuration Example for Forced Authorization Code	766
Example for Configuring Forced Authorization Code	766
Feature Information for Forced Authorization Code	767

CHAPTER 25

Headset Auto Answer 769

Information About Headset Auto Answer	769
Auto Answering Calls Using a Headset	769
Difference Between a Line and a Button	769
Configure Headset Auto Answer	771
Enable Headset Auto Answer	771
Verify Headset Auto Answer	772
Configuration Example for Headset Auto Answer	772
Example for Enabling Headset Auto Answer	772
Feature Information for Headset Auto Answer	773

CHAPTER 26

Intercom Lines 775

Information About Intercom Lines	775
Intercom Auto-Answer Lines	775
Whisper Intercom	776
SIP Intercom	776
Extension Number	778
Configure Intercom Lines	778
Configure an Intercom Auto-Answer Line on SCCP Phones	778
Configure Whisper Intercom on SCCP Phones	780
Configure an Intercom Auto-Answer Line on SIP Phones	782
Configure Intercom Call Option on SIP Phones	784
Configuration Examples for Intercom Lines	786
Example for Configuring Intercom Lines	786
Example for Configuring SIP Intercom Support	786
Where to Go Next	787
Feature Information for Intercom Lines	787

CHAPTER 27**Loopback Call Routing 789**

- Information About Loopback Call Routing 789
 - Loopback Call Routing 789
- Configure Loopback Call Routing 790
 - Enable Loopback Call Routing 790
 - Verify Loopback Call Routing 794
- Configuration Example for Loopback Call Routing 794
 - Example for Enabling Loopback Call Routing 794
- Feature Information for Loopback Call Routing 794

CHAPTER 28**Multilevel Precedence and Preemption 797**

- Prerequisites for MLPP 797
- Information About MLPP 797
 - Precedence 797
 - Basic Precedence Call Setup 798
 - Preemption 799
 - Basic Preemption Call 800
- DSN Dialing Format 800
 - Service Digit 801
 - Route Code 801
 - Example for Dialing 802
- MLPP Service Domains 802
- MLPP Indication 804
- MLPP Announcements 804
- Automatic Call Diversion (Attendant Console) 806
- Configure MLPP 807
 - Enable MLPP Service Globally in Cisco Unified CME 807
 - Enable MLPP Service on SCCP Phones 809
 - Enable MLPP Service on Analog FXS Phone Ports 813
 - Configure an MLPP Service Domain for Outbound Dial Peers 815
 - Configure MLPP Options 817
 - Troubleshooting MLPP Service 820
- Feature Information for MLPP 820

CHAPTER 29**Music on Hold 823**

- Prerequisites for Music on Hold 823
- Restrictions for Music on Hold 823
- Information About Music on Hold 824
 - Music on Hold Summary 824
 - Music on Hold 825
 - Music on Hold from a Live Feed 825
 - Music on Hold from a Live Feed on Cisco 4000 Series Integrated Services Routers 826
- Multicast MOH 827
- Music on Hold for SIP Phones 827
- Music On Hold Enhancement 827
- Caching MOH Files for Enhanced System Performance 828
- Configure G.711 and G.729 Files for Music on Hold 828
- Configure Music on Hold 829
 - Configure Music on Hold from an Audio File to Supply Audio Stream 829
 - Configure Music on Hold from a Live Feed 832
 - Configure Music on Hold Groups to Support Different Media Sources 837
 - Assign a MOH Group to a Directory Number 840
 - Assign a MOH Group to all Internal Calls Only to SCCP Phones 842
 - Configure Buffer Size for MOH Files 844
 - Verify MOH File Caching 845
 - Verify Music on Hold Group Configuration 846
- Feature Information for Music on Hold 849

CHAPTER 30**Paging 851**

- Restrictions for Paging 851
- Information About Paging 851
 - Audio Paging 851
 - Paging Group Support for Cisco Unified SIP IP Phones 852
- Configure Paging 854
 - Configure a Simple Paging Group on SCCP Phones 854
 - Configure a Combined Paging Group for SCCP Phones 855
 - Configure Paging Group Support for SIP IP Phones 858

Troubleshooting Tips	862
Verify Paging	862
Configuration Examples for Paging	863
Example for Configuring Simple Paging Group	863
Example for Configuring Combined Paging Groups	863
Example for Configuring a Combined Paging Group of Cisco Unified SIP IP Phones and Cisco Unified SCCP IP Phones	865
Where to Go Next	867
Feature Information for Paging	868

CHAPTER 31

Presence Service	869
Prerequisites for Presence Service	869
Restrictions for Presence Service	869
Information About Presence Service	869
Presence Service	869
BLF Monitoring of Ephone-DNs with DnD, Call Park, Paging, and Conferencing	871
Device-Based BLF Monitoring	872
Phone User Interface for BLF-Speed-Dial	873
Configure Presence Service	873
Enable Presence for Internal Lines	873
Enable a Directory Number to be Watched	875
Enable BLF Monitor for Speed-Dials and Call Lists Using SCCP Phones	877
Enable BLF Monitoring for Speed-Dials and Call Lists on SIP Phones	880
Enable BLF-Speed-Dial Menu	882
Configure Presence to Watch External Lines	883
Verify Presence Configuration	885
Troubleshooting Presence Service	886
Configuration Examples for Presence Service	887
Example for Configuring Presence in Cisco Unified CME	887
Feature Information for Presence Service	890

CHAPTER 32

Ringtones	893
Information About Ringtones	893
Distinctive Ringing	893

Customized Ringtones	894
On-Hold Indicator	894
Configure Ringtones	894
Configure Distinctive Ringing	894
Configure Customized Ringtones	895
Configure On-Hold Indicator	897
Enable Distinctive Ringing on SIP Phones	898
Configuration Examples for Ringtones	899
Example for Configuring Distinctive Ringing for Internal Calls	899
Example for Configuring On-Hold Indicator	899
Feature Information for Ringtones	899

CHAPTER 33

Single Number Reach 901

Information About Single Number Reach	901
Overview of Single Number Reach	901
SNR Enhancements	902
Hardware Conference	902
Call Park, Call Pickup, and Call Retrieval	902
Answer Too Soon Timer	902
SNR Phone Stops Ringing After Mobile Phone Answers	902
Single Number Reach for Cisco Unified SIP IP Phones	902
Virtual SNR DN for Cisco Unified SCCP IP Phones	903
Configure Single Number Reach	905
Configure Single Number Reach on SCCP Phones	905
Configure Single Number Reach Enhancements on SCCP Phones	909
Configure Single Number Reach on SIP Phones	911
Configure a Virtual SNR DN on SCCP Phones	915
Feature Information for Single Number Reach	917

CHAPTER 34

Customize Softkeys 919

Information About Softkeys	919
Softkeys on IP Phones	919
Softkeys Introduced in Unified CME Release 12.3 and Later Releases	921
Account Code Entry	922

Hookflash Softkey	923
Feature Blocking	923
Feature Policy Softkey Control	923
Immediate Divert for SIP IP Phones	924
Enhanced Immediate Divert (Enhanced iDivert)	924
Programmable Line Keys (PLK)	924
Configure Softkeys	932
Modify Softkey Display on SCCP Phone	932
Modify Softkey Display on SIP Phone	935
Verify Softkey Configuration	938
Enable Flash Softkey	939
Verify Flash Softkey Configuration	940
Configure Feature Blocking	941
Verify Block Softkey Configuration	943
Configure Immediate Divert (iDivert) Softkey on SIP Phone	943
Configure Service URL Line Key Button on SCCP Phone	945
Configure Service URL Line Key Button on SIP Phone	946
Configure Feature Buttons on SCCP Phone Line Key	948
Configure Feature Buttons on SIP Phone Line Key	949
Configuration Example for Softkeys	951
Example for Modifying Softkey Display	951
Example for Modifying HLog Softkey for SCCP Phones	951
Example for Modifying HLog Softkey for SIP Phones	952
Example for Enabling Flash Softkey for PSTN Calls	952
Example for Park and Transfer Blocking	952
Example for Conference Blocking	952
Example for Immediate Divert (iDivert) Configuration	953
Example for Configuring URL Buttons on a SCCP Phone Line Key	953
Example for Configuring URL Buttons on a SIP Phone Line Key	954
Example for Configuring Feature Button on a SCCP Phone Line Key	954
Example for Configuring Feature Button on a SIP Phone Line Key	954
Feature Information for Softkeys	955

Information About Speed Dial	957
Speed Dial Summary	957
Speed Dial Buttons and Abbreviated Dialing	959
Bulk-Loading Speed Dial Numbers	959
Monitor-Line Button for Speed Dial	960
DSS (Direct Station Select) Service	961
Phone User-Interface for Speed Dial and Fast Dial	961
Configure Speed Dial	961
Enable a Local Speed Dial Menu	961
Enable DSS Service	963
Enable a Personal Speed Dial Menu on SCCP Phones	964
Define Speed-Dial Buttons and Abbreviated Dialing on SCCP Phones	965
Enable Bulk-Loading Speed-Dial	967
Verify Bulk Speed-Dial Parameters on SCCP Phones	969
Enable Phone User Interface for Configuring Speed-Dial and Fast-Dial	969
Define Speed-Dial Buttons on SIP Phones	970
Enable a Personal Speed Dial Menu on SIP Phones	972
Configuration Examples for Speed Dial	973
Example for Enabling a Local Speed Dial Menu	973
Example for Configuring Personal Speed Dial Menu on SIP Phone	974
Example for Configuring Speed-Dial Buttons and Abbreviated Dialing	974
Example for Configuring Bulk-Loading Speed Dial	974
Example for Configuring Speed-Dial and Fast-Dial User Interface	975
Where to Go Next	975
Feature Information for Speed Dial	975

CHAPTER 36
Video Support 977

Prerequisites for Video Support	977
Restrictions for Video Support	977
Information About Video Support	979
Video Support Overview	979
SIP Trunk Video Support	979
Matching Endpoint Capabilities	980
Retrieving Video Codec Information	980

Call Fallback to Audio-Only	981
Call Setup for Video Endpoints	981
Call Setup Between Two Local SCCP Endpoints	981
Call Setup Between SCCP and H.323 Endpoints	981
Call Setup Between Two SCCP Endpoints Across an H.323 Network	982
SIP Endpoint Video and Camera Support for Cisco Unified IP Phones 8961, 9951, and 9971	982
Video and Camera Configuration for Cisco Unified IP Phones	982
Bandwidth Control for SIP Video Calls	983
Flow of the RTP Video Stream	983
Configure Video Support	983
Enable Video and Camera Support on Cisco Unified SIP Phones	983
Apply Video and Camera Configuration to Cisco Unified SIP Phones	987
Configure Video Bandwidth Control for SIP to SIP Video Calls	988
Enable Support for Video Streams Across H.323 Networks	990
Enable System-Level Video Capabilities	991
Enable Video Capabilities on a Phone	992
Verify Video Support	994
Troubleshooting Video Support	994
Where to Go Next	995
Feature Information for Video Support	995
CHAPTER 37	SSL VPN Client for SCCP IP Phones 997
Information About SSL VPN Client	997
SSL VPN Support on Cisco Unified CME with DTLS	997
Phone or Client Authentication	998
SSL VPN Client Support on SCCP IP Phones	998
Configure SSL VPN Client	999
Configure SSL VPN Client with ASA as VPN Headend	999
Prerequisites	1000
Basic Configuration on Cisco Unified CME	1000
Configure Cisco Unified CME as CA Server	1005
Verify Phone Registration and Phone Load	1008
Configure ASA (Gateway) as VPN Headend	1009
Configure VPN Group and Profile on Cisco Unified CME	1012

Associate VPN Group and Profile to SCCP IP Phone	1014
Configure Alternate TFTP Address on Phone	1017
Register Phone from a Remote Location	1017
Configure SSL VPN Client with DTLS on Cisco Unified CME as VPN Headend	1018
Set Up the Clock, Hostname, and Domain Name	1018
Configure Trustpoint and Enroll with the Certificates	1019
Configure VPN Gateway	1020
Configure User Database	1020
Configure Virtual Context	1021
Configure Group Policy	1021
Verify the IOS SSL VPN Connection	1021
Configure Cisco Unified SCCP IP Phones for SSL VPN	1022
Configuration on Cisco Unified SCCP IP Phone	1023
Configure SSL VPN on Cisco Unified CME	1023
VPN Phone Redundancy Support for Cisco Unified CME with DTLS	1024
Configuration Examples for SSL VPN Client	1024
Example for Configuring SSL VPN with ASA as VPN Headend	1024
Example for Configuring SSL VPN with DTLS on CME as VPN Headend	1025
Feature Information for SSL VPN Client	1027

CHAPTER 38
Automatic Line Selection 1029

Information About Automatic Line Selection	1029
Automatic Line Selection for Incoming and Outgoing Calls	1029
Configure Automatic Line Selection	1030
Enable Automatic Line Selection	1030
Verify Automatic Line Selection	1031
Configuration Examples for Automatic Line Selection	1032
Example for Automatic Line Selection	1032
Feature Information for Automatic Line Selection	1033

CHAPTER 39
Barge and Privacy 1035

Information About Barge and Privacy	1035
Barge and cBarge	1035
Barge (SIP)	1035

cBarge (SCCP and SIP)	1036
Privacy and Privacy on Hold	1037
Configure Barge and Privacy	1038
Configure the cBarge Soft Key on SCCP Phones	1038
Enable Barge and cBarge Soft Keys on SIP Phones	1040
Enable Privacy and Privacy on Hold on SCCP Phones	1042
Enable Privacy and Privacy on Hold on SIP Phones	1045
Feature Information for Barge and Privacy	1048

CHAPTER 40
Call Blocking 1049

Information About Call Blocking	1049
Call Blocking Based on Date and Time (After-Hours Toll Bar)	1049
After-Hours Pattern-Blocking Support for Regular Expressions	1050
Call Blocking Override	1051
Class of Restriction	1051
Configure Call Blocking	1052
Configure Call Blocking	1052
Configure Call Blocking Exemption for a Dial Peer	1054
Configure Call Blocking Override for All SCCP Phones	1055
Configure Call Blocking Exemption for an Individual SCCP Phone	1056
Configure Call Blocking Exemption for an Individual SIP Phone or Directory Number	1058
Verify Call Blocking Configuration	1059
Apply Class of Restriction to a Directory Number on SCCP Phone	1060
Apply Class of Restriction to Directory Number on SIP Phones	1061
Verify Class of Restriction	1062
Configuration Examples for Call Blocking	1064
Example for Configuring Call Blocking	1064
Example for Configuring Class of Restriction	1065
Example for Configuring After-Hours Block Patterns of Regular Expressions	1066
Where to Go Next	1066
Feature Information for Call Blocking	1066

CHAPTER 41
Call Park 1069

Information About Call Park	1069

Call Park Enhancements in Cisco Unified CME 7.1	1069
Basic Call Park	1070
View Active Parked Calls	1071
Configure User Interface to View Active List of Parked Calls	1071
Directed Call Park	1073
Park Reservation Groups	1073
Dedicated Call-Park Slots	1074
Call-Park Blocking	1075
Call-Park Redirect	1075
Call Park Recall Enhancement	1075
Park Monitor	1076
Configure Call Park	1076
Enable Call Park or Directed Call Park	1076
Verify Call Park	1082
Configure Timeout Duration for Recalled Calls	1083
Troubleshooting Call Park	1084
Configuration Examples for Call Park	1084
Example for Configuring Basic Call Park	1084
Example for Blocking Phone From Using Call Park	1085
Example for Configuring Call-Park Redirect	1085
Example for Configuring Call Park Recall	1085
Where to Go Next	1086
Feature Information for Call Park	1086

CHAPTER 42

Call Restriction Regulations	1089
Prerequisites for LPCOR	1089
Information About LPCOR	1089
LPCOR Overview	1089
LPCOR Policy and Resource Groups	1090
Default LPCOR Policy	1091
How LPCOR Policies are Associated with Resource Groups	1092
Analog Phones	1092
IP Phones	1092
PSTN Trunks	1092

VoIP Trunks	1092
LPCOR Support for Supplementary Services	1093
Phone Display and Warning Tone for LPCOR	1095
LPCOR VSAs	1095
Configure LPCOR	1096
Define a LPCOR Policy	1096
Associate a LPCOR Policy with Analog Phone or PSTN Trunk Calls	1099
Associate a LPCOR Policy with VoIP Trunk Calls	1102
Associate a LPCOR Policy with IP Phone or SCCP FXS Phone Calls	1105
Associate LPCOR with Mobile Phone Calls	1109
Verify LPCOR Configuration	1112
Configuration Examples for LPCOR	1113
Example for Configuring LPCOR for Cisco Unified CME	1113
Example for Configuring LPCOR on Cisco 3800 Series Integrated Services Router	1116
Feature Information for LPCOR	1131

CHAPTER 43
Call Transfer and Forward 1133

Information About Call Transfer and Forward	1133
Call Forward	1133
Selective Call Forward	1134
Call Forward Unregistered	1134
B2BUA Call Forward for SIP Devices	1135
Call Forward All Synchronization for SIP Phones	1136
Call Transfer	1136
Call Transfer Blocking	1136
Trunk-to-Trunk Transfer Blocking for Toll Fraud Prevention on Cisco Unified SIP IP Phones	1137
Transfer Pattern	1138
Transfer Max-Length	1139
Conference Max-Length	1139
Conference-Pattern Blocked	1140
Configure the Maximum Number of Digits for a Conference Call	1141
Configure Conference Blocking Options for Phones	1142
Transfer-Pattern Blocked	1144
Conference Transfer-Pattern	1144

Call Transfer Recall on SCCP Phones	1144
Call Transfer Recall on SIP Phones	1145
Consultative-Transfer Enhancements in Cisco Unified CME 4.3 and Later Versions	1146
Consultative Transfer With Direct Station Select	1146
H.450.2 and H.450.3 Support	1147
Tips for Using H.450 Standards	1148
Transfer Method Recommendations by Cisco Unified CME Version	1149
H.450.12 Support	1150
Hairpin Call Routing	1151
H.450 Tandem Gateways	1153
Dial Peers	1155
Q Signaling Supplementary Services	1156
Disable SIP Supplementary Services for Call Forward and Call Transfer	1157
Typical Network Scenarios for Call Transfer and Call Forwarding	1157
Configure Call Transfer and Forwarding	1160
Enable Call Transfer and Forwarding on SCCP Phones at System-Level	1160
Enable Call-Transfer Recall on SIP Phones at System-Level	1166
Enable Call Forwarding for a Directory Number	1167
Call Transfer for a Directory Number	1170
Configure Call Transfer Options for SCCP Phones	1172
Verify Call Transfer for SCCP Phones	1173
Specify Transfer Patterns for Trunk-to-Trunk Calls and Conferences for SIP	1174
Conference Max-Length	1177
Block Trunk-to-Trunk Call Transfers for SIP	1177
Enable H.450.12 Capabilities	1178
Enable H.323-to-H.323 Connection Capabilities	1180
Forward Calls Using Local Hairpin Routing	1182
Enable H.450.7 and QSIG Supplementary Services at System-Level	1184
Enable H.450.7 and QSIG Supplementary Services on a Dial Peer	1185
Disable SIP Supplementary Services for Call Forward and Call Transfer	1187
Enable Interworking with Cisco Unified Communications Manager	1189
Configure Cisco CME 3.1 or Later to Interwork with Cisco Unified Communications Manager	1190
Enable Cisco Unified Communications Manager to Interwork with Cisco Unified CME	1193
Troubleshooting Call Transfer and Forward Configuration	1194

Configure SIP-to-SIP Phone Call Forwarding	1195
Configure Call Forward Unregistered for SIP IP Phones	1198
Troubleshooting Tips for Call Forward Unregistered	1199
Configure Keepalive Timer Expiration in SIP Phones	1199
Configure Call-Forwarding-All Softkey URI on SIP Phones	1200
Specify Number of 3XX Responses To be Handled on SIP Phones	1201
Configure Call Transfer on SIP Phones	1202
Configuration Examples for Call Transfer and Forwarding	1204
Example for Configuring H.450.2 and H.450.3 Support	1204
Example for Configuring Basic Call Forwarding	1204
Example for Configuring Call Forwarding Blocked for Local Calls	1205
Example for Configuring Transfer Patterns	1205
Example for Configuring Maximum Length of Transfer Number	1205
Example for Configuring Conference Transfer Patterns	1205
Example for Blocking All Call Transfers	1206
Example for Configuring Selective Call Forwarding	1206
Example for Configuring Call Transfer	1206

Feature Information for XML API	1592

CHAPTER 1

Cisco Unified CME Features Roadmap

This roadmap lists the features that are documented in the *Cisco Unified Communications Manager Express System Administrator Guide* and maps them to the modules in which they appear.

Note The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on RFP documentation, or language that is used by a referenced third-party product.

Feature and Release Support

[Table 1: Supported Cisco Unified CME Features, on page 1](#) lists the Cisco Unified Communications Manager Express (Cisco Unified CME) version that introduced support for a given feature. Unless noted otherwise, subsequent versions of Cisco Unified CME software also support that feature. Only features that were introduced or modified in Cisco Unified CME 4.0 or a later version appear in the table. *Not all features may be supported in your Cisco Unified CME software version.*

To determine the correct Cisco IOS release to support a specific Cisco Unified CME version, see [Cisco Unified CME and Cisco IOS Software Version Compatibility Matrix](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. An account on Cisco.com is not required.

Table 1: Supported Cisco Unified CME Features

Version	Feature Name	Feature Description	Where Documented
Unified CME 14.1			
	SFTP CDR transfer	Allows transfer of CME CDRs using SFTP.	CDR Accounting Overview Configuring File Accounting gw-accounting

Version	Feature Name	Feature Description	Where Documented
	Support for Unified CME on Cisco 8200 and C8300 Edge Series Platforms	From Cisco IOS XE Bengaluru 17.6.1a onwards, Unified CME is supported on Cisco 8200, Cisco 8200L, and C8300 Edge platforms.	Unified CME 14.1 Supported Firmware, Platforms, Memory, and Voice Products
	Support for Cisco 1100 Platform	From Cisco IOS XE Bengaluru 17.5.1a onwards Unified CME is supported on Cisco 1100 Integrated Services Router (ISR)	Unified CME 14.1 Supported Firmware, Platforms, Memory, and Voice Products
	Smart Licensing Using Policy	From Cisco IOS XE Bengaluru 17.4.1a onwards, support is introduced for tracking license usage that is based on the historical usage data.	Licensing, on page 69
	Support for C8000V	Cisco IOS XE Bengaluru 17.4.1a onwards, support is introduced for Virtual CME on C8000V series.	Virtual CME Overview
Unified CME 12.6			
	Unified CME Password Policy and Encryption	Support for Unified CME Password Policy and Encryption.	Unified CME Password Policy, on page 576
	Simple Network Management Protocol Version 3 (SNMPv3) on Unified CME	Support for SNMP Version 3 (SNMPv3) on Unified CME.	Simple Network Management Protocol (SNMP) Support for Unified CME, on page 67
	Toll Fraud Prevention for Line Side SIP on Unified CME	Support for Toll Fraud Prevention for Line Side SIP on Unified CME.	Toll Fraud Prevention for SIP Line Side on Unified CME, on page 522
	GUI on Unified CME	End of Support for GUI on Unified CME.	Unified CME Graphical User Interface Deprecation, on page 65

Version	Feature Name	Feature Description	Where Documented
	Computer Telephony Integration (CTI) Computer Supported Telecommunications Applications (CSTA) Protocol Suite on Unified CME	End of Support for CTI CSTA Protocol Suite on Unified CME.	CTI CSTA Protocol Suite Deprecation, on page 66
Unified CME 12.5			
	Virtual CME on Cisco Cloud Services Router 1000V Series	Support for Virtual CME on Cisco Cloud Services Router 1000V Series.	Virtual CME
	Key Expansion Module (KEM)s on Cisco 8800 Series IP Phones on Unified CME	Support for CP-8800-A-KEM) and CP-8800-V-KEM Modules with Cisco 8800 Series IP Phones on Unified CME.	KEM Support for Cisco Unified SIP IP Phones, on page 260
	Cisco ATA 191 on Unified CME	Native support for Cisco ATA 191 on Unified CME.	Cisco ATAs in SIP Mode, on page 247
	Cisco Jabber on Unified CME	Support for Cisco Jabber 12.1.0 in Phone-only Mode on Unified CME.	Support for Cisco Jabber, on page 1438
Unified CME 12.3			
	Enhanced Line Mode for Cisco IP Phone 8800 Series on Unified CME	Support for Enhanced Line Mode on Cisco 4000 Series Integrated Services Routers for Cisco IP Conference Phone 8800 Series.	Enhanced Line Mode, on page 259
	Cisco IP Conference Phone 7832 and Cisco IP Conference Phone 8832 with Unified CME	Support for Cisco IP Conference Phone 7832 and Cisco IP Conference Phone 8832 on Unified CME Support for new Softkeys on Unified CME 12.3 and later releases.	Softkeys on IP Phones, on page 919
Unified CME 12.2			

Version	Feature Name	Feature Description	Where Documented
	Music On Hold from Live Feed on Unified CME	Support for Music On Hold from live feed on Unified CME (Cisco 4000 Series Integrated Services Routers)	Music on Hold from a Live Feed on Cisco 4000 Series Integrated Services Routers, on page 826
	Voice Hunt Group Enhancements on Unified CME	Support for Voice Hunt Group with Shared Lines and Mixed Shared Lines on Unified CME Support for Voice Class Codec (VCC) for SIP Shared Lines on Unified CME Support for All Agents Logged Out Message Display on SIP Phones	Hunt Groups, on page 1231 Shared Lines with Voice Class Codec Support, on page 236 All Agents Logged Out Display on SIP Phones, on page 1254
Unified CME 12.1			
	No New features added in the Unified CME 12.1 Release.		
Unified CME 12.0			
	New Phone Support	As part of Unified CME Release 12.0, new phone support for Cisco IP Phones 8821, 8845, 8865 was introduced for Cisco Integrated Services Router Generation 2. The support is introduced for T-Train Release Version, 15.7(3)M and later.	Phone Feature Support Guide for Cisco Unified CME, Cisco Unified SRST, Cisco Unified E-SRST, and Cisco Unified Secure SRST
	Idle URL for SIP Phones	Support for Idle URL feature was introduced for SIP Phones, as part of Unified CME Release 12.0.	Information About Cisco Unified IP Phone Options, on page 1433
	Calling Number Local	Support to configure Calling Number Local under voice register global configuration mode was introduced as part of Unified CME Release 12.0.	Calling Number Local, on page 1153

Version	Feature Name	Feature Description	Where Documented
	Called-Name Display (Dialed Number Identification Service)	Support to configure Dialed Number Identification Service for phones that are configured under a voice hunt group was introduced as part of Unified CME Release 12.0.	Called-Name Display, on page 658
	cBarge on Mixed Shared Lines	Support for cBarge functionality in a mixed deployment scenario was introduced as part of Unified CME Release 12.0.	Barge and Privacy, on page 1035
Unified CME 11.7			
11.7	New Phone Support	As part of Unified CME Release 11.7, new phone support for Cisco IP Phones 8821, 8845, 8865 was introduced. With this addition, Unified CME supports all phone models in Cisco IP Phone 7800 Series and Cisco IP Phone 8800 Series.	Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST
	Transcoding support for Music On Hold (MOH)	Transcoding for MOH is supported on Cisco 4000 Series Integrated Services Router from Cisco Unified CME Release 11.7 onwards.	Music on Hold, on page 823
	Support for Conferencing on Unified CME	Provides support for conferencing on Cisco 4000 Series Integrated Services Router from Cisco Unified CME Release 11.7 onwards.	Conferencing, on page 1359
	Support for Cisco Smart License	Provides support for Smart Licensing apart from the existing CSL licensing model from Cisco Unified CME Release 11.7 onwards.	Cisco Unified CME Overview, on page 65
Unified CME 11.6			

Version	Feature Name	Feature Description	Where Documented
11.6	Extension Assigner for SIP Phones	Provides support for automatically synchronizing configuration changes to backup systems for SIP Phones.	Create Phone Configurations Using Extension Assigner, on page 361
	Call Transfer Recall for SIP Phones	Support for call transfer recall functionality on SIP phones.	Call Transfer Recall on SIP Phones, on page 1145
	Secondary Unified CME for SIP Phones	Failover to Redundant Router —Sites can be set up with a primary and secondary Cisco Unified CME router to provide redundant Cisco Unified CME capability. SIP Phones automatically register at the secondary router if the primary router fails and later rehome to the primary router when it is operational again.	Redundant Cisco Unified CME Router for SIP Phones, on page 166
	VHG Enhancements	Support for voice hunt group features such as Hlog support on SIP phone, DND Softkey as Hlog, Members Logout, Auto Logout, Presentation of calls, and Dynamic Agent Join or Unjoin Status message display on SIP phones.	Call Coverage Features, on page 1223 Customize Softkeys, on page 919
	Night Service (Mixed Mode)	Support for night service functionality in a mixed deployment scenario.	Call Coverage Features, on page 1223
	Secondary Dial Tone for SIP Phones	Support for Secondary Dial Tone on SIP Phones.	Configure Dial Plans, on page 461
	BACD with Loopback call flows	Support to invoke B-ACD services when calling from a local SIP, SCCP or FXS phone.	http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/cucme/bacd/configuration/guide/cme40tcl/40bacd.html

Version	Feature Name	Feature Description	Where Documented
	Transcoding Support on Unified CME	Support for LTI-based Transcoding on Cisco 4000 Series Integrated Services Router.	Transcoding Support, on page 484
Cisco Unified CME 11.5			
11.5	Auto Registration	Support for auto registration of SIP phones on Unified CME. Introduced the CLI command auto-register in voice register global mode to enable automatic registration of SIP phones on Unified CME.	Auto Registration of SIP Phones on Cisco Unified CME, on page 240
	Night Service	Support for night service functionality on SIP phones.	Night Service, on page 1255
	B-ACD	Support for B-ACD functionality on SIP phones.	Cisco Unified CME B-ACD and Tel Call-Handling Applications
Cisco Unified CME 11.0			
11.0	New Phone Support	Lists the new phones that have been provided with support on Unified CME: • Support for Cisco IP Phone 7811 • Support for Cisco IP Phones 8811, 8831, 8841, 8851, 8851NR, 8861 • Support for Cisco ATA-190 Phones	Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST
Cisco Unified CME 10.5			

Version	Feature Name	Feature Description	Where Documented
10.5	New Phone Support	Lists the new phones that have been provided with support on Unified CME: • Support for Cisco Unified 78xx Series SIP IP Phones • Support for Cisco DX650	Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST
	Example for Monitoring the Status of Key Expansion Modules	Monitoring the Status of Key Expansion Modules: Example section has been updated to include support the show summary commands.	Example for Monitoring the Status of Key Expansion Modules, on page 352
	Monitoring and Maintaining Cisco Unified CME	Monitoring and Maintaining Cisco Unified CME table has been updated to include the new show commands introduced in this release.	Cisco IOS Commands for Monitoring and Maintaining Cisco Unified CME, on page 352
	Localization Enhancements in Cisco Unified CME	Localization Enhancement feature recommends User-Defines locales.	Localization Enhancements in Cisco Unified CME, on page 419
	Fast Dial	Fast Dial range has been increased to 100.	Enable a Personal Speed Dial Menu on SCCP Phones, on page 964
	Viewing Active Parked Calls	Viewing Active Parked Calls feature enables the user to view the list of active parked calls on SIP and SCCP phones.	View Active Parked Calls, on page 1071
	Distinctive Ring	Distinctive Ring feature enables the user to distinctly identify the type of call.	Call Park Recall Enhancement, on page 1075
	Viewing and Joining Voice Hunt Groups	Viewing and Joining Voice Hunt Groups feature enables the user to view voice hunt group related information on SIP and SCCP phones.	View and Join for Voice Hunt Groups, on page 1237

Version	Feature Name	Feature Description	Where Documented
	Dynamically Joining or Unjoining Multiple Voice Hunt Groups	Dynamically Joining or Unjoining Multiple Voice Hunt Groups feature provides support for phones to dynamically join the voice hunt groups is added.	Dynamically Join or Unjoin Multiple Voice Hunt Groups, on page 1248
	Audible Tone	The Audible Tone feature has been introduced on SCCP phones to enable the user to receive a confirmation on successful log in or log out from an ephone hunt group and voice hunt group.	Enable Audible Tone for Successful Login and Logout of a Hunt Group on SCCP Phone, on page 1294
	Cisco Jabber Client Support on CME	A new phone type, 'Jabber-CSF-Client' has been added to configure the Cisco Jabber client under voice register pool.	Cisco Jabber Client Support on CME, on page 1439
	Multi VRF Support	Multi VRF Support feature has been enhanced to provide support for SIP phones.	Example for Configuring Multi- VRF Support for Cisco Unified CME SIP Phones, on page 1542
Cisco Unified CME 10.0			
10.0	Fast-Track Configuration Approach for Cisco Unified SIP IP Phones	Fast-Track Configuration feature provides a new configuration utility using which you can input the phone characteristics of a new SIP phone model.	Fast-Track Configuration Approach for Cisco Unified SIP IP Phones, on page 262
	Cisco Jabber for Microsoft Windows	Cisco Jabber for Windows client is supported from Cisco Unified CME Release 10 onwards.	Cisco Jabber Client Support on CME, on page 1439
	Cisco Unified CME-SRST License	Cisco Unified CME-SRST permanent license has been introduced along with new license package called Collaboration Professional Suite.	Licensing, on page 69

Version	Feature Name	Feature Description	Where Documented
	Secure SIP Trunk Support on Cisco Unified CME	Supports supplementary services in secure SRTP and SRTP fallback modes on SIP trunk of the SCCP Cisco Unified CME.	Secure SIP Trunk Support on Cisco Unified CME, on page 589
Cisco Unified CME 9.5			
9.5	After-hours Pattern Blocking Support for Regular Expressions	Support for after-hours pattern blocking is extended to regular expression patterns for dial plans on Cisco Unified SIP and Cisco Unified SCCP IP phones.	After-Hours Pattern-Blocking Support for Regular Expressions, on page 1050
	Call Park Recall Enhancement	The recall force keyword is added to the call-park system command in telephony-service configuration mode to allow a user to force the recall or transfer of a parked call to the phone that put the call in park.	Call Park Recall Enhancement, on page 1075
	Display Support for Name of Called Voice Hunt Groups	The display of the name of the called voice-hunt-group pilot is supported by configuring the following command in voice hunt-group or ephone-hunt configuration mode: [no] name primary pilot name [secondary secondary pilot name]	Display Support for the Name of a Called Voice Hunt-Group, on page 1243

Version	Feature Name	Feature Description	Where Documented
	Enhancement of Support for Hunt Group Agent Statistics	Support for hunt group agent statistics of Cisco Unified SCCP IP phones is enhanced to include the following information: • Total logged in time—On an hourly basis, displays the duration (in sec) since a specific agent logged into a hunt group. • Total logged out time—On an hourly basis, displays the duration (in sec) since a specific agent logged out of a hunt group.	Enhancement of Support for Ephone-Hunt Group Agent Statistics, on page 1245
	HTTPS Support in Cisco Unified CME	With Hypertext Transfer Protocol Secure (HTTPS) support in Cisco Unified CME 9.5 and later versions, these services can be invoked using an HTTPS connection from the phones to Cisco Unified CME.	HTTPS Provisioning For Cisco Unified IP Phones, on page 592
	Localization Enhancements in Cisco Unified CME	Canadian French is supported as a user-defined locale on Cisco Unified SIP IP phones and Cisco Unified SCCP IP phones when the correct locale package is installed.	Localization Enhancements in Cisco Unified CME, on page 419
	Preventing Local-Call Forwarding to Final Agent in Voice Hunt Groups	Local calls are prevented from being forwarded to the final destination using the no forward local-calls to-final command in parallel or sequential voice hunt-group configuration mode.	Prevent Local Call Forwarding to the Final Agent in a Voice Hunt-Groups, on page 1244

Version	Feature Name	Feature Description	Where Documented
	Support for Voice Hunt Group Descriptions	A description can be specified for a voice hunt group using the description command in voice hunt-group configuration mode.	Support for Voice Hunt Group Descriptions, on page 1244
	Trunk to Trunk Transfer Blocking for Toll Fraud Prevention on Cisco Unified SIP IP Phones Cisco Unified CME 9.0	Trunk to trunk transfer blocking for toll bypass fraud prevention is supported on Cisco Unified Session Initiation Protocol (SIP) IP phones also.	Trunk-to-Trunk Transfer Blocking for Toll Fraud Prevention on Cisco Unified SIP IP Phones, on page 1137
Cisco Unified CME 9.0			
9.1	KEM Support for Cisco Unified 8961, 9951, and 9971 SIP IP Phones	Increases line key and feature key appearances, speed dials, or programmable buttons on Cisco Unified SIP IP phones.	
9.0	Cisco ATA-187	Supports T.38 fax relay and fax pass-through on Cisco ATA-187.	Configure Cisco ATA Support in SCCP Mode, on page 306
	Cisco Unified SIP IP Phones	Adds SIP support for the following phone types: • Cisco Unified 6901 and 6911 IP Phones • Cisco Unified 6921, 6941, 6945, and 6961 IP Phones • Cisco Unified 8941 and 8945 IP Phones	Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST

Version	Feature Name	Feature Description	Where Documented
	Localization Enhancements for Cisco Unified SIP IP Phones	Provides the following enhanced localization support for Cisco Unified SIP IP phones: • Localization support for Cisco Unified 6941 and 6945 SIP IP Phones. • Locale installer that supports a single procedure for all Cisco Unified SIP IP phones.	Localization Support for Cisco Unified SIP IP Phones, on page 421
	MIB Support for Extension Mobility in Cisco Unified SCCP IP Phones	Adds new MIB objects to monitor Cisco Unified SCCP IP Extension Mobility (EM) phones.	MIB Support for Extension Mobility in Cisco Unified SCCP IP Phones, on page 726
	Mixed Shared Lines	Allows Cisco Unified SIP and SCCP IP phones to share a common directory number.	Mixed Shared Lines, on page 237
	Multiple Calls Per Line	Overcomes the limitation on the maximum number of calls per line.	Multiple Calls Per Line, on page 255
	My Phone Apps for Cisco Unified SIP IP Phones	Adds support for My Phone Apps feature on Cisco Unified SIP IP phones.	My Phone Apps for Cisco Unified SIP IP Phones, on page 1441
	Olson Timezone	Eliminates the need to update time zone commands or phone loads to accommodate a new country with a new time zone or an existing country whose city or state wants to change their time zone, using the olsontimezone command in either telephony-service or voice register global configuration mode.	Olson Timezones, on page 130

Version	Feature Name	Feature Description	Where Documented
	Paging Group Support for Cisco Unified SIP IP Phones	Allows you to specify a paging-dn tag and dial the paging extension number to page the Cisco Unified SIP IP phone associated with the paging-dn tag or paging group using the paging-dn command in voice register pool or voice register template configuration mode.	Paging Group Support for Cisco Unified SIP IP Phones, on page 852
	Programmable Line Keys for Cisco Unified SIP IP Phones	Adds support for softkeys as programmable line keys on Cisco Unified 6911, 6921, 6941, 6945, 6961, 8941, and 8945 SIP IP Phones.	Programmable Line Keys (PLK), on page 924
	Single Number Reach for Cisco Unified SIP IP Phones	Supports the following SNR features for Cisco Unified SIP IP phones: • Enable and disable the EM feature. • Manual pull back of a call on a mobile phone. • Send a call to a mobile PSTN phone. • Send a call to a mobile phone regardless of whether the SNR phone is the originating or the terminating side.	Single Number Reach for Cisco Unified SIP IP Phones, on page 902
	Unsolicited Notify for Shared Line and Presence Events for Cisco Unified SIP IP Phones	Allows the Unsolicited Notify mechanism to reduce network traffic during Cisco Unified SIP IP phone registration using the bulk registration method.	Unsolicited Notify for Shared Line and Presence Events for Cisco Unified SIP IP Phones, on page 170

Version	Feature Name	Feature Description	Where Documented
	Virtual SNR DN for Cisco Unified SCCP IP Phones	Allows a call to be made to a virtual SNR DN and allows the SNR feature to be launched even when the SNR DN is not associated with any phone.	Virtual SNR DN for Cisco Unified SCCP IP Phones, on page 903
	Voice Hunt Group Enhancements	Allows all ephone and voice hunt group call statistics to be written to a file using the hunt-group statistics write-all command.	Hunt Groups, on page 1231
Cisco Unified CME 8.8			
	CTI CSTA Protocol Suite Enhancement	Enables the dial-via-office functionality from computer-based CSTA client applications and adds support to CSTA services and events.	CTI CSTA Protocol Suite Deprecation, on page 66
	HFS Download Support for IP Phone Firmware and Configuration Files	Provides download support for SIP and SCCP IP phone firmware, scripts, midlets, and configuration files using the HTTP File-Fetch Server (HFS) infrastructure.	HFS Download Support for IP Phone Firmware and Configuration Files, on page 162
	HTTPS Provisioning for Cisco Unified IP Phones	Allows you to import an IP phone's trusted certificate to an IP phone's CTL file using the import certificate command.	HTTPS support for an External Server, on page 592
	Localization Enhancement	Adds localization support for Cisco Unified 3905 SIP and Cisco Unified 6945, 8941, and 8945 SCCP IP Phones.	System-Defined Locales, on page 420
	Programmable Line Keys Enhancement	Adds support for softkeys as programmable line keys on Cisco Unified 6945, 8941, and 8945 SCCP IP Phones.	Programmable Line Keys (PLK), on page 924

Version	Feature Name	Feature Description	Where Documented
	Real-Time Transport Protocol Call Information Display Enhancement	Allows you to display information on active RTP calls using the show ephone rtp connections command. The output from this command provides an overview of all the connections in the system, narrowing the criteria for debugging pulse code modulation and Cisco Unified CME packets without a sniffer.	Real-Time Transport Protocol Call Information Display Enhancement, on page 257
	SIP Intercom	Adds intercom support to Cisco Unified SIP phones connected to a Cisco Unified CME system.	SIP Intercom, on page 776
	Support for Cisco Unified 3905 SIP IP Phones	Adds support for SIP phones connected to a Cisco Unified CME system.	Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST
	Support for Cisco Unified 6945, 8941, and 8945 SCCP IP Phones	Adds support for SCCP phones connected to a Cisco Unified CME system.	Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST
Cisco Unified CME 8.6			
8.6	Bulk Registration Support for SIP Phones	Adds support for SIP phone bulk registration.	Bulk Registration Support for SIP Phones, on page 155

Version	Feature Name	Feature Description	Where Documented
	Clear Directory Entries in Missed/Placed/Received Calls List Support for iPhone and iPod Touch Softphone Client	Adds ability to clear phone call logs. Adds support for SIP client software for iPhone and iPod Touch.	Clear Directory Entries, on page 1433 Support for Cisco Jabber, on page 1438
	Enhancement for Call-Forward Unregistered	Adds support for the CFU feature on SIP IP phones using the call-forward b2bua unregistered command under voice register dn tag.	Call Forward Unregistered, on page 1134
	Extension Mobility Support for SIP phone	Adds SIP phone support to extension mobility.	Extension Mobility for SIP Phones Enhancement, on page 726
	Increase in the Number of Translation Rules	Increases the number of translation rules from 15 to 100 rules per translation rule table.	Define Translation Rules for Callback-Number on SIP Phones, on page 475
	Localization Support for SIP IP Phones	Adds localization support for SIP IP phones.	Localization Support for Cisco Unified SIP IP Phones, on page 421 Multiple Locales, on page 422 Configure Localization Support on SCCP Phones, on page 423 Configure Multiple Locales on SIP Phones, on page 444
	SSL VPN SUPPORT on CUCME with DTLS	Adds enhanced SSL VPN support. Cisco Unified SCCP IP phones such as 7945, 7965, and 7975 located outside of the corporate network are able to register to Cisco Unified CME through an SSL VPN connection.	SSL VPN Support on Cisco Unified CME with DTLS, on page 997 Configure SSL VPN Client with DTLS on Cisco Unified CME as VPN Headend, on page 1018
	Support for 7926G Wireless SCCP IP Phone	Adds support for 7926G Wireless SCCP IP Phone.	

Version	Feature Name	Feature Description	Where Documented
			Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST
	Video Conferencing and Transcoding	Allows you to use on-board Digital Signal Processor resources (PVDM3) to facilitate adhoc or meet me video conference calls.	Transcoding Resources, on page 483
	Video and Camera Support for Cisco Unified IP Phones 8961, 9951, and 9971	Adds video support for IP phones 8961, 9951, and 9971.	SIP Endpoint Video and Camera Support for Cisco Unified IP Phones 8961, 9951, and 9971, on page 982
Cisco Unified CME 8.5			

Version	Feature Name	Feature Description	Where Documented
8.5	Customized Button Layout	Allows you to customize the display order of various button types on a phone using the button layout feature. The button layout feature allows you to customize the display of the following button types: • Line buttons • Speed Dial buttons • BLF Speed Dial buttons • Feature Buttons • ServiceURL buttons	Configure Button Layout on SCCP Phones, on page 1448 Configure Button Layout on SIP Phones, on page 1450
	Customized Phone User Interface Services	Allows to customize the availability of individual service items such as Extension Mobility, My Phone Apps, and Single Number Reach (SNR) on a phone's user interface by assigning an individual service item to a button using the Programmable Line Key (PLK) url-button command.	Customized Phone User Interface Services, on page 1435
	E.164 Enhancements	Allows to present a phone number in + E.164 telephone numbering format. E.164 is an International Telecommunication Union (ITU-T) recommendation that defines the international public telecommunication numbering plan used in the PSTN and other data networks.	E.164 Enhancements, on page 458
	Enhancement to Voice Hunt Group Restriction		Configure Call Coverage Features, on page 1262

Version	Feature Name	Feature Description	Where Documented
		Allows you to ignore the timeout value for voice hunt group member and the call forward no answer timer when call forward noan command is configured in a voice hunt group.	
	Feature Policy Softkey Control	Allows you to control softkeys on the Cisco Unified SIP IP Phones 8961, 9951, and 9971 using the feature policy template. The feature policy template allows you to enable and disable a list of feature softkeys on Cisco Unified SIP IP Phones 8961, 9951, and 9971.	Feature Policy Softkey Control, on page 923
	Forced Authorization Code	Allows you to manage call access and call accounting through the Forced Authorization Code (FAC) feature. The FAC feature regulates the type of call a certain caller may place and forces the caller to enter a valid authorization code on the phone before the call is placed. FAC allows you to track callers dialing non-toll-free numbers, long distance numbers, and also for accounting and billing purposes.	Forced Authorization Code, on page 757
	Immediate Divert for SIP Phones		Configure Immediate Divert (iDivert) Softkey on SIP Phone, on page 943

Version	Feature Name	Feature Description	Where Documented
		Allows you to immediately divert a call to a voice messaging system. You can divert a call to a voice messaging system by pressing the iDivert softkey on Cisco Unified SIP IP phones, such as 7940, 7040G, 7960 G, 7945, 7965, 7975, 8961, 9951, and 9971, with voice messaging systems (Cisco Unity Express or Cisco Unity).	
	Media Flow Around Support for SIP-SIP Trunk Calls	Eliminates the need to terminate RTP and re-originate on Cisco Unified CME through the media flow around feature, reducing media switching latency and increasing the call handling capacity for Cisco Unified CME SIP trunks.	Enable Media Flow Mode on SIP Trunks, on page 209
	Overlap Dialing Support for SIP and SCCP IP Phones	Enables overlap dialing on SCCP and SIP IP phones such as, 7942, 7945, 7962, 7965, 7970, 7971, and 7975.	Example for Configuring Overlap Dialing for SCCP IP Phones, on page 223
	Park Monitor	Allows you to park a call and monitor the status of the parked call until the parked call is retrieved or abandoned. When a Cisco Unified SIP IP Phone 8961, 9951, or 9971 parks a call using the park softkey, the park monitoring feature monitors the status of the parked call.	Park Monitor, on page 1076
	Phone User Interface for BLF-Speed-Dial		Enable BLF-Speed-Dial Menu, on page 882

Version	Feature Name	Feature Description	Where Documented
		Allows extension mobility (EM) users to configure IP-based Busy Lamp Field (BLF)-speed-dial settings directly on the phone through the Services feature button. BLF-speed-dial settings are added or modified (changed or deleted) on the phone using a menu available with the Services button.	
	Programmable Line Keys (PLK)	Allows you to program feature buttons or URL services button on phone's line keys. You can configure line keys as line buttons, speed dials, BLF speed dials, feature buttons, and URL buttons.	Programmable Line Keys (PLK), on page 924
	SNR Enhancements	Adds enhanced Single Number Reach feature for Cisco Unified CME: • Hardware Conference • Call Park, Call Pickup, and Call Retrieval • Answer Too Soon Timer • SNR Phone Stops Ringing After Mobile Phone Answers	Configure Single Number Reach Enhancements on SCCP Phones, on page 909
	SSL VPN Client Support on SCCP IP Phones	Enables Secure Sockets Layer (SSL) Virtual Private Network (VPN) on SCCP IP phones such as 7945, 7965, and 7975.	SSL VPN Client for SCCP IP Phones, on page 997
	XML API for Cisco Unified CME		XML API for Cisco Unified CME, on page 1547

Version	Feature Name	Feature Description	Where Documented
		Adds support for eXtensible Markup Language (XML) Application Programming Interface (API).	
Cisco Unified CME 8.1			
8.1	Toll Fraud Prevention	Enables Toll Fraud Prevention on Cisco Unified CME to secure the Cisco Unified CME system against potential toll fraud exploitation by unauthorized users.	Toll Fraud Prevention, on page 521
	Enhancements to SIP Phone Configuration	Allows you to verify SIP phone registration process, remove global registration parameters, and display details on phones that attempted to register with Cisco Unified CME and failed.	Cisco Unified CME Commands: show presence global through subnet.
	Support for Cisco Unified 6901 and 6911 SCCP IP Phones	Adds support for new SCCP IP phones 6901 and 6911.	Ephone-Type Parameters for Supported Phone Types, on page 269
Cisco Unified CME 8.0(1)			

Version	Feature Name	Feature Description	Where Documented
8.0	Cancel Call Waiting	Enables an SCCP phone user to disable Call Waiting for a call they originate.	Call Coverage Features, on page 1223
	CTI CSTA Protocol Suite	Allows computer-based CSTA client applications, such as a Microsoft Office Communicator (MOC) client, to monitor and control the Cisco Unified CME system to enable programmatic control of SCCP telephony devices registered in Cisco Unified CME.	CTI CSTA Protocol Suite Deprecation, on page 66
	IPv6 Support for SCCP Endpoints	Adds IPv6 support for SCCP phones. SCCP Phones can interact with and support any SCCP devices that support IPv4 only or both IPv4 and IPv6 (dual-stack).	Configure IP Phones in IPv4, IPv6, or Dual Stack Mode, on page 172
	Logical Partitioning Class of Restriction (LPCOR)	Enables a single directory number on an IP or analog phone that is registered to Cisco Unified CME to connect to both PSTN and VoIP calls according to restrictions specified by Telecom Regulatory Authority of India (TRAI) regulations.	Call Restriction Regulations, on page 1089
	MLPP enhancements		Configure MLPP, on page 807

Version	Feature Name	Feature Description	Where Documented
		Adds enhanced Multilevel Priority and Preemption (MLPP) features for Cisco Unified CME including: • Additional MLPP announcements for isolated code (ICA), unauthorized precedence level (UPA), loss of C2 features (LOC2), and vacant code (VCA) • Multiple service domains for the Defense Switched Network (DSN) and Defense Red Switched Network (DRSN) • Route codes and service digits in dialing formats • Support for supplementary services, such as Three-Way Conferencing, Call Pickup, and Cancel Call Waiting on Analog FXS ports	
	Music On Hold Enhancement	Adds support for Music on Hold from different media sources.	Configure Music on Hold Groups to Support Different Media Sources, on page 837
	Secure IP Phone (IP-STE) Support	Adds support for secure IP Phone, IP-STE.	Internet Protocol - Secure Telephone Equipment Support, on page 251
Cisco Unified CME 7.1			

Version	Feature Name	Feature Description	Where Documented
7.1	Autoconfiguration of Cisco VG202, VG204, and VG224	Allows you to automatically configure the Cisco VG202, VG204, and VG224 Analog Phone Gateway from Cisco Unified CME.	
	Barge and cBarge for SIP Phones	Enables phone users to join a call on a SIP shared-line directory number.	Barge and Privacy, on page 1035
	BLF Monitoring of Ephone-DNs with DND, Call Park, Paging, and Conferencing	Provides Busy Lamp Field (BLF) indicators for directory numbers that become DND-enabled or are configured as call-park slots, paging numbers, or conference numbers.	Presence Service, on page 869
	BLF Monitoring of Devices	Supports device-based BLF monitoring, allowing a watcher to monitor the status of a phone, not only a line on the phone.	Presence Service, on page 869
	Busy Trigger and Channel Huntstop for SIP Phones	Provides a busy trigger and channel huntstop for directory numbers on SIP phones to prevent incoming calls from overloading the phone.	
	Call Park Enhancements	Adds Call Park features for SIP phones and enhances the Directed Call Park feature.	
	Call Pickup Enhancements	Adds Call Pickup features for SIP phones and enables users to perform Directed Call Pickup using the GPickUp softkey.	Call Coverage Features, on page 1223

Version	Feature Name	Feature Description	Where Documented
	DND Enhancement for SIP phones	Modifies DND behavior so that the SIP phone flashes an alert to visually indicate an incoming call instead of ringing and the call can be answered if desired.	Do Not Disturb, on page 677
	DSCP	Supports Differentiated Services Code Point (DSCP) packet marking for Cisco Unified IP phones.	
	Privacy for SIP phones	Enables phone users to block other users from seeing call information or barging into a call on a SIP shared-line directory number.	Barge and Privacy, on page 1035
	Shared-Line Directory Numbers	Adds shared-line directory numbers for SIP phones.	
	Single Number Reach (SNR)	Enables users to answer incoming calls on their desktop IP phone or at a remote destination, such as a mobile phone.	Configure Single Number Reach, on page 905
	SIP Trunk Video Support for SCCP Endpoints	Supports video calls between SCCP endpoints across different Cisco Unified CME routers connected through a SIP trunk. Supports H.264 codec for video calls.	Video Support, on page 977
	Whisper Intercom	Provides a one-way voice path from the caller to the called party, regardless of whether the called party is busy or idle. The called phone automatically answers in speakerphone mode.	Intercom Lines, on page 775
Cisco Unified CME 7.0(1)			

Version	Feature Name	Feature Description	Where Documented
7.0(1)	Note Cisco Unified CME 7.0 includes the same features as Cisco Unified CME 4.3, which is renumbered to align with Cisco Unified Communications versions.		Configure System-Level Parameters, on page 172 Upgrade or Downgrade SCCP Phone Firmware, on page 114
	Cisco Unified CME Usability Enhancement	Automatically creates TFTP bindings using the enhanced load command if cnf location is router flash memory or router slot 0 memory.	
		- Introduces locale installer that supports a single procedure for all SCCP IP phones. - Automatically creates the required TFTP aliases for localization. - Provides backward compatibility with the configuration method in Cisco Unified CME 7.0 and earlier versions.	
	Cisco Unified CME TAPI Enhancement	Introduces a Cisco IOS command that disassociates and reestablishes a TAPI session that is in frozen state or out of synchronization.	
	Cisco Unity Express AXL Enhancement	Automatically synchronizes Cisco Unified CME and Cisco Unity Express passwords.	Voice Mail Integration, on page 535
	Cisco Unified IP Phones		Cisco Unified Communications Manager Express 7.0/4.3 Supported Firmware, Platforms, Memory, and Voice Products

Version	Feature Name	Feature Description	Where Documented
		Adds SCCP support for the following phone type: Cisco Unified Communications Manager Express 7.0/4.3 Supported Firmware, Platforms, Memory, and Voice Products • Cisco Unified Wireless IP Phone 7925	
	VRF Support on Cisco Unified CME	Adds support for conferencing, transcoding, a RSVP components in Cisco Unified CME through a VRF; also allows soft phones and TAPI clients in data VRF resources to communicate with phones in a VRF voice gateway.	Configure VRF Support, on page 1531
Cisco Unified CME 7.0/4.3			
7.0/4.3	Autoprovisioning Directory Numbers in SRST Fallback Mode	Allows you to specify whether Cisco Unified CME in SRST Fallback mode creates octo-line or dual-line directory numbers for ephone-dns that are “learned” automatically from the ephone configuration.	SRST Fallback Mode, on page 1513
	Barge	Enables phone users to join a call on a shared octo-line directory number by pressing the Cbarge softkey and converting the call to an ad hoc conference.	Configure Barge and Privacy, on page 1038
	Call Transfer Recall	Enables a transferred call to return to the phone that initiated the transfer if the destination does not answer.	

Version	Feature Name	Feature Description	Where Documented
	Cisco 3200 Series Mobile Access Router	Support for Cisco Unified CME on the Cisco 3200 Series Mobile Access Router was added.	
	Cisco Unified IP Phones	Adds SCCP support for the following phone types: • Cisco Unified IP Phone 7915 Expansion Module • Cisco Unified IP Phone 7916 Expansion Module • Cisco Unified IP Conference Station 7937 • Nokia E61 Adds SIP support for the following phone types: • Cisco Unified IP Phone 7942G and 7945G • Cisco Unified IP Phone 7962G and 7965G • Cisco Unified IP Phone 7975G	Cisco Unified Communications Manager Express 7.0/4.3 Supported Firmware, Platforms, Memory, and Voice Products
	Consultative Transfer Enhancements		

Version	Feature Name	Feature Description	Where Documented
		Modifies the digit-collection process for consultative call transfers. After a phone user presses the Transfer softkey for a consultative transfer, a new consultative call leg is created and the Transfer softkey is not displayed again until the dialed digits of the transfer-to number are matched to a transfer pattern and consultative call leg is in alerting state.	
	Directory Search Enhancement	Increases the number of entries supported in a search results list from 32 to 240 when using the directory search feature.	Directory Services, on page 657
	Extension Mobility Enhancement	Adds support for the following: • Automatic Logout, including: • Configurable time-of-day timers for automatically logging out all EM users. • Configurable idle-duration timer for logging out a single user from an idle EM phone. • Automatic Clear Call History when a user logs out from EM.	Extension Mobility, on page 723

Version	Feature Name	Feature Description	Where Documented
	Phone-Type Configuration	Allows you to dynamically add a new phone type to your configuration without upgrading your Cisco IOS software.	
	Live Record	Enables IP phone users to record a phone conversation when Cisco Unity Express is the voice mail system.	Voice Mail Integration, on page 535
	Maximum Ephones	Sets the maximum number of SCCP phones that can register to Cisco Unified CME using the max-ephones command, without limiting the number that can be configured. This enhancement also expands the maximum number of phones that can be configured to 1000.	
	Octo-Line Directory Numbers	Adds octo-line directory numbers that support up to eight active calls, both incoming and outgoing, on a single phone button. Unlike a dual-line directory number, an octo-line directory number can split its channels among other phones that share the directory number.	

Version	Feature Name	Feature Description	Where Documented
	Privacy	Enables phone users to block other users from seeing call information or barging into a call on a shared octo-line directory number.	Configure Barge and Privacy, on page 1038
	Push-to-Talk	Adds support for one-way Push-to-Talk (PTT) in Cisco Unified CME without requiring an external server to support the functionality. PTT is supported in firmware version 1.0.4 and later versions on Cisco Unified wireless IP phones with a thumb button.	Configure One-Way Push-to-Talk on Cisco Unified SCCP Wireless IP Phones, on page 1476
	Speed Dial/Fast Dial Phone User Interface	Allows IP phone users to configure their own speed-dial and fast-dial settings directly from the phone. Extension Mobility users can add or modify speed-dial settings in their user profile after logging in.	Speed Dial, on page 957
	Transfer to Voice Mail	Allows a phone user to transfer a call directly to a voice-mail extension by pressing the TrnsfVM softkey.	Voice Mail Integration, on page 535
	Voice Hunt-Group Enhancements		Call Coverage Features, on page 1223

Version	Feature Name	Feature Description	Where Documented
		Supports the following Voice Hunt Group features: • Call Forwarding to a Parallel Voice Hunt-Group (Blast Hunt Group). • Call Transfer to a Voice Hunt-Group. • Member of Voice Hunt-Group can be a SCCP phone, FXS analog phone, DS0-group, PRI-group, SIP phone, or SIP trunk.	
Cisco Unified CME 4.2(1)			
4.2(1)	Call Blocking Enhancements	Adds support for selective call blocking on IP phones and PSTN trunk lines.	Call Blocking, on page 1049
	Extension Assigner Synchronization	Provides support for automatically synchronizing configuration changes to backup systems.	Create Phone Configurations Using Extension Assigner, on page 361
	Extension Mobility Phone User support in Cisco Unified CME GUI	Allows a phone user to use a name and password from an EM profile to log into the Cisco Unified CME GUI for configuring personal speed dials on an EM phone. EM options in the GUI cannot be accessed from the System Administrator or Customer Administrator login screens.	Unified CME Graphical User Interface Deprecation, on page 65
Cisco Unified CME 4.2			

Version	Feature Name	Feature Description	Where Documented
4.2	Enhanced 911 Services	• Enables routing to the PSAP closest to the caller by assigning ERLs to zones. • Allows you to customize E911 services by defining a default ELIN, designated number for callback, expiry time for Last Caller table, and syslog messages for emergency calls. • Expands the E911 location information to include name and address. • Uses templates to assign ERLs to a group of phones. • Adds permanent call detail records.	Enhanced 911 Services, on page 685
	Extension Mobility	Provides the benefit of phone mobility for end users by enabling the user to log into any local Cisco Unified IP phone that is enabled for extension mobility.	Extension Mobility, on page 723

Version	Feature Name	Feature Description	Where Documented
	Interoperability with Cisco Unified Contact Center Express (Cisco UCCX)	Enables interoperability between Cisco Unified CME and Cisco Customer Response Solutions (CRS) 5.0 and later versions with Cisco Unified Contact Center Express (Unified CCX), including Cisco Unified IP IVR, enhanced call processing, device and call monitoring, and unattended call transfers to multiple call center agents and basic extension mobility.	Interoperability with Cisco Unified CCX, on page 1489
	Media Encryption (SRTP) on Cisco Unified Communications Manager Express	Provides the following secure voice call capabilities: • Secure call control signaling and media streams in Cisco Unified CME networks using Secure Real-Time Transport Protocol (SRTP) and H.323 protocols. • Secure supplementary services for Cisco Unified CME networks using H.323 trunks. • Secure Cisco VG224 Analog Phone Gateway endpoints.	Security, on page 575
Cisco Unified CME 4.1			

Version	Feature Name	Feature Description	Where Documented
4.1	Call Forward All Synchronization	When a user enables Call Forward All on a SIP phone using the CfwdAll softkey, the uniform resource identifier (URI) for the service is sent to Cisco Unified CME. When Call Forward All is configured in Cisco Unified CME, the configuration is sent to the SIP phone which updates the CfwdAll softkey to indicate that Call forward All is enabled.	

Version	Feature Name	Feature Description	Where Documented
	Cisco Unified IP Phones	Adds SCCP support for the following phones: • Cisco Unified IP Phone 7921G • Cisco Unified IP Phone 7942G and 7945G • Cisco Unified IP Phone 7962G and 7965G • Cisco Unified IP Phone 7975G Adds SIP support for the following phones: • Cisco Unified IP Phone 3911 • Cisco Unified IP Phone 3951 • Cisco Unified IP Phone 7911G • Cisco Unified IP Phone 7941G and 7941G-GE • Cisco Unified IP Phone 7961G and 7961G-GE • Cisco Unified IP Phone 7970G and 7971G-GE No additional configuration is required for these phones. They are supported in the appropriate Cisco IOS commands.	Cisco Unified CME 4.1 Supported Firmware, Platforms, Memory, and Voice Products
	Directory Services	Supports local directory and local speed dial features for SIP phones.	Directory Services, on page 657

Version	Feature Name	Feature Description	Where Documented
	Disabling SIP Supplementary Services for Call Forward and Call Transfer	Allows you to prevent REFER messages for call transfers and redirect responses for call forwarding from being sent by Cisco Unified CME if a destination gateway does not support supplementary services. Supports disabling of supplementary services if all endpoints use SCCP or all endpoints use SIP.	
	Enhanced 911 Services for Cisco Unified CME in SRST Fallback Mode	Routes callers dialing 911 to the correct location.	Enhanced 911 Services, on page 685
	KPML	Allows Key Press Markup Language (KPML) to report SIP phone users' input digit by digit to Cisco Unified CME, which performs pattern recognition by matching a destination pattern to a dial peer as it collects the dialed digits.	
	Multi-Party Conferencing Enhancements	Provides the following enhancements: - Enhanced ad-hoc conferences are hardware-based and allow more than three parties. - Meet-me conferences consist of at least three parties dialing a meet-me conference number.	Conferencing, on page 1359
	Network Time Protocol		Network Parameters, on page 129

Version	Feature Name	Feature Description	Where Documented
		Allows SIP phones registered to a Cisco Unified CME router to synchronize to a Network Time Protocol (NTP) server, known as the clock primary.	
	Out-of-Dialog REFER	Allows remote applications to establish calls by sending an out-of-dialog REFER (OOD-R) message to Cisco Unified CME without an initial INVITE. After the REFER message is sent, the remainder of the call setup is independent of the application and the media stream does not flow through the application.	Network Parameters, on page 129
	Presence with BLF Status	Allows presence to support BLF notification features for speed dial buttons and directory call lists for missed calls, placed calls, and received calls. SIP and SCCP phones that support BLF speed-dial and BLF call-list features can subscribe to status notification for internal and external directory numbers.	Presence Service, on page 869
	Restarting Phones	Allows SIP phones to quickly reset using the restart command. Phones contact the TFTP server for updated configuration information and re-register without contacting the DHCP server.	Reset and Restart Cisco Unified IP Phones, on page 409
	Session Transport		

Version	Feature Name	Feature Description	Where Documented
		Allows TCP to be used as the transport protocol for supported SIP phones connected to Cisco Unified CME. Previously, only UDP was supported.	
	SIP Dial Plans	Enables SIP phones to perform local digit collection and recognize dial patterns as user input is collected using dial plans. After a pattern is recognized, the SIP phone sends an INVITE message to Cisco Unified CME to initiate the call.	
	Softkeys	Allows you to customize the display and order of softkeys that appear on individual SIP phones during the connected, hold, idle, and seized call states.	Customize Softkeys, on page 919
	Translation Rules	Allows SIP phones in a Cisco Unified CME system to support translation rules with functionality similar to phones running SCCP. Translation rules can be applied to incoming calls for directory numbers on a SIP phone.	Dial Plans, on page 455
Cisco Unified CME 4.0(3)			

Version	Feature Name	Feature Description	Where Documented
4.0(3)	AMWI	Allows Cisco Unified IP Phone 7911 and Cisco Unified IP Phone 7931G to be configured to receive AMWI (Audible Message Line Indicator) and visual MWI notification from an external voice-messaging system.	Voice Mail Integration, on page 535
	Cisco Unified IP Phones	Adds support for the following phones: • Cisco Unified IP Phone 7906G • Cisco Unified IP Phone 7931G	Cisco Unified CME 4.0(3) Supported Firmware, Platforms, Memory, and Voice Products
	DSS	Introduces the DSS (Direct Station Select) feature that allows the phone user to press a single speed-dial line button to transfer an incoming call when the call is in the connected state. This feature is supported on all phones on which monitor line buttons for speed dial or speed-dial line buttons are configured.	Speed Dial, on page 957
	Extension Assigner	Allows installation technicians to assign extension numbers to phones without administrative access to Cisco Unified CME, typically during the installation of new phones or the replacement of broken phones.	Create Phone Configurations Using Extension Assigner, on page 361
	Fax Relay		Configure Fax Relay, on page 748

Version	Feature Name	Feature Description	Where Documented
		Introduces a SCCP-enhanced feature that adds support for Cisco Fax Relay and Super Group 3 (SG3) to G3 fax relay. The feature allows the fax stream between two SG3 fax machines to negotiate down to G3 speeds (less than 14.4 kbps) allowing SG3 fax machines to interoperate over fax relay with G3 fax machines.	
Cisco Unified CME 4.0(1)			

Version	Feature Name	Feature Description	Where Documented
4.0(1)	Call Forwarding	Automatic call forwarding during night service—Ephone-dns (extensions) can be designated to automatically forward their calls to a specified number during the time that night service is in effect. Blocking call forwarding of local calls—Forwarding of local (internal) calls from other Cisco Unified CME ephones can be blocked. External calls will continue to be forwarded as specified by the configuration for the ephone-dns. Selective call forwarding—Call forwarding for busy and no-answer ephone-dns can be applied selectively based on the number that a caller dials for a particular ephone-dn: the primary number, the secondary number, or either of those numbers expanded through the use of a dial-plan pattern.	

Version	Feature Name	Feature Description	Where Documented
	Call Park	Call park blocked per ephone—Individual ephones can be blocked from parking calls at call-park slots. Call park redirect—You can specify that calls use the H.450 or SIP Refer method of call forwarding or transfer to park calls and to pick up calls from park. Dedicated call-park slots—A private call-park slot can be configured for each ephone. Direct pickup of parked call on monitored park slot —A call that is parked on a monitored call-park slot can be picked up by pressing the assigned monitor button.	
	Call Pickup	Directed call pickup disable —The no service directed-pickup command globally disables directed call pickup and changes the action of the Pickup softkey to invoke local group pickup rather than directed call pickup.	Call Coverage Features, on page 1223
	Call Transfer		

Version	Feature Name	Feature Description	Where Documented
		Call transfer blocking—When call transfers to phones outside the Cisco Unified CME system have been globally enabled, you can block them for individual ephones. Call transfer destination digits limited—When call transfers to phones outside the Cisco Unified CME system have been globally enabled, you can limit the number of digits that can be dialed when transferring a call. transfer-system command—The command default has been changed from the blind keyword to the full-consult keyword, making H.450.2 consultative transfer the default method. QSIG supplementary services support—H.450 supplementary services features allow Cisco Unified CME phones to use QSIG to interwork with PBX phones. IP phones can use a PBX message center with proper MWI notifications.	
	Cisco Unified IP Phones		Cisco Unified CME 4.0 Supported Firmware, Platforms, Memory, And Voice Products

Version	Feature Name	Feature Description	Where Documented
		Adds support for the following phones: • Cisco Unified IP Phone 7911G • Cisco Unified IP Phone 7941G and 7941G-GE • Cisco Unified IP Phone 7961G and 7961G-GE No additional configuration is required for these phones. They are supported in the appropriate Cisco IOS commands.	
	Conferencing	Drop last party or keep parties connected—New options specify whether the last party that joined a conference can be dropped from the conference and whether the remaining two parties should be allowed to continue their connection after the conference initiator has left the conference. Improved conference display—A Cisco Unified IP phone that is connected to a three-way conference displays “Conference.” No special configuration is required.	Conferencing, on page 1359

Version	Feature Name	Feature Description	Where Documented
	Feature Access Codes	Feature Access Code (FAC) support —The same FACs that are used by analog phones can be enabled for IP phones. In addition, standard FACs can be customized and aliases can be created to simplify the dialing of a FAC and any additional digits that are required to activate the feature.	Feature Access Codes, on page 751
	Headset Auto-Answer	Headset auto-answer —When the headset key on a phone is activated, lines on the phone that are specified for headset auto-answer will automatically connect to incoming calls after playing an alerting tone to notify the phone user of the incoming call. This feature is available on Cisco Unified IP Phones 7940G, 7960G, 7970G, and 7971G-GE.	Headset Auto Answer, on page 769

Version	Feature Name	Feature Description	Where Documented
	Hunt Groups		Call Coverage Features, on page 1223

Version	Feature Name	Feature Description	Where Documented
		Agent status control—Hunt group agents can put their phones in a not-ready state to temporarily suspend the receiving of hunt group calls by using the HLog softkey. A new FAC can toggle ready and not-ready state. Automatic agent not-ready status—The criterion for placing a hunt group agent into not-ready status (previously called automatic logout) was changed. If an agent does not answer the number of consecutive hunt-group calls that you specify in the auto logout command, the agent's ephone-dn is put into not-ready status (logged out) and will not receive further hunt group calls. Call hold statistics—New fields describing the length of time that calls spend in the hold state are in the statistical reports for Cisco Unified CME B-ACD applications. See the show ephone-hunt statistics command and the hunt-group report url command in Cisco Unified CME B-ACD and Tcl Call-Handling Applications. Dynamic hunt group membership—Agents can join or leave a hunt group using standard or custom FACs when	

Version	Feature Name	Feature Description	Where Documented
		wildcard slots are configured for hunt groups and the agents' ephone-dns are authorized to join hunt groups. Change in hops command default—The maximum number of hops allowed by a hunt group is automatically adjusted to reflect the dynamically changing number of members. Enhanced display of ephone hunt-group information—A text string can be added to provide information in configuration output and to display on IP phones when a hunt-group call is ringing or answered or when all hunt-group members are logged out. Local call forwarding restriction in sequential ephone hunt groups—In sequential ephone-hunt groups, local (internal) calls to the hunt group can be prevented from being forwarded beyond the first ephone-dn in the hunt group.	

Version	Feature Name	Feature Description	Where Documented
	Hunt Groups		Call Coverage Features, on page 1223

Version	Feature Name	Feature Description	Where Documented
		Longest-idle hunt group improvement—The from-ring command specifies that on-hook time stamps should be updated when a call rings an agent and when a call is answered by an agent. Maximum number of agents—The maximum number of agents per hunt group has increased from 10 to 20. No special configuration is required. Maximum number of hunt groups—The maximum number of hunt groups per Cisco Unified CME system has increased from 10 to 100. No special configuration is required. No-answer timeout enhancements—No-answer timeouts in ephone hunt groups can be set individually for each ephone-dn in the list. A maximum cumulative no-answer timeout can be also be set. Restricting presentation of calls to idle or on-hook phones—The presentation of hunt group calls can be restricted to hunt-group members on phones that are idle or on-hook. This enhancement considers all lines on the phone, both members of the hunt group and nonmembers, when restricting presentation of hunt group calls. Return to a secondary	

Version	Feature Name	Feature Description	Where Documented
		destination in an ephone hunt group after call park—Calls parked by hunt group agents can be returned to a different entry point in the hunt group. Return to transferring party on no answer in an ephone hunt group—A call that was transferred into a hunt group and was not answered can be returned to the party that transferred it to the hunt group instead of being sent to voice mail or another final destination.	
	Localization	Multiple user locales and network locales—Up to five user and network locales are supported. User-defined user locales and network locales—User-defined locales can be added for supported phones.	

Version	Feature Name	Feature Description	Where Documented
	Music on Hold	Music on hold (MOH) for internal calls—Internal callers (those making calls between extensions in the same Cisco Unified CME system) hear music when they are on hold or are being transferred. The multicast moh command must be used to enable the flow of packets to the subnet on which the phones are located. Internal extensions that are connected through an analog voice gateway or through a WAN (remote extensions) do not hear MOH on internal calls. The ability to disable multicast MOH per phone was introduced, using the no multicast-moh command in ephone or ephone-template configuration mode.	Music on Hold, on page 823

Version	Feature Name	Feature Description	Where Documented
	Overlaid Ephone-dns	Overlaid ephone-dns—The maximum number of overlaid ephone-dns per ephone button has increased from 10 to 25. No special configuration is required. Overlaid ephone-dn call-waiting display—The number of waiting calls that can be displayed for overlaid ephone-dns that have call waiting configured has been increased to six for the Cisco IP Phone 7940G, 7941G, 7941G-GE, 7960G, 7961G, 7961G-GE, 7970G, and 7971G-GE. The overlaid ephone-dns must be configured on the phone using the button command and the c keyword. Overlaid ephone-dn call overflow to other buttons—One or more buttons can be dedicated to serve as expansion or overflow buttons for another button on the same Cisco Unified IP phone that has overlaid ephone-dns. A call to an overlay button that is busy with an active call will roll over to the next available expansion button.	Call Coverage Features, on page 1223
	Phone Support		

Version	Feature Name	Feature Description	Where Documented
		Cisco IP Communicator is a software-based application that appears on a user's computer monitor as a graphical, display-based IP phone with a color screen, a key pad, feature buttons, and softkeys. Cisco Unified CME supports Cisco IP Communicator 2.0 and later versions. Remote teleworker phone—Teleworkers can connect remote phones over a WAN and be directly supported by Cisco Unified CME.	
	Ring Tones	Distinctive ringing —An extension's ring patterns can be set to distinguish among internal, external, and feature calls.	Ringtones, on page 893
	Security	Cisco Unified CME phone authentication is a security infrastructure for providing secure Skinny Client Control Protocol (SCCP) signaling between Cisco Unified CME and IP phones.	Security, on page 575
	Softkeys		Customize Softkeys, on page 919

Version	Feature Name	Feature Description	Where Documented
		Feature blocking—The features associated with the following softkeys can be individually blocked per ephone: CFwdAll, Confrn, GpickUp, Park, PickUp, and Transfer. The softkey is not removed, but it does not function. Softkey control for hold state—The softkeys that are available while a call is on hold can be modified. The NewCall and Resume softkeys are normally available when a phone has a call on hold, but a template can be applied to the phone to remove these softkeys.	
	Speed Dial	Bulk-loading of speed-dial numbers—Text files with lists of speed-dial numbers can be loaded into system flash or a URL. The files can hold up to 10,000 numbers and can be applied to all ephones or to specific ephones.	Speed Dial, on page 957

Version	Feature Name	Feature Description	Where Documented
	System-Level Parameters	Disabling automatic phone registration—Normally, Cisco Unified CME allocates an ephone slot to any ephone that connects to the system. To prevent unauthorized registrations, the no auto-reg-ephone command prevents any ephone from registering with Cisco Unified CME if its MAC address is not explicitly listed in the configuration. External storage of configuration files and per-phone configuration files—Phone configuration files can be stored on an external TFTP server to offload the TFTP server function of the Cisco Unified CME router. This additional storage space permits the use of per-phone configuration files, which can be used to specify different user locales and network locales for phones. Failover to Redundant Router—Sites can be set up with a primary and secondary Cisco Unified CME router to provide redundant Cisco Unified CME capability. Phones automatically register at the secondary router if the primary router fails and later rehome to the primary router when it is operational again.	
	Templates		Templates, on page 1423

Version	Feature Name	Feature Description	Where Documented
		Maximum number of ephone templates—The maximum number of ephone templates that can be defined has increased from 5 to 20. No special configuration is required. New commands available for ephone templates—Ephone templates were previously introduced to allow system administrators to control the display of softkeys in various call states on individual ephones. Their role has been expanded to allow you to define a set of ephone parameter values that can be assigned to one or more phones in a single step. Ephone-dn templates—Ephone-dn templates are introduced to allow administrators to easily apply sets of configured parameters to individual ephone-dns. Up to 15 ephone-dn templates can be defined.	
	Video Support		Video Support, on page 977

Version	Feature Name	Feature Description	Where Documented
		Video support for SCCP-based endpoints —This feature adds video support to allow you to pass a video stream with a voice call between video-capable SCCP endpoints and between SCCP and H.323 endpoints. Through the Cisco Unified CME router, the video-capable endpoints can communicate with each other locally to a remote H.323 endpoint through a gateway or through an H.323 network.	
	Voice Mail		Voice Mail Integration, on page 535

Version	Feature Name	Feature Description	Where Documented
		Line-selectable MWI—Previously, the message-waiting indication (MWI) lamp on a phone could only indicate when messages were waiting for the primary number on a phone. Now, any phone line can be designated during configuration. Mailbox selection policy for voice-mail servers—A policy can be set for selecting the mailbox to use for calls that are diverted one or more times within a Cisco Unified CME system before being sent to a Cisco Unity Express, Cisco Unity, or PBX voice-mail pilot number. Prefix option for SIP unsolicited MWI Notify messages—Central voice-message servers that provide mailboxes for multiple Cisco Unified CME sites may use site codes or prefixes to distinguish among similarly numbered ranges of extensions at different sites. You can specify the prefix for your site so that central mailbox numbers are correctly converted to your extension numbers.	
	XML Interface		Configure XML API, on page 1586

Version	Feature Name	Feature Description	Where Documented
		XML interface enhancements —An eXtensible Markup Language (XML) application program interface (API) is provided to supply data from Cisco Unified CME to management software. In Cisco Unified CME 4.0 and later versions, all Cisco Unified CME features have XML support.

Obtaining Documentation, Obtaining Support, and Security Guidelines

For information on obtaining documentation, obtaining support, providing documentation feedback, security guidelines, and also recommended aliases and general Cisco documents, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at: <http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html>

DISCLAIMER: The use of monitoring, recording, or listening devices to eavesdrop, monitor, retrieve, or record phone conversations or other sound activities, whether or not contemporaneous with transmission, may be illegal in certain circumstances under federal, state and/or local laws. Legal advice should be sought prior to implementing any practice that monitors or records any phone conversation. Some laws require some form of notification to all parties to a phone conversation, such as by using a beep tone or other notification method or requiring the consent of all parties to the phone conversation, prior to monitoring or recording the phone conversation. Some of these laws incorporate strict penalties. In cases where local laws require a periodic beep while a conversation is being recorded, the Cisco Unity Express voice-mail system provides a user with the option of activating “the beep.” Prior to activating the Cisco Unity Express live record function, check the laws of all applicable jurisdictions. This is not legal advice and should not take the place of obtaining legal advice from a lawyer. IN ADDITION TO THE GENERAL DISCLAIMER THAT ACCOMPANIES THIS CISCO UNITY EXPRESS PRODUCT, CISCO ADDITIONALLY DISCLAIMS ANY AND ALL LIABILITY, BOTH CIVIL AND CRIMINAL, AND ASSUMES NO RESPONSIBILITY FOR THE UNAUTHORIZED AND/OR ILLEGAL USE OF THIS CISCO UNITY EXPRESS PRODUCT. THIS DISCLAIMER OF LIABILITY INCLUDES, BUT IS NOT NECESSARILY LIMITED TO, THE UNAUTHORIZED AND/OR ILLEGAL RECORDING AND MONITORING OF TELEPHONE CONVERSATIONS IN VIOLATION OF APPLICABLE FEDERAL, STATE AND/OR LOCAL LAWS.</p>

CHAPTER 2

Cisco Unified CME Overview

- [Important Information about Cisco IOS XE 16 Denali, on page 65](#)
- [Unified CME Graphical User Interface Deprecation, on page 65](#)
- [CTI CSTA Protocol Suite Deprecation, on page 66](#)
- [Simple Network Management Protocol \(SNMP\) Support for Unified CME, on page 67](#)
- [Introduction, on page 67](#)
- [Licensing, on page 69](#)
- [PBX or Keyswitch, on page 74](#)
- [Call Detail Records, on page 76](#)
- [Additional References, on page 76](#)

Important Information about Cisco IOS XE 16 Denali

Effective Cisco IOS XE Release 3.7.0E (for Catalyst Switching) and Cisco IOS XE Release 3.17S (for Access and Edge Routing) the two releases evolve (merge) into a single version of converged release—the Cisco IOS XE 16 Denali—providing one release covering the extensive range of access and edge products in the Switching and Routing portfolio.

For migration information related to the Cisco IOS XE 16, see [Cisco IOS XE Denali 16.2 Migration Guide for Access and Edge Routers](#).

Unified CME Graphical User Interface Deprecation

From Unified CME Release 12.6 (Cisco IOS XE Gibraltar 16.11.1a Release), the Graphical User Interface (GUI) is no more supported for Unified CME. Hence, the GUI files posted under the name **cme-gui-...**, as part of the Unified CME software bundle, is not available for download for Unified CME 12.6 and later releases. We recommend that you use the Command Line Interface (CLI) commands to configure Unified CME.

Note CME GUI allows configuration of essential SIP phone features.

All the CLI commands related to Unified CME GUI deployment are disabled for Unified CME 12.6 and later releases. The following CLI commands related to Unified CME GUI are disabled:

- **web admin customer name** *username* {**password** *string* | **secret** {0 | 5} *string*}
- **web admin system** [**name** *username*] [**password** *string* | **secret** {0 | 5} *string*]
- **web customize load** *filename*
- **time-webedit**
- **dn webedit**
- **show telephony-service admin**

CTI CSTA Protocol Suite Deprecation

From Unified CME Release 12.6 (Cisco IOS XE Gibraltar 16.11.1a), the Computer Telephony Integration (CTI) Computer Supported Telecommunications Applications (CSTA) protocol suite is no more supported on Unified CME. All the CLI commands related to CTI CSTA are disabled for Unified CME 12.6 and later releases.

The following CLI commands related to CTI CSTA that are configured under **voice service voip** configuration mode is disabled on Unified CME 12.6 and later releases:

- **cti shutdown**
- **cti callmonitor**
- **cti csta mode basic**
- **cti message device-id suppress-conversion**
- **cti timeout make-call-prompt**

The following CLI commands related to CTI CSTA that are configured under **ephone-dn** and **ephone-template** configuration mode is disabled on Unified CME 12.6 and later releases:

- **cti notify**
- **cti watch**

The following CLI commands related to CTI CSTA that are configured under **voice register session-server** configuration mode are disabled on Unified CME 12.6 and later releases:

- **cti aware**

The following CLI show commands related to CTI CSTA that are configured under **show cti ?** are disabled on Unified CME 12.6 and later releases:

- **show cti call**
- **show cti gcid**
- **show cti line-node**
- **show cti session**

Simple Network Management Protocol (SNMP) Support for Unified CME

Unified CME supports Simple Network Management Protocol (SNMP) Management Information Base (MIBs) for monitoring the product status. Unified CME Release 12.6 and later is SNMP Version 3 (SNMPv3) compliant. Unified CME supports the following main SNMP MIB:

- CISCO-CCME-MIB

For information on configuration of SNMP version 3 on Unified CME router, see [SNMP Configuration Guide](#).

Introduction

Note The Cisco Unified Communications Manager Express System Administrator Guide refers to a phone with SIP firmware as SIP Phone, SIP IP Phone, or Cisco Unified SIP IP phone. A phone with SCCP firmware is referred as SCCP Phone, SCCP IP Phone, or Cisco Unified SCCP IP phone.

Note It is mandatory to configure the command **supplementary-service media-renegotiate** under **voice service voip** configuration mode to enable the supplementary features supported on Unified CME.

Note It is mandatory to configure the CLI command **call-park system application** under **telephony-service** configuration mode to support SIP and mixed mode (SIP and SCCP) features such as Call Park and Call Pick-up in Unified CME.

Note Configure the CLI commands **no supplementary-service sip refer**, **no supplementary-service sip moved-temporarily** under **voice service voip** configuration mode for call transfer and call forward scenarios in Unified CME.

Cisco Unified Communications Manager Express (formerly known as Cisco Unified CallManager Express) is a call-processing application in Cisco IOS software that enables Cisco routers to deliver key-system or hybrid PBX functionality for enterprise branch offices or small businesses.

Cisco Unified CME is a feature-rich entry-level IP telephony solution that is integrated directly into Cisco IOS software. Cisco Unified CME allows small business customers and autonomous small enterprise branch offices to deploy voice, data, and IP telephony on a single platform for small offices, thereby streamlining operations and lowering network costs.

Cisco Unified CME is ideal for customers who have data connectivity requirements and also have a need for a telephony solution in the same office. Whether offered through a service provider's managed services

offering or purchased directly by a corporation, Cisco Unified CME offers most of the core telephony features required in the small office, and also many advanced features not available with traditional telephony solutions. The ability to deliver IP telephony and data routing by using a single converged solution allows customers to optimize their operations and maintenance costs, resulting in a very cost-effective solution that meets office needs.

A Cisco Unified CME system is extremely flexible because it is modular. A Cisco Unified CME system consists of a router that serves as a gateway and one or more VLANs that connect IP phones and phone devices to the router.

[Figure 1: Cisco Unified CME for the Small- and Medium-Size Office, on page 68](#) shows a typical deployment of Cisco Unified CME with several phones and devices connected to it. The Cisco Unified CME router is connected to the public switched telephone network (PSTN). The router can also connect to a gatekeeper and a RADIUS billing server in the same network.

Figure 1: Cisco Unified CME for the Small- and Medium-Size Office

[Figure 2: Cisco Unified CME for Service Providers, on page 69](#) shows a branch office with several Cisco Unified IP phones connected to a Cisco IAD2430 series router with Cisco Unified CME. The Cisco IAD2430 router is connected to a multiservice router at a service provider office, which provides connection to the WAN and PSTN.

Figure 2: Cisco Unified CME for Service Providers

A Cisco Unified CME system uses the following basic building blocks:

- **Ephone or voice register pool**—A software concept that usually represents a physical telephone, although it is also used to represent a port that connects to a voice-mail system, and provides the ability to configure a physical phone using Cisco IOS software. Each phone can have multiple extensions associated with it and a single extension can be assigned to multiple phones. Maximum number of ephones and voice register pools supported in a Cisco Unified CME system is equal to the maximum number of physical phones that can be connected to the system.
- **Directory number**—A software concept that represents the line that connects a voice channel to a phone. A directory number represents a virtual voice port in the Cisco Unified CME system, so the maximum number of directory numbers supported in Cisco Unified CME is the maximum number of simultaneous call connections that can occur. This concept is different from the maximum number of physical lines in a traditional telephony system.

Licensing

This section provides information on licensing of Cisco Unified Communications Manager Express (Unified CME).

Cisco Smart Licensing

Cisco Smart Licensing is a software licensing model that provides visibility of ownership and usage through the Cisco Smart Software Manager (CSSM) portal. CSSM is a central license repository that manages licenses across all Cisco products that you own, including Cisco Unified Communications Manager Express (Unified CME). Devices send license usage to CSSM either directly or use an on-premises satellite. Your Smart Account Administrator controls your access to CSSM. Use your Cisco credentials to access the CSSM portal using <http://software.cisco.com>.

Smart Licensing applies to all platform technology (UCK9, Security) and Unified CME feature licenses that the router uses. Unified CME requires one license entitlement (CME_EP) for each configured SIP or SCCP phone.

CSSM shows license usage across all devices that you register to a virtual account. A Virtual Account License Inventory displays the quantity of licenses that you purchase, those licenses in use, and a balance. Alert **Insufficient Licenses** is displayed if the license balance is below 0.

For example, consider a smart account in CSSM with 50 CME_EP licenses. If you have a single registered Unified CME router with 20 configured phones, the CSSM licenses page shows **Purchased** as 50, **In Use** as 20 and **Balance** as 30.

For more information on Smart Software Manager, see the [Cisco Smart Software Manager User Guide](#).

Note The CME_EP license count includes all phones configured in the Unified CME, covering both ephones and voice register pools, regardless of their registration status. This count is updated once a phone type is configured under ephone or voice register pool configuration. To avoid unnecessary reporting while you configure Unified CME, license usage is reported three minutes after the last configuration change.

Note Unified CME Smart Licenses also provide RTU entitlement for routers that are not configured for Smart Licensing.

Smart License Operation

Cisco IOS XE Everest 16.5.1 Release to Cisco IOS XE Fuji 16.9.1 Release

Cisco 4000 Series Integrated Services Routers support Smart Licensing as an alternative to Cisco Software RTU Licensing. Use the **license smart enable** command to enable Smart Licensing. To disable Smart Licensing, use the **no** form of the command and reaccept the EULA using the **license accept end user agreement** configuration command.

Cisco IOS XE Gibraltar 16.10.1 Release Onwards

The Cisco RTU Licensing and the CLI **license smart enable** command are deprecated. Smart Licensing is mandatory from this release.

Cisco IOS XE Everest 16.5.1 Release to Cisco IOS XE Amsterdam 17.3.1a Release

Routers configured to use Smart Licensing offer a 90-day evaluation period, during which you can use all the features without registering to CSSM. A Cisco Unified Communications Manager Express device is associated with CSSM using a registration token. You can obtain the registration token from the virtual CSSM account or from an on-premises satellite. Once registered, the evaluation period pauses and you can use the balance later. You cannot renew the evaluation period on its expiry.

Warning Cisco Unified Communications Manager Express shuts down when the router is unregistered and allowed to pass into the Evaluation Expired state.

To register the Cisco Unified Communications Manager Express router with CSSM, use **license smart register idtoken** command. For information on registering the device with CSSM, see [Software Activation Configuration Guide](#).

Upon successful registration, the device sends an authorization request to CSSM for the licenses in use. For each license type requested, if the Smart Account has sufficient licenses, CSSM responds with **Authorized**. If the Smart Account does not have sufficient licenses, CSSM responds with **Out of Compliance**.

Post successful authorization of the request, licenses are bound to the requesting device until the next authorization request submission.

An authorization request is sent every 30 days or when there is any change in license consumption, to maintain the registration with CSSM. The authorization expires if you do not update the license request for the router within 90 days. The certificate issued to identify the router at the time of registration is valid for one year and renewed every six months.

The router displays the License authorization as follows:

```
Router# show license summary
Smart Licensing is ENABLED
Registration:Status: REGISTERED
Smart Account: Call-Manager-Express
Virtual Account: CME Application
Export-Controlled Functionality: Not Allowed
Last Renewal Attempt: None
Next Renewal Attempt: Oct 07 12:08:10 2016 UTC
License Authorization:
Status: AUTHORIZED
Last Communication Attempt: SUCCESS

```

Cisco IOS XE Gibraltar 16.12.1 Release to Cisco IOS XE Amsterdam 17.3.1a Release

Specific License Reservation (SLR) is supported on Cisco 4000 Series Integrated Services Routers. SLR allows reservation and utilization of Cisco Smart Licenses without communicating the license information to CSSM. To reserve specific licenses for a device, generate request code from the device. Enter the request code in CSSM along with the required licenses and their quantity, and generate authorization code. Enter the authorization code on the device to map the license to the Unique Device Identifier (UDI).

Note

If upgrading to Cisco IOS XE Amsterdam 17.3.1a with a license reservation in place, update the reservation to include version 14, rather than version 12 CME licenses. The reservation may be updated before or after the software upgrade.

Cisco IOS XE Amsterdam 17.3.2 Release Onwards

This release introduces a new paradigm for tracking license usage across your business. In earlier releases, license authorization was forward-looking, binding licenses to a device until the next authorization request. Actual license usage during the proceeding reporting period is now sent to CSSM, allowing you to plan ongoing license requirements based on historical usage data.

Initial device registration is no longer required to use most platform functionality and the evaluation period is deprecated.

License usage reports are submitted periodically according to a minimum reporting policy set for your account. Typically, this period could be once per year. However, you can generate reports more frequently if the use of licensed features varies over time. CSSM acknowledges each Resource Utilization Monitoring (RUM) report to ensure that the usage is recorded reliably. If the router does not receive an acknowledgment within the minimum reporting period, call processing is disabled. Call processing is resumed when a valid acknowledgment is received.

Reports can be submitted to CSSM directly or through a satellite. Cisco Smart Licensing Utility (CSLU) applications can also receive usage reports, providing you with more flexibility in managing your license usage. Also, when a device is not able to communicate directly with a licensing server, a signed usage report can be generated and manually uploaded to CSSM. You must upload the CSSM generated acknowledgment to the device within the license reporting policy period to ensure continued use.

As license reporting is now based on historical usage, the registration process that is used previously has been replaced with a trust association that also defines the reporting policy set in your account. Establishing trust with CSSM or Cisco Smart Software Manager Satellite uses an identity token similar to earlier registrations. Use the **license smart trust idtoken** *token* command to establish the trust relationship within the initial reporting period set for the device. The CLI **license smart register** command is deprecated from this release.

Warning

When using any of the following releases, Unified CME shuts down if the router does not receive a report acknowledgment from CSSM before the acknowledgment deadline set by the account policy: 17.3.2, 17.3.3, 17.3.4a, 17.6.1a, or any 17.4 or 17.5 release. Unified CME does not shut down in this way with later releases.

Note

- Smart License Reservation (SLR) for Unified CME licenses is not compatible with Cisco IOS XE Amsterdam 17.3.2 and later releases. Even if a reservation is in place when upgrading to one of these releases, license use reporting is still required in accordance with the device policy.
- The enhancements that are made for Cisco IOS XE Amsterdam 17.3.2 and Cisco IOS XE Bengaluru 17.4.1a are not available for Cisco CSR 1000V.

Current license usage for Cisco Unified Communications Manager Express is displayed using the **show license summary** command:

```
Router(config)#do sh license summary
License Usage:
License           Entitlement tag           Count Status
appxk9            (ISR_4400_Application)    1 IN USE
uck9              (ISR_4400_UnifiedCommun...) 1 IN USE
securityk9        (ISR_4400_Security)       1 IN USE
CME_EP            (CME_EP)                  2 IN USE
```

Cisco Unified Border Element (CUBE) session licenses are required along with CME license specifically for SIP trunking flows.

The following are the SIP trunk call flow examples that trigger CUBE session license reporting:

- SIP/SCCP Unified CME registered IP phones making calls through a SIP dial-peer towards another Unified CME.
- SIP/SCCP Unified CME registered IP phones making calls through a SIP dial-peer towards a CUCM.

- SIP/SCCP Unified CME registered IP phones making calls through a SIP dial-peer towards a third-party IP PBX.
- SIP/SCCP Unified CME registered IP phones making calls through a SIP dial-peer towards a SIP ITSP.

Note For purchasing CUBE license subscriptions, see [Cisco Ordering Guide](#).

Use the **show voice sip license stats** command to verify the CUBE license usage status and license usage history:

The following example outputs are truncated to display 60-second and 60-minute tables only. Usage is recorded based on the peak value of concurrent calls for a defined interval of time.

Router# **show voice sip license stats table**

02:50:16 PM Wednesday Nov 13 2019 UTC

CUBE Trunk License Usage (last 60 seconds)		
Period	Average	Max
1-5	0	0
6-10	0	0
11-15	0	0
16-20	0	0
21-25	0	0
26-30	0	0
31-35	0	0
36-40	0	0
41-45	0	0
46-50	0	0
51-55	0	0

36-40	0	0
41-45	0	0
46-50	324	900
51-55	343	899
56-60	292	600

For more license usage examples, refer to [CUBE Smart Licensing](#).

PBX or Keyswitch

When setting up a Cisco Unified CME system, you need to decide if call handling should be similar to that of a PBX, similar to that of a keyswitch, or a hybrid of both. Cisco Unified CME provides significant flexibility in this area, but you must have a clear understanding of the model that you choose.

PBX Model

The simplest model is the PBX model, in which most of the IP phones in your system have a single unique extension number. Incoming PSTN calls are routed to a receptionist at an attendant console or to an automated attendant. Phone users may be in separate offices or be geographically separated and therefore often use the telephone to contact each other.

For this model, we recommend that you configure directory numbers as dual-lines so that each button that appears on an IP phone can handle two concurrent calls. The phone user toggles between calls using the blue navigation button on the phone. Dual-line directory numbers enable your configuration to support call waiting, call transfer with consultation, and three-party conferencing (G.711 only).

Figure 3: Incoming Call Using PBX Model, on page 74 shows a PSTN call that is received at the Cisco Unified CME router, which sends it to the designated receptionist or automated attendant (1), which then routes it to the requested extension (2).

Figure 3: Incoming Call Using PBX Model

For configuration information, see [Configure Phones for a PBX System, on page 264](#).

Keyswitch Model

In a keyswitch system, you can set up most of your phones to have a nearly identical configuration, in which each phone is able to answer any incoming PSTN call on any line. Phone users are generally close to each other and seldom need to use the telephone to contact each other.

For example, a 3x3 keyswitch system has three PSTN lines shared across three telephones, such that all three PSTN lines appear on each of the three telephones. This permits an incoming call on any PSTN line to be directly answered by any telephone—without the aid of a receptionist, an auto-attendant service, or the use of (expensive) DID lines. Also, the lines act as shared lines—a call can be put on hold on one phone and resumed on another phone without invoking call transfer.

In the keyswitch model, the same directory numbers are assigned to all IP phones. When an incoming call arrives, it rings all available IP phones. When multiple calls are present within the system at the same time, each individual call (ringing or waiting on hold) is visible and can be directly selected by pressing the corresponding line button on an IP phone. In this model, calls can be moved between phones simply by putting

the call on hold at one phone and selecting the call using the line button on another phone. In a keyswitch model, the dual-line option is rarely appropriate because the PSTN lines to which the directory numbers correspond do not themselves support dual-line configuration. Using the dual-line option also makes configuration of call-coverage (hunting) behaviors more complex.

You configure the keyswitch model by creating a set of directory numbers that correspond one-to-one with your PSTN lines. Then you configure your PSTN ports to route incoming calls to those ephone-dns. The maximum number of PSTN lines that you can assign in this model can be limited by the number of available buttons on your IP phones. If so, the overlay option may be useful for extending the number of lines that can be accessed by a phone.

[Figure 4: Incoming PSTN Call Using Keyswitch Model, on page 75](#) shows an incoming call from the PSTN (1), which is routed to extension 1001 on all three phones (2).

Figure 4: Incoming PSTN Call Using Keyswitch Model

For configuration information, see [Configure Phones for a Key System, on page 293](#).

Hybrid Model

PBX and keyswitch configurations can be mixed on the same IP phone and can include both unique per-phone extensions for PBX-style calling and shared lines for keyswitch-style call operations. Single-line and dual-line directory numbers can be combined on the same phone.

In the simplest keyswitch deployments, individual telephones do not have private extension numbers. Where key system telephones do have individual lines, the lines are sometimes referred to as intercoms rather than as extensions. The term “Intercom” is derived from “internal communication;” there is no assumption of the common “intercom press-to-talk” behavior of auto dial or auto answer in this context, although those options may exist.

For key systems that have individual intercom (extension) lines, PSTN calls can usually be transferred from one key system phone to another using the intercom (extension) line. When Call Transfer is invoked in the context of a connected PSTN line, the outbound consultation call is usually placed from the transferer phone to the transfer-to phone using one of the phone’s intercom (extension) line buttons. When the transferred call is connected to the transfer-to phone and the transfer is committed (the transferer hangs up), the intercom lines on both phones are normally released and the transfer-to call continues in the context of the original PSTN line button (all PSTN lines are directly available on all phones). The transferred call can be put on hold (on the PSTN line button) and then subsequently resumed from another phone that shares that PSTN line.

For example, you can design a 3x3 keyswitch system as shown in [Figure 4: Incoming PSTN Call Using Keyswitch Model, on page 75](#) and then add another, unique extension on each phone ([Figure 5: Incoming PSTN Call Using Hybrid PBX-Keyswitch Model, on page 76](#)). This setup will allow each phone to have a “private” line to use to call the other phones or to make outgoing calls.

Figure 5: Incoming PSTN Call Using Hybrid PBX-Keyswitch Model

Call Detail Records

The accounting process collects accounting data for each call leg created on the Cisco voice gateway. You can use this information for post-processing activities such as generating billing records and network analysis. Voice gateways capture accounting data in the form of call detail records (CDRs) containing attributes defined by Cisco. The gateway can send CDRs to a RADIUS server, syslog server, or to a file in .csv format for storing to flash or an FTP server. For information about generating CDRs, see [CDR Accounting for Cisco IOS Voice Gateways](#).

CHAPTER 3

Virtual CME

- [Overview, on page 79](#)
- [Prerequisites for Virtual CME, on page 79](#)
- [Protocol Support, on page 81](#)
- [Feature Support for Virtual CME, on page 81](#)
- [CLI Support on Virtual CME, on page 82](#)
- [Restrictions of Virtual CME, on page 82](#)
- [Install Virtual CME, on page 83](#)
- [Licensing Requirements, on page 83](#)
- [Enable Virtual CME, on page 84](#)
- [Example for Cisco VG300 Series Registration as SCCP Endpoint with Virtual CME, on page 85](#)
- [Feature Information for Virtual CME, on page 87](#)

Overview

The Cisco Unified Communications Manager Express (Unified CME) feature set is delivered with hardware router platforms, such as the Cisco Integrated Services Router (ISR) series. From Cisco IOS XE Gibraltar 16.10.1, a subset of Unified CME features (virtual CME) is used in virtualized environments with the Cisco CSR 1000v Series Cloud Services Router.

From Cisco IOS XE Bengaluru 17.4.1a, virtual CME is available for use with Cisco Catalyst 8000V Edge Software (Catalyst 8000V) series.

Note

When upgrading to C8000V software from a CSR1000V release, an existing throughput configuration will be reset to a maximum of 250 Mbps. Install an HSEC authorization code, which you can obtain from your Smart License account, before reconfiguring your required throughput level.

Prerequisites for Virtual CME

Virtual CME has the following prerequisites:

- [Hardware Requirements for Virtual CME, on page 80](#)
- [Software Requirements for Virtual CME, on page 81](#)

Hardware Requirements for Virtual CME

The virtual CME feature set is included with the Cisco virtual router software. For more information about the virtual CME host platform, see [Cisco CSR 1000V Series Cloud Services Router Software Configuration Guide](#) and [Cisco Catalyst 8000V Edge Software Configuration Guide](#).

As part of the Unified CME 14.1 release, virtual CME features have been verified using the following:

- VMware ESXi Hypervisor 6.5.0
- Cisco UCS Server—Cisco UCS C240 M5 (UCSC-C240-M5SX)

Note For more information on the requirements on supported hypervisors, see [CSR1000V Data Sheets](#) and [Cisco Catalyst 8000V Edge Software Data Sheet](#).

Virtual CME supports up to 450 device registrations and 113 active calls for any of the virtual machine resource profiles. The resource files can be small, medium, large, or large plus extra RAM. For more information, see the following table:

Table 3: Virtual CME Form Factor

Resource Profiles	vCPU	Memory	Cisco UCS	Hypervisor	Number of Devices Registered to Virtual CME	Number of Active Calls Supported on Virtual CME
Small	1	4	UCSC-C240-M5SX	ESXi 6.5.0	450	113
Medium	2	4				
Large	4	4				
Large plus Extra RAM	4	8				

- For information on the best practices for setting BIOS parameters for performance, see [BIOS Settings](#).
- For information on how to configure network interfaces for Unified CME, see [Mapping Cisco CSR 1000v Network Interfaces to VM Network Interfaces](#) and [Mapping the Cisco Catalyst 8000V Network Interfaces to VM Network Interfaces](#).

Software Requirements for Virtual CME

- Install the appropriate Cisco IOS image router and configure a working VoIP network. See [Install Virtual CME, on page 83](#) for more information. Cisco IOS XE Gibraltar 16.10.1a is the minimum IOS version that supports virtual CME.
- Obtain the relevant license for the router platform. See [Licensing Requirements, on page 83](#) for more information.

**Note**

Virtual CME is validated and supported only on the Cisco CSR 1000v Series Cloud Services Router.

Protocol Support

The endpoints with the following protocols are supported on virtual CME:

- SIP—All SIP endpoints that are supported on Unified CME. For information on the endpoints supported on Unified CME, see [Virtual Cisco Unified Communications Manager Express 12.5 Supported Firmware, Platforms, Memory, and Voice Products](#).
- SCCP—Only Analog Voice Gateways, such as Cisco VG310, VG320, and VG350 are supported as SCCP endpoints on virtual CME.
- Mixed Deployment (SIP and VG acting as SCCP endpoints). SCCP phones are not supported with virtual CME.

Feature Support for Virtual CME

Virtual CME supports most of the features that are supported by Unified CME. Due to the physical architecture of the router platform, the following features are not available with virtual CME:

- Hardware Conference (Due to the limitation in supporting the PVDM hardware)
- Transcoding (Due to the limitation in supporting the PVDM hardware)
- Physical Voice Ports

The following phone features are not supported by virtual CME:

- Music On Hold Groups
- cBarge
- Hold and Remote Resume with Shared Line (not supported for Analog VG endpoints)
- Multicast MOH is not supported for SIP or Analog VG endpoints.
- Live MOH is not supported for SIP or Analog VG endpoints.

Feature Support

All SIP endpoints supported by Unified CME, including the Cisco IP Phone 7800 Series and Cisco 8800 Series IP Phones, are supported by virtual CME. SCCP is only supported for use with Cisco VG 300 Series Analog Voice Gateways (VG310, VG320, and VG350) only.

For detailed feature support information on virtual CME for SIP endpoints and Cisco VG300 Series Analog Voice Gateways (SCCP), see [Cisco Unified Communications Manager Express Platform Protocol Compatibility Matrix](#).

For more information on memory and platform recommendations for virtual CME, see [Virtual Cisco Unified Communications Manager Express 12.5 Supported Firmware, Platforms, Memory, and Voice Products](#).

CLI Support on Virtual CME

Virtual CME does not support the hardware conferencing-related CLI commands available on Unified CME.

The following CLI commands cannot be configured on virtual CME:

- Within **telephony-service** configuration mode:
 - **conference hardware**
 - **fxo hook-flash**
 - Virtual CME does not support any of the **sdspfarm** related commands that are supported in Unified CME. Some of the examples are:
 - **sdspfarm units** *number*
 - **sdspfarm conference mute-on** *mute-ondigits* **mute-off** *mute-off-digits*
 - **sdspfarm tag** *number device-name*
- Within **voice register global** configuration mode:
 - **conference hardware**
- Within **ephone-dn** configuration mode:
 - **conference ad-hoc** | **meetme**
- Within global configuration mode:
 - **call-manager-fallback**

Restrictions of Virtual CME

- All caveats, restrictions, and limitations of Cisco IOS XE Gibraltar 16.12.1a are applicable to virtual CME.
- Only Unified CME features supported by Cisco IOS XE Fuji 16.9.1 (Unified CME 12.3) are available on virtual CME.

- As DSP or voice interface hardware is not available for the CSR 1000V or the CSR 8000V, related Unified CME features such as transcoding and hardware conferencing are not supported on virtual CME.
- NIM-based Analog or Digital PSTN Trunks are not supported.
- No support for colocation with CUBE.

Install Virtual CME

Use the CSR1000V or C8000V OVA application file (available from software.cisco.com) to deploy a new virtual instance directly in VMware ESXi. For details about how to perform the deployment, see [Installing the Cisco CSR 1000v in VMware ESXi Environments](#) and [Installing Catalyst 8000V in VMware ESXi Environment](#).

Note Explicit subscription of CPUs and Memory is required while deploying OVA provided by Cisco CSR 1000V or C8000V series.

Licensing Requirements

Virtual CME offers the same licensing options that are available for Unified CME.

To allow the configuration of virtual CME:

- Enable an APPX or AX license on a Cisco CSR 1000v Series Cloud Services Router.
- Enable a DNA Advantage subscription on a C8000V series.

The licensing options for virtual CME on the router platform are available under the CLI command **license boot level**:

```
Router(config)#license boot level ?
  appx      Enable appx license
  ax        Enable ax(ipb+sec+appx) license
  ipbase    Enable ipbase license
  security  Enable security license
```

For virtual CME, throughput license suitable for the number of calls and other traffic processed by the router should be selected. For information on throughput licenses, see [Changing Throughput Licenses](#).

Install Cisco Smart License for virtual CME. Cisco Smart License for virtual CME is enabled with the same entitlement tags that are assigned for Unified CME.

For more information on licensing options available for Unified CME, see [Licensing, on page 69](#).

For detailed steps about how to install Cisco CSR 1000V Licenses or C8000V series, see [Installing Cisco CSR 1000V Licenses](#) and [Cisco Catalyst 8000V Licensing](#).

Enable Virtual CME

Perform the following steps to enable virtual CME.

Before you begin

- Cisco CSR 1000v Series Cloud Services Router or C8000V series.
- Virtual CME license. See [Licensing Requirements, on page 83](#).
- Mandatory hardware and software. See [Hardware Requirements for Virtual CME, on page 80](#) and [Software Requirements for Virtual CME, on page 81](#).
- Acceptance of End User License Agreement (EULA).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **mode cme**
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router# enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode to set parameters for all supported SIP phones in virtual CME.
Step 4	mode cme Example: Router(config-register-global)# mode cme	Enables mode for provisioning SIP phones in Unified CME.
Step 5	end Example:	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Router(config-register-global)# end	

Example for Cisco VG300 Series Registration as SCCP Endpoint with Virtual CME

Cisco VG300 Series Voice Gateways support Skinny Client Control Protocol (SCCP) registration with virtual CME for Cisco IOS XE Gibraltar 16.10.1a or later releases.

The analog phone or fax machine is connected to the VG350's Foreign Exchange Station (FXS) port. The VG350 is registered to virtual CME through SCCP and communicates to the public switched telephone network (PSTN) provider through a Foreign Exchange Office (FXO) port.

Cisco VG350 Configuration

```
hostname GW-VG350
!
interface GigabitEthernet0/0
 ip address 10.8.1.10 255.255.255.0
 duplex auto

```

MAC Address Convention

After configuring the Analog Voice Gateway, enable the command **show stcapp device summary** to display the output summary with MAC address of all voice ports, as follows:

```
VCME#show stcapp device summary
Total Devices: 3
Total Calls in Progress: 0
Total Call Legs in Use: 0

Port Device Device Call Dev Directory Dev
Identifier Name State State Type Number Cntl
-----
0/0/0 AN6549AEBB58000 IS IDLE ALG 6901 CME
0/0/1 AN6549AEBB58001 IS IDLE ALG 6902 CME
0/0/2 AN6549AEBB58002 IS IDLE ALG 6903 CME
Router_VG350#
```

The MAC address of the voice ports can be identified by removing the first three characters of the Device Name displayed in the **show stcapp device summary** output. For example, the MAC address of the device with Device Name AN6549AEBB58000 is 549A.EBB5.8000.

```
VCME#show run | sec ephone
ephone 1
mac-address 549A.EBB5.8000

```

Feature Information for Virtual CME

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

Table 4: Feature Information for Virtual CME

Feature Name	Unified CME Version	Modification
Virtual CME	14.1	Support introduced for Virtual CME on C8000V series.
Virtual CME	12.5	Support introduced for Virtual CME on Cisco CSR 1000v Series Cloud Services Router.

CHAPTER 4

Before You Begin

- [Prerequisites for Configuring Cisco Unified CME, on page 89](#)
- [Restrictions for Configuring Cisco Unified CME, on page 90](#)
- [Information About Planning Your Configuration, on page 90](#)
- [Cisco Unified CME Workflow, on page 93](#)
- [Install Cisco Voice Services Hardware, on page 97](#)
- [Install Cisco IOS Software, on page 99](#)
- [Configure VLANs on a Cisco Switch, on page 100](#)
- [Using Cisco IOS Commands, on page 105](#)
- [Voice Bundles, on page 106](#)

Prerequisites for Configuring Cisco Unified CME

- Base Cisco Unified CME feature license and phone user licenses that entitle you to use Cisco Unified CME are purchased.

Note

To support H.323 call transfers and forwards to network devices that do not support the H.450 standard, such as Cisco Unified Communications Manager, a tandem gateway is required in the network. The tandem gateway must be running Cisco IOS release 12.3(7)T or a later release and requires the Integrated Voice and Video Services feature license (FL-GK-NEW-xxx), which includes H.323 gatekeeper, IP-to-IP gateway, and H.450 tandem functionality.

- Your IP network is operational and you can access Cisco web.
- You have a valid Cisco.com account.
- You have access to a TFTP server for downloading files.
- Cisco router with all recommended services hardware for Cisco Unified CME is installed. For installation information, see [Install Cisco Voice Services Hardware, on page 97](#).
- Recommended Cisco IOS IP Voice or higher image is downloaded to flash memory in the router.
 - To determine which Cisco IOS software release supports the recommended Cisco Unified CME version, see [Cisco Unified CME and Cisco IOS Software Compatibility Matrix](#).

- For a list of features for each Cisco IOS Software release, see [Feature Navigator](#).
- For installation information, see [Install Cisco IOS Software, on page 99](#).
- VoIP networking must be operational. For quality and security purposes, we recommend separate virtual LANs (VLANs) for data and voice. The IP network assigned to each VLAN should be large enough to support addresses for all nodes on that VLAN. Cisco Unified CME phones receive their IP addresses from the voice network, whereas all other nodes such as PCs, servers, and printers receive their IP addresses from the data network. For configuration information, see [Configure VLANs on a Cisco Switch, on page 100](#).

Restrictions for Configuring Cisco Unified CME

- Cisco Unified CME cannot register as a member of a Cisco Unified Communications Manager cluster.
- For conferencing and music on hold (MOH) support with G.729, hardware digital signal processors (DSPs) are required for transcoding G.729 between G.711.
- After a three-way conference is established, a participant cannot use call transfer to join the remaining conference participants to a different number.
- Cisco Unified CME does not support the following:
 - CiscoWorks IP Telephony Environment Monitor (ITEM)
 - Element Management System (EMS) integration
 - Media Gateway Control Protocol (MGCP) on-net calls
 - Java Telephony Application Programming Interface (JTAPI) applications, such as the Cisco IP Softphone, Cisco Unified Communications Manager Auto Attendant, or Cisco Personal Assistant
 - Telephony Application Programming Interface (TAPI)

Cisco Unified CME implements only a small subset of TAPI functionality. It supports operation of multiple independent clients (for example, one client per phone line), but not full support for multiple-user or multiple-call handling, which is required for complex features such as automatic call distribution (ACD) and Cisco Unified Contact Center (formerly Cisco IPCC). Also, this TAPI version does not have direct media and voice-handling capabilities.
- Co-location of CME and CUBE or LGW on the same device.

Information About Planning Your Configuration

System Design

Traditional telephony systems are based on physical connections and are therefore limited in the types of phone services that they can offer. Because phone configurations and directory numbers in a Cisco Unified CME system are software entities and because the audio stream is packet-based, an almost limitless number of combinations of phone numbers, lines, and phones can be planned and implemented.

Cisco Unified CME systems can be designed in many ways. The key is to determine the total number of simultaneous calls you want to handle at your site and at each phone at your site, and how many different directory numbers and phones you want to have. Even a Cisco Unified CME system has its limits, however. Consider the following factors in your system design:

- Maximum number of phones—This number corresponds to the maximum number of devices that can be attached. The maximum is platform- and version-dependent. To find the maximum for your platform and version, see [Cisco CME Supported Firmware, Platforms, Memory, and Voice Products](#).
- Maximum number of directory numbers—This number corresponds to the maximum number of simultaneous call connections that can occur. The maximum is platform- and version-dependent. To find the maximum for your platform and version, see [Cisco CME Supported Firmware, Platforms, Memory, and Voice Products](#).
- Telephone number scheme—Your numbering plan may restrict the range of telephone numbers or extension numbers that you can use. For example, if you have DID, the PSTN may assign you a certain series of numbers.
- Maximum number of buttons per phone—You may be limited by the number of buttons and phones that your site can use. For example, you may have two people with six-button phones to answer 20 different telephone numbers.

The flexibility of a Cisco Unified CME system is due largely to the different types of directory numbers (DNs) that you can assign to phones in your system. By understanding types of DNs and considering how they can be combined, you can create the complete call coverage that your business requires. For more information about DNs, see [Configuring Phones to Make Basic Calls, on page 229](#).

After setting up the DNs and phones that you need, you can add optional Cisco Unified CME features to create a telephony environment that enhances your business objectives. Cisco Unified CME systems are able to integrate with the PSTN and with your business requirements to allow you to continue using your existing number plans, dialing schemes, and call coverage patterns.

When creating number plans, dialing schemes, and call coverage patterns in Cisco Unified CME, there are several factors that you must consider:

- Is there an existing PBX or Key System that you are replacing and want to emulate?
- Number of phones and phone users to be supported?
- Do you want to use single-line or dual-line DNs?
- What protocols does your voice network support?
- Which call transfer and forwarding methods must be supported?
- What existing or preferred billing method do you want to use for transferred and forwarded calls?
- Do you need to optimize network bandwidth or minimize voice delay?

Because these factors can limit your choices for some of the configuration decisions that you will make when you create of a dialing plan, see the [Cisco Unified Communications Manager Express Solution Reference Network Design Guide](#) to help you understand the effect these factors have on your Cisco Unified CME implementation.

Toll Fraud Prevention

When a Cisco router platform is installed with a voice-capable Cisco IOS software image, appropriate features must be enabled on the platform to prevent potential toll fraud exploitation by unauthorized users. Deploy these features on all Cisco router Unified Communications applications that process voice calls, such as Cisco Unified Communications Manager Express (Cisco Unified CME), Cisco Survivable Remote Site Telephony (Cisco Unified SRST), Cisco Unified Border Element, Cisco IOS-based router and standalone analog and digital PBX and public-switched telephone network (PSTN) gateways, and Cisco contact-center VoiceXML gateways. These features include, but are not limited to, the following:

- **Disable secondary dial tone on voice ports**—By default, secondary dial tone is presented on voice ports on Cisco router gateways. Use private line automatic ringdown (PLAR) for foreign exchange office (FXO) ports and direct-inward-dial (DID) for T1/E1 ports to prevent secondary dial tone from being presented to inbound callers.
- **Cisco router access control lists (ACLs)**—Define ACLs to allow only explicitly valid sources of calls to the router or gateway, and therefore to prevent unauthorized Session Initiation Protocol (SIP) or H.323 calls from unknown parties to be processed and connected by the router or gateway.
- **Close unused SIP and H.323 ports**—If either the SIP or H.323 protocol is not used in your deployment, close the associated protocol ports. If a Cisco voice gateway has dial peers configured to route calls outbound to the PSTN using either time division multiplex (TDM) trunks or IP, close the unused H.323 or SIP ports so that calls from unauthorized endpoints cannot connect calls. If the protocols are used and the ports must remain open, use ACLs to limit access to legitimate sources.
- **Change SIP port 5060**—If SIP is actively used, consider changing the port to something other than well-known port 5060.
- **SIP registration**—If SIP registration is available on SIP trunks, turn on this feature because it provides an extra level of authentication and validation that only legitimate sources can connect calls. If it is not available, ensure that the appropriate ACLs are in place.
- **SIP Digest Authentication**—If the SIP Digest Authentication feature is available for either registrations or invites, turn this feature on because it provides an extra level of authentication and validation that only legitimate sources can connect calls.
- **Explicit incoming and outgoing dial peers**—Use explicit dial peers to control the types and parameters of calls allowed by the router, especially in IP-to-IP connections used on Cisco Unified CME, Cisco Unified SRST, and Cisco Unified Border Element. Incoming dial peers offer additional control on the sources of calls, and outgoing dial peers on the destinations. Incoming dial peers are always used for calls. If a dial peer is not explicitly defined, the implicit dial peer 0 is used to allow all calls.
- **Explicit destination patterns**—Use dial peers with more granularity than .T for destination patterns to block disallowed off-net call destinations. Use class of restriction (COR) on dial peers with specific destination patterns to allow even more granular control of calls to different destinations on the PSTN.
- **Translation rules**—Use translation rules to manipulate dialed digits before calls connect to the PSTN to provide better control over who may dial PSTN destinations. Legitimate users dial an access code and an augmented number for PSTN for certain PSTN (for example, international) locations.
- **Tcl and VoiceXML scripts**—Attach a Tcl/VoiceXML script to dial peers to do database lookups or additional off-router authorization checks to allow or deny call flows based on origination or destination numbers. Tcl/VoiceXML scripts can also be used to add a prefix to inbound DID calls. If the prefix plus DID matches internal extensions, then the call is completed. Otherwise, a prompt can be played to the caller that an invalid number has been dialed.

- Host name validation—Use the “permit hostname” feature to validate initial SIP Invites that contain a fully qualified domain name (FQDN) host name in the Request Uniform Resource identifier (Request URI) against a configured list of legitimate source hostnames.
- Dynamic Domain Name Service (DNS)—If you are using DNS as the “session target” on dial peers, the actual IP address destination of call connections can vary from one call to the next. Use voice source groups and ACLs to restrict the valid address ranges expected in DNS responses (which are used subsequently for call setup destinations).

For more configuration guidance, see [Cisco IOS Unified Communications Toll Fraud Prevention](#) and [Configure Toll Fraud Prevention](#), on page 525.

Cisco Unified CME Workflow

[Table 5: Workflow for Creating or Modifying Basic Telephony Configuration](#), on page 93 lists the tasks for installing and configuring Cisco Unified CME and for modifying the configuration, in the order in which the tasks are to be performed and including links to modules in this guide that support each task.

Note Not all tasks are required for all Cisco Unified CME systems, depending on software version and on whether it is a new Cisco Unified CME, an existing Cisco router that is being upgraded to support Cisco Unified CME, or an existing Cisco Unified CME that is being upgraded or modified for new features or to add or remove phones.

Table 5: Workflow for Creating or Modifying Basic Telephony Configuration

Task	Cisco Unified CME Configuration		
	New	Modify	Documentation
Install Cisco router and all recommended services hardware for Cisco Unified CME.	Required	Optional	Install Cisco Voice Services Hardware , on page 97
Download recommended Cisco IOS IP Voice or higher image to flash memory in the router.	Optional	Optional	Install Cisco IOS Software , on page 99
Download recommended Cisco Unified CME software including phone firmware.	Optional	Optional	Install and Upgrade Cisco Unified CME Software , on page 109
Configure separate virtual LANs (VLANs) for data and voice on the port switch.	Required	—	Network Assistant , on page 100 or Cisco IOS Commands , on page 101 or Internal Cisco Ethernet Switching Module , on page 104

Task	Cisco Unified CME Configuration		
	New	Modify	Documentation
• Enable calls in your VoIP network. • Define DHCP. • Set Network Time Protocol (NTP). • Configure DTMF Relay for H.323 networks in multisite installations. • Configure SIP trunk support. • Change the TFTP address on a DHCP server • Enable OOD-R.	Required	Optional	Network Parameters, on page 129
• Configure Bulk Registration. • Set up Cisco Unified CME. • Set date and time parameters. • Block Automatic Registration. • Define alternate location and type of configuration files. • Change defaults for Time Outs. • Configure a redundant router.	Required	Optional	System-Level Parameters, on page 155

Task	Cisco Unified CME Configuration		
	New	Modify	Documentation
• Create directory numbers and assigning directory numbers to phones. • Create phone configurations using Extension Assigner. • Generate configuration files for phones. • Reset or restart phones.	Required	Optional	Configure Phones to Make Basic Call, on page 327
Connect to PSTN.	Required	—	Dial Plans, on page 455
Install system- and user-defined files for localization of phones.	Optional	Optional	Localization Support, on page 419

Table 6: Workflow for Adding Features in Cisco Unified CME, on page 95 contains a list of tasks for adding commonly configured features in Cisco Unified CME and the module in which they appear in this guide. For a detailed list of features, with links to corresponding information in this guide, see [Cisco Unified CME Features Roadmap, on page 1](#).

Table 6: Workflow for Adding Features in Cisco Unified CME

Task	Documentation
Configure transcoding to support conferencing, call transferring and forwarding, MOH, and Cisco Unity Express.	Transcoding Resources, on page 483
Configure support for voice mail.	Voice Mail Integration, on page 535
Configure interoperability with Cisco Unified CCX.	Interoperability with Cisco Unified CCX, on page 1489
Configure authentication support.	Security, on page 575

Task	Documentation
Add features. • Call Blocking • Call-Coverage Features, including: • Call Hunt • Call Pickup • Call Waiting • Callback Busy Subscriber • Hunt Groups • Night Service • Overlaid Ephone-dns • Call Park • Call Transfer and Forwarding • Caller ID Blocking • Conferencing • Intercom Lines • Music on Hold (MOH) • Paging	• Automatic Line Selection, on page 1029 • Call Blocking, on page 1049 • Call Coverage Features, on page 1223 • Call Park, on page 1069 • Call Transfer and Forward, on page 1133 • Caller ID Blocking, on page 1353 • Conferencing, on page 1359 • Directory Services, on page 657 • Do Not Disturb, on page 677 • Extension Mobility, on page 723 • Feature Access Codes, on page 751 • Headset Auto Answer, on page 769 • Intercom Lines, on page 775 • Loopback Call Routing, on page 789 • Music on Hold, on page 823 • Paging, on page 851 • Presence Service, on page 869 • Ringtones, on page 893 • Customize Softkeys, on page 919 • Speed Dial, on page 957
Configure phone options, including: • Customized Background Images for Cisco Unified IP Phone 7970 • Fixed Line/Feature Buttons for Cisco Unified IP Phone 7931G • Header Bar Display • PC Port Disable • Phone Labels • Programmable vendorConfig Parameters • System Message Display • URL Provisioning for Feature Buttons	Modify Cisco Unified IP Phone Options, on page 1433

Task	Documentation
Configure video support.	Video Support, on page 977
Configure Cisco Unified CME as SRST Fallback.	SRST Fallback Mode, on page 1513

Install Cisco Voice Services Hardware

Note Cisco routers are normally shipped with Cisco voice services hardware and other optional equipment that you ordered already installed. In the event that the hardware is not installed or you are upgrading your existing Cisco router to support Cisco Unified CME or Cisco Unity Express, you will be required to install hardware components.

Voice bundles do not include all the necessary components for Cisco Unity Express. Contact the Cisco IP Communications Express partner in your area for more information about including Cisco Unity Express in your configuration.

Before you begin

- Cisco router and all recommended hardware for Cisco Unified CME, and if required, Cisco Unity Express, is ordered and delivered, or is already onsite.

Procedure

- Step 1** Install the Cisco router on your network. To find installation instructions for the Cisco router, access documents located at www.cisco.com>**Technical Support & Documentation**>**Product Support**>**Routers**>*router you are using*>**Install and Upgrade Guides**.
- Step 2** Install Cisco voice services hardware.
- To find installation instructions for any Cisco interface card, access documents located at www.cisco.com>**Technical Support & Documentation**>**Product Support**>**Cisco Interfaces and Modules**>*interface you are using*>**Install and Upgrade Guides** or Documentation Roadmap.
 - To install and configure your Catalyst switch, see [Cisco Network Assistant](#).
 - To find installation instructions for any Cisco EtherSwitch module, access documents located at www.cisco.com>**Technical Support & Documentation**>**Product Support**>**Cisco Switches**>*switch you are using*>**Install and Upgrade Guides**.
- Step 3** Connect to the Cisco router using a terminal or PC with terminal emulation. Attach a terminal or PC running terminal emulation to the console port of the router.
- Use the following terminal settings:
- 9600 baud rate
 - No parity
 - 8 data bits

- 1 stop bit
- No flow control

Note

Memory recommendations and maximum numbers of Cisco IP phones identified in the next step are for common Cisco Unified CME configurations only. Systems with large numbers of phones and complex configurations may not work on all platforms and can require additional memory or a higher performance platform.

- Step 4** Log in to the router and use the **show version** EXEC command or the **show flash** privileged EXEC command to check the amount of memory installed in the router. Look for the following lines after issuing the **show version** command.

Example:

```
Router> show version...
Cisco 2691 (R7000) processor (revision 0.1) with 177152K/19456K bytes of memory
...
31360K bytes of ATA System Compactflash (Read/Write)
```

The first line indicates how much Dynamic RAM (DRAM) and Packet memory is installed in your router. Some platforms use a fraction of their DRAM as Packet memory. The memory requirements take this into account, so you have to add both numbers to find the amount of DRAM available on your router (from a memory requirement point of view).

The second line identifies the amount of flash memory installed in your router.

or

Look for the following line after issuing the **show flash** command. Add the number available to the number used to determine the total flash memory installed in the Cisco router.

```
Router# show flash
...
2252800 bytes available, (29679616 bytes used]
```

- Step 5** Identify DRAM and flash memory requirements for the Cisco Unified CME version and Cisco router model you are using. To find Cisco Unified CME specifications, see the appropriate [Cisco Unified CME Supported Firmware, Platforms, Memory, and Voice Products](#).
- Step 6** Compare the amount of memory required to the amount of memory installed in the router. To install or upgrade the system memory in the router, access documents located at www.cisco.com>**Technical Support & Documentation**>**Product Support**>**Routers**>*router you are using*>**Install and Upgrade Guides**.
- Step 7** Use the **memory-size iomem** *i/o memory-percentage* privileged EXEC command to disable Smartinit and allocate ten percent of the total memory to Input/Output (I/O) memory.

Example:

```
Router# memory-size iomem 10
```

Install Cisco IOS Software

Note

The Cisco router in a voice bundle is preloaded with the recommended Cisco IOS software release and feature set plus the necessary Cisco Unified CME phone firmware files to support Cisco Unified CME and Cisco Unity Express. If the recommended software is not installed or if you are upgrading an existing Cisco router to support Cisco Unified CME and Cisco Unity Express, you will be required to download and extract the required image and files.

To verify that the recommended software is installed on the Cisco router and if required, download and install a Cisco IOS Voice or higher image, perform the following steps.

Before you begin

- The Cisco router is installed including sufficient memory, all Cisco voice services hardware, and other optional hardware.

Procedure

- Step 1** Identify which Cisco IOS software release is installed on router. Log in to the router and use the **show version EXEC** command.
- Step 2** Compare the Cisco IOS release installed on the Cisco router to the information in the [Cisco Unified CME and Cisco IOS Software Version Compatibility Matrix](#) to determine whether the Cisco IOS release supports the recommended Cisco Unified CME.
- Step 3** If required, download and extract the recommended Cisco IOS IP Voice or higher image to flash memory in the router.
- To find software installation information, access information located at [www.cisco.com>Technical Support & Documentation>Product Support> Cisco IOS Software>Cisco IOS Software Mainline release you are using>Configuration Guides> Cisco IOS Configuration Fundamentals and Network Management Configuration Guide>Part 2: File Management>Locating and Maintaining System Images](#).
- Step 4** To reload the Cisco Unified CME router with the new software after replacing or upgrading the Cisco IOS release, use the **reload** privileged EXEC command.

Example:

```
Router# reload
System configuration has been modified. Save [yes/no]:
Y
Building configuration...
OK
Proceed with reload? Confirm.
11w2d: %Sys-5-RELOAD: Reload requested by console. Reload reason: reload command . System bootstrap,
System Version 12.2(8r)T, RELEASE SOFTWARE (fc1)
```

```
...  
Press RETURN to get started.  
...  
Router>
```

What to do next

- If you installed a new Cisco IOS software release on the Cisco router, download and extract the compatible Cisco Unified CME version. See [Install and Upgrade Cisco Unified CME Software, on page 109](#).
- If you are installing a new stand-alone Cisco Unified CME system, see [Configure VLANs on a Cisco Switch, on page 100](#).

Configure VLANs on a Cisco Switch

To configure two Virtual Local Area Networks (VLANs), one for voice and one for data, on a Cisco Catalyst switch or an internal Cisco NM, HWIC, or Fast Ethernet switching module, perform only *one* of the following tasks.

- [Network Assistant, on page 100](#)
- [Cisco IOS Commands, on page 101](#)
- [Internal Cisco Ethernet Switching Module, on page 104](#)

Network Assistant

To configure two Virtual Local Area Networks (VLANs), one for voice and one for data, on an external Cisco Catalyst switch and to implement Cisco Quality-of-Service (QoS) policies on your network, perform the following steps.

Before you begin

- The Cisco router is installed including sufficient memory, all Cisco voice services hardware and other optional hardware.
- The recommended Cisco IOS release and feature set plus the necessary Cisco Unified CME phone firmware files are installed.
- Determine if you can use the Cisco Network Assistant to configure VLANs on the switch for your Cisco Unified CME router, see *Devices Supported* in the appropriate [Release Notes for Cisco Network Assistant](#).

Note A PC connected to the Cisco Unified CME router over the LAN is required to download, install, and run Cisco Network Assistant.

- If you want to use Cisco Network Assistant to configure VLANs on the Cisco Catalyst switch, verify that the PC on which you want to install and run Cisco Network Assistant meets the minimum hardware

and operating system requirements. See *Installing, Launching, and Connecting Network Assistant* in [Getting Started with Cisco Network Assistant](#).

- An RJ-45-to-RJ-45 rollover cable and the appropriate adapter (both supplied with the switch) connecting the RJ-45 console port of the switch to a management station or modem is required to manage a Cisco Catalyst switch through the management console.

Procedure

-
- Step 1** Install, launch, and connect Cisco Network Assistant. For instructions, see *Installing, Launching, and Connecting Network Assistant* in [Getting Started with Cisco Network Assistant](#).
- Step 2** Use Cisco Network Assistant to perform the following tasks. See online Help for additional information and procedures.
- Enable two VLANs on the switch port.
 - Configure a trunk between the Cisco Unified CME router and the switch.
 - Configure Cisco IOS Quality-of-Service (QoS).
-

Cisco IOS Commands

To configure two Virtual Local Area Networks (VLANs), one for voice and one for data, a trunk between the Cisco Unified CME router and the switch, and Cisco IOS Quality-of-Service (QoS) on an external Cisco Catalyst switch, perform the following steps.

Before you begin

- The Cisco router is installed including sufficient memory, all Cisco voice services hardware and other optional hardware.
- The recommended Cisco IOS release and feature set plus the necessary Cisco Unified CME phone firmware files are installed.
- An RJ-45-to-RJ-45 rollover cable and the appropriate adapter (both supplied with the switch) connecting the RJ-45 console port of the switch to a management station or modem is required to manage a Cisco Catalyst switch through the management console.

SUMMARY STEPS

1. **enable**
2. **vlan database**
3. **vlan** *vlan-number* **name** *vlan-name*
4. **vlan** *vlan-number* **name** *vlan-name*
5. **exit**
6. **wr**
7. **configure terminal**
8. **macro global apply cisco-global**

9. **interface** *slot-number / port-number*
10. **macro apply cisco-phone** *\$AVID number \$VVID number*
11. **interface** *slot-number / port-number*
12. **macro apply cisco-router** *\$NVID number*
13. **end**
14. **wr**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	vlan database Example: Switch# vlan database	Enters VLAN configuration mode.
Step 3	vlan <i>vlan-number</i> name <i>vlan-name</i> Example: Switch(vlan)# vlan 10 name data VLAN 10 modified Name: DATA	Specifies the number and name of the VLAN being configured. <i>vlan-number</i>—Unique value that you assign to the dial-peer being configured. Range: 2 to 1004. <i>name</i>—Name of the VLAN to associate to the <i>vlan-number</i> being configured.
Step 4	vlan <i>vlan-number</i> name <i>vlan-name</i> Example: Switch(vlan)# vlan 100 name voice VLAN 100 modified Name: VOICE	Specifies the number and name of the VLAN being configured.
Step 5	exit Example: Switch(vlan)# exit	Exits this configuration mode.
Step 6	wr Example: Switch# wr	Writes the modifications to the configuration file.
Step 7	configure terminal Example: Switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 8	macro global apply cisco-global Example: Switch (config)# macro global apply cisco-global	Applies the Smartports global configuration macro for QoS.
Step 9	interface slot-number / port-number Example: Switch (config)# interface fastEthernet 0/1	Specifies interface to be configured while in the interface configuration mode. • <i>slot-number/port-number</i>—Slot and port of interface to which Cisco IP phones or PCs are connected. Note The slash must be entered between the slot and port numbers.
Step 10	macro apply cisco-phone \$AVID number \$VVID number Example: Switch (config-if)# macro apply cisco-phone \$AVID 10 \$VVID 100	Applies VLAN and QoS settings in Smartports macro to the port being configured. • \$AVID number—Data VLAN configured in earlier step. • \$VVID number—Voice VLAN configured in earlier step.
Step 11	interface slot-number / port-number Example: Switch (config-if)# interface fastEthernet 0/24	Specifies interface to be configured while in the interface configuration mode. • <i>slot-number/port-number</i>—Slot and port of interface to which the Cisco router is connected. Note The slash must be entered between the slot and port numbers.
Step 12	macro apply cisco-router \$NVID number Example: Switch (config-if)# macro apply cisco-router \$NVID 10	Applies the VLAN and QoS settings in Smartports macro to the port being configured. • \$NVID number—Data VLAN configured in earlier step.
Step 13	end Example: Switch(config-if)# end	Exits to privileged EXEC configuration mode.
Step 14	wr Example: Switch# wr	Writes the modifications to the configuration file.

What to do next

See [Using Cisco IOS Commands](#), on page 105.

Internal Cisco Ethernet Switching Module

To configure two Virtual Local Area Networks (VLANs), one for voice and one for data, on an internal Cisco Ethernet switching module, perform the following steps.

Before you begin

- The Cisco router is installed including sufficient memory, all Cisco voice services hardware and other optional hardware.
- The recommended Cisco IOS release and feature set plus the necessary Cisco Unified CME phone firmware files are installed.
- The switch is in privileged EXEC mode.

SUMMARY STEPS

1. **enable**
2. **vlan database**
3. **vlan** *vlan-number* **name** *vlan-name*
4. **vlan** *vlan-number* **name** *vlan-name*
5. **exit**
6. **wr**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	vlan database Example: Switch# vlan database	Enters VLAN configuration mode.
Step 3	vlan <i>vlan-number</i> name <i>vlan-name</i> Example: Switch(vlan)# vlan 10 name data VLAN 10 modified Name: DATA	Specifies the number and name of the VLAN being configured. • <i>vlan-number</i>—Unique value that you assign to dial-peer being configured. Range: 2 to 1004. • <i>name</i>—Name of the VLAN to associate to the <i>vlan-number</i> being configured.
Step 4	vlan <i>vlan-number</i> name <i>vlan-name</i> Example:	Specifies the number and name of the VLAN being configured.

	Command or Action	Purpose
	Switch(vlan)# vlan 100 name voice VLAN 100 modified Name: VOICE	
Step 5	exit Example: Switch(vlan)# exit	Exits this configuration mode.
Step 6	wr Example: Switch# wr	Writes the modifications to the configuration file.

What to do next

See [Using Cisco IOS Commands, on page 105](#).

Using Cisco IOS Commands

Prerequisites

- Hardware and software to establish a physical or virtual console connection to the Cisco router using a terminal or PC running terminal emulation is available and operational.
- Connect to the Cisco router using a terminal or PC with terminal emulation. Attach a terminal or PC running terminal emulation to the console port of the router.

For connecting to the router to be configured, use the following terminal settings:

- 9600 baud rate
- No parity
- 8 data bits
- 1 stop bit
- No flow control

Your choice of configuration method depends on whether you want to create an initial configuration for your IP telephony system or you want to perform ongoing maintenance, such as routinely making additions and changes associated with employee turnover. [Table 7: Comparison of Configuration Methods for Cisco Unified CME, on page 106](#) compares the different methods for configuring Cisco Unified CME.

Table 7: Comparison of Configuration Methods for Cisco Unified CME

Configuration Method	Benefits	Restrictions
Cisco IOS command line interface	- Generates commands for running configuration which can be saved on Cisco router to be configured. - Use for setting up or modifying all parameters and features during initial configuration and ongoing maintenance.	Requires knowledge of Cisco IOS commands and Cisco Unified CME.

Voice Bundles

Voice bundles include a Cisco Integrated Services Router for secure data routing, Cisco Unified CME software and licenses to support IP telephony, Cisco IOS SP Services or Advanced IP Services software for voice gateway features, and the flexibility to add Cisco Unity Express for voice mail and auto attendant capabilities. Voice bundles are designed to meet the diverse needs of businesses worldwide. To complete the solution, add digital or analog trunk interfaces to interface to the PSTN or the host PBX, Cisco IP phones, and Cisco Catalyst data switches supporting Power-over Ethernet (PoE).

Table 8: Cisco Tools for Deploying Cisco IPC Express, on page 106 contains a list of the Cisco tools for deploying Cisco IPC Express.

Table 8: Cisco Tools for Deploying Cisco IPC Express

Tool Name	Description
Cisco Configuration Professional Express (Cisco CP Express) and Cisco Configuration Professional (Cisco CP)	Cisco CP Express is a basic router configuration tool that resides in router Flash memory. It is shipped with every device ordered with Cisco CP. Cisco CP Express allows the user to give the device a basic configuration, and allows the user to install Cisco CP for advanced configuration and monitoring capabilities. Cisco CP is the next generation advanced configuration and monitoring tool. It enables you to configure such things as router LAN and WAN interfaces, a firewall, IPsec VPN, dynamic routing, and wireless communication. Cisco CP is installed on a PC. It is available on a CD, and can also be downloaded from www.cisco.com.
Cisco Network Assistant	Cisco Network Assistant is a PC-based network management application optimized for networks of small and medium-sized businesses.
Initialization Wizard for Cisco Unity Express See <i>Configuring the System for the First Time</i> , in the appropriate Cisco Unity Express GUI Administrator Guide .	Initialization Wizard in the Cisco Unity Express GUI prompts the user for required information to configure users, voice mailboxes, and other features of voice mail and auto attendant. The wizard starts automatically the first time you log in to the Cisco Unity Express GUI.

Tool Name	Description
Router and Security Device Manager (SDM)	Cisco Router and Security Device Manager (Cisco SDM) is an intuitive, Web-based device-management tool for Cisco routers. Cisco SDM simplifies router and security configuration through smart wizards, which help customers and Cisco partners quickly and easily deploy, and configure a Cisco router without requiring knowledge of the command-line interface (CLI). Supported on Cisco 830 Series to Cisco 7301 routers, Cisco SDM is shipping on Cisco 1800 Series, Cisco 2800 Series, and Cisco 3800 Series routers pre-installed by the factory.

CHAPTER 5

Install and Upgrade Cisco Unified CME Software

- [Prerequisites for Installing Cisco Unified CME Software, on page 109](#)
- [Cisco Unified CME Software, on page 109](#)
- [Install and Upgrade Cisco Unified CME Software, on page 113](#)

Prerequisites for Installing Cisco Unified CME Software

Hardware

- Your IP network is operational and you can access Cisco web.
- You have a valid Cisco.com account.
- You have access to a TFTP server for downloading files.
- Cisco router and all recommended services hardware for Cisco Unified CME is installed. For installation information, see [Install Cisco Voice Services Hardware, on page 97](#).

Cisco IOS Software

- Recommended Cisco IOS IP Voice or higher image is downloaded to flash memory in the router. To determine which Cisco IOS software release supports the recommended Cisco Unified CME version, see [Cisco Unified CME and Cisco IOS Software Compatibility Matrix](#). For installation information, see [Install Cisco IOS Software, on page 99](#).

Cisco Unified CME Software

This section contains a list of the types of files that must be downloaded and installed in the router flash memory to use with Cisco Unified CME. The files listed in this section are included in zipped or tar archives that are downloaded from the Cisco Unified CME software download website at <https://software.cisco.com/download/home/277641082>.

Basic Files

A tar archive contains the basic files you need for Cisco Unified CME. Be sure to download the correct version for the Cisco IOS software release that is running on your router. The basic tar archive generally also contains the phone firmware files that you require, although you may occasionally need to download individual phone firmware files. For information about installing Cisco Unified CME, see [Install Cisco Unified CME Software, on page 113](#).

Phone Firmware Files

Phone firmware files provide code to enable phone displays and operations. These files are specialized for each phone type and protocol, SIP or SCCP, and are periodically revised. You must be sure to have the appropriate phone firmware files for the types of phones, protocol being used, and Cisco Unified CME version at your site.

New IP phones are shipped from Cisco with a default manufacturing SCCP image. When a IP phone downloads its configuration profile, the phone compares the phone firmware mentioned in the configuration profile with the firmware already installed on the phone. If the firmware version differs from the one that is currently loaded on the phone, the phone contacts the TFTP server to upgrade to the new phone firmware and downloads the new firmware before registering with Cisco Unified CME.

Generally, phone firmware files are included in the Cisco Unified CME software archive that you download. They can also be posted on the software download website as individual files or archives.

Early versions of Cisco phone firmware for SCCP and SIP IP phones had filenames as follows:

- SCCP firmware—P003xxyy.bin
- SIP firmware—P0S3xxyy.bin

In both bases, x represents the major version, and y represented the minor version. The third character represents the protocol, “0” for SCCP or “S” for SIP.

In later versions, the following conventions are used:

- SCCP firmware—P003xxyyzzww, where x represents the major version, y represents the major subversion, z represents the maintenance version, and w represents the maintenance subversion.
- SIP firmware—P0S3-xx-y-zz, where x represents the major version, y represents the minor version, and z represents the subversions.
- The third character in a filename—Represents the protocol, “0” for SCCP or “S” for SIP.

There are exceptions to the general guidelines. For Cisco ATA, the filename begins with AT. For Cisco Unified IP Phone 7002, 7905, and 7912, the filename can begin with CP.

Signed and unsigned versions of phone firmware are available for certain phone types. Signed binary files support image authentication, which increases system security. We recommend signed versions if your version of Cisco Unified CME supports them. Signed binary files have .sbn file extensions, and unsigned files have .bin file extensions.

For Java-based IP phones, such as the Cisco Unified IP Phone 7911, 7941, 7941GE, 7961, 7961GE, 7970, and 7971, the firmware consists of multiple files including JAR and tone files. All of the firmware files for each phone type must be downloaded the TFTP server before they can be downloaded to the phone.

The following example shows a list of phone firmware files that are installed in flash memory for the Cisco Unified IP Phone 7911:

```
tftp-server flash:SCCP11.7-2-1-0S.loads
tftp-server flash:term06.default.loads
tftp-server flash:term11.default.loads
tftp-server flash:cvm11.7-2-0-66.sbn
tftp-server flash:jar11.7-2-0-66.sbn
tftp-server flash:dsp11.1-0-0-73.sbn
tftp-server flash:apps11.1-0-0-72.sbn
```

```
tftp-server flash:cnull.3-0-0-81.sbn
```

However, you only specify the filename for the image file when configuring Cisco Unified CME. For Java-based IP phones, the following naming conventions are used for image files:

- SCCP firmware—TERMnn.xx-y-z-ww or SCCPnn.xx-y-zz-ww, where n represents the phone type, x represents the major version, y represents the major subversion, z represents the maintenance version, and w represents the maintenance subversion.

The following example shows how to configure Cisco Unified CME so that the Cisco Unified IP Phone 7911 can download the appropriate SCCP firmware from flash memory:

```
Router(config)# telephony-service
```

```
Router(config-telephony)#load 7911 SCCP11.7-2-1-0S
```

[Table 9: Firmware-Naming Conventions, on page 111](#) contains firmware-naming convention examples, in alphabetical order:

Table 9: Firmware-Naming Conventions

SCCP Phones		SIP Phones	
Image	Version	Image	Version
P00303030300	3.3(3)	P0S3-04-4-00	4.4
P00305000200	5.0(2)	P0S3-05-2-00	5.2
P00306000100	6.0(1)	P0S3-06-0-00	6.0
SCCP41.8-0-4ES4-0-1S	8.0(4)	SIP70.8-0-3S	8.0(3)
TERM41.7-0-3-0S	7.0(3)	—	—

The phone firmware filenames for each phone type and Cisco Unified CME version are listed in the appropriate document available at [Cisco CME Supported Firmware, Platforms, Memory, and Voice Products](#).

For information about installing firmware files, see [Install Cisco Unified CME Software, on page 113](#).

For information about configuring Cisco Unified CME for upgrading between versions or converting between SCCP and SIP, see [Install and Upgrade Cisco Unified CME Software, on page 109](#).

XML Template

The file called xml.template can be copied and modified to allow or restrict specific functions to customer administrators, a class of administrative users with limited capabilities in a Unified CME system. This file is included in tar archives (cme-basic-...). To install the file, see [Install Cisco Unified CME Software, on page 113](#).

Music-on-Hold (MOH) File

An audio file named `music-on-hold.au` provides music for external callers on hold when a live feed is not used. This file is included in the tar archive with basic files (`cme-basic-...`). To install the file, see [Install Cisco Unified CME Software, on page 113](#).

Script Files

Archives containing Tcl script files are listed individually on the Cisco Unified CME software download website. For example, the file named `app-h450-transfer.2.0.0.9.zip.tar` contains a script that adds H.450 transfer and forwarding support for analog FXS ports.

The Cisco Unified CME Basic Automatic Call Distribution and Auto Attendant Service (B-ACD) requires a number of script files and audio files, which are contained in a tar archive with the name `cme-b-acd-...`. For a list of files in the archive and for more information about the files, see [Cisco CME B-ACD and TCL Call-Handling Applications](#).

For information about installing Tcl script file or an archive, see [Install Cisco Unified CME Software, on page 113](#).

Bundled TSP Archive

An archive is available at the [Cisco Unified CME software download](#) website that contains several Telephony Application Programming Interface (TAPI) Telephony Service Provider (TSP) files. These files are needed to set up individual PCs for Cisco Unified IP phone users who wish to make use of Cisco Unified CME-TAPI integration with TAPI-capable PC software. To install the files from the archive, see the installation instructions in [TAPI Developer Guide for Cisco CME/SRST](#).

File Naming Conventions

Most of the files available at the Cisco Unified CME software download website are archives that must be uncompressed before individual files can be copied to the router. In general, the following naming conventions apply to files on the Cisco Unified CME software download website:

Table 10: File Naming Conventions

<code>cme-basic-...</code>	Basic Cisco Unified CME files, including phone firmware files for a particular Cisco Unified CME version or versions.
<code>cmterm..., P00..., 7970..</code>	Phone firmware files. Note Not all firmware files to be downloaded to a phone are specified in the load command. For a list of file names to be installed in flash memory, and which file names are to be specified by using the load command, see Cisco Unified CME Supported Firmware, Platforms, Memory, and Voice Products.
<code>cme-b-acd...</code>	Files required for Cisco Unified CME B-ACD service.

Install and Upgrade Cisco Unified CME Software

Note

Customers who purchase a router bundle enabled with Cisco Unified CME will have the necessary Cisco Unified CME files installed at time of manufacture.

Install Cisco Unified CME Software

Procedure

Step 1 Go to <https://software.cisco.com/download/home/277641082>.

Step 2 Select the file to download.

Step 3 Download zip file to tftp server.

Step 4 Use the zip program to extract the file to be installed, then:

a) If the file is an individual file, use the **copy** command to copy the files to router flash:

```
Router# copy tftp://x.x.x.x/P00307020300.sbn flash:
```

b) If the file is a tar file, use the **archive tar** command to extract the files to flash memory.

```
Router# archive tar /xtract source-urlflash:/file-url
```

Step 5 Verify the installation. Use the **show flash:** command to list the files installed in in flash memory.

```
Router# show flash:
```

```
31      128996 Sep 19 2005 12:19:02 -07:00 P00307020300.bin
32        461 Sep 19 2005 12:19:02 -07:00 P00307020300.loads
33      681290 Sep 19 2005 12:19:04 -07:00 P00307020300.sb2
34      129400 Sep 19 2005 12:19:04 -07:00 P00307020300.sbn
```

Step 6 Use the **archive tar /create** command to create a backup tar file of all the files stored in flash. You can create a tar file that includes all files in a directory or a list of up to four files from a directory.

For example, the following command creates a tar file of the three files listed:

```
archive tar /create flash:abctestlist.tar flash:orig1 sample1.txt sample2.txt
sample3.txt
```

The following command creates a tar file of all the files in the directory:

```
archive tar /create flash:abctest1.tar flash:orig1
```

The following command creates a tar file to backup the flash files to a USB card, on supported platforms:

```
archive tar /create usbflash1:abctest1.tar flash:orig1
```

What to do next

- If you installed Cisco Unified CME software and Cisco Unified CME is *not* configured on your router, see [Network Parameters, on page 129](#).
- If Cisco Unified IP phones presently connected to Cisco Unified CME are using the SCCP protocol to receive and place calls and the firmware version must be upgraded to a recommended version, or if the phones to be connected to Cisco Unified CME are brand new, out-of-the-box, the phone firmware preloaded at the factory must be upgraded to the recommended version before your phones can complete registration, see [Upgrade or Downgrade SCCP Phone Firmware, on page 114](#).
- If Cisco Unified IP phones presently connected to Cisco Unified CME are using the SIP protocol to receive and place calls and the firmware version must be upgraded to a recommended version, see [Upgrade or Downgrade SIP Phone Firmware, on page 116](#).
- If Cisco Unified IP phones presently connected to Cisco Unified CME are using the SCCP protocol to receive and place calls and you now want some or all of these phones to use the SIP protocol, the phone firmware for each phone type must be upgraded from SCCP to the recommended SIP version before the phones can register. See [Phone Firmware Conversion from SCCP to SIP, on page 120](#).
- If Cisco Unified IP phones to be connected to Cisco Unified CME are using the SIP protocol and are brand new, out-of-the-box, the phone firmware preloaded at the factory must be upgraded to the recommended SIP version before your SIP phones can complete registration. See [Phone Firmware Conversion from SCCP to SIP, on page 120](#).
- If Cisco Unified IP phones presently connected to Cisco Unified CME are using the SIP protocol to receive and place calls and you now want some or all of these phones to use the SCCP protocol, the phone firmware for each phone type must be upgraded from SIP to the recommended SCCP version before the phones can register. See [Phone Firmware Conversion from SIP to SCCP, on page 123](#).

Upgrade or Downgrade SCCP Phone Firmware

Note For certain IP phones, such as the Cisco Unified IP Phone 7911, 7941, 7961, 7970, and 7971, the firmware consists of multiple files including JAR and tone files. All of the firmware files must be downloaded to the TFTP server before they can be downloaded to the phone. For a list of files in each firmware version, see the appropriate [Cisco Unified CME Supported Firmware, Platforms, Memory, and Voice Products](#).

Before you begin

- Phone firmware for Cisco Unified IP phones to be connected to Cisco Unified CME, including all versions required during an upgrade or downgrade sequence, must be loaded in the flash memory of the TFTP server from which the phones download their configuration profiles. For information about installing firmware files in flash memory, see [Install Cisco Unified CME Software, on page 113](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **tftp-server** *device:firmware-file*
4. **telephony-service**
5. **load** *phone-type firmware-file*
6. **create** *cnf-files*
7. **end**

DETAILED STEPS

Procedure		
	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	tftp-server <i>device:firmware-file</i> Example: Router(config)# tftp-server flash:P00307020300.loads Router(config)# tftp-server flash:P00307020300.sb2 Router(config)# tftp-server flash:P00307020300.sbn Router(config)# tftp-server flash:P00307020300.bin	(Optional) Creates TFTP bindings to permit IP phones served by the Cisco Unified CME router to access the specified file. - A separate tftp-server command is required for each phone type. - Required for Cisco Unified CME 7.0/4.3 and earlier versions. - Cisco Unified CME 7.0(1) and later versions: Required only if the location for cnf files is <i>not</i> flash or slot 0. Use the complete filename, including the file suffix, for phone firmware versions later than version 8-2-2 for all phone types.
Step 4	telephony-service Example: Router(config)# telephony service	Enters telephony-service configuration mode.
Step 5	load <i>phone-type firmware-file</i> Example: Router(config-telephony)# load 7960-7940 P00307020300	Associates a phone type with a phone firmware file. - A separate load command is required for each IP phone type. <i>firmware-file</i>—Filenames are case-sensitive.

	Command or Action	Purpose
		- In Cisco Unified CME 7.0/4.3 and earlier versions, do not use the file suffix (.bin, .sbin, .loads) for any phone type except the Cisco ATA and Cisco Unified IP Phone 7905 and 7912. - In Cisco Unified CME 7.0(1) and later versions, you must use the complete filename, including the file suffix, for phone firmware versions later than version 8-2-2 for all phone types.
Step 6	create cnf-files Example: <code>Router(config-telephony)# create cnf-files</code>	Builds XML configuration files required for SCCP phones.
Step 7	end Example: <code>Router(config-telephony)# end</code>	Exits to privileged EXEC mode.

What to do next

- If the Cisco Unified IP phone to be upgraded is not configured in Cisco Unified CME, see [Configure Phones for a PBX System, on page 264](#).
- If the Cisco Unified IP phone is already configured in Cisco Unified CME and can make and receive calls, you are ready to reboot the Cisco Unified IP phones to download the phone firmware to the phone. See [Reset and Restart Cisco Unified IP Phones, on page 409](#).

Upgrade or Downgrade SIP Phone Firmware

The upgrade and downgrade sequences for SIP phones differ per phone type as follows:

- Upgrading or downgrading the phone firmware for Cisco Unified IP Phone 7905G, Cisco Unified IP Phone 7912G, and Cisco ATA Analog Telephone Adapter is straightforward; modify the **load** command to upgrade directly to the target load.
- The phone firmware version upgrade sequence for Cisco Unified IP Phone 7940Gs and 7960Gs is from version [234].x to 4.4, to 5.3, to 6.x, to 7.x. You cannot go directly from version [234].x to version 7.x.
- To downgrade phone firmware for Cisco Unified IP Phone 7940Gs and 7960Gs, first upgrade to version 7.x, then modify the **load** command to downgrade directly to the target phone firmware.

**Restriction**

- Cisco Unified IP Phone 7905G, Cisco Unified IP Phone 7912G, and Cisco ATA—Signed load starts from SIP v1.1. After you upgrade the firmware to a signed load, you cannot downgrade the firmware to an unsigned load.
- Cisco Unified IP Phone 7940G and Cisco Unified IP Phone 7960G—Signed load starts from SIP v5.x. Once you upgrade the firmware to a signed load, you cannot downgrade the firmware to an unsigned load.
- The procedures for upgrading phone firmware files for SIP phones is the same for all Cisco Unified IP phones. For other limits on firmware upgrade between versions, see [Cisco 7940 and 7960 IP Phones Firmware Upgrade Matrix](#).

Before you begin

Phone firmware for Cisco Unified IP phones to be connected to Cisco Unified CME, including all versions required during an upgrade or downgrade sequence, must be loaded in the flash memory of the TFTP server from which the phones will download their configuration profiles. For information about installing firmware files in flash memory, see [Install Cisco Unified CME Software, on page 113](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **mode cme**
5. **load *phone-type firmware-file***
6. **upgrade**
7. Repeat Step 5 and Step 6.
8. **file text**
9. **create profile**
10. **exit**
11. **voice register pool *pool-tag***
12. **reset**
13. **exit**
14. **voice register global**
15. **no upgrade**
16. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	
		• Enter your password if prompted.

	Command or Action	Purpose
	Router> enable	
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.
Step 4	mode cme Example: Router(config-register-global)# mode cme	Enables mode for provisioning SIP phones in Cisco Unified CME.
Step 5	load phone-type firmware-file Example: Router(config-register-global)# load 7960-7940 POS3-06-0-00	Associates a phone type with a phone firmware file. • A separate load command is required for each IP phone type. • <i>firmware-file</i>—Filename to be associated with the specified Cisco Unified IP phone type. • Do not use the .sbin or .loads file extension except for Cisco Unified IP Phone 7905 and 7912.
Step 6	upgrade Example: Router(config-register-global)# upgrade	Generates a file with the universal application loader image for upgrading phone firmware and performs the TFTP server alias binding.
Step 7	Repeat Step 5 and Step 6. Example: Router(config-register-global)# load 7960-7940 POS3-07-4-00 Router(config-register-global)# upgrade	(Optional) Repeat for each version required in multistep upgrade sequences only.
Step 8	file text Example: Router(config-register-global)# file text	(Optional) Generates ASCII text files for Cisco Unified IP Phone 7905s and 7905Gs, Cisco Unified IP Phone 7912s and 7912Gs, Cisco ATA-186, or Cisco ATA-188. • Default—System generates binary files to save disk space.
Step 9	create profile Example: Router(config-register-global)# create profile	Generates provisioning files required for SIP phones and writes the file to the location specified with the tftp-path command.
Step 10	exit Example:	Exits from the current command mode to the next highest mode in the configuration mode hierarchy.

	Command or Action	Purpose
	<code>Router(config-register-global)# exit</code>	
Step 11	voice register pool <i>pool-tag</i> Example: <code>Router(config)# voice register pool 1</code>	Enters voice register pool configuration mode to set phone-specific parameters for SIP phones. • <i>pool-tag</i>—Unique sequence number of the SIP phone to be configured. Range is 1 to 100 or the upper limit is as defined by max-pool command.
Step 12	reset Example: <code>Router(config-register-pool)# reset</code>	Performs a complete reboot of the single SIP phone specified with the voice register pool command and contacts the DHCP server and the TFTP server for updated information.
Step 13	exit Example: <code>Router(config-register-pool)# exit</code>	Exits from the current command mode to the next highest mode in the configuration mode hierarchy.
Step 14	voice register global Example: <code>Router(config)# voice register global</code>	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.
Step 15	no upgrade Example: <code>Router(config-register-global)# no upgrade</code>	Return to the default for the upgrade command.
Step 16	end Example: <code>Router(config-register-global)# end</code>	Exits configuration mode and enters privileged EXEC mode.

Example

The following example shows the configuration steps for upgrading firmware for a Cisco Unified IP Phone 7960G or Cisco Unified IP Phone 7940G from SIP 5.3 to SIP 6.0, then from SIP 6.0 to SIP 7.4:

```
Router(config)# voice register global
Router(config-register-global)# mode cme
Router(config-register-global)# load 7960 POS3-06-0-00
Router(config-register-global)# upgrade
Router(config-register-global)# load 7960 POS3-07-4-00
Router(config-register-global)# create profile
```

The following example shows the configuration steps for downgrading firmware for a Cisco Unified IP Phone 7960/40 from SIP 7.4 to SIP 6.0:

```
Router(config)# voice register global
Router(config-register-global)# mode cme
Router(config-register-global)# load 7960 POS3-06-0-00
Router(config-register-global)# upgrade
Router(config-register-global)# create profile
```

What to do next

- If the Cisco Unified IP phone to be upgraded is not configured in Cisco Unified CME, see [Configure Phones for a PBX System, on page 264](#).
- If the Cisco Unified IP phone is already configured in Cisco Unified CME and can make and receive calls, you are ready to reboot the Cisco Unified IP phones to download the phone firmware to the phone. See [Reset and Restart Cisco Unified IP Phones, on page 409](#).

Phone Firmware Conversion from SCCP to SIP

If Cisco Unified IP phones presently connected to Cisco Unified CME are using the SCCP protocol to receive and place calls and you now want some or all of these phones to use the SIP protocol, the phone firmware for each phone type must be upgraded from SCCP to the recommended SIP version before the phones can register. If Cisco Unified IP phones to be connected to Cisco Unified CME are brand new, out-of-the-box, the SCCP phone firmware preloaded at the factory must be upgraded to the recommended SIP version before your SIP phones can complete registration.

**Note**

If codec values for the dial peers of a connection do not match, the call fails. The default codec for the POTS dial peer for an SCCP phone is G.711 and the default codec for a VoIP dial peer for a SIP phone is G.729. If neither the SCCP phone nor the SIP phone in Cisco Unified CME has been specifically configured to change the codec, calls between the two IP phones on the same router will produce a busy signal caused by the mismatched default codecs. To avoid codec mismatch, specify the codec for IP phones in Cisco Unified CME. For configuration information, see [Configure Individual IP Phones for Key System on SCCP Phone, on page 304](#).

Before you begin

- Phone firmware for Cisco Unified IP phones to be connected to Cisco Unified CME, including all versions required during an upgrade or downgrade sequence, must be loaded in the flash memory of the TFTP server from which the phones download their configuration profiles. For information about installing firmware files in flash memory, see [Install Cisco Unified CME Software, on page 113](#).
- Cisco Unified IP Phone 7940Gs and Cisco Unified IP Phone 7960Gs—If these IP phones are already configured in Cisco Unified CME to use the SCCP protocol, the SCCP phone firmware on the phone must be version 5.x. If required, upgrade the SCCP phone firmware to 5.x before upgrading to SIP.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no ephone *ephone-tag***
4. **exit**
5. **no ephone-dn *dn-tag***
6. **exit**
7. **voice register global**
8. **mode cme**
9. **load *phone-type firmware-file***

10. **upgrade**
11. Repeat Step 9 and Step 10.
12. **create profile**
13. **file text**
14. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Router> enable</code>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3	no ephone <i>ephone-tag</i> Example: <code>Router (config)# no ephone 23</code>	(Optional) Disables the ephone and removes the ephone configuration. • Required only if the Cisco Unified IP phone to be configured is already connected to Cisco Unified CME and is using SCCP protocol. • <i>ephone-tag</i>—Particular IP phone to which this configuration change will apply.
Step 4	exit Example: <code>Router(config-ephone)# exit</code>	(Optional) Exits from the current command mode to the next highest mode in the configuration mode hierarchy. • Required only if you performed the previous step.
Step 5	no ephone-dn <i>dn-tag</i>	(Optional) Disables the ephone-dn and removes the ephone-dn configuration. • Required only if this directory number is not now nor will be associated to any SCCP phone line, intercom line, paging line, voice-mail port, or message-waiting indicator (MWI) connected to Cisco Unified CME. • <i>dn-tag</i>—Particular configuration to which this change will apply.
Step 6	exit Example: <code>Router(config-ephone-dn)# exit</code>	(Optional) Exits from the current command mode to the next highest mode in the configuration mode hierarchy. • Required only if you performed the previous step.

	Command or Action	Purpose
Step 7	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.
Step 8	mode cme Example: Router(config-register-global)# mode cme	Enables mode for provisioning SIP phones in Cisco Unified CME.
Step 9	load phone-type firmware-file Example: Router(config-register-global)# load 7960-7940 POS3-06-3-00	Associates a phone type with a phone firmware file. • A separate load command is required for each IP phone type.
Step 10	upgrade Example: Router(config-register-global)# upgrade	Generates a file with the universal application loader image for upgrading phone firmware and performs the TFTP server alias binding.
Step 11	Repeat Step 9 and Step 10. Example: Router(config-register-global)# load 7960-7940 POS3-07-4-00 Router(config-register-global)# upgrade	(Optional) Repeat for each version required in multistep upgrade sequences only.
Step 12	create profile Example: Router(config-register-global)# create profile	Generates provisioning files required for SIP phones and writes the file to the location specified with the tftp-path command.
Step 13	file text Example: Router(config-register-global)# file text	(Optional) Generates ASCII text files for Cisco Unified IP Phones 7905 and 7905G, Cisco Unified IP Phone 7912 and Cisco Unified IP Phone 7912G, Cisco ATA-186, or Cisco ATA-188. • Default—System generates binary files to save disk space.
Step 14	end Example: Router(config-register-global)# end	Exits configuration mode and enters privileged EXEC mode.

Example

The following example shows the configuration steps for converting firmware on an Cisco Unified IP phone already connected in Cisco Unified CME and using the SCCP protocol, from SCCP 5.x to SIP 7.4:

```
Router(config)# telephony-service
```

```
Router(config-telephony)# no create cnf
CNF files deleted
Router(config-telephony)# voice register global
Router(config-register-global)# mode cme
Router(config-register-global)# load 7960 P0S3-07-4-00
Router(config-register-global)# upgrade
Router(config-register-global)# create profile
```

What to do next

After you configure the **upgrade** command, refer to the following statements to determine which task to perform next.

- If the Cisco Unified IP phone to be upgraded is already connected in Cisco Unified CME and you removed the SCCP configuration file for the phone but have not configured this phone for SIP in Cisco Unified CME, see [Configure Phones for a PBX System, on page 264](#).
- If the Cisco Unified IP phones to be upgraded are already configured in Cisco Unified CME, see [Reset and Restart Cisco Unified IP Phones, on page 409](#).

Phone Firmware Conversion from SIP to SCCP

If Cisco Unified IP phones presently connected to Cisco Unified CME are using the SIP protocol to receive and place calls and you now want some or all of these phones to use the SCCP protocol, the phone firmware for each phone type must be upgraded from SIP to SCCP before the phones can register.

Note If codec values for the dial peers of a connection do not match, the call fails. The default codec for the POTS dial peer for an SCCP phone is G.711 and the default codec for a VoIP dial peer for a SIP phone is G.729. If neither the SCCP phone nor the SIP phone in Cisco Unified CME has been specifically configured to change the codec, calls between the two IP phones on the same router will produce a busy signal caused by the mismatched default codecs. To avoid codec mismatch, specify the codec for SIP and SCCP phones in Cisco Unified CME. For more information, see [Configure Phones for a PBX System, on page 264](#).

Before you begin

- Phone firmware for Cisco Unified IP phones to be connected to Cisco Unified CME, including all versions required during an upgrade or downgrade sequence, must be loaded in the flash memory of the TFTP server from which the phones will download their configuration profiles. For information about installing firmware files in flash memory, see [Install Cisco Unified CME Software, on page 113](#).
- Cisco Unified IP Phone 7940Gs and Cisco Unified IP Phone 7960Gs—If these IP phones are already configured in Cisco Unified CME to use the SIP protocol, the SIP phone firmware must be version 7.x. See [Upgrade or Downgrade SIP Phone Firmware, on page 116](#).

Remove SIP Configuration Profile

To remove the SIP configuration profile before downloading the SCCP phone firmware to convert a phone from SIP to SCCP, perform the steps in this task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no voice register pool** *pool-tag*
4. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Router> enable</code>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3	no voice register pool <i>pool-tag</i> Example: <code>Router(config)# no voice register pool 1</code>	Disables voice register pool and removes the voice pool configuration. • <i>pool-tag</i>—Unique sequence number for a particular SIP phone to which this configuration applies.
Step 4	end Example: <code>Router(config-register-pool)# end</code>	Exits from the current command mode to the next highest mode in the configuration mode hierarchy.

Generate SCCP XML Configuration File to Upgrade from SIP to SCCP

To create an ephone entry and generate a new SCCP XML configuration file for upgrading a particular Cisco Unified IP phone in Cisco Unified CME from SIP to SCCP, perform the steps in this task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *dn-tag*
4. **exit**
5. **tftp-server** *device:firmware-file*
6. **telephony-service**

7. **load** *phone-type firmware-file*
8. **create** *cnf-files*
9. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	ephone-dn <i>dn-tag</i> Example: <pre>Router(config)# ephone dn 1</pre>	Enters ephone-dn configuration mode, creates an ephone-dn, and optionally assigns it dual-line status. • <i>dn-tag</i>—Unique sequence number that identifies this ephone-dn during configuration tasks. The maximum number of ephone-dns in Cisco Unified CME is version and platform specific. Type ? to display range.
Step 4	exit Example: <pre>Router(config-ephone-dn)# exit</pre>	Exits from the current command mode to the next highest mode in the configuration mode hierarchy.
Step 5	tftp-server <i>device:firmware-file</i> Example: <pre>Router(config)# tftp-server flash:P00307020300.loads Router(config)# tftp-server flash:P00307020300.sb2 Router(config)# tftp-server flash:P00307020300.sbn Router(config)# tftp-server flash:P00307020300.bin</pre>	(Optional) Creates TFTP bindings to permit IP phones served by the Cisco Unified CME router to access the specified file. • A separate tftp-server command is required for each phone type. • Required for Cisco Unified CME 7.0/4.3 and earlier versions. • Cisco Unified CME 7.0(1) and later versions: Required only if the location for cnf files is <i>not</i> flash or slot 0. Use the complete filename, including the file suffix, for phone firmware versions later than version 8-2-2 for all phone types.
Step 6	telephony-service Example: <pre>Router(config)# telephony service</pre>	Enters telephony-service configuration mode.

Example

	Command or Action	Purpose
Step 7	load <i>phone-type firmware-file</i> Example: Router(config-telephony)# load 7960-7940 P00307020300	Associates a phone type with a phone firmware file. • A separate load command is required for each IP phone type. • <i>firmware-file</i>—Filename is case-sensitive. • Cisco Unified CME 7.0/4.3 and earlier versions: Do not use the .sbin or .loads file extension except for Cisco Unified IP Phone 7905 and 7912. • Cisco Unified CME 7.0(1) and later versions: Use the complete filename, including the file suffix, for phone firmware versions later than version 8-2-2 for all phone types.
Step 8	create cnf-files Example: Router(config-telephony)# create cnf-files	Builds XML configuration files required for SCCP phones.
Step 9	end Example: Router(config-telephony)# end	Exits to privileged EXEC mode.

Example

The following example shows the configuration steps for upgrading firmware for a Cisco Unified IP Phone 7960G from SIP to SCCP. First the SIP firmware is upgraded to SIP 6.3 and from SIP 6.3 to SIP 7.4; then, the phone firmware is upgraded from SIP 7.4 to SCCP 7.2(3). The SIP configuration profile is deleted and a new ephone configuration profile is created for the Cisco Unified IP phone.

```

Router(config)# v oice register global
Router(config-register-global)# mode cme
Router(config-register-global)# load 7960 POS3-06-0-00
Router(config-register-global)# upgrade
Router(config-register-global)# load 7960 POS3-07-4-00
Router(config-register-global)# exit
Router(config)# no voice register pool 1
Router(config-register-pool)# exit
Router(config)# v oice register global
Router(config-register-global)# no upgrade
Router(config-register-global)# exit
Router(config)# ephone-dn 1
Router(config-ephone-dn)# exit
Router(config)# tftp-server flash:P00307020300.loads
Router(config)# tftp-server flash:P00307020300.sb2
Router(config)# tftp-server flash:P00307020300.sbn
Router(config)# tftp-server flash:P00307020300.bin
Router(config)# telephony service
Router(config-telephony)# load 7960-7940 P00307000100
Router(config-telephony)# create cnf-files

```

What to Do Next

After you configure the **upgrade** command:

- If the Cisco Unified IP phone to be upgraded is already connected in Cisco Unified CME and you removed the SIP configuration file for the phone and have not configured the SCCP phone in Cisco Unified CME, see [Configure Phones for a PBX System, on page 264](#).
- If the Cisco Unified IP phones to be upgraded are already configured in Cisco Unified CME, see [Reset and Restart Cisco Unified IP Phones, on page 409](#).

Verify SCCP Phone Firmware Version

Procedure

Step 1 show flash:

Use this command to learn the filenames associated with that phone firmware

Router# **show flash:**

```

31      128996 Sep 19 2005 12:19:02 -07:00 P00307020300.bin
32          461 Sep 19 2005 12:19:02 -07:00 P00307020300.loads
33      681290 Sep 19 2005 12:19:04 -07:00 P00307020300.sb2
34      129400 Sep 19 2005 12:19:04 -07:00 P00307020300.sbn

```

Step 2 show ephone phone-load

Use this command to verify which phone firmware is installed on a particular ephone. The DeviceName includes the MAC address for the IP phone.

Router# **show ephone phone-load**

DeviceName	CurrentPhoneload	PreviousPhoneload	LastReset
=====			
SEP000A8A2C8C6E	7.3(3.02)		Initialized

Troubleshooting Tips for Cisco Phone Firmware

Use the **debug tftp event** command to troubleshoot an attempt to upgrade or convert Cisco phone firmware files for SIP phones.

CHAPTER 6

Network Parameters

- [Prerequisites for Defining Network Parameters, on page 129](#)
- [Restrictions for Defining Network Parameters, on page 129](#)
- [Information About Defining Network Parameters, on page 130](#)
- [Define Network Parameters, on page 132](#)
- [Configuration Examples for Network Parameters, on page 153](#)
- [Where to Go Next, on page 154](#)
- [Feature Information for Network Parameters, on page 154](#)

Prerequisites for Defining Network Parameters

- IP routing must be enabled.
- VoIP networking must be operational. For quality and security purposes, we recommend you have separate virtual LANs (VLANs) for data and voice. The IP network assigned to each VLAN should be large enough to support addresses for all nodes on that VLAN. Cisco Unified CME phones receive their IP addresses from the voice network, whereas all other nodes such as PCs, servers, and printers receive their IP addresses from the data network. For configuration information, see [Configure VLANs on a Cisco Switch, on page 100](#).
- If applicable, PSTN lines are configured and operational.
- If applicable, the WAN links are configured and operational.
- Trivial File Transfer Protocol (TFTP) must be enabled on the router to allow IP phones to download phone firmware files.
- To support IP phones that are running SIP to be directly connected to the Cisco Unified CME router, Cisco Unified CME 3.4 or later must be installed on the router.
- To provide voice-mail support for phones connected to the Cisco Unified CME router, install and configure voice mail on your network.

Restrictions for Defining Network Parameters

In Cisco Unified CME 4.0 and later versions, Layer-3-to-Layer-2 VLAN Class of Service (CoS) priority marking is not automatically processed. Cisco Unified CME 4.0 and later versions will continue to mark Layer

3, but Layer 2 marking is now only handled in the Cisco IOS software. Any Quality of Service (QoS) design that requires Layer 2 marking will have to be explicitly configured, either on a Catalyst switch that supports this capability or on the Cisco Unified CME router under the Ethernet interface configuration. For configuration information, see [Enterprise QoS Solution Reference Network Design Guide](#).

Information About Defining Network Parameters

DHCP Service

When a Cisco Unified IP phone is connected to the Cisco Unified CME system, it automatically queries for a Dynamic Host Configuration Protocol (DHCP) server. The DHCP server responds by assigning an IP address to the Cisco Unified IP phone and providing the IP address of the TFTP server through DHCP option 150. Then the phone registers with the Cisco Unified CME server and attempts to get configuration and phone firmware files from the TFTP server.

For configuration information, perform only *one* of the following procedures to set up DHCP service for your IP phones:

- If your Cisco Unified CME router is the DHCP server and you can use a single shared address pool for all your DHCP clients, see [Configure Single DHCP IP Address Pool, on page 135](#).
- If your Cisco Unified CME router is the DHCP server and you need separate pools for non-IP-phone DHCP clients, see [Configure Separate DHCP IP Address Pool for Each DHCP Client, on page 137](#).
- If the Cisco Unified CME router is not the DHCP server and you want to relay DHCP requests from IP phones to a DHCP server on a different router, see [Configure DHCP Relay, on page 139](#).

Network Time Protocol for the Cisco Unified CME Router

Network Time Protocol (NTP) allows you to synchronize your Cisco Unified CME router to a single clock on the network, which is known as the clock primary. NTP is disabled on all interfaces by default, but it is essential for Cisco Unified CME so you must ensure that it is enabled. For information about configuring NTP for the Cisco Unified CME router, see [Enable Network Time Protocol, on page 140](#).

Olson Timezones

Before Cisco Unified CME 9.0, some Cisco Unified SCCP IP phones and Cisco Unified SIP IP phones displayed exactly the same time as that of the Cisco Unified CME. For these phones, the correct time was displayed whenever the Cisco Unified CME time was set correctly. The **clock timezone**, **clock summer-time**, and **clock set** commands were the only commands used to set the Cisco Unified CME time correctly.

Other phones used only the **time-zone** command in telephony-service configuration mode and the **timezone** command in voice register global configuration mode to specify which time zone they were in so that the correct local time was displayed on Cisco Unified SCCP IP phones and Cisco Unified SIP IP phones, respectively. The phones calculated and displayed the time based on the Greenwich Mean Time (GMT) provided by the Cisco Unified CME or the Network Time Protocol server. The problem with this method is that every time a new country or new time zone was available or an old time zone was changed, the Cisco Unified CME **time-zone** and **timezone** commands and the phone loads had to be updated.

In Cisco Unified CME 9.0 and later versions, the Olson Timezone feature eliminates the need to update time zone commands or phone loads to accommodate a new country with a new time zone or an existing country whose city or state wants to change their time zone. Oracle's Olson Timezone updater tool, tzupdater.jar, only needs to be current for you to set the correct time using the **olsontimezone** command in either telephony-service or voice register global configuration mode.

For Cisco Unified 3911 and 3951 SIP IP phones and Cisco Unified 6921, 6941, 6945, and 6961 SCCP and SIP IP phones, the correct Olson Timezone updater file is TzDataCSV.csv. The TzDataCSV.csv file is created based on the tzupdater.jar file.

To set the correct time zone, you must determine the Olson Timezone area/location where the Cisco Unified CME is located and download the latest tzupdater.jar or TzDataCSV.csv to a TFTP server that is accessible to the Cisco Unified CME, such as flash or slot 0.

After a complete reboot, the phone checks if the version of its configuration file is earlier or later than 2010o. If it is earlier, the phone loads the latest tzupdater.jar and uses that updater file to calculate the Olson Timezone.

To make the Olson Timezone feature backward compatible, both the **time-zone** and **timezone** commands are retained as legacy time zones. Because the **olsontimezone** command covers approximately 500 time zones (Version 2010o of the tzupdater.jar file supports approximately 453 Olson Timezone IDs.), this command takes precedence when either the **time-zone** or the **timezone** command (that covers a total of 90 to 100 time zones only) is present at the same time as the **olsontimezone** command.

For more information on setting the time zone so that the correct local time is displayed on an IP phone, see [Set Olson Timezone for SCCP Phones, on page 142](#) or [Set Olson Timezone for SIP Phones, on page 145](#).

DTMF Relay

IP phones connected to Cisco Unified CME systems require the use of out-of-band DTMF relay to transport DTMF (keypad) digits across VoIP connections. The reason for this is that the codecs used for in-band transport may distort DTMF tones and make them unrecognizable. DTMF relay solves the problem of DTMF tone distortion by transporting DTMF tones out-of-band, or separate, from the encoded voice stream.

For IP phones on H.323 networks, DTMF is relayed using the H.245 alphanumeric method, which is defined by the ITU H.245 standard. This method separates DTMF digits from the voice stream and sends them as ASCII characters in H.245 user input indication messages through the H.245 signaling channel instead of the RTP channel. For information about configuring a DTMF relay in a multisite installation, see [Configure DTMF Relay for H.323 Networks in Multisite Installations, on page 148](#).

To use remote voice-mail or IVR applications on SIP networks from Cisco Unified CME phones, the DTMF digits used by the Cisco Unified CME phones must be converted to the RFC 2833 in-band DTMF relay mechanism used by SIP phones. The SIP DTMF relay method is needed in the following situations:

- When SIP is used to connect a Cisco Unified CME system to a remote SIP-based IVR or voice-mail application.
- When SIP is used to connect a Cisco Unified CME system to a remote SIP-PSTN voice gateway that goes through the PSTN to a voice-mail or IVR application.

The requirement for out-of-band DTMF relay conversion is limited to SCCP phones. SIP phones natively support in-band DTMF relay as specified in RFC 2833.

To use voice mail on a SIP network that connects to a Cisco Unity Express system, which uses a nonstandard SIP Notify format, the DTMF digits used by the Cisco Unified CME phones must be converted to the Notify format. Additional configuration may be required for backward compatibility with Cisco CME 3.0 and 3.1.

For configuration information about enabling DTMF relay for SIP networks, see [Configure SIP Trunk Support, on page 149](#).

SIP Register Support

SIP register support enables a SIP gateway to register E.164 numbers with a SIP proxy or SIP registrar, similar to the way that H.323 gateways can register E.164 numbers with a gatekeeper. SIP gateways allow registration of E.164 numbers to a SIP proxy or registrar on behalf of analog telephone voice ports (FXS) and IP phone virtual voice ports (EFXS) for local SCCP phones.

When registering E.164 numbers in dial peers with an external registrar, you can also register them with a secondary SIP proxy or registrar to provide redundancy. The secondary registration can be used if the primary registrar fails.

Note No commands allow registration between the H.323 and SIP protocols.

By default, SIP gateways do not generate SIP Register messages, so the gateway must be configured to register the gateway's E.164 telephone numbers with an external SIP registrar. For information about configuring the SIP gateway to register phone numbers with Cisco Unified CME, see [Configure SIP Trunk Support, on page 149](#).

Note When you configure SIP on a router, the ports on all its interfaces are open by default. This makes the router vulnerable to malicious attackers who can execute toll fraud across the gateway if the router has a public IP address and a public switched telephone network (PSTN) connection. To eliminate the threat, you should bind an interface to private IP address that is not accessible by untrusted hosts. In addition, you should protect any public or untrusted interface by configuring a firewall or an access control list (ACL) to prevent unwanted traffic from traversing the router.

Define Network Parameters

Enable Calls in Your VoIP Network

Restriction

- SIP endpoints are not supported on H.323 trunks. SIP endpoints are supported on SIP trunks only.
 - Cisco Unified CME 3.4 and later versions support Media Flow-through mode only; enabling SIP-to-SIP calls is required before you can successfully make SIP-to-SIP calls.
 - Media Flow-around configured with the **media flow-around** command is not supported by Cisco Unified CME with SIP phones.
-

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **allow-connections** *from-type to to-type*
5. **sip**
6. **registrar server** [**expires** [max sec] [min sec]]
7. **exit**
8. **sip-ua**
9. **notify telephone-event max-duration time**
10. **registrar** { **dns:host-name** | **ipv4:ip-address** } **expires seconds** [tcp] [secondary]
11. **retry register number**
12. **timers register time**
13. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice service voip Example: Router(config)# voice service voip	Enters voice service configuration mode and specifies Voice over IP (VoIP) encapsulation.
Step 4	allow-connections <i>from-type to to-type</i> Example: Router(config-voi-srv)# allow-connections h323 to h323 Router(config-voi-srv)# allow-connections h323 to SIP Router(config-voi-srv)# allow-connections SIP to SIP	Enables calls between specific types of endpoints in a VoIP network. • A separate allow-connections command is required for each type of endpoint to be supported.
Step 5	sip Example: Router(config-voi-srv)# sip	(Optional) Enters SIP configuration mode. • Required if you are connecting IP phones running SIP directly in Cisco CME 3.4 and later.

	Command or Action	Purpose
Step 6	registrar server [expires [max sec] [min sec]] Example: <pre>Router(config-voi-sip)# registrar server expires max 600 min 60</pre>	(Optional) Enables SIP registrar functionality in Cisco Unified CME. - Required if you are connecting IP phones running SIP directly in Cisco CME 3.4 and later. Note Cisco Unified CME does not maintain a persistent database of registration entries across reloads. Because SIP phones do not use a keepalive functionality, the SIP phones must register again. To decrease the amount of time after which the SIP phones register again, we recommend that you change the expiry. max sec—(Optional) Range: 600 to 86400. Default: 3600. Recommended value: 600. Note Ensure that the registration expiration timeout is set to a value smaller than the TCP connection aging timeout to avoid disconnection from the TCP. min sec—(Optional) Range: 60 to 3600. Default: 60.
Step 7	exit Example: <pre>Router(config-voi-sip)# exit</pre>	Exits dial-peer configuration mode.
Step 8	sip-ua Example: <pre>Router(config)# sip-ua</pre>	Enters SIP user-agent configuration mode.
Step 9	notify telephone-event max-duration time Example: <pre>Router(config-sip-ua)# notify telephone-event max-duration 2000</pre>	Configures the maximum time interval allowed between two consecutive NOTIFY messages for a single DTMF event. max-duration time—Range: 500 to 3000. Default: 2000.
Step 10	registrar {dns:host-name ipv4:ip-address} expires seconds [tcp] [secondary] Example: <pre>Router(config-sip-ua)# registrar ipv4:10.8.17.40 expires 3600 secondary</pre>	Registers E.164 numbers on behalf of analog telephone voice ports (FXS) and IP phone virtual voice ports (EFXS) with an external SIP proxy or SIP registrar server.
Step 11	retry register number Example: <pre>Router(config-sip-ua)# retry register 10</pre>	Sets the total number of SIP Register messages that the gateway should send. number—Number of Register message retries. Range: 1 to 10. Default: 10.

	Command or Action	Purpose
Step 12	timers register <i>time</i> Example: <pre>Router(config-sip-ua)# timers register 500</pre>	Sets how long the SIP user agent (UA) waits before sending Register requests. <i>time</i>—Waiting time, in milliseconds. Range: 100 to 1000. Default: 500.
Step 13	end Example: <pre>Router(config-sip-ua)# end</pre>	Exits configuration mode and enters privileged EXEC mode.

Configure DHCP

To set up DHCP service for your DHCP clients, perform only one of the following procedures:

- If your Cisco Unified CME router is the DHCP server and you can use a single shared address pool for all your DHCP clients, see [Configure Single DHCP IP Address Pool, on page 135](#).
- If your Cisco Unified CME router is the DHCP server and you need separate pools for each IP phone and each non-IP-phone DHCP client, see [Configure Separate DHCP IP Address Pool for Each DHCP Client, on page 137](#).
- If the Cisco Unified CME router is not the DHCP server and you want to relay DHCP requests from IP phones to a DHCP server on a different router, see [Configure DHCP Relay, on page 139](#).

Configure Single DHCP IP Address Pool

To create a shared pool of IP addresses for all DHCP clients, perform the following step.

Note

Do *not* perform this task if you already have a DHCP server on the LAN that can be used to provide addresses to the Cisco Unified CME phones. See [Enable Network Time Protocol, on page 140](#).

Restriction

A single DHCP IP address pool cannot be used if non-IP-phone clients, such as PCs, must use a different TFTP server address.

Before you begin

Your Cisco Unified CME router is a DHCP server.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp pool *pool-name***
4. **network *ip-address* [*mask* | / *prefix-length*]**

5. **option 150 ip** *ip-address*
6. **default-router** *ip-address*
7. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	ip dhcp pool <i>pool-name</i> Example: <pre>Router(config)# ip dhcp pool mypool</pre>	Creates a name for the DHCP server address pool and enters DHCP pool configuration mode.
Step 4	network <i>ip-address</i> [<i>mask</i> / <i>prefix-length</i>] Example: <pre>Router(config-dhcp)# network 10.0.0.0 255.255.0.0</pre>	Specifies the IP address of the DHCP address pool to be configured.
Step 5	option 150 ip <i>ip-address</i> Example: <pre>Router(config-dhcp)# option 150 ip 10.0.0.1</pre>	Specifies the TFTP server address from which the Cisco Unified IP phone downloads the image configuration file. • This is your Cisco Unified CME router's address.
Step 6	default-router <i>ip-address</i> Example: <pre>Router(config-dhcp)# default-router 10.0.0.1</pre>	(Optional) Specifies the router that the IP phones will use to send or receive IP traffic that is external to their local subnet. • If the Cisco Unified CME router is the only router on the network, this address should be the Cisco Unified CME IP source address. This command can be omitted if IP phones need to send or receive IP traffic only to or from devices on their local subnet. • The IP address that you specify for default router will be used by the IP phones for fallback purposes. If the Cisco Unified CME IP source address becomes unreachable, IP phones will attempt to register to the address specified in this command.

	Command or Action	Purpose
Step 7	end Example: Router(config-dhcp) # end	Returns to privileged EXEC mode.

What to do next

- If you are configuring Cisco Unified CME for the first time on this router, you are ready to configure NTP for the Cisco Unified CME router. For more information, see [Enable Network Time Protocol, on page 140](#).
- If you are finished modifying network parameters for an already configured Cisco Unified CME router, see [Configuration Files for Phones, on page 399](#).

Configure Separate DHCP IP Address Pool for Each DHCP Client

To create a DHCP IP address pool for each DHCP client, including non-IP-phone clients such as PCs, perform the following steps.

Note

Do *not* perform this task if you already have a DHCP server on the LAN that can be used to provide addresses to the Cisco Unified CME phones. See [Enable Network Time Protocol, on page 140](#).

Restriction

To use a separate DHCP IP address pool for each DHCP client, make an entry for each IP phone.

Before you begin

Your Cisco Unified CME router is a DHCP server.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp pool** *pool-name*
4. **host** *ip-address subnet-mask*
5. **client-identifier** *mac-address*
6. **option 150 ip** *ip-address*
7. **default-router** *ip-address*
8. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip dhcp pool <i>pool-name</i> Example: Router(config)# ip dhcp pool pool2	Creates a name for the DHCP server address pool and enters DHCP pool configuration mode.
Step 4	host <i>ip-address subnet-mask</i> Example: Router(config-dhcp)# host 10.0.0.0 255.255.0.0	Specifies the IP address that you want the phone to get.
Step 5	client-identifier <i>mac-address</i> Example: Router(config-dhcp)# client-identifier 01238.380.3056	Specifies the MAC address of the phone, which is printed on a label on each Cisco Unified IP phone. • A separate client-identifier command is required for each DHCP client. • Add “01” prefix number before the MAC address.
Step 6	option 150 ip <i>ip-address</i> Example: Router(config-dhcp)# option 150 ip 10.0.0.1	Specifies the TFTP server address from which the Cisco Unified IP phone downloads the image configuration file. • This is your Cisco Unified CME router’s address.
Step 7	default-router <i>ip-address</i> Example: Router(config-dhcp)# default-router 10.0.0.1	(Optional) Specifies the router that the IP phones will use to send or receive IP traffic that is external to their local subnet. • If the Cisco Unified CME router is the only router on the network, this address should be the Cisco Unified CME IP source address. This command can be omitted if IP phones need to send or receive IP traffic only to or from devices on their local subnet. • The IP address that you specify for default router will be used by the IP phones for fallback purposes. If the Cisco Unified CME IP source address becomes unreachable, IP phones will attempt to register to the address specified in this command.

	Command or Action	Purpose
Step 8	end Example: <code>Router(config-dhcp)# end</code>	Returns to privileged EXEC mode.

What to do next

- If you are configuring Cisco Unified CME for the first time on this router, you are ready to configure NTP for the Cisco Unified CME router. See [Enable Network Time Protocol, on page 140](#).
- If you are finished modifying network parameters for an already configured Cisco Unified CME router, see [Configuration Files for Phones, on page 399](#).

Configure DHCP Relay

To set up DHCP relay on the LAN interface where the Cisco Unified IP phones are connected and enable the DHCP relay to relay requests from the phones to the DHCP server, perform the following steps.

Restriction The Cisco Unified CME router cannot be the DHCP server.

Before you begin

There is a DHCP server that is not on this Cisco Unified CME router on the LAN that can provide addresses to the Cisco Unified CME phones.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **service dhcp**
4. **interface** *type number*
5. **ip helper-address** *ip -address*
6. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Router> enable</code>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Router# <code>configure terminal</code>	
Step 3	service dhcp Example: Router(config)# <code>service dhcp</code>	Enables the Cisco IOS DHCP server feature on the router.
Step 4	interface type number Example: Router(config)# <code>interface vlan 10</code>	Enters interface configuration mode for the specified interface.
Step 5	ip helper-address ip -address Example: Router(config-if)# <code>ip helper-address 10.0.0.1</code>	Specifies the helper address for any unrecognized broadcast for TFTP server and DNS server requests. • A separate ip helper-address command is required for each server if the servers are on different hosts. • You can also configure multiple TFTP server targets by using the ip helper-address commands for multiple servers.
Step 6	end Example: Router(config-if)# <code>end</code>	Returns to privileged EXEC mode.

What to do next

- If you are configuring Cisco Unified CME for the first time on this router, you are ready to configure NTP for the Cisco Unified CME router. See [Enable Network Time Protocol, on page 140](#).
- If you are finished modifying network parameters for an already configured Cisco Unified CME router, see [Configuration Files for Phones, on page 399](#).

Enable Network Time Protocol

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **clock timezone zone hours-offset [minutes-offset]**
4. **clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]**
5. **ntp server ip-address**
6. **exit**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	clock timezone zone hours-offset [minutes-offset] Example: Router(config)# clock timezone pst -8	Sets the local time zone.
Step 4	clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]] Example: Router(config)# clock summer-time pdt recurring	(Optional) Specifies daylight savings time. • Default: summer time is disabled. If the clock summer-time zone recurring command is specified without parameters, the summer time rules default to United States rules. Default of the <i>offset</i> argument is 60.
Step 5	ntp server ip-address Example: Router(config)# ntp server 10.1.2.3	Synchronizes software clock of router with the specified NTP server.
Step 6	exit Example: Router(config-telephony)# end	Returns to privileged EXEC mode.

What to do next

- If you are configuring Cisco Unified CME for the first time on this router and if you have a multisite installation, you are ready to configure a DTMF relay. See [Configure DTMF Relay for H.323 Networks in Multisite Installations, on page 148](#).
- If Cisco Unified CME will interact with a SIP Gateway, you must set up support for the gateway. See [Configure SIP Trunk Support, on page 149](#).
- If you are configuring Cisco Unified CME for the first time on this router and you are ready to configure system parameters. See [System-Level Parameters, on page 155](#).
- If you are finished modifying network parameters for an already configured Cisco Unified CME router, see [Configuration Files for Phones, on page 399](#).

Set Olson Timezone for SCCP Phones

To set the Olson Timezone so that the correct local time is displayed on a Cisco Unified SCCP IP phone, perform the following steps.

Before you begin

- TzDataCSV.csv file is added to the configuration files of Cisco Unified 6921, 6941, 6945, and 6961 SCCP IP phones.
- tzupdater.jar file is added to the configuration files of Cisco Unified 7961 SCCP IP phones.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **tftp-server device: tzupdater.jar**
4. **tftp-server device: TZDataCSV.csv**
5. **telephony-service**
6. **olsontimezone *timezone* version *number***
7. **create cnf-files**
8. **time-zone *number***
9. **exit**
10. **clock timezone *zone* hours-offset**
11. **clock summer-time *zone* date *date* month year hh:mm date month year hh:mm**
12. **exit**
13. **clock set hh:mm:ss day month year**
14. **configure terminal**
15. **telephony-service**
16. **reset**
17. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	tftp-server device: tzupdater.jar	Enables access to the tzupdater.jar file on the TFTP server.

	Command or Action	Purpose
	Example: Router(config)# tftp-server flash:tzupdater.jar	<i>device</i>—TFTP server that is accessible to the Cisco Unified CME, such as flash or slot 0.
Step 4	tftp-server device: TZDataCSV.csv Example: Router(config)# tftp-server flash:TZDataCSV.csv	Enables access to the TZDataCSV.csv file on the TFTP server. <i>device</i>—TFTP server that is accessible to the Cisco Unified CME, such as flash or slot 0.
Step 5	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.
Step 6	olsontimezone timezone version number Example: Router(config-telephony)# olsontimezone America/Argentina/Buenos Aires version 2010o	Sets the Olson Timezone so that the correct local time is displayed on Cisco Unified SCCP IP phones or Cisco Unified SIP IP phones. <i>timezone</i>—Olson Timezone names, which include the area (name of continent or ocean) and location (name of a specific location within that region, usually cities or small islands). <i>version number</i>—Version of the tzupdater.jar or TzDataCSV.csv file. The version indicates whether the file needs to be updated or not. Note In Cisco Unified CME 9.0, the latest version is 2010o.
Step 7	create cnf-files Example: Router(config-telephony)# create cnf-files	Builds the eXtensible Markup Language (XML) configuration files that are required for Cisco Unified SCCP IP phones in Cisco Unified CME.
Step 8	time-zone number Example: Router(config-telephony)# time-zone 21	Sets the time zone so that the correct local time is displayed on Cisco Unified SCCP IP phones. <i>number</i>—Numeric code for a named time zone.
Step 9	exit Example: Router(config-telephony)# exit	Exits telephony-service configuration mode.
Step 10	clock timezone zone hours-offset Example: Router(config)# clock timezone CST -6	Sets the time zone for display purposes. <i>zone</i>—Name of the time zone to be displayed when standard time is in effect. The length of the <i>zone</i> argument is limited to 7 characters. <i>hours-offset</i>—Hours difference from UTC.

	Command or Action	Purpose
Step 11	clock summer-time zone date date month year hh:mm date month year hh:mm Example: <pre>Router(config)# clock summer-time CST date 12 October 2010 2:00 26 April 2011 2:00</pre>	(Optional) Configures the Cisco Unified CME system to automatically switch to summer time (daylight saving time). • zone—Name of the time zone (for example, “PDT” for Pacific Daylight Time) to be displayed when summer time is in effect. The length of the zone argument is limited to 7 characters. • date—Indicates that summer time should start on the first specific date listed in the command and end on the second specific date in the command. • date—Date of the month (1 to 31). • month—Month (January, February, and so on). • year—Year (1993 to 2035). • hh:mm—Time (24-hour format) in hours and minutes.
Step 12	exit Example: <pre>Router(config)# exit</pre>	Exits global configuration mode.
Step 13	clock set hh:mm:ss day month year Example: <pre>Router# clock set 19:29:00 13 May 2011</pre>	Manually sets the system software clock. • hh:mm:ss—Current time in hours (24-hour format), minutes, and seconds. • day—Current day (by date) in the month. • month—Current month (by name). • year—Current year (no abbreviation).
Step 14	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 15	telephony-service Example: <pre>Router(config)# telephony-service</pre>	Enters telephony-service configuration mode.
Step 16	reset Example: <pre>Router(config-telephony)# reset</pre>	Performs a complete reboot of Cisco Unified SCCP IP phones associated with a Cisco Unified CME router.
Step 17	end Example:	Exits to privileged EXEC mode.

	Command or Action	Purpose
	Router(config-telephony)# end	

Set Olson Timezone for SIP Phones

To set the Olson Timezone so that the correct local time is displayed on a Cisco Unified SIP IP phone, perform the following steps.

Before you begin

- TzDataCSV.csv file is added to the configuration files of Cisco Unified 3911, 3951, 6921, 6941, 6945, and 6961 SIP IP phones.
- tzupdater.jar file is added to the configuration files of Cisco Unified 7961 SIP IP phones.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **tftp-server** *device:* **tzupdater.jar**
4. **tftp-server** *device:* **TZDataCSV.csv**
5. **voice register global**
6. **olsontimezone** *timezone* **version** *number*
7. **create profile**
8. **timezone** *number*
9. **exit**
10. **clock timezone** *zone* *hours-offset*
11. **clock summer-time** *zone* **date** *date month year hh:mm date month year hh:mm*
12. **exit**
13. **clock set** *hh:mm:ss day month year*
14. **configure terminal**
15. **voice register global**
16. **reset**
17. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	tftp-server device: tzupdater.jar Example: Router(config)# tftp-server slot0:tzupdater.jar	Enables access to the tzupdater.jar file on the TFTP server. • <i>device</i>—TFTP server that is accessible to the Cisco Unified CME, such as flash or slot 0.
Step 4	tftp-server device: TZDataCSV.csv Example: Router(config)# tftp-server slot0:TZDataCSV.csv	Enables access to the TZDataCSV.csv file on the TFTP server. • <i>device</i>—TFTP server that is accessible to the Cisco Unified CME, such as flash or slot 0.
Step 5	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode.
Step 6	olsontimezone timezone version number Example: Router(config-register-global)# olsontimezone America/Argentina/Buenos Aires version 2010o	Sets the Olson Timezone so that the correct local time is displayed on Cisco Unified SCCP IP phones or Cisco Unified SIP IP phones. • <i>timezone</i>—Olson Timezone names, which include the area (name of continent or ocean) and location (name of a specific location within that region, usually cities or small islands). • version number—Version of the tzupdater.jar or tzdatacsv.csv file. The version indicates whether the file needs to be updated or not. Note In Cisco Unified CME 9.0, the latest version is 2010o.
Step 7	create profile Example: Router(config-register-global)# create profile	Generates the configuration profile files required for Cisco Unified SIP IP phones.
Step 8	timezone number Example: Router(config-register-global)# timezone 21	Sets the time zone used for Cisco Unified SIP IP phones. • <i>number</i>—Range is 1 to 53. Default is 5, Pacific Standard/Daylight Time.
Step 9	exit Example: Router(config-register-global)# exit	Exits voice register global configuration mode.
Step 10	clock timezone zone hours-offset	Sets the time zone for display purposes.

	Command or Action	Purpose
	Example: <pre>Router(config)# clock timezone CST -6</pre>	• <i>zone</i>—Name of the time zone to be displayed when standard time is in effect. The length of the <i>zone</i> argument is limited to 7 characters. • <i>hours-offset</i>—Hours difference from UTC.
Step 11	clock summer-time zone date date month year hh:mm date month year hh:mm Example: <pre>Router(config)# clock summer-time CST date 12 October 2010 2:00 26 April 2011 2:00</pre>	(Optional) Configures the Cisco Unified CME system to automatically switch to summer time (daylight saving time). • <i>zone</i>—Name of the time zone (for example, “PDT” for Pacific Daylight Time) to be displayed when summer time is in effect. The length of the <i>zone</i> argument is limited to 7 characters. • date—Indicates that summer time should start on the first specific date listed in the command and end on the second specific date in the command. • <i>date</i>—Date of the month (1 to 31). • <i>month</i>—Month (January, February, and so on). • <i>year</i>—Year (1993 to 2035). • <i>hh:mm</i>—Time (24-hour format) in hours and minutes.
Step 12	exit Example: <pre>Router(config)# exit</pre>	Exits global configuration mode.
Step 13	clock set hh:mm:ss day month year Example: <pre>Router# clock set 15:25:00 17 November 2011</pre>	Manually sets the system software clock. • <i>hh:mm:ss</i>—Current time in hours (24-hour format), minutes, and seconds. • <i>day</i>—Current day (by date) in the month. • <i>month</i>—Current month (by name). • <i>year</i>—Current year (no abbreviation).
Step 14	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 15	voice register global Example: <pre>Router(config)# voice register global</pre>	Enters voice register global configuration mode.

	Command or Action	Purpose
Step 16	reset Example: Router(config-register-global)# reset	Performs a complete reboot of Cisco Unified SIP phones associated with a Cisco Unified CME router.
Step 17	end Example: Router(config-register-global)# end	Exits to privileged EXEC mode.

Configure DTMF Relay for H.323 Networks in Multisite Installations

To configure DTMF relay for H.323 networks in a multisite installation only, perform the following steps.

Note To configure DTMF relay on SIP networks, see [Configure SIP Trunk Support, on page 149](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice tag voip**
4. **dtmf-relay h245-alphanumeric**
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	dial-peer voice tag voip Example: Router(config)# dial-peer voice 2 voip	Enters dial-peer configuration mode.

	Command or Action	Purpose
Step 4	dtmf-relay h245-alphanumeric Example: <pre>Router(config-dial-peer)# dtmf-relay h245-alphanumeric</pre>	Specifies the H.245 alphanumeric method for relaying dual tone multifrequency (DTMF) tones between telephony interfaces and an H.323 network.
Step 5	end Example: <pre>Router(config-dial-peer)# end</pre>	Returns to privileged EXEC mode.

What to do next

- To set up support for a SIP trunk, see [Configure SIP Trunk Support, on page 149](#).
- If you are configuring Cisco Unified CME for the first time on this router and you are ready to configure system parameters. For more information, see [System-Level Parameters, on page 155](#).
- If you are finished modifying network parameters for an already configured Cisco Unified CME router, see [Configuration Files for Phones, on page 399](#).

Configure SIP Trunk Support

To enable DTMF relay on a dial-peer for a SIP gateway and set up the gateway to register phone numbers with Cisco Unified CME, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice tag voip**
4. **dtmf-relay rtp-nte**
5. **dtmf-relay sip-notify**
6. **exit**
7. **sip-ua**
8. **notify telephone-event max-duration msec**
9. **registrar { dns: host-name | ipv4: ip-address } expires seconds [tcp] [secondary]**
10. **retry register number**
11. **timers register msec**
12. **end**

DETAILED STEPS

Procedure		
	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: Router> enable	Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	dial-peer voice tag voip Example: Router(config)# dial-peer voice 2 voip	Enters dial-peer configuration mode.
Step 4	dtmf-relay rtp-nte Example: Router(config-dial-peer)# dtmf-relay rtp-nte	Forwards DTMF tones by using Real-Time Transport Protocol (RTP) with the Named Telephone Event (NTE) payload type and enables DTMF relay using the RFC 2833 standard method.
Step 5	dtmf-relay sip-notify Example: Router(config-dial-peer)# dtmf-relay sip-notify	Forwards DTMF tones using SIP NOTIFY messages.
Step 6	exit Example: Router(config-dial-peer)# exit	Exits dial-peer configuration mode.
Step 7	sip-ua Example: Router(config)# sip-ua	Enters SIP user-agent configuration mode.
Step 8	notify telephone-event max-duration msec Example: Router(config-sip-ua)# notify telephone-event max-duration 2000	Sets the maximum milliseconds allowed between two consecutive NOTIFY messages for a single DTMF event. max-duration time—Range: 500 to 3000. Default: 2000.
Step 9	registrar {dns: host-name ipv4: ip-address} expires seconds [tcp] [secondary] Example: Router(config-sip-ua)# registrar ipv4:10.8.17.40 expires 3600 secondary	Registers E.164 numbers on behalf of analog telephone voice ports (FXS) and IP phone virtual voice ports (EFXS) with an external SIP proxy or SIP registrar server.
Step 10	retry register number Example: Router(config-sip-ua)# retry register 10	Sets the total number of SIP Register messages that the gateway should send. number—Number of Register message retries. Range: 1 to 10. Default: 10.

	Command or Action	Purpose
Step 11	timers register msec Example: Router(config-sip-ua)# timers register 500	Sets how long the SIP user agent (UA) waits before sending Register requests. • <i>time</i>—Waiting time, in milliseconds. Range: 100 to 1000. Default: 500.
Step 12	end Example: Router(config-sip-ua)# end	Returns to privileged EXEC mode.

Verify SIP Trunk Support Configuration

To verify SIP trunk configuration, perform the following steps in any order.

Procedure

Step 1 show sip-ua status

Use this command to display the time interval between consecutive NOTIFY messages for a telephone event. In the following example, the time interval is 2000 ms:

Example:

```
Router# show sip-ua status

SIP User Agent Status
SIP User Agent for UDP :ENABLED
SIP User Agent for TCP :ENABLED
SIP User Agent bind status(signaling):DISABLED
SIP User Agent bind status(media):DISABLED
SIP early-media for 180 responses with SDP:ENABLED
SIP max-forwards :6
SIP DNS SRV version:2 (rfc 2782)
NAT Settings for the SIP-UA
Role in SDP:NONE
Check media source packets:DISABLED
Maximum duration for a telephone-event in NOTIFYs:2000 ms
SIP support for ISDN SUSPEND/RESUME:ENABLED
Redirection (3xx) message handling:ENABLED
SDP application configuration:
  Version line (v=) required
  Owner line (o=) required
  Timespec line (t=) required
```

```
Media supported:audio image
Network types supported:IN
Address types supported:IP4
Transport types supported:RTP/AVP udptl
```

Step 2 **show sip-ua timers**

This command displays the waiting time before Register requests are sent; that is, the value that has been set with the **timers register** command.

Step 3 **show sip-ua register status**

This command displays the status of local E.164 registrations.

Step 4 **show sip-ua statistics**

This command displays the Register messages that have been sent.

Change the TFTP Address on a DHCP Server

To change the TFTP IP address after it has already been configured, perform the following steps.

**Restriction**

If the DHCP server is on a different router than Cisco Unified CME, reconfigure the external DHCP server with the new IP address of the TFTP server.

Before you begin

Your Cisco Unified CME router is a DHCP server.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp pool** *pool-name*
4. **option 150 ip** *ip-address*
5. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip dhcp pool <i>pool-name</i> Example: Router(config)# ip dhcp pool pool2	Enters DHCP pool configuration mode to create or modify a DHCP pool. • <i>pool-name</i> —Previously configured unique identifier for the pool to be configured.
Step 4	option 150 ip <i>ip-address</i> Example: Router(config-dhcp)# option 150 ip 10.0.0.1	Specifies the TFTP server IP address from which the Cisco Unified IP phone downloads the image configuration file, XmlDefault.cnf.xml.
Step 5	end Example: Router(config-dhcp)# end	Returns to privileged EXEC mode.

Configuration Examples for Network Parameters

NTP Server

The following example defines the pst timezone as 8 hours offset from UTC, using a recurring daylight savings time called pdt, and synchronizes the clock with the NTP server at 10.1.2.3:

```
clock timezone pst -8
clock summer-time pdt recurring
ntp server 10.1.2.3
```

DTMF Relay for H.323 Networks

The following excerpt from the **show running-config** command output shows a dial peer configured to use H.245 alphanumeric DTMF relay:

```
dial-peer voice 4000 voip
destination-pattern 4000
session target ipv4:10.0.0.25
codec g711ulaw
dtmf-relay h245-alphanumeric
```

Where to Go Next

- If you are configuring Cisco Unified CME for the first time on this router, you are ready to configure system-level parameters. See [System-Level Parameters, on page 155](#).
- If you modified network parameters for an already configured Cisco Unified CME router, you are ready to generate the configuration file to save the modifications. See [Configuration Files for Phones, on page 399](#).

Feature Information for Network Parameters

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

Table 11: Feature Information for Network Parameters

Feature Name	Cisco Unified CME Version	Modification
Olson Timezone	9.0	Eliminates the need to update time zone commands or phone loads to accommodate a new country with a new time zone or an existing country whose city or state wants to change their time zone, using the olsontimezone command in either telephony-service or voice register global configuration mode.

CHAPTER 7

System-Level Parameters

- [Prerequisites for System-Level Parameters, on page 155](#)
- [Information About Configuring System-Level Parameters, on page 155](#)
- [Configure System-Level Parameters, on page 172](#)
- [Configuration Examples for System-Level Parameters, on page 213](#)
- [Where to Go Next, on page 225](#)
- [Feature Information for System-Level Parameters, on page 226](#)

Prerequisites for System-Level Parameters

- To directly connect Cisco Unified IP phones that are running Session Initiation Protocol (SIP) in Cisco Unified CME, Cisco CME 3.4 or a later version must be installed on the router. For installation information, see [Install and Upgrade Cisco Unified CME Software, on page 109](#).
- Cisco Unified CME must be configured to work with your IP network. For configuration information, see [Network Parameters, on page 129](#).

Information About Configuring System-Level Parameters

Bulk Registration Support for SIP Phones

Cisco Unified CME 8.6 enhances the bulk registration feature for Cisco Unified SIP IP phones by optimizing the two main transactions involved in bulk registration process and minimizing the number of required messages to be sent to the phones. The bulk registration process involves the following two main transactions:

- **Register**—Register transaction handles per line REGISTER messages coming to Cisco Unified CME and provisions phone DNs by creating dialpeers and various phone data structures.
- **Phone Status Update**—Phone status update transaction sends back device information using REFER and NOTIFY messages.

In Cisco Unified CME 8.6, the bulk registration process consists of only one REGISTER message per phone instead of one REGISTER message per phone per line, thus reducing any negative impact on your router's performance. For information on configuring bulk registration, see [Configure Bulk Registration for SIP IP Phones, on page 179](#).

The **show voice register pool** command displays the registration method a phone uses: per line, bulk-in progress, or bulk-completed. The per line option indicates that the phone is using the per line registration process. The bulk-in progress option indicates that the phone is using the bulk registration process but the registration process is not complete yet. The bulk-completed option indicates that the phone is registered using the bulk registration process and the registration process is complete. For information on verifying the phone registration process, see [Verify Phone Registration Type and Status, on page 180](#).

Note The bulk registration feature in Cisco Unified CME 8.6 optimizes line registration on SIP phones and is a phone interop feature. The bulk registration feature is not related to the **bulk** command under voice register global configuration mode.

In earlier versions of Cisco Unified CME, the registration process was very lengthy and several SIP messages were exchanged between the end points and Cisco Unified CME to properly provision the phone.

[Table 12: Number of Messages Required for an Eight-Button IP Phone, on page 156](#) lists the number of messages required to register an eight-button Cisco Unified SIP IP phone, where all of the eight buttons can be configured as a shared line with message waiting indicator (MWI) notification enabled, to Cisco Unified CME.

Table 12: Number of Messages Required for an Eight-Button IP Phone

Transactions	Method	Messages Per Transaction	Number of Transactions	Total number of messages (per line)	Total number of messages (bulk)
Register	REGISTER	2	8	24	3
Phone Status Update	REFER remotecc	2	3	6	2
	NOTIFY (mwi, service-control)	2	8	16	
Subscription	SUBSCRIBE (sharedline)	4	8	32	32
Total				78	37

You can see from the preceding table that more than 70 messages are required to register one 8-button IP phone. If there is a simultaneous registration of more phones, the amount of messages can be overwhelming and can have a negative impact on the performance of the router.

With the enhanced bulk registration process, the two main transactions (Register and Phone Status Update) are optimized to minimize the number of messages required to complete the phone registration process. [Table 12: Number of Messages Required for an Eight-Button IP Phone, on page 156](#) shows that the total number of messages required for bulk registration is only 37.

Register Transaction

The following is an example of the REGISTER message:

```

Phone Status Update Transaction

Cisco Unified IP phones use the option indication to negotiate supported options with Cisco Unified CME via remotecc request. Cisco Unified CME selects an option or options that it wishes to support and return it in the response. Cisco Unified CME ignores items (elements, attributes, and values) that it fails to understand. A new phone option, combine, is defined to optimize phone status update. This option combines remotecc status information (cfwdall, privacy, dnd, bulk mwi) and service-control. The following is an example of a combined status update:

```
<optionsind>
<combine max="5">
<remotecc><status/></remotecc>
<service-control/>
</combine>
</optionsind>
```

The following is another example of a combined status update:

```
<optionsind>
<combine max="4">
<remotecc><status/></remotecc>
<service-control/>
</combine>
</optionsind>
```

To minimize the data size, Cisco Unified CME and the phone agree ahead of time on a default value to apply updates. Therefore, during initial registration, Cisco Unified CME will not send the value if it matches the agreed upon default. [Table 13: Status Information and Default, on page 159](#) captures the existing status information and applicable default value.

Table 13: Status Information and Default

Status	Default	Initialization
CallForwardAll Update	No default	Always send regardless of the value
Privacyrequest	Disabled	Only send if the value is not equal to the default
DnDupdate	Disabled	Only send if value is not equal to the default
Bulkupdate (MWI)	No default	Always send regardless of value

During bulk registration, Cisco Unified CME uses a single REFER message to send combined phone status update message for phone status updates such as cfwdallupdate, privacyrequet, DnDupdate, and Bulkupdate (MWI) instead of sending phone status in individual NOTIFY or REFER message to the phone. The following is an example of the single REFER message sent by Cisco Unified CME to the phone:

```
REFER sip:6010@28.18.88.33:44332 SIP/2.0

```

Note Cisco Unified IP phones use the TCP for registration refresh. TCP socket has a default keepalive time out session of 60 minutes. If registration refresh to Cisco Unified CME does not takes place within an hour (60 minutes), the TCP connection will be removed. This will make the phones restart instead of refresh. To stop the phones from restarting, adjust the registrar expire timer under voice service voip or set the timer connection aging under sip-ua to a value greater than what the phone uses for registration refreshes. For example, if the phone does a registration refresh every 60 minutes, then setting up a timer connection aging to 100 minutes will guarantee that the TCP keeps the connection open. Or you can set the registrar expire maximum value to less than 3600.

DSCP

Differentiated Services Code Point (DSCP) packet marking is used to specify the class of service for each packet. Cisco Unified IP Phones get their DSCP information from the configuration file that is downloaded to the device.

In earlier versions of Cisco Unified CME, the DSCP value is predefined. In Cisco Unified CME 7.1 and later versions, you can configure the DSCP value for different types of network traffic. Cisco Unified CME downloads the configured DSCP value to SCCP and SIP phones in their configuration files and all control messages and flow-through RTP streams are marked with the configured DSCP value. This allows you to set different DSCP values, for example, for video streams and audio streams.

For configuration information, see [Set Up Cisco Unified CME for SCCP Phones](#), on page 181 or [Set Up Cisco Unified CME for SIP Phones](#), on page 197.

Maximum Ephones in Cisco Unified CME 4.3 and Later Versions

In Cisco Unified CME 4.3 and later versions, the **max-ephones** command is enhanced to set the maximum number of SCCP phones that can register to Cisco Unified CME, without limiting the number that can be configured. In previous versions of Cisco Unified CME, the **max-ephones** command defined the maximum number of phones that could be both configured and registered.

This enhancement expands the maximum number of phones that can be configured to 1000. The maximum number of phones that can register to Cisco Unified CME has not changed; it is dependent on the number of phones supported by the hardware platform and is limited by the **max-ephones** command.

This enhancement supports features, such as Extension Assigner, that require you to configure more phones than can register. For example, if you set the **max-ephones** command to 50 and configure 100 ephones, only 50 phones can register to Cisco Unified CME, one at a time in random order. The remaining 50 phones cannot register and an error message displays for each rejected phone. This enhancement also allows you to assign ephone tags that match the extension number of the phone, for extensions up to 1000.

If you reduce the value of the **max-ephones** command, currently registered phones are not forced to unregister until a reboot. If the number of registered phones, however, is already equal to or more than the **max-ephones** value, no additional phones can register to Cisco Unified CME. If you increase the value of the **max-ephones** command, the previously rejected ephones are able to register immediately until the new limit is reached.

Note For Cisco Integrated Services Router 4351, you can set the max-ephones value to 3925. For Cisco Integrated Services Router 4331, you can set the max-ephones value to 2921. For Cisco Integrated Services Router 4321, you can set the max-ephones value to 2901. For Cisco Integrated Services Router 4400 series, you can set the max-ephones value to 4451.

Network Time Protocol for SIP Phones

Although SIP phones can synchronize to a Cisco Unified CME router, the router can lose its clock after a reboot causing phones to display the wrong time. SIP phones registered to a Cisco Unified CME router can synchronize to a Network Time Protocol (NTP) server. Synchronizing to an NTP server ensures that SIP phones maintain the correct time. For configuration information, see [Set Network Time Protocol for SIP Phones](#), on page 204.

Per-Phone Configuration Files

In Cisco Unified CME 4.0 and later versions, you can use an external TFTP server to off load the TFTP server function on the Cisco Unified CME router. Using flash memory or slot 0 memory on the Cisco Unified CME router allows you to use different configuration files for each phone type or for each phone, permitting you to specify different user locales and network locales for different phones. Before Cisco Unified CME 4.0, you could specify only a single default user and network locale for a Cisco Unified CME system.

You can specify one of the following four locations to store configuration files:

- **System**—This is the default. When `system:/its` is the storage location, there is only one default configuration file for all phones in the system. All phones, therefore, use the same user locale and network locale. User-defined locales are not supported.
- **Flash or slot 0**—When flash memory or slot 0 memory on the router is the storage location, you can create additional configuration files to apply per phone type or per individual phone. Up to five user and network locales can be used in these configuration files.

Note When the storage location you selected is flash memory and the file system type on this device is Class B (LEFS), you must check the free space on the device periodically and use the **squeeze** command to free the space used up by deleted files. Unless you use the **squeeze** command, the space used by the moved or deleted configuration files cannot be used by other files. Rewriting flash memory space during the squeeze operation may take several minutes. We recommend that you use this command during scheduled maintenance periods or off-peak hours.

- **TFTP**—When an external TFTP server is the storage location, you can create additional configuration files that can be applied per phone type or per individual phone. Up to five user and network locales can be used in these configuration files.

You can then specify one of the following ways to create configuration files:

- **Per system**—This is the default. All phones use a single configuration file. The default user and network locale in a single configuration file are applied to all phones in the Cisco Unified CME system. Multiple locales and user-defined locales are not supported.
- **Per phone type**—This setting creates separate configuration files for each phone type. For example, all Cisco Unified IP Phone 7960s use `XMLDefault7960.cnf.xml`, and all Cisco Unified IP Phone 7905s use `XMLDefault7905.cnf.xml`. All phones of the same type use the same configuration file, which is generated using the default user and network locale. This option is not supported if you store the configuration files in the `system:/its` location.
- **Per phone**—This setting creates a separate configuration file for each phone by MAC address. For example, a Cisco Unified IP Phone 7960 with the MAC address 123.456.789 creates the per-phone configuration file `SEP123456789.cnf.xml`. The configuration file for a phone is generated with the default user and network locale unless a different user and network locale is applied to the phone using an ephone template. This option is not supported if you store the configuration files in the `system:/its` location.

For configuration information, see [Define Per-Phone Configuration Files and Alternate Location for SCCP Phones](#), on page 187.

HFS Download Support for IP Phone Firmware and Configuration Files

Legacy IP phones access the TFTP server to download firmware and configuration files but Cisco Unified CME 8.8 enhances download support for SIP phone firmware, scripts, midlets, and configuration files using the HTTP File-Fetch Server (HFS) infrastructure.

In Cisco Unified CME 8.8 and later versions, SIP phones use an HTTP server as the primary download service when it is configured and access a TFTP server as a secondary or fallback option when the HTTP server fails.

Note When the HFS download service is not configured, SIP phones automatically access the TFTP server.

The following scenario shows a successful download sequence using an HTTP server:

An IP phone initiates TCP connection to port 6970. A connection is established and an internal request for a file is sent to the HTTP server. The phone receives the HTTP response status code of 200, signifying that the download is successful.

The following scenario shows a download sequence that begins with an IP phone using an HTTP server to download files and ends with a TFTP server as a fallback option when the initial download attempt fails:

An IP phone initiates TCP connection to port 6970 but is unable to establish a connection. The phone contacts the TFTP server and sends an internal request for a file. The file is successfully downloaded from the TFTP server.

The following scenario shows how a download sequence that starts with an HTTP server does not always fall back to the TFTP server when the initial download attempt fails:

An IP phone initiates TCP connection to port 6970. A connection is established and an internal request for a file is sent to the HTTP server. The phone receives the HTTP response status code of 404, signifying that the file requested could not be found. Because the file cannot be found, the request is not sent to the TFTP server.

Note The configuration files are shared by the HTTP and TFTP servers. However, the firmware files are different for each server.

For more information on Phone Firmware Files, see [Install and Upgrade Cisco Unified CME Software](#), on page 109.

For more information on Per-Phone Configuration Files, see [Per-Phone Configuration Files](#), on page 162.

For more information on Configuration Files for Phones in Cisco Unified CME, see [Generate Configuration Files for Phones](#), on page 400.

Enable HFS Service

To enable the HFS download service, the underlying HTTP server must be enabled first because the HFS infrastructure is built on top of an existing IOS HTTP server.

```
Router(config)# ip http server
```

This HFS infrastructure enables multiple HTTP services to co-exist. The HFS download service runs on custom port 6970 but can also share default port 80 with other services. Other HTTP services run on other non-standard ports like 1234.

```
Router(config)# ip http server
Router(config)# ip http port 1234
```

The HFS download service starts when the following is configured in telephony-service configuration mode.

For the default port:

```
Router(config-telephony)# hfs enable
```

For the custom port:

```
Router(config-telephony)# hfs enable port 6970
```

Note If the entered custom HFS port clashes with the underlying IP HTTP port, an error message is displayed and the command is disallowed.

In the following example, port 6970 is configured as the IP HTTP port. When the HFS port is configured with the same value, an error message is displayed to show that the port is already in use.

```
Router (config)# ip http port 6970
.
.
Router (config)# telephony-service
Router (config-telephony)# hfs enable port 6970
```

Error Message Invalid port number or port in use by other application

Explanation The HFS port number is already in use by the underlying IP HTTP server.

Recommended Action Use an HFS port that is different from the underlying IP HTTP port.

Note Because IP phones are hardcoded to use port 6970 to connect to Cisco Unified CME, you must search for other applications running on port 6970 and assign them with ports different from 6970 to prevent a failure in connecting to Cisco Unified CME.

For configuration information, see [Enable HFS Download Service for SIP Phones, on page 205](#).

File Binding and Fetching

File binding and fetching using the HTTP server can be classified into two:

- **Explicit binding** – The **create profile** command triggers the system to generate the configuration and firmware files and store them in RAM or a flash memory. The system asks the new internal application programming interfaces (APIs) implemented by the HFS download service to bind the filename and alias that an IP phone wants to access to their corresponding URL.
- **Loose binding** – The HFS download service enables the Cisco Unified CME system to configure a home path from where any requested firmware file that has no explicit binding can be searched and fetched. The files can be stored on any device (such as flash memory or NVRAM) under a root directory or a suitable subdirectory.

No matter how the system is configured, if there is no explicit binding, the files will go to the home path.

An advantage of the HFS service over the TFTP service is that only the absolute path where the firmware files are located needs to be configured in telephony-service configuration mode.

For example:

```
Router(config-telephony)# hfs home-path flash:/cme/loads/
```

In contrast, the TFTP service requires that each file be explicitly bound to its URL using the following **tftp-server** command:

```
tftp-server flash: SCCP70.8-3-3-14S.loads
```

The method is inefficient because this step must be repeated for each file that needs to be fetched using the TFTP server.

For information on verifying HFS file bindings, see [Example for Verifying the HFS File Bindings of Cisco Unified SIP IP Phone Configuration and Firmware Files](#), on page 220.

For information on how to configure the home path, see [Configure HFS Home Path for SIP Phone Firmware Files](#), on page 207.

Locale Installer

Installing and configuring locale files in Cisco Unified CME when using an HTTP server is the same as when using a TFTP server.

For configuration information, see [Use the Locale Installer in Cisco Unified CME 7.0\(1\) and Later Versions](#), on page 430.

Security Recommendations

Like any access interface, the HFS download service can open router files that should only be accessed by authorized persons. Security issues are made more severe by the fact that the HFS download service is HTTP based, enabling anyone with a simple web browser to access sensitive files, such as configuration or image files, by entering a random string of words.

However, the HFS security problem is restricted to the loose binding operation, where the administrator provides an HFS home path in which the phone firmware and other related files are stored.

In the case where a unique directory path (where only the phone firmware files are stored) is used as the HFS home path

```
(config-telephony)# hfs home-path flash:/cme/loads/
```

only those files that are in flash:/cme/loads/ can be accessed.

But when it is the root directory path that is used as the HFS home path

```
(config-telephony)# hfs home-path flash:/
```

there is a risk of making configuration files and system images, which are stored in the root directory shared with the phone firmware files, accessible to unauthorized persons.

The following are two recommendations on how to make firmware files inaccessible to unauthorized persons:

- Create a unique directory, which is not shared by any other application or used for any other purpose, for IP phone firmware files. Using a root directory as the HFS home path is not recommended.
- Use the **ip http access-class** command to specify the access list that should be used to restrict access to the HTTP server. Before the HTTP server accepts a connection, it checks the access list. If the check fails, the HTTP server does not accept the request for a connection.

Redundant Cisco Unified CME Router for SCCP Phones

A second Cisco Unified CME router can be configured to provide call-control services if the primary Cisco Unified CME router fails. The secondary Cisco Unified CME router provides uninterrupted services until the primary router becomes operational again.

When a phone registers to the primary router, it receives a configuration file from the primary router. Along with other information, the configuration file contains the IP addresses of the primary and secondary

Cisco Unified CME routers. The phone uses these addresses to initiate a keepalive (KA) message to each router. The phone sends a KA message after every KA interval (30 seconds by default) to the router with which it is registered and after every two KA intervals (60 seconds by default) to the other router. The KA interval can be adjusted.

If the primary router fails, a phone will not receive an acknowledgment (ACK) to its KA message to the primary router. If the phone does not get an ACK from the primary router for three consecutive KAs, it registers with the secondary Cisco Unified CME router.

During the time that the phone is registered to the secondary router, it keeps sending a KA probe to the primary router to see if it has come back up, now every 60 seconds by default or two times the normal KA interval. After the primary Cisco Unified CME router returns to normal operation, the phone starts receiving ACKs for its probes. After the phone receives ACKs from the primary router for three consecutive probes, it switches back to the primary router and re-registers with it. The re-registration of phones with the primary router is also called rehoming.

The physical setup for redundant Cisco Unified CME routers is as follows. The FXO line from the PSTN is split using a splitter. From the splitter, one line goes to the primary Cisco Unified CME router and the other line goes to the secondary Cisco Unified CME router. When a call comes in on the FXO line, it is presented to both the primary and secondary Cisco Unified CME routers. The primary router is configured by default to answer the call immediately. The secondary Cisco Unified CME router is configured to answer the call after three rings. If the primary router is operational, it answers the call immediately and changes the call state so that the secondary router does not try to answer it. If the primary router is unavailable and does not answer the call, the secondary router sees the new call coming in and answers after three rings.

The secondary Cisco Unified CME router should be connected in some way on the LAN, either through the same switch or through another switch that may or may not be connected to the primary Cisco Unified CME router directly. As long as both routers and the phones are connected on the LAN with the appropriate configurations in place, the phones can register to whichever router is active.

Configure primary and secondary Cisco Unified CME routers identically, with the exception that the FXO voice port from the PSTN on the secondary router should be configured to answer after more rings than the primary router, as previously explained. The same command is used on both routers to specify the IP addresses of the primary and secondary routers.

For configuration information, see [Configure Redundant Router for SCCP Phones, on page 190](#).

Restriction

- Due to lack of High Availability support, Stateful Switchover or preservation of active calls is not supported in the redundancy feature offered by Unified CME.
- The physical setup for redundant Cisco Unified CME routers only support Loop start signaling. The Ground start signaling is not supported.

Redundant Cisco Unified CME Router for SIP Phones

A secondary Cisco Unified CME router can be configured to provide call-control services if the primary Cisco Unified CME router fails. The secondary Cisco Unified CME router provides uninterrupted services until the primary router becomes operational again.

When a SIP phone registers to the primary router, it receives a configuration file from the primary router. Along with other information, the configuration file contains the IP addresses of the primary and secondary Cisco Unified CME routers. The phone uses these addresses to initiate a keepalive (KA) message to the

secondary CME router. The phone sends a REGISTER message to the primary router for registration and a keepalive REGISTER message with Expires=0, to the secondary router during the keepalive interval (every 120 seconds by default). The keepalive interval can be configured (Range is 120 to 65535).

If primary router fails, a SIP phone (on registration refresh) will not receive a successful response for its REGISTER message. On unsuccessful response from primary router, phone registers with the secondary router. When the phone is registered to the secondary router, phone sends keepalive REGISTER (Expires=0) messages to the primary router.

After the primary Cisco Unified CME router returns to normal operation, the phone sends a "token-registration" to the primary router seeking permission to move registration of the phone from the standby secondary router to the primary router. To obtain a token, the SIP phones sends a Out-of-Dialog REFER message to the primary router for registration. The primary router accepts the token by responding with a 202 Accepted response. When the SIP phones receive the token (202 Accepted response) from the primary router, the phones will immediately de-register from the secondary router by sending a REGISTER message with Expires=0 for each line and registers back to the primary router. The re-registration of phones with the primary router is called rehomming.

No signaling or media preservation is done for any active calls on Unified CME. Hence during failover on primary CME, calls would remain in active state. But media would not be present for those calls. The SIP phones will not register to the secondary router until the active call is disconnected.

The secondary Cisco Unified CME router is connected directly to the same SIP trunk as the primary Cisco Unified CME router. As long as both routers and the phones are connected on the LAN with the appropriate configurations in place, the phones can register to whichever router is active. You should configure the primary and secondary Cisco Unified CME routers identically. The same command is used on both routers to specify the IP addresses of the primary and secondary routers.

For configuration information, see [Configure Redundant Router for SIP Phones, on page 192](#).

Restriction

- Due to lack of High Availability support, Stateful Switchover or preservation of active calls is not supported in the redundancy feature offered by Unified CME.

Timeouts

The following system-level timeout parameters have default values that are generally adequate:

- Busy Timeout—Length of time that can elapse after a transferred call reaches a busy signal before the call is disconnected.
- Interdigit Timeout—Length of time that can elapse between the receipt of individual dialed digits before the dialing process times out and is terminated. If the timeout ends before the destination is identified, a tone sounds and the call ends. This value is important when using variable-length dial-peer destination patterns (dial plans).
- Ringing Timeout—Length of time a phone can ring with no answer before returning a disconnect code to the caller. This timeout is used only for extensions that do not have no-answer call forwarding enabled. The ringing timeout prevents hung calls received over interfaces, such as FXO, that do not have forward-disconnect supervision.
- Keepalive—Interval determines how often a message is sent between the router and Cisco Unified IP phones, over the session, to ensure that the keepalive timeout is not exceeded. If no other traffic is sent over the session during the interval, a keepalive message is sent.

For configuration information, see [Modify Defaults for Timeouts for SCCP Phones, on page 188](#).

IPv6 Support for Cisco Unified CME SCCP Endpoints

Internet Protocol version 6 (IPv6), which is the latest version of the Internet Protocol (IP) that uses packets to exchange data, voice, and video traffic over digital networks, increases the number of network address bits from 32 bits in IPv4 to 128 bits. IPv6 support in Cisco Unified CME allows the network to behave transparently in a dual-stack (IPv4 and IPv6) environment and provides additional IP address space to SCCP phones and devices that are connected to the network. For information on configuring DHCP for IPv6, see [Network Parameters, on page 129](#).

Before Cisco Unified CME 8.0, SCCP supported IPv4 addresses (4 bytes) only. With Cisco Unified CME 8.0, the SCCP version is upgraded to store IPv6 address (16 bytes) also.

The following SCCP phones and devices are supported on IPv6: 7911, 7931, 7941G, 7941GE, 7961G, 7961GE, 7970G, 7971G, 7971G-GE, 7942, 7962, 7945, 7965, 7975, SCCP analogue gateway, Xcoder, and Hardware Conference devices. For more information on configuring SCCP IP phones for IPv6 source address, see [Configure IPv6 Source Address for SCCP IP Phones, on page 174](#).

Note You must disable Alternative Network Address Transport (ANAT) globally for SIP lines if you have a Cisco Unified CME with a dual-stack SIP trunk and enable ANAT at dial-peer level for the SIP trunk.

Support for IPv4-IPv6 (Dual-Stack)

Cisco Unified CME 8.0 can interact with and support any SCCP devices that support IPv4 only or both IPv4 and IPv6 (dual-stack). In dual-stack mode, two IP addresses are assigned to an interface, one is an IPv4 address and the other is an IPv6 address. Both IPv4 and IPv6 stacks are enabled on the voice gateways so that applications can interact with both versions of IP addresses. To support devices that use IPv4 only, IPv6 only, or both IPv4 and IPv6 (dual-stack) addresses, you must ensure that the Cisco Unified CME has both IPv4 address and IPv6 address enabled. For more information, see [Configure IP Phones in IPv4, IPv6, or Dual Stack Mode, on page 172](#).

Media Flow Through and Flow Around

Media transport modes, such as flow around and flow through, are used to transport media packets across endpoints. Media flow around enables media packets to pass directly between the endpoints, without the intervention of the IP-IP Gateway (IPIPGW). Media flow through enables media packets to pass through the endpoints, without the intervention of the IPIPGW.

[Table 14: Call Flow Scenarios Between IPv4 only, IPv6 only, and Dual-Stack, on page 169](#) lists media flow-through and flow-around scenarios between endpoints that support IPv4, IPv6, and dual-stack. When both endpoints are IPv4 only or IPv6 only, the call flows around. When one endpoint is IPv4 and the other is IPv6, calls flow through. When one endpoint is dual-stack and the other IPv4 or IPv6 the calls flow around. When both endpoints are dual-stack calls flow around or follows the preference (preferred IP address version) selected by protocol mode in dual-stack.

Table 14: Call Flow Scenarios Between IPv4 only, IPv6 only, and Dual-Stack

IP Versions	IPv4 Only	IPv6 Only	Dual-Stack
IPv4 Only	Flow Around ¹	Flow Through	Flow Around
IPv6 Only	Flow Through	Flow Around	Flow Around/IPv6
Dual-Stack	Flow Around/IPv4	Flow Around/IPv6	Flow Around/Preference

¹ When MTP is configured under ephones all the call flow-around scenarios change to flow-through. This is also applicable to cross-VRF endpoints.

Media Flow Around Support for SIP-SIP Trunk Calls

Cisco Unified CME 8.5 and later versions support the media flow around functionality for SIP to SIP trunk calls on Cisco Unified CME, allowing less consumption of resources on Cisco Unified CME.

The media flow around feature eliminates the need to terminate RTP and re-originate on Cisco Unified CME. This reduces media switching latency and increases the call handling capacity for a Cisco Unified CME SIP trunk.

Media flow around is supported in the following scenarios:

- **Single Number Reach (SNR) Push**—If an SNR call on a SIP trunk is pushed over to a mobile user over another SIP trunk, the resulting connection is a SIP-SIP trunk call connection. If both SIP trunks are configured for media flow around, the media is allowed to flow around Cisco Unified CME for the resulting call.
- **Call Forward**—If a SIP trunk call is forwarded over another SIP trunk and both the SIP trunks are configured for media flow around, media flows around Cisco Unified CME for the resulting SIP-SIP trunk call. Media flow around is supported for all types of call forwarding, such as call forward night-service, call forward all, call forward busy, and call forward no-answer.
- **Call Transfer**—If a SIP trunk call is transferred over another SIP trunk and both SIP trunks are configured for media flow around, media flows around Cisco Unified CME for the resulting SIP-SIP trunk call. Media flow around is supported on both SIP-line-initiated call transfer and SCCP-line-initiated call transfers. It is supported for all types of call transfers, such as blind transfer, consult transfer, and full consult transfer.

Media is forced to flow through on different types of call flows including the SIP to SIP trunk call with asymmetric flow mode configurations or symmetric flow through configuration. In asymmetric flow mode configurations, one SIP leg is configured in the media flow around mode and another SIP leg is configured in the media flow through mode. In such cases, media is forced to flow through Cisco Unified CME.

Media is forced to flow through Cisco Unified CME for the following types of call flows:

- Any calls involving a SIP endpoint, a SCCP endpoint, PSTN trunks (BRI/PRI/FXO), or FXO circuits.
- SIP to SIP trunk call with either asymmetric flow mode configurations or symmetric flow through configurations.
- SIP to SIP trunk call that requires transcoding services on Cisco Unified CME.

- SIP to SIP trunk calls that require DTMF interworking with RFC2833 on one side, and SIP-Notify on the other side.
- SNR pullback to SCCP— When an SNR call is pulled back from a mobile phone to the local SCCP SNR extension, the call is connected to the SCCP SNR extension. Media is required to flow through Cisco Unified CME because one of the calls is from a SCCP SNR extension, which is local to Cisco Unified CME.

In Cisco Unified CME 8.5, the media flow around feature is turned on or turned off using the **media** command in voice service voip, dial-peer voip, and voice class media configuration modes. The configuration specified under voice class media configuration mode takes precedence over the configuration in dial-peer configuration mode. If the media configuration is not specified under voice class media or dial-peer configuration mode, then the global configuration specified under voice service voip takes precedence. For more information, see [Enable Media Flow Mode on SIP Trunks, on page 209](#).

Overlap Dialing Support for SIP and SCCP IP Phones

Cisco Unified CME 8.5 and later versions support overlap dialing on SCCP and SIP IP phones such as 7942, 7945, 7962, 7965, 7970, 7971, and 7975.

In earlier versions of Cisco Unified CME, overlap dialing was not supported over PRI/BRI trunks for calls originating from SCCP or SIP IP phones. Dialing was always converted into enbloc dialing based on the dial-peer configuration and the dial-peer mapping application. Once dialpeer matching took place, no further dialing was possible and no overlap digit were sent over ISDN trunk, even though overlap dialing was supported over ISDN trunks.

SCCP IP phones currently support overlap dialing, but digits are converted to enbloc digits when it reaches Cisco Unified CME. Overlap dialing is supported on SIP IP phones using the KeyPad Markup Language (KPML) method.

With overlap dialing support, the dialed digits from the SIP or SCCP IP phones are passed across to the PRI/BRI trunks as overlap digits and not as enbloc digits, enabling overlap dialing on the PRI/BRI trunks as well.

For information on how to configure SCCP and SIP IP phones for overlap dialing, see [Configure Overlap Dialing on SCCP IP Phones, on page 196](#) and [Configure Overlap Dialing on SIP Phones, on page 211](#).

Unsolicited Notify for Shared Line and Presence Events for Cisco Unified SIP IP Phones

Before Cisco Unified CME 9.0, a Cisco Unified SIP IP phone receives NOTIFY messages that convey shared line and presence events from the Cisco Unified CME only by subscribing to such events. To subscribe, the IP phone sends a SUBSCRIBE message to the Cisco Unified CME with the type of event for which it wants to be notified. The Cisco Unified CME sends a NOTIFY message to alert the subscribed IP phone or subscriber of event updates.

In Unsolicited Notify, the Cisco Unified CME acquires the required information from the router configuration to create the implicit subscription and adds subscribers without a subscription request from Cisco Unified SIP IP phones. The Cisco Unified CME sends out NOTIFY messages to the IP phones for shared line or presence updates.

In Cisco Unified CME 9.0 and later versions, the Unsolicited Notify mechanism reduces network traffic particularly during Cisco Unified SIP IP phone registration using the bulk registration method. Through this registration method, the preferred notification method of the IP phone is embedded in the registration message.

Note Configuring TCP as the transport layer protocol under voice register pool configuration mode enables bulk registration with negotiation for the Unsolicited Notify mechanism.

The Unsolicited Notify mechanism supports backward compatibility with all existing Cisco Unified SIP IP phone features. This mechanism is also the defacto notify mechanism in newer IP phone and Cisco Unified CME features, such as SNR Mobility.

From the end-user perspective, the following are the only two discernible differences between the SUBSCRIBE/NOTIFY and the Unsolicited Notify mechanisms:

- **show presence subscription** and **show shared-line** commands display different subscription IDs for each mechanism.
- With the SUBSCRIBE/NOTIFY mechanism, a Cisco Unified SIP IP phone needs to refresh the Cisco Unified CME subscription. In Unsolicited Notify mode, the subscription is permanent and does not need a refresh as long as the IP phone remains registered.

Restriction

- Because Unsolicited Notify is negotiated during bulk registration, the mechanism is not available on Cisco Unified SIP IP phones that do not have bulk registration turned on or have firmware that do not support bulk registration.
- Cisco Unified CME cannot disable the Unsolicited Notify mechanism. The system complies with and cannot override the requests of Cisco Unified SIP IP phones.
- In the absence of Cisco Unified SIP IP phone subscription information to distinguish if a notification event is for line or device monitoring, local device monitoring is not supported in the Unsolicited Notify mode.

Interface Support for Unified CME and Unified SRST

Unified CME and Unified SRST routers have multiple interfaces that are used for signaling and data packet transfers. The two types of interfaces available on a Cisco router include the physical interface and the virtual interface. The types of physical interfaces available on a router depends on its interface processors or port adapters. Virtual interfaces are software-based interfaces that you create in the memory of the networking device using Cisco IOS commands. When you need to configure a virtual interface for connectivity, you can use the Loopback Interface for Unified CME and Unified SRST.

The following interfaces are supported on Unified CME and Unified SRST:

- Gigabit Ethernet Interface (IEEE 802.3z) (**interface gigabitethernet**)
- Loopback Interface (**interface loopback**)
- Fast Ethernet Interface (**interface fastethernet**)

The remaining Cisco IOS interfaces are not validated on Unified CME and Unified SRST. Hence, Unified CME and Unified SRST do not claim support for these interfaces. For more information on the Cisco IOS Interface commands, see [Cisco IOS Interface and Hardware Component Command Reference](#).

For physical interfaces such as **interface gigabitethernet** and **interface fastethernet**, subinterfaces are supported. In a subinterface, virtual interfaces are created by dividing a physical interface into multiple logical interfaces. For Cisco routers, a subinterface uses the parent physical interface for sending and receiving data. Virtual interfaces (For example, **interface loopback**) do not support subinterfaces.

A subinterface for **interface gigabitethernet** is configured as follows:

```
Router(config)#interface gigabitEthernet 0/0.1
Router(config-subif)#exit
Router(config)#exit
```

Configure System-Level Parameters

Configure IP Phones in IPv4, IPv6, or Dual Stack Mode

Restriction

- Legacy IP phones are not supported.
- Multicast MOH and multicast paging features are not supported on IPv6 only phones. If you want to receive paging calls on IPv6 enabled phones, use the default multicast paging.
- Primary and secondary CME need to be provisioned with the same network type.
- MWI relay server must be in IPv4 network.
- Presence server must be IPv4 only.
- Video endpoints, such as CUVA and 7985, are not supported in IPv6
- TAPI client is not supported in IPv6.
- All HTTP based IPv6 services are not supported.
- IOS TFTP server is not supported in IPv6.
- If protocol mode is IPv4, you can only configure IPv4 as the source IP-address, if protocol mode is IPv6 you can only configure IPv6 as the source IP address and if the protocol mode is dual-stack, you can configure both IPv4 and IPv6 source addresses.

Before you begin

- Cisco Unified CME 8.0 or later version.
- IPv6 CEF must be enabled for dual-stack configuration.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **protocol mode {ipv4 | ipv6 | dual-stack [preference {ipv4 | ipv6}]}**

5. end

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.
Step 4	protocol mode {ipv4 ipv6 dual-stack [preference {ipv4 ipv6}]} Example: Router(config-telephony)# protocol mode dual-stack preference ipv6	Allows SCCP phones to interact with phones on IPv6 voice gateways. You can configure phones for IPv4 addresses, IPv6 addresses, or for a dual-stack mode • ipv4—Allows you to set the protocol mode as an IPv4 address. • ipv6—Allows you to set the protocol mode as an IPv6 address. • dual-stack—Allows you to set the protocol mode for both IPv4 and IPv6 addresses. • preference—Allows you to choose a preferred IP address family if protocol mode is dual-stack.
Step 5	end Example: Router(config-telephony)# end	Returns to privileged EXEC mode.

Example

```
telephony-service
protocol mode dual-stack preference ipv6
....
ip source-address 10.10.2.1 port 2000
ip source-address 2000:A0A:201:0:F:35FF:FF2C:697D
```

Configure IPv6 Source Address for SCCP IP Phones

Restriction

- IPv6 option only appears if protocol mode is in dual-stack or IPv6.
- Do not change the default port number (2000) in the **ip source-address** configuration command. If you change the port number, IPv6 CEF packet switching engine may not be able to handle the IPv6 SCCP phones and various packet handling problems may occur.

Before you begin

Cisco Unified CME 8.0 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **ip source-address** {*ipv4 address* | *ipv6 address*} **port** *port* [**secondary** {*ipv4 address* | *ipv6 address*} [*rehome seconds*]] [**strict-match**]
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters the telephony-service configuration mode.
Step 4	ip source-address { <i>ipv4 address</i> <i>ipv6 address</i> } port <i>port</i> [secondary { <i>ipv4 address</i> <i>ipv6 address</i> } [<i>rehome seconds</i>]] [strict-match] Example: Router(config-telephony)# ip source-address 10.10.10.33 port 2000 ip source-address 2001:10:10:10::	Allows to configure an IPv4 or IPv6 address as an IP source-address for phones to communicate with a Cisco Unified CME router. • <i>ipv4 address</i>—Allows phones to communicate with phones or voice gateways in an IPv4 network. <i>ipv4 address</i> can only be configured with an IPv4 address or a dual-stack mode.

	Command or Action	Purpose
		• ipv6 address—Allows phones to communicate with phones or voice gateways in an IPv6 network. <i>ipv6 address</i> can only be configured with an IPv6 address or a dual-stack mode. • (Optional) port port—TCP/IP port number to use for SCCP. Range is from 2000 to 9999. Default is 2000. For dual-stack, port is only configured with an IPv4 address. • (Optional) secondary—Cisco Unified CME router with which phones can register if the primary Cisco Unified CME router fails. • (Optional) rehome seconds—Used only by Cisco Unified IP phones that have registered with a Cisco Unified Survivable Remote Site Telephony (SRST) router. This keyword defines a delay that is used by phones to verify the stability of their primary SCCP controller (Cisco Unified Communication Manager or Cisco Unified CME) before the phones re-register with it. This parameter is ignored by phones unless they are registered to a secondary Cisco Unified SRST router. The range is from 0 to 65535 seconds. The default is 120 seconds. The use of this parameter is a phone behavior and is subject to change, based on the phone type and phone firmware version. • (Optional) strict-match— Requires strict IP address checking for registration.
Step 5	end Example: <code>outer(config-telephony)# end</code>	Returns to privileged EXEC mode.

Verify IPv6 and Dual-Stack Configuration

Procedure

Step 1

The following example shows a list of success messages that are printed during Cisco IOS boot up. These messages confirm whether IPv6 has been enabled on interfaces (for example, EDSP0.1 to EDSP0.5) specific to exchanging RTP packets with SCCP endpoints.

Example:

```
Router#
00:00:33: %EDSP-6-IPV6_ENABLED: IPv6 on interface EDSP0 added.
00:00:34: %EDSP-6-IPV6_ENABLED: IPv6 on interface EDSP0.1 added.
00:00:34: %EDSP-6-IPV6_ENABLED: IPv6 on interface EDSP0.2 added.
00:00:34: %EDSP-6-IPV6_ENABLED: IPv6 on interface EDSP0.3 added.
```

```

00:00:34: %EDSP-6-IPV6_ENABLED: IPv6 on interface EDSP0.4 added.
00:00:34: %EDSP-6-IPV6_ENABLED: IPv6 on interface EDSP0.5 added.
00:00:34: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/1, changed state to down
00:00:34: %LINK-3-UPDOWN: Interface ephone_dsp DN 1.1, changed state to up
00:00:34: %LINK-3-UPDOWN: Interface ephone_dsp DN 1.2, changed state to up
.

```

Step 2 Use the **show ephone socket** command to verify if IPv4 only, IPv6 only, or dual-stack (IPv4/IPv6) is configured in Cisco Unified CME. In the following example, SCCP TCP listening socket (skinny_tcp_listen_socket fd) values 0 and 1 verify dual-stack configuration. When IPv6 only is configured, the **show ephone socket** command displays SCCP TCP listening socket values as (-1) and (0). The listening socket is closed if the value is (-1). When IPv4 only is configured, the **show ephone socket** command displays SCCP TCP listening socket values as (0) and (-1).

Example:

```

Router# show ephone socket
skinny_tcp_listen_socket fd = 0

skinny_tcp_listen_socket (ipv6) fd = 1

skinny_secure_tcp_listen_socket fd = -1
skinny_secure_tcp_listen_socket (ipv6) fd = -1

Phone 7,

skinny_sockets[15] fd = 16 [ipv6]

read_buffer 0x483C0BC4, read_offset 0, read_header N, read_length 0
resend_queue 0x47EC69EC, resend_offset 0, resend_flag N, resend_Q_depth 0

MTP 1,

skinny_sockets[16] fd = 17

read_buffer 0x483C1400, read_offset 0, read_header N, read_length 0
resend_queue 0x47EC6978, resend_offset 0, resend_flag N, resend_Q_depth 0

Phone 8,

skinny_sockets[17] fd = 18 [ipv6]

read_buffer 0x483C1C3C, read_offset 0, read_header N, read_length 0
resend_queue 0x47EC6904, resend_offset 0, resend_flag N, resend_Q_depth 0

```

Step 3 Use the **show ephone summary** command to verify the IPv6 or IPv4 addresses configured for ephones. The following example displays IPv6 and IPv4 addresses for different ephones:

Example:

```

Router# show ephone summary
ephone-2[1] Mac:0016.46E0.796A TCP socket:[7] activeLine:0 whisperLine:0 REGISTERED

mediaActive:0 whisper_mediaActive:0 startMedia:0 offhook:0 ringing:0 reset:0 reset_sent:0 debug:0
privacy:1 primary_dn: 1*

IPv6:2000:A0A:201:0:216:46FF:FEE0:796A* IP:10.10.10.12 7970 keepalive 599 music 0 1:1

```

```

sp1:2004

ephone-7[6] Mac:0013.19D1.F8A2 TCP socket:[6] activeLine:0 whisperLine:0 REGISTERED

mediaActive:0 whisper_mediaActive:0 startMedia:0 offhook:0 ringing:0 reset:0 reset_sent:0 debug:0
privacy:0 primary_dn: 13*

IP:10.10.10.14 * Telecaster 7940 keepalive 2817 music 0 1:13 2:28

```

Configure Bulk Registration

To configure bulk registration for registering a block of phone numbers with an external registrar so that calls can be routed to Cisco Unified CME from a SIP network, perform the following steps.

Numbers that match the number pattern defined by using the **bulk** command can register with the external registrar. The block of numbers that is registered can include any phone that is attached to Cisco Unified CME or any analog phone that is directly attached to an FXS port on a Cisco Unified CME router.

Note Use the **no reg** command to specify that an individual directory number should not register with the external registrar. For configuration information, see [Disable SIP Proxy Registration for a Directory Number, on page 288](#).

Before you begin

Cisco Unified CME 3.4 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **mode cme**
5. **bulk number**
6. **exit**
7. **sip-ua**
8. **registrar {dns: address | ipv4: destination-address} expires seconds [tcp] [secondary] no registrar [secondary]**
9. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.
Step 4	mode cme Example: Router(config-register-global)# mode cme	Enables mode for provisioning SIP phones in Cisco Unified CME.
Step 5	bulk number Example: Router(config-register-global)# bulk 408526...	Sets bulk registration for E.164 numbers that will register with a SIP proxy server. <i>number</i>—Unique sequence of up to 32 characters, including wild cards and patterns that represents E.164 numbers that will register with a SIP proxy server.
Step 6	exit Example: Router(config-register-pool)# exit	Exits configuration mode to the next highest mode in the configuration mode hierarchy.
Step 7	sip-ua Example: Router(config)# sip-ua	Enters SIP user agent (UA) configuration mode for configuring the user agent.
Step 8	registrar {dns: address ipv4: destination-address} expires seconds [tcp] [secondary] no registrar [secondary] Example: Router(config-sip-ua)# registrar server ipv4:1.5.49.240	Enables SIP gateways to register E.164 numbers with a SIP proxy server.
Step 9	end Example: Router(config-sip-ua)# end	Exits SIP UA configuration mode and enters privileged EXEC mode.

Examples

The following example shows that all phone numbers that match the pattern “408555...” can register with a SIP proxy server (IP address 1.5.49.240):

```
voice register global
 mode cme
 bulk 408555...
 sip-ua
 registrar ipv4:1.5.49.240
```

Configure Bulk Registration for SIP IP Phones

Before you begin

- Cisco Unified CME 8.6 or a later version.
- Phone firmware 8.3 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool tag**
4. **session-transport {tcp | udp}**
5. **number tag dn tag**
6. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register pool tag Example: Router(config)#voice register pool 20	Enters voice register dn configuration mode to define a directory number for a SIP phone, intercom line, voice port, or an MWI.
Step 4	session-transport {tcp udp} Example: Router(config-register-pool)#session-transport tcp	Specifies the transport layer protocol that a SIP phone uses to connect to Cisco Unified CME. • tcp —TCP is used for bulk registration.

Verify Phone Registration Type and Status

	Command or Action	Purpose
		• udp—UDP is used for line registration.
Step 5	number tag dn tag Example: Router(config-register-pool)#number 1 dn 2	Associates a directory number with the SIP phone being configured. • dn dn-tag—Identifies the directory number for this SIP phone as defined by the voice register dn command.
Step 6	end Example: Router(config-register-pool)# end	Returns to privileged EXEC mode.

Verify Phone Registration Type and Status

You can verify phone registration type and status using the **show voice register pool** command. The following example shows that the Cisco Unified IP phone 7970 used the bulk registration method and completed the registration process:

```
Router#sh voice register pool 20
Pool Tag 20
Config:
Mac address is 001B.2A89.3698
Type is 7970
Number list 1 : DN 20
Number list 2 : DN 2
Number list 3 : DN 24
Number list 4 : DN 4
Number list 5 : DN 6
Number list 6 : DN 7
Number list 7 : DN 17
Number list 8 : DN 23
Proxy Ip address is 0.0.0.0
Current Phone load version is Cisco-CP7970G/9.0.1
DTMF Relay is enabled, rtp-nte, sip-notify
Call Waiting is enabled
DnD is disabled
Video is disabled
Camera is disabled
Busy trigger per button value is 0
speed-dial blf 1 6779 label 6779_device
speed-dial blf 2 3555 label 3555_remote
speed-dial blf 3 6130 label 6130
```

```

speed-dial blf 4 3222 label 3222_remote_dev
fastdial 1 1234
keep-conference is enabled
username johndoe password cisco
template is 1
kpml signal is enabled
Lpcor Type is none
Transport type is tcp
service-control mechanism is supported
Registration method: bulk - completed
registration Call ID is 001b2a89-3698017e-68646967-126b902e@28.18.88.33
Privacy is configured:  init status: ON, current status: ON
Privacy button is enabled
active primary line is: 6010

```

Set Up Cisco Unified CME for SCCP Phones

To identify filenames and the location of phone firmware for phone types to be connected, specify the port for phone registration, and specify the number of phones and directory numbers to be supported, perform the following steps.

Restriction

DSCP requires Cisco Unified CME 7.1 or a later version. If DSCP is configured for the gateway interface using the **service-policy** command or for the dial peer using the **ip qos dscp** command, the value set with those commands takes precedence over the DSCP value configured in this procedure.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **tftp-server** *device:filename*
4. **telephony-service**
5. **load** *phone-type firmware-file*
6. **max-ephones** *max-phones*
7. **max-dn** *max-directory-numbers* [**preference** *preference-order*] [**no-reg** **primary** | **both**]
8. **ip source-address** *ip-address* [**port** *port*] [**any-match** | **strict-match**]
9. **ip qos dscp** { {*number* | *af* | *cs* | **default** | **ef**} {**media** | **service** | **signaling** | **video**}}
10. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	tftp-server device:filename Example: Router(config)# tftp-server flash:P00307020300.bin	(Optional) Creates TFTP bindings to permit IP phones served by the Cisco Unified CME router to access the specified file. • A separate tftp-server command is required for each phone type. • Required for Cisco Unified CME 7.0/4.3 and earlier versions. • Cisco Unified CME 7.0(1) and later versions: Required only if the location for cnf files is not flash or slot 0, such as system memory or a TFTP server url. Use the complete filename, including the file suffix, for phone firmware versions later than version 8.2(2) for all phone types.
Step 4	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.
Step 5	load phone-type firmware-file Example: Router(config-telephony)# load 7960-7940 P00307020300	Identifies a Cisco Unified IP phone firmware file to be used by phones of the specified type when they register. • A separate load command is required for each IP phone type. • firmware-file—Filename is case-sensitive. • Cisco Unified CME 7.0/4.3 and earlier versions: Do not use the .sbin or .loads file extension except for the Cisco ATA and Cisco Unified IP Phone 7905 and 7912. • Cisco Unified CME 7.0(1) and later versions: Use the complete filename, including the file suffix, for phone firmware versions later than version 8.2(2) for all phone types.

	Command or Action	Purpose
		Note If you are loading a firmware file larger than 384 KB, you must first load a file for that phone type that is smaller than 384 KB and then load the larger file.
Step 6	max-ephones <i>max-phones</i> Example: <pre>Router(config-telephony)# max-ephones 24</pre>	Sets the maximum number of phones that can register to Cisco Unified CME. • Maximum number is platform and version-specific. Type ? for range. • In Cisco Unified CME 7.0/4.3 and later versions, the maximum number of phones that can register is different from the maximum number of phones that can be configured. The maximum number of phones that can be configured is 1000. • In versions earlier than Cisco Unified CME 7.0/4.3, this command restricted the number of phones that could be configured on the router.
Step 7	max-dn <i>max-directory-numbers</i> [preference <i>preference-order</i>] [no-reg primary both] Example: <pre>Router(config-telephony)# max-dn 200 no-reg primary</pre>	Limits number of directory numbers to be supported by this router. • Maximum number is platform and version-specific. Type ? for value.
Step 8	ip source-address <i>ip-address</i> [port <i>port</i>] [any-match strict-match] Example: <pre>Router(config-telephony)# ip source-address 10.16.32.144</pre>	Identifies the IP address and port number that the Cisco Unified CME router uses for IP phone registration. • port <i>port</i>—(Optional) TCP/IP port number to use for SCCP. Range is 2000 to 9999. Default is 2000. • any-match—(Optional) Disables strict IP address checking for registration. This is the default. • strict-match—(Optional) Instructs the router to reject IP phone registration attempts if the IP server address used by the phone does not exactly match the source address.
Step 9	ip qos dscp {{ <i>number</i> <i>af</i> <i>cs</i> default ef } { media service signaling video }} Example: <pre>Router(config-telephony)# ip qos dscp af43 video</pre>	Sets the DSCP priority levels for different types of traffic.
Step 10	end Example: <pre>Router(config-telephony)# end</pre>	Returns to privileged EXEC mode.

Examples

The following example shows different DSCP settings for media, signaling, video, and services enabled with the `ip qos dscp` command:

```
telephony-service
load 7960-7940 P00308000500
max-ephones 100
max-dn 240
ip source-address 10.10.10.1 port 2000
ip qos dscp af11 media
ip qos dscp cs2 signal
ip qos dscp af43 video
ip qos dscp 25 service
cnf-file location flash:
.
.
```

Set Date and Time Parameters for SCCP Phones

To specify the format of the date and time that appears on all SCCP phones in Cisco Unified CME, perform the following steps.

Note For certain phones, such as the Cisco Unified IP Phones 7906, 7911, 7931, 7941, 7942, 7945, 7961, 7962, 7965, 7970, 7971, and 7975, you must configure the **time-zone** command to ensure that the correct time stamp appears on the phone display. This command is not required for Cisco Unified IP Phone 7902G, 7905G, 7912G, 7920, 7921, 7935, 7936, 7940, 7960, or 7985G.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **date-format** {dd-mm-yy | mm-dd-yy | yy-dd-mm | yy-mm-dd}
5. **time-format** {12 | 24}
6. **time-zone** *number*
7. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.
Step 4	date-format {dd-mm-yy mm-dd-yy yy-dd-mm yy-mm-dd} Example: Router(config-telephony)# date-format yy-mm-dd	(Optional) Sets the date format for phone display. • Default: mm-dd-yy .
Step 5	time-format {12 24} Example: Router(config-telephony)# time-format 24	(Optional) Selects a 12-hour or 24-hour clock for the time display format on phone display. • Default: 12 .
Step 6	time-zone number Example: Router(config-telephony)# time-zone 2	Sets time zone for SCCP phones. • Not required for Cisco Unified IP Phone 7902G, 7905G, 7912G, 7920, 7921, 7935, 7936, 7940, 7960, or 7985G. • Default: 5, Pacific Standard/Daylight Time (-480).
Step 7	end Example: Router(config-telephony)# end	Returns to privileged EXEC mode.

Block Automatic Registration for SCCP Phones

Before you begin

Cisco Unified CME 4.0 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **no auto-reg-ephone**
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.
Step 4	no auto-reg-ephone Example: Router(config-telephony)# no auto-reg-ephone	Disables automatic registration of Cisco Unified IP phones that are running SCCP but are not explicitly configured in Cisco Unified CME. • Default: Enabled.
Step 5	end Example: Router(config-telephony)# end	Returns to privileged EXEC mode.

Define Per-Phone Configuration Files and Alternate Location for SCCP Phones

Restriction

- TFTP does not support file deletion. When configuration files are updated, they overwrite any existing configuration files with the same name. If you change the configuration file location, files are not deleted from the TFTP server.
- Generating configuration files on flash memory or slot 0 memory can take up to a minute, depending on the number of files being generated.
- For smaller routers such as the Cisco 2600 series routers, you must manually enter the **squeeze** command to erase files after changing the configuration file location or entering any commands that trigger the deletion of configuration files. Unless you use the **squeeze** command, the space used by the moved or deleted configuration files is not usable by other files.
- If VRF Support on Cisco Unified CME is configured and the **cnf-file location** command is configured for system:, the per phone or per phone type file for an ephone in a VRF group is created in *system:/its/vrf<group-tag>/*. The vrf directory is automatically created and appended to the TFTP path. No action is required on your part. Locale files are still created in system:/its/.
- If VRF Support on Cisco Unified CME is configured and the **cnf-file location** command is configured as **flash:** or **slot0:**, the per phone or per phone type file for an ephone in a VRF group is named *flash:/its/vrf<group-tag>_<filename>* or *slot0:/its/vrf<group-tag>_<filename>*. The vrf directory is automatically created and appended to the TFTP path. No action is required on your part. The location of the locale files is not changed.

To define a location other than system:/its for storing configuration files for per-phone and per-phone type configuration files, perform the following steps.

Before you begin

- Cisco Unified CME 4.0 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **cnf-file location {flash: | slot0: | tftp tftp-url}**
5. **cnf-file {perphonetype | perphone}**
6. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: Router> enable	Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.
Step 4	cnf-file location {flash: slot0: tftp tftp-url} Example: Router(config-telephony)# cnf-file location flash:	Specifies a location other than system:/its for storing phone configuration files. Required for per-phone or per-phone type configuration files.
Step 5	cnf-file {perphonetype perphone} Example: Router(config-telephony)# cnf-file perphone	Specifies whether to use a separate file for each type of phone or for each individual phone. Required if you configured the cnf-file location command.
Step 6	end Example: Router(config-telephony)# end	Returns to privileged EXEC mode.

Example

The following example selects flash memory as the configuration file storage location and per-phone as the type of configuration files that the system generates:

```
telephony-service
cnf-file location flash:
cnf-file perphone
```

What to do next

If you changed the configuration file storage location, use the **option 150 ip** command to update the address. See [Change the TFTP Address on a DHCP Server, on page 152](#).

Modify Defaults for Timeouts for SCCP Phones

To configure values for system-level intervals for which default values are typically adequate, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **timeouts busy** *seconds*
5. **timeouts interdigit** *seconds*
6. **timeouts ringing** *seconds*
7. **keepalive** *seconds*
8. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Router> enable</code>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3	telephony-service Example: <code>Router(config)# telephony-service</code>	Enters telephony-service configuration mode.
Step 4	timeouts busy <i>seconds</i> Example: <code>Router(config-telephony)# timeouts busy 20</code>	(Optional) Sets the length of time after which calls that are transferred to busy destinations are disconnected. • <i>seconds</i>—Number of seconds. Range is 0 to 30. Default is 10.
Step 5	timeouts interdigit <i>seconds</i> Example: <code>Router(config-telephony)# timeouts interdigit 30</code>	(Optional) Configures the interdigit timeout value for all Cisco Unified IP phones attached to the router. • <i>seconds</i>—Number of seconds before the interdigit timer expires. Range is 2 to 120. Default is 10.
Step 6	timeouts ringing <i>seconds</i> Example: <code>Router(config-telephony)# timeouts ringing 30</code>	(Optional) Sets the duration, in seconds, for which the Cisco Unified CME system allows ringing to continue if a call is not answered. Range is 5 to 60000. Default is 180.
Step 7	keepalive <i>seconds</i> Example: <code>Router(config-telephony)# keepalive 45</code>	(Optional) Sets the time interval, in seconds, between keepalive messages that are sent to the router by Cisco Unified IP phones.

	Command or Action	Purpose
		- The default is usually adequate. If the interval is set too large, it is possible for notification to be delayed when a system goes down. - Range: 10 to 65535. Default: 0.
Step 8	end Example: Router(config-telephony)# end	Returns to privileged EXEC mode.

Configure Redundant Router for SCCP Phones

Before you begin

- Cisco Unified CME 4.0 or a later version.
- The secondary router's running configuration must be identical to that of the primary router.
- The physical configuration of the secondary router must be as described in [Redundant Cisco Unified CME Router for SCCP Phones, on page 165](#).
- Phones that use this feature must be configured with the **type** command, which guarantees that the appropriate phone configuration file will be present.

SUMMARY STEPS

- enable**
- configure terminal**
- telephony-service**
- ip source-address** *ip-address* [**port** *port*] [**secondary** *ip-address* [**rehome** *seconds*]] [**any-match** | **strict-match**]
- exit**
- voice-port** *slot-number* / *port*
- signal ground-start**
- incoming alerting ring-only**
- ring number** *number*
- end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	telephony-service Example: <pre>Router(config)# telephony-service</pre>	Enters telephony-service configuration mode.
Step 4	ip source-address <i>ip-address</i> [<i>port port</i>] [<i>secondary ip-address</i> [<i>rehome seconds</i>]] [<i>any-match</i> <i>strict-match</i>] Example: <pre>Router(config-telephony)# ip source-address 10.0.0.1 port 2000 secondary 10.2.2.25</pre>	Identifies the IP address and port number that the primary Unified CME router uses for IP phone registration. • <i>ip-address</i>—Address of the primary Unified CME router. • <i>port port</i>—(Optional) TCP/IP port number to use for SCCP. Range is 2000 to 9999. Default is 2000. • <i>secondary ip-address</i>—Indicates a backup Unified CME router. • <i>rehome seconds</i>—Not used by Unified CME. Used only by phones registered to Cisco Unified SRST. • <i>any-match</i>—(Optional) Disables strict IP address checking for registration. This is the default. • <i>strict-match</i>—(Optional) Router rejects IP phone registration attempts if the IP server address used by the phone does not exactly match the source address.
Step 5	exit Example: <pre>Router(config-telephony)# exit</pre>	Exits telephony-service configuration mode.
Step 6	voice-port <i>slot-number</i> / <i>port</i> Example: <pre>Router(config)# voice-port 2/0</pre>	Enters voice-port configuration mode for the FXO voice port for DID calls from the PSTN.
Step 7	signal ground-start Example: <pre>Router(config-voiceport)# signal ground-start</pre>	Specifies ground-start signaling for a voice port.
Step 8	incoming alerting ring-only Example: <pre>Router(config-voiceport)# incoming alerting ring-only</pre>	Instructs the FXO ground-start voice port to detect incoming calls by detecting incoming ring signals.
Step 9	ring number <i>number</i> Example: <pre>Router(config-voiceport)# ring number 3</pre>	(Required only for the secondary router) Sets the maximum number of rings to be detected before answering an incoming call over an FXO voice port. • <i>number</i>—Number of rings detected before answering the call. Range is 1 to 10. Default is 1.

	Command or Action	Purpose
		Note For an incoming FXO voice port on a secondary Cisco Unified CME router, set this value higher than is set on the primary router. We recommend setting this value to 3 on the secondary router.
Step 10	end Example: <code>Router(config-voiceport)# end</code>	Returns to privileged EXEC mode.

Configure Redundant Router for SIP Phones

Before you begin

- Cisco Unified CME 11.6 or a later version.
- Auto-register configuration is recommended only on the primary router.
- XML interface for secondary backup router is configured. See [Configure the XML Interface for the Secondary Backup Router, on page 194](#).

Note

It is recommended to configure the XML interface for a seamless failover from primary to secondary Cisco Unified CME. Else, there is delay in the phones getting registered to secondary Cisco Unified CME due to mismatch in the configuration version timestamp.

- Ensure that you configure version stamp synchronization on the primary router. See [Configure Version Stamp Synchronization on the Primary Router, on page 193](#).

Note

It is recommended to configure version stamp synchronization for a seamless failover from primary to secondary Cisco Unified CME. Else, there is delay in the phones getting registered to secondary Cisco Unified CME.

Restriction

- Active calls are not supported when switchover happens from primary router to the secondary router.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **source-address** *ip-address* [**port** *port*] [**secondary** *ip-address*]

5. **keepalive** *seconds*
6. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode.
Step 4	source-address <i>ip-address</i> [port <i>port</i>] [secondary <i>ip-address</i>] Example: Router(config-register-global)# source-address 10.6.21.4 port 6000 secondary 10.6.50.6	Identifies the IP address and port number that the Cisco Unified CME router uses for IP phone registration. • <i>ip-address</i>—Address of the primary Cisco Unified CME router. • port <i>port</i>—(Optional) TCP/IP port number to use for SIP. Range is 2000 to 9999. Default is 5060 for SIP. • secondary <i>ip-address</i>—Indicates a backup Cisco Unified CME router.
Step 5	keepalive <i>seconds</i> Example: Router(config-register-global)# keepalive 200	Sets the length of the time interval between successive keepalive messages from the SIP phones to Cisco Unified CME router. Default is 120 seconds.
Step 6	end Example: Router(config-register-global)# end	Returns to privileged EXEC mode.

Configure Version Stamp Synchronization on the Primary Router

To configure the primary router to enable automatic synchronization of 'version stamp' with secondary backup router, perform the following steps.

Tip

All phone-related configurations are tagged with a 'version stamp' that indicates when the last configuration change was made.

Before you begin

- XML interface for secondary backup router is configured. See [Configure the XML Interface for the Secondary Backup Router, on page 194](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **standby username** *username* **password** *password*
5. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters telephony service configuration mode.
Step 4	standby username <i>username</i> password <i>password</i> Example: Router(config-telephony)# standby username user23 password 3Rs92uzQ	Defines an authorized user. • Same username and password that is defined in Configure the XML Interface for the Secondary Backup Router, on page 194 .
Step 5	end Example: Router(config-telephony)# end	Returns to privileged EXEC mode.

Configure the XML Interface for the Secondary Backup Router

To configure the secondary backup router to activate the XML interface required to receive "version stamp" configuration change information from the primary router, perform the following steps.

**Restriction**

- Automatic synchronization for new or replacement routers is not supported.

Before you begin

- The XML interface, provided through the Cisco IOS XML Infrastructure (IXI), must be configured. See [Configuring the XML API](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **xml user** *user-name* **password** *password* *privilege-level*
5. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters telephony service configuration mode.
Step 4	xml user <i>user-name</i> password <i>password</i> <i>privilege-level</i> Example: Router(config-telephony)# xml user user23 password 3Rs92uzQ 15	Defines an authorized user. • <i>user-name</i>—Username of the authorized user. • <i>password</i>—Password to use for access. • <i>privilege-level</i>—Level of access to Cisco IOS commands to be granted to this user. Only the commands with the same or a lower level can be executed via XML. Range is 0 to 15.
Step 5	end Example:	Returns to privileged EXEC mode.

	Command or Action	Purpose
	<code>Router(config-telephony) # end</code>	

Configure Overlap Dialing on SCCP IP Phones

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `telephony-service`
4. `overlap-signal`
5. `exit`
6. `ephone phone-tag`
7. `overlap-signal`
8. `exit`
9. `ephone-template template-tag`
10. `overlap-signal`
11. `end`

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Router> enable</code>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3	telephony-service Example: <code>Router(config) telephony-service</code>	Enters telephony-service configuration mode.
Step 4	overlap-signal Example: <code>Router(config-telephony) #overlap-signal</code>	Allows to configure overlap signaling support for SCCP IP phones.
Step 5	exit Example: <code>Router(config-telephony) #exit</code>	Exits telephony-service configuration mode.

	Command or Action	Purpose
Step 6	ephone <i>phone-tag</i> Example: <code>Router(config)ephone 10</code>	Enters ephone configuration mode.
Step 7	overlap-signal Example: <code>Router(config-ephone)overlap-signal</code>	Applies overlap signaling support for ephone.
Step 8	exit Example: <code>Router(config-ephone)exit</code>	Exits ephone configuration mode.
Step 9	ephone-template <i>template-tag</i> Example: <code>Router(config)ephone-template 10</code>	Enters ephone-template configuration mode.
Step 10	overlap-signal Example: <code>Router(config-ephone-template)#overlap-signal</code>	Applies overlap signaling support to ephone template.
Step 11	end Example: <code>Router(config-ephone-template)# end</code>	Returns to privileged EXEC mode.

Set Up Cisco Unified CME for SIP Phones

To identify filenames and location of phone firmware for phone types to be connected, to specify the port for phone registration, and to specify the number of phones and directory numbers to be supported, perform the following steps.

Note If your Cisco Unified CME system supports SCCP and SIP phones, do not connect your SIP phones to your network until after you have verified the configuration profile for the SIP phone.

Note From Cisco IOS XE Amsterdam 17.2.1r onwards, **cme-app** mode was added for ISR4321 routers. This mode allows configuration of up to 200 phones for routers that are dedicated to CME use only. The **cme** or **cme-app** modes configure SIP phones and features for standalone call control use.

**Restriction**

- SIP endpoints are not supported on H.323 trunks. SIP endpoints are supported on SIP trunks only.
- Certain Cisco Unified IP phones, such as the Cisco Unified IP Phones 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE, are supported only in Cisco Unified CME 4.1 and later versions.
- DSCP requires Cisco Unified CME 7.1 or a later version. If DSCP is configured for the gateway interface using the **service-policy** command or for the dial peer using the **ip qos dscp** command, the value set with those commands takes precedence over the DSCP value configured in this procedure.

Before you begin

Cisco CME 3.4 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **mode** [**cme** | **cme-app**]
5. **source-address** *ip-address* [**port** *port*]
6. **load** *phone-type* *firmware-file*
7. **tftp-path** {**flash:** | **slot0:** | **tftp://url**}
8. **max-pool** *max-phones*
9. **max-dn** *max-directory-numbers*
10. **authenticate** [**all**][**realm** *string*]
11. **ip qos dscp** { {*number* | *af* | *cs* | **default** | **ef**} {**media** | **service** | **signaling** | **video**}}
12. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.

	Command or Action	Purpose
Step 4	mode [<i>cme</i> <i>cme-app</i>] Example: Router(config-register-global)# mode cme	Enables mode for provisioning SIP phones in Cisco Unified CME.
Step 5	source-address <i>ip-address</i> [port <i>port</i>] Example: Router(config-register-global)# source-address 10.6.21.4	Enables the Cisco Unified CME router to receive messages from SIP phones through the specified IP address and port. • port <i>port</i>—(Optional) TCP/IP port number. Range: 2000 to 9999. Default: 2000.
Step 6	load <i>phone-type</i> <i>firmware-file</i> Example: Router(config-register-global)# load 7960-7940 P0S3-07-3-00	Associates a phone type with a phone firmware file. • A separate load command is required for each phone type.
Step 7	tftp-path { <i>flash:</i> <i>slot0:</i> <i>tftp://url</i> } Example: Router(config-register-global)# tftp-path http://mycompany.com/files	(Optional) Defines a location, other than system memory, from which the SIP phones will download configuration profile files. • Default: system memory (system:/cme/sipphone/).
Step 8	max-pool <i>max-phones</i> Example: Router(config-register-global)# max-pool 10	Sets maximum number of SIP phones to be supported by the Cisco Unified CME router. • Version- and platform-dependent; type ? for range. • In Cisco CME 3.4 to Cisco Unified CME 7.0: Default is maximum number supported by platform. • In Cisco Unified CME 7.0(1) and later versions: Default is 0.
Step 9	max-dn <i>max-directory-numbers</i> Example: Router(config-register-global)# max-dn 20	(Optional) Sets maximum number of directory numbers for SIP phones to be supported by the Cisco Unified CME router. • Required for Cisco Unified CME 7.0(1) and later versions. • In Cisco Unified CME 7.0(1) and later versions: Default is 0. Range is 1 to maximum number supported by platform. Type ? for range. • In Cisco CME 3.4 to Cisco Unified CME 7.0: Default is 150 or maximum allowed on platform. Type ? for value.
Step 10	authenticate [all][<i>realm string</i>] Example: Router(config-register-global)# authenticate all realm company.com	(Optional) Enables authentication for registration requests in which the MAC address of the SIP phone cannot be identified by using other methods.

	Command or Action	Purpose
Step 11	ip qos dscp {{number af cs default ef} {media service signaling video}} Example: Router(config-register-global)# ip qos dscp af43 video	Sets the DSCP priority levels for different types of traffic.
Step 12	end Example: Router(config-register-global)# end	Exits voice register global configuration mode and enters privileged EXEC mode.

Set Up Cisco Unified CME for SIP Phones

To identify filenames and location of phone firmware for phone types to be connected, to specify the port for phone registration, and to specify the number of phones and directory numbers to be supported, perform the following steps.

Note If your Cisco Unified CME system supports SCCP and SIP phones, do not connect your SIP phones to your network until after you have verified the configuration profile for the SIP phone.

Note From Cisco IOS XE Amsterdam 17.2.1r onwards, **cme-app** mode was added for ISR4321 routers. This mode allows configuration of up to 200 phones for routers that are dedicated to CME use only. The **cme** or **cme-app** modes configure SIP phones and features for standalone call control use.

Restriction

- SIP endpoints are not supported on H.323 trunks. SIP endpoints are supported on SIP trunks only.
- Certain Cisco Unified IP phones, such as the Cisco Unified IP Phones 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE, are supported only in Cisco Unified CME 4.1 and later versions.
- DSCP requires Cisco Unified CME 7.1 or a later version. If DSCP is configured for the gateway interface using the **service-policy** command or for the dial peer using the **ip qos dscp** command, the value set with those commands takes precedence over the DSCP value configured in this procedure.

Before you begin

Cisco CME 3.4 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**

4. **mode** [*cme* | *cme-app*]
5. **source-address** *ip-address* [*port port*]
6. **load** *phone-type firmware-file*
7. **tftp-path** {*flash:* | *slot0:* | *tftp://url*}
8. **max-pool** *max-phones*
9. **max-dn** *max-directory-numbers*
10. **authenticate** [*all*][*realm string*]
11. **ip qos dscp** { {*number* | *af* | *cs* | **default** | *ef*} {*media* | *service* | *signaling* | *video*}}
12. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	voice register global Example: <pre>Router(config)# voice register global</pre>	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.
Step 4	mode [<i>cme</i> <i>cme-app</i>] Example: <pre>Router(config-register-global)# mode cme</pre>	Enables mode for provisioning SIP phones in Cisco Unified CME.
Step 5	source-address <i>ip-address</i> [<i>port port</i>] Example: <pre>Router(config-register-global)# source-address 10.6.21.4</pre>	Enables the Cisco Unified CME router to receive messages from SIP phones through the specified IP address and port. • port port—(Optional) TCP/IP port number. Range: 2000 to 9999. Default: 2000.
Step 6	load <i>phone-type firmware-file</i> Example: <pre>Router(config-register-global)# load 7960-7940 P0S3-07-3-00</pre>	Associates a phone type with a phone firmware file. • A separate load command is required for each phone type.
Step 7	tftp-path { <i>flash:</i> <i>slot0:</i> <i>tftp://url</i> } Example: <pre>Router(config-register-global)# tftp-path http://mycompany.com/files</pre>	(Optional) Defines a location, other than system memory, from which the SIP phones will download configuration profile files. • Default: system memory (<i>system:/cme/sipphone/</i>).

	Command or Action	Purpose
Step 8	max-pool <i>max-phones</i> Example: <pre>Router(config-register-global)# max-pool 10</pre>	Sets maximum number of SIP phones to be supported by the Cisco Unified CME router. • Version- and platform-dependent; type ? for range. • In Cisco CME 3.4 to Cisco Unified CME 7.0: Default is maximum number supported by platform. • In Cisco Unified CME 7.0(1) and later versions: Default is 0.
Step 9	max-dn <i>max-directory-numbers</i> Example: <pre>Router(config-register-global)# max-dn 20</pre>	(Optional) Sets maximum number of directory numbers for SIP phones to be supported by the Cisco Unified CME router. • Required for Cisco Unified CME 7.0(1) and later versions. • In Cisco Unified CME 7.0(1) and later versions: Default is 0. Range is 1 to maximum number supported by platform. Type ? for range. • In Cisco CME 3.4 to Cisco Unified CME 7.0: Default is 150 or maximum allowed on platform. Type ? for value.
Step 10	authenticate [all][<i>realm string</i>] Example: <pre>Router(config-register-global)# authenticate all realm company.com</pre>	(Optional) Enables authentication for registration requests in which the MAC address of the SIP phone cannot be identified by using other methods.
Step 11	ip qos dscp {{ <i>number</i> <i>af</i> <i>cs</i> default ef } { media service signaling video }} Example: <pre>Router(config-register-global)# ip qos dscp af43 video</pre>	Sets the DSCP priority levels for different types of traffic.
Step 12	end Example: <pre>Router(config-register-global)# end</pre>	Exits voice register global configuration mode and enters privileged EXEC mode.

Set Date and Time Parameters for SIP Phones

Before you begin

- Cisco CME 3.4 or a later version.
- **mode cme** command is enabled.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **timezone** *number*
5. **date-format** [*d/m/y* | *m/d/y* | *y-d-m* | *y/d/m* | *y/m/d* | *yy-m-d*]
6. **time-format** {*12* | *24*}
7. **dst auto-adjust**
8. **dst** {*start* | *stop*} *month* [*day* *day-of-month* | *week* *week-number* | *day* *day-of-week*] **time** *hour:minutes*
9. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.
Step 4	timezone <i>number</i> Example: Router(config-register-global)# timezone 8	Selects the time zone used for SIP phones in Cisco Unified CME. • Default: 5, Pacific Standard/Daylight Time. Type ? to display a list of time zones.
Step 5	date-format [<i>d/m/y</i> <i>m/d/y</i> <i>y-d-m</i> <i>y/d/m</i> <i>y/m/d</i> <i>yy-m-d</i>] Example: Router(config-register-global)# date-format yy-m-d	(Optional) Selects the date display format on SIP phones in Cisco Unified CME. • Default: <i>m/d/y</i> .
Step 6	time-format { <i>12</i> <i>24</i> }	(Optional) Selects the time display format on SIP phones in Cisco Unified CME. • Default: 12.
Step 7	dst auto-adjust Example:	(Optional) Enables automatic adjustment of Daylight Saving Time on SIP phones in Cisco Unified CME.

	Command or Action	Purpose
	<code>Router(config-register-global)# dst auto-adjust</code>	To modify start and stop times for daylight savings time, use the dst command.
Step 8	dst {start stop} month [day day-of-month week week-number day day-of-week] time hour:minutes Example: <code>Router(config-register-global)# dst start jan day 1 time 00:00</code> <code>Router(config-register-global)# dst stop mar day 31 time 23:59</code>	(Optional) Sets the time period for Daylight Saving Time on SIP phones in Cisco Unified CME. - Required if automatic adjustment of Daylight Saving Time is enabled by using the dst auto-adjust command. - Default is Start: First week of April, Sunday, 2:00 a.m. Stop: Last week of October, Sunday 2:00 a.m.
Step 9	end Example: <code>Router(config-register-global)# end</code>	Returns to privileged EXEC mode.

Set Network Time Protocol for SIP Phones

To enable Network Time Protocol (NTP) for certain phones, such as the Cisco Unified IP Phones 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE, connected to Cisco Unified CME running SIP, perform the following steps.

Before you begin

- Cisco Unified CME 4.1 or a later version.
- The firmware load 8.2(1) or a later version is installed for SIP phones to download. For upgrade information, see [Upgrade or Downgrade SIP Phone Firmware, on page 116](#).

SUMMARY STEPS

- enable
- configure terminal
- voice register global
- ntp-server ip-address [mode {anycast | directedbroadcast | multicast | unicast}]
- end

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Router> enable</code>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3	voice register global Example: <code>Router(config)# voice register global</code>	Enters voice register global configuration mode to set global parameters for all supported SIP phones in a Cisco Unified CME environment.
Step 4	ntp-server ip-address [mode {anycast directedbroadcast multicast unicast}] Example: <code>Router(config-register-global)# ntp-server 10.1.2.3</code>	Synchronizes clock on this router with the specified NTP server.
Step 5	end Example: <code>Router(config-register-global)# end</code>	Returns to privileged EXEC mode.

Enable HFS Download Service for SIP Phones

Restriction

- Only Cisco Unified 8951, 9951, and 9971 SIP IP Phones are supported.
- No IPv6 support for the HFS download service.

Before you begin

Cisco Unified CME 8.8 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **ip http port *number***
5. **voice register global**
6. **mode cme**
7. **load *phone-type firmware-file***
8. **create profile**
9. **exit**
10. **telephony-service**
11. **hfs enable [port *port-number*]**
12. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip http server Example: Router(config)# ip http server	Enables the underlying IOS HTTP server of the HFS infrastructure.
Step 4	ip http port <i>number</i> Example: Router(config)# ip http port 60	(Optional) Specifies the port where the HTTP service is run.
Step 5	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode to set global parameters for all supported Cisco SIP IP phones in a Cisco Unified CME.
Step 6	mode cme Example: Router(config-register-global)# mode cme	Enables the mode for configuring SIP IP phones in a Cisco Unified CME system.
Step 7	load <i>phone-type firmware-file</i> Example: Router(config-register-global)# load 3951 SIP51.9.2.1S	Associates a type of SIP IP phone with a phone firmware file.
Step 8	create profile Example: Router(config-register-global)# create profile	Generates the configuration profile files required for SIP IP phones.
Step 9	exit Example: Router(config-register-global)# exit	Exits voice register global configuration mode.
Step 10	telephony-service Example: Router (config)# telephony-service	Enters telephony-service configuration mode for configuring Cisco Unified CME.

	Command or Action	Purpose
Step 11	hfs enable [<i>port port-number</i>] Example: <pre>Router(config-telephony)# hfs enable port 5678</pre>	Enables the HFS download service on a specified port. • port port-number—(Optional) Specifies the port where the HFS download service is enabled. Range is from 1024 to 65535. Port 80 is the default port. Port 6970 is the custom port. Note If the entered custom HFS port clashes with the underlying IP HTTP port, an error message is displayed and the command is disallowed.
Step 12	end Example: <pre>Router(config-telephony)# end</pre>	Exits to privileged EXEC mode.

Troubleshooting HFS Download Service

The **debug cme-hfs** command can be used to troubleshoot an attempt to download Cisco Unified SIP IP phone configuration and firmware files using the HFS service.

Configure HFS Home Path for SIP Phone Firmware Files

To configure a home path where any requested Cisco Unified SIP IP Phone firmware file that has no explicit binding can be searched and fetched using the HFS download service, perform the following steps.

Restriction

- Only Cisco 8951, 9951, and 9971 SIP IP Phones are supported.
- No IPv6 support for the HFS download service.

Before you begin

Cisco Unified CME 8.8 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **ip http port** *number*
5. **telephony-service**
6. **hfs enable** [*port port-number*]
7. **hfs home-path** *path*
8. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip http server Example: Router(config)# ip http server	Enables the underlying IOS HTTP server of the HFS infrastructure.
Step 4	ip http port <i>number</i> Example: Router(config)# ip http port 1234	Specifies the port where the HTTP service is run.
Step 5	telephony-service Example: Router (config)# telephony-service	Enters telephony-service configuration mode for configuring Cisco Unified CME.
Step 6	hfs enable [port <i>port-number</i>] Example: Router(config-telephony)# hfs enable port 6970	Enables the HFS download service on a specified port.
Step 7	hfs home-path <i>path</i> Example: Router(config-telephony)# hfs home-path flash:/cme/loads/	Sets a home path directory for Cisco Unified SIP IP phone firmware files that can be searched and fetched using the HFS download service. Note The administrator must store the phone firmware files at the location set as the home path directory.
Step 8	end Example: Router(config-telephony)# end	Exits to privileged EXEC mode.

Change Session-Level Application for SIP Phones

Before you begin

Cisco CME 3.4 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **application** *application-name*
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.
Step 4	application <i>application-name</i> Example: Router(config-register-global)# application sipapp2	(Optional) Changes the default application for all dial peers associated with the SIP phones in Cisco Unified CME to the specified application. Note This command can also be configured in voice register pool configuration mode. The value set in voice register pool configuration mode has priority over the value set in voice register global mode.
Step 5	end Example: Router(config-register-global)# end	Exits voice register global configuration mode and enters privileged EXEC mode.

Enable Media Flow Mode on SIP Trunks

Restriction

- If any media service (like transcoding and conferencing) is needed for SIP to SIP trunk call, at least one of the SIP trunks must be placed in flow through mode.
- If media needs to flow through Cisco Unified CME for voicemail calls, the SIP trunk going towards the voicemail must be in flow through mode.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **media [flow around | flow through]**
5. **exit**
6. **dial-peer voice tag voip**
7. **media {[flow-around | flow-through] forking}**
8. **exit**
9. **voice class media tag**
10. **media {[flow-around | flow-through] forking}**
11. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice service voip Example: Router(config)#voice service voip	Enters voice service voip configuration mode.
Step 4	media [flow around flow through] Example: Router(conf-voi-serv)#media flow-around	Enables global media setting for VoIP calls. • flow around—Allows the media to flow around the gateway. • flow through—Allows the media to flow through the gateway.
Step 5	exit Example: Router(config-voi-ser)#exit	Exits voice service voip configuration mode.
Step 6	dial-peer voice tag voip Example: Router(config)#dial-peer voice 222 voip	Enters dial-peer configuration mode to define a VoIP dial peer for the voice-mail system. • tag—Defines the dial peer being configured. Range is 1 to 1073741823.

	Command or Action	Purpose
Step 7	media {[flow-around flow-through] forking} Example: <pre>Router(config-dial-peer)#media flow-around</pre>	Enables media settings for voice dial-peer. • flow-around—Allows the media to flow around the gateway. • flow-through—Allows the media to flow through the gateway. • forking—Enables media forking.
Step 8	exit Example: <pre>Router(config-ephone)exit</pre>	Exits voip dial-peer configuration mode.
Step 9	voice class media tag Example: <pre>Router(config)#voice class media 10</pre>	Enters voice class media configuration mode. • tag— Defines the voice class media tag being configured. Range is from 1 to 10000.
Step 10	media {[flow-around flow-through] forking} Example: <pre>Router(config-class)#media flow-around</pre>	Enables media settings for voice dial-peer. • flow-around—Allows the media to flow around the gateway. • flow-through—Allows the media to flow through the gateway. • forking—Enables media forking.
Step 11	end Example: <pre>Router(config-class)# end</pre>	Returns to privileged EXEC mode.

Configure Overlap Dialing on SIP Phones

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **overlap-signal**
5. **exit**
6. **voice register pool** *pool-tag*
7. **overlap-signal**
8. **exit**
9. **voice register template** *template tag*
10. **overlap-signal**
11. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global Example: Router(config)voice register global	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.
Step 4	overlap-signal Example: Router(config-register-pool)overlap-signal	Allows to configure overlap signaling support for SIP IP phones.
Step 5	exit Example: Router(config-register-pool)exit	Exits voice register pool configuration mode.
Step 6	voice register pool <i>pool-tag</i> Example: Router(config)voice register pool 10	Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone.
Step 7	overlap-signal Example: Router(config-register-global)overlap-signal	Enables overlap signaling support for voice register global.
Step 8	exit Example: Router(config-register-global)exit	Exits voice register-template configuration mode.
Step 9	voice register template <i>template tag</i> Example: Router(config)voice register template 5	Enters voice register-template configuration mode to create an ephone template. • <i>template-tag</i>—Unique identifier for the ephone template that is being created. Range: 1 to 10.
Step 10	overlap-signal Example: Router(config-register-temp) overlap-signal	Applies overlap signaling support for voice register-template.

	Command or Action	Purpose
Step 11	end Example: Router(config-register-temp)# end	Returns to privileged EXEC mode.

Configuration Examples for System-Level Parameters

Example for Bulk Registration Support for SIP Phones

The following example shows TCP and UDP configured for various phones. Notice that in Bulk Registration (TCP), only the primary directory number is displayed, while in Line Registration (UDP), all directory numbers are displayed.

```
Router# show sip-ua status registrar

Line          destination      expires(sec)  contact
transport     call-id
              peer
=====

Example for System-Level Parameters

The following example shows the system-level configuration for a Cisco Unified CME that can support up to 500 directory numbers on 100 phones. It sets up TFTP file sharing for phone firmware files for Cisco Unified IP Phones 7905, 7912, 7914, 7920, 7940, and 7960 and it loads those files.

```

Example for Blocking Automatic Registration

The following example shows how to disable automatic ephone registration, display a log of attempted registrations, and then clear the log:

```

Router(config)# telephony-service

Router(config-telephony)# no auto-reg-ephone

Router(config-telephony)# exit

```

```

Router(config)# exit

Router# show ephone attempted-registrations

Attempting Mac address:

Router# clear telephony-service ephone-attempted-registrations

```

Example for Enabling the HFS Download Service for Cisco Unified SIP IP Phone

The following example shows how to enable the HFS download service:

```

Router(config)# ip http server
Router(config)# ip http port 1234
Router (config)# telephony-service
Router(config-telephony)# hfs enable port 65500

```

Example for Configuring an HFS Home Path for Cisco Unified SIP IP Phone Firmware Files

The following example shows how a new directory called phone-load can be created under the root directory of the flash memory and set as the hfs home-path:

```

cassini-c2801#mkdir flash:phone-loads
Create directory filename [phone-loads]?
Created dir flash:phone-loads
cassini-c2801#sh flash:
-#- --length-- -----date/time----- path

```

Example for Verifying the HFS File Bindings of Cisco Unified SIP IP Phone Configuration and Firmware Files

The following is a sample output from the **show voice register hfs** command:

```
Router(config)#show voice register hfs
```

```

Fetch Service Enabled = Y
  App enabled port = 6970
  Use default port = N
  Registered session-id = 19

Default home path = flash:/
  Ongoing fetches from home = 0

HTTP File Server Bindings
  No. of bindings = 11
  No. of url table entries = 9

No. of alias table entries = 9

```

Example for Redundant Router for SCCP Phones

The following example is configured on the primary Cisco Unified CME router. It establishes the router at 10.5.2.78 as a secondary router. The voice port 3/0/0 is the FXO port for incoming calls from the PSTN. It is set to use ground-start signaling and to detect incoming calls by counting incoming ring signals.

```

telephony-service

  ip source-address 10.0.0.1 port 2000 secondary 10.5.2.78

voice-port 3/0/0
  signal ground-start
  incoming alerting ring-only

```

The secondary Cisco Unified CME router is configured with the same commands, except that the ring number command is set to 3 instead of using the default of 1.

```
telephony-service
 ip source-address 10.0.0.1 port 2000 secondary 10.5.2.78

voice-port 3/0/0
 signal ground-start
 incoming alerting ring-only
 ring number 3
```

Example for Redundant Router for SIP Phones

The following example is configured on the primary Cisco Unified CME router. It establishes the router at 10.6.50.6 as a secondary router with keepalive value set to 200 seconds.

Note For the synchronization to happen, additional configurations are needed. These configurations such as IXI, HTTP, and telephony-service are provided in the output.

```
voice register global
 source-address 10.6.21.4 port 6000 secondary 10.6.50.6
 keepalive 200

ip http server

ixi transport http
 response size 8
 no shutdown
 request outstanding 2
 request timeout 30

ixi application cme
 no shutdown
 response timeout -1

telephony-service
 ip source-address 10.6.21.4 secondary 10.6.50.6
 standby user cisco password cisco123
```

The secondary Cisco Unified CME router is configured with the same commands:

```
voice register global
 source-address 10.6.21.4 port 6000 secondary 10.6.50.6
 keepalive 200

ip http server

ixi transport http
 response size 8
 no shutdown
 request outstanding 2
 request timeout 30

ixi application cme
 no shutdown
 response timeout -1

telephony-service
```

```
ip source-address 10.6.50.6
xml user cisco password cisco123 15
```

Example for Media Flow Around Mode for SIP Trunks

The following example shows media flow-around enabled in voice service voip, voice class media, and dial peer configuration modes:

Where to Go Next

After configuring system-level parameters, you are ready to configure phones for making basic calls in Cisco Unified CME.

- To use Extension Assigner to assign extension numbers to the phones in your Cisco Unified CME, see [Create Phone Configurations Using Extension Assigner, on page 361](#).
- Otherwise, see [Configure Phones to Make Basic Call, on page 327](#).

Feature Information for System-Level Parameters

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

Table 15: Feature Information for System-Level Parameters

Feature Name	Cisco Unified CME Versions	Feature Information
Redundant Router for SIP Phones	11.6	Introduces redundant router support for SIP phones.
Unsolicited Notify for Shared Line and Presence Events for Cisco Unified SIP IP Phones	9.0	Allows the Unsolicited Notify mechanism to reduce network traffic during Cisco Unified SIP IP phone registration using the bulk registration method.
HFS Download Support for IP Phone Firmware and Configuration Files	8.8	Provides download support for SIP and SCCP IP phone firmware, scripts, midlets, and configuration files using the HTTP File-Fetch Server (HFS) infrastructure.
Bulk Registration	8.6/3.4	Introduces bulk registration support for SIP phones. Introduces bulk registration for registering a block of phone numbers with an external registrar.
Media Flow Around for SIP-SIP Trunks	8.5	Introduces the media flow around feature, which eliminates the need to terminate RTP and re-originate on Cisco Unified CME, reducing media switching latency and increasing the call handling capacity for Cisco Unified CME SIP trunk.
Overlap Dialing for SCCP and SIP Phones	8.5	Allows the dialed digits from the SIP or SCCP IP phones to pass across the PRI/BRI trunks as overlap digits and not as enbloc digits, enabling overlap dialing on the PRI/BRI trunks.
DSCP	7.1	Supports DSCP packet marking for Cisco Unified IP Phones to specify the class of service for each packet.
Maximum Ephones	7.0/4.3	The max-ephones command sets the maximum number of SCCP phones that can register to Cisco Unified CME, without limiting the number that can be configured. Maximum number of phones that can be configured is 1000.
Network Time Protocol for SIP Phones	4.1	Allows SIP phones to synchronize to an NTP server.

Feature Name	Cisco Unified CME Versions	Feature Information
Blocking Automatic Registration	4.0	Blocks IP phones that are not explicitly configured in Cisco Unified CME from registering.
Per-Phone Configuration Files and Alternate Location	4.0	Defines a location other than system for storing configuration files and specifies the type of configuration files to generate.
Redundant Router for SCCP Phones	4.0	Introduces redundant router capability.
SIP phones in Cisco Unified CME	3.4	Introduces support for SIP endpoints directly connected to Cisco Unified CME.

CHAPTER 8

Configuring Phones to Make Basic Calls

This chapter describes how to configure Cisco Unified IP phones in Cisco Unified Communications Manager Express (Cisco Unified CME) so that you can make and receive basic calls.

Caution

The Interactive Voice Response (IVR) media prompts feature is only available on the IAD2435 when running IOS version 15.0(1)M or later.

- [Configuration Examples for Making Basic Calls, on page 341](#)
- [Where To Go Next, on page 355](#)
- [Feature Information for Configuring Phones to Make Basic Calls, on page 356](#)

Prerequisites for Configuring Phones to Make Basic Calls

- Cisco IOS software and Cisco Unified CME software, including phone firmware files for Cisco Unified IP phones to be connected to Cisco Unified CME, must be installed in router flash memory. See [Install Cisco Unified CME Software, on page 113](#).
- For Cisco Unified IP phones that are running SIP and are connected directly to Cisco Unified CME, Cisco Unified CME 3.4 or a later version must be installed on the router. See [Install Cisco Unified CME Software, on page 113](#).
- Procedures in [Network Parameters, on page 129](#) and [Configure System-Level Parameters, on page 172](#) must be completed before you start the procedures in this section.

Restrictions for Configuring Phones to Make Basic Calls

When you are configuring dial peers or ephone-dns, including park slots and conferencing extensions, on Cisco Integrated Services Router Voice Bundles, the following message may appear to warn you that free memory is not available:

```
%DIALPEER_DB-3-ADDPEER_MEM_THRESHOLD: Addition of dial-peers limited by available memory
```

To configure more dial peers or ephone-dns, increase the DRAM in the system. A moderately complex configuration may exceed the default 256 MB DRAM and require 512 MB DRAM. Note that many factors contribute to memory usage, in addition to the number of dial peers and ephone-dns configured.

Information About Configuring Phones to Make Basic Calls

Phones in Cisco Unified CME

An ephone, or “Ethernet phone,” for SCCP or a voice-register pool for SIP is the software configuration for a phone in Cisco Unified CME. This phone can be either a Cisco Unified IP phone or an analog phone. Each physical phone in your system must be configured as an ephone or voice-register pool on the Cisco Unified CME router to receive support in the LAN environment. Each phone has a unique tag, or sequence number, to identify it during configuration.

For information on the phones supported in Cisco Unified CME Release 8.8 and later versions, see [Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST](#).

Directory Numbers

A directory number, also known as an ephone-dn for SCCP or a voice-register dn for SIP, is the software configuration in Cisco Unified CME that represents the line connecting a voice channel to a phone. A directory number has one or more extension or telephone numbers associated with it to allow call connections to be made. Generally, a directory number is equivalent to a phone line, but not always. There are several types of directory numbers, which have different characteristics.

Each directory number has a unique *dn-tag*, or sequence number, to identify it during configuration. Directory numbers are assigned to line buttons on phones during configuration.

One virtual voice port and one or more dial peers are automatically created for each directory number, depending on the configuration for SCCP phones, or for SIP phones, when the phone registers in Cisco Unified CME.

Because each directory number represents a virtual voice port in the router, the number of directory numbers that you create corresponds to the number of simultaneous calls that you can have. This means that if you want more than one call to the same number to be answered simultaneously, you need multiple directory numbers with the same destination number pattern.

The directory number is the basic building block of a Cisco Unified CME system. Six different types of directory numbers can be combined in different ways for different call coverage situations. Each type will help with a particular type of limitation or call-coverage need. For example, if you want to keep the number of directory numbers low and provide service to a large number of people, you might use shared directory

numbers. Or if you have a limited quantity of extension numbers that you can use and you need to have a large quantity of simultaneous calls, you might create two or more directory numbers with the same number. The key is knowing how each type of directory number works and its advantages.

Not all types of directory numbers can be configured for all phones or for all protocols. In the remaining information about directory numbers, we have used SCCP in the examples presented but that does not imply exclusivity. The following sections describe the types of directory numbers in a Cisco Unified CME system:

Single-Line

A single-line directory number has the following characteristics:

- Makes one call connection at a time using one phone line button. A single-line directory number has one telephone number associated with it.
- Should be used when phone buttons have a one-to-one correspondence to the PSTN lines that come into a Cisco Unified CME system.
- Should be used for lines that are dedicated to intercom, paging, message-waiting indicator (MWI), loopback, and music-on-hold (MOH) feed sources.
- Must have more than one single-line directory number on a phone when used with multiple-line features like call waiting, call transfer, and conferencing.
- Can be combined with dual-line directory numbers on the same phone.

Note You must make the choice to configure each directory number in your system as either dual-line or single-line when you initially create configuration entries. If you need to change from single-line to dual-line later, you must delete the configuration for the directory number, then recreate it.

Figure 6: [Single-Line Directory Number, on page 231](#) shows a single-line directory number for an SCCP phone in Cisco Unified CME.

Figure 6: Single-Line Directory Number

Dual-Line

A dual-line directory number has the following characteristics:

- Has one voice port with two channels.
- Supported on IP phones that are running SCCP; not supported on IP phones that are running SIP.
- Can make two call connections at the same time using one phone line button. A dual-line directory number has two channels for separate call connections.
- Can have one number or two numbers (primary and secondary) associated with it.

- Should be used for a directory number that needs to use one line button for features like call waiting, call transfer, or conferencing.
- Cannot be used for lines that are dedicated to intercom, paging, message-waiting indicator (MWI), loopback, and music-on-hold (MOH) feed sources.
- Can be combined with single-line directory numbers on the same phone.

Note You must make the choice to configure each directory number in your system as either dual-line or single-line when you initially create configuration entries. If you need to change from single-line to dual-line later, you must delete the configuration for the directory number, then recreate it.

[Figure 7: Dual-Line Directory Number, on page 232](#) shows a dual-line directory number for an SCCP phone in Cisco Unified CME.

Figure 7: Dual-Line Directory Number

Octo-Line

An octo-line directory number supports up to eight active calls, both incoming and outgoing, on a single button of a SCCP phone. Unlike a dual-line directory number, which is shared exclusively among phones (after a call is answered, that phone owns both channels of the dual-line directory number), an octo-line directory number can split its channels among other phones that share the directory number. All phones are allowed to initiate or receive calls on the idle channels of the shared octo-line directory number.

Because octo-line directory numbers do not require a different ephone-dn for each active call, one octo-line directory number can handle multiple calls. Multiple incoming calls to an octo-line directory number ring simultaneously. After a phone answers a call, the ringing stops on that phone and the call-waiting tone plays for the other incoming calls. When phones share an octo-line directory number, incoming calls ring on phones without active calls and these phones can answer any of the ringing calls. Phones with an active call hear the call-waiting tone.

After a phone answers an incoming call, the answering phone is in the connected state. Other phones that share the octo-line directory number are in the remote-in-use state.

After a connected call on an octo-line directory number is put on-hold, any phone that shares this directory number can pick up the held call. If a phone user is in the process of initiating a call transfer or creating a conference, the call is locked and other phones that share the octo-line directory number cannot steal the call.

[Figure 8: Octo-Line Directory Number, on page 233](#) shows an octo-line directory number for SCCP phones in Cisco Unified CME.

Figure 8: Octo-Line Directory Number

The Barge and Privacy features control whether other phones are allowed to view call information or join calls on the shared octo-line directory number.

Feature Comparison by Directory Number Line-Mode on SCCP Phones

Table 16: Feature Comparison by Line Mode on SCCP Phones , on page 233 lists some common directory number features and their support based on the type of line mode defined with the **ephone-dn** command.

Table 16: Feature Comparison by Line Mode on SCCP Phones

Feature	Single-Line	Dual-Line	Octo-Line
Barge	—	—	Yes
Busy Trigger	—	—	Yes
Conferencing (8-party)	—	4 directory numbers	1 directory number
FXO Trunk Optimization	Yes	Yes	—
Huntstop Channel	—	Yes	Yes
Intercom	Yes	—	—
Key System (one call per button)	Yes	—	—
Maximum Calls	—	—	Yes
MWI	Yes	—	—
Overlay directory numbers (c, o, x)	Yes	Yes	—
Paging	Yes	—	—
Park	Yes	—	—
Privacy	—	—	Yes

SIP Shared-Line (Nonexclusive)

Cisco Unified CME 7.1 and later versions support SIP shared lines to allow multiple phones to share a common directory number. All phones sharing the directory number can initiate and receive calls at the same time. Calls to the shared line ring simultaneously on all phones without active calls and any of these phones can answer the incoming calls. After a phone answers a call, the ringing stops on all phones and the call-waiting tone plays for other incoming calls to the connected phone.

The phone that answers an incoming call is in the connected state. Other phones that share the directory number are in the remote-in-use state. The first user that answers the call on the shared line is connected to the caller and the remaining users see the call information and status of the shared line.

Calls on a shared line can be put on hold like calls on a non-shared line. When a call is placed on hold, other phones with the shared-line directory number receive a hold notification so all phones sharing the line are aware of the held call. Any shared-line phone user can resume the held call. If the call is placed on hold as part of a conference or call transfer operation, the call cannot be resumed by other shared-line phone users. The ID of the held call is used by other shared-line members to resume the call. Notifications are sent to all associated phones when a held call is resumed on a shared line.

Shared lines support up to 16 calls, depending on the configuration in Cisco Unified CME, which rejects any new call that exceeds the configured limit. For configuration information, see [Create Directory Numbers for SIP Phones, on page 275](#).

The Barge and Privacy features control whether other phones are allowed to view call information or join calls on the shared-line directory number. See [Barge and Privacy, on page 1035](#).

Note When the **no supplementary-service sip handle-replaces** command is configured, SIP shared-line is not supported on CME.

Two Directory Numbers with One Telephone Number

Two directory numbers with one telephone or extension number have the following characteristics:

- Have the same telephone number but two separate virtual voice ports, and therefore can have two separate call connections.
- Can be dual-line (SCCP only) or single-line directory numbers.
- Can appear on the same phone on different buttons or on different phones.
- Should be used when you want the ability to make more call connections while using fewer numbers.

[Figure 9: Two Directory Numbers with One Number on One Phone, on page 235](#) shows a phone with two buttons that have the same number, extension 1003. Each button has a different directory number (button 1 is directory number 13 and button 2 is directory number 14), so each button can make one independent call connection if the directory numbers are single-line and two call connections (for a total of four) if the directory numbers are dual-line.

[Figure 10: Two Directory Numbers with One Number on Two Phones, on page 235](#) shows two phones that each have a button with the same number. Because the buttons have different directory numbers, the calls that are connected on these buttons are independent of one another. The phone user at phone 4 can make a call on extension 1003, and the phone user on phone 5 can receive a different call on extension 1003 at the same time.

The two directory numbers-with-one-number situation is different than a shared line, which also has two buttons with one number but has only one directory number for both of them. A shared directory number will have the same call connection at all the buttons on which the shared directory number appears. If a call on a shared directory number is answered on one phone and then placed on hold, the call can be retrieved from the second phone on which the shared directory number appears. But when there are two directory numbers with one number, a call connection appears only on the phone and button at which the call is made or received. In the example in [Figure 10: Two Directory Numbers with One Number on Two Phones, on page 235](#), if the user at phone 4 makes a call on button 1 and puts it on hold, the call can be retrieved only from phone 4. For more information about shared lines, see [Shared Line \(Exclusive\), on page 236](#) section.

The examples in [Figure 9: Two Directory Numbers with One Number on One Phone, on page 235](#) and [Figure 10: Two Directory Numbers with One Number on Two Phones, on page 235](#) show how two directory numbers with one number are used to provide a small hunt group capability. In [Figure 9: Two Directory Numbers with One Number on One Phone, on page 235](#), if the directory number on button 1 is busy or does not answer, an incoming call to extension 1003 rolls over to the directory number associated with button 2 because the appropriate related commands are configured. Similarly, if button 1 on phone 4 is busy, an incoming call to 1003 rolls over to button 1 on phone 5.

Figure 9: Two Directory Numbers with One Number on One Phone

Figure 10: Two Directory Numbers with One Number on Two Phones

Dual-Number

A dual-number directory number has the following characteristics:

- Has two telephone numbers, a primary number and a secondary number.
- Can make one call connection if it is a single-line directory number.
- Can make two call connections at a time if it is a dual-line directory number (SCCP only).
- Should be used when you want to have two different numbers for the same button without using more than one directory number.

[Figure 11: Dual-Number Directory, on page 236](#) shows a directory number that has two numbers, extension 1006 and extension 1007.

Figure 11: Dual-Number Directory

Shared Line (Exclusive)

An exclusively shared directory number has the following characteristics:

- Has a line that appears on two different phones but uses the same directory number, and extension or phone number.
- Can make one call at a time and that call appears on both phones.
- Should be used when you want the capability to answer or pick up a call at more than one phone.

Because this directory number is shared exclusively among phones, if the directory number is connected to a call on one phone, that directory number is unavailable for calls on any other phone. If a call is placed on hold on one phone, it can be retrieved on the second phone. This is like having a single-line phone in your house with multiple extensions. You can answer the call from any phone on which the number appears, and you can pick it up from hold on any phone on which the number appears.

Note Transcoding is not supported for Shared Lines. From Unified CME Release 12.2, you can use Voice Class Codec (VCC) with shared lines.

Figure 12: Shared Directory Number (Exclusive), on page 236 shows a shared directory number on phones that are running SCCP. Extension 1008 appears on both phone 7 and phone 8.

Figure 12: Shared Directory Number (Exclusive)

Shared Lines with Voice Class Codec Support

From Unified CME 12.2 Release, Unified CME supports voice class codecs (VCC) with SIP shared lines. A VCC is a construct within which a codec preference order is defined. Preferences defined within the VCC can be used to determine which codecs will be selected over others. When a VCC is applied to a dial peer on the Unified CME, the dial peer then follows the preference order defined in the VCC.

The VCC configuration can be applied for phones having shared line configured on Unified CME. However, the voice class codec behavior of SIP trunk remains unchanged. It is recommended that the same voice class codec configuration is applied on all phones using the shared line directory number. The VCC configuration applied under the **voice register pool** configuration mode is used for filtering the codecs on inbound and outbound calls from the phone. If the VCC configuration does not have a common codec negotiated, then the

call is disconnected. When the codec on the incoming SIP trunk is not listed in the VCC, the call is not placed. It is mandatory to configure the CLI command **supplementary-service media-renegotiate** under **voice service voip** configuration mode for VCC configuration support with SIP shared lines. For a sample configuration of VCC with shared line, see [Examples for Configuring VCC with Shared Lines, on page 348](#).

Codec Support

All the codecs listed under the CLI command `voice class codec` are supported as part of the VCC support for SIP shared lines on Unified CME.

Feature Support

The following shared line features are supported as part of the VCC configuration:

- Hold and Remote Resume
- Barge
- cBarge
- Video
- MOH Transcoding
- Privacy

Advantages

- Insertion of transcoding resource to place a call can be avoided.

Restrictions

- Transcoding is not supported for SIP shared lines with VCC support.

Mixed Shared Lines

Cisco Unified CME 9.0 and later versions support the mixed Cisco Unified SIP/SCCP shared line. This feature allows Cisco Unified SIP and SCCP IP phones to share a common directory number.

The mixed shared line supports up to 16 calls, depending on the configuration in Cisco Unified CME, which rejects any new call that exceeds the configured limit.

For configuration information, see [Create Directory Numbers for SCCP Phones, on page 264](#) and [Create Directory Numbers for SIP Phones, on page 275](#).

Incoming and Outgoing Calls

All phones sharing the common directory number can initiate and receive calls at the same time. Calls to the mixed shared line ring simultaneously on all phones without active calls and any of these phones can answer the incoming calls. After a phone answers a call, the ringing stops on all phones and the call-waiting tone plays for other incoming calls to the connected phone.

The phone that answers an incoming call is in the connected state. Other phones that share the common directory number are in the remote-in-use state. The first user who answers the call on the mixed shared line is connected to the caller and the remaining users see the call information and status of the mixed shared line.

When a mixed shared-line user makes an outgoing call on the shared line, all the other shared-line users are notified of the outgoing call. When the called party answers, the caller is connected while the remaining shared-line users see the call information and the status of the call on the mixed shared line.

Hold and Resume

Calls on a mixed shared line can be put on hold like calls on a non-shared line. When a call is placed on hold, other phones with the shared-line directory number receive a hold notification so all phones sharing the line are aware of the call on hold. Any shared-line phone user can resume the call on hold. The ID of the call on hold is used by other shared-line members to resume the call. Notifications are sent to all associated phones when a call on hold is resumed on a mixed shared line. If the call is placed on hold as part of a conference or call transfer operation, the resume feature is not allowed.

Privacy on Hold

The Privacy on Hold feature prevents other phone users from viewing call information or retrieving a call put on hold by another phone sharing a common directory number. Only the caller who put the call on hold can see the status of the held call.

By default, Privacy on Hold feature is disabled for all phones on a shared line. Use the **privacy-on-hold** command in telephony-service configuration mode to enable the Privacy feature for calls that are on hold on Cisco Unified SCCP IP phones on a mixed shared line. Use the **privacy-on-hold** command in voice register global configuration mode to enable the Privacy feature for calls that are on hold on Cisco Unified SIP IP phones on a mixed shared line.

The **no privacy** and **privacy off** commands override the **privacy-on-hold** command.

Call Transfer and Forwarding

Both blind transfer and consult transfer are supported on a mixed shared line. A mixed shared line can be the one transferring the call, the one receiving the transferred call, or the call being transferred.

There are four types of call forwarding: all calls, no answer, busy, and night service. Any of these can be configured under a shared SCCP ephone-dn or a shared SIP voice register dn. However, the user must keep the call forwarding parameters for the SCCP and SIP lines synchronized with each other. A mixed shared line can be the one forwarding the call, the one receiving the forwarded call, or the call being forwarded.

For more information, see [Configure Call Transfer and Forwarding, on page 1160](#).

Call Pickup

The Call Pickup feature is supported on a mixed shared line and SIP lines only when the **call-park system application** command is configured in telephony-service configuration mode.

A user can answer a call that:

- Originates from a shared line
- Rings on a shared line
- Originates from one shared line and rings on another shared line

For more information, see [Call Pickup, on page 1227](#).

Call Park

The Call Park feature is supported on a mixed shared line and SIP lines only when the **call-park system application** command is configured in telephony-service configuration mode.

For more information, see [Call Park, on page 1069](#).

Message Waiting Indication

SCCP and SIP message-waiting indication (MWI) services are supported on Cisco Unity and Cisco Unity voice mails on mixed shared lines:

The following are two ways of registering a mixed shared line for an MWI service from a SIP-based MWI server with the shared-line option:

- Configure the **mw**i **si**p command in ephone-dn or ephone-dn-template configuration mode.
- Configure the **mw**i command in voice register dn configuration mode.

For SCCP MWI service on a mixed shared line, use the **mw**i { **off** | **on** | **on-off** } command in ephone-dn configuration mode to enable a specific Cisco Unified IP phone extension to receive MWI notification from an external voice-messaging system.

Software Conferencing

A local software conference can be created on a mixed shared line, with the mixed shared line acting as a conference creator and a conference participant.

For software conferencing on a mixed shared line, other shared-line users remain in remote-in-use state and do not see the calls on hold when the conference call is put on hold by a mixed-shared-line user acting as the conference creator.

Note Only the conference creator, who put a conference call on hold, can resume the conference call.

Dial Plan

A dial plan pattern enables abbreviated extensions to be expanded into fully qualified E.164 numbers and builds additional dial peers for the expanded numbers it creates.

Features are effectively supported on a mixed shared line when dial-plan patterns have matching configurations in telephony-service and voice register global configuration modes using the **dialplan pattern** command.

Busy Lamp Field Speed-Dial Monitoring

A mixed shared line only supports directory number-based Busy-Lamp-Field (BLF) Speed-Dial monitoring and not device-based monitoring.

Restrictions For Mixed Shared Lines

The following features are not supported on mixed Cisco Unified SIP/SCCP shared lines:

- Single Number Reach
- Hardware Conferencing
- Remote-resume on a local software conference call
- Video calls
- Overlay DNs on Cisco Unified SCCP IP phones

Feature Support

The following features are supported on mixed Cisco Unified SIP/SCCP shared lines from Unified CME, 12.2:

- Hold and Resume
- Privacy
- Barge
- cBarge

Overlaid Directory Numbers

An overlaid directory number has the following characteristics:

- Is a member of an overlay set, which includes all the directory numbers that have been assigned together to a particular phone button.
- Can have the same telephone or extension number as other members of the overlay set or different numbers.
- Can be single-line or dual-line, but cannot be mixed single-line and dual-line in the same overlay set.
- Can be shared on more than one phone.

Overlaid directory numbers provide call coverage similar to shared directory numbers because the same number can appear on more than one phone. The advantage of using two directory numbers in an overlay arrangement rather than as a simple shared line is that a call to the number on one phone does not block the use of the same number on the other phone, as would happen if it were a shared directory number.

For information about configuring call coverage using overlaid ephone-dns, see [Configure Call Coverage Features, on page 1262](#).

You can overlay up to 25 lines on a single button. A typical use of overlaid directory numbers would be to create a “10x10” shared line, with 10 lines in an overlay set shared by 10 phones, resulting in the possibility of 10 simultaneous calls to the same number. For configuration information, see [Creating Directory Numbers for a Simple Key System on SCCP Phone, on page 293](#).

Auto Registration of SIP Phones on Cisco Unified CME

Cisco Unified CME supports auto registration of both SIP and SCCP phones. When the auto registration feature is enabled, the **voice register pool** and **voice register dn** commands do not need to be manually configured for the phones. The configuration is automatically created when the phone registers.

The auto registration feature for SIP phones is enabled with the **auto-register** command under **voice register global** configuration mode. For more information on auto-register command, see [Cisco Unified Communications Manager Express Command Reference](#).

The auto registration of SCCP phones is enabled with the **auto-reg-ephone** command under **telephony-service** configuration mode. For more information on auto-register command, see [Cisco Unified Communications Manager Express Command Reference](#).

As part of the **auto-register** command, certain CLI sub-mode configuration options are available to the administrator to successfully register phones using auto-registration on Unified CME.

```

Router(config-register-global)#auto-register
Router(config-voice-auto-register)#
Router(config-voice-auto-register)# ?
VOICE auto register configuration commands:
  auto-assign      Define DN range for auto assignment
  default          Set a command to its defaults
  exit            Exit from voice register group configuration mode
  no              Negate a command or set its defaults
  password         Default password for auto-register phones
  service-enable   Enable SIP phone Auto-Registration
  template        Default template for auto-register phones

```

For details on the configuration steps for auto registration of SIP phones, see [Configure Auto Registration for SIP Phones, on page 327](#).

Service Enable —If the administrator needs to temporarily disable or enable auto registration without losing configurations such as DN range, and password, the **no** form of the CLI option **service-enable** is used (**no service-enable**). Once **auto-register** command is entered, the service is enabled by default. To re-enable the auto registration feature, use the command **service-enable**. It is a sub-mode option in the CLI command **auto-register**. To disable auto registration including removal of configurations such as password and DN range, the **no** form of the CLI command **auto-register** (under voice register global) is used.

```

Router(config)#voice register global
Router(config-register-global)#auto-register
Router(config-voice-auto-register)#no service-enable ?
<cr>

```

Password —As part of the auto registration feature, authentication of phones registering on Unified CME is enabled. When the phone registers with Unified CME, it is mandatory for the administrator to configure the password credentials; username is assigned by default. However, the administrator can modify the username and password credentials under the corresponding voice register pool that gets created after auto registration.

```

Router(config)#voice register global
Router(config-register-global)#auto-register
Router(config-voice-auto-register)#password ?
WORD Password string

```

Note It is mandatory that **password** is configured before DN range (auto-assign) while registering phones using auto registration.

Auto Assign —It is mandatory to define a directory number (DN) range for auto-registration feature to work. The DN range that can be assigned to phones registering on Unified CME is configured using **auto-assign** **<first-dn> to <last-dn>**, which is a submode option of the CLI command **auto-register** (under **voice register global**). The DN numbers assigned to the phones through auto registration are always within the DN range that is defined. However, ensure that the defined DN range is within the maximum DNs recommended for the supported platform.

```

Router(config)#voice register global
Router(config-register-global)#auto-register
Router(config-voice-auto-register)#auto-assign ?
  <1-4294967295> First DN number
Router(config-voice-auto-register)#auto-assign 1001 ?
  <1-4294967295> Last DN number
Router(config-voice-auto-register)#auto-assign 1001 to 1010

```

The automatic registration feature also provides the administrators with the option to enhance a predefined DN range. The enhancement of an existing DN range is supported such that the new first-dn is not greater than the existing first-dn and the new last-dn is not less than the existing last-dn.

For example, the DN range 8001-8006 can be enhanced as 7999-8006, 8000-8007, but not as 8002-8006 or 8001 to 8005.

```
Router# show running-config | section voice register global
voice register global
mode cme
source-address 8.41.20.1 port 5060
auto-register
password xxxx
auto-assign 8001 to 8006
max-dn 50
max-pool 40
Router(config-register-global)#auto-assign 8002 to 8006
Start DN should not be greater than existing First DN
Router(config-register-global)#auto-assign 8001 to 8005
Stop DN should not be less than existing Last DN
```

The DN assigned to phone using the auto registration feature does not duplicate a manually configured DN. When the defined DN range includes a previously registered DN, that DN is skipped as part of the auto registration process. However, when a previously registered DN deregisters and the corresponding configuration for the DN and pool are removed, it can be assigned to a phone registering on Unified CME using auto registration. The assignment of DN range is done in round robin fashion and the first available free DN is assigned to the phone that is auto registering with Unified CME.

Note We recommend that administrators choose different DN ranges for manually configured and auto configured phones.

Template—Administrators are provided the option to create a basic configuration template that can be applied to all phones registering automatically on Unified CME. This basic configuration template supports all the configurations currently supported by the voice register template. It is mandatory that voice register template is configured with the same template tag.

```
Router(config)#voice register global
Router(config-register-global)#auto-register
Router(config-voice-auto-register)#template ?
<1-10> template tag>
Router(config-voice-auto-register)#template 10
```

All phone configurations such as voice-register-pool and voice-register-dn that are generated as part of the auto registration process are persistent configurations. These configurations will be available on the Unified CME even after an event of router reload.

The CLI commands show **voice register pool all** and **show voice register pool all brief** distinctly mention the registration process for phones as registered or unregistered for manual registration, and registered* or unregistered* for automatic registration. However, the registration status for auto-registered phones are reset in the event of a router reload. Then, phone registration status displays only as registered or unregistered.

Syslog Messages

Unified CME generates Syslog messages as part of the registration feature, when the phone registers and unregisters with the Cisco Unified CME. Also, based on the DN range configured, the administrator gets

syslog message providing updates on the registration status of assigned DNs. The syslog messages that provide updates are generated at two instances; at 80% utilization of available DNs, and at 100% utilization of DNs.

From Unified CME 12.3 Release (Cisco IOS XE Fuji Release 16.9.1), the following changes are introduced to Syslog messages printed in Unified CME:

- Syslog messages are printed for successful endpoint assignment and unassignment using Extension Assigner (EA) feature.
- The device type information in the registration and unregistration syslog messages of Unified CME is printed as **DeviceType:Phone-Type**

A sample output for Unified CME 12.3 syslog changes is as follows:

```
Successful extension assignment:
=====
000246: *Apr 23 03:58:46.238: %EXTASSIGNER-6-ASSIGNED: Extension assignment successful for
phone:SEP382056447710. New pool(2). Old pool(1).

Successful extension un-assignment:
=====
000407: *May 3 07:13:08.876: %EXTASSIGNER-6-UNASSIGNED: Extension unassignment successful
for phone:SEP382056447710. Unassigned pool(2).

Phone un-registration:
=====
000300: *Apr 23 03:58:55.128: %SIPPHONE-6-UNREGISTER: VOICE REGISTER POOL-1 has unregistered.
Name:SEP382056447710 IP:8.55.0.108 DeviceType:Phone-8851

Phone registration:
=====
000310: *Apr 23 03:59:08.054: %SIPPHONE-6-REGISTER: VOICE REGISTER POOL-2 has registered.
Name:SEP382056447710 IP:8.55.0.108 DeviceType:Phone-8851
```

The Unified CME system generates the following syslog messages as part of auto registration.

- Syslog message when phone registers with Unified CME:

```
*Mar 28 21:44:08.795 IST: %SIPPHONE-6-REGISTER: VOICE REGISTER POOL-8 has registered.
Name:SEP2834A2823843 IP:8.41.20.58 DeviceType:Phone
```
- Syslog message at 80% utilization of DN range:

```
*Mar 28 21:42:25.732 IST: %SIPPHONE-6-AUTOREGISTER80: AUTO-REGISTER: 80% of DN range
is consumed
```
- Syslog message at 100% utilization of DN range:

```
*Mar 28 21:44:03.328 IST: %SIPPHONE-6-AUTOREGISTER100: AUTO-REGISTER: 100% of DN range
is consumed
```
- Syslog message when phone unregisters with Unified CME:

```
*Mar 28 18:03:41.748 IST: %SIPPHONE-6-UNREGISTER: VOICE REGISTER POOL-6 has unregistered.
Name:SEPB000B4BAF3DA IP:8.41.20.53 DeviceType:Phone
```

Monitor Mode for Shared Lines

In Cisco CME 3.0 and later versions, monitor mode for shared lines provides a visible line status indicating whether the line is in-use or not. A monitor-line lamp is off or unlit only when its line is in the idle call state.

The idle state occurs before a call is made and after a call is completed. For all other call states, the monitor line lamp is lit. A receptionist who monitors the line can see that it is in use and can decide not to send additional calls to that extension, assuming that other transfer and forwarding options are available, or to report the information to the caller; for example, “Sorry, that extension is busy, can I take a message?”

In Cisco CME 3.2 and later versions, consultative transfers can occur during Direct Station Select (DSS) for transferring calls to idle monitored lines. The receptionist who transfers a call from a normal line can press the Transfer button and then press the line button of the monitored line, causing the call to be transferred to the phone number of the monitored line. For information about consultative transfer with DSS, see [Configure Call Transfer and Forwarding, on page 1160](#).

In Cisco Unified CME 4.0(1) and later versions, the line button for a monitored line can be used as a DSS for a call transfer when the monitored line is idle or in-use, provided that the call transfer can succeed; for example, when the monitored line is configured for Call Forward Busy or Call Forward No Answer.

Note Typically, Cisco Unified CME does not attempt a transfer that causes the caller (transferee) to hear a busy tone. However, the system does not check the state of subsequent target numbers in the call-forward path when the transferred call is transferred more than once. Multiple transfers can occur because a call-forward-busy target is also busy and configured for Call Forward Busy.

In Cisco Unified CME 4.3 and later versions, a receptionist can use the Transfer to Voicemail feature to transfer a caller directly to a voice-mail extension for a monitored line. For configuration information, see [Transfer to Voice Mail, on page 546](#).

For configuration information for monitor mode, see [Create Directory Numbers for SCCP Phones, on page 264](#).

Monitor mode is intended for use only in the context of shared lines so that a receptionist can visually monitor the in-use status of several users’ phone extensions; for example, for Busy Lamp Field (BLF) notification. To monitor all lines on an individual phone so that a receptionist can visually monitor the in-use status of that phone, see [Watch Mode for Phones, on page 244](#).

For BLF monitoring of speed-dial buttons and directory call-lists, see [Configure Presence Service, on page 873](#).

Watch Mode for Phones

In Cisco Unified CME 4.1 and later versions, a line button that is configured for watch mode on one phone provides BLF notification for all lines on another phone (watched phone) for which watched directory number is the primary line. Watch mode allows a phone user, such as a receptionist, to visually monitor the in-use status of an individual phone. A user can use the line button that has been set in watch mode as a speed-dial to call the first extension of the watched phone. The watching phone button displays a red light when the watched phone is unregistered in a DND state or in an offhook state. Pressing the button when it is not displaying a red light will dial the number in the same manner it would for a monitor button or the speed-dial button. Incoming calls on a line button that is in watch mode do not ring and do not display caller ID or call-waiting caller ID.

The line button for a watched phone can also be used as a DSS for a call transfer when the watched phone is idle. In this case, the phone user who transfers a call from a normal line can press the Transfer button and then press the line button of the watched directory number, causing the call to be transferred to the phone number associated with the watched directory number.

For configuration information, see [Create Directory Numbers for SCCP Phones, on page 264](#).

If the watched directory number is a shared line and the shared line is not idle on any phone with which it is associated, then in the context of watch mode, the status of the line button indicates that the watched phone is in use.

For best results when monitoring the status of an individual phone based on a watched directory number, the directory number configured for watch mode should not be a shared line. To monitor a shared line so that a receptionist can visually monitor the in-use status of several users' phone extensions, see [Monitor Mode for Shared Lines, on page 243](#).

For BLF monitoring of speed-dial buttons and directory call-lists, see [Presence Service, on page 869](#).

PSTN FXO Trunk Lines

In Cisco CME 3.2 and later versions, IP phones running SCCP can be configured to have buttons for dedicated PSTN FXO trunk lines, also known as FXO lines. FXO lines may be used by companies whose employees require private PSTN numbers. For example, a salesperson may need a special number that customers can call without having to go through a main number. When a call comes in to the direct number, the salesperson knows that the caller is a customer. In the salesperson's absence, the customer can leave a voice mail. FXO lines can use PSTN service provider voice mail: when the line button is pressed, the line is seized, allowing the user to hear the stutter dial tone provided by the PSTN to indicate that voice messages are available.

Because FXO lines behave as private lines, users do not have to dial a prefix, such as 9 or 8, to reach an outside line. To reach phone users within the company, FXO-line users must dial numbers that use the company's PSTN number. For calls to non-PSTN destinations, such as local IP phones, a second directory number must be provisioned.

Calls placed to or received on an FXO line have restricted Cisco Unified CME services and cannot be transferred by Cisco Unified CME. However, phone users are able to access hookflash-controlled PSTN services using the Flash softkey.

In Cisco Unified CME 4.0(1), the following FXO trunk enhancements were introduced to improve the keyswitch emulation behavior of PSTN lines on phones running SCCP in a Cisco Unified CME system:

- **FXO port monitoring**—Allows the line button on IP phones to reliably show the status of an FXO port when the port is in use. The status indicator, either a lamp or an icon, depending on the phone model, accurately displays the status of the FXO port during the duration of the call, even after the call is forwarded or transferred. The same FXO port can be monitored by multiple phones using multiple trunk ephone-dns.
- **Transfer recall**—If a transfer-to phone does not answer after a specified timeout, the call is returned to the phone that initiated the transfer and it resumes ringing on the FXO line button. The directory number must be dual-lined.
- **Transfer-to button optimization**—When an FXO call is transferred to a private extension button on another phone, and that phone has a shared line button for the FXO port, after the transfer is committed and the call is answered, the connected call displays on the FXO line button of the transfer-to phone. This frees up the private extension line on the transfer-to phone. The directory number *n* must be dual-line.
- **Dual-line ephone-dns**—Directory numbers for FXO lines can now be configured for dual-line to support the FXO monitoring, transfer recall, and transfer-to button optimization features.

For configuration information, see [Configure Trunk Lines for a Key System on SCCP Phone, on page 296](#).

Codecs for Cisco Unified CME Phones

In Cisco CME 3.4, support for connecting and provisioning SIP phones was added. The default codec of the POTS dial peer for an SCCP phone is G.711 and the default codec of a VoIP dial peer for a SIP phone is G.729. If neither the SCCP phone nor the SIP phone in Cisco Unified CME is specifically configured to change the codec, calls between the two phones on the same router will produce a busy signal caused by the mismatched default codecs. To avoid codec mismatch, specify the codec for individual IP phones in Cisco Unified CME. Modify the configuration for either SIP or SCCP phones to ensure that the codec for all phones match. Do not modify the configuration for both SIP and SCCP phones. For configuration information, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).

In Cisco Unified CME 4.3, support for G.722-64K and the Internet Low Bit Rate Codec (iLBC) was added. This enables Cisco Unified CME to support the same codecs that are used in newer Cisco Unified IP phones, mobile wireless networks, and internet telephony without transcoding. This feature provides support for the following:

- iLBC and G.722-capable SIP and SCCP IP phones in Cisco Unified CME.
- iLBC-capable SCCP analog endpoints and remote phones in Cisco Unified CME.
- Conferencing support for G.722 and iLBC.
- Supplementary services, such as transfer, call forward, MOH, support for G.722 and iLBC, including any supplementary services that require transcoding between G.722 and any other codec.
- Transcoding for G.722 and iLBC, including G.722 to G.711 and G.722 to any other codec.

With the introduction of G.722 and iLBC codecs, there can be a disparity between codec capabilities of different phones and different firmware versions on same phone type. For example, when a H.323 call is established, the codec is negotiated based on the dial-peer codec and the assumption is that the codecs supported on H.323 side are supported by the phones. This assumption is not valid after G.722 and iLBC codec are introduced in your network. If the phones do not support the codecs on the H.323 side, a transcoder is required. To avoid transcoding in this situation, configure incoming dial-peers so that G.722 and iLBC codecs are not used for calls to phones that are not capable of supporting these codecs. Instead, configure these phones for G.729 or G.711. Also, when configuring shared directory numbers, ensure that phones with the same codec capabilities are connected to the shared directory number.

G.722-64K

Traditional PSTN telephony codecs, including G.711 and G.729, are classified as narrowband codecs because they encode audio signals in a narrow audio bandwidth, giving telephone calls a characteristic “tinny” sound. Wideband codecs, such as G.722, provide a superior voice experience because wideband frequency response is 200 Hz to 7 kHz compared to narrowband frequency response of 300 Hz to 3.4 kHz. At 64 kbps, the G.722 codec offers conferencing performance and good music quality.

A wideband handset for certain Cisco Unified IP phones, such as the Cisco Unified IP Phone 7906G, 7911G, 7941G-GE, 7942G, 7945G, 7961G-GE, 7962G, 7965G, and 7975G, take advantage of the higher voice quality provided by wideband codecs to enhance end-user experience with high-fidelity wideband audio. When users use a headset that supports wideband, they experience improved audio sensitivity when the wideband setting on their phones is enabled. You can configure phone-user access to the wideband headset setting on IP phones by setting the appropriate VendorConfig parameters in the phone’s configuration file. For configuration information, see [Modify Cisco Unified IP Phone Options, on page 1433](#).

If the system is not configured for a wideband codec, phone users may not detect any additional audio sensitivity, even when they are using a wideband headset.

You can configure the G.722-64K codec at a system-level for all calls through Cisco Unified CME. For configuration information, see [Modify the Global Codec, on page 289](#). To configure individual phones and avoid codec mismatch for calls between local phones, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).

iLBC codec

Internet Low Bit Rate Codec (iLBC) enables graceful speech quality degradation in a network where frames get lost. Consider iLBC suitable for real-time communications, such as telephony and video conferencing, streaming audio, archival, and messaging. This codec is widely used by internet telephony softphones. The SIP, SCCP, and MGCP call protocols support use of the iLBC as an audio codec. iLBC provides better voice quality than G.729 but less than G.711. Supporting codecs that have standardized use in other networks, such as iLBC, enables end-to-end IP calls without the need for transcoding.

To configure individual SIP or SCCP phones, including analog endpoints in Cisco Unified CME, and avoid codec mismatch for calls between local phones, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).

Analog Phones

Cisco Unified CME supports analog phones and fax machines using Cisco Analog Telephone Adaptors (ATAs) or FXS ports in SCCP, H.323 mode, and fax pass-through mode. The FXS ports used for analog phones or fax can be on a Cisco Unified CME router, Cisco VG224 voice gateway, or integrated services router (ISR).

This section provides information on the following topics:

Cisco ATAs in SCCP Mode

You can configure the Cisco ATA 186 or Cisco ATA 188 to cost-effectively support analog phones using SCCP in Cisco IOS Release 12.2(11)T and later versions. Each Cisco ATA enables two analog phones to function as IP phones. For configuration information, see [Configure Cisco ATA Support in SCCP Mode, on page 306](#).

Cisco ATAs in SIP Mode

You can configure the Cisco ATA 187, Cisco ATA 190 or Cisco ATA 191 to cost-effectively support analog phones and FAX using SIP for Unified CME. The support for Cisco ATA 191 is introduced from Unified CME 12.5 (Cisco IOS XE Gibraltar 16.10.1a) Release. Each Cisco ATA enables two analog phones to function as IP phones. For configuration information, see [Configure Cisco ATA Support in SIP Mode, on page 308](#).

The following are some of the known restrictions for Cisco ATA 191 on Unified CME:

- If both ports of a Cisco ATA 191 are configured as shared line, then a call put on hold on one port cannot be resumed at the other port.
- For Unified CME, a call put on hold on Unified SIP IP Phone cannot be resumed from a Cisco ATA 191.
- You cannot configure the same shared line DN on both ports of the Cisco ATA 191. On configuring the same shared line DN on both the lines of the Cisco ATA 191, second line does not get registered.

Cisco ATA 191 on Unified CME

The ATA 191 analog telephone adapter is a telephony-device-to-Ethernet adapter that allows regular analog phones to operate on IP-based telephony networks. The ATA 191 supports two voice ports, each with an independent phone number. The ATA 191 also has an RJ-45 10/100BASE-T data port.

Unified CME 12.5 and later release provide native support for Cisco ATA 191. The SIP protocol is supported on Cisco ATA 191.

The ATA 191 supports two lines, but has only a single MAC address. Hence, you must use a shifted MAC address to configure the second line on ATA 191. A sample configuration for Line 1 and Line 2 for an ATA 191 is as follows:

```
Line 1 configuration:
voice register dn 15
  number 8015
voice register pool 15
  id mac DCEB.941C.F33D
  type ATA-191
  number 1 dn 15
  username abcd password xxxx
  codec g711ulaw
Line 2 configuration:
voice register dn 16
  number 8016
voice register pool 16
  id mac EB94.1CF3.3D01
  type ATA-191
  number 1 dn 16
  username uvwx password xxxx
  codec g711ulaw
```

Note Left shift the MAC address by two places, and append the two removed digits at the end with 01 to define the shifted MAC address. For example, the MAC address **DCEB.941C.F33D** is modified to get the shifted MAC address, **EB94.1CF3.3D01**.

Feature Support for Cisco ATA 191

The Cisco ATA 191 supports the following features on Unified CME:

- **Hold or Resume**—Hold or Resume is invoked using a hookflash for Cisco ATA 191 on Unified CME. For more information on the feature, see [Put a Call on Hold on Your Analog Phone](#).
- **Consult or Semi Consult Transfer**—To Transfer a call using Cisco ATAT 191 on Unified CME, you need to use hookflash along with FAC. For information on the feature, see [Transfer a Call from Your Analog Phone](#).
- **Call Waiting**—Call Waiting calls are answered using a hookflash for Cisco ATA 191 on Unified CME. For more information on the feature, see [Answer Call Waiting on Your Analog Phone](#).
- **MeetMe Conference**—To host a MeetMe Conference on Cisco ATAT 191 on Unified CME, you need to use hookflash along with FAC. For information on how to invoke the feature, see [Host a Meet Me Conference on Your Analog Phone](#).

- Call Forward (All, Busy, No Answer)—Call Forward is invoked using a hookflash for Cisco ATA 191 on Unified CME. For more information on the feature, see [Forward Your Analog Phone Calls to Another Number](#).
- cBarge—cBarge is invoked using a hookflash for Cisco ATA 191 on Unified CME. For more information on the feature, see [Call Features and Star Codes for Analog Phones](#).
- Built-in Bridge Conference (BIB)—BIB is invoked using a hookflash for Cisco ATA 191 on Unified CME. For more information on the feature, see [Make a Conference Call from Your Analog Phone](#).
- Call Park—Call Park is invoked using a FAC Code for Cisco ATA 191 on Unified CME. To park a call on Cisco ATA 191 on Unified CME, you need to transfer the call to the FAC code, ****6**. For more information, see [Call Park, on page 1069](#).
- Call Park Pickup and G-Pickup—To pick up a parked call, dial the park-slot number.
- Voice Mail—For Voice Mail support on Cisco ATA 191, you need to go offhook, and dial the voice mail number configured on Unified CME to access the IVR options.
- Fax Transmission (with T.38, Passthrough)—For Fax transmission to work with Cisco ATA 191 on Unified CME, you need to configure the CLI command **service phone faxMode 0** under **telephony-service** configuration mode. For information on the feature, see [Send and Receive Fax Calls](#).
- Shared Line/Mixed Shared Line—For information on the feature, see [Shared Lines on Your Analog Phone](#).
- KPML Dialing—For KPML Dialing support on Cisco ATA 191, you need to go offhook and dial the number.
- TCP/UDP Registration
- Extension Assigner
- Auto Registration
- DTMF
- Caller ID Blocking
- Music On Hold (MOH)
- Upgrade or Downgrade Firmware
- Redial
- WebAccess
- SSH
- MWI—Cisco ATA 191 plays a stuttered tone instead of MWI

Feature Support Restriction

The following are the known feature restrictions for Cisco ATA 191 on Unified CME:

- Barge—Cisco ATA 191 cannot barge into an active shared line call (phone limitation). However, non-ATA phones can barge into Cisco ATA's shared line call.
- Hardware Conference is not supported.

- Do Not Disturb
- Span to PC Port
- Speed Dial—For Cisco ATA 191, Abbreviated Dial is supported as Speed Dial. Unified CME does not support Abbreviated Dial.
- Secondary CME
- Call Waiting with Caller-ID—For Cisco ATA 191, the phone Caller-ID does not display any call waiting notification (only call waiting tone is supported).
- Localization
- Shared Line
 - Both the ports of a Cisco ATA191 cannot be configured with the same Shared Line DN.
 - Remote Resume is not supported for a Shared Line call placed on hold.

FXS Ports in SCCP Mode

FXS ports on Cisco VG224 Voice Gateways and Cisco 2800 Series and Cisco 3800 Series ISRs can be configured for SCCP supplementary features. For information about using SCCP supplementary features on analog FXS ports on a Cisco IOS gateway under the control of a Cisco Unified CME router, see [Supplementary Services Features for FXS Ports on Cisco IOS Voice Gateways Configuration Guide](#).

FXS Ports in H.323 Mode

FXS ports on platforms that cannot enable SCCP supplementary features can use H.323 mode to support call waiting, caller ID, hookflash transfer, modem pass-through, fax (T.38, Cisco fax relay, and pass-through), and PLAR. These features are provisioned as Cisco IOS voice features and not as Cisco Unified CME features.

Note When using Cisco Unified CME, you can configure FXS ports in H.323 mode for call waiting or hookflash transfer, but not both at the same time.

Fax Support

Cisco Unified CME 4.0 introduced the use of G.711 fax pass-through for SCCP on the Cisco VG224 voice gateway and Cisco ATA. In Cisco Unified CME 4.0(3) and later versions, fax relay using the Cisco-proprietary fax protocol is the only supported fax option for SCCP-controlled FXS ports on the Cisco VG224 and integrated service routers. For more information on fax relay, see [Fax Relay, on page 745](#).

Cisco ATA-187

Cisco Unified CME 9.0 and later versions provide voice and fax support on Cisco ATA-187.

Cisco ATA-187 is a SIP-based analog telephone adaptor that turns traditional telephone devices into IP devices. Cisco ATA-187 can connect with a regular analog FXS phone or fax machine on one end, while the other end is an IP side that uses SIP for signaling and registers to Cisco Unified CME as a Cisco Unified SIP IP phone.

Cisco ATA-187 functions as a Cisco Unified SIP IP phone that supports T.38 fax relay and fax pass-through, enabling the real-time transmission of fax over IP networks. The fax rate is from 7.2 to 14.4 kbps.

For information on how to configure voice and fax support on Cisco ATA-187, see [Configure Voice and T.38 Fax Relay on Cisco ATA-187, on page 310](#).

For information on the features supported in Cisco ATA-187, see [Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST](#).

For more information on Cisco ATA-187, see [Cisco ATA 187 Analog Telephone Adaptor Administration Guide for SIP](#).

Cisco VG202, VG204, and VG224 Auto Configuration

The Auto Configuration feature in Cisco Unified CME 7.1 and later versions allows you to automatically configure the Cisco VG202, VG204, and VG224 Analog Phone Gateway. You can configure basic voice gateway information in Cisco Unified CME, which then generates XML configuration files for the gateway and saves the files to either the default location in system:/its/ or to a location you define in system memory, flash memory, or an external TFTP server. When the voice gateway powers up, it downloads the configuration files from Cisco Unified CME and based on the information in the files, the voice gateway provisions its analog voice ports and creates the corresponding dial peers.

Using this Auto Configuration feature with the existing Auto Assign feature allows you to quickly set up analog phones to make basic calls. After the voice gateway is properly configured and it downloads its XML configuration files from Cisco Unified CME, the SCCP telephony control (STC) application registers each configured voice port to Cisco Unified CME.

If you enable the Auto Assign feature, the gateway automatically assigns the next available directory number from the pool set by the **auto assign** command, binds that number to the requesting voice port, and creates an ephone entry associated with the voice port. The MAC address for the ephone entry is calculated based on the MAC address of the gateway and the port number. You can manually assign a directory number to each of the voice ports by creating the ephone-dn and corresponding ephone entry.

You can initiate a reset or restart of the analog endpoints from Cisco Unified CME, which triggers the autoconfiguration process. The voice gateway downloads its configuration files from Cisco Unified CME and applies the new changes.

For configuration information, see [Auto-Configuration for Cisco VG202, VG204, and VG224, on page 314](#).

Internet Protocol - Secure Telephone Equipment Support

Cisco Unified CME 8.0 adds support for a new secure endpoint, Internet Protocol - Secure Telephone Equipment (IP-STE). IP-STE is a standalone, V.150.1 capable device which functions like a 7960 phone with secure communication capability. IP-STE has native state signaling events (SSE / SPRT) support and supports SCCP protocol. IP-STE uses the device ID 30035 when registering to a SCCP server. However, only V.150.1 modem relay is implemented in an IP-STE stack and V150.1 modem passthrough is not supported. Therefore, the response to capability query from Cisco Unified CME only includes media_payload_XV150_MR_711U and media_payload_xv150_MR_729A.

For configuration information, see [Configure Secure IP Phone \(IP-STE\) on SCCP Phone, on page 323](#).

The following support is added for IP-STE endpoints:

- The IP-STE endpoint allows secure communication between gateway-connected legacy analog STE/STU devices and IP STE devices using existing STE devices in voice networks.

- Secure voice and secure data modes from STE/STU devices connected to Cisco IOS gateway foreign exchange station (FXS) and BRI ports to an IP-STE.
- Support for the state signaling events (SSE) protocol, allowing for modem signaling end-to-end and VoIP to modem over IP (MoIP) transition and operation.
- Interoperation between line-side and trunk-side gateways and Cisco Unified CME to determine codec support and V.150.1 negotiation. You can configure gateway-attached devices to support either modem relay, modem pass-through, both modem transport methods, or neither method.

Secure Communications Between STU, STE, and IP-STE

Secure Telephone Equipment (STE) and Secure Telephone Units (STUs) encrypt voice and data streams with government proprietary algorithms (Type-1 encryption). To provide support for the legacy STEs and STUs and next generation IP Secure Telephone Equipment (IP-STE), voice gateways must be able to support voice and data in secure mode within the IP network and be able to pass calls within and also to and from government voice networks.

In earlier versions of Cisco Unified CME, Cisco IOS gateways supported secure voice and data communication between legacy STE and STU devices using modem pass-through method. Cisco Unified CME 8.0 and later versions control the secure endpoints by implementing a subset of v.150.1 modem relay protocol and ensures secure communications between IP-STE endpoints and STE/STU endpoints. This allows Cisco Unified CME SCCP controlled secure endpoints to communicate with the IP-STE or legacy endpoints in secure mode.

SCCP Media Control for Secure Mode

IP-STE endpoints use the V.150.1 modem relay transport method using Future Narrow Band Digital Terminal (FNBDT) signaling over a V.32 or V.34 data pump for secure communication with other legacy STE endpoints. However, IP-STE endpoints cannot communicate with STU endpoints because STU endpoints use the modem pass-through method using a proprietary data pump and do not support the FNBDT signaling.

Secure communication between IP-STE endpoints and legacy STE endpoints support the following encryption-capable endpoints:

- STE—Specialized encryption-capable analog or BRI phones that can communicate over V.150.1 modem relay or over modem pass-through, also known as Voice Band Data (VBD).
- IP-STE—Specialized encryption-capable IP phones that communicate only over V.150.1 modem relay.
- STU—Specialized encryption-capable analog phones that operate only over NSE-based modem pass-through connections.

[Table 17: Supported Secure Call Scenarios and Modem Transport Methods](#), on page 252 lists call scenarios between devices along with modem transport methods that the IP-STE endpoints use to communicate with STE endpoints.

Table 17: Supported Secure Call Scenarios and Modem Transport Methods

Device Type	STU	STE	IP-STE
STU	Pass-through	Pass-through	None
STE	Pass-through	Pass-through	Relay

Device Type	STU	STE	IP-STE
IP-STE	None	Relay	Relay

Secure Communication Between STE, STU, and IP-STE Across SIP Trunk

The Secure Device Provisioning (SDP) for SIP end-to-end negotiation includes four proprietary media types for secure communication between Cisco Unified CME and SIP trunk. These proprietary VBD or Modem Relay (MR) media types can be encoded into media attributes of SDP media lines. VBD capabilities are signaled using the SDP extension mechanism and Cisco proprietary nomenclature. MR capabilities are signaled through V.150.1. The following example shows VBD capabilities. The SDP syntax are based on RFC 2327 and V.150.1 Appendix E.

```
a=rtpmap:100 X-NSE/8000
a=rtpmap:118 v150fw/8000
a=sgn:0
a=cdsc:1 audio RTP/AVP 118 0 18

a=cpar: a=sprtmap: 120 v150mr/8000
```

Remote Teleworker Phones

IP phones or a Cisco IP Communicator can be connected to a Cisco Unified CME system over a WAN to support teleworkers who have offices that are remote from the Cisco Unified CME router. The maximum number of remote phones that can be supported is determined by the available bandwidth.

IP addressing is a determining factor in the most critical aspect of remote teleworker phone design. The following two scenarios represent the most common designs, the second one is the most common for small and medium businesses:

- Remote site IP phones and the hub Cisco Unified CME router use globally routable IP addresses.
- Remote site IP phones use NAT with unroutable private IP addresses and the hub Cisco Unified CME router uses a globally routable address (see [Figure 13: Remote Site IP Phones Using NAT, on page 254](#)). This scenario results in one-way audio unless you use one of the following workarounds:
 - Configure static NAT mapping on the remote site router (for example, a Cisco 831 Ethernet Broadband Router) to convert between a private address and a globally routable address. This solution uses fewer Cisco Unified CME resources, but voice is unencrypted across the WAN.
 - Configure an IPsec VPN tunnel between the remote site router (For example, a Cisco 831 Ethernet Broadband Router) and the Cisco Unified CME router. This solution requires Advanced IP Services or higher image on the Cisco Unified CME router if this router is used to terminate the VPN tunnel. Voice will be encrypted across the WAN. This method will also work with the Cisco VPN client on a PC to support a Cisco IP Communicator.

Figure 13: Remote Site IP Phones Using NAT

Media Termination Point for Remote Phones

Media termination point (MTP) configuration is used to ensure that Real-Time Transport Protocol (RTP) media packets from remote phones always transit through the Cisco Unified CME router. Without the MTP feature, a phone that is connected in a call with another phone in the same Cisco Unified CME system sends its media packets directly to the other phone, without the packets going through the Cisco Unified CME router. MTP forces the packets to be sourced from the Cisco Unified CME router.

When this configuration is used to instruct a phone to always send its media packets to the Cisco Unified CME router, the router acts as an MTP or proxy and forwards the packets to the destination phone. If a firewall is present, it can be configured to pass the RTP packets because the router uses a specified UDP port for media packets. In this way, RTP packets from remote IP phones can be delivered to IP phones on the same system though they must pass through a firewall.

You must use the **mtp** command to explicitly enable MTP for each remote phone that sends media packets to Cisco Unified CME.

One factor to consider is whether you are using multicast music on hold (MOH) in your system. Multicast packets generally cannot be forwarded to phones that are reached over a WAN. The multicast MOH feature checks to see if MTP is enabled for a phone and if it is, MOH is not sent to that phone. If you have a WAN configuration that can forward multicast packets and you can allow RTP packets through your firewall, you can decide not to use MTP.

For configuration information, see [Enable Remote Phone, on page 319](#).

G.729r8 Codec on Remote Phones

You can select the G.729r8 codec on a remote IP phone to help save network bandwidth. The default codec is G.711 mu-law. If you use the **codec g729r8** command without the **dspfarm-assist** keyword, the use of the G.729 codec is preserved only for calls between two phones on the Cisco Unified CME router (such as between an IP phone and another IP phone or between an IP phone and an FXS analog phone). The **codec g729r8** command has no effect on a call directed through a VoIP dial peer unless the **dspfarm-assist** keyword is also used.

For configuration information, see [Enable Remote Phone, on page 319](#).

For information about transcoding behavior when using the G.729r8 codec, see [Transcoding When a Remote Phone Uses G.729r8, on page 488](#).

Busy Trigger and Channel Huntstop for SIP Phones

Cisco Unified CME 7.1 introduced busy trigger and huntstop channel support for SIP phones, such as the Cisco Unified IP Phone 7941G, 7941GE, 7942G, 7945G, 7961G, 7961GE, 7962G, 7965G, 7970G, 7971GE, 7975G, and 7985. For these SIP phones, the number of channels supported is limited by the amount of memory on the phone. To prevent incoming calls from overloading the phone, you can configure a busy trigger and a channel huntstop for the directory numbers on the phone.

The Channel Huntstop feature limits the number of channels available for incoming calls to a directory number. If the number of incoming calls reaches the configured limit, Cisco Unified CME does not present the next incoming call to the directory number. This reserves the remaining channels for outgoing calls or for features, such as call transfer and conferencing.

The Busy Trigger feature limits the calls to a directory number by triggering a busy response. After the number of active calls, both incoming and outgoing, reaches the configured limit, Cisco Unified CME forwards the next incoming call to the Call Forward Busy destination or rejects the call with a busy tone if Call Forward Busy is not configured.

The busy-trigger limit applies to all directory numbers on a phone. If a directory number is shared among multiple SIP phones, Cisco Unified CME presents incoming calls to those phones that have not reached their busy-trigger limit. Cisco Unified CME initiates the busy trigger for an incoming call only if all the phones sharing the directory number exceed their limit.

For configuration information, see [Create Directory Numbers for SIP Phones, on page 275](#) and [Assign Directory Numbers to SIP Phones, on page 277](#).

Multiple Calls Per Line

Cisco Unified CME 9.0 provides support for the Multiple Calls Per Line (MCPL) feature on Cisco Unified 6921, 6941, 6945, and 6961 SIP IP phones and Cisco Unified 8941 and 8945 SCCP and SIP IP phones.

Before Cisco Unified CME 9.0, the maximum number of calls supported for every directory number (DN) on Cisco Unified 8941 and 8945 SCCP IP phones was restricted to two.

With Cisco Unified CME 9.0, the MCPL feature overcomes the limitation on the maximum number of calls per line.

In Cisco Unified CME 9.0, the MCPL feature is not supported on Cisco Unified 6921, 6941, 6945, and 6961 SCCP IP phones.

Cisco Unified 8941 and 8945 SCCP IP Phones

Before Cisco Unified CME 9.0, Cisco Unified 8941 and 8945 SCCP IP phones only supported two incoming calls per line and a third channel was reserved for call transfers or conference calls. These phones were also hardcoded with **ephone-dn octo-line**, **huntstop-channel 2**, **max-calls-per-button 3**, and **busy-trigger-per-button 2**.

In Cisco Unified CME 9.0, you can configure the **ephone-dn dn-tag [dual-line | octo-line]** in global configuration mode and the **max-calls-per-button** and **busy-trigger-per-button** commands in ephone or ephone-template configuration mode for Cisco Unified 8941 and 8945 SCCP IP phones to configure a DN and enable the number of calls per DN, set the maximum number of calls allowed on an octo-line DN, and set the maximum number of calls allowed on an octo-line DN before activating a busy tone.

For configuration information, see [Configure the Maximum Number of Calls on SCCP Phone, on page 331](#).

Cisco Unified 6921, 6941, 6945, 6961, 8941, and 8945 SIP IP Phones

In Cisco Unified CME 9.0, the default values for the **busy-trigger-per-button** command is 1 for the Cisco Unified 6921, 6941, 6945, and 6961 SIP IP phones and 2 for the Cisco Unified 8941 and 8945 SIP IP phones.

You can configure the maximum number of calls before a phone receives a busy tone. For example, if you configure **busy-trigger-per-button 2** in voice register pool configuration mode for a Cisco Unified 6921, 6941, 6945, or 6961 SIP IP phone, the third incoming call to the phone receives a busy tone.

For information on the Busy Trigger feature on Cisco Unified SIP IP phones, see [Busy Trigger and Channel Huntstop for SIP Phones, on page 254](#).

For configuration information, see [Configure the Busy Trigger Limit on SIP Phone, on page 333](#).

Digit Collection on SIP Phones

Digit strings dialed by phone users must be collected and matched against predefined patterns to place calls to the destination corresponding to the user's input. Before Cisco Unified CME 4.1, SIP phone users had to press the DIAL softkey or # key or wait for the interdigit-timeout to trigger call processing. In Cisco Unified CME 4.1 and later versions, two methods of collecting and matching digits are supported for SIP phones, depending on the model of phone:

Key Press Markup Language Digit Collection

Key Press Markup Language (KPML) uses SIP SUBSCRIBE and NOTIFY methods to report user input digit by digit. Each digit dialed by the phone user generates its own signaling message to Cisco Unified CME, which performs pattern recognition by matching a destination pattern to a dial peer as it collects the dialed digits. This process of relaying each digit immediately is similar to the process used by SCCP phones. It eliminates the need for the user to press the Dial softkey or wait for the interdigit timeout before the digits are sent to Cisco Unified CME for processing.

KPML is supported on Cisco Unified IP Phones 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE. For configuration information, see [Enable KPML on a SIP Phone, on page 285](#).

SIP Dial Plans

A dial plan is a set of dial patterns that SIP phones use to determine when digit collection is complete after a user goes off-hook and dials a destination number. Dial plans allow SIP phones to perform local digit collection and recognize dial patterns as user input is collected. After a pattern is recognized, the SIP phone sends an INVITE message to Cisco Unified CME to initiate the call to the number matching the user's input. All of the digits entered by the user are presented as a block to Cisco Unified CME for processing. Because digit collection is done by the phone, dial plans reduce signaling messages overhead compared to KPML digit collection.

SIP dial plans eliminate the need for a user to press the Dial softkey or # key or to wait for the interdigit timeout to trigger an outgoing INVITE. You configure a SIP dial plan and associate the dial plan with a SIP phone. The dial plan is downloaded to the phone in the configuration file.

You can configure SIP dial plans and associate them with the following SIP phones:

- Cisco Unified IP Phones 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE—These phones use dial plans and support KPML. If both a dial plan and KPML are enabled, the dial plan has priority. If a matching dial plan is not found and KPML is disabled, the user must wait for the interdigit timeout before the SIP NOTIFY message is sent to Cisco Unified CME. Unlike other SIP phones, these phones do not have a Dial softkey to indicate the end of dialing, except when on-hook dialing is used. In this case, the user can press the Dial softkey at any time to send all the dialed digits to Cisco Unified CME.
- Cisco Unified IP Phones 7905, 7912, 7940, and 7960—These phones use dial plans and do not support KPML. If you do not configure a SIP dial plan for these phones, or if the dialed digits do not match a dial plan, the user must press the Dial softkey or wait for the interdigit timeout before digits are sent to Cisco Unified CME.

When you reset a phone, the phone requests its configuration files from the TFTP server, which builds the appropriate configuration files depending on the type of phone.

- Cisco Unified IP Phones 7905 and 7912—The dial plan is a field in their configuration files.
- Cisco Unified IP Phones 7911G, 7940, 7941G, 7941GE, 7960, 7961G, 7961GE, 7970G, and 7971GE—The dial plan is a separate XML file that is pointed to from the normal configuration file.

For configuration information for Cisco Unified CME, see [Configure Dial Plans for SIP Phones, on page 280](#).

Session Transport Protocol for SIP Phones

In Cisco Unified CME 4.1 and later versions, you can select TCP as the transport protocol for connecting supported SIP phones to Cisco Unified CME. Previously only UDP was supported. TCP is selected for individual SIP phones by using the **session-transport** command in voice register pool or voice register template configuration mode. For configuration information, see [Select Session-Transport Protocol for a SIP Phone, on page 286](#).

Real-Time Transport Protocol Call Information Display Enhancement

Before Cisco Unified CME 8.8, active RTP call information on ephone call legs were determined only by parsing the **show ephone registered** or **show ephone offhook** command output. The **show voip rtp connections** command showed active call information in the system but it did not apply to ephone call legs. In Cisco Unified CME 8.8 and later versions, you can display information on active RTP calls, including the ephone tag number of the phone with an active call, the channel of the ephone-dn, and the caller and called party's numbers for the connection for both local and remote endpoints, using the **show ephone rtp connections** command. The output from this command provides an overview of all the connections in the system, narrowing the criteria for debugging pulse code modulation and Cisco Unified CME packets without a sniffer.

Note When an ephone to non-ephone call is made, information on the non-ephone does not appear in a **show ephone rtp connections** command output. To display the non-ephone call information, use the **show voip rtp connections** command.

The following sample output shows all the connected ephones in the Cisco Unified CME system. The sample output shows five active ephone connections with one of the phones having the **dspfarm-assist** keyword configured to transcode the code on the local leg to the indicated codec. The output also shows four ephone-to-ephone calls, represented in the CallID columns of both the RTP connection source and RTP connection destination by zero values.

Normally, a phone can have only one active connection but in the presence of a whisper intercom call, a phone can have two. In the sample output, ephone-40 has two active calls: it is receiving both a normal call and a whisper intercom call. The whisper intercom call is being sent by ephone-6, which has an invalid LocalIP of 0.0.0.0. The invalid LocalIP indicates that it does not receive RTP audio because it only has a one-way voice connection to the whisper intercom call recipient.

```
Router# show ephone rtp connections
Ephone RTP active connections :
Ephone   Line  DN  Chan  SrcCallID  DstCallID  Codec (xcoded?)
      SrcNum  DstNum  LocalIP                RemoteIP
ephone-5      1    5    1         15         14 G729 (Y)
      1005   1102   [192.168.1.100]:23192  [192.168.1.1]:2000

1140 1141 [192.168.1.70]:20664 [192.168.1.81]:21244
Found 5 active ephone RTP connections

```

Ephone-Type Configuration

In Cisco Unified CME 4.3 and later versions, you can dynamically add a new phone type to your configuration without upgrading your Cisco IOS software. New phone models that do not introduce new features can easily be added to your configuration without requiring a software upgrade.

The ephone-type configuration template is a set of commands that describe the features supported by a type of phone, such as the particular phone type's device ID, number of buttons, and security support. Other phone-related settings under telephony-service, ephone-template, and ephone configuration mode can override the features set within the ephone-type template. For example, an ephone-type template can specify that a particular phone type supports security and another configuration setting can disable this feature. However, if an ephone-type template specifies that this phone does not support security, the other configuration cannot enable support for the security feature.

Cisco Unified CME uses the ephone-type template to generate XML files to provision the phone. System-defined phone types continue to be supported without using the ephone-type configuration. Cisco Unified CME checks the ephone-type against the system-defined phone types. If there is conflict with the phone type or the device ID, the configuration is rejected.

For configuration information, see [Configure Ephone-Type Templates for SCCP Phones, on page 267](#).

7926G Wireless SCCP IP Phone Support

Cisco Unified CME 8.6 adds support for the Cisco Unified 7926G Wireless SCCP IP phone. The 7926G wireless phone is similar to the 7925 wireless phone with a 2D barcode and EA15 module attached. The 7926G wireless phone is capable of scanning functionality. For more details on phone features and functionality, see [Cisco Unified IP Phone 7900 Series User Guide](#).

Cisco Unified CME 8.6 supports the scanning function on the 7926G SCCP wireless phone using the ephone built-in device type. [Table 18: Supported Values for Ephone-Type Command](#), on page 258 shows supported values for the ephone-type for 7926G wireless phone.

Table 18: Supported Values for Ephone-Type Command

Supported Device	device-id	device-type	num-buttons	max-presentation
Cisco Unified Wireless IP Phone 7926G	577	7926	6	2

To support service provisioning, an XML file is constructed externally and applied to the ephone-template of the phone. To allow the phone to read the external XML file, you are required to create-cnf and download the XML file to the ephone. For more information on configuring PhoneServices XML file, see [Configure Phone Services XML File for Cisco Unified Wireless Phone 7926G, on page 325](#).

The following is an example of the <phoneServices> XML file:

```
<phoneServices useHTTPS="true">
  <provisioning>0</provisioning>
  <phoneService type="1" category="0">
    <name>Missed Calls</name>
    <url>Application:Cisco/MissedCalls</url>
    <vendor></vendor>
    <version></version>
  </phoneService>
  <phoneService type="0" category="1">
    <displayName>Store Ops</displayName>
    <name>Store Ops</name>
    <url>http://1.4.206.105/Midlets/StoreOps.jad?StoreNumber=1777</url>
    <http://1.4.206.105/Midlets/StoreOps.jad?StoreNumber=1777%3c/url%3e>
    <http://1.4.206.105/Midlets/StoreOps.jad?StoreNumber=1777%3c/url%3e>
    <vendor>CiscoSystems</vendor>
    <version>0.0.82</version>
  </phoneService>
</phoneServices>
```

Enhanced Line Mode

Enhanced Line Mode allows you to use the buttons on both sides of the phone screen to configure Line Keys (DNs), Feature Buttons, or Speed Dial.

In a scenario where you have Line Keys, Feature Button, and Speed Dial configured under **voice register pool** configuration mode for phones that are supported on Unified CME, the priority is set as follows:

- Line Keys
- Speed Dial
- Feature Button

From Unified CME Release 12.3, support is introduced for Enhanced Line Mode (ELM) on Cisco IP Phone 8800 Series. The support is introduced for all Cisco IP Phone 8800 Series phones, except Cisco Wireless IP Phone 8821, Cisco Unified IP Conference Phone 8831, and Cisco IP Conference Phone 8832. ELM for Unified CME is supported on the Cisco 4000 Series Integrated Services Routers. For Cisco IP Phone 8800 Series, a maximum of 10 phone buttons can be configured for ELM lines.

For ELM on Unified CME, you need to configure the CLI command **service phone lineMode 1** under **telephony-service** configuration mode to enable Enhanced Line Mode on phones. The Cisco IP Phone 8800 Series configured on Unified CME uses the vendor config XML body in the CNF file to verify if the CLI command **service phone lineMode 1** is added to enable ELM mode. For a sample configuration of ELM on Unified CME, see [Example for Configuring Enhanced Line Mode on Unified CME, on page 355](#).

Note The CLI command **service phone lineMode** is case-sensitive, and must be entered exactly as mentioned.

You can enable ELM on Unified CME using the CLI command **service phone lineMode** as follows:

```
Router(config)#telephony-service
Router(config-telephony)#service phone lineMode ?
WORD enter the phone xml file parameter text for the previously entered
```

```

        parameter name
Router(config-telephony)#service phone lineMode 1
Router(config-telephony)#create cnf-files
Router(config-telephony)#end

```

Once you enable **service phone lineMode 1** under **telephony-service** for ELM, you need to **create profile** and **restart** the phones under **voice register global** configuration mode to enable ELM for the Cisco IP Phone 8800 series phones on Unified CME.

```

Router(config)#voice register global
Router(config-register-global)#create profile
Router(config-register-global)#restart
Router(config-register-global)#end

```

Feature Support on Enhanced Line Mode

The following features are supported for ELM on Cisco IP Phone 8800 Series:

- HLog
- DND
- Park
- Redial
- Mobility
- Group Pickup
- Meet Me
- Mobility
- Pickup
- Privacy

KEM Support for Cisco Unified SIP IP Phones

For Unified CME 12.3 and prior releases, KEM support is limited to C-KEM and BE-KEM device types. From Unified CME Release 12.5, Key Expansion Module (KEM) device types A-KEM (Audio) and V-KEM (Video) are supported for Cisco IP Phone 8800 Series. The support is introduced for both SLM (Session Line Mode) and ELM (Enhanced Line Mode) configuration. You can switch from SLM to ELM mode to use buttons on both sides of the Cisco IP Phone 8800 Series.

The following endpoints are supported as part of Unified CME Release 12.5:

- Cisco IP Phone 8851—Supports upto 2 A-KEM Modules.
- Cisco IP Phone 8851NR—Supports upto 2 A-KEM Modules
- Cisco IP Phone 8861—Supports upto 3 A-KEM Modules.
- Cisco IP Phone 8865—Supports upto 3 V-KEM Modules

An A-KEM or V-KEM Module supports a maximum of 28 lines. Hence, the total number of lines on the supported phone types for Unified CME 12.5 are as follows:

Table 19: A-KEM and V-KEM Line Support

Phone Model	Number of KEM Lines Supported	Line Support (With SLM)	Line Support (With ELM)
8851	56 (2*28)	61 (56+5)	66 (56+10)
8851NR	56(2*28)	61 (56+5)	66 (56+10)
8861	84 (3*28)	89 (84+5)	94 (84+10)
8865	84 (3*28)	89 (84+5)	94 (84+10)

V-KEM is supported only with the 8865 phone type. You need to configure **CP-8800-Video** to support V-KEM with 8865 phones. You need to configure **CP-8800-Audio** to support A-KEM with the phone types 8851, 8851NR, and 8861. The phone types 8851, 8851NR, and 8861 also support CKEM and BEKEM.

Note A mixed deployment of KEM Modules is not supported for any phone type. For example, if the phone type 8861 supports three KEM modules, then all three KEM modules have to be either CKEM, BEKEM, or CP-8800-Audio.

To enable A-KEM or V-KEM on Unified CME, you need to configure the KEM option for the phone type under **voice register pool** configuration mode for Unified CME 12.5 and later releases:

```
Router(config)# enable
Router(config)# configure terminal
Router(config)# voice register pool
Router(config-register-pool)# type 8851 addon 1 CP-8800-Audio 2 CP-8800-Audio
Router(config-register-pool)# type 8851NR addon 1 CP-8800-Audio 2 CP-8800-Audio
Router(config-register-pool)# type 8861 addon 1 CP-8800-Audio 2 CP-8800-Audio 3 CP-8800-Audio
Router(config-register-pool)# type 8865 addon 1 CP-8800-Video 2 CP-8800-Video 3 CP-8800-Video
```

To configure KEM on Unified SIP Phones, see [Configure KEMs on SIP Phones, on page 335](#).

For more information on the KEM support for Cisco Unified 8851/51NR, 8861, 8865, 8961, 9951, and 9971 SIP IP Phones, see [Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST](#).

Key Mapping

The mapping of configured keys on a phone depends on the number of KEMs attached to the phone.

If only one CKEM is attached to a phone and the number of keys configured is 114, only 36 keys on the CKEM are mapped to the configured keys on the phone. The rest of the keys are not visible on the phone or the KEM. The maximum number of supported keys on each A-KEM and V-KEM device is 28. For information on A-KEM and V-KEM support, see [Table 19: A-KEM and V-KEM Line Support, on page 261](#).

Call Control

All call control features are supported by KEMs on Cisco Unified SIP IP phones. Any feature that can be configured on the phone keys can also be configured on the KEM.

XML Updates

- There is no separate firmware for KEMs, instead they are built in as part of the phones.
- The number of XML entries in the configuration file increases with the number of keys configured.
- The device type for KEMs is C-KEM, BE-KEM, A-KEM, and V-KEM. The maximum number of supported keys on each C-KEM device is 36. The maximum number of supported keys on each A-KEM and V-KEM device is 28.

Restrictions for KEM Support

- KEMs are not supported for Cisco Unified SCCP IP phones and Cisco Unified SIP IP phones other than the Cisco Unified 8851/51NR, 8861, 8865, 8961, 9951, and 9971 SIP IP phones.
- Features configured on keys are disabled when supported Cisco Unified SIP IP phones are in Cisco Unified SIP SRST.
- All Cisco Unified 8851/51NR, 8861, 8865, 8961, 9951, and 9971 SIP IP phone restrictions and limitations apply to KEMs.
- All Cisco Unified CME and Cisco Unified SIP SRST feature restrictions and limitations apply to KEMs.

For more information on how the **blf-speed-dial**, **number**, and **speed-dial** commands, in voice register pool configuration mode, have been modified, see [Cisco Unified Communications Manager Express Command Reference](#).

For information on installing KEMs on Cisco Unified IP Phone, see “*Installing a Key Expansion Module on the Cisco Unified IP Phone*” section of [Cisco Unified IP Phone 8961, 9951, and 9971 Administration Guide for Cisco Unified Communications Manager 10.0](#).

For information on installing KEMs on Cisco Unified 8811, 8841, 8851, 8851NR, 8865, and 8861 Phones, see *Cisco IP Phone Key Expansion Module* section of [Cisco IP Phone 8800 Series Administration Guide for Cisco Unified Communications Manager](#).

Fast-Track Configuration Approach for Cisco Unified SIP IP Phones

In Cisco Unified CME Release 10.0, the Fast-Track Configuration feature provides a new configuration utility using which you can input the phone characteristics of a new SIP phone model. This utility allows you to configure the existing SIP line features to the new SIP phone models. In the fast-track configuration, an option is provided to input an existing SIP phone as a reference phone. This feature is supported only on new SIP phone models that do not need any changes in the software protocols and the Cisco Unified CME application.

Note To deploy Cisco Unified SIP IP phones on Cisco Unified CME using the fast-track configuration approach, you require Cisco IOS Release 15.3(3)M or a later release.

Forward Compatibility

When a new SIP phone model is configured using the fast-track configuration approach, and the Cisco Unified CME is upgraded to a later version that supports the new SIP phone model, the fast-track configuration

pertaining to that SIP phone model is removed automatically. If the Cisco Unified CME is downgraded to a version that does not have the built-in support, the fast-track configuration should be applied again.

To support Fast-Track Configuration feature, the **voice register pool-type** command has been introduced in the global configuration mode. The properties of the new SIP phone can be configured under the voice register pool-type submode. In addition to the explicit configuration of the phone's properties, the reference-pooltype option can be used to inherit the properties of an existing SIP phone.

Localization support

CME supports localization for phones in fast-track mode through locale installer. However, the locale package should have .jar files for a specific phone model to make the feature work.

To use the locale installer, see [Locale Installer for Cisco Unified SIP IP Phones, on page 423](#).

For new SIP phone models validated using Fast-track configuration and the supported locale package version, see [Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST](#).

Restrictions for Fast-Track Support

- The fast-track configuration does not allow you to use the following phone models as reference phone:
 - ATA—Cisco ATA-186 and Cisco ATA-188
 - 7905—Cisco Unified IP Phone 7905 and Cisco Unified IP Phone 7905G
 - 7912—Cisco Unified IP Phone 7912 and Cisco Unified IP Phone 7912G
 - 7940—Cisco Unified IP Phone 7940 and Cisco Unified IP Phone 7940G
 - 7960—Cisco Unified IP Phone 7960 and Cisco Unified IP Phone 7960G
 - P100—PingTel Xpressa 100
 - P600—Polycom SoundPoint IP 600
- Existing Cisco Unified SIP IP phones are not allowed to be configured as new Cisco Unified SIP IP phones using the fast-track configuration approach.
- The reference-pooltype functionality is allowed only on existing SIP phone models. New SIP phone models configured using the fast-track configuration approach cannot be used as a reference phone.
- The fast-track configuration approach supports only the XML format and not support the text format for phone configuration.
- The fast-track approach does not support the new SIP phone models that have a new call flow, new message flow, or a new configuration file format that are not supported by the Cisco Unified CME.

For configuration information, see [Provision SIP Phones to Use the Fast-Track Configuration Approach, on page 338](#).

For configuration examples, see [Example for Fast-Track Configuration Approach, on page 354](#).

Configure Phones for a PBX System

This section contains the following tasks:

Create Directory Numbers for SCCP Phones

To create a directory number in Cisco Unified CME for a SCCP phone, intercom line, voice port, or a message-waiting indicator (MWI), perform the following steps for each directory number to be created. Each ephone-dn becomes a virtual line, or extension, on which call connections can be made. Each ephone-dn configuration automatically creates one or more virtual dial peers and virtual voice ports to make those call connections.

Note

To create and assign directory numbers to be included in an overlay set, see [Configure Overlaid Ephone-dns on SCCP Phones, on page 1312](#).

Restriction

- The Cisco Unified IP Phone 7931G is a SCCP keyset phone and, when configured for a key system, does not support the dual-line option for a directory number. To configure a Cisco Unified IP Phone 7931G, see [Configure Phones for a Key System, on page 293](#).
- Octo-line directory numbers are not supported by the Cisco Unified IP Phone 7902, 7920, or 7931, or by analog phones connected to the Cisco VG224 or Cisco ATA.
- Octo-line directory numbers are not supported in button overlay sets.
- Octo-line directory numbers do not support the **trunk** command.

Before you begin

- Maximum number of directory numbers must be changed from the default of 0 by using the **max-dn** command.
- Octo-line directory numbers are supported in Cisco Unified CME 4.3 and later versions.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *dn-tag* [**dual-line** | **octo-line**]
4. **number** *number* [**secondary** *number*] [**no-reg** [**both** | **primary**]]
5. **huntstop** [**channel** *number*]
6. **name** *name*
7. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	ephone-dn <i>dn-tag</i> [<i>dual-line</i> <i>octo-line</i>] Example: <pre>Router(config)# ephone-dn 7 octo-line</pre>	Enters ephone-dn configuration mode to create a directory number for a SCCP phone. • dual-line—(Optional) Enables two calls per directory number. Supports features such as call waiting, call transfer, and conferencing with a single ephone-dn. • octo-line—(Optional) Enables eight calls per directory number. Supported in Cisco Unified CME 4.3 and later versions. • To change the line mode of a directory number, for example from dual-line to octo-line or the reverse, you must first delete the ephone-dn and then recreate it.
Step 4	number <i>number</i> [<i>secondary number</i>] [<i>no-reg</i> [<i>both</i> <i>primary</i>]] Example: <pre>Router(config-ephone-dn)# number 2001</pre>	Configures an extension number for this directory number. • Configuring a secondary number supports features such as call waiting, call transfer, and conferencing with a single ephone-dn.
Step 5	huntstop [<i>channel number</i>] Example: <pre>Router(config-ephone-dn)# huntstop channel 4</pre>	(Optional) Enables Channel Huntstop, which keeps a call from hunting to the next channel of a directory number if the first channel is busy or does not answer. • channel number—Number of channels available to accept incoming calls. Remaining channels are reserved for outgoing calls and features such as call transfer, call waiting, and conferencing. Range: 1 to 8. Default: 8. • <i>number</i> argument is supported for octo-line directory numbers only.
Step 6	name <i>name</i> Example: <pre>Router(config-ephone-dn)# name Smith, John</pre>	(Optional) Associates a name with this directory number. • Name is used for caller-ID displays and in the local directory listings.

	Command or Action	Purpose
		Must follow the name order that is specified with the directory command.
Step 7	end Example: Router(config-ephone-dn)# end	Returns to privileged EXEC mode.

Example

Example for Nonshared Octo-Line Directory Number

In the following example, ephone-dn 7 is assigned to phone 10 and not shared by any other phone. There are two active calls on ephone-dn 7. Because the **busy-trigger-per-button** command is set to 2, a third incoming call to extension 2001 is either rejected with a busy tone or forwarded to another destination if Call Forward Busy is configured. The phone user can still make an outgoing call or transfer or conference a call on ephone-dn 7 because the **max-calls-per-button** command is set to 3, which allows a total of three calls on ephone-dn 7.

```
ephone-dn 7 octo-line
 number 2001
 name Smith, John
 huntstop channel 4
!
!
ephone 10
 max-calls-per-button 3
 busy-trigger-per-button 2
 mac-address 00E1.CB13.0395
 type 7960
 button 1:7
```

Example for Shared Octo-Line Directory Number

In the following example, ephone-dn 7 is shared between phone 10 and phone 11. There are two active calls on ephone-dn 7. A third incoming call to ephone-dn 7 rings only phone 11 because its **busy-trigger-per-button** command is set to 3. Phone 10 allows a total of three calls, but it rejects the third incoming call because its **busy-trigger-per-button** command is set to 2. A fourth incoming call to ephone-dn 7 on ephone 11 is either rejected with a busy tone or forwarded to another destination if Call Forward Busy is configured. The phone user can still make an outgoing call or transfer or conference a call on ephone-dn 7 on phone 11 because the **max-calls-per-button** command is set to 4, which allows a total of four calls on ephone-dn 7 on phone 11.

```
ephone-dn 7 octo-line
 number 2001
 name Smith, John
 huntstop channel 4
!
!
ephone 10
 max-calls-per-button 3
 busy-trigger-per-button 2
 mac-address 00E1.CB13.0395>
```

```

type 7960
button 1:7
!
!
!
ephone 11
max-calls-per-button 4
busy-trigger-per-button 3
mac-address 0016.9DEF.1A70
type 7960
button 1:7

```

What to do next

After creating directory numbers, you can assign one or more directory numbers to a Cisco Unified IP Phone. See [Assign Directory Numbers to SCCP Phones](#), on page 270.

Configure Ephone-Type Templates for SCCP Phones

Restriction

Ephone-type templates are not supported for system-defined phone types. For a list of system-defined phone types, see the **type** command in [Cisco Unified CME Command Reference](#).

Before you begin

Cisco Unified CME 4.3 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-type** *phone-type* [**addon**]
4. **device-id** *number*
5. **device-name** *name*
6. **device-type** *phone-type*
7. **num-buttons** *number*
8. **max-presentation** *number*
9. **addon**
10. **security**
11. **phoneload**
12. **utf8**
13. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ephone-type <i>phone-type</i> [addon] Example: Router(config)# ephone-type E61	Enters ephone-type configuration mode to create an ephone-type template. <i>phone-type</i>—Unique label that identifies the type of IP phone for which the phone-type template is being defined. addon—(Optional) Phone type is an add-on module, such as the Cisco Unified IP Phone 7915 Expansion Module.
Step 4	device-id <i>number</i> Example: Router(config-ephone-type)# device-id 376	Specifies the device ID for the phone type. - This device ID must match the predefined device ID for the specific phone model. - If this command is set to the default value of 0, the ephone-type is invalid. - See Table 20: Supported Values for Ephone-Type Commands, on page 269 for a list of supported device IDs.
Step 5	device-name <i>name</i> Example: Router(config-ephone-type)# device-name E61 Mobile Phone	Assigns a name to the phone type. See Table 20: Supported Values for Ephone-Type Commands, on page 269 for a list of supported device types.
Step 6	device-type <i>phone-type</i> Example: Router(config-ephone-type)# device-type E61	Specifies the device type for the phone.
Step 7	num-buttons <i>number</i> Example: Router(config-ephone-type)# num-buttons 1	Number of line buttons supported by the phone type. <i>number</i>—Range: 1 to 100. Default: 0.

	Command or Action	Purpose
		See Table 20: Supported Values for Ephone-Type Commands , on page 269 for the number of buttons supported by each phone type.
Step 8	max-presentation number Example: <code>Router(config-ephone-type)# max-presentation 1</code>	Number of call presentation lines supported by the phone type. <i>number</i>—Range: 1 to 100. Default: 0. - See Table 20: Supported Values for Ephone-Type Commands , on page 269 for the number of presentation lines supported by each phone type.
Step 9	addon Example: <code>Router(config-ephone-type)# addon</code>	(Optional) Specifies that this phone type supports an add-on module, such as the Cisco Unified IP Phone 7915 Expansion Module.
Step 10	security Example: <code>Router(config-ephone-type)# security</code>	(Optional) Specifies that this phone type supports security features. This command is enabled by default.
Step 11	phoneload Example: <code>Router(config-ephone-type)# phoneload</code>	(Optional) Specifies that this phone type requires that the load command be configured. This command is enabled by default.
Step 12	utf8 Example: <code>Router(config-ephone-type)# utf8</code>	(Optional) Specifies that this phone type supports UTF8. This command is enabled by default.
Step 13	end Example: <code>Router(config-ephone-type)# end</code>	Exits to privileged EXEC mode.

Ephone-Type Parameters for Supported Phone Types

[Table 20: Supported Values for Ephone-Type Commands , on page 269](#) lists the required device ID, device type, and the maximum number of buttons and call presentation lines that are supported for each phone type that can be added with ephone-type templates.

Table 20: Supported Values for Ephone-Type Commands

Supported Device	device-id	device-type	num-buttons	max-presentation
Cisco Unified IP Phone 6901	547	6901	1	1
Cisco Unified IP Phone 6911	548	6911	10	1

Supported Device	device-id	device-type	num-buttons	max-presentation
Cisco Unified IP Phone 6945	564	6945	4	2
Cisco Unified IP Phone 7915 Expansion Module with 12 buttons	227	7915	12	0 (default)
Cisco Unified IP Phone 7915 Expansion Module with 24 buttons	228	7915	24	0
Cisco Unified IP Phone 7916 Expansion Module with 12 buttons	229	7916	12	0
Cisco Unified IP Phone 7916 Expansion Module with 24 buttons	230	7916	24	0
Cisco Unified Wireless IP Phone 7925	484	7925	6	4
Cisco Unified IP Conference Station 7937G	431	7937	1	6
Cisco Unified IP Phone 8941	586	8941	4	3
Cisco Unified IP Phone 8945	585	8945	4	3
Cisco Unified IP Phone 8941 with Fast-Track configuration support	586	8941	4	3
Cisco Unified IP Phone 8945 with Fast-Track configuration support	586	8945	4	3
Nokia E61	376	E61	1	1

Example

The following example shows the Nokia E61 added with an ephone-type template, which is then assigned to ephone 2:

```

ephone-type E61
  device-id 376
  device-name E61 Mobile Phone
  num-buttons 1
  max-presentation 1
  no utf8
  no phoneload
!
ephone 2
  mac-address 001C.821C.ED23
  type E61
  button 1:2

```

Assign Directory Numbers to SCCP Phones

This task sets up the initial ephone-dn-to-ephone relationships: how and which extensions appear on each phone. To create and modify phone-specific parameters for individual SCCP phones, perform the following steps for each SCCP phone to be connected in Cisco Unified CME.

**Note**

To create and assign directory numbers to be included in an overlay set, see [Configure Overlaid Ephone-dns on SCCP Phones, on page 1312](#).

**Restriction**

- For Watch mode. If the watched directory number is associated with several phones, then the watched phone is the one on which the watched directory number is on button 1 or the one on which the watched directory number is on the button that is configured by using the **auto-line** command, with auto-line having priority. For configuration information, see [Automatic Line Selection, on page 1029](#).
- Octo-line directory numbers are not supported by the Cisco Unified IP Phone 7902, 7920, or 7931, or by analog phones connected to the Cisco VG224 or Cisco ATA.
- Octo-line directory numbers are not supported in button overlay sets.

Before you begin

- To configure a phone line for Watch (w) mode by using the **button** command, Cisco Unified CME 4.1 or a later version.
- To configure a phone line for Monitor (m) mode by using the **button** command, Cisco CME 3.0 or a later version.
- To assign a user-defined phone type in Cisco Unified CME 4.3 or a later version, you must first create an ephone-type template. See [Configure Ephone-Type Templates for SCCP Phones, on page 267](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **mac-address** [*mac-address*]
5. **type** *phone-type* [**addon** **1** *module-type* [**2** *module-type*]]
6. **button** *button-number* {*separator*} *dn-tag* [, *dn-tag...*] [*button-number* {*x*} *overlay-button-number*] [*button-number...*]
7. **max-calls-per-button** *number*
8. **busy-trigger-per-button** *number*
9. **keypad-normalize**
10. **nte-end-digit-delay** [*milliseconds*]
11. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	ephone <i>phone-tag</i> Example: <pre>Router(config)#ephone 6</pre>	Enters ephone configuration mode. • <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks. The maximum number of ephones is version and platform-specific. Type ? to display range.
Step 4	mac-address [<i>mac-address</i>] Example: <pre>Router(config-ephone)#mac-address 2946.3f2.311</pre>	Specifies the MAC address of the IP phone that is being configured. • <i>mac-address</i>—(Optional) For CiscoUnifiedCME 3.0 and later versions, it is not required to register phones before configuring the phone because CiscoUnifiedCME can detect MAC addresses and automatically populate phone configurations with the MAC addresses and phone types for individual phones. Not supported for voice-mail ports.
Step 5	type <i>phone-type</i> [addon 1 <i>module-type</i> [2 <i>module-type</i>]] Example: <pre>Router(config-ephone)# type 7960 addon 1 7914</pre>	Specifies the type of phone. • CiscoUnifiedCME 4.0 and later versionsThe only types to which you can apply an add-on module are 7960, 7961,7961GE, and 7970. • CiscoCME 3.4 and earlier versionsThe only type to which you can apply an add-on module is 7960.
Step 6	button <i>button-number</i> {<i>separator</i>} <i>dn-tag</i> [, <i>dn-tag</i>...] [<i>button-number</i> {<i>x</i>} <i>overlay-button-number</i>] [<i>button-number</i>...] Example: <pre>Router(config-ephone)# button 1:10 2:11 3b12 4o13,14,15</pre>	Associates a button number and line characteristics with an extension (ephone-dn). Maximum number of buttons is determined by phone type. Note The CiscoUnified IPPhone7910 has only one line button but can be given two ephone-dn tags.

	Command or Action	Purpose
Step 7	max-calls-per-button <i>number</i> Example: <pre>Router(config-ephone)# max-calls-per-button 3</pre>	(Optional) Sets the maximum number of calls, incoming and outgoing, allowed on an octo-line directory number on this phone. • <i>number</i>—Range: 1 to 8. Default: 8. • This command is supported in CiscoUnifiedCME4.3 and later versions. • This command must be set to a value that is more than or equal to the value set with the busy-trigger-per-button command. • This command can also be configured in ephone-template configuration mode and applied to one or more phones. The ephone configuration has priority over the ephone-template configuration.
Step 8	busy-trigger-per-button <i>number</i> Example: <pre>Router(config-ephone)# busy-trigger-per-button 2</pre>	(Optional) Sets the maximum number of calls allowed on this phones octo-line directory numbers before triggering Call Forward Busy or a busy tone. • <i>number</i>—Range: 1 to 8. Default: 0 (disabled). • This command is supported in CiscoUnifiedCME4.3 and later versions. • After the number of existing calls, incoming and outgoing, on an octo-line directory number exceeds the number of calls set with this command, the next incoming call to the directory number is forwarded to the Call Forward Busy destination if configured, or the call is rejected with a busy tone. • This command must be set to a value that is less than or equal to the value set with the max-calls-per-button command. • This command can also be configured in ephone-template configuration mode and applied to one or more phones. The ephone configuration has priority over the ephone-template configuration.
Step 9	keypad-normalize Example: <pre>Router(config-ephone)# keypad-normalize</pre>	(Optional) Imposes a 200-millisecond delay before each keypad message from an IP phone. • When used with the nte-end-digit-delay command, this command ensures that the delay configured for a dtmf-end event is always honored.

	Command or Action	Purpose
Step 10	n te-end-digit-delay [<i>milliseconds</i>] Example: Router(config-ephone)# nte-end-digit-delay 150	(Optional) Specifies the amount of time that each digit in the RTP NTE end event in an RFC2833 packet is delayed before being sent. - This command is supported in CiscoUnifiedCME 4.3 and later versions. <i>milliseconds</i>—length of delay. Range: 10 to 200. Default: 200. - To enable the delay, you must also configure the dtmf-interworking rtp-nte command in voice-service or dial-peer configuration mode. For information, see Enable DTMF Integration Using RFC 2833, on page 557. - This command can also be configured in ephone-template configuration mode. The value set in ephone configuration mode has priority over the value set in ephone-template mode.
Step 11	e nd Example: Router(config-ephone)# end	Returns to privileged EXEC mode.

Example

Example for assigning directory number to SCCP Phone

The following example assigns extension 2225 in the Accounting Department to button 1 on ephone 2:

```
ephone-dn 25
 number 2225
 name Accounting

ephone 2
 mac-address 00E1.CB13.0395
 type 7960
 button 1:25
```

What to do next

- If you have SIP and SCCP phones connected to the same Cisco Unified CME, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).
- After configuring phones in Cisco Unified CME to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Files for SCCP Phones, on page 400](#).

Create Directory Numbers for SIP Phones

To create a directory number in Cisco Unified CME for a SIP phone, intercom line, voice port, or a message-waiting indicator (MWI), perform the following steps for each directory number to be created.

Restriction

- Valid characters in voice register DN include 0–9, '.', '+', '*', and '#'.
- The name or label that is associated with a directory number that is configured under **voice register dn** or **voice register global** configuration mode cannot contain special characters such as quotes ("), angle brackets (<, >), ampersand (&), and percentage (%).
- To allow insertion of '#' at any place in voice register DN, the CLI "allow-hash-in-dn" is configured in voice register global mode.
- When the CLI "allow-hash-in-dn" is configured, the user is required to change the dial-peer terminator from '#' (default terminator) to another valid terminator in configuration mode. The other terminators that are supported include '0'-'9', 'A'-'F', and '*'.
- Maximum number of directory numbers that are supported by a router is version and platform dependent.
- Call Forward All, Presence, and message-waiting indication (MWI) features in Cisco Unified CME 4.1 and later versions require that SIP phones be configured with a directory number using the **dn** keyword with the **number** command; direct line numbers are not supported.
- SIP endpoints are not supported on H.323 trunks. SIP endpoints are supported on SIP trunks only.
- The Media Flow-around feature configured with the **media flow-around** command is not supported by Cisco Unified CME with SIP phones.
- SIP shared-line directory numbers are not supported by the Cisco Unified IP Phone 7902, 7920, 7931, 7940, or 7960, or by analog phones connected to the Cisco VG224.
- For Unified CME 12.1 and prior releases, SIP shared-line directory numbers cannot be members of voice hunt groups.
- If this directory number is used as shared line, you can associate the directory number to a maximum of 16 phones.

Before you begin

- Cisco CME 3.4 or a later version.
- SIP shared-line directory numbers are supported in Cisco Unified CME 7.1 and later versions.
- **registrar server** command must be configured. For configuration information, see [Enable Calls in Your VoIP Network, on page 132](#).
- In Cisco Unified CME 7.1 and later versions, the maximum number of directory numbers must be changed from the default of 0 by using the **max-dn** (voice register global) command. For configuration information, see [Set Up Cisco Unified CME for SIP Phones, on page 197](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn** *dn-tag*
4. **number** *number*
5. **shared-line** [**max-calls** *number-of-calls*]
6. **huntstop channel** *number-of-channels*
7. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	voice register dn <i>dn-tag</i> Example: <pre>Router(config)# voice register dn 17</pre>	Enters voice register DN configuration mode to define a directory number for a SIP phone, intercom line, voice port, or a message-waiting indicator (MWI).
Step 4	number <i>number</i> Example: <pre>Router(config-register-dn)# number 7001</pre>	Defines a valid number for a directory number.
Step 5	shared-line [max-calls <i>number-of-calls</i>] Example: <pre>Router(config-register-dn)# shared-line max-calls 6</pre>	(Optional) Creates a shared-line directory number. • max-calls <i>number-of-calls</i> (Optional)—Maximum number of calls, both incoming and outgoing. Range: 2–16. Default: 2. • Must be set to a value that is more than or equal to the value set with the busy-trigger-per-button command. • This command is supported in Cisco Unified CME 7.1 and later versions.
Step 6	huntstop channel <i>number-of-channels</i> Example: <pre>Router(config-register-dn)# huntstop channel 3</pre>	(Optional) Enables Channel Huntstop, which keeps a call from hunting to the next channel of a directory number if the first channel is busy or does not answer. • <i>number-of-channels</i>—Number of channels available to accept incoming calls on the directory number.

	Command or Action	Purpose
		Remaining channels are reserved for outgoing calls and features, such as Call Transfer, Call Waiting, and Conferencing. Range: 1–50. Default: 0 (disabled). • This command is supported in Cisco Unified CME 7.1 and later versions.
Step 7	end Example: Router(config-register-dn)# end	Exits to privileged EXEC mode.

Example

Example for assigning directory numbers to SIP Phones

The following example shows directory number 24 configured as a shared line and assigned to phone 124 and phone 125:

```
voice register dn 24
  number 8124
  shared-line max-calls 6
!
voice register pool 124
  id mac 0017.E033.0284
  type 7965
  number 1 dn 24
!
voice register pool 125
  id mac 00E1.CB13.0395
  type 7965
  number 1 dn 24
```

Assign Directory Numbers to SIP Phones

This task sets up which extensions appear on each phone. To create and modify phone-specific parameters for individual SIP phones, perform the following steps for each SIP phone to be connected in Cisco Unified CME.

Note If your Cisco Unified CME system supports SCCP and SIP phones, do not connect your SIP phones to your network until after you have verified the configuration profile for the SIP phone.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **id** { *network address mask mask* | **ip** *address mask mask* | **mac** *address* }

5. **type** *phone-type*
6. **number** *tag dn dn-tag*
7. **busy-trigger-per-button** *number-of-calls*
8. **username** *username password password*
9. **dtmf-relay** { [**cisco-rtp**] [**rtp-nte**] [**sip-notify**] }
10. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	voice register pool <i>pool-tag</i> Example: <pre>Router(config)# voice register pool 3</pre>	Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone.
Step 4	id { network <i>address mask mask</i> ip <i>address mask mask</i> mac <i>address</i> } Example: <pre>Router(config-register-pool)# id mac 0009.A3D4.1234</pre>	Explicitly identifies a locally available individual SIP phone to support a degree of authentication.
Step 5	type <i>phone-type</i> Example: <pre>Router(config-register-pool)# type 7960-7940</pre>	Defines a phone type for the SIP phone being configured.
Step 6	number <i>tag dn dn-tag</i> Example: <pre>Router(config-register-pool)# number 1 dn 17</pre>	Associates a directory number with the SIP phone being configured. • dn <i>dn-tag</i>—identifies the directory number for this SIP phone as defined by the voice register dn command.

	Command or Action	Purpose
Step 7	busy-trigger-per-button <i>number-of-calls</i> Example: <pre>Router(config-register-pool)# busy-trigger-per-button 2</pre>	(Optional) Sets the maximum number of calls allowed on any of this phone's directory numbers before triggering Call Forward Busy or a busy tone. • <i>number-of-calls</i>—Maximum number of calls allowed before Cisco Unified CME forwards the next incoming call to the Call Forward Busy destination, if configured, or rejects the call with a busy tone. Range: 1 to 50. • This command is supported in Cisco Unified CME 7.1 and later versions.
Step 8	username <i>username</i> password <i>password</i> Example: <pre>Router(config-register-pool)# username smith password 123zyx</pre>	(Optional) Required only if authentication is enabled with the authenticate command. Creates an authentication credential. Note This command is not for SIP proxy registration. The password will not be encrypted. All lines in a phone will share the same credential. • <i>username</i>—identifies a local Cisco Unified IP phone user. Default: Admin.
Step 9	dtmf-relay { [cisco-rtp] [rtp-nte] [sip-notify] } Example: <pre>Router(config-register-pool)# dtmf-relay rtp-nte</pre>	(Optional) Specifies a list of DTMF relay methods that can be used by the SIP phone to relay DTMF tones. Note SIP phones natively support in-band DTMF relay as specified in RFC 2833.
Step 10	end Example: <pre>Router(config-register-pool)# end</pre>	Returns to privileged EXEC mode.

Example for configuring SIP Nonshared Line

Example for configuring SIP Shared Line

In the following example, voice register dn 23 is assigned to phone 123. The fourth incoming call to extension 8123 is not presented to the phone because the **huntstop channel** command is set to 3. Because the **busy-trigger-per-button** command is set to 2 on phone 123 and Call Forward Busy is configured, the third incoming call to extension 8123 is forwarded to extension 8200.

```
voice register dn 23
number 8123
call-forward b2bua busy 8200
```

```

huntstop channel 3
!
voice register pool 123
  busy-trigger-per-button 2
  id mac 0009.A3D4.1234
  type 7965
  number 1 dn 23

```

In the following example, voice register dn 24 is shared by phones 124 and 125. The first two incoming calls to extension 8124 ring both phones. A third incoming call rings only phone 125 because its **busy-trigger-per-button** command is set to 3. The fourth incoming call to extension 8124 triggers Call Forward Busy because the busy trigger limit on all phones is exceeded.

```

voice register dn 24
  number 8124
  call-forward b2bua busy 8200
  shared-line max-calls 6
  huntstop channel 6
!
voice register pool 124
  busy-trigger-per-button 2
  id mac 0017.E033.0284
  type 7965
  number 1 dn 24
!
voice register pool 125
  busy-trigger-per-button 3
  id mac 00E1.CB13.0395
  type 7965
  number 1 dn 24

```

What to do next

- If you have SIP and SCCP phones connected to the same Cisco Unified CME, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).
- If you want to select the session-transport protocol for a SIP phone, see [Select Session-Transport Protocol for a SIP Phone, on page 286](#).
- If you are finished configuring phones to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

Configure Dial Plans for SIP Phones

Dial plans enable SIP phones to recognize digit strings dialed by users. After the phone recognizes a dial pattern, it automatically sends a SIP INVITE message to the Cisco Unified CME to initiate the call and does not require the user to press the Dial key or wait for the interdigit timeout. To define a dial plan for a SIP phone, perform the following steps.

Before you begin

- Cisco Unified CME 4.1 or a later version.
- **mode cme** command must be enabled in Cisco Unified CME.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dialplan** *dialplan-tag*
4. **type** *phone-type*
5. **pattern** *tag string* [**button** *button-number*] [**timeout** *seconds*] [**user** {**ip** | **phone**}] or **filename** *filename*
6. **exit**
7. **voice register pool** *pool-tag*
8. **dialplan** *dialplan-tag*
9. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	voice register dialplan <i>dialplan-tag</i> Example: <pre>Router(config)# voice register dialplan 1</pre>	Enters voice register dialplan configuration mode to define a dial plan for SIP phones.
Step 4	type <i>phone-type</i> Example: <pre>Router(config-register-dialplan)# type 7905-7912</pre>	Defines a phone type for the SIP dial plan. • 7905-7912—Cisco Unified IP Phone 7905, 7905G, 7912, or 7912G. • 7940-7960-others—Cisco Unified IP Phone 7911, 7940, 7940G, 7941, 7941GE, 7960, 7960G, 7961, 7961GE, 7970, or 7971. • The phone type specified with this command must match the type of phone for which the dial plan is used. If this phone type does not match the type assigned to the phone with the type command in voice register pool mode, the dial-plan configuration file is not generated. • You must enter this command before using the pattern or filename command in the next step.

	Command or Action	Purpose
Step 5	pattern <i>tag string</i> [button <i>button-number</i>] [timeout <i>seconds</i>] [user {ip phone}] or filename <i>filename</i> Example: <pre>Router(config-register-dialplan)# pattern 1 52...</pre> or <pre>Router(config-register-dialplan)# filename dialsip</pre>	Defines a dial pattern for a SIP dial plan. • tag—Number that identifies the dial pattern. Range: 1 to 24. • string—Dial pattern, such as the area code, prefix, and first one or two digits of the telephone number, plus wildcard characters or dots (.) for the remainder of the dialed digits. • button <i>button-number</i>—(Optional) Button to which the dial pattern applies. • timeout <i>seconds</i>— (Optional) Time, in seconds, that the system waits before dialing the number entered by the user. Range: 0 to 30. To have the number dialed immediately, specify 0. If you do not use this parameter, the phone's default interdigit timeout value is used (10 seconds). • user—(Optional) Tag that automatically gets added to the dialed number. Do not use this keyword if Cisco Unified CME is the only SIP call agent. • ip—Uses the IP address of the user. • phone—Uses the phone number of the user. • Repeat this command for each pattern that you want to include in this dial plan. or Specifies a custom XML file that contains the dial patterns to use for the SIP dial plan. • You must load the custom XML file must into flash and the filename cannot include the .xml extension. • The filename command is not supported for the Cisco Unified IP Phone 7905 or 7912.
Step 6	exit Example: <pre>Router(config-register-dialplan)# exit</pre>	Exits dialplan configuration mode.
Step 7	voice register pool <i>pool-tag</i> Example: <pre>Router(config)# voice register pool 4</pre>	Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone. • pool-tag—Unique sequence number of the SIP phone to be configured. Range is version and platform-dependent; type ? to display range. You can modify the upper limit for this argument by using the the max-pool command.

	Command or Action	Purpose
Step 8	dialplan <i>dialplan-tag</i> Example: Router(config-register-pool)# dialplan 1	Assigns a dial plan to a SIP phone. <i>dialplan-tag</i>—Number that identifies the dial plan to use for this SIP phone. This is the number that was used with the voice register dialplan command in Step 3. Range: 1 to 24.
Step 9	end Example: Router(config-register-global)# end	Exits to privileged EXEC mode.

Examples

The following example shows the configuration for dial plan 1, which is assigned to SIP phone 1:

```
voice register dialplan 1
  type 7940-7960-others
  pattern 1 2... timeout 10 user ip
  pattern 2 1234 user ip button 4
  pattern 3 65...
  pattern 4 1...!
!
voice register pool 1
  id mac 0016.9DEF.1A70
  type 7961GE
  number 1 dn 1
  number 2 dn 2
  dialplan 1
  dtmf-relay rtp-nte
  codec g711ulaw
```

Troubleshooting Tips for Configuring Dial Plans for SIP

If you create a dial plan by downloading a custom XML dial pattern file to flash and using the **filename** command, and the XML file contains an error, the dial plan might not work properly on a phone. We recommend creating a dial pattern file using the **pattern** command.

To remove a dial plan that was created using a custom XML file with the **filename** command, you must remove the dial plan from the phone, create a new configuration profile, and then use the **reset** command to reboot the phone. You can use the **restart** command after removing a dial plan from a phone only if the dial plan was created using the **pattern** command.

To use KPML if a matching dial plan is not found, when both a dial plan and KPML are enabled on a phone, you must configure a dial pattern with a single wildcard character (.) as the last pattern in the dial plan. For example:

```
voice register dialplan 10
  type 7940-7960-others
  pattern 1 66...
  pattern 2 91.....
```

What to Do Next

If you are done modifying parameters for SIP phones, you must generate a new configuration profile and restart the phones. See [Configuration Files for Phones, on page 399](#).

Verify SIP Dial Plan Configuration

Procedure

Step 1 **show voice register dialplan tag**

This command displays the configuration information for a specific SIP dial plan.

Example:

```
Router# show voice register dialplan 1

Dialplan Tag 1
Config:
  Type is 7940-7960-others
  Pattern 1 is 2..., timeout is 10, user option is ip, button is default
  Pattern 2 is 1234, timeout is 0, user option is ip, button is 4
  Pattern 3 is 65..., timeout is 0, user option is phone, button is default
  Pattern 4 is 1..., timeout is 0, user option is phone, button is default
```

Step 2 **show voice register pool tag**

This command displays the dial plan assigned to a specific SIP phone.

Example:

```
Router# show voice register pool 29

Pool Tag 29
Config:
  Mac address is 0012.7F54.EDC6
  Number list 1 : DN 29
  Proxy Ip address is 0.0.0.0
  DTMF Relay is disabled
  Call Waiting is enabled
  DnD is disabled
  keep-conference is enabled
  dialplan tag is 1
  kpml signal is enabled
  service-control mechanism is not supported
.
.
.
```

Step 3 **show voice register template tag**

This command displays the dial plan assigned to a specific template.

Example:

```
Router# show voice register template 3

Temp Tag 3
Config:
  Attended Transfer is disabled
  Blind Transfer is enabled
```

```
Semi-attended Transfer is enabled
Conference is enabled
Caller-ID block is disabled
DnD control is enabled
Anonymous call block is disabled
Voicemail is 62000, timeout 15
Dialplan Tag is 1
Transport type is tcp
```

Enable KPML on a SIP Phone

To enable KPML digit collection on a SIP phone, perform the following steps.

Restriction

- This feature is supported only on Cisco Unified IP Phones 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE.
- A dial plan assigned to a phone has priority over KPML.

Before you begin

Cisco Unified CME 4.1 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **digit collect kpml**
5. **end**
6. **show voice register dial-peers**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	voice register pool <i>pool-tag</i> Example: Router(config)# voice register pool 4	Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone. <i>pool-tag</i>—Unique sequence number of the SIP phone to be configured. Range is version and platform-dependent; type ? to display range. You can modify the upper limit for this argument by using the max-pool command.
Step 4	digit collect kpml Example: Router(config-register-pool)# digit collect kpml	Enables KPML digit collection for the SIP phone. Note This command is enabled by default for supported phones in Cisco Unified CME.
Step 5	end Example: Router(config-register-pool)# end	Exits to privileged EXEC mode.
Step 6	show voice register dial-peers Example: Router# show voice register dial-peers	Displays details of all dynamically created VoIP dial peers associated with the Cisco Unified CME SIP register, including the defined digit collection method.

What to do next

If you are done modifying parameters for SIP phones, you must generate a new configuration profile and restart the phones. See [Configuration Files for Phones, on page 399](#).

Select Session-Transport Protocol for a SIP Phone

To change the session-transport protocol for a SIP phone from the default of UDP to TCP, perform the following steps.

**Restriction**

- TCP is not supported as a session-transport protocol for the Cisco Unified IP Phone 7905, 7912, 7940, or 7960. If TCP is assigned to an unsupported phone, calls to that phone will not complete successfully. However, the phone can originate calls using UDP, although TCP has been assigned.

Before you begin

- Cisco Unified CME 4.1 or a later version.
- Directory number must be assigned to SIP phone to which configuration is to be applied. For configuration information, see [Assign Directory Numbers to SIP Phones, on page 277](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **session-transport** { **tcp** | **udp** }
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register pool <i>pool-tag</i> Example: Router(config)# voice register pool 3	Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone in Cisco Unified CME.
Step 4	session-transport { tcp udp } Example: Router(config-register-pool)# session-transport tcp	(Optional) Specifies the transport layer protocol that a SIP phone uses to connect to Cisco Unified CME. • This command can also be configured in voice register template configuration mode and applied to one or more phones. The voice register pool configuration has priority over the voice register template configuration.
Step 5	end Example: Router(config-register-pool)# end	Exits voice register pool configuration mode and enters privileged EXEC mode.

What to do next

Note

When TCP is used as session-transport for the SIP phones, and if the TCP Connection aging timer is less than the SIP Register expire timer; then after every TCP connection aging timer expires, the phone will be reset and will re-register to CME. If this is not desired, then modify the TCP Connection aging timer and/or SIP Register expire timer so that SIP Register expire timer is less than TCP Connection aging timer.

- If you want to disable SIP Proxy registration for an individual directory number, see [Disable SIP Proxy Registration for a Directory Number, on page 288](#).
- If you have SIP and SCCP phones connected to the same Cisco Unified CME, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).
- If you are finished configuring phones to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

Disable SIP Proxy Registration for a Directory Number

To prevent a particular directory number from registering with an external SIP proxy server, perform the following steps.

Restriction	Phone numbers that are registered under a voice register dn must belong to a SIP phone that is registered in Cisco Unified CME.

Before you begin

- Cisco Unified CME 3.4 or a later version.
- Bulk registration is configured at system level. For configuration information, see [Configure Bulk Registration, on page 177](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn** *dn-tag*
4. **number** *number*
5. **no-reg**
6. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	voice register dn <i>dn-tag</i> Example: <pre>Router(config-register-global)# voice register dn 1</pre>	Enters voice register dn configuration mode to define a directory number for a SIP phone, intercom line, voice port, or an MWI.
Step 4	number <i>number</i> Example: <pre>Router(config-register-dn)# number 4085550152</pre>	Defines a valid number for a directory number to be assigned to a SIP phone in Cisco Unified CME.
Step 5	no-reg Example: <pre>Router(config-register-dn)# no-reg</pre>	Prevents directory number being configured from registering with an external proxy server.
Step 6	end Example: <pre>Router(config-register-dn)# end</pre>	Exits voice register dn configuration mode and enters privileged EXEC mode.

What to do next

- If you want to configure the G.722-64K codec for all calls through your Cisco Unified CME system, see [Modify the Global Codec, on page 289](#).
- If you have SIP and SCCP phones connected to the same Cisco Unified CME, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).
- If you want to configure individual phones to support some codec other than the system-level codec or some codec other than the phone's native codec, see [Codecs for Cisco Unified CME Phones, on page 246](#).
- If you are finished configuring phones to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

Modify the Global Codec

To change the global codec from the default (G.711ulaw) to G.722-64K for all calls through Cisco Unified CME, perform the following steps.

Restriction	If G.722-64K codec is configured globally and a phone does not support the codec, the fallback codec is G.711ulaw.

Before you begin

Cisco Unified CME 4.3 or later versions.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **codec {g711-ulaw | g722-64k}**
5. **service phone g722CodecSupport {0 | 1 | 2}**
6. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters telephony service configuration mode to set parameters for SCCP and SIP phones in Cisco Unified CME.
Step 4	codec {g711-ulaw g722-64k} Example: Router(config-telephony)# codec g722-64k	Specifies the preferred codec for phones in Cisco Unified CME. • Required only if you want to modify codec from the default (G.711ulaw) to G.722-64K.
Step 5	service phone g722CodecSupport {0 1 2} Example: Router(config)# service phone g722CodecSupport 2	Causes all phones to advertise the G.722-64K codec to Cisco Unified CME. • Required only if you configured the codec g722-64k command in telephony-service configuration mode. • g722CodecSupport—Default: 0, phone default set by manufacturer and equal to enabled or disabled. • Cisco phone firmware 8.2.1 or a later version is required to support the G.722-64K codec on G.722-capable SCCP phones. • Cisco phone firmware 8.3.1 or a later version is required to support the G.722-64K codec on G.722-capable SIP phones.

	Command or Action	Purpose
		For SCCP only: This command can also be configured in ephone- template configuration mode and applied to one or more SCCP phones.
Step 6	end Example: Router(config-telephony) # end	Exits the telephony service configuration mode and enters privileged EXEC mode.

What to do next

- If you have SIP and SCCP phones connected to the same Cisco Unified CME, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).
- If you want to configure individual phones to support some codec other than the system-level codec or some codec other than the phone's native codec, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).
- If you are finished configuring SCCP phones to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Files for SCCP Phones, on page 400](#).

Configure Codecs of Individual Phones for Calls Between Local Phones

To designate a codec for individual phones to ensure connectivity between a variety of phones connected to the same Cisco Unified CME router, perform the following steps for each SCCP or SIP phone.

Note

If codec values for the dial peers of an internal connection do not match, the call fails. For calls to external phones, that is, phones that are not in the same Cisco Unified CME, such as VoIP calls, the codec is negotiated based on the protocol that is used for the call, such as H.323. Cisco Unified CME plays no part in the negotiation.

Restriction

- Not all phones support all codecs. To verify whether your phone supports a particular codec, see your phone documentation.
- For SIP and SCCP phones in Cisco Unified CME: Modify the configuration for either SIP or SCCP phones to ensure that the codec for all phones match. Do not modify the configuration for both SIP and SCCP phones.
- If G.729 is the desired codec for Cisco ATA-186 and Cisco ATA-188, then only one port of the Cisco ATA device should be configured in Cisco Unified CME. If a call is placed to the second port of the Cisco ATA device, it will be disconnected gracefully. If you want to use both Cisco ATA ports simultaneously, then configure G.711 in Cisco Unified CME.
- If G.722-64K or iLBC codecs are configured in ephone configuration mode and the phone does not support the codec, the fallback is the global codec or G.711ulaw if the global codec is not supported. To configure a global codec, see [Modify the Global Codec, on page 289](#).

Before you begin

- For SIP phones in Cisco Unified CME: Cisco Unified CME 3.4 or a later version.
- For G.722-64K and iLBC codecs: Cisco Unified CME 4.3 or a later version.
- To support G.722-64K on an individual phone: Cisco phone firmware 8.2.1 or a later version for SCCP phones and 8.3.1 or a later version for SIP phones. For information about upgrading Cisco phone firmware, see [Install Cisco Unified CME Software, on page 113](#).
- To support iLBC on an individual phone: Cisco phone firmware 8.3.1 or a later version for SCCP and SIP phones. For information about upgrading Cisco phone firmware, see [Install Cisco Unified CME Software, on page 113](#).
- Cisco Unified IP phone to which the codec is to be applied must be already configured. For configuration information for SIP phones, see [Assign Directory Numbers to SIP Phones, on page 277](#). For configuration information for SCCP phones, see [Assign Directory Numbers to SCCP Phones, on page 270](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *ephone-tag* or **voice register pool** *pool-tag*
4. **codec** *codec-type*
5. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ephone <i>ephone-tag</i> or voice register pool <i>pool-tag</i> Example: Router(config)# voice register pool 1	Enters ephone configuration mode to set phone-specific parameters for a SCCP phone in Cisco Unified CME. or Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone in Cisco Unified CME.
Step 4	codec <i>codec-type</i> Example:	Specifies the codec for the dial peer for the IP phone being configured. • <i>codec-type</i> —Type? for a list of codecs.

	Command or Action	Purpose
	<pre>Router(config-ephone)# codec g729r8 or Router(config-register-pool)# codec g711alaw</pre>	• This command overrides any previously configured codec selection set with the voice-class codec command. • This command overrides any previously configured codec selection set with the codec command in telephony-service configuration mode. • SCCP only—This command can also be configured in ephone-template configuration mode and applied to one or more phones.
Step 5	end Example: <pre>Router(config-ephone)# end</pre> or <pre>Router(config-register-pool)# end</pre>	Exits the configuration mode and enters privileged EXEC mode.

What to do next

- If you want to select the session-transport protocol for a SIP phone, see [Select Session-Transport Protocol for a SIP Phone, on page 286](#).
- If you are finished configuring SIP phones to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Profiles for SIP Phones, on page 403](#).
- If you are finished configuring SCCP phones to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Files for SCCP Phones, on page 400](#).

Configure Phones for a Key System

Creating Directory Numbers for a Simple Key System on SCCP Phone

To create a set of directory numbers with the same number to be associated with multiple line buttons on an IP phone and provide support for call waiting and call transfer on a key system phone, perform the following steps.

Restriction

- Do not configure directory numbers for a key system for dual-line mode because this does not conform to the key system one-call-per-line button usage model for which the phone is designed.
- Provisioning support for the Cisco Unified IP Phone 7931 is available only in Cisco Unified CME 4.0(2) and later versions.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *dn-tag*
4. **number** *number* [**secondary** *number*] [**no-reg** [**both** | **primary**]]
5. **preference** *preference-order*
6. **no huntstop** or **huntstop**
7. **mwi-type** {**visual** | **audio** | **both**}
8. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ephone-dn <i>dn-tag</i> Example: Router(config)# ephone-dn 11	Enters ephone-dn configuration mode to create a directory number.
Step 4	number <i>number</i> [secondary <i>number</i>] [no-reg [both primary]] Example: Router(config-ephone-dn)# number 101	Configures a valid phone or extension number for this directory number.
Step 5	preference <i>preference-order</i> Example: Router(config-ephone-dn)# preference 1	Sets dial-peer preference order for a directory number associated with a Cisco Unified IP phone. • Default: 0. • Increments the preference order for all subsequent instances within a set of ephone dns with the same number to be associated with a key system phone. That is, the first instance of the directory number is preference 0 by default and you must specify 1 for the second instance of the same number, 2 for the next, and so on. This allows you to create multiple buttons with the same number on an IP phone. • Required to support call waiting and call transfer on a key system phone.

	Command or Action	Purpose
Step 6	no huntstop or huntstop Example: <pre>Router(config-ephone-dn)# no huntstop</pre> or <pre>Router(config-ephone-dn)# huntstop</pre>	Explicitly enables call hunting behavior for a directory number. • Configure no huntstop for all instances, except the final instance, within a set of ephone dns with the same number to be associated with a key system phone. • Required to allow call hunting across multiple line buttons with the same number on an IP phone. or Disables call hunting behavior for a directory number. • Configure the huntstop command for the final instance within a set of ephone dns with the same number to be associated with a key system phone. • Required to limit the call hunting to a set of multiple line buttons with the same number on an IP phone.
Step 7	mwi-type {visual audio both} Example: <pre>Router(config-ephone-dn)# mwi-type audible</pre>	Specifies the type of MWI notification to be received. • This command is supported only by Cisco Unified IP Phone 7931s and Cisco Unified IP Phone 7911s. • This command can also be configured in ephone-dn-template configuration mode. The value set in ephone-dn configuration mode has priority over the value set in ephone-dn-template mode.
Step 8	end Example: <pre>Router(config-ephone-dn)# end</pre>	Exits to privileged EXEC mode.

What to do next

The following example shows the configuration for six instances of directory number 101, assigned to the first six buttons of an IP phone:

```
ephone-dn 10
number 101
no huntstop

ephone-dn 11
number 101
preference 1
no huntstop

ephone-dn 12
number 101
preference 2
no huntstop
```

```
ephone-dn 13
  number 101
  preference 3
  no huntstop

ephone-dn 14
  number 101
  preference 4
  no huntstop

ephone-dn 15
  number 101
  preference 5

ephone 1
  mac-address 0001.2345.6789>
  type 7931
  button 1:10 2:11 3:12 4:13 5:14 6:15
```

Configure Trunk Lines for a Key System on SCCP Phone

To set up trunk lines for your key system, perform only one of the following procedures:

- To only enable direct status monitoring of the FXO port on the line button of the IP phone, see [Configure a Simple Key System Phone Trunk Line Configuration on SCCP Phone, on page 296](#).
- To enable direct status monitoring and allow transferred PSTN FXO line calls to be automatically recalled if the transfer target does not answer, see [Configure an Advanced Key System Phone Trunk Line Configuration on SCCP Phone, on page 300](#).

Configure a Simple Key System Phone Trunk Line Configuration on SCCP Phone

Perform the steps in this section to:

- Create directory numbers corresponding to each FXO line that allows phones to have shared or private lines connected directly to the PSTN.
- Enable direct status monitoring of the FXO port on the line button of the IP phone. The line button indicator, either a lamp or an icon depending on the phone, shows the in-use status of the FXO port during the duration of the call.

**Restriction**

- Directory number with a trunk line cannot be configured for call forward, busy, or no answer.
- Numbers entered after a trunk line is seized will not be displayed. Only the trunk tag is displayed on IP phones.
- Numbers entered after trunk line is seized will not appear in call history or call detail records (CDRs) of a Cisco Unified CME router. Only the trunk tag is logged for calls made from trunk lines.
- FXO trunk lines do not support the CFwdALL, Transfer, Pickup, GPickUp, Park, CallBack, and NewCall softkeys.
- FXO trunk lines do not support conference initiator dropoff.
- FXO trunk lines do not support on-hook redial. The phone user must explicitly select the FXO trunk line before pressing the Redial button.
- FXO trunk lines do not support call transfer to IP phones. However, the call initiator can conference an FXO line with an IP phone by pressing the Hold button, which leaves the FXO trunk line and IP phone connected. The conference initiator is unable to participate in the conference, but can place calls on other lines.
- FXO trunk lines do not support bulk speed dial.
- FXO port monitoring has the following restrictions:
 - Not supported before Cisco Unified CME 4.0.
 - Supported only for analog FXO loop-start and ground-start ports and T1/E1 FXO CAS ports. FXS loop-start and ground-start ports and PRI/BRI PSTN trunks are not supported.
 - Not supported for analog ports on the Cisco VG224 or Cisco ATA 180 Series.
 - T1 CAS DS0 group must be configured per time slot (cannot bundle more than one time slot into a ds0-group).
- Transfer recall and transfer-to button optimization are supported on dual-line directory numbers only in Cisco Unified CME 4.0 and later versions.
- Transfer-to button optimization is not supported for call forwarding, call-park recall, call pickup on hold, or call pickup at alert.

Before you begin

- FXO port for a private line automatic ringdown (PLAR) off-premises extension (OPX) connection must be configured; for example:

```
voice-port 1/0/0
connection p lar-opx 801 <-----Private number
```

- Dial peers for FXO port must be configured; for example:

```
dial-peer voice 111 pots
destination-pattern 811 <-----Trunk-tag
port 1/0/0
```

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn dn-tag**
4. **number number [secondary number] [no-reg [both | primary]]**
5. **trunk trunk-tag [timeout seconds] monitor-port port**
6. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	ephone-dn dn-tag Example: <pre>Router(config)# ephone-dn 51</pre>	Enters ephone-dn configuration mode to create a directory number. • Configure this command in the default single line mode, without the dual-line keyword, when configuring a simple key system trunk line.
Step 4	number number [secondary number] [no-reg [both primary]] Example: <pre>Router(config-ephone-dn)# number 801</pre>	Configures a valid phone or extension number for this directory number.
Step 5	trunk trunk-tag [timeout seconds] monitor-port port Example: <pre>Router(config-ephone-dn)# trunk 811 monitor-port 1/0/0</pre>	Associates a directory number with an FXO port. • The monitor-port keyword is not supported before Cisco Unified CME 4.0. • The monitor-port keyword is not supported on directory numbers for analog ports on the Cisco VG224 or Cisco ATA 180 Series.
Step 6	end Example: <pre>Router(config-ephone-dn)# end</pre>	Returns to privileged EXEC mode.

Examples

The following example shows the configuration for six instances of directory number 101, assigned to the first six buttons of an IP phone, plus four PSTN line appearances that are assigned to buttons 7 to 10:

```
ephone-dn 10
  number 101
  no huntstop

ephone-dn 11
  number 101
  preference 1
  no huntstop

ephone-dn 12
  number 101
  preference 2
  no huntstop

ephone-dn 13
  number 101
  preference 3
  no huntstop

ephone-dn 14
  number 101
  preference 4
  no huntstop

ephone-dn 15
  number 101
  preference 5

ephone-dn 51

  connection plar opx 801

voice-port 1/0/1
  connection plar opx 802
```

```
voice-port 1/0/2
 connection plar opx 803

voice-port 1/0/3
 connection plar opx 804

dial-peer voice 811 pots
 destination-pattern 811
 port 1/0/0

dial-peer voice 812 pots
 destination-pattern 812
 port 1/0/1

dial-peer voice 813 pots
 destination-pattern 813
 port 1/0/2

dial-peer voice 814 pots
 destination-pattern 814
 port 1/0/3
```

What to do next

You are ready to configure each individual phone and assign button numbers, line characteristics, and directory numbers to buttons on the phone. See [Configure Individual IP Phones for Key System on SCCP Phone, on page 304](#).

Configure an Advanced Key System Phone Trunk Line Configuration on SCCP Phone

Perform the steps in this section to:

- Create directory numbers corresponding to each FXO line that allows phones to have shared or private lines connected directly to the PSTN.
- Enable direct status monitoring of the FXO port on the line button of the IP phone. The line button indicator, either a lamp or an icon depending on the phone, shows the in-use status of the FXO port during the duration of the call.
- Allow transferred PSTN FXO line calls to be automatically recalled if the transfer target does not answer after the specified number of seconds. The call is withdrawn from the transfer-to phone and the call resumes ringing on the phone that initiated the transfer.

**Restriction**

- Ephone-dn with a trunk line cannot be configured for call forward, busy, or no answer.
- Numbers entered after a trunk line is seized will not be displayed. Only the trunk tag is displayed on IP phones.
- Numbers entered after a trunk line is seized will not appear in call history or call detail records (CDRs) of a Cisco Unified CME router. Only the trunk tag is logged for calls made from trunk lines.
- FXO trunk lines do not support the CFwdALL, Transfer, Pickup, GPickUp, Park, CallBack, and NewCall softkeys.
- FXO trunk lines do not support conference initiator dropoff.
- FXO trunk lines do not support on-hook redial. The phone user must explicitly select the FXO trunk line before pressing the Redial button.
- FXO trunk lines do not support call transfer to IP phones. However, the call initiator can conference an FXO line with an IP phone by pressing the Hold button, which leaves the FXO trunk line and IP phone connected. The conference initiator is unable to participate in the conference, but can place calls on other lines.
- FXO trunk lines do not support bulk speed dial.
- FXO port monitoring has the following restrictions:
 - Not supported before Cisco Unified CME 4.0.
 - Supported only for analog FXO loop-start and ground-start ports and T1/E1 FXO CAS ports. FXS loop-start and ground-start ports and PRI/BRI PSTN trunks are not supported.
 - Not supported for analog ports on the Cisco VG224 or Cisco ATA 180 Series.
 - T1 CAS DS0 group must be configured per time slot (cannot bundle more than one time slot into a ds0-group).
- Transfer recall and transfer-to button optimization is supported on dual-line directory numbers only in Cisco Unified CME 4.0 and later.
- Transfer-to button optimization is not supported for call forwarding, call-park recall, call pickup on hold, or call pickup at alert.
- Transfer recall is not supported for analog ports on the Cisco VG224 or Cisco ATA 180 Series.

Before you begin

- FXO port for a private line automatic ringdown (PLAR) off-premises extension (OPX) connection must be configured; for example:

```
voice-port 1/0/0
connection plar-opx 801 <-----Private number
```

- Dial peers for FXO port must be configured; for example:

```
dial-peer voice 111 pots
destination-pattern 811 <-----Trunk-tag
port 1/0/0
```

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn *dn-tag* dual-line**
4. **number *number* [*secondary number*] [*no-reg* [*both* | *primary*]]**
5. **trunk *digit-string* [*timeout seconds*] [*transfer-timeout seconds*] [*monitor-port port*]**
6. **huntstop [*channel*]**
7. **end**

DETAILED STEPS

Procedure		
	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	ephone-dn <i>dn-tag</i> dual-line Example: <pre>Router(config)# ephone-dn 51 dual-line</pre>	Enters ephone-dn configuration mode for the purpose of creating and configuring a telephone or extension number. • dual-line—Required when configuring an advanced key system phone trunk line. Dual-line mode provides a second call channel for the directory number on which to place an outbound consultation call during the call transfer attempt. This also allows the phone to remain part of the call to monitor the progress of the transfer attempt and if the transfer is not answered, to pull the call back to the phone on the original PSTN line button.
Step 4	number <i>number</i> [<i>secondary number</i>] [<i>no-reg</i> [<i>both</i> <i>primary</i>]] Example: <pre>Router(config-ephone-dn)# number 801</pre>	Configures a valid telephone number or extension number for this directory number.
Step 5	trunk <i>digit-string</i> [<i>timeout seconds</i>] [<i>transfer-timeout seconds</i>] [<i>monitor-port port</i>] Example: <pre>Router(config-ephone-dn)# trunk 811 transfer-timeout 30 monitor-port 1/0/0</pre>	Associates this directory number with an FXO port. • transfer-timeout <i>seconds</i>—For dual-line ephone-dns only. Range: 5 to 60000. Default: Disabled. • The monitor-port keyword is not supported before Cisco Unified CME 4.0.

	Command or Action	Purpose
		The monitor-port and transfer-timeout keywords are not supported on directory numbers for analog ports on the Cisco VG224 or Cisco ATA 180 Series.
Step 6	huntstop [channel] Example: <pre>Router(config-ephone-dn)# huntstop channel</pre>	Disables call hunting to the second channel of this directory number if the first channel is busy or does not answer. channel—Required when configuring an advanced key system phone trunk line. Reserves the second channel created by configuring dual-line mode for the ephone-dn command so that an outbound consultation call can be placed during a call transfer attempt.
Step 7	end Example: <pre>Router(config-ephone-dn)# end</pre>	Exits to privileged EXEC mode.

Examples

The following example shows the configuration for six instances of directory number 101, assigned to the first six buttons of an IP phone, plus four PSTN line appearances that are assigned to buttons 7 to 10. These four PSTN line appearances are configured as dual lines to provide a second call channel on which to place an outbound consultation call during a call transfer attempt. This configuration allows the phone to remain part of the call to monitor the progress of the transfer attempt, and if the transfer is not answered, to pull the call back to the phone on the original PSTN line button.

Configure Individual IP Phones for Key System on SCCP Phone

To assign button numbers, line characteristics, and directory numbers to buttons on an individual phone that will operate as a key system phone, perform the following steps.

**Restriction**

- Provisioning for Cisco Unified IP Phone 7931G is available only in Cisco Unified CME 4.0(2) and later versions.
- Cisco Unified IP Phone 7931G can support only one call waiting overlaid per directory number.
- Cisco Unified IP Phone 7931G cannot support overlays that contain directory numbers configured for dual-line mode.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **mac-address** [*mac-address*]
5. **type** *phone-type*
6. **button** *button-number* {*separator*} *dn-tag* [,*dn-tag*...] [*button-number*{**x**}*overlay-button-number*] [*button-number*...]
7. **mwi-line** *line-number*
8. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ephone <i>phone-tag</i> Example: Router(config)# ephone 1	Enters ephone configuration mode.
Step 4	mac-address [<i>mac-address</i>] Example: Router(config-ephone)# mac-address 0001.2345.6789	Specifies the MAC address of the IP phone that is being configured.
Step 5	type <i>phone-type</i> Example: Router(config-ephone)# type 7931	Specifies the type of phone that is being configured.

	Command or Action	Purpose
Step 6	button <i>button-number</i> { <i>separator</i> } <i>dn-tag</i> [, <i>dn-tag</i> ...] [<i>button-number</i> { <i>x</i> } <i>overlay-button-number</i>] [<i>button-number</i> ...] Example: <pre>Router(config-ephone)# button 1:11 2:12 3:13 4:14 5:15 6:16 7:51 8:52 9:53 10:54</pre>	Associates a button number and line characteristics with an ephone-dn. Maximum number of buttons is determined by phone type. Tip The line button layout for the Cisco Unified IP Phone 7931G is a bottom-up array. Button 1 is at the bottom right of the array and button 24 is at the top left of the array.
Step 7	mwi-line <i>line-number</i> Example: <pre>Router(config-ephone)# mwi-line 3</pre>	Selects a phone line to receive MWI treatment; when a message is waiting for the selected line, the message waiting indicator is activated. • <i>line-number</i>—Range: 1 to 34. Default: 1.
Step 8	end Example: <pre>Router(config-ephone)# end</pre>	Exits ephone configuration mode and enters privileged EXEC mode.

What to do next

- If you have SIP and SCCP phones connected to the same Cisco Unified CME, see [Configure Codecs of Individual Phones for Calls Between Local Phones](#), on page 291.
- To select a fixed-button layout for a Cisco Unified IP Phone 7931G, see [Select Button Layout for a Cisco Unified SCCP IP Phone 7931G](#), on page 1447.
- If you are finished configuring phones to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Files for SCCP Phones](#), on page 400.

Configure Cisco ATA, Analog Phone Support, Remote Phones, Cisco IP Communicator, and Secure IP Phone (IP-STE)

Configure Cisco ATA Support in SCCP Mode

To enable an analog phone that uses a Cisco ATA to register with Cisco Unified CME, perform the following steps.

Restriction

For a Cisco ATA that is registered to a Cisco Unified CME system to participate in fax calls, it must have its ConnectMode parameter set to use the same RTP payload type as the Cisco voice gateway that is performing the fax pass-through. Cisco voice gateways use standard payload type 0/8, which is selected on Cisco ATAs by setting bit 2 of the ConnectMode parameter to 1. For more information, see the *Parameters and Defaults* chapter in [Cisco ATA 186 and Cisco ATA 188 Analog Telephone Adaptor Administrator's Guide for SCCP \(version 3.0\)](#).

Procedure

-
- Step 1** Install the Cisco ATA.
- See the *Installing the Cisco ATA* chapter in [Cisco ATA 186 and Cisco ATA 188 Analog Telephone Adaptor Administrator's Guide for SCCP \(version 3.0\)](#).
- Step 2** Configure the Cisco ATA.
- See the *Configuring the Cisco ATA for SCCP* chapter in [Cisco ATA 186 and Cisco ATA 188 Analog Telephone Adaptor Administrator's Guide for SCCP \(version 3.0\)](#).
- Step 3** Upgrade the firmware to the latest Cisco ATA image.
- If you are using either the v2.14 or v2.14ms Cisco ATA 186 image based on the 2.14 020315a build for H.323/SIP or the 2.14 020415a build for MGCP or SCCP, you must upgrade to the latest version to install a security patch. This patch fixes a security hole in the Cisco ATA Web server that allows users to bypass the user interface password.
- For information about upgrading firmware, see [Install Cisco Unified CME Software, on page 113](#). Alternatively, you can use a manual method, as described in the *Upgrading the Cisco ATA Signaling Image* chapter of [Cisco ATA 186 and Cisco ATA 188 Analog Telephone Adaptor Administrator's Guide for SCCP \(version 3.0\)](#).
- Step 4** Set the following network parameters on the Cisco ATA:
- DHCP parameter to **1** (enabled).
 - TFTP parameter to **1** (enabled).
 - TFTPURL parameter to the IP address of the router running Cisco Unified CME.
 - SID0 parameter to a period (.) or the MAC address of the Cisco ATA (to enable the first port).
 - SID1 parameter to a period (.) or a modified version the Cisco ATA's MAC address, with the first two hexadecimal numbers removed and 01 appended to the end, if you want to use the second port. For example, if the MAC address of the Cisco ATA is 00012D01073D, set SID1 to 012D01073D01.
 - Nprintf parameter to the IP address and port number of the host to which all Cisco ATA debug messages are sent. The port number is usually set to 9001.
 - To prevent tampering and unauthorized access to the Cisco ATA 186, you can disable the web-based configuration. However, if you disable the web configuration page, you must use either a TFTP server or the voice configuration menu to configure the Cisco ATA 186.
- Step 5** In Cisco Unified CME, configure analog phones that use a Cisco ATA in the same way as a Cisco Unified IP phone. In the **type** command, use the **ata** keyword. For information on how to provision phones, see [Create Directory Numbers for SCCP Phones, on page 264](#).
-

What to do next

- If you have SIP and SCCP phones connected to the same Cisco Unified CME, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).

- To select a fixed-button layout for a Cisco Unified IP Phone 7931G, see [Select Button Layout for a Cisco Unified SCCP IP Phone 7931G](#), on page 1447.
- If you are finished configuring phones to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Files for SCCP Phones](#), on page 400 and [Generate Configuration Profiles for SIP Phones](#), on page 403.

Configure Cisco ATA Support in SIP Mode

Cisco ATA 187, 190, and 191 support SIP mode. To enable an analog phone that uses a Cisco ATA 191 to register with Unified CME, perform the following steps.

Restriction

- For a Cisco ATA that is registered to a Unified CME system to participate in fax calls, it must have its ConnectMode parameter set to use the same RTP payload type as the Cisco voice gateway that is performing the Fax pass-through. Cisco voice gateways use standard payload type 0/8, which is selected on Cisco ATAs by setting bit 2 of the ConnectMode parameter to 1. For more information, see the *Configure Fax Services* chapter in [Cisco ATA 191 Analog Telephone Adapter Administration Guide for Cisco Unified Communications Manager](#).
- If both ports of a Cisco ATA 191 are configured as shared line, then a call put on hold on one port cannot be resumed at the other port.

Procedure

-
- Step 1** Install the Cisco ATA.
See the *Install the ATA 191* chapter in [Cisco ATA 191 Analog Telephone Adapter Administration Guide for Cisco Unified Communications Manager](#).
- Step 2** Configure the Cisco ATA.
See the *Configure the ATA 191* chapter in [Cisco ATA 191 Analog Telephone Adapter Administration Guide for Cisco Unified Communications Manager](#).
- Step 3** Upgrade the firmware to the latest Cisco ATA image. For more information, see [Configure Firmware Upgrade for ATA in SIP Mode](#), on page 308.
- Step 4** In Cisco Unified CME, configure analog phones that use a Cisco ATA in the same way as a Cisco Unified IP phone. In the **type** command that is configured under **voice register pool** configuration mode, use the **ATA-191** keyword. For information on how to provision phones, see [Create Directory Numbers for SIP Phones](#), on page 275.
-

Configure Firmware Upgrade for ATA in SIP Mode

Cisco ATA 187, 190, and 191 support SIP mode. To configure firmware upgrade for ATA 190 in SIP mode with Unified CME, perform the following steps.

You can specify the Cisco ATA 191 phone type using the CLI command **type** as shown:

```
Router(config)# voice register pool 1
Router(config-register-pool)# type ATA-191
```

Procedure

- Step 1** Copy the firmware files to router flash memory.
- For example, ATA190.1-1-2-005.loads and ATA190.1-1-2-005.bin.sgn are firmware files for ATA 190. The firmware file for ATA 12.0(1) tat is supported in Unified CME is cmterm-ata191.12-0-1SR1-1.zip.
- Step 2** Create TFTP bindings for the firmware files.
- ```
Router(config)#tftp-server Flash:ATA190.1-1-2-005.bin.sgn
Router(config) tftp-server Flash:ATA190.1-1-2-005.loads
```
- Step 3** Specify the load using **loads** command under **voice register global** configuration mode.
- ```
Router(config)#voice register global
Router(config-register-global) load ATA-190 ATA190.1-1-2-005
```
- Step 4** Configure a pool for ATA phone to be upgraded.
- Step 5** Create CNF files using **create profile** CLI command under **voice register global** configuration mode.
- Step 6** Restart the ATA by unplugging and re-plugging or by executing the **reset** command.
- Cisco ATA 190/191 takes around 5 mins to upgrade the firmware.
- Verify the new firmware using **show voice register pool phone-load** CLI command

```
Router#show voice register pool phone-load
Pool Device Name      Current-Version      Previous-Version
==== =====
1 SEP34DB2D18001C Cisco/ATA190-1.1.2(005) Cisco/ATA190-1.1.1(003)
```

Verify Cisco ATA Support

Use the **show ephone ata** command to display SCCP phone configurations with the **type ata** command.

The following is sample output for a Cisco Unified CME configured for two analog phones using a Cisco ATA with MAC address 000F.F758.E70E:

```
ephone-30 Mac:000F.F758.E70E TCP socket:[2] activeLine:0 REGISTERED in SCCP ver 1 and
Server in ver 1
mediaActive:0 offhook:0 ringing:0 reset:0 reset_sent:0 paging 0 debug:0 caps:7
IP:1.4.188.72 15325 ATA Phone keepalive 7 max_line 2 dual-line
button 1: dn 80 number 8080 CH1 IDLE CH2 IDLE

ephone-31 Mac:0FF7.58E7.0E01 TCP socket:[3] activeLine:0 REGISTERED in SCCP ver 1 and
Server in ver 1
mediaActive:0 offhook:0 ringing:0 reset:0 reset_sent:0 paging 0 debug:0 caps:3
IP:1.4.188.72 15400 ATA Phone keepalive 7 max_line 2 dual-line
button 1: dn 81 number 8081 CH1 IDLE CH2 IDLE
```

Troubleshooting Cisco ATA Support

Use the **debug ephone detail** command to diagnose problems with analog phones that use Cisco ATAs.

Call Pickup and Group Call Pickup with Cisco ATA

Most of the procedures for using Cisco ATAs with Cisco Unified CME are the same as those for using Cisco ATAs with Cisco Unified Communications Manager, as described in the *How to Use Pre-Call and Mid-Call Services* chapter of [Cisco ATA 186 and Cisco ATA 188 Analog Telephone Adaptor Administrator's Guide for SCCP \(version 3.0\)](#). However, the call pickup and group call pickup procedures are different when using Cisco ATAs with Cisco Unified CME, as described below:

Call Pickup

When using Cisco ATAs with Cisco Unified CME:

- To pickup the last parked call, press ****3***.
- To pickup a call on a specific extension, press ****3** and enter the extension number.
- To pickup a call from a park slot, press ****3** and enter the park slot number.

Group Call Pickup

When using Cisco ATAs with Cisco Unified CME:

- To answer a phone within your call pickup group, press ****4***.
- To answer a phone outside of your call pickup group, press ****4** and the group ID number.

Note If there is only one pickup group, you do not need to enter the group ID after the ****4** to pickup a call.

Configure Voice and T.38 Fax Relay on Cisco ATA-187

Restriction

- H.323 trunk calls are not supported.
- Hardware conferencing with DSPFarm resource is not supported on Cisco ATA-187 in Cisco Unified CME 9.0. With the correct firmware (9.2(3) or a later version), local three-way conferencing is supported.

Before you begin

Cisco Unified CME 9.0 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **voice register global**
4. **authenticate realm** *string*
5. **exit**
6. **voice service** { **voip** | **voatm** }
7. **allow-connections** *from-type* **to** *to-type*
8. **fax protocol t38** [**ls_redundancy** *value* [**hs_redundancy** *value*]] [**fallback** { **cisco** | **none** | **pass-through** { **g711ulaw** | **g711alaw** } }]
9. **exit**
10. **voice register pool** *pool-tag*
11. **id mac** *address*
12. **type** *phone-type*
13. **ata-ivr-pwd** *password*
14. **session-transport** { **tcp** | **udp** }
15. **number tag dn** *dn-tag*
16. **username** *username* [**password** *password*]
17. **codec** *codec-type* [*bytes*]
18. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode.
Step 4	authenticate realm <i>string</i> Example: Router(config-register-global)# authenticate realm xxxxxx	• realm <i>string</i>—Realm parameter for challenge and response as specified in RFC 2617 is authenticated.
Step 5	exit Example: Router(config-register-global)# exit	Exits voice register global configuration mode.

	Command or Action	Purpose
Step 6	voice service {voip voatm} Example: <pre>Router(config)# voice service voip</pre>	Enters voice-service configuration mode to specify a voice encapsulation type. • voip—Specifies Voice over IP (VoIP) parameters. • voatm—Specifies Voice over ATM (VoATM) parameters.
Step 7	allow-connections from-type to to-type Example: <pre>Router(config-voi-serv)# allow-connections sip to sip</pre>	Allows connections between specific types of endpoints in a VoIP network. • from-type—Originating endpoint type. The following choices are valid: • sip—Session Interface Protocol. • to—Indicates that the argument that follows is the connection target. • to-type—Terminating endpoint type. The following choices are valid: • sip—Session Interface Protocol.
Step 8	fax protocol t38 [ls_redundancy value [hs_redundancy value]] [fallback {cisco none pass-through {g711ulaw g711alaw}}] Example: <pre>Router(config-voi-serv)# fax protocol t38 ls-redundancy 0 hs-redundancy 0 fallback pass-through g711ulaw</pre>	Specifies the global default ITU-T T.38 standard fax protocol to be used for all VoIP dial peers. • ls_redundancy value—(Optional) (T.38 fax relay only) Specifies the number of redundant T.38 fax packets to be sent for the low-speed V.21-based T.30 fax machine protocol. Range varies by platform from 0 (no redundancy) to 5 or 7. Default is 0. • hs_redundancy value—(Optional) (T.38 fax relay only) Specifies the number of redundant T.38 fax packets to be sent for high-speed V.17, V.27, and V.29 T.4 or T.6 fax machine image data. Range varies by platform from 0 (no redundancy) to 2 or 3. Default is 0. • fallback—(Optional) A fallback mode is used to transfer a fax across a VoIP network if T.38 fax relay could not be successfully negotiated at the time of the fax transfer. • pass-through—(Optional) The fax stream uses one of the following high-bandwidth codecs: • g711ulaw—Uses the G.711 u-law codec. • g711alaw—Uses the G.711 a-law codec.

	Command or Action	Purpose
Step 9	exit Example: <pre>Router(config-voi-serv)# exit</pre>	Exits voice-service configuration mode.
Step 10	voice register pool <i>pool-tag</i> Example: <pre>Router(config)# voice register pool 11</pre>	Enters voice register pool configuration mode to set phone-specific parameters for a Cisco Unified SIP phone in Cisco Unified CME. • <i>pool-tag</i>—Unique number assigned to the pool. Range: 1 to 100.
Step 11	id mac <i>address</i> Example: <pre>Router(config-register-pool)# id mac 93FE.12D8.2301</pre>	identifies a locally available Cisco Unified SIP IP phone. • <i>mac address</i>—Identifies the MAC address of a particular Cisco Unified SIP IP phone.
Step 12	type <i>phone-type</i> Example: <pre>Router(config-register-pool)# type ATA-187</pre>	Defines a phone type for the SIP phone being configured.
Step 13	ata-ivr-pwd <i>password</i> Example: <pre>Router(config-register-pool)# ata-ivr-pwd 1234</pre>	(Optional) Defines a password to access interactive voice response (IVR) and change the default phone settings on Cisco Analog Telephone Adaptors. • <i>password</i>—Four-digit or five-digit string to be used as password to access IVR. Password string must contain numbers 0 to 9.
Step 14	session-transport {tcp udp} Example: <pre>Router(config-register-pool)# session-transport tcp</pre>	(Optional) Specifies the transport layer protocol that a Cisco Unified SIP IP phone uses to connect to Cisco Unified CME. • tcp—Transmission Control Protocol (TCP) is used. • udp—User Datagram Protocol (UDP) is used. This is the default.
Step 15	number <i>tag</i> dn <i>dn-tag</i> Example: <pre>Router(config-register-pool)# number 1 dn 33</pre>	Indicates the E.164 phone numbers that the registrar permits to handle the Register message from the Cisco Unified SIP IP phone. • <i>tag</i>—Identifies the telephone number when there are multiple number commands. Range: 1 to 10. • dn <i>dn-tag</i>—Identifies the directory number tag for this phone number as defined by the voice register dn command. Range: 1 to 150.

	Command or Action	Purpose
Step 16	username <i>username</i> [password <i>password</i>] Example: <pre>Router(config-register-pool)# username ata112 password cisco</pre>	Assigns an authentication credential to a phone user so that the SIP phone can register in Cisco Unified CME. • username—Username of the local Cisco IP phone user. Default: Admin. • password—Enables password for the Cisco IP phone user. • password—Password string.
Step 17	codec <i>codec-type</i> [<i>bytes</i>] Example: <pre>Router(config-register-pool)# codec g711ulaw</pre>	Specifies the codec to be used when setting up a call for a SIP phone or group of SIP phones in Cisco Unified CME. • codec-type—Preferred codec; values are as follows: • g711alaw—G.711 A law 64K bps. • g711ulaw—G.711 micro law 64K bps. • g722r64—G.722-64K at 64K bps. • g729r8—G.729 8K bps (default). • ilbc—internet Low Bitrate Codec (iLBC) at 13,330 bps or 15,200 bps.
Step 18	end Example: <pre>Router(config-register-pool)# end</pre>	Exits to privileged EXEC mode.

Auto-Configuration for Cisco VG202, VG204, and VG224

Restriction Supported only for the Cisco VG202, VG204, and VG224 voice gateways.

Before you begin

- Cisco Unified CME 7.1 or a later version. The Cisco Unified CME router must be configured and running before you boot the analog voice gateway. See [Set Up Cisco Unified CME for SCCP Phones](#), on page 181.
- Default location of configuration files is `system:/its/`. To define an alternate location at which to save the gateway configuration files, see [Define Per-Phone Configuration Files and Alternate Location for SCCP Phones](#), on page 187.
- To automatically assign the next available directory number to the voice port as it registers to Cisco Unified CME, and create an ephone entry associated with each voice port, enable the **auto assign** command in Cisco Unified CME.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice-gateway system tag**
4. **mac-address mac-address**
5. **type {vg202 | vg204 | vg224}**
6. **voice-port port-range**
7. **network-locale locale-code**
8. **create cnf-files**
9. **reset or restart**
10. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice-gateway system tag Example: Router(config)# voice-gateway system 1	Enters voice gateway configuration mode and creates a voice gateway configuration.
Step 4	mac-address mac-address Example: Router(config-voice-gateway)# mac-address	Defines the MAC address of the voice gateway to autoconfigure.
Step 5	type {vg202 vg204 vg224} Example: Router(config-voice-gateway)# type vg224	Defines the type of voice gateway to autoconfigure.
Step 6	voice-port port-range Example: Router(config-voice-gateway)# voice-port 0-23	Identifies the ports on the voice gateway that register to Cisco Unified CME.
Step 7	network-locale locale-code Example: Router(config-voice-gateway)# network-locale FR	Selects a geographically specific set of tones and cadences for the voice gateway's analog endpoints that register to Cisco Unified CME.

	Command or Action	Purpose
Step 8	create cnf-files Example: <code>Router(config-voice-gateway)# create cnf-files</code>	Generates the XML configuration files that are required for the voice gateway to autoconfigure its analog ports that register to Cisco Unified CME.
Step 9	reset or restart Example: <code>Router(config-voice-gateway)# reset</code> or <code>Router(config-voice-gateway)# restart</code>	(Optional) Performs a complete reboot of all analog phones associated with the voice gateway and registered to Cisco Unified CME. or (Optional) Performs a fast restart of all analog phones associated with the voice gateway after simple changes to buttons, lines, or speed-dial numbers. • Use these commands to download new configuration files to the analog phones after making configuration changes to the phones in Cisco Unified CME.
Step 10	end Example: <code>Router(config-voice-gateway)# end</code>	Exits to privileged EXEC mode.

Example

The following example shows the voice gateway configuration in Cisco Unified CME:

```
voice-gateway system 1
 network-locale FR
 type VG224
 mac-address 001F.A30F.8331
 voice-port 0-23
 create cnf-files
```

What to do next

- Cisco VG202 or VG204 voice gateway Enable the gateway for autoconfiguration. See the *Auto-Configuration on the Cisco VG202 and Cisco VG204 Voice Gateways* section in [Cisco VG202 and Cisco VG204 Voice Gateways Software Configuration Guide](#).
- Cisco VG224 analog phone gateway Enable SCCP and the STC application on the gateway. See the *Configuring FXS Ports for Basic Calls* chapter in [Supplementary Services Features for FXS Ports on Cisco IOS Voice Gateways Configuration Guide](#).

Configure Phones on SCCP Controlled Analog (FXS) Ports

Configuring Cisco Unified CME to support calls and features on analog endpoints connected to SCCP controlled analog (FXS) ports is basically the same as configuring any SCCP phone in Cisco Unified CME. This section

describes only the steps that have special meaning for phones connected to a Cisco VG224 Analog Phone Gateway.

Restriction	FXS ports on Cisco VG248 analog phone gateways are not supported by Cisco Unified CME.

Before you begin

- For phones connected to analog FXS ports on the Cisco VG224 Analog Phone Gateway: Cisco CME 3.2.2 or a later version.
- For phones connected to analog FXS ports on the Cisco Integrated Services Routers (ISR) voice gateway: Cisco Unified CME 4.0 or a later version.
- Cisco ISR voice gateway or Cisco VG224 analog phone gateway is installed and configured for operation. For information, see the appropriate Cisco configuration documentation.
- Prior to Cisco IOS Release 12.4(11)T, set the **timeouts ringing** command to **infinity** for all SCCP-controlled analog ports. In Cisco IOS Release 12.4(11)T and later, the default for this command is infinity.
- SCCP is enabled on the Cisco IOS voice gateway. For configuration information, see [Supplementary Services Features for FXS Ports on Cisco IOS Voice Gateways Configuration Guide](#).

Procedure

Step 1 Set up ephone-dns for up to 24 endpoints on the Cisco IOS gateway.

Use the **ephone-dn** command:

Example:

```
ephone-dn 1 dual-line
  number 1000
.
.
.
ephone-dn 24 dual-line
  number 1024
```

Step 2 Set the maximum number of ephones.

Use the **max ephones** command to set a number equal to or greater than the total number of endpoints that you intend to register on the Cisco Unified CME router, including both IP and analog endpoints. For example, if you have 6 IP phones and 12 analog phones, set the **max ephones** command to 18 or greater.

Step 3 Assign ephone-dns to ephones.

Use the **auto assign** command to enable the automatic assignment of an available ephone-dn to each phone as the phone contacts the Cisco Unified CME router to register.

Note

The order of ephone-dn assignment is not guaranteed. For example, if you have analog endpoints on ports 2/0 through 2/23 on the Cisco IOS gateway, port 2/0 does not necessarily become ephone 1. Use one of the following commands to enable automatic ephone-dn assignment.

- **auto assign 1 to 24**—You do not need to use the **type** keyword if you have only analog endpoints to be assigned or if you want all endpoints to be automatically assigned.
- **auto assign 1 to 24 type anl**—Use the **type** keyword if you have other phone types in the system and you want only the analog endpoints to be assigned to ephone-dns automatically.

An alternative to using the **auto assign** command is to manually assign ephone-dns to ephones (analog phones on FXS ports). This method is more complicated, but you might need to use it if you want to assign a specific extension number (ephone-dn) to a particular ephone. The reason that manual assignment is more complicated is because a unique device ID is required for each registering ephone and analog phones do not have unique MAC addresses like IP phones do. To create unique device IDs for analog phones, the auto assign process uses a particular algorithm. When you make manual ephone assignments, you have to use the same algorithm for each phone that receives a manual assignment.

The algorithm uses the single 12-digit SCCP local interface MAC address on the Cisco IOS gateway as the base to create unique 12-digit device IDs for all the FXS ports on the Cisco IOS gateway. The rightmost 9 digits of the SCCP local interface MAC address are shifted left three places and are used as the leftmost 9 digits for all 24 individual device IDs. The remaining 3 digits are the hexadecimal translation of the binary representation of the port's slot number (3 digits), subunit number (2 digits), and port number (7 digits). The following example shows the use of the algorithm to create a unique device ID for one port:

- The MAC address for the Cisco VG224 SCCP local interface is 000C.8638.5EA6.
- The FXS port has a slot number of 2 (010), a subunit number of 0 (00), and a port number of 1 (0000001). The binary digits are strung together to become 0100 0000 0001, which is then translated to 401 in hexadecimal to create the final device ID for the port and ephone.
- The resulting unique device ID for this port is C863.85EA.6401.

When manually setting up an ephone configuration for an analog port, assign it just one button because the port represents a single-line device. The **button** command can use the “:” (colon, for normal), “o” (overlay) and “c” (call-waiting overlay) modes.

Note

Once you have assigned ephone-dns to all the ephones that you want to assign manually, you can use the **auto assign** command to automatically assign the remaining ports.

Step 4 Set up feature parameters as desired.

The following list includes commonly configured features. For information about supported features, see [Supplementary Services Features for FXS Ports on Cisco IOS Voice Gateways Configuration Guide](#).

- Call transfer—To use call transfer from analog endpoints, the **transfer-system** command must be configured for the **full-blind** or **full-consult** keyword in telephony-service configuration mode on the Cisco Unified CME router. This is the recommended setting for Cisco CME 3.0 and later versions, but it is not the default.
- Call forwarding—Call forwarding destinations are specified for all, busy, and no-answer conditions for each ephone-dn using the **call-forward all**, **call-forward busy**, and **call-forward noan** commands in ephone-dn configuration mode.
- Call park—Call-park slots are created using the **park-slot** command in ephone-dn configuration mode. Phone users must be instructed how to transfer calls to the call-park slots and use directed pickup to retrieve the calls.
- Call pickup groups—Extensions are added to pickup groups using the **pickup-group** command in ephone-dn configuration mode. Phone users must be told which phones are in which groups.

- **Caller ID**—Caller names are defined using the **name** command in ephone-dn configuration mode. Caller numbers are defined using the **number** command in ephone-dn configuration mode.
- **Speed dial**—Numbers to be speed-dialed are stored with their associated speed-dial codes using the **speed-dial** command in ephone configuration mode.
- **Speed dial to voice mail**—The voice-mail number is defined using the **voicemail** command in telephony-service configuration mode.

Step 5 Set up feature restrictions as desired.

Features such as transfer, conference, park, pickup, group pickup (gpickup), and call forward all (cfwdall) can be restricted from individual ephones using the appropriate Cisco Unified CME softkey template command, even though analog phones do not have softkeys. Simply create a template that leaves out the softkey that represents the feature you want to restrict and apply the template to the ephone for which you want the feature restricted. For more information about softkey template customization, see [Customize Softkeys, on page 919](#).

What to do next

- If you have SIP and SCCP phones connected to the same Cisco Unified CME, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).
- To select a fixed-button layout for a Cisco Unified IP Phone 7931G, see [Select Button Layout for a Cisco Unified SCCP IP Phone 7931G, on page 1447](#).
- After configuring phones in Cisco Unified CME to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Files for SCCP Phones, on page 400](#).

Verify Analog Phone Support

Use the following **show** commands to display information about analog endpoints.

- **show ephone anl**—Displays MAC address, registration status, ephone-dn, and speed-dial numbers for analog ephones.
- **show telephony-service ephone-dn**—Displays call forward, call waiting, pickup group, and more information about ephone-dns.
- **show running-config**—Displays running configuration nondefault values.

Enable Remote Phone

To enable IP phones or instances of Cisco IP Communicator to connect to a Cisco Unified CME system over a WAN, perform the following steps.

**Restriction**

- Because Cisco Unified CME is not designed for centralized call processing, remote phones are supported only for fixed teleworker applications, such as working from a home office.
- Cisco Unified CME does not support CAC for remote SCCP phones, so voice quality can degrade if a WAN link is oversubscribed. High-bandwidth data applications used over a WAN can cause degradation of voice quality for remote IP phones.
- Cisco Unified CME does not support Emergency 911 (E911) calls from remote IP phones. Teleworkers using remote phones connected to Cisco Unified CME over a WAN should be advised not to use these phones for E911 emergency services because the local public safety answering point (PSAP) will not be able to obtain valid calling-party information from them.

We recommend that you make all remote phone users aware of this issue. One way is to place a label on all remote teleworker phones that reminds users not to place 911 emergency calls on remote IP phones. Remote workers should place any emergency calls through locally configured hotel, office, or home phones (normal land-line phones) whenever possible. Inform remote workers that if they must use remote IP phones for emergency calls, they should be prepared to provide specific location information to the answering PSAP personnel, including street address, city, state, and country.

Before you begin

- The WAN link supporting remote teleworker phones should be configured with a Call Admission Control (CAC) or Resource Reservation Protocol (RSVP) solution to prevent the oversubscription of bandwidth, which can degrade the quality of all voice calls.
- If DSP farms will be used for transcoding, you must configure them separately. See [Configure Transcoding Resources, on page 489](#).
- A SCCP phone to be enabled as a remote phone is configured in Cisco Unified CME. For configuration information, see [Create Directory Numbers for SCCP Phones, on page 264](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone *phone-tag***
4. **mtp**
5. **codec { g711ulaw | g722r64 | g729r8 [dspfarm-assist] }**
6. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.

	Command or Action	Purpose
	Router> enable	
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ephone <i>phone-tag</i> Example: Router(config)# ephone 36	Enters ephone configuration mode. • <i>phone-tag</i> —Unique sequence number that identifies this ephone during configuration tasks.
Step 4	mtp Example: Router(config-ephone)# mtp	Sends media packets to the Cisco Unified CME router.
Step 5	codec {g711ulaw g722r64 g729r8 [dspfarm-assist] } Example: Router(config-ephone)# codec g729r8 dspfarm-assist	(Optional) Selects a preferred codec for setting up calls. • Default: G.711 mu-law codec. • The g722r64 keyword requires Cisco Unified CME 4.3 and later versions. • dspfarm-assist —Attempts to use DSP-farm resources for transcoding the segment between the phone and the Cisco Unified CME router if G.711 is negotiated for the call. Note The dspfarm-assist keyword is ignored if the SCCP endpoint type is ATA, VG224, or VG248.
Step 6	end Example: Router(config-ephone)# end	Returns to privileged EXEC mode.

What to do next

- If you have SIP and SCCP phones connected to the same Cisco Unified CME, see [Configure Codecs of Individual Phones for Calls Between Local Phones, on page 291](#).
- To select a fixed-button layout for a Cisco Unified IP Phone 7931G, see [Select Button Layout for a Cisco Unified SCCP IP Phone 7931G, on page 1447](#).
- After configuring phones in Cisco Unified CME to make basic calls, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Files for SCCP Phones, on page 400](#).

Verify Remote Phones

Procedure

Use the **show running-config** command or the **show telephony-service ephone** command to verify parameter settings for remote ephones.

Configure Cisco IP Communicator Support on SCCP Phone

To enable support for Cisco IP Communicator, perform the following steps.

Before you begin

- Cisco Unified CME 4.0 or a later version.
- IP address of the Cisco Unified CME TFTP server.
- PC for Cisco IP Communicator is installed. For hardware and platform requirements, see the appropriate [Cisco IP Communicator User Guide](#).
- Audio devices, such as headsets and handsets for users, are installed. You can install audio devices any time, but the ideal time to do this is before you install and launch Cisco IP Communicator.
- Directory numbers and ephone configuration for Cisco IP Communicator are configured in Cisco Unified CME. For information, see [Configure Phones for a PBX System, on page 264](#).

Procedure

-
- Step 1** Download Cisco IP Communicator 2.0 or a later version software from the software download site at <https://software.cisco.com/download/home/277641082>.
- Step 2** Install the software on your PC, then launch the Cisco IP Communicator application.
- For information, see the *Installing and Launching Cisco IP Communicator* section in the appropriate [Cisco IP Communicator User Guide](#).
- Step 3** Complete the configuration and registration tasks on the Cisco IP Communicator as required, including the following:
- a) Configure the IP address of the Cisco Unified CME TFTP server.
 - Right-click on the Cisco IP Communicator interface, then choose **Preferences > Network > Use these TFTP servers**.
 - Enter the IP address of the Cisco Unified CME TFTP server in the field.
 - b) Disable the Optimize for low bandwidth parameter to ensure that Cisco IP Communicator sends voice packets for all calls.

Note

The following steps are required to enable Cisco IP Communicator to support the G.711 codec, which is the fallback codec for Cisco Unified CME. You can compensate for disabling the optimization parameter by using the codec command in ephone configuration mode to configure G.729 or another advanced codec as the preferred codec for Cisco IP Communicator. This helps to ensure that the codec for a VoIP (For example, SIP or H.323) dial-peer is supported by Cisco IP Communicator and can prevent audio problems caused by insufficient bandwidth.

- Right-click on the Cisco IP Communicator interface and choose **Preferences > Audio**.
- Uncheck the checkbox next to Optimize for low bandwidth.

Step 4 Wait for the Cisco IP Communicator application to connect and register to Cisco Unified CME.

Step 5 Test Cisco IP Communicator.

For more information, see [Verify Cisco IP Communicator Support on SCCP Phone, on page 323](#).

Verify Cisco IP Communicator Support on SCCP Phone

Procedure

-
- Step 1** Use the **show running-config** command to display ephone-dn and ephone information associated with this phone.
- Step 2** After Cisco IP Communicator registers with Cisco Unified CME, it displays the phone extensions and softkeys in its configuration. Verify that these are correct.
- Step 3** Make a local call from the phone and have someone call you. Verify that you have a two-way voice path.
-

Troubleshooting Cisco IP Communicator Support on SCCP Phone

Procedure

Use the **debug ephone detail** command to diagnose problems with calls. For more information, see [Cisco Unified CME Command Reference](#).

Configure Secure IP Phone (IP-STE) on SCCP Phone

To configure an IP-STE phone on Cisco Unified CME, perform the following steps.

**Restriction**

- Detection or conversion between Network Transmission Equipment (NTE) and Session Signaling Event (SSE) is not supported.
- Transcoding or trans-compress rate support for different Voice Band Data (VBD) and Modem Relay (MR) media type is not supported.
- IP-STE supports only single-line calls, dual-line and octo-line calls are not supported.
- Speed-dial can only be configured manually on the IP-STE.

Before you begin

Cisco Unified CME 8.0 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **mac-address** [*mac-address*]
5. **type ip-ste**
6. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	ephone <i>phone-tag</i> Example: <pre>Router(config)# ephone 6</pre>	Enters ephone configuration mode. • <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks. The maximum number of ephones is version and platform-specific. Type ? to display range.
Step 4	mac-address [<i>mac-address</i>] Example: <pre>Router(config-ephone)# mac-address 2946.3f2.311</pre>	Specifies the MAC address of the IP phone that is being configured.

	Command or Action	Purpose
Step 5	type ip-ste Example: <code>Router(config-ephone)# type ip-ste</code>	Specifies the type of phone.
Step 6	end Example: <code>Router(config-ephone)# end</code>	Returns to privileged EXEC mode.

Configure Phone Services XML File for Cisco Unified Wireless Phone 7926G

To configure the phone services XML file for Cisco Unified Wireless phone 7926G, perform the following steps:

Before you begin

Cisco Unified CME 8.6 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **mac-address** [*mac-address*]
5. **type** *phone-type*
6. **button** *button-number*
7. **ephone-template** *template tag*
8. **service** [*phone parameter name parameter value*] | [**xml-config append** *phone_service xml filename*]
9. **telephony-service**
10. **cnf-file** *perphone*
11. **create cnf-files**
12. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Router> enable</code>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <code>Router# configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	ephone <i>phone-tag</i> Example: Router(config)# ephone 1	Enters ephone configuration mode.
Step 4	mac-address [<i>mac-address</i>] Example: Router(config-ephone)# mac-address 0001.2345.6789	Specifies the MAC address of the IP phone that is being configured.
Step 5	type <i>phone-type</i> Example: Router(config-ephone)# type 7926	Specifies the type of phone that is being configured.
Step 6	button <i>button-number</i> Example: Router(config-ephone)# button 1:1	Creates a set of ephone-dns overlaid on a single button.
Step 7	ephone-template <i>template tag</i> Example: Router(config)# ephone-template 5	Enters ephone-template configuration mode to create an ephone template.
Step 8	service [phone <i>parameter name parameter value</i>] [xml-config append <i>phone_service xml filename</i>] Example: Router(config-ephone-template)# service xml-config append flash:7926_phone_services.xml	Sets parameters for all IP phones that support the configured functionality and to which this template is applied. • <i>parameter name</i>—The parameter name is word and case-sensitive. See Cisco Unified CME Command Reference. • <i>phone_service xml filename</i>—Allows the addition of a phone services xml file.
Step 9	telephony-service Example: Router(config) telephony-service	Enters telephony-service configuration mode.
Step 10	cnf-file perphone Example: (config-telephony)# cnf-file perphone	Specifies that the system generates a separate configuration XML file for each IP phone. • Separate configuration files for each endpoint are required for security.
Step 11	create cnf-files Example: Router(config-telephony)# create cnf-files	Builds XML configuration files required for SCCP phones.

	Command or Action	Purpose
Step 12	end Example: <code>Router(config-telephony)#end</code>	Returns to privileged EXEC mode.

Configure Phones to Make Basic Call

Configure Auto Registration for SIP Phones

To configure automatic registration of SIP phones with the Cisco Unified CME system, perform the following steps.

Restriction

- The DNs assigned to auto registered phones cannot be configured as shared line DNs.
- Only Cisco Unified 7800 and 8800 series phones are supported with auto registration.

Before you begin

- Cisco CME 11.5 or a later version.
- It is recommended that administrators choose different DN ranges for manually configured and auto configured phones.
- It is mandatory that **password** is configured before DN range (**auto-assign**) while registering SIP phones using auto registration.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **auto-register**
5. **password** *string*
6. **auto-assign** *First DN number to Last DN number*
7. **service-enable**
8. **template** *tag*
9. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	voice register global Example: <pre>Router(config)# voice register global</pre>	Enters voice register global configuration mode.
Step 4	auto-register Example: <pre>Router(config-register-global)# auto-register</pre>	Enters auto registration mode for SIP phones registering with Unified CME.
Step 5	password <i>string</i> Example: <pre>Router(config-voice-auto-register)# password cisco</pre>	Configures the default password for SIP phones that auto register. • <i>string</i>—Configures the mandatory word string that administrator provides for auto registration of phones on Unified CME.
Step 6	auto-assign <i>First DN number to Last DN number</i> Example: <pre>Router(config-voice-auto-register)# auto-assign 1 to 10</pre>	Configures the range of directory numbers for phones that auto register on Unified CME. • <i>First DN number to Last DN number</i>—Range is 1 to 4294967295.
Step 7	service-enable Example: <pre>Router(config-voice-auto-register)# service-enable</pre>	Enables the auto registration of SIP phones on Unified CME. Once auto-register command is entered, the service is enabled by default. To temporarily disable auto registration feature without losing DN and password configurations, use the no form of this command.
Step 8	template <i>tag</i> Example: <pre>Router(config-voice-auto-register) template 10</pre>	Configures a basic configuration template that supports all the configurations available on the voice register template. • It is mandatory that voice register template is configured with the same template tag. • <i>tag</i>—Range is 1 to 10.

	Command or Action	Purpose
Step 9	end Example: Router(config-voice-auto-register)# end	Exits to privileged EXEC mode.

Configure a Mixed Shared Line

To configure a mixed shared line between Cisco Unified SIP IP and Cisco Unified SCCP IP phones, perform the following steps.

Restriction

- Cisco Unified SCCP trunk-dn is not supported.
- Mixed shared lines can only be configured on one of several common directory numbers.
- Mixed shared lines are not supported in Cisco Unified SRST.

Before you begin

Cisco Unified CME 9.0 or a later version.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn** *dn-tag*
4. **number** *number*
5. **shared-line** [**max-calls** *number-of-calls*]
6. **exit**
7. **ephone-dn** *dn-tag* [**dual-line** | **octo-line**]
8. **number** *number*
9. **shared-line sip**
10. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	voice register dn <i>dn-tag</i> Example: <pre>Router(config)# voice register dn 1</pre>	Enters voice register dn configuration mode. • <i>dn-tag</i>—Unique sequence number that identifies a particular directory number during configuration tasks. Range is 1 to 150 or the maximum defined by the max-dn command.
Step 4	number <i>number</i> Example: <pre>Router(config-register-dn)# number 1001</pre>	Associates a telephone or extension number with a Cisco Unified SIP IP phone in a Cisco Unified CME system. • <i>number</i>—String of up to 16 characters that represents an E.164 telephone number. Normally, the string is composed of digits, but the string may contain alphabetic characters when the number is dialed only by the router, as with an intercom number.
Step 5	shared-line [max-calls <i>number-of-calls</i>] Example: <pre>Router(config-register-dn)# shared-line max-calls 4</pre>	Creates a directory number to be shared by multiple Cisco Unified SIP IP phones. • max-calls <i>number-of-calls</i>—(Optional) Maximum number of active calls allowed on the shared line. Range: 2 to 16. Default: 2.
Step 6	exit Example: <pre>Router(config-register-dn)# exit</pre>	Exits voice register dn configuration mode.
Step 7	ephone-dn <i>dn-tag</i> [dual-line octo-line] Example: <pre>Router(config)# ephone-dn 1 octo-line</pre>	Enters ephone-dn configuration mode to configure a directory number for an IP phone line. • <i>dn-tag</i>—Unique number that identifies an ephone-dn during configuration tasks. Range is 1 to the number set by the max-dn command. • dual-line—(Optional) Enables two calls per directory number. • octo-line—(Optional) Enables eight calls per directory number.
Step 8	number <i>number</i> Example: <pre>Router(config-ephone-dn)# number 1001</pre>	Associates a telephone or extension number with this ephone-dn. • <i>number</i>—String of up to 16 characters that represents an E.164 telephone number. Normally, the string is composed of digits, but the string may contain

	Command or Action	Purpose
		alphabetic characters when the number is dialed only by the router, as with an intercom number.
Step 9	shared-line sip Example: <code>Router(config-ephone-dn)# shared-line sip</code>	Adds an ephone-dn as a member of a shared directory number in the database of the Shared-Line Service Module for a mixed shared line between Cisco Unified SIP and Cisco Unified SCCP IP phones.
Step 10	end Example: <code>Router(config-ephone-dn)# end</code>	Exits to privileged EXEC mode.

Troubleshooting Tips for Mixed Shared Line

Use the **debug ephone shared-line-mixed** command to display debugging information about mixed shared lines.

Configure the Maximum Number of Calls on SCCP Phone

To configure the maximum number of calls on a Cisco Unified SCCP IP phone in Cisco Unified CME 9.0, perform the following steps.

Before you begin

- Cisco Unified CME 9.0 and later versions.
- Correct firmware, 9.2(1) or a later version, is installed.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *dn-tag* [**dual-line** | **octo-line**]
4. **number** *number*
5. **exit**
6. **ephone** *phone-tag*
7. **mac-address** *mac-address*
8. **type** *phone-type*
9. **busy-trigger-per-button** *number-of-calls*
10. **max-calls-per-button** *number-of-calls*
11. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ephone-dn <i>dn-tag</i> [<i>dual-line</i> <i>octo-line</i>] Example: Router(config)# ephone-dn 6 octo-line	Enters ephone-dn configuration mode to configure a directory number for an IP phone line. • <i>dn-tag</i>—Unique number that identifies an ephone-dn during configuration tasks. Range is 1 to the number set by the max-dn command. • dual-line—(Optional) Enables two calls per directory number. • octo-line—(Optional) Enables eight calls per directory number.
Step 4	number <i>number</i> Example: Router(config-ephone-dn)# number 1007	Associates a telephone or extension number with an ephone-dn in a Cisco Unified CME. • <i>number</i>—String of up to 16 characters that represents an E.164 telephone number. Normally the string is composed of digits, but the string may contain alphabetic characters when the number is dialed only by the router, as with an intercom number. One or more periods (.) can be used as wildcard characters.
Step 5	exit Example: Router(config-ephone-dn)# exit	Exits ephone-dn configuration mode.
Step 6	ephone <i>phone-tag</i> Example: Router(config)# ephone 98	Enters ephone configuration mode. • <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks. The maximum number of ephones is version and platform-specific. Type ? to display range.
Step 7	mac-address <i>mac-address</i> Example:	Associates the MAC address of a Cisco IP phone with an ephone configuration in a Cisco Unified CME.

	Command or Action	Purpose
	<code>Router(config-ephone)# mac-address ABCD.1234.56EF</code>	<i>mac-address</i>—Identifying MAC address of an IP phone.
Step 8	type <i>phone-type</i> Example: <code>Router(config-ephone)# type 8941</code>	Assigns a phone type to an SCCP phone.
Step 9	busy-trigger-per-button <i>number-of-calls</i> Example: <code>Router(config-ephone)# busy-trigger-per-button 6</code>	Sets the maximum number of calls allowed on an octo-line directory number before activating Call Forward Busy or a busy tone. <i>number-of-calls</i>—Maximum number of calls. Range: 1 to 8. Default: 0 (disabled).
Step 10	max-calls-per-button <i>number-of-calls</i> Example: <code>Router(config-ephone)# max-calls-per-button 4</code>	Sets the maximum number of calls allowed on an octo-line directory number on an SCCP phone. <i>number-of-calls</i>—Maximum number of calls. Range: 1 to 8. Default: 8.
Step 11	end Example: <code>Router(config-ephone)# end</code>	Exits configuration mode and enters privileged EXEC mode.

Configure the Busy Trigger Limit on SIP Phone

To configure the busy trigger limit on a Cisco Unified SIP IP phone in Cisco Unified CME 9.0, perform the following steps.

**Restriction**

You cannot configure the maximum number of calls per line. The phone controls the maximum number of outgoing calls.

[Table 21: Maximum Number of Incoming and Outgoing Calls](#), on page 334 shows the maximum number of outgoing calls allowed by a phone and the maximum number of incoming calls that can be configured using the **busy-trigger-per-button** command for Cisco Unified 6921, 6941, 6945, 6961, 8941, and 8945 SIP IP Phones in Cisco Unified CME 9.0.

Table 21: Maximum Number of Incoming and Outgoing Calls

Cisco Unified SIP IP Phones	Maximum Number of Outgoing Calls (Controlled by Phones)	Maximum Number of Incoming Calls Before Busy Tone (Configurable)
6921	12	12
6941	24	24
6945	24	24
6961	72	72
8941	24	24
8945	24	24

Before you begin

- Cisco Unified CME 9.0 and later versions.
- Correct firmware is installed:
 - 9.2(1) or a later version for Cisco Unified 6921, 6941, 6945 and 6961 SIP IP phones.
 - 9.2(2) or a later version for Cisco Unified 8941 and 8945 SIP IP phones.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **type** *phone-type*
5. **busy-trigger-per-button** *number*
6. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	voice register pool <i>pool-tag</i> Example: <pre>Router(config)# voice register pool 20</pre>	Enters voice register pool configuration mode and creates a pool configuration for a SIP IP phone in Cisco Unified CME. <i>pool-tag</i> —Unique number assigned to the pool. Range is 1 to 100. Note For Cisco Unified CME systems, the upper limit for this argument is defined by the max-pool command.
Step 4	type <i>phone-type</i> Example: <pre>Router(config-register-pool)# type 6921</pre>	Defines a phone type for a SIP phone.
Step 5	busy-trigger-per-button <i>number</i> Example: <pre>Router(config-register-pool)# busy-trigger-per-button 25</pre>	Sets the maximum number of calls allowed on a SIP directory number before activating Call Forward Busy or a busy tone. • <i>number</i>—Maximum number of calls. Range: 1 to the maximum number of incoming calls listed in Step 6. The default values are 1 for the Cisco Unified 6921, 6941, 6945, and 6961 SIP IP phones and 2 for the Cisco Unified 8941 and 8945 SIP IP phones.
Step 6	end Example: <pre>Router(config-register-pool)# end</pre>	Exits configuration mode and enters privileged EXEC mode.

Configure KEMs on SIP Phones

To configure KEMs for Cisco SIP IP phones, perform the following steps.

Before you begin

Unified CME 9.1 or a later version for C-KEM and BE-KEM.

Unified CME 12.5 or a later release for A-KEM and V-KEM.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **type** *phone-type* [**addon 1 CKEM** | **CP-8800-Audio** | **CP-8800-Video** [**2 CKEM** | **CP-8800-Audio** | **CP-8800-Video** [**3 CKEM** | **CP-8800-Audio** | **CP-8800-Video**]]]

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	voice register pool <i>pool-tag</i> Example: <pre>Router(config)# voice register pool 29</pre>	Enters voice register pool configuration mode and creates a pool configuration for a Cisco Unified SIP IP phone in Cisco Unified CME. • <i>pool-tag</i>—Unique number assigned to the pool. Range is 1 to 100. Note For Cisco Unified CME systems, the upper limit for this argument is defined by the max-pool command.
Step 4	type <i>phone-type</i> [addon 1 CKEM CP-8800-Audio CP-8800-Video [2 CKEM CP-8800-Audio CP-8800-Video [3 CKEM CP-8800-Audio CP-8800-Video]]] Example: <pre>Router(config-register-pool)# type 9971 addon 1 CKEM 2 CKEM 3 CKEM Router(config-register-pool)# type 8851 addon 1 CP-8800-Audio 2 CP-8800-Audio Router(config-register-pool)# type 8851NR addon 1 CP-8800-Audio 2 CP-8800-Audio</pre>	Defines a phone type for a Cisco Unified SIP IP phone. The following keywords increase the number of speed-dial, busy-lamp-field, and directory number keys that can be configured: • addon 1 CKEM—(Optional) Tells the router that a Cisco SIP IP Phone CKEM 36-Button Line Expansion Module is being added to this Cisco Unified SIP IP Phone. Note

	Command or Action	Purpose
	<pre>Router(config-register-pool)# type 8861 addon 1 CP-8800-Audio 2 CP-8800-Audio 3 CP-8800-Audio Router(config-register-pool)# type 8865 addon 1 CP-8800-Video 2 CP-8800-Video 3 CP-8800-Video</pre>	This option is available to Cisco Unified 8961, 9951, and 9971 SIP IP phones only. • addon 1 CP-8800-Audio or addon 1 CP-8800-Video—(Optional) Tells the router that a Cisco SIP IP Phone A-KEM or V-KEM is being added to this Cisco Unified SIP IP Phone. Note The option addon 1 CP-8800-Audio is available to Cisco Unified 8851, 8851NR, and 8861 SIP IP phones only. The option addon 1 CP-8800-Video is available only to Unified IP Phone 8865. • 2 CKEM (Optional)—Tells the router that a second Cisco SIP IP Phone CKEM 36-Button Line Expansion Module is being added to this Cisco Unified SIP IP Phone. Note This option is available to Cisco Unified 9951 and 9971 SIP IP phones only. • 2 CP-8800-Audio or 2 CP-8800-Video—(Optional) Tells the router that a second Cisco SIP IP Phone A-KEM or V-KEM is being added to this Cisco Unified SIP IP Phone. Note The option 2 CP-8800-Audio is available to Cisco Unified 8851, 8851NR, and 8861 SIP IP phones only. The option 2 CP-8800-Video is available only to Unified IP Phone 8865. • 3 CKEM—(Optional) Tells the router that a third Cisco SIP IP Phone CKEM 36-Button Line Expansion Module is being added to this Cisco Unified SIP IP Phone. Note This option is available to Cisco Unified 9971 SIP IP phones only. • 3 CP-8800-Audio or 3 CP-8800-Video—(Optional) Tells the router that a third Cisco SIP IP Phone A-KEM or V-KEM is being added to this Cisco Unified SIP IP Phone. Note

	Command or Action	Purpose
		The option 3 CP-8800-Audio is available to Cisco Unified 8861 SIP IP phones only. The option 3 CP-8800-Video is available only to Unified IP Phone 8865.

Provision SIP Phones to Use the Fast-Track Configuration Approach

To provision the Cisco Unified SIP IP phones using the fast-track configuration approach, perform the following steps.

Restriction

When a new Cisco Unified SIP IP phone is configured on Cisco Unified CME using the fast-track configuration approach, and the Cisco Unified CME is upgraded to a later version that supports the new phone type, the fast-track configuration pertaining to that SIP IP phone is removed automatically.

Before you begin

You require Cisco Unified CME Release 10 or a later release.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool-type** *pool-type*
4. **addons** *max-addons*
5. **description** *string*
6. **gsm-support**
7. **num-lines** *max-lines*
8. **Phoneload-support**
9. **reference-pooltype** *phone-type*
10. **telnet-support**
11. **transport** {**udp** | **TCP**}
12. **Xml-config** {**maxNumCalls** | **busyTrigger** | **custom**}
13. **exit**
14. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables the privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters the global configuration mode.
Step 3	voice register pool-type <i>pool-type</i> Example: <pre>Router(config)# voice register pool-type 9900</pre>	Enters the voice register pool configuration mode and creates a pool configuration for a Cisco Unified SIP IP phone in Cisco Unified CME. If the new phone type is an existing phone that is supported on Cisco Unified CME release, you get the following error message: <pre>ERROR: 8945 is built-in phonemodel, cannot be changed</pre>
Step 4	addons <i>max-addons</i> Example: <pre>Router(config-register-pooltype)# addons 3</pre>	Defines the maximum number of add-on modules supported in Cisco Unified SIP IP phones. • <i>max-addons</i>—The maximum allowed value is 3. The configured add-on modules can be used while defining the pool for the new SIP phone model using the existing type command as shown below: <pre>type <phone-type> [addon 1 module-type [2 module-type]]</pre>
Step 5	description <i>string</i> Example: <pre>Router(config-register-pooltype)# description TEST PHON</pre>	Defines the description string for the new phone type.
Step 6	gsm-support Example: <pre>Router(config-register-pooltype)# gsm-support</pre>	Defines phone support for Global System for Mobile Communications (GSM) support.
Step 7	num-lines <i>max-lines</i> Example: <pre>Router(config-register-pooltype)# num-lines 12</pre>	Defines the maximum number of lines supported by the new phone. • <i>max-lines</i>—If this parameter is not configured, the default value 1 is used.
Step 8	Phoneload-support Example: <pre>Router(config-register-pooltype)# Phoneload-support</pre>	Defines phone support for firmware download from Cisco Unified CME. You can use the load command in the voice register global mode to configure the corresponding phone load for the new phone type if it supports phone load.
Step 9	reference-pooltype <i>phone-type</i> Example: <pre>voice register pool-type 7821?</pre>	Defines the nearest phone family from which the SIP IP phone in fast-track mode will inherit the properties. • <i>phone-type</i>—Unique number that represents the phone model.

	Command or Action	Purpose
	<pre>description Cisco IP Phone 7821 reference-pooltype 6921</pre>	Default There is no reference point to inherit the properties.
Step 10	telnet-support Example: <pre>Router(config-register-pooltype)# telnet-support</pre>	Defines phone support for Telnet access.
Step 11	transport {udp TCP} Example: <pre>Router(config-register-pooltype)# transport Tcp</pre>	Defines the default transport type supported by the new phone. If this parameter is not configured, UDP is used as the default value. The session-transport command configured at the voice register pool takes priority over this configuration.
Step 12	Xml-config {maxNumCalls busyTrigger custom} Example: <pre>Router(config-register-pooltype)#xml-config busyTrigger 2 Router(config-register-pooltype)#xml-config maxNumCalls 4 Router(config-register-pooltype)#xml-config custom <test>1</test></pre>	Defines the phone-specific XML tags to be used in the configuration file. • maxNumCalls—Defines the maximum number of calls allowed per line. • busyTrigger—Defines the number of calls that triggers Call Forward Busy per line on the SIP phone. • custom—Defines custom XML tags which can be appended at the end of the phone specific CNF file. These parameters are used while generating the configuration profile file. CUCME does not use these configuration values for any other purpose.
Step 13	exit Example: <pre>Router(config-register-pooltype)# exit</pre>	Exits the voice register-pooltype configuration mode.
Step 14	end Example: <pre>Router(config)# end</pre>	Exits the privileged EXEC configuration mode.

SIP Phone Models Validated for CME using Fast-track Configuration

For information on the SIP phone models validated for Cisco Unified CME using fast-track configuration, see [Phone Feature Support Guide for Unified CME, Unified SRST, Unified E-SRST, and Unified Secure SRST](#).

Configuration Examples for Making Basic Calls

This section contains the following examples of the required Cisco Unified CME configurations with some of the additional options that are discussed in other modules.

Example for Configuring SCCP Phones for Making Basic Calls

The following is a sample output of the **show running-config** command, showing how an SCCP phone is configured to make basic calls:

```
Router# show running-config

Example for Disabling a Bulk Registration for a SIP Phone

The following example shows that all phone numbers that match the pattern “408555..” can register with the SIP proxy server (IP address 1.5.49.240) except directory number 1, number “4085550101,” for which bulk registration is disabled:

```

voice register global
mode cme
bulk 408555...
!
voice register dn 1
number 4085550101
no-reg
sip-ua
registrars ipv4:1.5.49.240

```

Examples for Configuring VCC with Shared Lines

Example

The following is a sample configuration for VCC with shared lines, with the same voice class codec configured under the voice register pools.

```

Router#

voice class codec 1
codec preference 1 g711ulaw
codec preference 2 g729r8
codec preference 3 g722-64

voice class codec 2
codec preference 1 g711ulaw
codec preference 2 g729r8

voice register pool 1
busy-trigger-per-button 2
id mac 08CC.A785.EE9C
type 8865
number 1 dn 1
dtmf-relay rtp-nte
voice-class codec 1
username abcd password xxxx
no vad

voice register pool 2
busy-trigger-per-button 2
id mac D42C.4485.D9C2
type 7861
number 1 dn 1
dtmf-relay rtp-nte
voice-class codec 1
username uvwx password xxxx
no vad

```

```
dial-peer voice 2 voip
 session protocol sipv2
 incoming called-number 50..
 voice-class codec 2
 dtmf-relay rtp-nte
 no vad
```

Example for Configuring a Mixed Shared Line on a Second Common Directory Number

The following example shows how configuring a mixed shared line on a second common directory number is rejected:

```
Router(config)#ephone-dn 14 octo-line
Router(config-ephone-dn)#number 2502
Router(config-ephone-dn)#shared-line sip

Router(config)#ephone-dn 20 octo-line

Example for Cisco ATA

The following example shows the configuration for two analog phones using a single Cisco ATA with MAC address 000F.F758.E70E. The analog phone attached to the first port uses the MAC address of the Cisco ATA. The analog phone attached to the second port uses a modified version of the Cisco ATA's MAC address; the first two hexadecimal numbers are removed and 01 is appended to the end.

```

Example for Cisco ATA in SIP Mode

The following example shows the configuration for an analog phones using a Cisco ATA 190 or ATA 191 with MAC address DCEB.941C.F33D.

```
enable
```

```

configure terminal
voice register dn 15
    number 8015
voice register pool 15
    id mac DCEB.941C.F33D
    type ATA-190/ATA-191
    number 1 dn 15
    username abcd password xxxx
    codec g711ulaw
end

```

Example for SCCP Analog Phone

The following partial sample output from a Cisco Unified CME configuration sets transfer type to full-blind and sets the voice-mail extension to 5200. Ephone-dn 10 has the extension 4443 and is assigned to Tommy; that number and name will be used for caller-ID displays. The description field under ephone-dn is used to indicate that this ephone-dn is on the Cisco VG224 voice gateway at port 1/3. Extension 4443 is assigned to ephone 7, which is an analog phone type with 10 speed-dial numbers.

Example for Monitoring the Status of Key Expansion Modules

Show commands are used to monitor the status and other details of Key Expansion Modules (KEMs).

The following example demonstrates how the **show voice register all** command displays KEM details with all the Cisco Unified CME configurations and registration information:

```
show voice register all
VOICE REGISTER GLOBAL
=====
CONFIG [Version=9.1]
=====
.....
Pool Tag 5
Config:
  Mac address is B4A4.E328.4698
  Type is 9971 addon 1 CKEM
  Number list 1 : DN 2
  Number list 2 : DN 3
  Proxy Ip address is 0.0.0.0
  DTMF Relay is disabled
  Call Waiting is enabled
  DnD is disabled
  Video is enabled
  Camera is enabled
  Busy trigger per button value is 0
  keep-conference is enabled
  registration expires timer max is 200 and min is 60
  kpml signal is enabled
  Lpcor Type is none
```

The following example demonstrates how the **show voice register pool type** command displays all the phones configured with add-on KEMs in Cisco Unified CME:

```
Router# show voice register pool type CKEM
Pool ID          IP Address      Ln DN   Number      State

Cisco IOS Commands for Monitoring and Maintaining Cisco Unified CME

To monitor and maintain Cisco Unified Communications Manager Express (CME), use the following commands in privileged EXEC mode.

Command	Purpose
Router# show call-manager-fallback all	Displays the detailed configuration of all the Cisco Unified IP phones, voice ports, and dial peers of the Cisco Unified CME Router.
Router# show call-manager-fallback dial-peer	Displays the output of the dial peers of the Cisco Unified CME Router.
Router# show call-manager-fallback ephone-dn	Displays Cisco Unified IP Phone destination numbers when in call manager fallback mode.
Router# show call-manager-fallback voice-port	Displays output for the voice ports.
Router# show dial-peer voice summary	Displays a summary of all voice dial peers.
Router# show ephone <i>phone</i>	Displays Cisco Unified IP Phone status.
Router# show ephone offhook	Displays Cisco Unified IP Phone status for all phones that are off hook.
Router# show ephone registered	Displays Cisco Unified IP Phone status for all phones that are currently registered.
Router# show ephone remote	Displays Cisco Unified IP Phone status for all nonlocal phones (phones that have no Address Resolution Protocol [ARP] entry).
Router# show ephone ringing	Displays Cisco Unified IP Phone status for all phones that are ringing.
Router# show ephone summary	Displays a summary of all Cisco Unified IP Phones.
Router# show ephone summary brief	Displays a brief summary of all Cisco Unified SCCP phones.
Router# show ephone summary types	Displays a summary of all types of Cisco Unified SCCP phones.
Router# show ephone registered summary	Displays a summary of all registered Cisco Unified SCCP phones.
Router# show ephone unregistered summary	Displays a summary of all unregistered Cisco Unified SCCP phones.
Router# show ephone telephone-number <i>phone-number</i>	Displays Unified IP Phone status for a specific phone number.
Router# show ephone unregistered	Displays Unified IP Phone status for all unregistered phones.
Router# show ephone-dn <i>tag</i>	Displays Unified IP Phone destination numbers.

Command	Purpose
Router# show ephone-dn summary	Displays a summary of all Cisco Unified IP Phone destination numbers.
Router# show ephone-dn loopback	Displays Cisco Unified IP Phone destination numbers in loopback mode.
Router# show running-config	Displays the configuration.
Router # show sip-ua status registrar	Display SIP registrar clients.
Router# show voice port summary	Displays a summary of all voice ports.
Router # show voice register all	Displays all SIP SRST configurations , SIP phone registrations and dial peer info.
Router # show voice register global	Displays voice register global config.
Router # show voice register pool all	Displays all config SIP phone voice register pool detail info.
Router # show voice register pool type summary	Displays a summary of all registered and unregistered Cisco SIP Phones.
Router # show voice register pool <tag>	Displays specific SIP phone voice register pool detail info.
Router # show voice register dial-peers	Displays SIP-CME created dial peer.
Router # show voice register dn all	Displays all config voice register dn detail info.
Router # show voice register dn <tag>	Displays specific voice register dn detail info.

Example for Fast-Track Configuration Approach

The following example shows how to enable the new Cisco Unified 9900 SIP IP phone to inherit the properties of the Cisco Unified SIP IP phone 9951 and overwrite some of the phone's properties:

```
voice register pool-type 9900
  reference-pooltype 9951
  description SIP Phone 9900 addon module
  num-lines 24
  addons 3
  no phoneload-support
  xml-config custom "custom-sftp"1"/custom-sftp"

voice register pool 1
  type 9900 addon 1 CKEM 2 CKEM 3 CKEM
  id mac 1234.4567.7891
voice register global
```

```
mode cme
load 9900 POS3-06-0-00
```

The following example shows how to inherit the existing properties of a reference phone type (Cisco Unified SIP IP phone 6921) using the fast-track configuration approach.

```
voice register pooltype 6922
  reference-pooltype 6921
  device-name "SIP Phone 6922"

voice register pool 11
  type 6922
  id mac 1234.4567.7890
```

Example for Configuring Key Expansion Module for Cisco 8800 Series IP Phones on Unified CME

The following example demonstrates how to configure the **type** command for phone type 8865 with the KEM option **CP-8800-Video** to enable Key Expansion Module for Cisco IP Phone 8800 Series on Unified CME 12.5 and later releases:

```
enable
configure terminal
voice register pool
  id mac eeee.ffff.cccc
  type 8865 addon 1 CP-8800-Video 2 CP-8800-Video 3 CP-8800-Video
```

Example for Configuring Enhanced Line Mode on Unified CME

The following example demonstrates how to configure **service phone lineMode** command under **telephony-service** to enable Enhanced Line Mode feature for Cisco IP Phone 8800 Series on Unified CME:

```
Router#sh run | s tele
telephony-service
max-ephones 50

Where To Go Next

To select a fixed-button layout for a Cisco Unified IP Phone 7931G, see [Select Button Layout for a Cisco Unified SCCP IP Phone 7931G, on page 1447](#).

After configuring phones in Cisco Unified CME to make basic calls, you are ready to generate configuration files for the phones to be connected to your router. See [Generate Configuration Files for Phones, on page 400](#).

Feature Information for Configuring Phones to Make Basic Calls

Caution The Interactive Voice Response (IVR) media prompts feature is only available on the IAD2435 when running IOS version 15.0(1)M or later.

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

Table 22: Feature Information for Basic Call Features

Feature Name	Cisco Unified CME Versions	Feature Information
Cisco ATA 191	12.5	Introduces native support for Cisco ATA 191 with Unified CME.
Enhanced Line Mode	12.3	Support introduced for Enhanced Line Mode (ELM) on Cisco IP Phone 8800 Series.
Shared Lines with Voice Class Codec Support	12.2	Adds support for shared lines with voice class codec on Unified CME.
KEM Support for Cisco 8000 Series SIP IP Phones	12.5	Supports A-KEM and V-KEM for Cisco IP Phones 8851, 8851NR, 8861, and 8865 Cisco SIP IP Phones.
KEM Support for Cisco Unified 8961, 9951, and 9971 SIP IP Phones	9.1	Increases line key and feature key appearances, speed dials, or programmable buttons on Cisco Unified SIP IP phones.
Cisco ATA-187	9.0	Supports T.38 fax relay and fax pass-through on Cisco ATA-187.

Feature Name	Cisco Unified CME Versions	Feature Information
Cisco Unified SIP IP Phones		Adds SIP support for the following phone types: • Cisco Unified 6901 and 6911 IP Phones • Cisco Unified 6921, 6941, 6945, and 6961 IP Phones • Cisco Unified 8941 and 8945 IP Phones
Mixed Shared Lines		Allows Cisco Unified SIP and SCCP IP phones to share a common directory number.
Multiple Calls Per Line		Overcomes the limitation on the maximum number of calls per line.
Real-Time Transport Protocol Call Information Display Enhancement	8.8	Allows you to display information on active RTP calls using the show ephone rtp connections command. The output from this command provides an overview of all the connections in the system, narrowing the criteria for debugging pulse code modulation and Cisco Unified CME packets without a sniffer.
Support for Cisco Unified 3905 SIP IP Phones		Adds support for SIP phones connected to a Cisco Unified CME system.
Support for Cisco Unified 6945, 8941, and 8945 SCCP IP Phones		Adds support for SCCP phones connected to a Cisco Unified CME system.
Support for 7926G Wireless SCCP IP Phone	8.6	Added support for 7926G Wireless SCCP IP Phone.
Secure IP Phones	8.0	Adds support for Secure IP Phone (IP-STE).
SIP Shared Lines	7.1	Adds support for nonexclusive shared lines on SIP phones.

Feature Name	Cisco Unified CME Versions	Feature Information
Autoconfiguration for Cisco VG202, VG204, and VG224		Adds autoconfiguration for the Cisco VG202, VG204, and VG224 Analog Phone Gateway.
Ephone-Type Templates	7.0/4.3	Adds support for dynamically adding new phone types without upgrading Cisco IOS software.
Octo-Line Directory Numbers		Adds octo-line directory numbers that support up to eight active calls.
G.722 and iLBC Transcoding and Conferencing Support in Cisco Unified CME		Adds support for the G.722-64K and iLBC codecs.
Dial Plans for SIP Phones	4.1	Adds support for dial plans for SIP phones.
KPML		Adds support for KPML for SIP phones.
Session Transport Protocol		Adds selection for session-transport protocol for SIP phones.
Watch Mode		Provides Busy Lamp Field (BLF) notification on a line button that is configured for watch mode on one phone for all lines on another phone (watched phone) for which the watched directory number is the primary line.
Remote Teleworker Phones	4.0	Introduces support for teleworker remote phones.
Analog Phones	4.0	Introduces support for analog phones with SCCP supplementary features using FXS ports on Cisco Integrated Services Routers.

Feature Name	Cisco Unified CME Versions	Feature Information
	3.2.1	Introduces support for analog phones with SCCP supplementary features using FXS ports on a Cisco VG224 voice gateway.
	3.0	Introduces support for Cisco ATA 186 and Cisco ATA 188.
	1.0	Introduces support for analog phones in H.323 mode using FXS ports.
Cisco IP Communicator	4.0	Introduces support for Cisco IP Communicator.
Direct FXO Trunk Lines	4.0	Adds enhancements to improve the keyswitch emulation behavior of PSTN lines in a Cisco Unified CME system, including the following: • Status monitoring of the FXO port on the line button of an IP phone. • Transfer recall if a transfer-to phone does not answer after a specified timeout. • Transfer-to button optimization to free up the private extension line on the transfer-to phone • Directory numbers for FXO lines can be configured for dual-line to support the FXO monitoring, transfer recall, and transfer-to button optimization features.
	3.2	Introduces direct FXO trunk line capability.

Feature Name	Cisco Unified CME Versions	Feature Information
SIP Phones	3.4	Adds support for SIP phones connected to Cisco CME system.
Monitor Mode for Shared Lines	3.0	Provides a visible line status indicating whether the line is in-use or not.

CHAPTER 9

Create Phone Configurations Using Extension Assigner

- [Prerequisites for Extension Assigner, on page 361](#)
- [Restrictions for Extension Assigner, on page 361](#)
- [Information About Extension Assigner, on page 362](#)
- [Configure Extension Assigner, on page 368](#)
- [Configure Extension Assigner Synchronization, on page 387](#)
- [Assign Extension Numbers Onsite by Using Extension Assigner, on page 389](#)
- [Verify Extension Assigner Configuration for SCCP Phones, on page 392](#)
- [Verify Extension Assigner Configuration for SIP Phones, on page 392](#)
- [Configuration Examples for Extension Assigner, on page 392](#)

Prerequisites for Extension Assigner

- Cisco Unified CME 11.6 or a later version for SIP phones.
- Cisco Unified CME 4.0(3) or a later version for SCCP phones.
- For Extension Assigner Synchronization, Cisco Unified CME 4.2(1) or a later version.
- The **auto-register-phone** command must be enabled (default) for SCCP phones, and **auto-register** must be enabled for SIP phones.
- DHCP must be configured. For configuration information, see [Defining Network Parameters](#).
- You have a valid Cisco.com account.
- You have access to a TFTP server for downloading files.

Restrictions for Extension Assigner

- The number of phones that you install cannot exceed the maximum number of phones supported by the router chassis. To find the maximum number of phones for a particular router and Cisco Unified CME version, see the appropriate [Cisco Unified CME Supported Firmware, Platforms, Memory, and Voice Products](#) for your Cisco IOS release.
- For Extension Assigner Synchronization, automatic synchronization only applies to configuration changes made by Cisco Unified CME Extension Assigner.

Information About Extension Assigner

Extension Assigner Overview

From Cisco Unified CME Release 11.6 onwards, Extension Assigner feature is supported for both SIP and SCCP phones. This feature enables installation technicians to assign extension numbers to Cisco Unified CME phones without administrative access to the server, typically during the installation of new phones or the replacement of broken phones. However, before an installation technician can use this feature, the system administrator must first configure Cisco Unified CME to allow specific extensions to be assigned. The system administrator must also provide the installation technician with the information necessary for assigning extension numbers to phones. The installation technician can then assign extension numbers to phones with access to only the phones themselves and with no further intervention from the administrator.

To configure this feature, tasks must be performed on the Cisco router by an administrator and onsite by installation technicians.

Procedure for System Administrators

Before an installation technician can assign new extension numbers to phones, you must complete the following tasks:

1. Determine which extension numbers will be assigned to the new phones and plan your configuration.
2. Download the appropriate Tcl script and associated audio prompt files and place them in the correct directory.
3. Configure the Cisco Unified CME router to:
 - Configure and load the appropriate Tcl script.
 - Specify the extension that the installation technician calls to assign extension numbers.
 - Optionally specify whether the extension used to assign extension numbers is dialed automatically.
 - Specify the password that the installation technician enters to assign extension numbers.
 - Configure the extension assigner feature.
 - Configure ephone-dns with temporary extension numbers (applicable only for SCCP phones).
 - Configure ephone-dns and voice register dns with the extension numbers that the installation technician can assign to phones.
 - Configure ephones and voice register pools with temporary MAC addresses for each phone that will be assigned an extension number by the installation technician.
 - Optionally configure the router to automatically save your configuration.

Note All phone configurations such as dn and pool that are generated as part of the auto registration process are persistent configurations (If the command **background save interval** is configured under telephony-service). These phone configurations are available on Unified CME even after an event of router reload.

4. Provide the installation technician with the information needed to assign extension numbers to the new phones.

Before you can configure this feature, you must understand how the extension assigner application works and what information the installation technician needs to assign extension numbers to phones.

Other information you must provide to the installation technician involves the tasks that the installation technician must perform. These tasks include:

- Dialing a configurable extension number to access the extension assigner application.
- Entering a configurable password.
- Entering a tag (provision-tag for SIP phones, and ephone-tag or provision-tag for SCCP phones) that identifies the extension number that will be assigned to the phone.

Therefore, you must make the following decisions:

- Which extension number must be dialed to access the extension assigner application.
- Whether the number is dialed automatically when a phone goes off hook.
- What password the installation technician must enter to access the extension assigner application.
- What type of tag (provision-tag for SIP phones, and ephone-tag or provision-tag for SCCP phones) numbers to use to identify the extension number to assign to the phone.
- What specific tag numbers to use to identify the extension number to assign to the phone.

The first three decisions are straightforward, but the last two tag number decisions require some knowledge of how the extension assigner feature works.

This feature is implemented using a Tcl script and audio files. To run this script, the installation technician plugs in the phone, waits for a random extension number to be automatically assigned, and dials a specified extension assigner number to invoke the extension assigner service.

After the phones have registered and received their temporary extension numbers, the installation technician can access extension assigner and enter a tag number. This tag number is used to identify the extension number and must match either an ephone tag (only for SCCP phones) or a similar new tag called the provision-tag (applicable to both SIP and SCCP phones).

For SCCP phones, you must decide on which tag you want to use before you configure your ephone and ephone-dn entries.

The advantage of using the provision-tag is that you can make it easier for the installation technician to assign extension numbers because you can configure the tag to match the primary extension number or some other unique identifier for the phone, such as a jack number. We recommend you to configure provision-tag same as the primary extension number.

The disadvantage is that you configure an additional keyword for each ephone entry, as shown in the following example:

```
ephone 1
  provision-tag 9001
  mac-address 02EA.EAEA.0001
  button 1:1

voice register pool 1
  provision-tag 1001
  mac-address 02EA.EAEA.0001
  number 1 dn 101
```

For SCCP phones, if you decide to use the ephone tag, it requires less configuration. However, the installation technician enters an arbitrary tag number instead of the actual extension number when configuring a phone. This restriction is because the number of ephone tags that you can configure is limited by your license. For

example, if you use the ephone tag and you have a 100-user license, the installation technician cannot enter 9001 for the tag because you can configure only ephone 1 to ephone 100.

Note that each ephone entry that you configure must also include a temporary MAC address. As shown in the above example, this address should begin with 02EA.EAEA and can end with any unique number. We strongly recommend that you can configure this unique number to match the ephone tag for SCCP phones.

For SCCP phones, you do not have to configure any ephone entries for the extension number that are randomly assigned. The auto assign feature automatically creates an ephone entry for each new phone when it registers. The auto assign feature then automatically assigns an ephone-dn entry if there is an available ephone-dn that has one of the tag numbers specified by the **auto assign** command. The resulting ephone pool configurations have the actual MAC address of the phone and a button with the first available ephone-dn designated for the auto assign feature. For more information, see [Configure Temporary Extension Numbers for SCCP Phones That Use Extension Assigner, on page 374](#).

For SIP phones, you do not have to configure voice register pool or voice register dn. You need to configure auto-register command for automatic registration of SIP phones on Cisco Unified CME. For more information, see [Configure Temporary Extension Numbers for SCCP Phones That Use Extension Assigner, on page 374](#).

Note For manually registered phones, ephone (or voice register pool) and ephone-dn (or voice register dn) are manually created.

As shown in the following example, you configure at least one ephone-dn for a temporary extension and specify which ephone-dns the autoassign feature will assign to the temporary ephone entries:

```
telephony-service
  auto assign 101 to 105
ephone-dn 101
  number 0001
```

When the installation technician assigns an extension number to a phone, the temporary MAC address is replaced by the actual MAC address and the ephone entry created by the auto register feature is deleted. The number of ephone-dns that you configure for the auto assign feature determines how many phones you can plug in at one time and get an automatically assigned extension. If you define four ephone-dns for auto assign and you plug in five phones, one phone will not get a temporary extension number until you assign an extension to one of the other four phones and reset the fifth phone. You are permitted to set the max-ephone value higher than the number of users and phones supported by your Cisco Unified CME phone licenses for the purpose of enrolling licensed phones using Extension Assigner.

In addition to configuring one ephone-dn for each temporary extension number that is assigned automatically, you also must configure an ephone-dn entry for each extension number that is assigned by the installation technician. For more details on configuring extension numbers that technicians can assign to SCCP phones, see [Configure Extension Numbers That Installation Technicians Can Assign to SCCP Phones, on page 377](#).

For SIP Phones, the temporary MAC address is replaced by the actual MAC address and voice register pool entry created by the auto-register feature is deleted when the installation technician assigns an extension number to a phone. The number of voice register dns that you configure for the auto assign feature determines how many phones you can plug in at one time and get an automatically assigned extension. If you define four voice register dns for auto assign and you plug in five phones, one phone will not get a temporary extension number until you assign an extension to one of the other four phones and reset the fifth phone. You are permitted to set the max-pool value higher than the number of users and phones supported by your Cisco Unified CME phone licenses for the purpose of enrolling licensed phones using Extension Assigner. For more

details on configuring extension numbers that technicians can assign to SIP phones, see [Configure Extension Numbers That Installation Technicians Can Assign to SIP Phones, on page 379](#).

Note For SIP Phones, you need not create temporary dn if auto registration is used.

To complete the configuration, as shown in the following example, you must:

- Specify whether to use the ephone or the provision-tag number to identify the extension number to assign to the phone. Set this when the feature is enabled with the new **extension-assigner tag-type** command provided with this feature.
- Configure an ephone-dn for each temporary extension number that is assigned automatically.
- Configure an ephone-dn or voice register dn for each extension number that you want the installation technician to assign to a phone.
- Configure an ephone or voice register pool with a temporary MAC address for each phone that is assigned an extension number by the installation technician. Optionally, this ephone definition can include the new provision-tag. For SIP phones, it is necessary to have provision-tag information under voice register pool. For more information, see [Configure Ephones with Temporary MAC Addresses, on page 380](#).

```
telephony-service
 extension-assigner tag-type provision-tag
 auto assign 101 to 105
 ephone-dn 1 dual-line
 number 6001
 ephone-dn 101
 number 0001
 label Temp-Line-not assigned yet
 ephone 1
 provision-tag 6001
 mac-address 02EA.EAEA.0001
 button 1:1
*****
```

```
voice register pool 1
 provision-tag 1001
 mac-address 02EA.EAEA.0001
 number 1 dn 101
```

Because you must configure two ephone-dns or voice register dns for each extension number that you want to assign, you may exceed your max-dn setting. You are permitted to set the max-dn value higher than the number allowed by your license for the purpose of enrolling licensed phones using extension assigner.

Assuming that your max-dn setting is set high enough, your max-ephone or max-pool setting determines how many phones you can plug in at one time. For example, if your max-ephone or max-pool setting is ten more than the number of phones to which you want to assign extension numbers, then you can plug in ten phones at a time. If you plug in eleven phones, one phone will not register or get a temporary extension number until you assign an extension to one of the first ten phones and reset the eleventh phone.

After you have configured your ephone or voice register pool, and ephone-dn or voice register dn entries, you can complete your router configuration by optionally configuring the router to automatically save your configuration. If the router configuration is not saved, any extension assignments made by the installation technician will be lost when the router is restarted. The alternative to this optional procedure is to have the installation technician connect to the router and enter the **write memory** command to save the router configuration.

The final task of the system administrator is to document the information that the installation technician needs to assign extension numbers to the new phones. You can also use this documentation as a guide when you configure Cisco Unified CME to implement this feature. This information includes:

- How many phones the installation technician can plug in at one time
- Which extension number to dial to access the extension assigner application
- Whether the number is dialed automatically when a phone goes off hook
- What password to enter to access the application
- Which tag numbers to enter to assign an extension to each phone

Note Because this feature is implemented using a Tcl script and audio files, you must place the script and associated audio prompt files in the correct directory. Do not edit this script; just configure Cisco Unified CME to load the appropriate script.

Extension Assigner in Mixed Deployment

From Cisco Unified CME release 11.6 onwards, extension assigner feature supports mixed deployment of SCCP and SIP phones. In a mixed deployment scenario, you sometimes have to migrate or replace an SCCP phone with a SIP phone or vice versa. The extension assigner functionality ensures a seamless migration experience in this scenario by letting you assign extension numbers to the new phone (irrespective of SIP or SCCP).

In mixed mode deployment, you can reassign any current extension number to a new phone. When you dial in to the extension assigner system to perform this task, you are redirected to the unassign menu. You need to unassign the current extension number so that it is no more assigned to any phone. After successfully unassigning the extension number, the call is disconnected. When you dial in to the extension assigner again, you can reassign the extension number to your new phone. For more information, see [Reassign the Current Extension Number, on page 391](#).

Note You cannot unassign the extension number of a phone if it is in use. The phone has to be in idle or unregistered state.

Procedures for Installation Technicians

This feature is implemented using a Tcl script and audio prompt files that enable the installation technician to assign an extension number to a new Cisco Unified CME phone by performing the following procedure. The system administrator provides the installation technician with all of the information required to perform this procedure.

Procedure

- Step 1** Plug in a specified number of new phones.
- Step 2** Wait for the phones to be assigned temporary, random extension numbers.
- Step 3** Dial a specified number to access the extension assigner application.
- Step 4** Enter a specified password.

Step 5 Enter a tag that identifies an extension number and enables the installation technician to perform one of the following tasks:

- Assign a new extension number to a phone.
- Unassign the current extension number.
- Reassign an extension number.

Files Included in this Release

The app-cme-ea-2.0.0.0.tar or later archive file provided for the extension assigner feature includes a readme file, a Tcl script, and several audio prompt files. If you want to replace the audio files with files that use a language other than English, do not change the name of the files. The Tcl script is written to use only the following list of the filenames:

- app-cme-ea-2.0.0.0.tcl (script)
- en_cme_tag_assign_phone.au (audio file)
- en_cme_tag_assigned_to_phone.au (audio file)
- en_cme_tag_assigned_to_phone_idle.au (audio file)
- en_cme_tag_assigned_to_phone_inuse.au (audio file)
- en_cme_tag_assigned_to_phone_unreg.au (audio file)
- en_cme_tag_available.au (audio file)
- en_cme_tag_extension.au (audio file)
- en_cme_tag_invalid.au (audio file)
- en_cme_tag_unassign_phone.au (audio file)
- en_cme_tag_action_cancelled.au (audio file)
- en_cme_tag_assign_failed.au (audio file)
- en_cme_tag_assign_success.au (audio file)
- en_cme_tag_contact_admin.au (audio file)
- en_cme_tag_disconnect.au (audio file)
- en_cme_tag_ephone_tagid.au (audio file)
- en_cme_tag_invalid_password.au (audio file)
- en_cme_tag_invalidoption.au (audio file)
- en_cme_tag_noentry.au (audio file)
- en_cme_tag_password.au (audio file)
- en_cme_tag_unassign_failed.au (audio file)
- en_cme_tag_unassign_success.au (audio file)
- en_eight.au (audio file)
- en_five.au (audio file)
- en_four.au (audio file)
- en_nine.au (audio file)
- en_one.au (audio file)
- en_seven.au (audio file)
- en_six.au (audio file)
- en_three.au (audio file)

- en_two.au (audio file)
- en_zero.au (audio file)
- readme.txt

Extension Assigner Synchronization

Extension Assigner Synchronization enables the secondary backup router to automatically receive any changes made by Extension Assigner to ephone or voice register pool mac-addresses in the primary router. The synchronization is performed using the Cisco Unified CME XML interface. The Cisco Unified CME XML client encapsulates the configuration changes into an **ISexecCLI** request and sends it to the secondary backup router using HTTP. The server on the secondary backup side processes the incoming XML request and calls the Cisco IOS CLI parser to perform the updates.

For configuration information, see [Configuring Extension Assigner Synchronization](#).

Configure Extension Assigner

The following tasks are performed by an administrator or other personnel who is responsible for configuring Extension Assigner:

Determine Extension Numbers to Assign to the New Phones and Plan Your Configuration

After you determine which extension number to assign to each phone, you must make the following decisions:

- Which extension number must be dialed to access the extension assigner application.
- Whether the number is dialed automatically when a phone goes off hook.
- What password the installation technician must enter to access the extension assigner application.
- Whether to use ephone-tag (applicable only for SCCP phones) or the provision-tag number to identify the extension number to assign to the phone.
- How many temporary extension numbers to configure. This will determine how many temporary ephone-dns or voice register dns, and temporary MAC addresses to configure.
- What specific tag numbers to use to identify the extension number to assign to the phone.

Download the Tcl Script and Audio Prompt Files

To download the Tcl script and audio prompt files for the extension assigner feature, perform the following steps.

For more information about how to use Tcl scripts, see the [Cisco IOS Tcl IVR and Voice XML Application Guide](#) for your Cisco IOS release.

Note Do not edit the Tcl script

SUMMARY STEPS

1. Go to the Cisco Unified CME software download website at <http://software.cisco.com/download/type.html?mdfid=277641082&catid=null>.
2. Download the Cisco Unified CME extension assigner tar archive to a TFTP server that is accessible to the Cisco Unified CME router.
3. **enable**
4. **archive tar /xtract source-url destination-url**

DETAILED STEPS

Procedure		
	Command or Action	Purpose
Step 1	Go to the Cisco Unified CME software download website at http://software.cisco.com/download/type.html?mdfid=277641082&catid=null .	Gives you access to Cisco Unified CME software downloads.
Step 2	Download the Cisco Unified CME extension assigner tar archive to a TFTP server that is accessible to the Cisco Unified CME router.	• This tar archive contains the extension assigner Tcl script and the default audio files that you need for the extension assigner service.
Step 3	enable Example: Router> enable	Enters global configuration mode.
Step 4	archive tar /xtract source-url destination-url Example: Router# archive tar /xtract tftp://192.168.1.1/app-cme-ea-2.0.0.0.tar flash:	Uncompresses the files in the archive file and copies them to a location that is accessible by the Cisco Unified CME router. • <i>source-url</i>—URL of the source of the extension assigner TAR file. Valid URLs can refer to TFTP or HTTP servers or to flash memory. • <i>location</i>—URL of the destination of the extension assigner TAR file, including its Tcl script and audio files. Valid URLs can refer to TFTP or HTTP servers or to flash memory.

Configure the Tcl Script

To configure and load the Tcl script for the extension assigner feature and create the password that installation technicians enter to access the extension assigner application, perform the following steps.

For more information about how to use Tcl scripts, see the [Cisco IOS Tcl IVR and Voice XML Application Guide](#) for your Cisco IOS release.

Note To change the password, you must remove the existing extension assigner service and create a new service that defines a new password.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **application**
4. **service** *service-name location*
5. **param ea-password** *password*
6. **paramspace english index** *number*
7. **paramspace english language** *en*
8. **paramspace english location** *location*
9. **paramspace english prefix** *en*
10. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	application Example: Router(config)# application	Enters application configuration mode to configure packages and services.
Step 4	service <i>service-name location</i> Example: Router(config-app)# service EA flash:/EA/	Enters service parameter configuration mode to configure parameters for the call-queue service. • <i>service-name</i>—Name of the extension assigner service. This arbitrary name is used to identify the service during configuration tasks. • <i>location</i>—URL of the Tcl script for the extension assigner service. Valid URLs can refer to TFTP or HTTP servers or to flash memory.
Step 5	param ea-password <i>password</i> Example: Router(config-app-param)# param ea-password 1234	Sets the password that installation technicians enter to access the extension assigner application. • <i>password</i>—Numerical password that installation technicians enter to access the extension assigner application. Length: 2 to 10 digits.

	Command or Action	Purpose
Step 6	paramspace english index <i>number</i> Example: <pre>Router(config-app-param)# paramspace english index 0</pre>	Defines the language of audio files that are used for dynamic prompts by an IVR application. For the Extension Assigner, language must be English and prefix is en.
Step 7	paramspace english language <i>en</i> Example: <pre>Router(config-app-param)# paramspace english language en</pre>	Defines the language of audio files that are used for dynamic prompts by an IVR application. For the Extension Assigner, language must be English and prefix is en.
Step 8	paramspace english location <i>location</i> Example: <pre>Router(config-app-param)# paramspace english location flash:/EA/</pre>	Defines the location of audio files that are used for dynamic prompts by an IVR application. - For the Extension Assigner, language must be English. <i>location</i>—URL of the Tcl script for the extension assigner service. Valid URLs can refer to TFTP or HTTP servers or to flash memory.
Step 9	paramspace english prefix <i>en</i> Example: <pre>Router(config-app-param)# paramspace english prefix en</pre>	Defines the prefix of audio files that are used for dynamic prompts by an IVR application. For the Extension Assigner, language must be English and prefix is en.
Step 10	end Example: <pre>Router(config-app-param)# end</pre>	Returns to privileged EXEC mode.

Specify the Extension for Accessing Extension Assigner Application

To specify the extension number that installation technicians must dial to access the extension assigner application during onsite installation, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice** *tag* **voip**
4. **service** *service-name* **out-bound**
5. **destination-pattern** *string*
6. **session protocol** **sipv2**
7. **session target** **ipv4:** *destination-address*
8. **dtmf-relay** **rtp-nte**
9. **codec** *g711ulaw*

10. `no vad`
11. `end`

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Router> enable</code>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3	dial-peer voice tag voip Example: <code>Router(config)# dial-peer voice 5999 voip</code>	Enters dial-peer configuration mode. • <i>tag</i>—Number used during configuration tasks to identify this dial peer.
Step 4	service service-name out-bound Example: <code>Router(config-dial-peer)# service extensionassigner out-bound</code>	Loads and configures the extension assigner application on a dial peer. • <i>service-name</i>—Name must match the name that you used to load the extension assigner Tcl script in the <i>Configuring the Tcl Script</i> section. • outbound—Required for Extension Assigner.
Step 5	destination-pattern string Example: <code>Router(config-dial-peer)# destination pattern 1010</code>	Specifies either the prefix or the full E.164 telephone number (depending on the dial plan) for a dial peer. • <i>string</i>—Number that the installation technician calls when assigning an extension number to a phone.
Step 6	session protocol sipv2 Example: <code>Router(config-dial-peer)# session protocol sipv2</code>	Designates a SIP loopback trunk for Extension Assigner application.
Step 7	session target ipv4: destination-address Example: <code>Router(config-dial-peer)# session target ipv4:172.16.200.200</code>	Designates a network-specific address to receive calls from a VoIP dial peer. • <i>destination</i>—IP address for the Cisco Unified CME interface on this router.
Step 8	dtmf-relay rtp-nte Example: <code>Router(config-dial-peer)# dtmf-relay rtp-nte</code>	Specifies the method for relaying dual tone multifrequency (DTMF) tones between two devices as per RFC2833.

	Command or Action	Purpose
Step 9	codec <i>g711ulaw</i> Example: Router(config-dial-peer)# codec g711ulaw	Specifies the voice coder rate of speech for a dial peer. • <i>g711ulaw</i>-Option that represents the correct voice decoder rate. g711ulaw is the only codec supported with Extension Assigner application.
Step 10	no vad Example: Router(config-dial-peer)# no vad	Disables voice activity detection (VAD) for the calls using a particular dial peer. • Required for Extension Assigner.
Step 11	end Example: Router(config-dial-peer)# end	Returns to privileged EXEC mode.

Configure Provision-Tags for the Extension Assigner Feature

To modify Extension Assigner to use provision-tags, perform the following steps. By default, the extension assigner is enabled and uses ephone tags.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **extension-assigner tag-type { ephone-tag | provision-tag }**
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.

	Command or Action	Purpose
Step 4	extension-assigner tag-type { ephone-tag provision-tag } Example: <pre>Router(config-telephony)# extension-assigner tag-type provision-tag</pre>	Specifies tag type to use to identify extension numbers for Extension Assigner. • ephone-tag -Specifies that extension assigner use the ephone tag to identify the extension number that is assigned to a phone. The installation technician enters this number to assign an extension number to a phone. • provision-tag -Specifies that extension assigner use the provision-tag to identify the extension number that is assigned to a phone. The installation technician enters this number to assign an extension number to a phone.
Step 5	end Example: <pre>Router(config-telephony)# end</pre>	Returns to privileged EXEC mode.

Configure Temporary Extension Numbers for SCCP Phones That Use Extension Assigner

To create ephone-dn that is used as temporary extension numbers for phones to which an extension number will be assigned by Extension Assigner, perform the following steps for each temporary number to be created.

Tip The readme file that is included with the script contains some sample entries for this procedure that you can edit to fit your needs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn dn-tag [dual-line]**
4. **number number [secondary number] [no-reg [both | primary]]**
5. **trunk digit-string [timeout seconds]**
6. **name name**
7. **exit**
8. **telephony-service**
9. **auto assign dn-tag to dn-tag**
10. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	ephone-dn <i>dn-tag</i> [<i>dual-line</i>] Example: <pre>Router(config)# ephone-dn 90</pre>	Enters ephone-dn configuration mode, creates an ephone-dn, and optionally assigns it dual-line status. Note We recommend that you use single-line mode for your temporary extension numbers.
Step 4	number <i>number</i> [<i>secondary number</i>] [<i>no-reg</i> [<i>both</i> <i>primary</i>]] Example: <pre>Router(config-ephone-dn)# number 9000</pre>	Configures a valid extension number for this ephone-dn instance.
Step 5	trunk <i>digit-string</i> [<i>timeout seconds</i>] Example: <pre>Router(config-ephone-dn)# trunk 5999</pre>	(Optional) Configures extension number to be automatically dialed for accessing the extension assigner application. • <i>digit-string</i> - Must match the number that you configured in the Specifying the Extension for Accessing Extension Assigner Application section.
Step 6	name <i>name</i> Example: <pre>RRouter(config-ephone-dn)# name hardware</pre>	(Optional) Associates a name with this ephone-dn instance. This name is used for caller-ID displays and in the local directory listings. • Must follow the name order that is specified with the directory command.
Step 7	exit Example: <pre>Router(config-ephone-dn)# exit</pre>	Exits ephone-dn configuration mode.
Step 8	telephony-service Example: <pre>Router(config)# telephony-service</pre>	Enters telephony-service configuration mode.

	Command or Action	Purpose
Step 9	auto assign <i>dn-tag to dn-tag</i> Example: <pre>Router(config-telephony)# auto assign 90 to 99</pre>	Automatically assigns ephone-dn tags to Cisco Unified IP phones as they register for service with a Cisco Unified CME router. • Must match the tags that you configured in earlier step.
Step 10	end Example: <pre>Router(config-telephony)# end</pre>	Returns to privileged EXEC mode.

Configure Temporary Extension Numbers for SIP Phones That Use Extension Assigner

To create voice register dns to use as temporary extension numbers for phones in which an extension number is assigned by Extension Assigner, perform the following steps for each temporary number to be created.

Tip The readme file that is included with the script contains some sample entries for this procedure that you can edit to fit your needs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **auto-register**
5. **password** *string*
6. **auto-assign** *first dn to last dn*
7. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	voice register global Example: <code>Router(config)# voice register global</code>	Enters voice register global configuration mode.
Step 4	auto-register Example: <code>Router(config-register-global)# auto-register</code>	Enters auto-register configuration mode.
Step 5	password <i>string</i> Example: <code>Router(config-voice-auto-register)# password xxxx</code>	Specifies default password for auto registered phones.
Step 6	auto-assign <i>first dn to last dn</i> Example: <code>Router(config-voice-auto-register)# auto-assign 90 to 99</code>	Automatically assigns voice register dn with these extensions to Cisco Unified IP phones as they register for service with a Cisco Unified CME router.
Step 7	end Example: <code>Router(config-voice-auto-register)# end</code>	Returns to privileged EXEC mode.

Configure Extension Numbers That Installation Technicians Can Assign to SCCP Phones

To create ephone-dns for an extension numbers that the installation technicians can assign to phones, perform the following steps for each directory number to be created.

Tip The readme file provided with this feature contains sample entries that you can edit to fit your needs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn *dn-tag* [**dual-line**]**
4. **number *number* [**secondary number**] [**no-reg** [**both** | **primary**]]**
5. **trunk *digit-string* [**timeout seconds**]**
6. **name *name***
7. **exit**
8. **telephony-service**
9. **auto assign *dn-tag* to *dn-tag***
10. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ephone-dn dn-tag [dual-line] Example: Router(config)# ephone-dn 20	Enters ephone-dn configuration mode, creates an ephone-dn, and optionally assigns it dual-line status. Note To change an ephone-dn from dual-line to single-line mode or the reverse, first delete the ephone-dn and then recreate it.
Step 4	number number [secondary number] [no-reg [both primary]] Example: Router(config-ephone-dn)# number 9000	Configures a valid extension number for this ephone-dn instance.
Step 5	trunk digit-string [timeout seconds] Example: Router(config-ephone-dn)# trunk 5999	(Optional) Configures extension number to be automatically dialed for accessing the extension assigner application. • digit-string - Must match the number that you configured in the Specifying the Extension for Accessing Extension Assigner Application section.
Step 6	name name Example: Router(config-ephone-dn)# name hardware	(Optional) Associates a name with this ephone-dn instance. This name is used for caller-ID displays and in the local directory listings. • Must follow the name order that is specified with the directory command.
Step 7	exit Example: Router(config-ephone-dn)# exit	Exits ephone-dn configuration mode
Step 8	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.

	Command or Action	Purpose
Step 9	auto assign <i>dn-tag</i> to <i>dn-tag</i> Example: Router(config-telephony)# auto assign 90 to 99	Automatically assigns ephone-dn tags to Cisco Unified IP phones as they register for service with a Cisco Unified CME router. • Must match the tags that you configured in earlier step.
Step 10	end Example: Router(config-telephony)# end	Returns to privileged EXEC mode.

Configure Extension Numbers That Installation Technicians Can Assign to SIP Phones

To create voice register dns for an extension numbers that the installation technicians can assign to phones, perform the following steps for each directory number to be created.

Tip The readme file provided with this feature contains sample entries that you can edit to fit your needs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn tag**
4. **number** *number*
5. **name** *name*
6. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	voice register dn tag Example: <code>Router(config)# voice register dn 20</code>	Enters voice register dn configuration mode, and creates a voice register dn.
Step 4	number number Example: <code>Router(config-register-dn)# number 20</code>	Configures a valid extension number for this voice register dn instance.
Step 5	name name Example: <code>Router(config-register-dn)# name hardware</code>	(Optional) Associates a name with this voice register dn instance. This name is used for caller-ID displays and in the local directory listings. • Must follow the name order that is specified with the directory command.
Step 6	end Example: <code>Router(config-register-dn)# end</code>	Returns to privileged EXEC mode.

Configure Ephones with Temporary MAC Addresses

Restriction

To create an ephone configuration with temporary MAC address for a Cisco Unified CME phone to which you want the installation technician to assign extension numbers, perform the following steps for each phone.

- Max-ephone setting determines how many phones you can plug in at one time. For example, if your max-ephone setting is ten more than the number of phones to which you want to assign extension numbers, the you can plug in ten phones at a time. If you plug in eleven phones, one phone will not register or get a temporary extension number until you assign an extension to one of the first ten phones and reset the eleventh phone.
- For Cisco VG224 analog voice gateways with extension assigner, a minimum of 24 temporary ephones is required.

Tip

The readme file provided with this feature contains some sample entries for this procedure that you can edit to fit your needs.

Before you begin

The **max-ephone** command must be configured for a value equal to at least one greater than the number of phones to which you want to assign extension numbers to allow the autoregister feature to automatically create at least one ephone for your temporary extension numbers.

Note You are permitted to set the max-ephone value higher than the number of users supported by your Cisco Unified CME licenses for the purpose of enrolling licensed phones using Extension Assigner.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **enable** *phone-tag*
4. **provision-tag** *number*
5. **mac-address** *02EA.EAEA. number*
6. **type** *phone-type* [**addon** *1 module-type* [*2 module-type*]]
7. **button** *button-number{separator}dn-tag*
8. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	enable <i>phone-tag</i> Example: Router(config)# ephone 20	Enters ephone configuration mode. • <i>phone-tag</i> -Maximum number is version and platform-specific. Type ? to display range. • Number that the installation technician enters when assigning an extension to a phone if Extension Assigner uses ephone-tags (default).
Step 4	provision-tag <i>number</i> Example: Router(config-ephone)# provision-tag 20	(Optional) Creates a unique sequence number to be used by Extension Assigner to identify extension numbers to be assigned. • required only if you configured the provision-tag keyword with the extension-assigner tag-type command.
Step 5	mac-address <i>02EA.EAEA. number</i>	Specifies a temporary MAC address number for this ephone.

	Command or Action	Purpose
	Example: <pre>Router(config-ephone)# mac-address 02EA.EAEA.0020</pre>	- For Extension Assigner, MAC address must begin with 02EA.EAEA. <i>number</i> - we strongly recommend that you make this number the same as the ephone number.
Step 6	type <i>phone-type</i> [addon 1 <i>module-type</i> [<i>2 module-type</i>]] Example: <pre>Router(config-ephone)# type 7960 addon 1 7914</pre>	Specifies the type of phone.
Step 7	button <i>button-number</i> { <i>separator</i> } <i>dn-tag</i> Example: <pre>Router(config-ephone)# button 1:1</pre>	Associates a button number and line characteristics with an extension (ephone-dn). Maximum number of buttons is determined by phone type. Note The Cisco Unified IP Phone 7910 has only one line button, but can be given two ephone-dn tags.
Step 8	end Example: <pre>Router(config-ephone)# end</pre>	Returns to privileged EXEC mode

Configure Voice Register Pools with Temporary MAC Addresses

Restriction

- Max-pool setting determines how many phones you can plug in at one time. For example, if your max-pool setting is ten more than the number of phones to which you want to assign extension numbers, the you can plug in ten phones at a time. If you plug in eleven phones, one phone will not register or get a temporary extension number until you assign an extension to one of the first ten phones and reset the eleventh phone.

Tip

The readme file provided with this feature contains some sample entries for this procedure that you can edit to fit your needs.

Before you begin

The **max-pool** command must be configured for a value equal to at least one greater than the number of phones to which you want to assign extension numbers to allow the autoregister feature to automatically create at least one ephone for your temporary extension numbers.

**Note**

- You are permitted to set the max-pool value higher than the number of users supported by your Cisco Unified CME licenses for the purpose of enrolling licensed phones using Extension Assigner.
- For a phone that needs to invoke Extension Assigner application for assign or unassign operations, g711ulaw codec and dtmf-relay as rtp-nte needs to be configured in voice register pool.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **provision-tag** *number*
5. **mac-address** 02EA.EAEA. *number*
6. **type** *phone-type* [**addon** 1 *module-type* [2 *module-type*]]
7. **number** *number* **dn** *dn-tag*
8. **dtmf-relay** rtp-nte
9. **codec** *g711ulaw*
10. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register pool <i>pool-tag</i> Example: Router(config)# voice register pool 20	Enters voice register pool configuration mode. • phone-tag-Maximum number is version and platform-specific. Type ? to display range. • Number that the installation technician enters when assigning an extension to a phone.
Step 4	provision-tag <i>number</i> Example:	Creates a unique sequence number to be used by Extension Assigner to identify extension numbers to be assigned.

Configure the Router to Automatically Save Your Configuration

	Command or Action	Purpose
	<code>Router(config-register-pool)# provision-tag 20</code>	required only if you configured the provision-tag keyword with the extension-assigner tag-type command.
Step 5	mac-address 02EA.EAEA. <i>number</i> Example: <code>Router(config-register-pool)# mac-address 02EA.EAEA. 0020</code>	Specifies a temporary MAC address number for this phone. - For Extension Assigner, MAC address must begin with 02EA.EAEA. <i>number</i> - we strongly recommend that you make this number same as the voice register pool number.
Step 6	type <i>phone-type</i> [addon 1 <i>module-type</i> [2 <i>module-type</i>]] Example: <code>Router(config-register-pool)# type 8860 addon 1 CKEM 2</code>	Specifies the type of phone.
Step 7	number <i>number</i> dn <i>dn-tag</i> Example: <code>Router(config-register-pool)# number 1 dn 1</code>	Associates number and line characteristics with an extension (voice register dn).
Step 8	dtmf-relay rtp-nte Example: <code>Router(config-register-pool)# dtmf-relay rtp-nte</code>	(Optional) Specifies the method for relaying dual tone multifrequency (DTMF) tones between two devices as per RFC2833. This configuration is required only to perform assign or unassign operation using Extension Assigner application.
Step 9	codec <i>g711ulaw</i> Example: <code>Router(config-register-pool)# codec g711ulaw</code>	(Optional) Specifies the voice coder rate of speech for a dial peer. This configuration is required only to perform assign or unassign operation using Extension Assigner application. <i>g711ulaw</i>-Option that represents the correct voice decoder rate. <i>g711ulaw</i> is the only codec supported with Extension Assigner application.
Step 10	end Example: <code>Router(config-register-pool)# end</code>	Returns to privileged EXEC mode.

Configure the Router to Automatically Save Your Configuration

To automatically save your router configuration when the router is restarted, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **kron policy-list** *list-name*
4. **cli write**
5. **exit**
6. **kron occurrence** *occurrence-name* [**user** *username*] [[**in** *numdays:*] *numhours:*] *nummin* { **oneshot** | **recurring** }
7. **policy-list** *list-name*
8. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	kron policy-list <i>list-name</i> Example: Router(config)# kron policy-list save-config	Specifies a name for a new or existing Command Scheduler policy list and enters kron-policy configuration mode. • If the value of the <i>list-name</i> argument is new, a new policy list structure is created. • If the value of the <i>list-name</i> argument exists, the existing policy list structure is accessed. No editor function is available, and the policy list is run in the order in which it was configured. Note You can also use the CLI command background save interval configured under telephony-service to automatically save configurations on Unified CME. This is as an alternative for the kron command.
Step 4	cli write Example: Router(config-kron-policy)# cli write	Specifies the fully-qualified EXEC command and associated syntax to be added as an entry in the Command Scheduler policy list.
Step 5	exit Example: Router(config-kron-policy)# exit	Returns to global configuration mode.

	Command or Action	Purpose
Step 6	kron occurrence <i>occurrence-name</i> [user <i>username</i>] [[in <i>numdays</i>:] <i>numhours</i>:] <i>nummin</i> { oneshot recurring } Example: <pre>Router(config)# kron occurrence backup in 30 recurring</pre>	Specifies schedule parameters for a Command Scheduler occurrence and enters kron-occurrence configuration mode. • We recommend that you configure your router to save your configuration every 30 minutes. • occurrence-name-Specifies the name of the occurrence. Length of occurrence-name is from 1 to 31 characters. If the occurrence-name is new, an occurrence structure is created. If the occurrence-name is not new, the existing occurrence is edited. • user-(Optional) Used to identify a particular user. • username-Name of user. • in-Identifies that the occurrence is to run after a specified time interval. The timer starts when the occurrence is configured. • numdays:- (Optional) Number of days. If used, add a colon after the number. • numhours:- (Optional) Number of hours. If used, add a colon after the number. • nummin:- (Optional) Number of minutes. • oneshot-Identifies that the occurrence is to run only one time. After the occurrence has run, the configuration is removed. • recurring-Identifies that the occurrence is to run on a recurring basis.
Step 7	policy-list <i>list-name</i> Example: <pre>Router(config-kron-occurrence)# policy-list save-config</pre>	Specifies a Command Scheduler policy list.
Step 8	end Example: <pre>Router(config-kron-occurrence)# end</pre>	Returns to privileged EXEC mode.

Provide the Installation Technician with the Required Information

Before the installation technician can assign extension numbers to the new phones, you must provide the following information:

- How many phones the installation technician can plug in at one time. This is determined by the number of temporary MAC addresses that you configured.

- Which extension number to dial to access the extension assigner application.
- Whether the number is dialed automatically when a phone goes off hook (applicable only to SCCP phones).
- What password to enter to access the application.
- Which tag numbers to enter to assign an extension to each phone.

Configure Extension Assigner Synchronization

Configure the XML Interface for the Secondary Backup Router

To configure the secondary backup router to activate the XML interface required to receive configuration change information from the primary router, perform the following steps.

Note

If there are HTTP connection issues between the primary router and the secondary backup router during automatic synchronization, the extension assigner synchronization changes are lost.

Restriction

- Automatic synchronization for new or replacement routers is not supported.
- Extension assigner preconfiguration must be manually performed on the secondary backup router.

Before you begin

- The XML interface, provided through the Cisco IOS XML Infrastructure (IXI), must be configured. See [Configuring the XML API](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service | voice register global**
4. **xml user** *user-name* **password** *password* *privilege-level*
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	telephony-service voice register global Example: <pre>Router(config)# telephony-service Router(config)# voice register global</pre>	Enters telephony service configuration mode or voice register global mode.
Step 4	xml user user-name password password privilege-level Example: <pre>Router(config-telephony)# xml user user23 password 3Rs92uzQ 15 Router(config-register-global)# xml user user23 password 3Rs92uzQ 15</pre>	Defines an authorized user. • <i>user-name</i>—Username of the authorized user. • <i>password</i>—Password to use for access. • <i>privilege-level</i>—Level of access to Cisco IOS commands to be granted to this user. Only the commands with the same or a lower level can be executed via XML. Range is 0 to 15.
Step 5	end Example: <pre>Router(config-telephony)# end Router(config-register-global)# end</pre>	Returns to privileged EXEC mode.

Configure Extension Assigner Synchronization on the Primary Router

To configure the primary router to enable automatic synchronization to the secondary backup router, perform the following steps.

Before you begin

- XML interface for secondary backup router is configured. See [Configuring the XML Interface for the Secondary Backup Router](#).
- The secondary backup router's IP address must already be configured using the **ip source-address** command in telephony-service configuration mode.

Note Phone configurations such as MAC address, pool-tag, and phone type are saved as part of synchronization for Extension Assigner feature.

SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **telephony-service | voice register global**
4. **standby username** *username* **password** *password*
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	telephony-service voice register global Example: <pre>Router(config)# telephony-service Router(config)# voice register global</pre>	Enters telephony service configuration mode or voice register global mode.
Step 4	standby username <i>username</i> password <i>password</i> Example: <pre>Router(config-telephony)# standby username user23 password 3Rs92uzQ Router(config-register-global)# standby username user23 password 3Rs92uzQ</pre>	Defines an authorized user. • Same username and password that was previously defined for the XML interface on the secondary backup router.
Step 5	end Example: <pre>Router(config-telephony)# end Router(config-register-global)# end</pre>	Returns to privileged EXEC mode.

Assign Extension Numbers Onsite by Using Extension Assigner

The following tasks are performed by the installation technician at the customer's site:

Assign New Extension Numbers

Initially, when you install a phone, it is assigned a temporary, random extension number. To access Extension Assigner and assign the appropriate extension number to this phone, perform the following steps.

Procedure

-
- Step 1** Get the information you need to use extension assigner from your system administrator. For a list of this information, see [Provide the Installation Technician with the Required Information](#).
- Step 2** Dial the appropriate extension number to access the extension assigner system.
- Step 3** Enter the password for the extension assigner and press #.
- Step 4** Enter the ID number that represents this phone's extension and press #.
- Step 5** If the extension is not assigned to another phone, press **1** to confirm that you want to assign the extension to your phone, then hang up. After the phone resets, the assignment is complete.
- Step 6** If the extension is assigned to another phone that is idle:
- Press **2** to confirm that you want to unassign the extension from the other phone.
 - Hang up.
 - Repeat this procedure beginning at [Step 2, on page 390](#).
- Step 7** If the extension is assigned to another phone that is in use, either:
- Return to [Step 5, on page 390](#) to enter another extension number.
 - Perform the procedures in the [Unassigning an Extension Number](#) section and then repeat this procedure beginning at [Step 2, on page 390](#).
-

Unassign an Extension Number

After the new extension number is assigned, you may find that you assigned the wrong number or that your original dial plan has changed. To unassign the wrong number so that it can be used by another phone, perform the following steps.

Note You can unassign the extension number of the phone that is used to dial in to the Extension Assigner or the extension number of another phone that has a provision-tag configured.

Procedure

-
- Step 1** Get the information you need to use extension assigner from your system administrator. For a list of this information, see [Provide the Installation Technician with the Required Information](#).
- Step 2** Dial the appropriate extension number to access the extension assigner system.
- Step 3** Enter the password for the extension assigner and press #.
- Step 4** Enter the provision-tag of the phone that needs to be unassigned, and press #.
- Step 5** When you enter the provision-tag for the phone extension that needs to be unassigned, you are prompted to press **2** followed by # to confirm that you want to unassign the extension from the phone.

Step 6 Hang up.

Reassign the Current Extension Number

- If you must replace a broken phone or you want to reassign an extension number, perform the following steps.

Note

You can reassign a number to a phone only if that number:

- Is not assigned to another phone
 - Is assigned to another phone and that phone is idle
 - Is assigned to another phone and you first unassign the extension
-

Procedure

- Step 1** Get the information you need to use extension assigner from your system administrator. For a list of this information, see [Provide the Installation Technician with the Required Information](#).
- Step 2** Dial the appropriate extension number to access the extension assigner system.
- Step 3** Enter the password for the extension assigner and press #.
- Step 4** Enter the ID number that represents this phone's extension and press #.
- Step 5** If the extension is not assigned to another phone, press **1** to confirm that you want to assign the extension to your phone, then hang up. After the phone resets, the reassignment is complete.
- Step 6** If the extension is assigned to another phone that is idle:
- Press **2** to confirm that you want to unassign the extension from the other phone.
 - Hang up.
 - Perform the procedure in the [Assign New Extension Numbers](#) section.
- Step 7** If the extension is assigned to another phone that is in use, either:
- Return to [Step 5, on page 391](#) to enter another extension number.
 - Perform the procedures in the [Unassign an Extension Number](#) section and the [Assign New Extension Numbers](#) section.
-

Verify Extension Assigner Configuration for SCCP Phones

Procedure

-
- Step 1** Use the **debug ephone extension-assigner** command to display status messages produced by the extension assigner application.
- Step 2** Use the **debug voip application script** command to display status messages produced by the server as it runs the assigner application Tcl script.
- Step 3** Use the **debug ephone state** command as described in the Cisco IOS Debug Command Reference.
-

Verify Extension Assigner Configuration for SIP Phones

Procedure

-
- Step 1** Use the **debug voice register events** and **debug voice register error** commands to display status messages produced by the extension assigner application.
- Step 2** Use the **debug voip application script** command to display status messages produced by the server as it runs the assigner application Tcl script.
- Step 3** Use the **debug ccsip messages** and **debug ccsip error** commands to display status messages for unregistration of phones.
-

Configuration Examples for Extension Assigner

Example for Extension Assigner on SCCP Phone

This example shows a router configuration with the following characteristics:

- The extension that the installation technician dials to access the extension assigner application is 0999.
- The password that the installation technician enters to access the extension assigner application is 1234.
- The **auto assign** command is configured to assign extensions 0001 to 0005.
- The installation technician can use extension assigner to assign extension numbers 6001 to 6005.
- The extension assigner uses the provision-tag to identify which ephone configuration and extension numbers to assign to the phone.
- The **auto-reg-ephone** command is shown but required, since it is enabled by default.
- The **kron** command is used to automatically save the router configuration.
- The max-ephone and max-dn settings of 51 are high enough to allow the installation technician to assign extensions to 50 phones, plugging them in one at a time. If the installation technician is assigning extensions to 40 phones, 11 can be plugged in one at a time. The exception is if you use

CiscoVG224AnalogVoiceGateways. Extension assigner creates 24 ephones for each CiscoVG224AnalogVoiceGateway, one for each port.

Example for Extension Assigner on SIP Phone

The following example shows that provision tag 1001 is configured for voice register pool 1 and provision tag 1002 is configured for voice register pool 2:

```

voice register global
  auto-register
  password cisco1234
  auto assign 101-102

voice register dn 1001
  number 1001

voice register dn 1002
  number 1002

voice register pool 1
  provision-tag 1001
  mac-address 02EA.EAEA.0001
  number 1 dn 1001

voice register pool 2
  provision-tag 1002
  mac-address 02EA.EAEA.0002
  number 2 dn 1002

```

Example for Extension Assigner Synchronization

Primary Router: Example

The extension assigner is authorized to send configuration change information from the primary router to the secondary backup router.

```
telephony-service
standby username user555 password purplehat
```

Secondary Backup Router: Example

System components are enabled and the XML interface is readied to receive configuration change information.

```
ip http server
ixi transport http
no shutdown
ixi application cme
no shutdown
telephony-service
xml user user555 password purplehat 15
```

Feature Information for Extension Assigner

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 23: Feature Information for Extension Assigner

Feature Name	Cisco Unified CME Version	Feature Information
Extension Assigner for SIP Phones	11.6	Enables the installation technicians to assign extension numbers to SIP Phones configured on Cisco Unified CME.
Extension Assigner Synchronization	4.2(1)	Enables the secondary backup router to automatically receive any changes made to ephone mac-addresses in the primary router.
Extension Assigner	4.0(3)	Enables installation technicians to assign extension numbers to Cisco Unified CME SCCP phones without accessing the server.

CHAPTER 10

Configuration Files for Phones

- [Information About Configuration Files, on page 399](#)
- [Generate Configuration Files for Phones, on page 400](#)
- [Where To Go Next, on page 407](#)

Information About Configuration Files

Configuration Files for Phones

When a phone requests service from Cisco Unified CME, the registrar confirms the username, i.e. the phone number for the phone. The phone accesses its configuration profile on the TFTP server, typically the Cisco Unified CME router, and processes the information contained in the file, registers itself, and puts the phone number on the phone console display.

Minimally, a configuration profile contains the MAC address, the type, and the phone number that is permitted by the registrar to handle the Register message for a particular Cisco Unified IP phone.

Any time you create or modify parameters for either an individual phone or a directory number, generate a new phone configuration to properly propagate the parameters.

By default, there is one shared XML configuration file located in `system:/its/` for all Cisco Unified IP phones that are running SCCP. For SIP phones directly connected to Cisco Unified CME, an individual configuration profile is created for each phone and stored in `system:/cme/sipphone/`.

When an IP phone comes online or is rebooted, it automatically gets information about itself from the appropriate configuration file.

The Cisco universal application loader for phone firmware files allows you to add additional phone features across all protocols. To do this, a hunt algorithm searches for multiple configuration files. After a phone is reset or restarted, the phone automatically selects protocol depending on which *matching* configuration file is found first. To ensure that Cisco Unified IP phones download the appropriate configuration for the desired protocol, SCCP or SIP, you must properly configure the IP phones *before* connecting or rebooting the phones. The hunt algorithm searches for files in the following order:

1. CTLSEP <mac> file for a SCCP phone—For example, CTLSEP003094C25D2E.tlv
2. SEP <mac> file for a SCCP phone—For example, SEP003094C25D2E.cnf.xml
3. SIP <mac> file for a SIP phone—For example, SIP003094C25D2E.cnf or gk003069C25D2E

4. XML default file for SCCP phones—For example, SEPDefault.cnf.xmls
5. XML default file for SIP phones—For example, SIPDefault.cnf

In Cisco Unified CME 4.0 and later for SCCP and in Cisco CME 3.4 and later for SIP, you can designate one of the following locations in which to store configuration files:

- System (Default)—For SCCP phones, one configuration file is created, stored, and used for all phones in the system. For SIP phones, an individual configuration profile is created for each phone.
- Flash or slot 0—When flash or slot 0 memory on the router is the storage location, you can create additional configuration files to be applied per phone type or per individual phone, such as user or network locales.
- TFTP—When an external TFTP server is the storage location, you can create additional configuration files to be applied per phone type or per individual phone, which are required for multiple user and network locales.

Per-Phone Configuration Files

If configurations files for SCCP phones are to be stored somewhere other than in the default location, the following individual configuration files can be created for SCCP phones:

- Per phone type—Creates separate configuration files for each phone type and all phones of the same type use the same configuration file. This method is not supported if the configuration files are to be stored in the system location.
- Per phone—Creates a separate configuration file for each phone, by MAC address. This method is not supported if the configuration files are to be stored in the system location.

For configuration information, see [Define Per-Phone Configuration Files and Alternate Location for SCCP Phones, on page 187](#).

Generate Configuration Files for Phones

Generate Configuration Files for SCCP Phones

To generate the configuration profile files that are required by the SCCP phones in Cisco Unified CME and write them to either system memory or to the location specified by the **cnf-file location** command, follow the steps in this section.

**Restriction**

- Externally stored and per-phone configuration files are not supported on the Cisco Unified IP Phone 7902G, 7910, 7910G, or 7920, or the Cisco Unified IP Conference Station 7935 and 7936.
- TFTP does not support file deletion. When configuration files are updated, they overwrite any existing configuration files with the same name. If you change the configuration file location, files are not deleted from the TFTP server.
- Generating configuration files on flash or slot 0 can take up to a minute, depending on the number of files being generated.
- For smaller routers such as Cisco 2600 series routers, you must manually enter the **squeeze** command to erase files after changing the configuration file location or entering any commands that trigger the deletion of configuration files. Unless you use the **squeeze** command, the space used by the moved or deleted configuration files is not usable by other files.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **create cnf-files**
5. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.
Step 4	create cnf-files Example: Router(config-telephony)# create cnf-files	Builds the XML configuration files required for IP phones.

	Command or Action	Purpose
Step 5	end Example: Router(config-telephony)# end	Returns to privileged EXEC mode.

Verify Configuration Files for SCCP Phones

To verify the Cisco Unified CME phone configuration, perform the following steps.

Procedure

Step 1 show telephony-service all

Use this command to verify the configuration for phones, directory numbers, voice ports, and dial peers in Cisco Unified CME.

Example:

Router# **show telephony-service all**

```

CONFIG (Version=4.0(0))
=====
Version 4.0(0)
Cisco Unified CallManager Express
For on-line documentation please see:
www.cisco.com/en/US/products/sw/voicesw/ps4625/tsd_products_support_series_home.html

ip source-address 10.0.0.1 port 2000
max-ephones 24
max-dn 24
dialplan-pattern 1 408734....
voicemail 11111
transfer-pattern 510734....
keepalive 30

ephone-dn 1
number 5001
huntstop

ephone-dn 2
number 5002
huntstop
call-forward noan 5001 timeout 8

```

Step 2 show telephony-service tftp-bindings

Use this command to display the current configuration files accessible to IP phones.

Example:

Router# **show telephony-service tftp-bindings**

```

tftp-server system:/its/SEPDEFAULT.cnf
tftp-server system:/its/SEPDEFAULT.cnf alias SEPDefault.cnf
tftp-server system:/its/XMLDefault.cnf.xml alias XMLDefault.cnf.xml

```

```

Generate Configuration Profiles for SIP Phones

To generate the configuration profile files that are required by the SIP phones in Cisco Unified CME and write them to the location specified by the **tftp-path (voice register global)** command, follow the steps in this section.

Any time you create or modify parameters under the voice register dn or voice register pool configuration modes, generate a new configuration profile and properly propagate the parameters.

Caution

If your Cisco Unified CME system supports SCCP and also SIP phones, do not connect your SIP phones to the network until after you have verified the phone configuration profiles.

Before you begin

- Cisco Unified CME 3.4 or a later version.
- The **mode cme** command must be enabled in Cisco Unified CME.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **file text**
5. **create profile**
6. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global Example: Router(config)# voice register global	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.
Step 4	file text Example: Router(config-register-global)# file text	(Optional) Generates ASCII text files of the configuration profiles generated for Cisco Unified IP Phone 7905s and 7905Gs, Cisco Unified IP Phone 7912s and 7912Gs, Cisco ATA-186, or Cisco ATA-188. • Default—System generates binary files to save disk space.
Step 5	create profile Example: Router(config-register-global;)# create profile	Generates configuration profile files required for SIP phones and writes the files to the location specified with tftp-path command.
Step 6	end Example: Router(config-register-global)# end	Exits configuration mode and enters privileged EXEC mode.

Verify Configuration Profiles for SIP Phones

To verify the configuration profiles, perform the following steps. SIP phones to be connected to Cisco Unified CME can register and minimally, have an assigned phone number, only if the configuration is correct.

Procedure

Step 1 show voice register tftp-bind

Use this command to display a list of configuration profiles that are accessible to SIP phones using TFTP. The file name includes the MAC address for each SIP phone, such as SIP <mac-address>.cnf. Verify that a configuration profile is available for each SIP phone in Cisco Unified CME.

The following is sample output from this command:

Example:

```
Router(config)# show voice register tftp-bind

tftp-server SIPDefault.cnf url system:/cme/sipphone/SIPDefault.cnf>
tftp-server syncinfo.xml url system:/cme/sipphone/syncinfo.xml
tftp-server SIP0009B7F7532E.cnf url system:/cme/sipphone/SIP0009B7F7532E.cnf
tftp-server SIP000ED7DF7932.cnf url system:/cme/sipphone/SIP000ED7DF7932.cnf
```

```
tftp-server SIP0012D9EDE0AA.cnf url system:/cme/sipphone/SIP0012D9EDE0AA.cnf
tftp-server gk123456789012 url system:/cme/sipphone/gk123456789012
tftp-server gk123456789012.txt url system:/cme/sipphone/gk123456789012.txt
```

Step 2 show voice register profile

Use this command to display the contents of the ASCII format configuration profile for a particular voice register pool.

Note

To generate ASCII text files of the configuration profiles for Cisco Unified IP Phone 7905s and 7905Gs, Cisco Unified IP Phone 7912s and 7912Gs, Cisco ATA-186s, and Cisco ATA-188s, use the **file text** command.

Example:

The following is sample output from this command displaying information in the configuration profile for voice register pool 4.

```
Router# show voice register profile text 4
```

```
Pool Tag: 4
# txt
AutoLookUp:0
DirectoriesUrl:0
...
CallWaiting:1
CallForwardNumber:0
Conference:1
AttendedTransfer:1
BlindTransfer:1
...
SIPRegOn:1
UseTftp:1
UseLoginID:0
UIPassword:0
NTPIP:0.0.0.0
UID:2468
```

Step 3 more system

Use this command to display the contents of the configuration profile for a particular Cisco Unified IP Phone 7940, Cisco Unified IP Phone 7905G, Cisco Unified IP Phone 7960, or Cisco Unified IP Phone 7960G.

The following is sample output from this command displaying information in two SIP configuration profile files. The SIPDefault.cnf configuration profile is a shared file and SIP < MAC address > .cnf is the SIP configuration profile for the SIP phone with the designated MAC address.

```
Router# more system:/cme/sipphone/SIPDefault.cnf
```

Where To Go Next

After you generate a configuration file for a Cisco Unified IP phone connected to the Cisco Unified CME router, you are ready to download the file to the phone. See [Reset and Restart Phones, on page 410](#).

CHAPTER 11

Reset and Restart Cisco Unified IP Phones

- [Information About Resetting and Restarting Phones, on page 409](#)
- [Reset and Restart Phones, on page 410](#)
- [Feature Information for Reset and Restart Phones, on page 416](#)

Information About Resetting and Restarting Phones

Differences between Resetting and Restarting IP Phones

Cisco Unified IP phones must be rebooted after configuration changes in order for the changes to be effective. Configurations for phones in Cisco Unified CME are downloaded when a phone is rebooted or reset. You can reboot a single phone or you can reboot all phones in a Cisco Unified CME system. The differences between reboot types are summarized in [Table 24: reset and restart Command Differences, on page 409](#).

Note When rebooting multiple IP phones, it is possible for a conflict to occur if too many phones attempt to access changed Cisco Unified CME configuration information via TFTP simultaneously.

Table 24: reset and restart Command Differences

	reset Command	restart Command
Type of Reboot	Similar to power-off, power-on reboot.	Quick restart.
Phone Configurations	Downloads configurations for IP phones.	Downloads configurations for IP phones.
DHCP and TFTP	Contacts DHCP and TFTP servers for updated configuration information. Note This command was introduced for SIP phones in Cisco CME 3.4.	Phones contact the TFTP server for updated configuration information and reregister without contacting the DHCP server. Note This command was introduced for SIP phones in Cisco Unified CME 4.1.

	reset Command	restart Command
Processing Time	Takes longer to process when updating multiple phones.	Faster processing for multiple phones.
When Required	• Date and time settings • Network locale • Phone firmware • Source address • TFTP path • URL parameters • User locale • Voicemail access number Can be used when updating the following: • Directory numbers • Phone buttons • Speed-dial numbers	• Directory numbers • Phone buttons • Speed-dial numbers

Cisco Unified CME TAPI Enhancement

Before Cisco Unified CME 7.0(1), the only method to clear a session between a Microsoft Windows Workstation and an SCCP phone that was out-of-sync was to reboot the router. In Cisco Unified CME 7.0(1) and later versions, you can clear a Telephony Application Programming Interface (TAPI) session that is in a frozen state or out of synchronization by using a Cisco IOS software command. For configuration information, see [Reset a Session Between a TAPI Application and an SCCP Phone, on page 413](#).

This enhancement also automatically handles ephone-TAPI registration error conditions. No additional configuration is required for this new feature.

Reset and Restart Phones

Note

If phones are not yet plugged in, resetting or restarting phones is not necessary. Instead, connect your IP phones to your network to boot the phone and download the required configuration files.

Use the reset Command on SCCP Phones

To reboot and reregister one or more SCCP phones, including contacting the DHCP server for updated information, perform the following steps.

Before you begin

- Phones to be rebooted are connected to the Cisco Unified CME router.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service** or **ephone** *ephone-tag*
4. **reset** { **all** [*time-interval*] | **cancel** | **mac-address** *mac-address* | **sequence-all** } or **reset**
5. **end**

DETAILED STEPS

Procedure		
	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service or ephone <i>ephone-tag</i> Example: Router(config)# telephony-service or Router(config)# ephone 1	Enters telephony-service configuration mode. or Enters ephone configuration mode.
Step 4	reset { all [<i>time-interval</i>] cancel mac-address <i>mac-address</i> sequence-all } or reset Example: Router(config-telephony)# reset all or Router(config-ephone)# reset	Performs a complete reboot of the specified or all phones running SCCP, including contacting the DHCP and TFTP servers for the latest configuration information. or Performs a complete reboot of the individual SCCP phone being configured.
Step 5	end Example: Router(config-telephony)# end or Router(config-ephone)# end	Returns to privileged EXEC mode.

Use the restart Command on SCCP Phones

To fast reboot and reregister one or more SCCP phones, perform the following steps.

Before you begin

- Phones to be rebooted are connected to the Cisco Unified CME router.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service** or **ephone** *ephone-tag*
4. **restart** {**all** [*time-interval*] | *mac-address*} or **restart**
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service or ephone <i>ephone-tag</i> Example: Router(config)# telephony-service or Router(config)# ephone 1	Enters telephony-service configuration mode. or Enters ephone configuration mode.
Step 4	restart { all [<i>time-interval</i>] <i>mac-address</i> } or restart Example: Router(config-telephony)# restart all or Router(config-ephone)# restart	Performs a fast reboot of the specified phone or all phones running SCCP associated with this Cisco Unified CME router. Does not contact the DHCP server for updated information. or Performs a fast reboot of the individual SCCP phone being configured.
Step 5	end Example:	Returns to privileged EXEC mode.

	Command or Action	Purpose
	<code>Router(config-ephone)# end</code>	

Reset a Session Between a TAPI Application and an SCCP Phone

To clear a TAPI session that is in a frozen state or out of synchronization, perform the following steps.

Before you begin

- Cisco Unified CME 7.0(1) or a later version

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **reset tapi**
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Router> enable</code>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3	ephone <i>phone-tag</i> Example: <code>Router(config)# ephone 36</code>	Enters ephone configuration mode. • <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks.
Step 4	reset tapi Example: <code>Router(config-ephone)# reset tapi</code>	Resets the connection between a Telephony Application Programmer's Interface (TAPI) application and the SCCP phone.
Step 5	end Example: <code>Router(config-ephone)# end</code>	Returns to privileged EXEC mode.

Use the reset Command on SIP Phones

To reboot and reregister one or more SIP phones, including contacting the DHCP server for updated information, perform the following steps.

Before you begin

- Cisco Unified CME 3.4 or later.
- The **mode** cme command must be enabled in Cisco Unified CME.
- Phones to be rebooted are connected to the Cisco Unified CME router.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global** or **voice register pool** *pool-tag*
4. **reset**
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global or voice register pool <i>pool-tag</i> Example: Router(config)# voice register global or Router(config)# voice register pool 1	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME. or Enters voice register pool configuration mode to set phone-specific parameters for SIP phones
Step 4	reset Example: Router(config-register-global)# reset or Router(config-register-pool)# reset	Performs a complete reboot of all phones connected to this router that are running SIP, including contacting the DHCP and TFTP servers for the latest configuration information. or Performs a complete reboot of the individual SIP phone being configured.

	Command or Action	Purpose
Step 5	end Example: Router(config-register-global)# end or Router(config-register-pool)# end	Exits to privileged EXEC mode.

Use the restart Command on SIP Phones

To fast reboot and reregister one or more SIP phones, perform the following steps.

Before you begin

- Cisco Unified CME 4.1 or later.
- The **mode cme** command must be enabled in Cisco Unified CME.
- Phones to be rebooted are connected to the Cisco Unified CME router.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global** or **voice register pool** *pool-tag*
4. **restart**
5. **end**

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	voice register global or voice register pool <i>pool-tag</i> Example: Router(config)# voice register global or	Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME. or

	Command or Action	Purpose
	or Router(config)# voice register pool 1	Enters voice register pool configuration mode to set phone-specific parameters for SIP phones.
Step 4	restart Example: Router(config-register-global)# restart or Router(config-register-pool)# restart	Performs a fast reboot all SIP phones associated with this Cisco Unified CME router. Does not contact the DHCP server for updated information. or Performs a fast reboot of the individual SIP phone being configured.
Step 5	end Example: Router(config-register-global)# end or Router(config-register-pool)# end	Exits configuration mode and enters privileged EXEC mode.

Verify Basic Call

To verify that Cisco IP phones in Cisco Unified CME can place and receive calls through the voice ports, perform the following steps.

Procedure

-
- Step 1** Test local phone operation. Make calls between phones on the Cisco Unified CME router.
- Step 2** Place a call *from* a phone in Cisco Unified CME to a number in the local calling area.
- Step 3** Place a call *to* a phone in Cisco Unified CME from a phone outside this Cisco Unified CME system.
-

Feature Information for Reset and Restart Phones

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

Table 25: Feature Information for Reset and Restart Phones

Feature Name	Cisco Unified CME Version	Feature Information
Cisco Unified CME TAPI Enhancement	7.0(1)	Disassociates and reestablishes a TAPI session that is in a frozen state or out of synchronization by using a Cisco IOS command. This enhancement also automatically handles ephone-TAPI registration error conditions.

CHAPTER 12

Localization Support

This chapter describes the localization support in Cisco Unified Communications Manager Express (Cisco Unified CME) for languages other than English and network tones and cadences not specific to the United States.

- [Information About Localization, on page 419](#)
- [Configure Localization Support on SCCP Phones, on page 423](#)
- [Configure Localization Support on SIP Phones, on page 438](#)
- [Configuration Examples for Localization, on page 447](#)
- [Configuration Examples for Locale Installer on SCCP Phones, on page 450](#)
- [Where to Go Next, on page 453](#)
- [Feature Information for Localization Support, on page 454](#)

Information About Localization

Localization Enhancements in Cisco Unified CME

Cisco Unified CME supports the French locale but some phrases in France French and Canadian French differ. In Cisco Unified CME 9.5, Canadian French is supported as a user-defined locale on Cisco Unified SIP IP phones and Cisco Unified SCCP IP phones when the correct locale package is installed.

Note Some abbreviations such as BLF, SNR, and CME are not localized.

Prerequisites

- Cisco Unified CME 9.5 or later version
- Locale package version 9.5.2.6 is required

**Restriction**

All the localization enhancements are supported in Cisco Unified CME only. They are not supported in Cisco Unified SRST. [Table 26: Language Codes for User-Defined Locales, on page 420](#) shows the language codes used in the filenames of locale files.

Table 26: Language Codes for User-Defined Locales

Language	Language Code
Canadian French	fr_CA

For configuration information, see [Install User-Defined Locales, on page 427](#).

System-Defined Locales

Cisco Unified CME provides built-in, system-defined localization support for 12 languages including English and 16 countries including the United States. Network locales specify country-specific tones and cadences; user locales specify the language to use for text displays.

Configuring system-defined locales depends on the type of IP phone:

- Cisco Unified IP Phone 7905, 7912, 7940, and 7960—System-defined network locales and user locales are preloaded into Cisco IOS software. No external files are required. Use the **network-locale** and **user-locale** commands to set the locales for these phones.
- Cisco Unified IP Phone 6921, 6945, 7906, 7911, 7921, 7931, 7941, 7961, 7970, 7971, 8941, 8945, and Cisco IP Communicator—You must download locale files to support the system-defined locales and store the files in flash memory, slot 0, or on an external TFTP server. See [Install System-Defined Locales for Cisco Unified IP Phone 6921, 6945, 7906, 7911, 7921, 7931, 7941, 7961, 7970, 7971, and Cisco IP Communicator, on page 423](#).
- Cisco Unified 3905, 6941, 6945, 8961, 9951, and 9971 SIP IP Phones—You must download locale files to support the system-defined locales and store the files in flash memory, slot 0, or on an external TFTP server.

**Note**

TFTP aliases for localization are not automatically created for Cisco Unified SIP IP phones in a Cisco Unified CME system. For more information on how to manually create TFTP aliases, see [Install System-Defined Locales for Cisco Unified IP Phone 8961, 9951, and 9971, on page 438](#).

**Note**

Cisco Unified CME 10.5 Release onwards, the System defined locales are deprecated and User-defined locales are recommended.

Cisco Unified 3905 SIP IP Phones and Cisco Unified 6945, 8941, and 8945 SCCP IP Phones have support for all locales up to Cisco Unified CME 8.8.

Localization Support for Cisco Unified SIP IP Phones

Cisco Unified CME 8.6 provides localization support for 12 languages including English and 16 countries including the United States. Network locales specify country-specific tones and cadences; user locales specify the language to use for text displays. Create additional localization support with user-defined locales. For more information about user-defined locales, see [User-Defined Locales, on page 421](#).

In Cisco Unified CME 9.0 and later versions, localization is enhanced to support Cisco Unified 6941 and 6945 SIP IP Phones.

The **load** command supports both user-defined and system-defined locales.

Note The locale files must be stored in the same location as the configuration files.

User-Defined Locales

The user-defined locale feature allows you to support network and user locales other than the system-defined locales that are predefined in Cisco IOS software. For example, if your site has phones that must use the language and tones for Traditional Chinese, which is not one of the system-defined choices, you must install the locale files for Traditional Chinese.

In Cisco Unified CME 4.0 and later versions, you can download files to support a particular user and network locale and store the files in flash memory, slot 0, or an external TFTP server. These files cannot be stored in the system location. User-defined locales can be assigned to all phones or to individual phones.

User-defined language codes for user locales are based on ISO 639 codes, which are available at the Library of Congress website at <http://www.loc.gov/standards/iso639-2/>. User-defined country codes for network locales are based on ISO 3166 codes.

For configuration information, see [Install User-Defined Locales, on page 427](#).

Localization Support for Phone Displays

On the Cisco Unified IP Phone 8961, 9951, and 9971, menus and prompts that are managed by the locale file for the IP phone type (.jar) or the Cisco Unified CME dictionary file are localized. Display options configured through Cisco IOS commands are not localized.

The following display items are localized by the IP phone (.jar file):

- System menus accessed with feature buttons (for example, messages, directories, services, settings, and information)
- Call processing messages
- Softkeys (for example, Redial and CFwdALL)

The following display items are localized by the dictionary file for Cisco Unified CME:

- Directory Service (Local Directory, Local Speed Dial, and Personal Speed Dial)
- Status Line

Display options configured through Cisco IOS commands are not localized and can only be displayed in English. For example, this includes features such as:

- Caller ID
- Header Bar
- Phone Labels
- System Message

Multiple Locales

In Cisco Unified CME 8.6 and later versions, you can specify up to five user and network locales and apply different locales to individual ephones or groups of ephones using ephone templates. For example, you can specify French for phones A, B, and C; German for phones D, E, and F; and English for phones G, H, and I. Only one user and network locale can be applied to each phone.

Each of the five user and network locales that you can define in a multilocale system is identified by a locale tag. The locale identified by tag 0 is always the default locale, although you can define this default to be any supported locale. For example, if you define user locale 0 to be JP (Japanese), the default user locale for all phones is JP. If you do not specify a locale for tag 0, the default is US (United States).

To apply alternative locales to different phones, you must use per-phone configuration files to build individual configuration files for each phone. The configuration files automatically use the default user-locale 0 and network-locale 0. You can override these defaults for individual phones by configuring alternative locale codes and then creating ephone-templates to assign the locales to individual ephones.

For configuration information, see [Configure Multiple Locales on SCCP Phones, on page 433](#).

Locale Installer for Cisco Unified SCCP IP Phones

Before Cisco Unified CME 7.0(1), configuring localization required up to 16 steps, most of which were manual and some of which required filename changes. In Cisco Unified CME 7.0(1) and later versions, the following enhancements for installing locales are supported:

- Locale installer that supports a single procedure for all SCCP IP phones.
- Cisco Unified CME parses new firmware-load text files and automatically creates the TFTP aliases for localization, eliminating the requirement for you to manually create up to five aliases for files in the TAR file. To use this feature in Cisco Unified CME 7.0(1), you must use the complete filename, including the file suffix, when you configure the **load** command for phone firmware versions later than version 8-2-2 for all phone types. For example:

```
Router(config-telephony) # load 7941 SCCP41.8-3-3S.loads
```

Note

In Cisco Unified CME 4.3 and earlier versions, you do not include the file suffix for any phone type except Cisco ATA and Cisco Unified IP Phone 7905 and 7912. For example:

```
Router(config-telephony) # load 7941 SCCP41.8-2-2SR2S
```

- Backward compatibility with the configuration method in Cisco Unified CME 7.0 and earlier versions.

For configuration information, see [Use the Locale Installer in Cisco Unified CME 7.0\(1\) and Later Versions, on page 430](#).

Locale Installer for Cisco Unified SIP IP Phones

Cisco Unified CME 9.0 and later versions support the following enhancements for installing locales for Cisco Unified SIP IP phones:

- Locale installer that supports a single procedure for all Cisco Unified SIP IP phones.
- New **load** keyword that requires you to use the complete filename, including the file suffix (.tar), when you configure the **user-locale** command for all Cisco Unified SIP IP phone types. The command syntax is **user-locale** [*user-locale-tag*] {[*user-defined-code*] *country-code*} [**load** *TAR-filename*]. For example,

```
Router(config-register-global)#user-locale 2 DE load
CME-locale-de_DE-German-8.6.3.0.tar
```

With the locale installer, you do not need to perform manual configuration. Instead, you copy the locale file using the **copy** command in privileged EXEC configuration mode.

Note You must copy the locale file into the /its directory (flash:/its or slot0:/its) when you store the locale files on the Cisco Unified CME router.

For example,

```
Router# copy tftp://12.1.1.100/CME-locale-de_DE-German-8.6.3.0.tar flash:/its
```

For configuration information, see [Use the Locale Installer in Cisco Unified CME 9.0 and Later Versions, on page 441](#).

Configure Localization Support on SCCP Phones

Install System-Defined Locales for Cisco Unified IP Phone 6921, 6945, 7906, 7911, 7921, 7931, 7941, 7961, 7970, 7971, and Cisco IP Communicator

Network locale files allow an IP phone to play the proper network tone for the specified country. You must download and install a tone file for the country you want to support.

User locale files allow an IP phone to display the menus and prompts in the specified language. You must download and install JAR files and dictionary files for each language you want to support.

To download and install locale files for system-defined locales, perform the following steps.

Tip The locale installer simplifies the installation and configuration of system- and user-defined locales in Cisco Unified CME 7.0(1) and later versions. To use the locale installer in Cisco Unified CME 7.0(1) and later versions, see [Use the Locale Installer in Cisco Unified CME 7.0\(1\) and Later Versions, on page 430](#).

**Restriction**

- Localization is not supported for SIP phones.
- Phone firmware, configuration files, and locale files must be in the same directory, except the directory file for Japanese and Russian, which must be in flash memory.

Before you begin

- Cisco Unified CME 4.0(2) or a later version.
- You must create per-phone configuration files as described in [Define Per-Phone Configuration Files and Alternate Location for SCCP Phones, on page 187](#).
- You must have an account on Cisco.com to download locale files.

Procedure

- Step 1** Go to <http://www.cisco.com/cgi-bin/tablebuild.pl/CME-Locale>.
- You must have an account on Cisco.com to access the Software Download Center. If you do not have an account or if you have forgotten your username or password, click the appropriate button at the login dialog box and follow the instructions that appear.
- Step 2** Navigate to **Downloads Home > Products > Unified Communications > Call Control > Mid-Market Call Control > Cisco Unified Communications Manager Express > Unified Communications Manager Express Individual File Set** and select your version of Cisco Unified CME.
- Step 3** Select the TAR file for the locale you want to install. Each TAR file contains locale files for a specific language and country and uses the following naming convention: *CME-locale-language_country-CMEversion*
- Example:**
- For example, CME-locale-de_DE-4.0.2-2.0 is German for Germany for Cisco Unified CME 4.0(2).
- Step 4** Download the TAR file to a TFTP server that is accessible to the Cisco Unified CME router. Each file contains all the firmware required for all phone types supported by that version of Cisco Unified CME.
- Step 5** Use the **archive tar** command to extract the files to flash memory, slot 0, or an external TFTP server.
- Example:**
- ```
Router# archive tar /xtract source-urlflash://file-url
```
- Example:**
- For example, to extract the contents of CME-locale-de\_DE-4.0.2-2.0.tar from TFTP server 192.168.1.1 to router flash memory, use this command:
- ```
Router# archive tar /xtract tftp://192.168.1.1/cme-locale-de_DE-4.0.2-2.0.tar
flash:
```
- Step 6** See [Table 27: Phone-Type Codes for Locale JAR Files, on page 425](#) and [Table 28: System-Defined User and Network Locales, on page 425](#) for a description of the codes used in the filenames and the list of supported directory names.
- Each phone type has a JAR file that uses the following naming convention:

language-phone-sccp.jar

Example:

For example, de-td-sccp.jar is for German on the Cisco Unified IP Phone 7970.

Each TAR file also includes the file g3-tones.xml for country-specific network tones and cadences.

Table 27: Phone-Type Codes for Locale JAR Files

Phone Type	Phone Code
6921	rtl
6945	rtl
7906/7911	tc
7931	gp
7941/7961	mk
7970/7971	td
8941/8945	gh
CIPC	ipc

Table 28: System-Defined User and Network Locales

Language	Language Code	User-Locale Directory Name	Country Code	Network-Locale Directory Name
English	en	English_United_States ²	US	United_States
		English_United_Kingdom	UK	United_Kingdom
			CA	Canada
Danish	dk	Danish_Denmark	DK	Denmark
Dutch	nl	Dutch_Netherlands	NL	Netherlands
French	fr	French_France	FR	France
			CA	Canada
German	de	German_Germany	DE	Germany
			AT	Austria
			CH	Switzerland
Italian	it	Italian_Italy	IT	Italy
Japanese ³	jp	Japanese_Japan	JP	Japan

Language	Language Code	User-Locale Directory Name	Country Code	Network-Locale Directory Name
Norwegian	no	Norwegian_Norway	NO	Norway
Portuguese	pt	Portuguese_Portugal	PT	Portugal
Russian	ru	Russian_Russia	RU	Russian_Federation
Spanish	es	Spanish_Spain	ES	Spain
Swedish	se	Swedish_Sweden	SE	Sweden

² English for the United States is the default language. You do not need to install the JAR file for U.S. English unless you assign a different language to a phone and then want to reassign English.

³ Katakana is supported by Cisco Unified IP Phone 7905, 7912, 7940, and 7960. Kanji is supported by Cisco Unified IP Phone 7911, 7941, 7961, 7970, and 7971.

Step 7

If you store the locale files in flash memory or slot 0 on the Cisco Unified CME router, create a TFTP alias for the user locale (text displays) and network locale (tones) using this format:

Example:

```
Router(config)# tftp-server flash:/jar_filealias directory_name/td-sccp.jar
```

```
Router(config)# tftp-server flash:/g3-tones.xml aliasdirectory_name/g3-tones.xml
```

Use the appropriate directory name shown in [Table 28: System-Defined User and Network Locales, on page 425](#) and remove the two-letter language code from the JAR file name. For example, the TFTP aliases for German and Germany for the Cisco Unified IP Phone 7970 are:

```
Router(config)# tftp-server flash:/de-td-sccp.jar alias German_Germany/td-sccp.jar
```

```
Router(config)# tftp-server flash:/g3-tones.xml alias Germany/g3-tones.xml
```

Note

On Cisco 3800 series routers, you must include /its in the directory name (flash:/its or slot0:/its). For example, the TFTP alias for German for the Cisco Unified IP Phone 7970 is: Router# **tftp-server flash:/its/de-td-sccp.jar alias German_Germany/td-sccp.jar**

Step 8

If you store the locale files on an external TFTP server, create a directory under the TFTP root directory for each user and network locale.

Use the appropriate directory name shown in [Table 28: System-Defined User and Network Locales, on page 425](#) and remove the two-letter language code from the JAR file name.

Example:

For example, the user-locale directory for German and the network-locale directory for Germany for the Cisco Unified IP Phone 7970 are:

TFTP-Root/German_Germany/td-sccp.jar TFTP-Root/Germany/g3-tones.xml

Step 9

For Russian and Japanese, you must copy the UTF8 dictionary file into flash memory to use special phrases.

- Only flash memory can be used for these locales. Copy `russian_tags_utf8_phrases` for Russian; `Japanese_tags_utf8_phrases` for Japanese.
- Use the **user-locale jp** and **user-locale ru** command to load the UTF8 phrases into Cisco Unified CME.

- Step 10** Assign the locales to phones. To set a default locale for all phones, use the **user-locale** and **network-locale** commands in telephony-service configuration mode.
- Step 11** To support more than one user or network locale, see [Configure Multiple Locales on SCCP Phones, on page 433](#).
- Step 12** Use the **create cnf-files** command to rebuild the configuration files.
- Step 13** Use the **reset** command to reset the phones and see the localized displays.

Install User-Defined Locales

You must download XML files for locales that are not predefined in the system. To install up to five user-defined locale files to use with phones, perform the following steps.

Note From Cisco Unified CME 10.5 Release onwards, the System defined locales are deprecated and User-defined locales are recommended. However, the older locale packages can be still used but some phrases may be displayed in English.

Restriction

- User-defined locales are not supported on the Cisco Unified IP Phone 7920 or 7936.
- User-defined locales are not supported if the configuration file location is “system:”.
- When you use the setup tool from the **telephony-service setup** command to provision phones, you can only choose a default user locale and network locale and you are limited to selecting a locale code that is supported in the system. You cannot use multiple locales or user-defined locales with the setup tool.
- When using a user-defined locale, the phone normally displays text using the user-defined fonts, except for any strings that are interpreted by Cisco Unified CME, such as “Cisco/Personal Directory,” “Speed Dial/Fast Dial,” and so forth.

Before you begin

- Cisco Unified CME 4.0(3) or a later version.
- You must create per-phone configuration files as described in [Define Per-Phone Configuration Files and Alternate Location for SCCP Phones, on page 187](#).
- You must have an account on Cisco.com to download locale files.

Procedure

- Step 1** Go to <http://www.cisco.com/cgi-bin/tablebuild.pl/CME-Locale>.

You must have an account on Cisco.com to access the Software Download Center. If you do not have an account or if you have forgotten your username or password, click the appropriate button at the login dialog box and follow the instructions that appear.

Step 2 Navigate to **Downloads Home > Products > Unified Communications > Call Control > Mid-Market Call Control > Cisco Unified Communications Manager Express > Unified Communications Manager Express Individual File Set** and select your version of Cisco Unified CME.

Step 3 Select the TAR file for the locale that you want to install. Each TAR file contains locale files for a specific language and country and uses the following naming convention: *CME-locale-language_country-CMEversion-fileversion*.

Example:

For example, CME-locale-zh_CN-4.0.3-2.0 is Traditional Chinese for China for Cisco Unified CME 4.0(3).

Step 4 Download the TAR file to a TFTP server that is accessible to the Cisco Unified CME router. Each file contains all the firmware required for all phone types supported by that version of Cisco Unified CME.

Step 5 Use the **archive tar** command to extract the files to slot 0, flash memory, or an external TFTP server.

Example:

```
Router# archive tar /xtract source-urlflash:/file-url
```

For example, to extract the contents of CME-locale-zh_CN-4.0.3-2.0.tar from TFTP server 192.168.1.1 to router flash memory, use this command:

```
Router# archive tar /xtract tftp://192.168.1.1/cme-locale-zh_CN-4.0.3-2.0.tar
flash:
```

Step 6 For Cisco Unified IP Phone 7905, 7912, 7940, or 7960, go to [Step 11, on page 430](#). For Cisco Unified IP Phone 7911, 7941, 7961, 7970, or 7971, go to [Step 7, on page 428](#).

Step 7 Each phone type has a JAR file that uses the following naming convention: *language-type-sccp.jar*

Example:

For example, zh-td-sccp.jar is Traditional Chinese for the Cisco Unified IP Phone 7970.

See [Table 29: Phone-Type Codes for Locale Files, on page 428](#) and [Table 30: Language Codes for User-Defined Locales, on page 429](#) for a description of the codes used in the filenames.

Table 29: Phone-Type Codes for Locale Files

Phone Type	Code
6921	rtl
6945	rtl
7906/7911	tc
7931	gp
7941/7961	mk
7970/7971	td
8941/8945	gh
CIPC	ipc

Table 30: Language Codes for User-Defined Locales

Language	Language Code
Bulgarian	bg
Chinese	zh ⁴
Croatian	hr
Czech Republic	cs
Finnish	fi
Greek	el
Hungarian	hu
Korean	ko
Polish	pl
Portugese (Brazil)	pt
Romanian	ro
Serbian	sr
Slovakian	sk
Slovenian	sl
Turkish	tr

⁴ For Cisco Unified IP Phone 7931, code for Chinese Simplified is chs; Chinese Traditional is cht.

Step 8

If you store the locale files in flash memory or slot 0 on the Cisco Unified CME router, create a TFTP alias using this format:

Example:

```
Router(config)# tftp-server flash:/jar_filealias directory_name/td-sccp.jar
```

Remove the two-letter language code from the JAR filename and use one of five supported directory names with the following convention:

user_define_number, where number is 1 to 5

For example, the alias for Chinese on the Cisco Unified IP Phone 7970 is:

```
Router(config)# tftp-server flash:/zh-td-sccp.jar alias user_define_1/td-sccp.jar
```

Note

On Cisco 3800 series routers, you must include /its in the directory name (flash:/its or slot0:/its). For example, the TFTP alias for Chinese for the Cisco Unified IP Phone 7970 is:

```
Router(config)# tftp-server flash:/its/zh-td-sccp.jar alias user_define_1/td-sccp.jar
```

Step 9

If you store the locale files on an external TFTP server, create a directory under the TFTP root directory for each locale.

Remove the two-letter language code from the JAR filename and use one of five supported directory names with the following convention:

`user_define_number`, where *number* is 1 to 5

Example:

For example, for Chinese on the Cisco Unified IP Phone 7970, remove “zh” from the JAR filename and create the “`user_define_1`” directory under TFTP-Root on the TFTP server:

TFTP-Root/`user_define_1`/td-sccp.jar

Step 10 Go to [Step 13, on page 430](#).

Step 11 Download one or more of the following XML files depending on your selected locale and phone type. All required files are included in the JAR file.

Example:

```
7905-dictionary.xml
7905-font.xml
7905-kate.xml
7920-dictionary.xml
7960-dictionary.xml
7960-font.xml
7960-kate.xml
7960-tones.xml
SCCP-dictionary.utf-8.xml
SCCP-dictionary.xml
```

Step 12 Rename these files and copy them to flash memory, slot 0, or an external TFTP server. Rename the files using the format `user_define_number_filename` where *number* is 1 to 5.

Example:

For example, use the following names if you are setting up the first user-locale:

```
user_define_1_7905-dictionary.xml
user_define_1_7905-font.xml
user_define_1_7905-kate.xml
user_define_1_7920-dictionary.xml
user_define_1_7960-dictionary.xml
user_define_1_7960-font.xml
user_define_1_7960-kate.xml
user_define_1_7960-tones.xml
user_define_1_SCCP-dictionary.utf-8.xml
user_define_1_SCCP-dictionary.xml
```

Step 13 Copy the *language_tags_file* and *language_utf8_tags_file* to the location of the other locale files (flash memory, slot 0, or TFTP server). Rename the files to `user_define_number_tags_file` and `user_define_number_utf8_tags_file` respectively, where *number* is 1 to 5 and matches the user-defined directory.

Step 14 Assign the locales to phones. See [Configure Multiple Locales on SCCP Phones, on page 433](#).

Step 15 Use the **create cnf-files** command to rebuild the configuration files.

Step 16 Use the **reset** command to reset the phones and see the localized displays.

Use the Locale Installer in Cisco Unified CME 7.0(1) and Later Versions

To install and configure locale files to use with SCCP phones in Cisco Unified CME, perform the following steps.

Tip

Cisco Unified CME 7.0(1) provides backward compatibility with the configuration method in Cisco Unified CME 4.3/7.0 and earlier versions. To use the same procedures as you used with earlier versions of Cisco Unified CME, see [Install System-Defined Locales for Cisco Unified IP Phone 6921, 6945, 7906, 7911, 7921, 7931, 7941, 7961, 7970, 7971, and Cisco IP Communicator, on page 423](#).

Restriction

- When using an external TFTP server, you must manually create the user locale folders in the root directory. This is a limitation of the TFTP server.
- Locale support is limited to phone firmware versions that are supported by Cisco Unified CME.
- User-defined locales are not supported on the Cisco Unified IP Phone 7920 or 7936.
- User-defined locales are not supported if the configuration file location is system.
- When you use the setup tool from the **telephony-service setup** command to provision phones, you can only choose a default user locale and network locale, and you are limited to selecting a locale code that is supported in the system. You cannot use multiple locales or user-defined locales with the setup tool.
- When using a user-defined locale, the phone normally displays text using the user-defined fonts, except for any strings that are interpreted by Cisco Unified CME, such as “Cisco/Personal Directory,” and “Speed Dial/Fast Dial.”
- If you install and configure a user-defined locale using country codes U1-U5 and then you install a new locale using the same label, the phone retains the original language locale even after the phone is reset. This is a limitation of the IP phone. To work around this limitation, you must configure the new package using a different country code.
- Each user-defined country code (U1-U5) can be used for only one user-locale-tag at a time. For example:

```
Router(config-telephony) # user-locale 2 U2 load Finnish.pkg
Router(config-telephony) # user-locale 1 U2 load Chinese.pkg
LOCALE ERROR: User Defined Locale U2 already exists on locale index 2.
```

Before you begin

- Cisco Unified CME 7.0(1) or a later version.
- You must configure Cisco Unified CME for per-phone configuration files. See [Define Per-Phone Configuration Files and Alternate Location for SCCP Phones, on page 187](#).
- When the storage location specified by the **cnf-file location** command is flash memory, sufficient space must be on the flash file system for extracting the contents of the locale TAR file.
- You must have an account on Cisco.com to download locale files.

Procedure

Step 1

Go to <http://www.cisco.com/cgi-bin/tablebuild.pl/CME-Locale>.

You must have an account on Cisco.com to access the Software Download Center. If you do not have an account or have forgotten your username or password, click the appropriate button at the login dialog box and follow the instructions that appear.

Step 2 Navigate to **Downloads Home > Products > Unified Communications > Call Control > Mid-Market Call Control > Cisco Unified Communications Manager Express > Unified Communications Manager Express Individual File Set** and select your version of Cisco Unified CME.

Step 3 Select the TAR file for the locale you want to install. Each TAR file contains locale files for a specific language and country and uses the following naming convention: *CME-locale-language_country-CMEversion*

Example:

For example, *CME-locale-de_DE-7.0.1.0* is German for Germany for Cisco Unified CME 7.0(1).

Step 4 Download the TAR file to the location previously specified by the **cnf-file location** command. Each file contains all the firmware required for all phone types supported by that version of Cisco Unified CME.

- If the **cnf-file** location is flash memory: Copy the TAR file to the `flash:/its` directory.
- If the **cnf-file** location is slot0: Copy the TAR file to the `slot0:/its` directory.
- If the **cnf-file** location is tftp: Create a folder in the root directory of the TFTP server for each locale using the following format and then copy the TAR file to the TFTP-Root folder. **TFTP-Root/TAR-filename**

Example:

For system-defined locales, use the locale folder name as shown in [Table 31: System-Defined and User-Defined Locales, on page 432](#). For example, create the folder for system-defined German as follows:

TFTP-Root/de_DE-7.0.1.0.tar

For up to five user-defined locales, use the `User_Define_n` folder name as shown in [Table 31: System-Defined and User-Defined Locales, on page 432](#). A user-defined locale is a language other than the system-defined locales that are predefined in Cisco IOS software. For example, create the folder for user-defined locale Chinese (`User_Define_1`) as follows:

TFTP-Root/CME-locale-zh_CN-7.0.1.0.tar

Note

For a list of user-defined languages supported in Cisco Unified CME, see [Cisco Unified CME Localization Matrix](#).

Table 31: System-Defined and User-Defined Locales

Language	Locale Folder Name	Country Code
English	English_United_States	US
	English_United_Kingdom	UK
		CA
Danish	Danish_Denmark	DK
Dutch	Dutch_Netherlands	NL
French	French_France	FR
		CA

Language	Locale Folder Name	Country Code
German	German_Germany	DE
		AT
		CH
Italian	Italian_Italy	IT
Japanese ⁵	Japanese_Japan	JP
Norwegian	Norwegian_Norway	NO
Portuguese	Portuguese_Portugal	PT
Russian	Russian_Russia	RU
Spanish	Spanish_Spain	ES
Swedish	Swedish_Sweden	SE
Un ⁶	User_Define_n ²	Un ²

⁵ Katakana is supported by Cisco Unified IP Phone 7905, 7912, 7940, and 7960. Kanji is supported by Cisco Unified IP Phone 7911, 7941, 7961, 7970, and 7971.

⁶ Where “n” is a number from 1 to 5.

Step 5 Use the **user-locale** [*user-locale-tag*] *country-code***load** *TAR-filename* command in telephony-service configuration mode to extract the contents of the TAR file. For country codes, see [Table 31: System-Defined and User-Defined Locales, on page 432](#).

Example:

For example, to extract the contents of the CME-locale-zh_CN-7.0.1.0.tar file when U1 is the country code for user-defined locale Chinese (User_Define_1), use this command:

```
Router (telephony-service)# user-locale U1 load CME-locale-zh_CN-7.0.1.0.tar
```

Step 6 Assign the locales to phones. See [Configure Multiple Locales on SCCP Phones, on page 433](#).

Step 7 Use the **create cnf-files** command to rebuild the configuration files.

Step 8 Use the **reset** command to reset the phones and see the localized displays.

Verify User-Defined Locales

See [Verify Multiple Locales on SCCP Phones, on page 437](#).

Configure Multiple Locales on SCCP Phones

To define one or more alternatives to the default user and network locales and apply them to individual phones, perform the following steps.

**Restriction**

- Multiple user and network locales are not supported on the Cisco Unified IP Phone 7902G, 7910, 7910G, or 7920, or the Cisco Unified IP Conference Stations 7935 and 7936.
- When you use the setup tool from the **telephony-service setup** command to provision phones, you can only choose a default user locale and network locale and you must select a locale code that is predefined in the system. You cannot use multiple or user-defined locales with the setup tool.

Before you begin

- Cisco Unified CME 4.0 or a later version.
- To specify alternative user and network locales for individual phones in a Cisco Unified CME system, you must use per-phone configuration files. For more information, see [Define Per-Phone Configuration Files and Alternate Location for SCCP Phones, on page 187](#).
- You can also use user-defined locale codes as alternative locales after you download the appropriate XML files. See [Install User-Defined Locales, on page 427](#).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **user-locale** *[user-locale-tag]* { *[user-defined-code]* *country-code* }
5. **network-locale** *network-locale-tag* *[user-defined-code]* *country-code*
6. **create cnf-files**
7. **exit**
8. **ephone-template** *template-tag*
9. **user-locale** *user-locale-tag*
10. **network-locale** *network-locale-tag*
11. **exit**
12. **ephone** *phone-tag*
13. **ephone-template** *template-tag*
14. **exit**
15. **telephony-service**
16. **reset** { **all** *[time-interval]* | **cancel** | **mac-address** *mac-address* | **sequence-all** }
17. **end**

DETAILED STEPS**Procedure**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.

	Command or Action	Purpose
	Router> enable	
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.
Step 4	user-locale [<i>user-locale-tag</i>] { [<i>user-defined-code</i>] <i>country-code</i> } Example: Router(config-telephony)# user-locale 1 U1 ZH	Specifies a language for phone displays. • <i>user-locale-tag</i>—Assigns a locale identifier to the locale. Range is 0 to 4. Default: 0. This argument is required when defining some locale other than the default (0). • <i>user-defined-code</i>—(Optional) Assigns one of the user-defined codes to the specified country code. Valid codes are U1, U2, U3, U4, and U5. • <i>country-code</i>—Type ? to display a list of system-defined codes. Default: US (United States). You can assign any valid ISO 639 code to a user-defined code (U1 to U5).
Step 5	network-locale <i>network-locale-tag</i> [<i>user-defined-code</i>] <i>country-code</i> Example: Router(config-telephony)# network-locale 1 FR	Specifies a country for tones and cadences. • <i>network-locale-tag</i>—Assigns a locale identifier to the country code. Range is 0 to 4. Default: 0. This argument is required when defining some locale other than the default (0). • <i>user-defined-code</i>—(Optional) Assigns one of the user-defined codes to the specified country code. Valid codes are U1, U2, U3, U4, and U5. • <i>country-code</i>—Type ? to display a list of system-defined codes. Default: US (United States). You can assign any valid ISO 3166 code to a user-defined code (U1 to U5).
Step 6	create cnf-files Example: Router(config-telephony)# create cnf-files	Builds the required XML configuration files for IP phones. Use this command after you update configuration file parameters such as the user locale or network locale.
Step 7	exit Example: Router(config-telephony)# exit	Exits telephony-service configuration mode.

	Command or Action	Purpose
Step 8	ephone-template <i>template-tag</i> Example: Router(config)# ephone template 1	Enters ephone-template configuration mode. • <i>template-tag</i>—Unique sequence number that identifies this template during configuration tasks.
Step 9	user-locale <i>user-locale-tag</i> Example: Router(config-ephone-template)# user-locale 2	Assigns a user locale to this ephone template. • <i>user-locale-tag</i>—A locale tag that was created in Step 4, on page 435. Range is 0 to 4.
Step 10	network-locale <i>network-locale-tag</i> Example: Router(config-ephone-template)# network-locale 2	Assigns a network locale to this ephone template. • <i>network-locale-tag</i>—A locale tag that was created in Step 5, on page 435. Range is 0 to 4.
Step 11	exit Example: Router(config-ephone-template)# exit	Exits ephone-template configuration mode.
Step 12	ephone <i>phone-tag</i> Example: Router(config)# ephone 36	Enters ephone configuration mode. • <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks.
Step 13	ephone-template <i>template-tag</i> Example: Router(config-ephone)# ephone-template 1	Applies an ephone template to an ephone. • <i>template-tag</i>—Number of the template to apply to this ephone.
Step 14	exit Example: Router(config-ephone)# exit	Exits ephone configuration mode.
Step 15	telephony-service Example: Router(config)# telephony-service	Enters telephony-service configuration mode.
Step 16	reset { all [<i>time-interval</i>] cancel mac-address <i>mac-address</i> sequence-all } Example: Router(config-telephony)# reset all	Performs a complete reboot of all phones or the specified phone, including contacting the DHCP and TFTP servers for the latest configuration information. • all—All phones in the Cisco Unified CME system. • <i>time-interval</i>—(Optional) Time interval, in seconds, between each phone reset. Range is 0 to 60. Default is 15. • <i>cancel</i>—Interrupts a sequential reset cycle that was started with a reset sequence-all command. • mac-address <i>mac-address</i>—A specific phone.

	Command or Action	Purpose
		• sequence-all—Resets all phones in strict one-at-a-time order by waiting for one phone to reregister before starting the reset for the next phone.
Step 17	end Example: Router(config-telephony) # end	Returns to privileged EXEC mode.

Verify Multiple Locales on SCCP Phones

Procedure

- Step 1** Use the **show telephony-service tftp-bindings** command to display a list of configuration files that are accessible to IP phones using TFTP, including the dictionary, language, and tone configuration files.

Example:

```
Router(config)# show telephony-service tftp-bindings
```

```
tftp-server system:/its/SEPDEFAULT.cnf
tftp-server system:/its/SEPDEFAULT.cnf alias SEPDefault.cnf
tftp-server system:/its/XMLDefault.cnf.xml alias XMLDefault.cnf.xml
tftp-server system:/its/ATADefault.cnf.xml
tftp-server system:/its/XMLDefault7960.cnf.xml alias SEP00036B54BB15.cnf.xml
tftp-server system:/its/germany/7960-font.xml alias German_Germany/7960-font.xml
tftp-server system:/its/germany/7960-dictionary.xml alias German_Germany/7960-dictionary.xml
tftp-server system:/its/germany/7960-kate.xml alias German_Germany/7960-kate.xml
tftp-server system:/its/germany/SCCP-dictionary.xml alias German_Germany/SCCP-dictionary.xml
tftp-server system:/its/germany/7960-tones.xml alias Germany/7960-tones.xml
```

- Step 2** Ensure that per-phone configuration files are defined with the **cnf-file perphone** command.
- Step 3** Use the **show telephony-service ephone-template** command to check the user locale and network locale settings in each ephone template.
- Step 4** Use the **show telephony-service ephone** command to check that the correct templates are applied to phones.
- Step 5** If the configuration file location is not TFTP, use the **debug tftp events** command to see which files Cisco Unified CME is looking for and whether the files are found and opened correctly. There are usually three states (“looking for x file,” “opened x file,” and “finished x file”). The file is found when all three states are displayed. For an external TFTP server you can use the logs from the TFTP server.

Configure Localization Support on SIP Phones

Install System-Defined Locales for Cisco Unified IP Phone 8961, 9951, and 9971

Network locale files allow an IP phone to play the proper network tone for the specified country. You must download and install a tone file for the country you want to support.

User locale files allow an IP phone to display the menus and prompts in the specified language. You must download and install JAR files and dictionary files for each language you want to support.

To download and install locale files for system-defined locales, perform the following steps.

Restriction Phone firmware, configuration files, and locale files must be in the same directory.

Before you begin

- Cisco Unified CME 8.6 or a later version. For Cisco Unified IP Phone 9971, Cisco Unified CME 8.8 or a later version.
- You must have an account on Cisco.com to download locale files.

Procedure

-
- Step 1** Go to <http://www.cisco.com/cgi-bin/tablebuild.pl/CME-Locale>.
- You must have an account on Cisco.com to access the Software Download Center. If you do not have an account or if you have forgotten your username or password, click the appropriate button at the login dialog box and follow the instructions that appear.
- Step 2** Navigate to **Downloads Home > Products > Unified Communications > Call Control > Mid-Market Call Control > Cisco Unified Communications Manager Express > Unified Communications Manager Express Individual File Set** and select your version of Cisco Unified CME.
- Step 3** Select the TAR file for the locale you want to install. Each TAR file contains locale files for a specific language and country and uses the following naming convention: *CME-locale-language_country-CMEversion*
- Example:**
- For example, CME-locale-de_DE-8.6 is German for Germany for Cisco Unified CME 8.6.
- Step 4** Download the TAR file to a TFTP server that is accessible to the Cisco Unified CME router. Each file contains all the firmware required for all phone types supported by that version of Cisco Unified CME.
- Step 5** Use the **archive tar** command to extract the files to flash memory, slot 0, or an external TFTP server.
- Example:**
- ```
Router# archive tar /xtract source-urlflash://file-url
```
- For example, to extract the contents of CME-locale-de\_DE-8.6.tar from TFTP server 192.168.1.1 to router flash memory, use this command:

```
Router# archive tar /xtract tftp://192.168.1.1/cme-locale-de_DE-8.6.tar flash:
```

**Step 6**

See [Table 32: Phone-Type Codes for Locale JAR Files, on page 439](#) and [Table 33: System-Defined User and Network Locales , on page 439](#) for a description of the codes used in the filenames and the list of supported directory names.

Each phone type has a JAR file that uses the following naming convention:

*language-phone-sip.jar*

**Example:**

For example, de-gh-sip.jar is for German on the Cisco Unified IP Phone 8961.

Each TAR file also includes the file g4-tones.xml for country-specific network tones and cadences.

**Table 32: Phone-Type Codes for Locale JAR Files**

| Phone Type | Phone Code |
|------------|------------|
| 3905       | cin        |
| 6941       | rtl        |
| 6945       | rtl        |
| 8961       | gh         |
| 9951       | gd         |
| 9971       | gd         |

**Table 33: System-Defined User and Network Locales**

| Language | Language Code | User-Locale<br>Directory Name      | Country Code | Network-Locale<br>Directory Name |
|----------|---------------|------------------------------------|--------------|----------------------------------|
| English  | en            | English_United_States <sup>7</sup> | US           | United_States                    |
|          |               | English_United_Kingdom             | UK           | United_Kingdom                   |
|          |               |                                    | GB           | United_Kingdom                   |
|          |               |                                    | CA           | Canada                           |
|          |               |                                    | AU           | Australia                        |
| Danish   | dk            | Danish_Denmark                     | DK           | Denmark                          |
| Dutch    | nl            | Dutch_Netherlands                  | NL           | Netherlands                      |
| French   | fr            | French_France                      | FR           | France                           |
|          |               |                                    | CA           | Canada                           |

| Language   | Language Code | User-Locale<br>Directory Name | Country Code | Network-Locale<br>Directory Name |
|------------|---------------|-------------------------------|--------------|----------------------------------|
| German     | de            | German_Germany                | DE           | Germany                          |
|            |               |                               | AT           | Austria                          |
|            |               |                               | CH           | Switzerland                      |
| Italian    | it            | Italian_Italy                 | IT           | Italy                            |
| Japanese   | jp            | Japanese_Japan                | JP           | Japan                            |
| Norwegian  | no            | Norwegian_Norway              | NO           | Norway                           |
| Portuguese | pt            | Portuguese_Portugal           | PT           | Portugal                         |
| Russian    | ru            | Russian_Russia                | RU           | Russian_Federation               |
| Spanish    | es            | Spanish_Spain                 | ES           | Spain                            |
| Swedish    | se            | Swedish_Sweden                | SE           | Sweden                           |

<sup>7</sup> English for the United States is the default language. You do not need to install the JAR file for U.S. English unless you assign a different language to a phone and then want to reassign English.

## Step 7

If you store the locale files in flash memory or slot 0 on the Cisco Unified CME router, create a TFTP alias for the user locale (text displays) and network locale (tones) using this format:

### Example:

```
Router(config)# tftp-server flash:/jar_filealias directory_name/gh-sip.jar
Router(config)# tftp-server flash:/g4-tones.xml aliasdirectory_name/g4-tones.xml
```

Use the appropriate directory name shown in [Table 32: Phone-Type Codes for Locale JAR Files, on page 439](#) and remove the two-letter language code from the JAR file name.

For example, the TFTP aliases for German and Germany for the Cisco Unified IP Phone 8961 are:

```
Router(config)# tftp-server flash:/de-gh-sip.jar alias German_Germany/
Router(config)# tftp-server flash:/g4-tones.xml alias Germany/g4-tones.xml
```

## Step 8

If you store the locale files on an external TFTP server, create a directory under the TFTP root directory for each user and network locale.

Use the appropriate directory name shown in [Table 32: Phone-Type Codes for Locale JAR Files, on page 439](#) and remove the two-letter language code from the JAR file name.

### Example:

For example, the user-locale directory for German and the network-locale directory for Germany for the Cisco Unified IP Phone 8961 are:

TFTP-Root/German\_Germany/gh-sip.jar TFTP-Root/Germany/g4-tones.xml

## Step 9

Assign the locales to the phones. To set a default locale for all phones, use the **user-locale** and **network-locale** commands in voice register global configuration mode.

## Step 10

To support more than one user or network locale, see [Verify Multiple Locales on SIP Phones, on page 446](#).

- Step 11** Use the **create profile** command to rebuild the configuration files.
- Step 12** Use the **reset** command to reset the phones and see the localized displays.

## Use the Locale Installer in Cisco Unified CME 9.0 and Later Versions

### Restriction

- When using an external TFTP server, you must manually create the user locale folders in the root directory. This is a limitation of the TFTP server.
- Locale support is limited to phone firmware versions that are supported by Cisco Unified CME.
- User-defined locales are not supported if the configuration file location is “system:”.
- If you install and configure a user-defined locale using country codes U1-U5 and then you install a new locale using the same label, the phone retains the original language locale even after the phone is reset. This is a limitation of the IP phone. To work around this limitation, you must configure the new package using a different country code.
- Each user-defined country code (U1-U5) can be used for only one user-locale-tag at a time. For example:

```
Router(config-register-global)# user-locale 2 U2 load Finnish.pkg
Router(config-register-global)# user-locale 1 U2 load Chinese.pkg
LOCALE ERROR: User Defined Locale U2 already exists on locale index 2.
```

### Before you begin

- Cisco Unified CME 9.0(1) or a later version.
- When the storage location specified by the **cnf-file location** command is flash memory, sufficient space must be on the flash file system for extracting the contents of the locale TAR file.
- You must have an account on Cisco.com to download locale files.

### Procedure

- Step 1** Go to <http://www.cisco.com/cgi-bin/tablebuild.pl/CME-Locale>
- You must have an account on Cisco.com to access the Software Download Center. If you do not have an account or have forgotten your username or password, click the appropriate button at the login dialog box and follow the instructions that appear.
- Step 2** Navigate to **Downloads Home > Products > Unified Communications > Call Control > Mid-Market Call Control > Cisco Unified Communications Manager Express > Unified Communications Manager Express Individual File Set** and select your version of Cisco Unified CME.
- Step 3** Select the TAR file for the locale you want to install. Each TAR file contains locale files for a specific language and country and uses the following naming convention: *CME-locale-language\_country-CMEversion.tar*

### Example:

For example, CME-locale-de\_DE-German-8.6.3.0.tar is German for Germany for Cisco Unified CME 9.0.

- Step 4** Download the TAR file to the location previously specified by the **cnf-file location** command. Each file contains all the firmware required for all phone types supported by that version of Cisco Unified CME.

With the locale installer, you do not need to perform manual configuration. Instead, you copy the locale file using the **copy** command in privileged EXEC configuration mode.

**Note**

You must copy the locale file into the /its directory (flash:/its or slot0:/its) when you store the locale files on the Cisco Unified CME router.

- a) If the cnf-file location is flash memory: Copy the TAR file to the flash:/its directory.

**Example:**

For example,

```
Router# copy tftp://12.1.1.100/CME-locale-de_DE-German-8.6.3.0.tar flash:/its
```

- b) If the cnf-file location is slot0: Copy the TAR file to the slot0:/its directory.  
c) If the cnf-file location is tftp: Create a folder in the root directory of the TFTP server for each locale using the following format and then copy the TAR file to the TFTP-Root folder.

**Example:**

**TFTP-Root/***TAR-filename*

For system-defined locales, use the locale folder name as shown in [Table 34: System-Defined and User-Defined Locales](#), on page 442. For example, create the folder for system-defined German as follows:

**TFTP-Root/de\_DE-8.6.3.0.tar**

For up to five user-defined locales, use the User\_Define\_n folder name as shown in [Table 34: System-Defined and User-Defined Locales](#), on page 442. A user-defined locale is a language other than the system-defined locales that are predefined in Cisco IOS software. For example, create the folder for user-defined locale Chinese (User\_Define\_1) as follows:

**TFTP-Root/CME-locale-zh\_CN-Chinese-8.6.3.0.tar**

**Note**

For a list of user-defined languages supported in Cisco Unified CME, see Cisco Unified CME Localization Matrix.

**Table 34: System-Defined and User-Defined Locales**

| Language | Locale Folder Name     | Country Code |
|----------|------------------------|--------------|
| English  | English_United_States  | US           |
|          | English_United_Kingdom | UK           |
|          |                        | CA           |
| Danish   | Danish_Denmark         | DK           |
| Dutch    | Dutch_Netherlands      | NL           |

| Language        | Locale Folder Name         | Country Code    |
|-----------------|----------------------------|-----------------|
| French          | French_France              | FR              |
|                 |                            | CA              |
| German          | German_Germany             | DE              |
|                 |                            | AT              |
|                 |                            | CH              |
| Italian         | Italian_Italy              | IT              |
| Japanese        | Japanese_Japan             | JP              |
| Norwegian       | Norwegian_Norway           | NO              |
| Portuguese      | Portuguese_Portugal        | PT              |
| Russian         | Russian_Russia             | RU              |
| Spanish         | Spanish_Spain              | ES              |
| Swedish         | Swedish_Sweden             | SE              |
| Un <sup>8</sup> | User_Define_n <sup>1</sup> | Un <sup>1</sup> |

<sup>8</sup> Where “n” is a number from 1 to 5.

**Step 5** Use the **user-locale** *[user-locale-tag] {[user-defined-code]country-code} [load TAR-filename]* command in voice register global configuration mode to extract the contents of the TAR file. For country codes, see [Table 34: System-Defined and User-Defined Locales](#), on page 442.

**Note**

Use the complete filename, including the file suffix (.tar), when you configure the **user-locale** command for all Cisco Unified SIP IP phone types.

**Example:**

For example, to extract the contents of the CME-locale-zh\_CN-Chinese-8.6.3.0.tar file when U1 is the country code for user-defined locale Chinese (User\_Define\_1), use this command:

```
Router(config-register-global) # user-locale U1 load CME-locale-zh_CN-Chinese-8.6.3.0.tar
```

**Step 6** Assign the locales to the phones. See [Configure Multiple Locales on SIP Phones](#), on page 444.

**Step 7** Use the **create profile** command in voice register global configuration mode to generate the configuration profile files required for Cisco Unified SIP IP phones.

**Step 8** Use the **reset** command to reset the phones and see the localized displays.

# Configure Multiple Locales on SIP Phones

To define one or more alternatives to the default user and network locales and apply them to individual phones, perform the following steps.

## Restriction

- Multiple user and network locales are supported only on Cisco Unified IP Phone 8961, 9951, and 9971.

## Before you begin

- Cisco Unified CME 8.6 or a later version. For Cisco Unified IP Phone 9971, Cisco Unified CME 8.8 or a later version.
- To specify alternative user and network locales for individual phones in a Cisco Unified CME system, you must use per-phone configuration files. For more information, see [Install System-Defined Locales for Cisco Unified IP Phone 6921, 6945, 7906, 7911, 7921, 7931, 7941, 7961, 7970, 7971, and Cisco IP Communicator](#), on page 423.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **user-locale** *[user-locale-tag]* { *[user-defined-code]* *country-code* }
5. **network-locale** *network-locale-tag* *[user-defined-code]* *country-code*
6. **create profile**
7. **exit**
8. **voice register template** *template-tag*
9. **user-locale** *user-locale-tag*
10. **network-locale** *network-locale-tag*
11. **exit**
12. **voice register pool** *pool-tag*
13. **voice register template** *template-tag*
14. **exit**
15. **voice register global**
16. **reset**
17. **end**

## DETAILED STEPS

### Procedure

|        | Command or Action | Purpose                                                                              |
|--------|-------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>     | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b>   | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>Router&gt; enable</code>                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>                                                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>voice register global</b><br><b>Example:</b><br><code>Router(config)#voice register global</code>                                                                                    | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>user-locale</b> [ <i>user-locale-tag</i> ] { [ <i>user-defined-code</i> ] <i>country-code</i> }<br><b>Example:</b><br><code>Router(config-register-global)# user-locale 1 DE</code>  | Specifies a language for phone displays. <ul style="list-style-type: none"> <li>• <i>user-locale-tag</i>—Assigns a locale identifier to the locale. Range is 0 to 4. Default: 0. This argument is required when defining some locale other than the default (0).</li> <li>• <i>country-code</i>—Type ? to display a list of system-defined codes. Default: US (United States).</li> </ul>                                                                                       |
| <b>Step 5</b> | <b>network-locale</b> <i>network-locale-tag</i> [ <i>user-defined-code</i> ] <i>country-code</i><br><b>Example:</b><br><code>Router(config-register-global)# network-locale 1 FR</code> | Specifies a country for tones and cadences. <ul style="list-style-type: none"> <li>• <i>network-locale-tag</i>—Assigns a locale identifier to the country code. Range is 0 to 4. Default: 0. This argument is required when defining some locale other than the default (0).</li> <li>• <i>country-code</i>—Type ? to display a list of system-defined codes. Default: US (United States). You can assign any valid ISO 3166 code to a user-defined code (U1 to U5).</li> </ul> |
| <b>Step 6</b> | <b>create profile</b><br><b>Example:</b><br><code>Router(config-register-global)# create profile</code>                                                                                 | Generates provisioning files required for SIP phones and writes the file to the location specified with the <code>tftp-path</code> command.                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-telephony)# exit</code>                                                                                                           | Exits voice register global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 8</b> | <b>voice register template</b> <i>template-tag</i><br><b>Example:</b><br><code>Router(config)voice register template 10</code>                                                          | Enters voice register template configuration mode to define a template of common parameters for SIP phones in Cisco Unified CME. <ul style="list-style-type: none"> <li>• Range— 1 to 10.</li> </ul>                                                                                                                                                                                                                                                                            |
| <b>Step 9</b> | <b>user-locale</b> <i>user-locale-tag</i><br><b>Example:</b><br><code>Router(config-ephone-template)# user-locale 2</code>                                                              | Assigns a user locale to this ephone template. <ul style="list-style-type: none"> <li>• <i>user-locale-tag</i>—A locale tag that was created in <a href="#">Step 4, on page 445</a>. Range is 0 to 4.</li> </ul>                                                                                                                                                                                                                                                                |

|                | Command or Action                                                                                                      | Purpose                                                                                                                                                                                                                 |
|----------------|------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 10</b> | <b>network-locale</b> <i>network-locale-tag</i><br><b>Example:</b><br>Router(config-ephone-template)# network-locale 2 | Assigns a network locale to this ephone template.<br><ul style="list-style-type: none"><li>• <i>network-locale-tag</i>—A locale tag that was created in <a href="#">Step 5, on page 445</a>. Range is 0 to 4.</li></ul> |
| <b>Step 11</b> | <b>exit</b><br><b>Example:</b><br>Router(config-ephone-template)# exit                                                 | Exits voice register template configuration mode.                                                                                                                                                                       |
| <b>Step 12</b> | <b>voice register pool</b> <i>pool-tag</i><br><b>Example:</b><br>Router(config)#voice register pool 5                  | Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone.                                                                                                                         |
| <b>Step 13</b> | <b>voice register template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)voice register template 10      | Enters voice register template configuration mode to define a template of common parameters for SIP phones in Cisco Unified CME.<br><ul style="list-style-type: none"><li>• Range— 1 to 10.</li></ul>                   |
| <b>Step 14</b> | <b>exit</b><br><b>Example:</b><br>Router(config-ephone)# exit                                                          | Exits voice register template configuration mode.                                                                                                                                                                       |
| <b>Step 15</b> | <b>voice register global</b><br><b>Example:</b><br>Router(config)#voice register global                                | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.                                                                                                    |
| <b>Step 16</b> | <b>reset</b><br><b>Example:</b><br>Router(config-register-global)# reset                                               | Performs a complete reboot of all phones or the specified phone, including contacting the DHCP and TFTP servers for the latest configuration information.                                                               |
| <b>Step 17</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-global)# end                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                        |

## Verify Multiple Locales on SIP Phones

### Procedure

- Step 1** Use the **show voice register tftp-bind** command to display a list of configuration files that are accessible to IP phones using TFTP, including the dictionary, language, and tone configuration files.

**Example:**

```
Router#sh voice register tftp-bind
tftp-server syncinfo.xml url system:/cme/sipphone/syncinfo.xml
tftp-server SIPDefault.cnf url system:/cme/sipphone/SIPDefault.cnf
tftp-server softkeyDefault_kpml.xml url system:/cme/sipphone/softkeyDefault_kpml.xml
tftp-server softkeyDefault.xml url system:/cme/sipphone/softkeyDefault.xml
tftp-server softkey2_kpml.xml url system:/cme/sipphone/softkey2_kpml.xml
tftp-server softkey2.xml url system:/cme/sipphone/softkey2.xml
tftp-server featurePolicyDefault.xml url system:/cme/sipphone/featurePolicyDefault.xml
tftp-server featurePolicy2.xml url system:/cme/sipphone/featurePolicy2.xml
tftp-server SEPACA016FDC1BD.cnf.xml url system:/cme/sipphone/SEPACA016FDC1BD.cnf.xml
```

- Step 2** Use the **show voice register template all** command to check the user locale and network locale settings in each ephone template.
- Step 3** Use the **show voice register pool all** command to check that the correct templates are applied to phones.
- Step 4** If the configuration file location is not TFTP, use the **debug tftp events** command to see which files Cisco Unified CME is looking for and whether the files are found and opened correctly. There are usually three states (“looking for x file,” “opened x file,” and “finished x file”). The file is found when all three states are displayed. For an external TFTP server, you can use the logs from the TFTP server.

## Configuration Examples for Localization

### Example for Configuring Multiple User and Network Locales

The following example sets the default locale of 0 to Germany, which defines Germany as the default user and network locale. Germany is used for all phones unless you apply a different locale to individual phones using ephone templates.

```
telephony service
 cnf-file location flash:
 cnf-file perphone
 user-locale 0 DE
 network-locale 0 DE
```

After using the previous commands to define Germany as the default user and network locale, use the following commands to return the default value of 0 to US:

```
telephony service
 no user-locale 0 DE
 no network-locale 0 DE
```

Another way to define Germany as the default user and network locale is to use the following commands:

```
telephony service
 cnf-file location flash:
 cnf-file perphone
 user-locale DE
 network-locale DE
```

After using the previous commands, use the following commands to return the default to US:

```
telephony service
 no user-locale DE
 no network-locale DE
```

The following example defines three alternative locales: JP (Japan), FR (France), and ES (Spain). The default is US for all phones that do not have an alternative applied using ephone templates. In this example, ephone 11 uses JP for its locales, ephone 12 uses FR, ephone 13 uses ES, and ephone 14 uses the default, US.

```
telephony-service
 cnf-file location flash:
 cnf-file perphone
 create cnf-files
 user-locale 1 JP
 user-locale 2 FR
 user-locale 3 ES
 network-locale 1 JP
 network-locale 2 FR
 network-locale 3 ES
 create cnf-files

 ephone-template 1
 user-locale 1
 network-locale 1

 ephone-template 2
 user-locale 2
 network-locale 2

 ephone-template 3
 user-locale 3
 network-locale 3

 ephone 11
 button 1:25
 ephone-template 1

 ephone 12
 button 1:26
 ephone-template 2

 ephone 13
 button 1:27
 ephone-template 3

 ephone 14
 button 1:28
```

## Example for Configuring User-Defined Locales

The following example shows user-locale tag 1 assigned to code U1, which is defined as ZH for Traditional Chinese. Traditional Chinese is not predefined in the system so you must download the appropriate XML files to support this language.

In this example, ephone 11 uses Traditional Chinese (ZH) and ephone 12 uses the default, US English. The default is US English for all phones that do not have an alternative applied using ephone templates.

```
telephony-service
 cnf-file location flash:
 cnf-file perphone
 user-locale 1 U1 ZH
 network-locale 1 U1 CN

 ephone-template 2
 user-locale 1
 network-locale 1
```

```
ephone 11
 button 1:25
 ephone-template 2

ephone 12
 button 1:26
```

## Example for Configuring Chinese as the User-Defined Locale

The following is a sample output from the **user-locale** command when you configure the Chinese language as the user-defined locale in Cisco Unified CME:

```
Router(config-register-global)# user-locale U1 load chinese.pkg
Updating CNF files

LOCALE INSTALLER MESSAGE: VER:1
LOCALE INSTALLER MESSAGE: Langcode:zh
LOCALE INSTALLER MESSAGE: Language:Chinese
LOCALE INSTALLER MESSAGE: Filename: 7905-dictionary.xml

## Example for Configuring Swedish as the System-Defined Locale

The following is a sample output from the **user-locale** command when you configure the Swedish language as the system-defined locale in Cisco Unified CME:

```
Router(config-register-global)# user-locale SE load swedish.pkg
Updating CNF files

LOCALE INSTALLER MESSAGE: VER:1
LOCALE INSTALLER MESSAGE: Langcode:se
LOCALE INSTALLER MESSAGE: Language:swedish
LOCALE INSTALLER MESSAGE: Filename: g3-tones.xml
LOCALE INSTALLER MESSAGE: Filename: gp-sccp.jar
LOCALE INSTALLER MESSAGE: Filename: ipc-sccp.jar
```

```

LOCALE INSTALLER MESSAGE: Filename: mk-sccp.jar
LOCALE INSTALLER MESSAGE: Filename: tc-sccp.jar
LOCALE INSTALLER MESSAGE: Filename: td-sccp.jar
LOCALE INSTALLER MESSAGE: New Locale configured

CNF-FILES: Clock is not set or synchronized, retaining old versionStamps
CNF files updating complete

```

## Configuration Examples for Locale Installer on SCCP Phones

### System-Defined Locale is the Default Applied to All Phones

The following example is the output from the **user-locale** command when you configure a system-defined locale for Cisco Unified CME and the locale is on the default locale index (user-locale-tag 0). The *user-locale-tag* argument is required only when using multiple locales; otherwise, the specified language is the default applied to all SCCP phones.

```

Router(config-telephony)# user-locale SE load CME-locale-sv_SV-7.0.1.1a.tar
Updating CNF files

LOCALE INSTALLER MESSAGE: VER:1
LOCALE INSTALLER MESSAGE: Langcode:se
LOCALE INSTALLER MESSAGE: Language:swedish
LOCALE INSTALLER MESSAGE: Filename: g3-tones.xml
LOCALE INSTALLER MESSAGE: Filename: gp-sccp.jar
LOCALE INSTALLER MESSAGE: Filename: ipc-sccp.jar
LOCALE INSTALLER MESSAGE: Filename: mk-sccp.jar
LOCALE INSTALLER MESSAGE: Filename: tc-sccp.jar
LOCALE INSTALLER MESSAGE: Filename: td-sccp.jar
LOCALE INSTALLER MESSAGE: New Locale configured

CNF-FILES: Clock is not set or synchronized, retaining old versionStamps
CNF files updating complete
Router(config-telephony)# create cnf-files
Router(config-telephony)# ephone 3
Router(config-ephone)# reset

```

### User-Defined Locale is Default Language to be Applied to All Phones

The following example is the output from the **user-locale** command when you configure a user-defined locale for Cisco Unified CME and the locale is on the default locale index (user-locale-tag 0). The *user-locale-tag* argument is required when using multiple locales, otherwise the specified language is the default applied to all SCCP phones.

```

Router(config-telephone)# user-locale U1 load CME-locale-xh_CN-7.0.1.1.tar
Updating CNF files
LOCALE INSTALLER MESSAGE: VER:1
LOCALE INSTALLER MESSAGE: Langcode:fi
LOCALE INSTALLER MESSAGE: Language:Finnish

Router(config-telephony)# create cnf-files
Router(config-telephony)# ephone 3
Router(config-ephone)# reset

```

## Locale on a Non-default Locale Index

The following example is the output from the **user-locale** command if you configure a user-defined locale as an alternate locale for a particular SCCP phone (ephone 1) in Cisco Unified CME. The *user-locale-tag* argument is required only when using multiple locales. In this configuration, the locale is user-defined Finnish (U2) on user-locale index 2.

```

Router(config-telephony)# user-locale 2 U2 load CME-locale-fi_FI-7.0.1.1.tar
Updating CNF files

LOCALE INSTALLER MESSAGE: VER:1
LOCALE INSTALLER MESSAGE: Langcode:fi

## Examples for Configuring Multiple User and Network Locales on SIP Phones

The following example sets the default locale of 0 to Germany, which defines Germany as the default user and network locale. Germany is used for all phones unless you apply a different locale to individual phones using ephone templates.

```

voice register global
 user-locale 0 DE
 network-locale 0 DE

```

After using the previous commands to define Germany as the default user and network locale, use the following commands to return the default value of 0 to US:

```

voice register global
 no user-locale 0 DE
 no network-locale 0 DE

```

Another way to define Germany as the default user and network locale is to use the following commands:

```

voice register global
 user-locale DE
 network-locale DE

```

After using the previous commands, use the following commands to return the default to US:

```

voice register global
 no user-locale DE
 no network-locale DE

```

### SIP: Alternative Locales

The following example defines three alternative locales: JP (Japan), FR (France), and ES (Spain). The default is US for all phones that do not have an alternative applied using ephone templates. In this example, ephone 11 uses JP for its locales, ephone 12 uses FR, ephone 13 uses ES, and ephone 14 uses the default, US.

```

voice register global
 create profile
 user-locale 1 JP
 user-locale 2 FR
 user-locale 3 ES
 network-locale 1 JP
 network-locale 2 FR
 network-locale 3 ES
 create profile

voice register template 1
 user-locale 1

```

```

network-locale 1

voice register template 2
 user-locale 2
 network-locale 2

voice register pool 1
 number 1 dn 1
 template 1
 user-locale 3
 network-locale 3

voice register pool 2
 number 2 dn 2
 template 2

voice register pool 6
 number 3 dn 3
 template 3

```

## Example for Configuring Locale Installer on SIP Phones

The following example shows how the locale installer only requires you to copy the locale file using the **copy** command in privileged EXEC configuration mode to configure a locale on a Cisco Unified SIP IP phone. The example also shows that the locale file has been copied in the /its directory.

```

Router# copy tftp://100.1.1.1/CME-locale-de_DE-German-8.6.3.0.tar flash:/its
Destination filename [/its/CME-locale-de_DE-German-8.6.3.0.tar]?
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# voice register global
Router(config-register-global)# user-locale DE load
CME-locale-de_DE-German-8.6.3.0.tar
LOCALE INSTALLER MESSAGE (SIP):Loading Locale Package...
LOCALE INSTALLER MESSAGE: VER:3
LOCALE INSTALLER MESSAGE: Langcode:de_DE
LOCALE INSTALLER MESSAGE: Language:German
LOCALE INSTALLER MESSAGE: Filename: g3-tones.xml
LOCALE INSTALLER MESSAGE: Filename: tags_file
LOCALE INSTALLER MESSAGE: Filename: utf8_tags_file
LOCALE INSTALLER MESSAGE: Filename: gd-sip.jar
LOCALE INSTALLER MESSAGE: Filename: gh-sip.jar
LOCALE INSTALLER MESSAGE: Filename: g4-tones.xml
LOCALE INSTALLER MESSAGE: New Locale configured
Router(config-register-global)#

```

## Where to Go Next

### Ephone Templates

For more information about ephone templates, see [Templates](#), on page 1423.

## Feature Information for Localization Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 35: Feature Information for Localization Support**

| Feature Name                                              | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                                                                                                                                           |

## CHAPTER 13

# Dial Plans

This chapter describes features that enable Cisco Unified Communications Manager Express (Cisco Unified CME) to expand or manipulate internal extension numbers so that they conform to numbering plans used by external systems.

- [Information About Dial Plans, on page 455](#)
- [Configure Dial Plans, on page 461](#)
- [Configuration Examples for Dial Plan Features, on page 478](#)
- [Feature Information for Dial Plan Features, on page 480](#)

## Information About Dial Plans

### Phone Number Plan

If you install a Cisco Unified CME system to replace an older telephony system that had an established telephone number plan, you can retain the old number plan. Cisco Unified CME supports flexible extension number lengths and can provide automatic conversion between extension dialing and E.164 public telephone number dialing.

When a router receives a voice call, it selects an outbound dial peer by comparing the called number (the full E.164 telephone number) in the call information with the number configured as the destination pattern for the POTS dial peer. The router then strips out the left-justified numbers corresponding to the destination pattern matching the called number. If you have configured a prefix, the prefix will be put in front of the remaining numbers, creating a dial string, which the router will then dial. If all numbers in the destination pattern are stripped-out, the user will receive (depending on the attached equipment) a dial tone.

A successful Cisco Unified CME system requires a telephone numbering plan that supports future expansion. The numbering plan also must not overlap or conflict with other numbers that are on the same VoIP network or are part of a centralized voice mail system.

Cisco Unified CME supports shared lines and multiple lines configured with the same extension number. This means that you can set up several phones to share an extension number to provide coverage for that number. You can also assign several line buttons on a single phone to the same extension number to create a small hunt group.

If you are configuring more than one Cisco Unified CME site, you need to decide how calls between the sites will be handled. Calls between Cisco Unified CME phones can be routed either through the PSTN or over VoIP. If you are routing calls over VoIP, you must decide among the following three choices:

- You can route calls using a global pool of fixed-length extension numbers. For example, all sites have unique extension numbers in the range 5000 to 5999, and routing is managed by a gatekeeper. If you select this method, assign a subrange of extension numbers to each site so that duplicate number assignment does not result. You will have to keep careful records of which Cisco Unified CME system is assigned which number range.
- You can route calls using a local extension number plus a special prefix for each Cisco Unified CME site. This choice allows you to use the same extension numbers at more than one site.
- You can use an E.164 PSTN phone number to route calls over VoIP between Cisco Unified CME sites. In this case, intersite callers use the PSTN area code and local prefix to route calls between Cisco Unified CME systems.

If you choose to have a gatekeeper route calls among multiple Cisco Unified CME systems, you may face additional restrictions on the extension number formats that you use. For example, you might be able to register only PSTN-formatted numbers with the gatekeeper. The gatekeeper might not allow the registration of duplicate telephone numbers in different Cisco Unified CME systems, but you might be able to overcome this limitation. Cisco Unified CME allows the selective registration of either 2- to 5-digit extension numbers or 7- to 10-digit PSTN numbers, so registering only PSTN numbers might prevent the gatekeeper from sensing duplicate extensions.

Mapping of public telephone numbers to internal extension numbers is not restricted to simple truncation of the digit string. Digit substitutions can be made by defining dial plan patterns to be matched. For information about dial plans, see [Dial Plan Patterns, on page 456](#). More sophisticated number manipulations can be managed with voice translation rules and voice translation profiles, which are described in the [Voice Translation Rules and Profiles](#) section.

In addition, your selection of a numbering scheme for phones that can be directly dialed from the PSTN is limited by your need to use the range of extensions that are assigned to you by the telephone company that provides your connection to the PSTN. For example, if your telephone company assigns you a range from 408 555-0100 to 408 555-0199, you may assign extension numbers only in the range 100 to 199 if those extensions are going to have Direct Inward Dialing (DID) access. For more information about DID, see [Direct Inward Dialing Trunk Lines, on page 457](#).

## Dial Plan Patterns

A dial plan pattern enables abbreviated extensions to be expanded into fully qualified E.164 numbers. Use dial plan patterns when configuring a network with multiple Cisco Unified CMEs to ensure that the appropriate calling number, extension or E.164 number, is provided to the target Cisco Unified CME, and appears on the phone display of the called phone. In networks that have a single router, you do not need to use dial plan patterns.

When you define a directory number for an SCCP phone, the Cisco Unified CME system automatically creates a POTS dial peer with the ephone-dn endpoint as a destination. For SIP phones connected directly into Cisco Unified CME, the dial peer is automatically created when the phone registers. By default, Cisco Unified CME creates a single POTS dial peer for each directory number.

For example, when the ephone-dn with the number 1001 was defined, the following POTS dial peer was automatically created for it:

```
dial-peer voice 20001 pots
destination-pattern 1001
voice-port 50/0/2
```

A dial plan pattern builds additional dial peers for the expanded numbers it creates. If a dialplan pattern is configured and it matches against a directory number, two POTS dial peers are created, one for the abbreviated number and one for the complete E.164 direct-dial telephone number.

For example, if you then define a dial plan pattern that 1001 will match, such as 408555001, a second dial peer is created so that calls to both the 0001 and 4085550001 numbers are completed. In this example, the additional dial peer that is automatically created looks like the following:

```
dial-peer voice 20002 pots
destination-pattern 40855510001
voice-port 50/0/2
```

In networks with multiple routers, you may need to use dial plan patterns to expand extensions to E.164 numbers because local extension numbering schemes can overlap each other. Networks with multiple routers have authorities such as gatekeepers that route calls through the network. These authorities require E.164 numbers so that all numbers in the network are unique. Define dial plan patterns to expand extension numbers into unique E.164 numbers for registering with a gatekeeper. For more information on E.164 numbers, see [E.164 Enhancements, on page 458](#).

If multiple dial plan patterns are defined, the system matches extension numbers against the patterns in sequential order, starting with the lowest numbered dial plan pattern tag first. Once a pattern matches an extension number, the pattern is used to generate an expanded number. If additional patterns subsequently match the extension number, they are not used.

## Direct Inward Dialing Trunk Lines

Direct Inward Dialing (DID), is a one-way incoming trunking mechanism, that allows an external caller to directly reach a specific extension without the call being served by an attendant or other intervention.

It is a service offered in which the last few (typically three or four) digits dialed by the caller are forwarded to the called party on a special DID trunk. For example, all the phone numbers from 555-0000 to 555-0999 could be assigned to a company with 20 DID trunks. When a caller dials any number in this range, the call is forwarded on any available trunk. If the caller dialed 555-0234, then the digits 2, 3, and 4 are forwarded. These DID trunks could be terminated on a PBX, so that the extension 234 gets the call without operator assistance. This makes it look as though 555-0234 and the other 999 lines all have direct outside lines, while only requiring 20 trunks to service the 1,000 telephone extensions. Using DID, a company can offer its customers individual phone numbers for each person or workstation within the company without requiring a physical line into the PBX for each possible connection. Compared to regular PBX service, DID saves the cost of a switchboard operator. Calls go through faster, and callers feel they are calling a person rather than a company.

Dial plan patterns are required to enable calls to DID numbers. When the PSTN connects a DID call for “4085550234” to the Cisco Unified CME system, it also forwards the extension digits “234” to allow the system to route the call.

## Voice Translation Rules and Profiles

Translation rules manipulate dialed numbers to conform to internal or external numbering schemes. Voice translation profiles allow you to group translation rules together and apply them to the following types of numbers:

- Called numbers (DNIS)

- Calling numbers (ANI)
- Redirected called numbers
- Redirected target numbers—These are transfer-to numbers and call-forwarding final destination numbers. Supported by SIP phones in Cisco Unified CME 4.1 and later versions.

After you define a set of translation rules and assign them to a translation profile, you can apply the rules to incoming and outgoing call legs to and from the Cisco Unified CME router based on the directory number. Translation rules can perform regular expression matches and replace substrings. A translation rule replaces a substring of the input number if the number matches the match pattern, number plan, and type present in the rule.

For configuration information, see [Define Voice Translation Rules in Cisco CME 3.2 and Later Versions, on page 464](#).

For examples of voice translation rules and profiles, see the [Voice Translation Rules](#) technical note and the [Number Translation using Voice Translation Profiles](#) technical note.

## Secondary Dial Tone

A secondary dial tone is available for Cisco Unified IP phones connected to Cisco Unified CME. From Cisco Unified CME Release 11.6 onwards, secondary dial tone is supported on both SIP phones and SCCP phones.

The secondary dial tone is generated when a phone user dials a predefined PSTN access prefix and terminates when additional digits are dialed. An example is when a secondary dial tone is heard after a PSTN access prefix, such as the number 9, is dialed to reach an outside line. For SIP phones, a dialplan file is downloaded when the phone restarts. This dialplan file will have the dialplan pattern configured. Based on this dialplan pattern, phone would collect the digits or play secondary dial tone if there is a comma (,) in the pattern. The call is placed from the phone, when there is matching pattern in the dialplan file. Also note that when this feature is enabled, KPML digit collection is disabled on SIP phones.

For configuration information, see [Activate Secondary Dial Tone For SCCP Phones, on page 473](#) and [Activate Secondary Dial Tone for SIP Phones, on page 474](#).

## E.164 Enhancements

Cisco Unified CME 8.5 allows you to present a phone number in +E.164 telephone numbering format. E.164 is an International Telecommunication Union (ITU-T) recommendation that defines the international public telecommunication numbering plan used in the PSTN and other data networks. E.164 defines the format of telephone numbers. A leading +E.164 telephone number can have a maximum of 15 digits and is usually written with a '+' prefix defining the international access code. To dial such numbers from a normal fixed line phone, the appropriate international call prefix must be used.

The leading +E.164 number is unique number specified to a phone or a device. Callers from around the world dial the leading +E.164 phone number to reach a phone or a device without the need to know local or international prefix. The leading +E.164 feature also reduces the overall telephony configuration process by eliminating the need to further translate the telephone numbers.

### Phone Registration with Leading +E164 Number

In Cisco Unified CME, phones register using the leading '+' dialing plan in two ways. Phones can either register with the extension number or with leading +E.164 number.

When phones are registered with extension number, the phones will have a dial peer association with the extension number. The **dialplan-pattern** command is enhanced to allow you to configure leading + phone numbers on the dialplan pattern. Once dialplan-pattern is configured, there could be an E.164 number dialpeer associated with the same phone.

For example, phones registered with extension number 1111 can also be reached by dialing +13332221111. This phone registration method is beneficial in two ways, that is, locally, phones are able to reach each other by just dialing the extension numbers and, remotely, phones can dial abbreviated numbers which are translated as an E.164 number at the outgoing dial-peer. See [Example 1, on page 459](#) for more information.

**Note** There are instances where phone is registered with Unified CME using the extension number. If the user has to reach the phone using the full +E.164 number, a dial peer needs to be configured for the full number. This is applicable only when the extension-length is specified to have the same length as extension number.

When phones are registered with a leading + E.164 number, there is only one leading + E.164 number associated with the phone. The **demote** option in the **dialplan-pattern** command allows the phone to have two dialpeers associated with the same phone. For more information on configuring the dialplan-patterns, see [Configure Dial Plans, on page 461](#).

For example, a phone registered with + E.164 phone number +12223331111 will have two dialpeers associated with the same phone that is, +12223331111 and 1111. See [Example 2 , on page 459](#).

### Example 1

In the following example, phones are registered with extension number 1111 but they can be reached by either dialing the 4-digit extension number, or a leading + E.164 number (+12223331111). When the dial-peer pattern is configured, phones can also be reached by dialing its + E.164 number. The phone can be reached by dialing either the 4-digit extension number or the + E.164 number.

```
!
ephone-dn 1
 number 1111
!
ephone 1
 button 1:1
!
telephony-service
 dialplan-pattern 1 +1222333.... extension-length 4
!
voice register dn 1
 number 1235
!
voice register pool 1
 number 1 dn 1
!
voice register global
 dialplan-pattern 1 +1222333.... extension-length 4
```

### Example 2

In the following example, phones are registered with leading + E.164 number (+12223331111) and the phones can be reached by dialing either the 4-digit extension number or the + E.164 number. In this example, phone can be reached by dialing 1111 or the +E.164 number.

## Example 3

```

!
ephone-dn 1
 number +12223331111

!
ephone 1
 button 1:1

!
telephony-service
 dialplan-pattern 1 +1222333.... extension-length 4 demote

!
voice register dn 1
 number +12223331235

!
voice register pool 1
 number 1 dn 1

!
voice register global
 dialplan-pattern 1 +1222333.... extension-length 4 demote

```

---

**Note** Because the legacy phone does not have a '+' button, you can configure dialplan-pattern or translation profile.

---

## Example 3

In the following example, phones are registered with leading + E.164 number (+12223331111) for SCCP phone and +12223331235 for SIP phone) and the phones can be reached by dialing either the 6-digit number or the + E.164 number. The phone number +12223331234 can be reached by dialing either the 6-digit demoted number or the + E.164 number.

```

!
ephone-dn 1
 number +12223331111

!
ephone 1
 button 1:1

!
telephony-service
 dialplan-pattern 1 +1222333.... extension-length 6 demote

!
voice register dn 1
 number +12223331235

!
voice register pool 1
 number 1 dn 1

!
voice register global
 dialplan-pattern 1 +1222333.... extension-length 6 demote

```

After the CLI for demote is configured to extension-length 6, you can dial 331235 for SIP phone, and 331111 for SCCP phone.

## Callback and Calling Number Display

In earlier versions of Cisco Unified CME and Cisco Unified SRST, the calling number (number from an incoming call ringing on your phone) was used for both callback (number displayed under Missed Calls in your local phone directory number) and calling numbers. The + E.164 feature in Cisco Unified CME 8.5, allows you to display both calling number and callback numbers in appropriate format so that you are not required to edit the phone numbers before placing a call. The calling number is displayed on the phone when you configure the **translation-profile outgoing** command in ephone-dn or voice register dn mode.

The **translate callback-number** configuration in voice translation-profile allows you to translate the callback number and display it in E.164 format. The **translate callback number** configuration is only applicable for outgoing calls on SIP and SCCP IP phones. When **translate callback number** is configured, the extra callback field is displayed and if the number matches the translation rule, it is translated. For more information see [Define Translation Rules for Callback-Number on SIP Phones, on page 475](#).

Similarly, in Cisco Unified SRST 8.5, you can configure **translate calling** under **voice translation-profile** mode to display the calling number. You can configure **translation-profile outgoing** in **call-manager-fallback** mode or **voice register pool** to display the callback number. You can use **translate called** command in **translation-profile** and **call-manager-fallback** or **voice register pool** will try to match the called number to do the translation. See [Enabling Translation Profiles](#) for more information.

The leading '+' in the E.164 number is stripped from the called and calling numbers if the called endpoint or gateway, such as H323 or QSIG gateway, does not support the leading '+' sign in the E.164 number translation. You can strip the leading '+' sign from the number you are calling or a called number using the **translation-profile incoming** or **translation-profile outgoing** commands.

# Configure Dial Plans

## Configure SCCP Dial Plan Patterns

**Tip** In networks that have a single router, you do not need to define dial plan patterns.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **dialplan-pattern tag pattern extension-length length [extension-pattern epattern] [no-reg]**
5. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                        | Purpose                                                                                                            |

| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br><pre>Router(config)# telephony-service</pre>                                                                                                                                                                                                                                                                                              | Enters telephony-service configuration mode.                                                                       |
| <b>Step 4</b> | <b>dialplan-pattern tag pattern extension-length length</b><br><b>[extension-pattern epattern] [no-reg]</b><br><b>Example:</b><br><pre>Router(config-telephony)# dialplan-pattern 1 4085550100 extension-length 3 extension-pattern 4..</pre> <b>Note</b><br>This example maps all extension numbers 4xx to the PSTN number 40855501xx, so that extension 412 corresponds to 4085550112. | Maps a digit pattern for an abbreviated extension-number prefix to the full E.164 telephone number pattern.        |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-telephony)# end</pre>                                                                                                                                                                                                                                                                                                                | Exits configuration mode and enters privileged EXEC mode.                                                          |

## Configure SIP Dial Plan Patterns

To create and apply a pattern for expanding individual abbreviated SIP extensions into fully qualified E.164 numbers, follow the steps in this section. dial plan pattern expansion affects calling numbers and for call forward using B2BUA, redirecting, including originating and last reroute, numbers for SIP extensions in Cisco Unified CME.

**Before you begin**

Cisco Unified CME 4.0 or a later version.

## SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **voice register global**
4. **dialplan-pattern** *tag pattern extension-length extension-length* [**extension-pattern** *extension-pattern* | **no-reg**]
5. **call-forward system redirecting-expanded**
6. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                                                                                     | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                                                                                | Enters global configuration mode.                                                                                                                                                  |
| <b>Step 3</b> | <b>voice register global</b><br><b>Example:</b><br><pre>Router(config)# voice register global</pre>                                                                                                                                                                  | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.                                                               |
| <b>Step 4</b> | <b>dialplan-pattern</b> <i>tag pattern extension-length extension-length</i> [ <b>extension-pattern</b> <i>extension-pattern</i>   <b>no-reg</b> ]<br><b>Example:</b><br><pre>Router(config-register-global)# dialplan-pattern 1 4085550... extension-length 5</pre> | Defines pattern that is used to expand abbreviated extension numbers of SIP calling numbers in Cisco Unified CME into fully qualified E.164 numbers.                               |
| <b>Step 5</b> | <b>call-forward system redirecting-expanded</b><br><b>Example:</b><br><pre>Router(config-register-global)# call-forward system redirecting-expanded</pre>                                                                                                            | Applies dial plan pattern expansion globally to redirecting, including originating and last reroute, numbers for SIP extensions in Cisco Unified CME for call forward using B2BUA. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-register-global)# end</pre>                                                                                                                                                                                      | Exits configuration mode and enters privileged EXEC mode.                                                                                                                          |

## Verify Dial Plan Patterns

### SUMMARY STEPS

1. **show telephony-service**

## 2. SCCP: **show telephony-service dial-peer** or SIP: **show dial-peer summary**

### DETAILED STEPS

#### Procedure

##### Step 1 **show telephony-service**

Use this command to verify dial plan patterns in the configuration.

##### Example:

The following example maps the extension pattern 4.. to the last three digits of the dial plan pattern 4085550155:

```
telephony-service
dialplan-pattern 1 4085550155 extension-length 3 extension-pattern 4..
```

##### Step 2 **SCCP: show telephony-service dial-peer** or SIP: **show dial-peer summary**

Use the command to display dial peers that are automatically created by the **dialplan-pattern** command.

Use this command display the configuration for all VoIP and POTS dial peers configured for a router, including dial peers created by using the **dialplan-expansion (voice register)** command.

##### Example:

The following example is output from the **show dial-peer summary** command displaying information for four dial peers, one each for extensions 60001 and 60002 and because the **dialplan-expansion** command is configured to expand 6.... to 408555...., one each for 4085550001 and 4085550002. The latter two dial peers will not appear in the running configuration.

```
Router# show dial-peer summary
```

| TAG   | TYPE | MIN | OPER | PREFIX | DEST-PATTERN | PRE<br>FER | PASS<br>THRU | OUT<br>SESS-TARGET | OUT<br>STAT |
|-------|------|-----|------|--------|--------------|------------|--------------|--------------------|-------------|
| 20010 | pots | up  | up   |        | 60002\$      | 0          |              |                    | 0           |
| 20011 | pots | up  | up   |        | 60001\$      | 0          |              |                    | 9           |
| 20012 | pots | up  | up   |        | 510555001\$  | 0          |              |                    | 9           |
| 20013 | pots | up  | up   |        | 510555002\$  | 0          |              |                    | 0           |

## Define Voice Translation Rules in Cisco CME 3.2 and Later Versions

**Note** To configure translation rules for voice calls in Cisco CME 3.1 and earlier versions, see [Cisco IOS Voice, Video, and FAX Configuration Guide](#).

#### Before you begin

- SCCP support—Cisco CME 3.2 or a later version.
- SIP support—Cisco Unified CME 4.1 or a later version.
- To define up to 100 translation rules per translation rule table—Cisco Unified CME 8.6 or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice translation-rule** *number*
4. **rule** *precedence* */match-pattern/* */replace-pattern/*
5. **exit**
6. **voice translation-profile** *name*
7. **translate** { **called** | **calling** | **redirect-called** | **redirect-target** } *translation-rule-number*
8. **end**

## DETAILED STEPS

## Procedure

|        | Command or Action                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 3 | <b>voice translation-rule</b> <i>number</i><br><b>Example:</b><br>Router(config)# voice translation-rule 1                                       | Defines a translation rule for voice calls and enters voice translation-rule configuration mode. <ul style="list-style-type: none"> <li>• <i>number</i>—Number that identifies the translation rule. Range: 1 to 2147483647.</li> </ul>                                                                                                                                                                                                                                                                                                                                                               |
| Step 4 | <b>rule</b> <i>precedence</i> <i>/match-pattern/</i> <i>/replace-pattern/</i><br><b>Example:</b><br>Router(cfg-translation-rule)# rule 1 /^9/ // | Defines a translation rule. <ul style="list-style-type: none"> <li>• <i>precedence</i>—Priority of the translation rule. Range: 1 to 100.</li> </ul> <p><b>Note</b><br/>Range limited to 15 maximum rules in CME 8.5 and earlier versions.</p> <ul style="list-style-type: none"> <li>• <i>match-pattern</i>—Stream Editor (SED) expression used to match incoming call information. The slash (/) is a delimiter in the pattern.</li> <li>• <i>replace-pattern</i>—SED expression used to replace the match pattern in the call information. The slash (/) is a delimiter in the pattern.</li> </ul> |
| Step 5 | <b>exit</b><br><b>Example:</b>                                                                                                                   | Exits voice translation-rule configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|               | Command or Action                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Step 6</b> | <b>voice translation-profile</b> <i>name</i><br><b>Example:</b><br><code>Router(config)# voice translation-profile name1</code>                                                                                             | Defines a translation profile for voice calls. <ul style="list-style-type: none"> <li>• <b>name</b>—Name of the translation profile. Maximum length of the voice translation profile name is 31 alphanumeric characters.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 7</b> | <b>translate</b> { <b>called</b>   <b>calling</b>   <b>redirect-called</b>   <b>redirect-target</b> } <i>translation-rule-number</i><br><b>Example:</b><br><code>Router(cfg-translation-profile)# translate called 1</code> | Associates a translation rule with a voice translation profile. <ul style="list-style-type: none"> <li>• <b>called</b>—Associates the translation rule with called numbers.</li> <li>• <b>calling</b>—Associates the translation rule with calling numbers.</li> <li>• <b>redirect-called</b>—Associates the translation rule with redirected called numbers.</li> <li>• <b>redirect-target</b>—Associates the translation rule with transfer-to numbers and call-forwarding final destination numbers. This keyword is supported by SIP phones in Cisco Unified CME 4.1 and later versions.</li> <li>• <b>translation-rule-number</b>—Reference number of the translation rule configured in <a href="#">Step 3, on page 465</a>. Range: 1 to 2147483647.</li> </ul> |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><code>Router(cfg-translation-profile)# end</code>                                                                                                                                          | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### What to do next

- To apply voice translation profiles to SCCP phones connected to Cisco Unified CME 3.2 or a later version, see [Apply Voice Translation Rules on SCCP Phones in Cisco Unified CME 3.2 and Later Versions, on page 467](#).
- To apply voice translation profiles to SIP phones connected to Cisco Unified CME 4.1 or a later version, see [Apply Voice Translation Rules on SIP Phones in Cisco Unified CME 4.1 and Later, on page 469](#).
- To apply voice translation profiles to SIP phones connected to Cisco CME 3.4 or Cisco Unified CME 4.0(x), see [Apply Voice Translation Rules on SIP Phones Before Cisco Unified CME 4.1, on page 470](#).

# Apply Voice Translation Rules on SCCP Phones in Cisco Unified CME 3.2 and Later Versions

To apply a voice translation profile to incoming or outgoing calls to or from a directory number on a SCCP phone, perform the following steps.

## Before you begin

- Cisco CME 3.2 or a later version.
- Voice translation profile containing voice translation rules to be applied must be already configured. For configuration information, see [Define Voice Translation Rules in Cisco CME 3.2 and Later Versions](#), on page 464.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn tag**
4. **translation-profile {incoming | outgoing} name**
5. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br>• Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>ephone-dn tag</b><br><b>Example:</b><br>Router(config)# ephone-dn 1     | Enters ephone-dn configuration mode to create an extension (ephone-dn) for a Cisco Unified IP phone line, an intercom line, a paging line, a voice-mail port, or a message-waiting indicator (MWI).<br>• <i>tag</i> —Unique sequence number that identifies this ephone-dn during configuration tasks. Range is 1 to the maximum number of ephone-dns allowed on the router platform. See the CLI help for the maximum value for this argument. |
| <b>Step 4</b> | <b>translation-profile {incoming   outgoing} name</b><br><b>Example:</b>   | Assigns a translation profile for incoming or outgoing call legs to or from Cisco Unified IP phones.                                                                                                                                                                                                                                                                                                                                            |

|               | Command or Action                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router(config-ephone-dn) # translation-profile outgoing name1       | <ul style="list-style-type: none"> <li>You can also use an ephone-dn template to apply this command to one or more directory numbers. If you use an ephone-dn template to apply a command and you use the same command in ephone-dn configuration mode for the same directory number, the value that you set in ephone-dn configuration mode has priority.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-ephone-dn) # end | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                      |

### What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

## Apply Translation Rules on SCCP Phones Before Cisco Unified CME 3.2

To apply a translation rule to an individual directory number in Cisco CME 3.1 and earlier versions, perform the following steps.

### Before you begin

Translation rule to be applied must be already configured by using the **translation-rule** and **rule** commands. For configuration information, see [Cisco IOS Voice, Video, and FAX Configuration Guide](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn tag**
4. **translate { called | calling } translation-rule-tag**
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                      | Purpose                                                                                                          |
|---------------|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b>       | Enters global configuration mode.                                                                                |

|               | Command or Action                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>Router# configure terminal</code>                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>ephone-dn tag</b><br><b>Example:</b><br><code>Router(config)# ephone-dn 1</code>                                                      | Enters ephone-dn configuration mode to create directory number for a Cisco Unified IP phone line, an intercom line, a paging line, a voice-mail port, or a message-waiting indicator (MWI).                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>translate {called   calling} translation-rule-tag</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# translate called 1</code> | Specifies rule to be applied to the directory number being configured. <ul style="list-style-type: none"> <li>• <i>translation-rule-tag</i>—Reference number of previously configured translation rule. Range: 1 to 2147483647.</li> <li>• You can use an ephone-dn template to apply this command to one or more directory numbers. If you use an ephone-dn template to apply a command to a directory number and you also use the same command in ephone-dn configuration mode for the same directory number, the value that you set in ephone-dn configuration mode has priority.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><code>Router(cfg-translation-profile)# end</code>                                                       | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

## Apply Voice Translation Rules on SIP Phones in Cisco Unified CME 4.1 and Later

To apply a voice translation profile to incoming calls to a directory number on a SIP phone, perform the following steps.

### Before you begin

- Cisco Unified CME 4.1 or a later version.
- Voice translation profile containing voice translation rules to be applied must be already configured. For configuration information, see [Define Voice Translation Rules in Cisco CME 3.2 and Later Versions, on page 464](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn dn-tag**

4. **translation-profile incoming** *name*
5. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                 | Purpose                                                                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><code>Router&gt; enable</code>                                                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>                                                           | Enters global configuration mode.                                                                                                                          |
| <b>Step 3</b> | <b>voice register dn</b> <i>dn-tag</i><br><b>Example:</b><br><code>Router(config)# voice register dn 1</code>                                     | Enters voice register dn configuration mode to define a directory number for a SIP phone, intercom line, voice port, or a message-waiting indicator (MWI). |
| <b>Step 4</b> | <b>translation-profile incoming</b> <i>name</i><br><b>Example:</b><br><code>Router(config-register-dn)# translation-profile incoming name1</code> | Assigns a translation profile for incoming call legs to this directory number.                                                                             |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-register-dn)# end</code>                                                                     | Returns to privileged EXEC mode.                                                                                                                           |

### What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

## Apply Voice Translation Rules on SIP Phones Before Cisco Unified CME 4.1

To apply an already-configured voice translation rule to modify the number dialed by extensions on a SIP phone, perform the following steps.

### Before you begin

- Cisco CME 3.4 or a later version.
- Voice translation rule to be applied must be already configured. For configuration information, see [Define Voice Translation Rules in Cisco CME 3.2 and Later Versions, on page 464](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **translate-outgoing** { **called** | **calling** } *rule-tag*
5. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                | Purpose                                                                                             |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                           | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                             |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                   | Enters global configuration mode.                                                                   |
| <b>Step 3</b> | <b>voice register pool</b> <i>pool-tag</i><br><br><b>Example:</b><br>Router(config)# <b>voice register pool</b> 3                                                | Enters voice register pool configuration mode to set phone-specific parameters for SIP phones.      |
| <b>Step 4</b> | <b>translate-outgoing</b> { <b>called</b>   <b>calling</b> } <i>rule-tag</i><br><br><b>Example:</b><br>Router(config-register-pool)# translate-outgoing called 1 | Specifies an already configured voice translation rule to be applied to SIP phone being configured. |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-register-global)# end                                                                                         | Exits configuration mode and enters privileged EXEC mode.                                           |

## What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

## Verify Voice Translation Rules and Profiles

To verify voice translation profiles, and rules, perform the following steps.

## SUMMARY STEPS

1. **show voice translation-profile** [*name*]
2. **show voice translation-rule** [*number*]

### 3. test voice translation-rule *number*

#### DETAILED STEPS

##### Procedure

---

**Step 1** **show voice translation-profile** [*name*]

This command displays the configuration of one or all translation profiles.

**Example:**

```
Router# show voice translation-profile profile-8415

Translation Profile: profile-8415
 Rule for Calling number: 4
 Rule for Called number: 1
 Rule for Redirect number: 5
 Rule for Redirect-target number: 2
```

**Step 2** **show voice translation-rule** [*number*]

This command displays the configuration of one or all translation rules.

**Example:**

```
Router# show voice translation-rule 6

Translation-rule tag: 6
 Rule 1:
 Match pattern: 65088801..
 Replace pattern: 6508880101
 Match type: none Replace type: none
 Match plan: none Replace plan: none
```

**Step 3** **test voice translation-rule** *number*

This command enables you to test your translation rules.

**Example:**

```
Router(config)# voice translation-rule 5
Router(cfg-translation-rule)# rule 1 /201/ /102/
Router(cfg-translation-rule)# exit
Router(config)# exit
Router# test voice translation-rule 5 2015550101

Matched with rule 5
Original number:2015550101 Translated number:1025550101
Original number type: none Translated number type: none
Original number plan: none Translated number plan: none
```

---

## Activate Secondary Dial Tone For SCCP Phones

To activate a secondary dial tone after a phone user dials the specified number, perform the following steps.

### Before you begin

- Cisco CME 3.0 or a later version.
- PSTN access prefix must be configured for outbound dial peer.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **secondary-dialtone** *digit-string*
5. **end**

|---------------|----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                           | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                   | Enters global configuration mode.                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>telephony-service</b><br><br><b>Example:</b><br>Router(config)# telephony-service                                             | Enters telephony-service configuration mode.                                                                                                                                                                                                           |
| <b>Step 4</b> | <b>secondary-dialtone</b> <i>digit-string</i><br><br><b>Example:</b><br>Router(config-telephony)# <b>secondary-dialtone</b><br>9 | Activates a secondary dial tone when <i>digit-string</i> is dialed.<br><br>• <i>digit-string</i> —String of up to 32 digits that, when dialed, activates a secondary dial tone. Typically, the <i>digit-string</i> is a predefined PSTN access prefix. |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-telephony)# end                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                       |

## Activate Secondary Dial Tone for SIP Phones

To activate a secondary dial tone after a phone user dials the specified number, perform the following steps.

### Before you begin

- Cisco Unified CME 11.6 or later for SIP phones.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dialplan tag**
4. **type 7940-7960-others**
5. **pattern tag string**
6. **voice register pool tag**
7. **dialplan tag**
8. **voice register global**
9. **create profile**
10. **voice register pool tag**
11. **reset**
12. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                          | Purpose                                                                                                                                                 |
|---------------|------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                 | Enters global configuration mode.                                                                                                                       |
| <b>Step 3</b> | <b>voice register dialplan tag</b><br><b>Example:</b><br>Router(config)# voice register dialplan 1         | Enters voice register dialplan configuration mode.<br><ul style="list-style-type: none"> <li>• <i>tag</i>—Range for dialplan tag is 1 to 24.</li> </ul> |
| <b>Step 4</b> | <b>type 7940-7960-others</b><br><b>Example:</b><br>Router(config-register-dialplan)# type 7940-7960-others | Specifies the phone type assigned.                                                                                                                      |

|                | Command or Action                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                               |
|----------------|--------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b>  | <b>pattern tag <i>string</i></b><br><b>Example:</b><br><pre>Router(config-register-dialplan)# pattern 1 30,</pre>              | Specifies the pattern to be matched while dialing from phone. Range is 1 to 24. <ul style="list-style-type: none"> <li>• <i>tag</i>—Range for pattern tag is 1 to 24.</li> <li>• <i>string</i>—It is the pattern to be matched while dialing from phone. This string is represented as WORD and the value of this string can be a combination of [0-9.*#].</li> </ul> |
| <b>Step 6</b>  | <b>voice register pool <i>tag</i></b><br><b>Example:</b><br><pre>Router(config-register-dialplan)# voice register pool 1</pre> | Defines the voice register pool tag, and enters the voice register pool configuration mode.                                                                                                                                                                                                                                                                           |
| <b>Step 7</b>  | <b>dialplan <i>tag</i></b><br><b>Example:</b><br><pre>Router(config-register-pool)# dialplan 1</pre>                           | Specifies the dialplan to be attached to the pool.                                                                                                                                                                                                                                                                                                                    |
| <b>Step 8</b>  | <b>voice register global</b><br><b>Example:</b><br><pre>Router(config-register-pool)# voice register global</pre>              | Enters voice register global configuration mode.                                                                                                                                                                                                                                                                                                                      |
| <b>Step 9</b>  | <b>create profile</b><br><b>Example:</b><br><pre>Router(config-register-global)# create profile</pre>                          | Creates the XML configuration files for the phone.                                                                                                                                                                                                                                                                                                                    |
| <b>Step 10</b> | <b>voice register pool <i>tag</i></b><br><b>Example:</b><br><pre>Router(config-register-global)# voice register pool 1</pre>   | Defines the voice register pool tag, and enters the voice register pool configuration mode.                                                                                                                                                                                                                                                                           |
| <b>Step 11</b> | <b>reset</b><br><b>Example:</b><br><pre>Router(config-register-pool)# reset</pre>                                              | Resets the phone for the phone configurations to be applied.                                                                                                                                                                                                                                                                                                          |
| <b>Step 12</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-register-pool)# end</pre>                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                      |

## Define Translation Rules for Callback-Number on SIP Phones

### Before you begin

- To define up to 100 translation rules per translation rule table—Cisco Unified CME 8.6 or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice translation-rule** *number*
4. **rule** *precedence* | *match-pattern* | *replace-pattern* |
5. **exit**
6. **voice translation-profile** *name*
7. **translate** { *callback-number* | *called* | *calling* | *redirect-called* | *redirect-target* }  
*translation-rule-number*
8. **exit**
9. **voice register pool** *phone-tag*
10. **number tag dn** *dn-tag*
11. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                 | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>voice translation-rule</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# voice translation-rule 10                                        | Defines a translation rule for voice calls and enters voice translation-rule configuration mode.<br><br>• <i>number</i> —Number that identifies the translation rule. Range: 1 to 2147483647.                                                                                                                                                           |
| <b>Step 4</b> | <b>rule</b> <i>precedence</i>   <i>match-pattern</i>   <i>replace-pattern</i>  <br><br><b>Example:</b><br>Router(cfg-translation-rule)# rule 1 /^9/ // | Defines a translation rule.<br><br>• <i>precedence</i> —Priority of the translation rule. Range: 1 to 100.<br><br><b>Note</b><br>Range limited to 15 maximum rules in CME 8.5 and earlier versions.<br><br>• <i>match-pattern</i> —Stream Editor (SED) expression used to match incoming call information. The slash (/) is a delimiter in the pattern. |

|                | Command or Action                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Step 11</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-translation-profile)# end | Returns to privileged EXEC mode.                                                                                                                                     |

### Example

The following examples show translation rules defined for callback-number:

```

!
!
voice service voip
ip address trusted list
 ipv4 20.20.20.1
media flow-around
allow-connections sip to sip
!
!
voice translation-rule 10
!
!
voice translation-profile eastcoast
!
voice translation-profile eastern
 translate callback-number 10
!

```

### What to do next

- To apply voice translation profiles to SIP phones connected to Cisco Unified CME 4.1 or a later version, see [Apply Voice Translation Rules on SIP Phones in Cisco Unified CME 4.1 and Later, on page 469](#).

## Configuration Examples for Dial Plan Features

### Example for Configuring Secondary Dial Tone on SCCP Phones

```

telephony-service

```

## Example for Configuring Secondary Dial Tone on SIP Phones

A secondary dial tone is played on the phone when comma (',') is found in the pattern. In this example, secondary dial tone is played after the digit 50.

```
voice register dialplan 1
 type 7940-7960-others
 pattern 1 50,

voice register pool 1
 busy-trigger-per-button 2
 id mac 0C11.6780.52A3
 type 7841
 number 1 dn 1
 dialplan 1
 dtmf-relay rtp-nte
 username cisco1 password cisco
 codec g711ulaw
 no vad
 provision-tag 1
```

## Example for Configuring Voice Translation Rules

In the following configuration examples, if a user on Cisco Unified CME 1 dials 94155550100, the call matches on dial peer 9415 and uses translation profile *profile-9415*. The called number is translated from 94155550100 to 4155550100, as specified by the **translate called** command using translation rule 1.

If a user on Cisco Unified CME 1 calls a phone on Cisco Unified CME 2 by dialing 5105550120, and the call forward number is 94155550100, Cisco Unified CME 1 attempts to forward the call to 94155550100. A 302 message is then sent to Cisco Unified CME 1 with the “Contact:” field translated to 4155550100. When the 302 reaches Cisco Unified CME 1, it matches the To: field in the 302 message (5105550120) with dial peer 510. It does incoming translation from 4155550100 to 84155550100, and an INVITE with 84155550100 is sent, which matches dial-peer 8415.

Figure 14: Translation Rules in SIP Call Transfer

| Cisco Unified CME 1 with 408555.... dialplan-pattern                                                                                                                                                                                                                                                                                | Cisco Unified CME 2 with 510555.... dialplan-pattern                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Feature Information for Dial Plan Features

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Table 36: Feature Information for Dialing Plan Features

| Feature Name            | Cisco Unified CME Versions | Feature Information                                                                                                                                                                                                 |
|-------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dial Plan Pattern       | 4.0                        | Added support for dial plan pattern expansion for call forward and call transfer when the forward or transfer-to target is an individual abbreviated SIP extension or an extension that appear on a SIP phone.      |
|                         | 2.1                        | Strips leading digit pattern from extension number when expanding an extension to an E.164 telephone number. The length of the extension pattern must equal the value configured for the extension-length argument. |
|                         | 1.0                        | Adds a prefix to extensions to transform them into E.164 numbers.                                                                                                                                                   |
| E.164 Enhancements      | 8.5                        | Added support for E.164 enhancements.                                                                                                                                                                               |
| Secondary Dial Tone     | 11.6                       | Support for Secondary Dial Tone on SIP phones.                                                                                                                                                                      |
|                         | 3.0                        | Support for secondary dial tone after dialing specified number string.                                                                                                                                              |
| Voice Translation Rules | 8.6                        | Added support for an increased number of translation rules per translation table. Old value is 15 maximum, new value is 100 maximum.                                                                                |
|                         | 4.1                        | Added support for voice translation profiles for incoming call legs to a directory number on a SIP phone.                                                                                                           |
|                         | 3.4                        | Added support for voice translation rules to modify the number dialed by extensions on a SIP phone.                                                                                                                 |
|                         | 3.2                        | Adds, removes, or transforms digits for calls going to or originating from specified ephone-dns.                                                                                                                    |

## CHAPTER 14

# Transcoding Resources

This chapter describes the transcoding support available in Cisco Unified Communications Manager Express (Cisco Unified CME).

### Note

- To configure a DSP farm profile for multi-party ad hoc and meet-me conferencing in Unified CME, see [Meet Me Conference, on page 1363](#) and [Meet-Me Conferencing in Cisco Unified CME 11.7 and Later Versions, on page 1364](#).

- [Prerequisites for Configuring Transcoding Resources, on page 483](#)
- [Restrictions for Configuring Transcoding Resources, on page 483](#)
- [Information About Transcoding Resources, on page 484](#)
- [Configure Transcoding Resources, on page 489](#)
- [Configuration Examples for Transcoding Resources, on page 517](#)
- [Where to go Next, on page 519](#)
- [Feature Information for Transcoding Resources, on page 519](#)

## Prerequisites for Configuring Transcoding Resources

- Cisco Unified CME 3.2 or a later version.
- Cisco Unified CME 11.6 or later versions for LTI-based transcoding, supported on Cisco 4000 Series Integrated Services Router (ISR).

## Restrictions for Configuring Transcoding Resources

- Before Cisco CME 3.2, only G.729 is supported for two-party voice calls.
- In Cisco CME 3.2 to Cisco Unified CME 4.0, transcoding between G.711 and G.729 does not support the following:
  - Meet-me conferencing
  - Multiple-party ad-hoc conferencing

- Transcoding security
- For Cisco Unified CME Release 11.6, hardware conferencing is not supported with LTI-based transcoding on Cisco 4000 Series Integrated Services Router (ISR).
- In Unified CME 11.6, SCCP based transcoding is not supported.

## Information About Transcoding Resources

### Transcoding Support

Transcoding compresses and decompresses voice streams to match endpoint-device capabilities. Transcoding is required when an incoming voice stream is digitized and compressed (by means of a codec) to save bandwidth, and the local device does not support that type of compression.

Cisco Unified CME 3.2 and later versions support transcoding between G.711 and G.729 codecs for the following features:

- Ad hoc conferencing—One or more remote conferencing parties uses G.729.
- Call transfer and forward—One leg of a Voice over IP (VoIP)-to-VoIP hairpin call uses G.711 and the other leg uses G.729. A hairpin call is an incoming call that is transferred or forwarded over the same interface from which it arrived.
- Cisco Unity Express or Cisco Unity Express Virtual—An H.323 or SIP call using G.729 is forwarded to Cisco Unity Express or Cisco Unity Express Virtual. Cisco Unity Express or Cisco Unity Express Virtual supports only G.711, so G.729 must be transcoded.

From Cisco Unified CME Release 11.6 onwards, SIP calls coming to Cisco Unity Express or Cisco Unity Express Virtual is supported on Cisco 4000 Series ISR routers using the LTI transcoding infrastructure. For more information on configuring LTI transcoding on Cisco Unified CME, see [Configure LTI-based Transcoding, on page 515](#).

- Music on hold (MOH)—The phone receiving MOH is part of a system that uses G.729, G.722, or internet Low Bitrate Codec (iLBC). When the G.711 MOH is transcoded into G.729, it results in a poorer quality sound due to the lower compression of G.729. From Cisco Unified CME Release 11.7 onwards, Music on Hold is supported on Cisco 4000 Series ISR routers using the LTI transcoding infrastructure. For more information on configuring LTI transcoding on Cisco Unified CME, see [Configure LTI-based Transcoding, on page 515](#).

Each of the preceding call situations is illustrated in [Figure 15: Three-Way Conferencing, Call Transfer and Forward, Cisco Unity Express, and MOH Between G.711 and G.729, on page 485](#).

**Figure 15: Three-Way Conferencing, Call Transfer and Forward, Cisco Unity Express, and MOH Between G.711 and G.729**

Transcoding is facilitated through DSPs, which are located in network modules. All network modules have single in-line memory module (SIMM) sockets or packet voice/data modules (PVDM) slots that each hold a Packet Voice DSP Module (PVDM). Each PVDM holds DSPs. A router can have multiple network modules.

Cisco Unified CME routers and external voice routers on the same LAN must be configured with digital signal processors (DSPs) that support transcoding. DSPs reside either directly on a voice network module, such as the NM-HD-2VE, on PVDM2s that are installed in a voice network module, such as the NM-HDV2, or on PVDM2s that are installed directly onto the motherboard, such as on the Cisco 2800 and 3800 series voice gateway routers.

- DSPs on the NM-HDV, NM-HDV2, NM-HD-1V, NM-HD-2V, and NM-HD-2VE can be configured for transcoding.
- PVDM2-xx on the Cisco 2800 series and the Cisco 3800 series motherboards can also be configured for transcoding.

Transcoding of G.729 calls to G.711 allows G.729 calls to participate in existing G.711 software-based, three-party conferencing, thus eliminating the need to divide DSPs between transcoding and conferencing.

Figure 16: NM-HDV Supports up to Five PVDMs, on page 486 shows an NM-HDV with five SIMM sockets or PVDM slots that each hold a 12-Channel PVDM (PVDM-12). Each PVDM-12 holds three TI 549 DSPs. Each DSP supports four channels.

**Figure 16: NM-HDV Supports up to Five PVDMs**

Use DSP resources to provide voice termination of the digital voice trunk group or resources for a DSP farm. DSP resources available for transcoding and not used for voice termination are referred to as a DSP farm.

[Figure 17: DSP Farm, on page 487](#) shows a DSP farm managed by Cisco Unified CME.

Figure 17: DSP Farm

## Local Transcoding Interface (LTI) Based Transcoding

From Cisco Unified CME Release 11.6 onwards, Local Transcoding Interface (LTI) based transcoding is supported on Cisco 4000 series ISR. LTI includes an internal API that accesses digital signal processor (DSP) resources. This API does not require the use of Skinny Client Control Protocol (SCCP) based configuration for transcoding to work.

LTI-based transcoding is an alternative to SCCP-based transcoding. The LTI-based transcoding configures transcoding functionality only on the specific Unified CME router. Unlike the SCCP-based transcoding, other Unified CME routers cannot leverage the transcoding capabilities configured on a specific Unified CME router. That is, transcoding resources (DSPFARM) are required to be co-located with Unified CME router for LTI-based configuration to work. When both LTI-based and SCCP-based transcoding are configured, LTI takes precedence.

With LTI-based transcoding, internal APIs are used to access DSP resources for transcoding. The TCP sockets are not opened and no registration is used. Also, you need to configure only the DSPFARM profile configuration.

Voice Class Codec (VCC) is supported with LTI-based Transcoding on Cisco 4000 Series ISR, and is an optional configuration. A VCC defines the codec preference order. When a voice class codec is applied to a dial peer, the preference order defined in the voice class codec is followed.

LTI infrastructure supports the features SIP-to-SIP line to trunk transcoding, DTMF Interworking (with in-band on the trunk and rtp-nte on the line), and mid-call transcoder invocation and deletion with call transfer. Features such as Shared Line, Call Park, Call Pickup, iDivert, and so on are not supported with LTI-based transcoding.

## Transcoding When a Remote Phone Uses G.729r8

A situation in which transcoding resources may be used is when you use the **codec** command to select the G.729r8 codec to help save network bandwidth for a remote IP phone. If a conference is initiated, all phones in the conference switch to G.711 mu-law. To allow the phone to retain its G.729r8 codec setting when joined to a conference, you can use the **codec g729r8 dspfarm-assist** command to specify that this phone's calls should use the resources of a DSP farm for transcoding. For example, there are two remote phones (A and B) and a local phone (C) that initiates a conference with them. Both A and B are configured to use the G.729r8 codec with the assistance of the DSP-farm transcoder. In the conference, the call leg from C to the conference uses the G.711 mu-law codec, and the call legs from A and B to the Cisco Unified CME router use the G.729r8 codec.

Consider your options carefully when deciding to use the **codec g729r8 dspfarm-assist** command. The benefit is that it allows calls to use the G.729r8 codec on the call leg between the IP phone and the Cisco Unified CME router, which saves network bandwidth. The disadvantage is that for situations requiring G.711 codecs, such as conferencing and Cisco Unity Express, DSP resources that are possibly scarce are used to transcode the call, and delay is introduced while voice is shuttled to and from the DSP. In addition, the overuse of this feature can mask configuration errors in the codec selection mechanisms involving dial peers and codec lists.

Therefore, we recommend using the **codec g729r8 dspfarm-assist** command sparingly and only when absolutely required for bandwidth savings or when you know the phone will be participating very little, if at all, in calls that require a G.711 codec.

Because of how Cisco Unified CME uses voice channels with Skinny Client Control Protocol (SCCP) endpoints, you must configure at least two available transcoding sessions when establishing a call that requires transcoding configured with the **codec g729r8 dspfarm-assist** command. Only one session is used after the voice path is established with transcoding. However, during the SCCP manipulations, a temporary session may be allocated. If this temporary session cannot be allocated, the transcoding request is not honored, and the call continues with the G.711 codec.

If the **codec g729r8 dspfarm-assist** command is configured for a phone and a DSP resource is not available when needed for transcoding, a phone registered to the local Cisco Unified CME router will use G.711 instead of G.729r8. This is not true for nonSCCP call legs; if DSP resources are not available for the transcoding required for a conference, for example, the conference is not created.

## Secure DSP Farm Transcoding

Cisco Unified CME uses the secure transcoding DSP farm capability only in the case described in [Transcoding When a Remote Phone Uses G.729r8, on page 488](#). If a call using the **codec g729r8 dspfarm-assist** command is secure, Cisco Unified CME looks for a secure transcoding resource. If it cannot find one, transcoding is not done. If the call is not secure, Cisco Unified CME looks for a nonsecure transcoding resource. If it cannot find one, Cisco Unified CME looks for a secure transcoding resource. Even if Cisco Unified CME uses a secure transcoding resource, the call is not secure, and a more expensive secure DSP Farm resource is not needed for a nonsecure call because Cisco Unified CME cannot find a less expensive nonsecure transcoder.

# Configure Transcoding Resources

This section contains the following tasks:

## Determine DSP Resource Requirements for Transcoding

To determine if there are enough DSPs available on your router for transcoding services, perform the following steps.

### Procedure

- 
- |               |                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Use the <b>show voice dsp</b> command to display current status of digital signal processor (DSP) voice channels. |
| <b>Step 2</b> | Use the <b>show sdspfarm sessions</b> command to display the number of transcoder sessions that are active.       |
| <b>Step 3</b> | Use the <b>show sdspfarm units</b> command to display the number of DSP farms that are configured.                |
- 

## Provision Network Modules or PVDMs for Transcoding

DSPs can reside directly on any one of the following:

- A voice network module, such as the NM-HD-2VE,
- PVDM2s that are installed in a voice network module, such as the NM-HDV2. A single network module can hold up to five PVDMs.
- PVDM2s that are installed directly onto the motherboard, such as on the Cisco 2800 and 3800 series voice gateway routers.

You must determine the number of PVDM2s or network modules that are required to support your conferencing and transcoding services and install the modules on your router.

### SUMMARY STEPS

1. Determine performance requirements.
2. Determine the number of DSPs that are required.
3. Determine the number of DSPs that are supportable
4. Verify your solution.
5. Install hardware.

### DETAILED STEPS

## Procedure

- 
- Step 1** Determine the number of transcoding sessions that your router must support.
- Step 2** Determine the number of DSPs that are required to support transcoding sessions. See Table 5 and Table 6 in the “Allocation of DSP Resources” section of the “Configuring Enhanced Conferencing and Transcoding for Voice Gateway Routers” chapter of the [Cisco Unified Communications Manager and Cisco IOS Interoperability Guide](#).
- If voice termination is also required, determine the additional number of DSPs required.
- For example: 16 transcoding sessions (30-ms packetization) and 4 G.711 voice calls require two DSPs.
- Step 3** Determine the maximum number of NMs or NM farms that your router can support by using Table 4 in the “Allocation of DSP Resources” section of the “Configuring Enhanced Conferencing and Transcoding for Voice Gateway Routers” chapter of the [Cisco Unified Communications Manager and Cisco IOS Interoperability Guide](#).
- Step 4** Ensure that your requirements fall within router capabilities, taking into account whether your router supports multiple NMs or NM farms. If necessary, reassess performance requirement.
- Step 5** Install PVDMS, NMs, and NM farms as needed. See the [Connecting Voice Network Modules](#) chapter in the *Cisco Network Modules Hardware Installation Guide*.
- 

## What to do next

Perform one of the following options, depending on the type of network module to be configured:

- To set up DSP farms on NM-HDs and NM-HDV2s, see [Configure DSP Farms for NM-HDs and NM-HDV2s, on page 490](#).
- To set up DSP farms for NM-HDVs, see [Configure DSP Farms for NM-HDVs, on page 495](#).

# Configure DSP Farms for NM-HDs and NM-HDV2s

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice-card** *slot*
4. **dsp services dspfarm**
5. **exit**
6. **sccp local** *interface-type interface-number*
7. **sccp ccm** *ip-address identifier identifier-number*
8. **sccp**
9. **sccp ccm group** *group-number*
10. **bind interface** *interface-type interface-number*
11. **associate ccm** *identifier-number priority priority-number*
12. **associate profile** *profile identifier register device-name*
13. **keepalive retries** *number*
14. **switchover method** [*graceful* | *immediate*]

15. **switch back method** { **graceful** | **guard timeout-guard-value** | **immediate** | **uptime** *uptime-timeout-value* }
16. **switchback interval** *seconds*
17. **exit**
18. **dspfarm profile** *profile-identifier* **transcode** [**security**]
19. **trustpoint** *trustpoint-label*
20. **codec** *codec-type*
21. **maximum sessions** *number*
22. **associate application** **sccp**
23. **end**

| <b>Step 13</b> | <b>keepalive retries</b> <i>number</i><br><b>Example:</b><br><pre>Router(config-sccp-ccm)# keepalive retries 5</pre>                                                                                                                         | Sets the number of keepalive retries from SCCP to Cisco Unified CME. <ul style="list-style-type: none"> <li>• <i>number</i>—Number of keepalive attempts. Range: 1 to 32. Default: 3.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 14</b> | <b>switchover method</b> [ <b>graceful</b>   <b>immediate</b> ]<br><b>Example:</b><br><pre>Router(config-sccp-ccm)# switchover method immediate</pre>                                                                                        | Sets the switchover method that the SCCP client uses when its communication link to the active Cisco Unified CME system goes down. <ul style="list-style-type: none"> <li>• <b>graceful</b>—Switchover happens only after all the active sessions have been terminated gracefully.</li> <li>• <b>immediate</b>—Switches over to any one of the secondary Cisco Unified CME systems immediately.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 15</b> | <b>switch back method</b> { <b>graceful</b>   <b>guard</b> <i>timeout-guard-value</i>   <b>immediate</b>   <b>uptime</b> <i>uptime-timeout-value</i> }<br><b>Example:</b><br><pre>Router(config-sccp-ccm)# switchback method immediate</pre> | Sets the switch back method that the SCCP client uses when the primary or higher priority Cisco Unified CME becomes available again. <ul style="list-style-type: none"> <li>• <b>graceful</b>—Switchback happens only after all the active sessions have been terminated gracefully.</li> <li>• <b>guard</b> <i>timeout-guard-value</i>—Switchback happens either when the active sessions have been terminated gracefully or when the guard timer expires, whichever happens first. Timeout value is in seconds. Range: 60 to 172800. Default: 7200.</li> <li>• <b>immediate</b>—Switches back to the higher order Cisco Unified CME immediately when the timer expires, whether there is an active connection or not.</li> <li>• <b>uptime</b> <i>uptime-timeout-value</i>—Initiates the uptime timer when the higher-order Cisco Unified CME system comes alive. Timeout value is in seconds. Range: 60 to 172800. Default: 7200.</li> </ul> |
| <b>Step 16</b> | <b>switchback interval</b> <i>seconds</i><br><b>Example:</b><br><pre>Router(config-sccp-ccm)# switchback interval 5</pre>                                                                                                                    | Sets the amount of time that the DSP farm waits before polling the primary Cisco Unified CME system when the current Cisco Unified CME switchback connection fails. <ul style="list-style-type: none"> <li>• <i>seconds</i>—Timer value, in seconds. Range: 1 to 3600. Default: 60.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                | Command or Action                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 17</b> | <b>exit</b><br><b>Example:</b><br>Router(config-sccp-cm) # exit                                                                                  | Exits SCCP configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 18</b> | <b>dspfarm profile <i>profile-identifier</i> transcode [security]</b><br><b>Example:</b><br>Router(config)# dspfarm profile 1 transcode security | Enters DSP farm profile configuration mode and defines a profile for DSP farm services. <ul style="list-style-type: none"> <li>• <i>profile-identifier</i>—Number that uniquely identifies a profile. Range: 1 to 65535.</li> <li>• <b>transcode</b>—Enables profile for transcoding.</li> <li>• <b>security</b>—Enables secure DSP farm services. This keyword is supported in Cisco Unified CME 4.2 and later versions.</li> </ul> |
| <b>Step 19</b> | <b>trustpoint <i>trustpoint-label</i></b><br><b>Example:</b><br>Router(config-dspfarm-profile)# trustpoint dspfarm                               | (Optional) Associates a trustpoint with a DSP farm profile.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 20</b> | <b>codec <i>codec-type</i></b><br><b>Example:</b><br>Router(config-dspfarm-profile)# codec g711ulaw                                              | Specifies the codecs supported by a DSP farm profile. <ul style="list-style-type: none"> <li>• <i>codec-type</i>—Specifies the preferred codec. Type ? for a list of supported codecs.</li> <li>• Repeat this step for each supported codec.</li> </ul>                                                                                                                                                                              |
| <b>Step 21</b> | <b>maximum sessions <i>number</i></b><br><b>Example:</b><br>Router(config-dspfarm-profile)# maximum sessions 5                                   | Specifies the maximum number of sessions that are supported by the profile. <ul style="list-style-type: none"> <li>• <i>number</i>—Number of sessions supported by the profile. Range: 0 to X. Default: 0.</li> <li>• The X value is determined at run time depending on the number of resources available with the resource provider.</li> </ul>                                                                                    |
| <b>Step 22</b> | <b>associate application sccp</b><br><b>Example:</b><br>Router(config-dspfarm-profile)# associate application sccp                               | Associates SCCP with the DSP farm profile.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 23</b> | <b>end</b><br><b>Example:</b><br>Router(config-dspfarm-profile)# end                                                                             | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                     |

### What to do next

- To register the DSP Farm to Cisco Unified CME in secure mode, see [Register the DSP Farm with Cisco Unified CME 4.2 or a Later Version in Secure Mode, on page 506](#).

# Configure DSP Farms for NM-HDVs

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice-card** *slot*
4. **dsp services dspfarm**
5. **exit**
6. **sccp local** *interface-type interface-number*
7. **sccp ccm** *ip-address priority priority-number*
8. **sccp**
9. **dsp farm transcoder maximum sessions** *number*
10. **dspfarm**
11. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                          | Purpose                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                 | Enters global configuration mode.                                                                                                    |
| <b>Step 3</b> | <b>voice-card</b> <i>slot</i><br><b>Example:</b><br>Router(config)# voice-card 1                                           | Enters voice-card configuration mode and identifies the slot in the chassis in which the NM-HDV or NM-HDV farm is located.           |
| <b>Step 4</b> | <b>dsp services dspfarm</b><br><b>Example:</b><br>Router(config-voicecard)# dsp services dspfarm                           | Enables DSP-farm services on the NM-HDV or NM-HDV farm.                                                                              |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-voicecard)# exit                                                           | Returns to global configuration mode.                                                                                                |
| <b>Step 6</b> | <b>sccp local</b> <i>interface-type interface-number</i><br><b>Example:</b><br>Router(config)# sccp local FastEthernet 0/0 | Selects the local interface that the SCCP applications (transcoding and conferencing) should use to register with Cisco Unified CME. |

|                | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                 | <ul style="list-style-type: none"> <li>• <i>interface-type</i>—Interface type that the SCCP application uses to register with Cisco Unified CME. The type can be an interface address or a virtual-interface address such as Ethernet.</li> <li>• <i>interface-number</i>—Interface number that the SCCP application uses to register with Cisco Unified CME.</li> </ul> |
| <b>Step 7</b>  | <b>sccp ccm ip-address priority priority-number</b><br><b>Example:</b><br>Router(config)# sccp ccm 10.10.10.1 priority 1        | Specifies the Cisco Unified CME address. <ul style="list-style-type: none"> <li>• <i>ip-address</i>—IP address of the Cisco Unified CME router.</li> <li>• <b>priority priority</b>—Priority of the Cisco Unified CME router relative to other connected routers. Range: 1 (highest) to 4 (lowest).</li> </ul>                                                           |
| <b>Step 8</b>  | <b>sccp</b><br><b>Example:</b><br>Router(config)# sccp                                                                          | Enables SCCP and its associated transcoding and conferencing applications.                                                                                                                                                                                                                                                                                               |
| <b>Step 9</b>  | <b>dsp farm transcoder maximum sessions number</b><br><b>Example:</b><br>Router(config)# dspfarm transcoder maximum sessions 12 | Specifies the maximum number of transcoding sessions to be supported by the DSP farm. A DSP can support up to four transcoding sessions.<br><br><b>Note</b><br>When you assign this value, take into account the number of DSPs allocated for conferencing services.                                                                                                     |
| <b>Step 10</b> | <b>dspfarm</b><br><b>Example:</b><br>Router(config)# dspfarm                                                                    | Enables the DSP farm.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 11</b> | <b>end</b><br><b>Example:</b><br>Router(config)# end                                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                         |

## Configure the Cisco Unified CME Router to Act as the DSP Farm Host

### Determine the Maximum Number of Transcoder Sessions

To determine the maximum number of transcoder sessions that can occur at one time perform the following steps.

## Procedure

- 
- Step 1** Use the **dspfarm transcoder maximum sessions** command to set the maximum number of transcoder sessions you have configured.
- Step 2** Use the **show sdspfarm sessions** command to display the number of transcoder sessions that are active.
- Step 3** Use the **show sdspfarm units** command to display the number of DSP farms that are configured.
- Step 4** Obtain the maximum number of transcoder sessions by multiplying the number of transcoder sessions from Step 2 (configured in Step 1 using the **dspfarm transcoder maximum sessions** command) by the number of DSP farms from Step 3.
- 

## Set the Cisco Unified CME Router to Receive IP Phone Messages

---

**Note** You can unregister all active calls' transcoding streams with the **sdspfarm unregister force** command.

---

### Before you begin

Identify the MAC address of the SCCP client interface. For example, if you have the following configuration:

```
interface FastEthernet 0/0
 ip address 10.5.49.160 255.255.0.0
 .
 .
 .
 sccp local FastEthernet 0/0
 sccp
```

The **show interface FastEthernet 0/0** command will yield a MAC address. In the following example, the MAC address of the Fast Ethernet interface is 000a.8aea.ca80:

```
Router# show interface FastEthernet 0/0
.
.
.
FastEthernet0/0 is up, line protocol is up
Hardware is AmdFE, address is 000a.8aea.ca80 (bia 000a.8aea.ca80)
```

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **ip source-address** *ip-address* [**port** *port*] [**any-match** | **strict-match**]
5. **sdspfarm units** *number*
6. **sdspfarm transcode sessions** *number*
7. **sdspfarm tag** *number device-name*
8. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Step 7</b> | <b>sdspfarm tag <i>number device-name</i></b><br><br><b>Example:</b><br><pre>Router(config-telephony)# sdspfarm tag 1 mtp000a8eaca80</pre> or<br><pre>Router(config-telephony)# sdspfarm tag 1 MTP000a8eaca80</pre> | Permits a DSP farm unit to be registered to Cisco Unified CME and associates it with an SCCP client interface's MAC address. <ul style="list-style-type: none"> <li>• Required only if you blocked automatic registration by using the <b>auto-reg-ephone</b> command.</li> <li>• <i>number</i>—The tag number. Range: 1 to 5.</li> <li>• <i>device-name</i>—MAC address of the SCCP client interface with the "MTP" prefix added.</li> </ul> |
| <b>Step 8</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-telephony)# end</pre>                                                                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                              |

## Configure the Cisco Unified CME Router to Host a Secure DSP Farm

You must configure the Media Encryption Secure Real-Time Transport Protocol (SRTP) feature in the Cisco Unified CME 4.2 and later versions, making it a secure Cisco Unified CME, before it can host a secure DSP farm. For information on configuring a secure Cisco Unified CME, see [Configure Security, on page 593](#).

## Modify DSP Farms for NM-HDVs After Upgrading Cisco IOS Software

To ensure continued support for existing DSP farms for NM-HDVs configured after upgrading the Cisco IOS software on your Cisco router, perform the following steps.

**Note** Perform this task if previously-configured DSP farms for NM-HDVs fail to register to Cisco Unified CME after you upgrade the Cisco IOS software release.

### Before you begin

Confirm that device name for a dspfarm tag in telephony-service configuration is lower case by using the **show-running configuration** command.

Example:

```
Router#show-running configuration
Building configuration...
.
.
.
!
telephony-service
max-ephones 2
max-dn 20
ip source-address 142.103.66.254 port 2000
auto assign 1 to 2
system message Your current options
sdspfarm units 2
```

```

sdspfarm transcode sessions 16
sdspfarm tag 1 mtp00164767cc20 !<===Device name is MAC address with lower-case
"mtp" prefix
.
.
.

```

## SUMMARY STEPS

1. enable
2. configure terminal
3. no sdspfarm tag *number*
4. sdspfarm tag *number device-name*
5. dspfarm
6. end

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>no sdspfarm tag <i>number</i></b><br><b>Example:</b><br>Router(config)# no sdspfarm tag 1                       | Disables the DSP farm.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>sdspfarm tag <i>number device-name</i></b><br><b>Example:</b><br>Router(config)# sdspfarm tag 1 MTP00164767cc20 | Permits a digital-signal-processor (DSP) farm to be registered to Cisco Unified CME and associates it with a SCCP client interface's MAC address. <ul style="list-style-type: none"> <li>• Required only if you blocked automatic registration by using the <b>auto-reg-ephone</b> command.</li> <li>• <i>device-name</i>—MAC address of the SCCP client interface with the "MTP" prefix added.</li> </ul> |
| <b>Step 5</b> | <b>dspfarm</b><br><b>Example:</b><br>Router(config)# dspfarm                                                       | Enables the DSP farm.                                                                                                                                                                                                                                                                                                                                                                                      |

|        | Command or Action                                                     | Purpose                          |
|--------|-----------------------------------------------------------------------|----------------------------------|
| Step 6 | <b>end</b><br><br><b>Example:</b><br><code>Router(config)# end</code> | Returns to privileged EXEC mode. |

## Modify the Number of Transcoding Sessions for NM-HDVs

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no dspfarm**
4. **dspfarm transcoder maximum sessions** *number*
5. **dspfarm**
6. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action                                                                                                                                      | Purpose                                                                                                            |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br><code>Router&gt; enable</code>                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br><code>Router# configure terminal</code>                                                            | Enters global configuration mode.                                                                                  |
| Step 3 | <b>no dspfarm</b><br><br><b>Example:</b><br><code>Router(config)# no dspfarm</code>                                                                    | Disables the DSP farm.                                                                                             |
| Step 4 | <b>dspfarm transcoder maximum sessions</b> <i>number</i><br><br><b>Example:</b><br><code>Router(config)# dspfarm transcoder maximum sessions 12</code> | Specifies the maximum number of transcoding sessions to be supported by the DSP farm.                              |
| Step 5 | <b>dspfarm</b><br><br><b>Example:</b><br><code>Router(config)# dspfarm</code>                                                                          | Enables the DSP farm.                                                                                              |
| Step 6 | <b>end</b><br><br><b>Example:</b>                                                                                                                      | Returns to privileged EXEC mode.                                                                                   |

|  | Command or Action                | Purpose |
|--|----------------------------------|---------|
|  | <code>Router(config)# end</code> |         |

## Tune DSP-Farm Performance on an NM-HDV

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **sccp ip precedence** *value*
4. **dspfarm rtp timeout** *seconds*
5. **dspfarm connection interval** *seconds*
6. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                                                   | Purpose                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><code>Router&gt; enable</code>                                                                  | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>                                             | Enters global configuration mode.                                                                                                   |
| <b>Step 3</b> | <b>sccp ip precedence</b> <i>value</i><br><b>Example:</b><br><code>Router(config)# sccp ip precedence 5</code>                      | (Optional) Sets the IP precedence value to increase the priority of voice packets over connections controlled by SCCP.              |
| <b>Step 4</b> | <b>dspfarm rtp timeout</b> <i>seconds</i><br><b>Example:</b><br><code>Router(config)# dspfarm rtp timeout 60</code>                 | (Optional) Configures the Real-Time Transport Protocol (RTP) timeout interval if the error condition "RTP port unreachable" occurs. |
| <b>Step 5</b> | <b>dspfarm connection interval</b> <i>seconds</i><br><b>Example:</b><br><code>Router(config)# dspfarm connection interval 60</code> | (Optional) Specifies how long to monitor RTP inactivity before deleting an RTP stream.                                              |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><code>Router(config)# end</code>                                                                   | Returns to privileged EXEC mode.                                                                                                    |

## Verify DSP Farm Operation

To verify that the DSP farm is registered and running, perform the following steps in any order.

### Procedure

- Step 1** Use the **show sccp [statistics | connections]** command to display the SCCP configuration information and current status.

#### Example:

```
Router# show sccp statistics
SCCP Application Service(s) Statistics:

Profile ID:1, Service Type:Transcoding
TCP packets rx 7, tx 7
Unsupported pkts rx 1, Unrecognized pkts rx 0
Register tx 1, successful 1, rejected 0, failed 0
KeepAlive tx 0, successful 0, failed 0
OpenReceiveChannel rx 2, successful 2, failed 0
CloseReceiveChannel rx 0, successful 0, failed 0
StartMediaTransmission rx 2, successful 2, failed 0
StopMediaTransmission rx 0, successful 0, failed 0
Reset rx 0, successful 0, failed 0
MediaStreamingFailure rx 0
Switchover 0, Switchback 0
```

Use the **show sccp connections** command to display information about the connections controlled by the SCCP transcoding and conferencing applications. In the following example, the secure value of the stype field indicates that the connection is encrypted:

```
Router# show sccp connections

sess_id conn_id stype mode codec ripaddr rport sport

16777222 16777409 secure-xcode sendrecv g729b 10.3.56.120 16772 19534
16777222 16777393 secure-xcode sendrecv g711u 10.3.56.50 17030 18464
Total number of active session(s) 1, and connection(s) 2
```

- Step 2** Use the **show sdspfarm units** command to display the configured and registered DSP farms.

#### Example:

```
Router# show sdspfarm units

mtp-1 Device:MTP003080218a31 TCP socket:[2] REGISTERED
actual_stream:8 max_stream 8 IP:10.10.10.3 11470 MTP YOKO keepalive 1
Supported codec:G711Ulaw
 G711Alaw
 G729a
 G729ab

max-mtps:1, max-streams:40, alloc-streams:8, act-streams:2
```

- Step 3** Use the **show sdspfarm sessions** command to display the transcoding streams.

#### Example:

```

Router# show sdspfarm sessions
Stream-ID:1 mtp:1 10.10.10.3 18404 Local:2000 START
usage:Ip-Ip
codec:G711Ulaw64k duration:20 vad:0 peer Stream-ID:2

Stream-ID:2 mtp:1 10.10.10.3 17502 Local:2000 START
usage:Ip-Ip
codec:G729AnnexA duration:20 vad:0 peer Stream-ID:1

Stream-ID:3 mtp:1 0.0.0.0 0 Local:0 IDLE
usage:
codec:G711Ulaw64k duration:20 vad:0 peer Stream-ID:0

Stream-ID:4 mtp:1 0.0.0.0 0 Local:0 IDLE
usage:
codec:G711Ulaw64k duration:20 vad:0 peer Stream-ID:0

Stream-ID:5 mtp:1 0.0.0.0 0 Local:0 IDLE
usage:
codec:G711Ulaw64k duration:20 vad:0 peer Stream-ID:0

Stream-ID:6 mtp:1 0.0.0.0 0 Local:0 IDLE
usage:
codec:G711Ulaw64k duration:20 vad:0 peer Stream-ID:0

Stream-ID:7 mtp:1 0.0.0.0 0 Local:0 IDLE
usage:
codec:G711Ulaw64k duration:20 vad:0 peer Stream-ID:0

Stream-ID:8 mtp:1 0.0.0.0 0 Local:0 IDLE
usage:
codec:G711Ulaw64k duration:20 vad:0 peer Stream-ID:0

```

**Step 4** Use the **show sdspfarm sessions summary** command to display a summary view the transcoding streams.

**Example:**

```
Router# show sdspfarm sessions summary
```

```

max-mtps:2, max-streams:240, alloc-streams:40, act-streams:2

```

| ID | MTP | State | CallID | confID | Usage                      | Codec/Duration    |
|----|-----|-------|--------|--------|----------------------------|-------------------|
| 1  | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 2  | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 3  | 2   | START | -1     | 3      | MoH (DN=3 , CH=1) FE=TRUE  | G729 /20ms        |
| 4  | 2   | START | -1     | 3      | MoH (DN=3 , CH=1) FE=FALSE | G711Ulaw64k /20ms |
| 5  | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 6  | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 7  | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 8  | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 9  | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 10 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 11 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 12 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 13 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 14 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 15 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 16 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 17 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 18 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 19 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 20 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 21 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 22 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |
| 23 | 2   | IDLE  | -1     | 0      |                            | G711Ulaw64k /20ms |

```

24 2 IDLE -1 0 G711Ulaw64k /20ms
25 2 IDLE -1 0 G711Ulaw64k /20ms
26 2 IDLE -1 0 G711Ulaw64k /20ms
27 2 IDLE -1 0 G711Ulaw64k /20ms
28 2 IDLE -1 0 G711Ulaw64k /20ms
29 2 IDLE -1 0 G711Ulaw64k /20ms
30 2 IDLE -1 0 G711Ulaw64k /20ms
31 2 IDLE -1 0 G711Ulaw64k /20ms
32 2 IDLE -1 0 G711Ulaw64k /20ms
33 2 IDLE -1 0 G711Ulaw64k /20ms
34 2 IDLE -1 0 G711Ulaw64k /20ms
35 2 IDLE -1 0 G711Ulaw64k /20ms
36 2 IDLE -1 0 G711Ulaw64k /20ms

```

**Step 5** Use the **show sdpfarm sessions active** command to display the transcoding streams for all active sessions.

**Example:**

```

Router# show sdpfarm sessions active

Stream-ID:1 mtp:1 10.10.10.3 18404 Local:2000 START
usage:Ip-Ip
codec:G711Ulaw64k duration:20 vad:0 peer Stream-ID:2

Stream-ID:2 mtp:1 10.10.10.3 17502 Local:2000 START
usage:Ip-Ip
codec:G729AnnexA duration:20 vad:0 peer Stream-ID:1

```

**Step 6** Use the **show sccp connections details** command to display the SCCP connections details such as call-leg details.

**Example:**

```

Router# show sccp connections details

bridge-info(bid, cid) - Normal bridge information(Bridge id, Calleg id)
mmbridge-info(bid, cid) - Mixed mode bridge information(Bridge id, Calleg id)

sess_id conn_id call-id codec pkt-period type bridge-info(bid, cid) mmbridge-info(bid,
cid)

1 - 14 N/A N/A transmsp All RTPSPI Callegs N/A

1 2 15 g729a 20 rtpspi (4,14) N/A

1 1 13 g711u 20 rtpspi (3,14) N/A

Total number of active session(s) 1, connection(s) 2, and callees 3

```

**Step 7** Use the **debug sccp {all | errors | events | packets | parser}** command to set debugging levels for SCCP and its applications.

**Step 8** Use the **debug dspfarm {all | errors | events | packets}** command to set debugging levels for DSP-farm service.

**Step 9** Use the **debug ephone mtp** command to enable Message Transfer Part (MTP) debugging. Use this debug command with the **debug ephone mtp**, **debug ephone register**, **debug ephone state**, and **debug ephone pak** commands.

# Register the DSP Farm with Cisco Unified CME 4.2 or a Later Version in Secure Mode

The DSP farm can reside on the same router with the Cisco Unified CME or on a different router. Some of the steps in the following tasks are optional depending the location of the DSP farm.

## Obtain Digital Certificate from a CA Server

The CA server can be the same router as the DSP farm. The DSP farm router can be configured as a CA server. The configuration steps below show how to configure a CA server on the DSP farm router. Additional configurations are required for configuring CA server on an external Cisco router or using a different CA server by itself.

### Configure a CA Server

**Note** Skip this procedure if the DSP farm resides on the same router as the Cisco Unified CME. Proceed to the [Create a Trustpoint, on page 509](#) section.

The CA server automatically creates a trustpoint where the certificates are stored. The automatically created trustpoint stores the CA root certificate.

#### Before you begin

- Cisco Unified CME 4.2 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki server *label***
4. **database level complete**
5. **grant auto**
6. **database url *root-url***
7. **no shutdown**
8. **exit**
9. **crypto pki trustpoint *label***
10. **revocation-check *crl***
11. **rsa keypair *key-label***

### DETAILED STEPS

#### Procedure

|        | Command or Action | Purpose                       |
|--------|-------------------|-------------------------------|
| Step 1 | enable            | Enables privileged EXEC mode. |

|               | Command or Action                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|-----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Router> enable                                                                   | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>crypto pki server label</b><br><br><b>Example:</b><br>Router(config)# crypto pki server dspcert  | Defines a label for the certificate server and enters certificate-server configuration mode. <ul style="list-style-type: none"> <li><i>label</i>—Name for CA certificate server.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 4</b> | <b>database level complete</b><br><br><b>Example:</b><br>Router(cs-server)# database level complete | (Optional) Controls the type of data stored in the certificate enrollment database. The default if this command is not used is <b>minimal</b> . <ul style="list-style-type: none"> <li><b>complete</b>—In addition to the information given in the minimal and names levels, each issued certificate is written to the database.</li> </ul> <p><b>Note</b><br/>The <b>complete</b> keyword produces a large amount of information; so specify an external TFTP server in which to store the data using of the <b>database url</b> command.</p>                                                       |
| <b>Step 5</b> | <b>grant auto</b><br><br><b>Example:</b><br>Router(cs-server)# grant auto                           | (Optional) Allows an automatic certificate to be issued to any requester. The recommended method and default if this command is not used is manual enrollment. <p><b>Tip</b><br/>Use this command only during enrollment when testing and building simple networks. A security best practice is to disable this functionality using the <b>no grant auto</b> command after configuration so that certificates cannot be continually granted.</p>                                                                                                                                                     |
| <b>Step 6</b> | <b>database url root-url</b><br><br><b>Example:</b><br>Router(cs-server)# database url nvram:       | (Optional) Specifies the location where all database entries for the certificate server are to be written out. If this command is not specified, all database entries are written to NVRAM. <ul style="list-style-type: none"> <li><i>root-url</i>—Location where database entries will be written out. The URL can be any URL that is supported by the Cisco IOS file system.</li> </ul> <p><b>Note</b><br/>If the CA is going to issue a large number of certificates, select an appropriate storage location like flash or other storage device to store the certificates.</p> <p><b>Note</b></p> |

|                | Command or Action                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                            | When the storage location chosen is flash and the file system type on this device is Class B (LEFS), make sure to check free space on the device periodically and use the <b>squeeze</b> command to free the space used up by deleted files. This process may take several minutes and should be done during scheduled maintenance periods or off-peak hours.                                                                                      |
| <b>Step 7</b>  | <b>no shutdown</b><br><b>Example:</b><br><code>Router(cs-server)# no shutdown</code>                                       | (Optional) Enables the CA.<br><br><b>Note</b><br>You should use this command only after you have completely configured the CA.                                                                                                                                                                                                                                                                                                                     |
| <b>Step 8</b>  | <b>exit</b><br><b>Example:</b><br><code>Router(cs-server)# exit</code>                                                     | Exits certificate-server configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 9</b>  | <b>crypto pki trustpoint <i>label</i></b><br><b>Example:</b><br><code>Router(config)# crypto pki trustpoint dspcert</code> | (Optional) Declares a trustpoint and enters ca-trustpoint configuration mode.<br><br><ul style="list-style-type: none"> <li>• <i>label</i>—Name for the trustpoint.</li> </ul> <b>Note</b><br>Use this command and the <b>enrollment url</b> command if this CA is local to the Cisco Unified CME router. These commands are not needed for a CA running on an external router. The <i>label</i> has to be the same as the <i>label</i> in Step 3. |
| <b>Step 10</b> | <b>revocation-check <i>crl</i></b><br><b>Example:</b><br><code>Router(ca-trustpoint)# revocation-check <i>crl</i></code>   | (Optional) Checks the revocation status of a certificate and specifies one or more methods to check the status. If a second and third method are specified, each method is used only if the previous method returns an error, such as a server being down.<br><br><ul style="list-style-type: none"> <li>• <i>crl</i>—Certificate checking is performed by a certificate revocation list (CRL). This is the default behavior.</li> </ul>           |
| <b>Step 11</b> | <b>rsa-keypair <i>key-label</i></b><br><b>Example:</b><br><code>Router(ca-trustpoint)# rsa-keypair caserver</code>         | (Optional) Specifies an RSA key pair to use with a certificate.<br><br><ul style="list-style-type: none"> <li>• <i>key-label</i>—Name of the key pair, which is generated during enrollment if it does not already exist or if the <b>auto-enroll regenerate</b> command is used.</li> </ul> <b>Note</b><br>Multiple trustpoints can share the same key.                                                                                           |

## Create a Trustpoint

The trustpoint stores the digital certificate for the DSP farm. To create a trustpoint, perform the following procedure:

### Before you begin

- Cisco Unified CME 4.2 or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *label*
4. **enrollment url** *ca-url*
5. **serial-number** *none*
6. **fqdn** *none*
7. **ip-address** *none*
8. **subject-name** [*x.500-name*]
9. **revocation-check** *none*
10. **rsa** *keypair key-label*

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                                  |
|---------------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                    | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                            | Enters global configuration mode.                                                                                                                                                                                        |
| <b>Step 3</b> | <b>crypto pki trustpoint</b> <i>label</i><br><b>Example:</b><br>Router(config)# crypto pki trustpoint dspcert         | Declares the trustpoint that your RA mode certificate server should use and enters CA-trustpoint configuration mode.<br><ul style="list-style-type: none"> <li>• <i>label</i>—Name for the trustpoint and RA.</li> </ul> |
| <b>Step 4</b> | <b>enrollment url</b> <i>ca-url</i><br><b>Example:</b><br>Router(ca-trustpoint)# enrollment url http://10.3.105.40:80 | Specifies the enrollment URL of the issuing CA certificate server (root certificate server).<br><ul style="list-style-type: none"> <li>• <i>ca-url</i>—URL of the router on which the root CA is installed.</li> </ul>   |
| <b>Step 5</b> | <b>serial-number</b> <i>none</i><br><b>Example:</b>                                                                   | Specifies whether the router serial number should be included in the certificate request.                                                                                                                                |

## Authenticate and Enroll a Certificate with the CA Server

|                | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                | <code>Router(ca-trustpoint)# serial-number none</code>                                                                                          | <ul style="list-style-type: none"> <li>• <b>none</b>—Specifies that a serial number will not be included in the certificate request.</li> </ul>                                                                                                                                                                                                                                                                                  |
| <b>Step 6</b>  | <b>fqdn none</b><br><b>Example:</b><br><code>Router(ca-trustpoint)# fqdn none</code>                                                            | <p>Specifies a fully qualified domain name (FQDN) that will be included as "unstructuredName" in the certificate request.</p> <ul style="list-style-type: none"> <li>• <b>none</b>—Router FQDN will not be included in the certificate request.</li> </ul>                                                                                                                                                                       |
| <b>Step 7</b>  | <b>ip-address none</b><br><b>Example:</b><br><code>Router(ca-trustpoint)# ip-address none</code>                                                | <p>Specifies a dotted IP address or an interface that will be included as "unstructuredAddress" in the certificate request.</p> <ul style="list-style-type: none"> <li>• <b>none</b>—Specifies that an IP address is not to be included in the certificate request.</li> </ul>                                                                                                                                                   |
| <b>Step 8</b>  | <b>subject-name [x.500-name]</b><br><b>Example:</b><br><code>Router(ca-trustpoint)# subject-name cn=vig224, ou=ABU, o=Cisco Systems Inc.</code> | <p>Specifies the subject name in the certificate request.</p> <p><b>Note</b><br/>The example shows how to format the certificate subject name to be similar to that of an IP phones.</p>                                                                                                                                                                                                                                         |
| <b>Step 9</b>  | <b>revocation-check none</b><br><b>Example:</b><br><code>Router(ca-trustpoint)# revocation-check none</code>                                    | <p>(Optional) Checks the revocation status of a certificate and specifies one or more methods to check the status. If a second and third method are specified, each method is used only if the previous method returns an error, such as a server being down.</p> <ul style="list-style-type: none"> <li>• <b>none</b>—Certificate checking is not required.</li> </ul>                                                          |
| <b>Step 10</b> | <b>rsa-keypair key-label</b><br><b>Example:</b><br><code>Router(ca-trustpoint)# rsa-keypair dspcert</code>                                      | <p>(Optional) Specifies an RSA key pair to use with a certificate.</p> <ul style="list-style-type: none"> <li>• <b>key-label</b>—Name of the key pair, which is generated during enrollment if it does not already exist or if the <b>auto-enroll regenerate</b> command is used.</li> </ul> <p><b>Note</b><br/>Multiple trustpoints can share the same key. The <i>key-label</i> is the same as the <i>label</i> in Step 3.</p> |

## Authenticate and Enroll a Certificate with the CA Server

## Before you begin

- Cisco Unified CME 4.2 or a later version.

## SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **crypto pki authenticate** *trustpoint-label*
4. **crypto pki enroll** *trustpoint-label*

## DETAILED STEPS

| Procedure |                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                        |

| Step 3    | <b>crypto pki authenticate</b> <i>trustpoint-label</i><br><b>Example:</b><br><pre>Router(config)# crypto pki authenticate dspcert</pre> | Retrieves the CA certificate and authenticates it. Checks the certificate fingerprint if prompted. <ul style="list-style-type: none"> <li>• <i>trustpoint-label</i>—Trustpoint label.</li> </ul> <p><b>Note</b><br/>The <i>trustpoint-label</i> is the trustpoint label specified in the <a href="#">Create a Trustpoint, on page 509</a> section.</p> |
| Step 4    | <b>crypto pki enroll</b> <i>trustpoint-label</i><br><b>Example:</b><br><pre>Router(config)# crypto pki enroll dspcert</pre>             | Enrolls with the CA and obtains the certificate for this trustpoint. <ul style="list-style-type: none"> <li>• <i>trustpoint-label</i>—Trustpoint label.</li> </ul> <p><b>Note</b><br/>The <i>trustpoint-label</i> is the trustpoint label specified in the <a href="#">Create a Trustpoint, on page 509</a> section.</p>                               |

## Copy the CA Root Certificate of the DSP Farm Router to the Cisco Unified CME Router

The DSP farm router and Cisco Unified CME router exchanges certificates during the registration process. These certificates are digitally signed by the CA server of the respective router. For the routers to accept each others digital certificate, they should have the CA root certificate of each other. Manually copy the CA root certificate of the DSP farm and Cisco Unified CME router to each other.

### Before you begin

- Cisco Unified CME 4.2 or a later version.

## SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **crypto pki trustpoint *label***
4. **enrollment terminal**
5. **crypto pki export *trustpoint* pem terminal**
6. **crypto pki authenticate *trustpoint-label***
7. You will be prompted to enter the CA certificate. Cut and paste the base 64 encoded certificate at the command line, then press Enter, and type "quit". The router prompts you to accept the certificate. Enter "yes" to accept the certificate.

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                          |

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                  | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                |
| <b>Step 3</b> | <b>crypto pki trustpoint <i>label</i></b><br><b>Example:</b><br>Router(config)# crypto pki trustpoint dspcert                               | Declares the trustpoint that your RA mode certificate server should use and enters CA-trustpoint configuration mode. <ul style="list-style-type: none"> <li>• <i>label</i>—Name for the trustpoint and RA.</li> </ul> <p><b>Note</b><br/>The <i>label</i> is the trustpoint label specified in the <a href="#">Create a Trustpoint, on page 509</a> section.</p> |
| <b>Step 4</b> | <b>enrollment terminal</b><br><b>Example:</b><br>Router(ca-trustpoint)# enrollment terminal                                                 | Specifies manual cut-and-paste certificate enrollment.                                                                                                                                                                                                                                                                                                           |
| <b>Step 5</b> | <b>crypto pki export <i>trustpoint</i> pem terminal</b><br><b>Example:</b><br>Router(ca-trustpoint)# crypto pki export dspcert pem terminal | Exports certificates and RSA keys that are associated with a trustpoint in a privacy-enhanced mail (PEM)-formatted file.                                                                                                                                                                                                                                         |
| <b>Step 6</b> | <b>crypto pki authenticate <i>trustpoint-label</i></b><br><b>Example:</b><br>Router(config)# crypto pki authenticate vg224                  | Retrieves the CA certificate and authenticates it. Checks the certificate fingerprint if prompted. <ul style="list-style-type: none"> <li>• <i>trustpoint-label</i>—Trustpoint label.</li> </ul> <p><b>Note</b><br/>This command is optional if the CA certificate is already loaded into the configuration.</p>                                                 |

|               | Command or Action                                                                                                                                                                                                                                | Purpose                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Step 7</b> | You will be prompted to enter the CA certificate. Cut and paste the base 64 encoded certificate at the command line, then press Enter, and type "quit". The router prompts you to accept the certificate. Enter "yes" to accept the certificate. | Completes the copying of the CA root certificate of the DSP farm router to the Cisco Unified CME router. |

## Copy CA Root Certificate of the Cisco Unified CME Router to the DSP Farm Router

Repeat the steps in the [Copy the CA Root Certificate of the DSP Farm Router to the Cisco Unified CME Router, on page 511](#) section in the opposite direction, that is, from Cisco Unified CME router to the DSP farm router.

Prerequisites

- Cisco Unified CME 4.2 or a later version.

## Configure Cisco Unified CME to Allow the DSP Farm to Register

**Before you begin**

- Cisco Unified CME 4.2 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **sdspfarm units** *number*
5. **sdspfarm transcode sessions** *number*
6. **sdspfarm tag** *number device-name*
7. **exit**

| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                       |
| <b>Step 3</b> | <b>telephony-service</b><br><br><b>Example:</b>                                | Enters telephony-service configuration mode.                            |

|               | Command or Action                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>Router(config)# telephony-service</code>                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 4</b> | <b><code>sdspfarm units</code> <i>number</i></b><br><b>Example:</b><br><code>Router(config-telephony)# sdspfarm units 1</code>                            | Specifies the maximum number of digital-signal-processor (DSP) farms that are allowed to be registered to the Skinny Client Control Protocol (SCCP) server.                                                                                                                                                                                                       |
| <b>Step 5</b> | <b><code>sdspfarm transcode sessions</code> <i>number</i></b><br><b>Example:</b><br><code>Router(config-telephony)# sdspfarm transcode sessions 30</code> | Specifies the maximum number of transcoding sessions allowed per Cisco Unified CME router. <ul style="list-style-type: none"> <li>• <i>number</i>—Declares the number of DSP farm sessions. Valid values are numbers from 1 to 128.</li> </ul>                                                                                                                    |
| <b>Step 6</b> | <b><code>sdspfarm tag</code> <i>number device-name</i></b><br><b>Example:</b><br><code>Router(config-telephony)# sdspfarm tag 1 vg224</code>              | Permits a DSP farm to register to Cisco Unified CME and associates it with a SCCP client interfaces MAC address.<br><br><b>Note</b><br>The <i>device-name</i> in this step must be the same as the <i>device-name</i> in the <b>associate profile</b> command in Step 17 of the <a href="#">Configure DSP Farms for NM-HDs and NM-HDV2s, on page 490</a> section. |
| <b>Step 7</b> | <b><code>exit</code></b><br><b>Example:</b><br><code>Router(config-telephony)# exit</code>                                                                | Exits telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                       |

## Verify DSP Farm Registration with Cisco Unified CME

Use the **show sdspfarm units** command to verify that the DSP farm is registering with Cisco Unified CME. Use the **show voice dsp group slot** command to show the status of secure conferencing.

### Prerequisites

- Cisco Unified CME 4.2 or a later version.

### show sdspfarm units

Router# **show sdspfarm units**

```
mtsp-2 Device:choc2851SecCFB1 TCP socket:[1] REGISTERED
actual_stream:8 max_stream 8 IP:10.1.0.20 37043 MTP YOKO keepalive 17391
Supported codec: G711Ulaw
 G711Alaw
 G729
 G729a
 G729ab
 GSM FR

max-mtps:2, max-streams:60, alloc-streams:18, act-streams:0
```

**show voice dsp**

```
Router# show voice dsp group slot 1

dsp 13:
 State: UP, firmware: 4.4.706
 Max signal/voice channel: 16/16
 Max credits: 240
 Group: FLEX_GROUP_VOICE, complexity: FLEX
 Shared credits: 180, reserved credits: 0
 Signaling channels allocated: 2
 Voice channels allocated: 0
 Credits used: 0
 Group: FLEX_GROUP_XCODE, complexity: SECURE MEDIUM
 Shared credits: 0, reserved credits: 60
 Transcoding channels allocated: 0
 Credits used: 0
dsp 14:
 State: UP, firmware: 1.0.6
 Max signal/voice channel: 16/16
 Max credits: 240
 Group: FLEX_GROUP_CONF, complexity: SECURE CONFERENCE
 Shared credits: 0, reserved credits: 240
 Conference session: 1
 Credits used: 0
```

## Configure LTI-based Transcoding

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice-card *slot***
4. **dsp services dspfarm**
5. **exit**
6. **dspfarm profile *profile-identifier* transcode [universal]**
7. **codec *codec-type***
8. **maximum sessions *number***
9. **associate application CUBE**
10. **no shutdown**
11. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action                                      | Purpose                                                                                                                   |
|--------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                  | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>voice-card slot</b><br><b>Example:</b><br>Router(config)# voice-card 1                                                                   | Enters voice-card configuration mode for the network module on which you want to enable DSP-farm services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 4</b> | <b>dsp services dspfarm</b><br><b>Example:</b><br>Router(config-voicecard)# dsp services dspfarm                                            | Enables DSP-farm services for the voice card.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-voicecard)# exit                                                                            | Exits voice-card configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 6</b> | <b>dspfarm profile profile-identifier transcode [universal]</b><br><b>Example:</b><br>Router(config)# dspfarm profile 1 transcode universal | Enters DSP farm profile configuration mode and defines a profile for DSP farm services. <ul style="list-style-type: none"> <li>• <i>profile-identifier</i>—Number that uniquely identifies a profile. Range: 1 to 65535.</li> <li>• <b>transcode</b>—Enables profile for transcoding.</li> <li>• <b>universal</b>—Enables transcoding support between all codecs for DSP farm services. Without <b>universal</b>, transcoding is always from g711ulaw to any other codec. This keyword is supported in Cisco Unified CME 11.6 and later versions for Cisco 4000 Series ISR.</li> </ul> |
| <b>Step 7</b> | <b>codec codec-type</b><br><b>Example:</b><br>Router(config-dspfarm-profile)# codec g711ulaw                                                | Specifies the codecs supported by a DSP farm profile. <ul style="list-style-type: none"> <li>• <i>codec-type</i>—Specifies the preferred codec. Type ? for a list of supported codecs.</li> <li>• Repeat this step for each supported codec.</li> </ul>                                                                                                                                                                                                                                                                                                                                |
| <b>Step 8</b> | <b>maximum sessions number</b><br><b>Example:</b><br>Router(config-dspfarm-profile)# maximum sessions 5                                     | Specifies the maximum number of sessions that are supported by the profile. <ul style="list-style-type: none"> <li>• <i>number</i>—Number of sessions supported by the profile. If the variable is not configured or if the DSP resources are not available, the value is set to 0.</li> <li>• The X value is determined at run time depending on the number of resources available with the resource provider.</li> </ul>                                                                                                                                                             |

|         | Command or Action                                                                                                                 | Purpose                                    |
|---------|-----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| Step 9  | <b>associate application CUBE</b><br><br><b>Example:</b><br><pre>Router(config-dspfarm-profile)# associate application CUBE</pre> | Associates CUBE with the DSP farm profile. |
| Step 10 | <b>no shutdown</b><br><br><b>Example:</b><br><pre>Router(config-dspfarm-profile)# no shutdown</pre>                               | Enables the DSP farm profile.              |
| Step 11 | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-dspfarm-profile)# end</pre>                                               | Returns to privileged EXEC mode.           |

#### What to do next

**Note** You can use the command **show dspfarm profile *profile-number*** to verify the configured DSP farm profiles. Use the command to verify if the profile status is UP, and the application status is ASSOCIATED.

## Configuration Examples for Transcoding Resources

### Example for Setting up DSP Farms for NM-HDVs

The following example sets up a DSP farm of 4 DSPs to handle up to 16 sessions (4 sessions per DSP) on a router with an IP address of 10.5.49.160 and a priority of 1 among other servers.

```
voice-card 1
 dsp services dspfarm
 exit
 sccp local FastEthernet 0/0
 sccp
 sccp ccm 10.5.49.160 priority 1
 dspfarm transcoder maximum sessions 16
 dspfarm

telephony-service
 ip source-address 10.5.49.200 port 2000
 sdspfarm units 4
 sdspfarm transcode sessions 40
 sdspfarm tag 1 mtp000a8eaca80
 sdspfarm tag 2 mtp123445672012
```

### Example for Setting Up DSP Farms for NM-HDs and NM-HDV2s

The following example sets up six transcoding sessions on a router with one DSP farm, an IP address of 10.5.49.160, and a priority of 1 among servers.

```

voice-card 1
 dsp services dspfarm

sccp local FastEthernet 0/1
sccp
sccp ccm 10.5.49.160 identifier 1

sccp ccm group 123
 associate ccm 1 priority
 associate profile 1 register mtp123456792012
 keepalive retries 5
 switchover method immediate
 switchback method immediate
 switchback interval 5

dspfarm profile 1 transcode
 codec g711ulaw
 codec g711alaw
 codec g729ar8
 codec g729abr8
 maximum sessions 6
 associate application sccp

telephony-service
 ip source-address 10.5.49.200 port 2000
 sdspfarm units 1
 sdspfarm transcode sessions 40
 sdspfarm tag 1 mtp000a8eaca80
 sdspfarm tag 2 mtp123445672012

```

## Example for Configuring Cisco Unified CME Router as the DSP Farm Host

The following example configures Cisco Unified CME router address 10.100.10.11 port 2000 to be the farm host using the DSP farm at mtp000a8eaca80 to allow for a maximum of 1 DSP farm and 16 transcoder sessions.

```

telephony-service
 ip source address 10.100.10.11 port 2000
 sdspfarm units 1
 sdspfarm transcode sessions 16
 sdspfarm tag 1 mtp000a8eaca80

```

## Example for Configuring LTI-based Transcoding

The following example configures Cisco Unified CME router for LTI-based transcoding.

```

voice-card 0
 dsp services dspfarm
!--- Dspfarm profile configuration with associate
!--- application CUBE for LTI transcoding.
dspfarm profile 1 transcode universal
 codec g729ar8
 codec g729br8
 codec g711alaw
 codec g711ulaw
 codec g729r8
 maximum sessions 12
 associate application CUBE

!--- Only dspfarm profile configurations are needed for

```

```
!--- LTI-based transcoding. All the SCCP-based transcoding
!--- features will be supported with LTI-based transcoding.
```

## Example for Configuring Voice Class Codec

The following example configures voice class codec under a dial peer on Unified CME.

```
voice class codec 10
 codec preference 1 g711alaw
 codec preference 2 g711ulaw bytes 80
 codec preference 3 g723ar53
 codec preference 4 g723ar63 bytes 144
 codec preference 5 g723r53
 codec preference 6 g723r63 bytes 120
 codec preference 7 g726r16
 codec preference 8 g726r24
 codec preference 9 g726r32 bytes 80
 codec preference 10 g728
 codec preference 11 g729br8
 codec preference 12 g729r8 bytes 50

dial-peer voice 100 voip
 voice-class codec 10
```

You can also configure voice class codec under a voice register pool on Unified CME.

```
voice register pool 1
 id mac 0030.94C2.A22A
 preference 5
 cor incoming call91 1 91011
 translate-outgoing called 1
 proxy 192.0.2.0 preference 1 monitor probe icmp-ping
 alias 1 94... to 91011 preference 8
 voice-class codec 10
```

## Where to go Next

### Music on Hold

Music on hold can require transcoding resources. See [Music on Hold, on page 823](#).

### Teleworker Remote Phones

Transcoding has benefits and disadvantages for remote teleworker phones. See the discussion in [Configuring Phones to Make Basic Calls, on page 229](#).

## Feature Information for Transcoding Resources

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

*Table 37: Feature Information for Transcoding Resources*

| Feature Name          | Cisco Unified CME Version | Feature Information                                                                               |
|-----------------------|---------------------------|---------------------------------------------------------------------------------------------------|
| LTI-based Transcoding | 11.6                      | Support for LTI-based Transcoding on Cisco 4000 Series ISR.                                       |
| Secure Transcoding    | 4.2                       | Secure transcoding for calls using the <b>codec g729r8 dspfarm-assist</b> command was introduced. |
| Transcoding Support   | 3.2                       | Transcoding between G.711 and G.729 was introduced.                                               |

## CHAPTER 15

# Toll Fraud Prevention

---

- [Prerequisites, on page 521](#)
- [Overview, on page 521](#)
- [IP Address Trusted Authentication, on page 524](#)
- [Direct Inward Dial for Incoming ISDN Calls, on page 525](#)
- [Disconnect ISDN Calls With No Matching Dial-peer, on page 525](#)
- [Block Two-stage Dialing Service on Analog and Digital FXO Ports, on page 525](#)
- [Configure Toll Fraud Prevention, on page 525](#)
- [Feature Information for Toll Fraud Prevention, on page 533](#)

## Prerequisites

The following are the prerequisites for configuring Toll Fraud prevention with Unified CME:

### Prerequisites for Configuring Toll Fraud Prevention on Trunk Side

- Cisco Unified CME 8.1 or a later version.
- Cisco IOS Release 15.1(2)T.

### Prerequisites for Configuring Toll Fraud Prevention for Line Side SIP

- Unified CME 12.6 or a later version.
- Cisco IOS XE Gibraltar Release 16.11.1a or later.

## Overview

Unified CME Release 12.6 enhances the existing Toll Fraud Prevention feature by enforcing security on the SIP line side of Unified CME. The feature enhancement secures the Unified CME system against potential toll fraud exploitation by unauthorized users from the SIP line side.

Some of the key features of Toll Fraud Prevention on Unified CME for secure calls over SIP lines are:

- All the REGISTER messages from SIP lines to be processed.

- REFER message from SIP lines to be processed only on Primary CME, when Secondary CME is enabled (Refer-To: urn:X-cisco-remotecc:token-registration).
- All the SIP line messages that are triggered from the endpoints to Unified CME are authenticated.
- If the IP address of the endpoint is not part of the IP address trusted list, the call is not placed through Unified CME.

For more information on Toll Fraud Prevention on Unified CME 12.6 and later, see [Toll Fraud Prevention for SIP Line Side on Unified CME, on page 522](#).

**Note** For Unified CME 8.1 to 12.5 Releases, toll fraud prevention was restricted to securing calls over the SIP trunk only. For more information about Toll Fraud Prevention over a SIP trunk, see [Configuring a Trusted IP Address List for Toll-Fraud Prevention](#).

## Toll Fraud Prevention for SIP Line Side on Unified CME

Unified CME 12.6 enforces security and toll fraud prevention for SIP line side on Unified CME. The **ip address trusted authentication** configuration blocks unauthorized calls from the line side. Hence, the Toll fraud Prevention feature secures Unified CME 12.6 and later from unauthorized users on the line side.

As part of the configuration for toll fraud prevention on Unified CME 12.6, all the line side endpoints must register to Unified CME. The following are the configurations of Toll Fraud Prevention in Unified CME, 12.6:

- The CLI command **ip address trusted authentication** is enabled by default in Unified CME. The command ensures that security is enabled on the Unified CME system.
- You can manually configure your Unified CME endpoints as trusted by entering the IP address or subnet of the trusted phone under the **iptrust-list** configuration mode, as follows:

```
Router (conf-voi-serv)#ip address trusted list
Router(cfg-iptrust-list)#ipv4 192.168.10.11
```

- You can verify the manually added IP address of the Unified CME endpoint, as follows:

```
Router(cfg-iptrust-list)#do show run | s voice service voip
voice service voip
ip address trusted list
ipv4 192.168.10.30
ipv4 192.168.10.31
ipv4 192.168.10.32
ipv4 192.168.10.33
media bulk-stats
```

- The CLI command **ip address trusted list** lists the IP address of incoming calls from all the registered directory numbers. The command is configured under **voice service voip** configuration mode.
- The **show ip address trusted list** CLI command displays a list of trusted IP addresses. The trusted IP addresses are displayed under the following lists:
  - Dial Peer (only applicable for trunk side): Provides details on the IP address of the phones that are configured under the dial-peer configuration mode.

- **Configured IP Address Trusted List:** Provides details on the manually configured IP addresses that are trusted.
- **Dynamic IP Address Trusted List:** Provides details on the IP address of the registered phones. This list is introduced in Unified CME 12.6 Release.
- **Server Group:** Provides details on the IP address of the phones that are configured under server-groups configuration mode.

```
Router>enable
Router#show ip address trusted list
IP Address Trusted Authentication
Administration State: UP
Operation State: UP

IP Address Trusted Call Block Cause: call-reject (21)

VoIP Dial-peer IPv4 and IPv6 Session Targets:
Peer Tag Oper State Session Target

4 UP ipv4:10.65.125.155

Configured IP Address Trusted List:
ipv4 192.168.20.1
ipv4 192.168.20.2 255.255.0.0
ipv4 192.168.20.3 255.255.0.0
ipv4 192.168.20.4 255.255.255.0

Dynamic IP Address Trusted List:
IP Address Subnet Mask Count Reason

ipv4:8.55.22.36 1 Phone Registered
ipv4:192.168.10.12 2 Phone Registered
ipv6:2001:420:54FF:13::312:0 119 1 Phone Registered
ipv4:8.55.22.15 1 Phone Registered
```

- The CLI command **ip address trusted list** provides information on the IP address of all trusted IP phones on Unified CME. For information specific to a particular IP phone on Unified CME, use the CLI command **show ip address trusted check**.

```
Router#show ip address trusted check 8.55.0.139
ip[8.55.0.139] authentication is FAILED!

Router#show ip address trusted check 8.55.0.136
ip[8.55.0.136] authenticate is PASSED by dynamic TrustList
```

- The CLI command **silent-discard untrusted** in **sip** configuration mode discards SIP requests from untrusted sources. This command is enabled by default on Unified CME.

## Upgrade Considerations

When you upgrade to Unified CME 12.6 version, you need not perform additional configurations for supporting toll fraud prevention. All the endpoints that are manually configured or auto-registered on Unified CME are added to the Unified CME IP Address Trust List. You can view the list of trusted IP addresses under the output of the CLI command **show ip address trusted list**.

# IP Address Trusted Authentication

IP address trusted authentication process blocks unauthorized calls and helps secure the Unified CME system against potential toll fraud exploitation by unauthorized users. In Unified CME, **IP address trusted authentication** is enabled by default. When IP address trusted authentication is enabled, Unified CME accepts incoming VoIP (SIP/H.323) calls only if the remote IP address of an incoming VoIP call is successfully validated from the system **IP address trusted list**. If the IP address trusted authentication fails, an incoming VoIP call is then disconnected by the application with a user-defined cause code and a new application internal error code 31 message (TOLL\_FRAUD\_CALL\_BLOCK) is logged. For configuration information, see [Configure IP Address Trusted Authentication for Incoming VoIP Calls, on page 525](#).

Unified CME maintains an **IP address trusted list** to validate the remote IP addresses of incoming VOIP calls. Unified CME saves an IPv4 session target of VoIP dial-peer to add the trusted IP addresses to **IP address trusted list** automatically. The IPv4 session target is identified as a trusted IP address only if the status of VoIP dial-peer in operation is “UP”. Up to 100 IPv4 addresses can be defined in the trusted IP address list. No duplicate IP addresses are allowed in the trusted IP address list. You can manually add up to 100 trusted IP addresses for incoming VOIP calls. For more information on manually adding trusted IP addresses, see [Add Valid IP Addresses For Incoming VoIP Calls, on page 527](#).

A call detail record (CDR) history record is generated when the call is blocked as a result of IP address trusted authentication failure. A new voice Internal Error Code (IEC) is saved to the CDR history record. The voice IEC error messages are logged to syslog if “voice iec syslog” option is enabled. The following is an IEC toll fraud call rejected syslog display:

```
*Aug 14 19:54:32.507: %VOICE_IEC-3-GW: Application Framework Core: Internal Error (Toll
fraud call rejected): IEC=1.1.228.3.31.0 on callID 3 GUID=AE5066C5883E11DE8026A96657501A09
```

The **IP address trusted list** authentication must be suspended when Unified CME is defined with “gateway” and a VoIP dial-peer with “session-target ras” is in operational UP status. The incoming VOIP call routing is then controlled by the gatekeeper. [Table 38: Administration and Operation States of IP Address Trusted Authentication, on page 524](#) shows administration state and operational state in different trigger conditions.

**Table 38: Administration and Operation States of IP Address Trusted Authentication**

| Trigger Condition                                                                                                                                                         | Administration State | Operation State |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-----------------|
| When <b>ip address trusted authenticate</b> is enabled.                                                                                                                   | Down                 | Down            |
| When “gateway” is defined and a VoIP dial-peer with “ras” as a session target is in “UP” operational state                                                                | Up                   | Down            |
| When <b>ip address trusted authenticate</b> is enabled and either “gateway” is not defined or no voip dial-peer with “ras” as session target is in “UP” operational state | Up                   | Up              |

**Note** We recommend enabling SIP authentication before enabling Out-of-dialog REFER (OOD-R) to avoid any potential toll fraud threats.

## Direct Inward Dial for Incoming ISDN Calls

In Cisco Unified CME 8.1 and later versions the **direct-inward-dial isdn** feature is enabled to prevent the toll fraud for incoming ISDN calls. The called number of an incoming ISDN enbloc dialing call is used to match the outbound dial-peers even if the **direct-inward-dial** option is disabled from a selected inbound plain old telephone service (POTS) dial-peer. If no outbound dial-peer is selected for the outgoing call set up, the incoming ISDN call is disconnected with cause-code “unassigned-number (1)”. For configuration information, see [Configure Direct Inward Dial for Incoming ISDN Calls, on page 529](#).

## Disconnect ISDN Calls With No Matching Dial-peer

Cisco Unified CME 8.1 and later versions disconnect unauthorized ISDN calls when no matching inbound voice dial-peer is selected. Cisco Unified CME and voice gateways use the **dial-peer no-match disconnect-cause** command to disconnect an incoming ISDN call when no inbound dial-peer is selected to avoid default POTS dial-peer behavior including two-stage dialing service to handle the incoming ISDN call.

## Block Two-stage Dialing Service on Analog and Digital FXO Ports

Cisco Unified CME 8.1 and later versions block the two-stage dialing service which is initiated when an Analog or Digital FXO port goes offhook and the private line automatic ringdown (PLAR) connection is not setup from the voice-port. As a result, no outbound dial-peer is selected for an incoming analog or digital FXO call and no dialed digits are collected from an FXO call. Cisco Unified CME and voice gateways disconnect the FXO call with cause-code “unassigned-number (1)”. Cisco Unified CME uses the **no secondary dialtone** command by default from FXO voice-port to block the two-stage dialing service on Analog or digital FXO ports. For more information on blocking two-stage dialing service on Analog and Digital FXO port, see [Block Secondary Dial tone on Analog and Digital FXO Ports, on page 530](#).

## Configure Toll Fraud Prevention

### Configure IP Address Trusted Authentication for Incoming VoIP Calls

---

**Restriction**

- IP address trusted authentication is skipped if an incoming call is an IPv6 call.
  - For an incoming VoIP call, IP trusted authentication must be invoked when the IP address trusted authentication is in “UP” operational state.
- 

**Before you begin**

- Unified CME 12.6 or a later version for SIP line calls.

- Unified CME 8.1 or a later version for secure trunk calls.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **ip address trusted authenticate**
5. **ip-address trusted call-block cause code**
6. **end**
7. **show ip address trusted list**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                          | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                  | Enters global configuration mode.                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>voice service voip</b><br><br><b>Example:</b><br>Router(config)# voice service voip                                                          | Enters voice service voip configuration mode.                                                                                                                                                                                                                                                          |
| <b>Step 4</b> | <b>ip address trusted authenticate</b><br><br><b>Example:</b><br>Router(conf-voi-serv)# ip address trusted authenticate                         | Enables IP address authentication on incoming H.323 or SIP trunk calls for toll fraud prevention support.<br><br>IP address trusted list authenticate is enabled by default. Use the “ <b>no ip address trusted list authenticate</b> ” command to disable the IP address trusted list authentication. |
| <b>Step 5</b> | <b>ip-address trusted call-block cause code</b><br><br><b>Example:</b><br>Router(conf-voi-serv)#ip address trusted call-block cause call-reject | Issues a cause-code when the incoming call is rejected to the IP address trusted authentication.<br><br><b>Note</b><br>If the IP address trusted authentication fails, a call-reject (21) cause-code is issued to disconnect the incoming VoIP call.                                                   |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br>Router()# end                                                                                              | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                       |

|        | Command or Action                                                                                                                                                                                                                                               | Purpose                                                                                                                         |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Step 7 | <b>show ip address trusted list</b><br><br><b>Example:</b><br><br><pre>Router#show ip address trusted list IP Address Trusted Authentication   Administration State: UP   Operation State:      UP  IP Address Trusted Call Block Cause: call-reject (21)</pre> | Verifies a list of valid IP addresses for incoming H.323 or SIP trunk calls, with Call Block cause for rejected incoming calls. |

### Example

Router #**show ip address trusted list**

```
IP Address Trusted Authentication
Administration State: UP
Operation State: UP

IP Address Trusted Call Block Cause: call-reject (21)

VoIP Dial-peer IPv4 and IPv6 Session Targets:
Peer Tag Oper State Session Target

4 UP ipv4:10.65.125.155

Configured IP Address Trusted List:
ipv4 192.168.10.20
ipv4 192.168.10.21
ipv4 192.168.10.22

Dynamic IP Address Trusted List:
ipv4 8.55.0.134 [1]
ipv4 8.55.0.136 [2]
ipv4 8.55.0.213 [1]
```

## Add Valid IP Addresses For Incoming VoIP Calls

### Before you begin

- Unified CME 8.1 and later for secure trunk calls.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **ip address trusted list**
5. **ipv4 {<ipv4 address> [<network mask>]}**
6. **end**
7. **show ip address trusted list**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                    | Purpose                                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                   | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                           | Enters global configuration mode.                                                                                                                                                                                                                                                |
| <b>Step 3</b> | <b>voice service voip</b><br><b>Example:</b><br>Router(config)# voice service voip                                   | Enters voice service voip configuration mode.                                                                                                                                                                                                                                    |
| <b>Step 4</b> | <b>ip address trusted list</b><br><b>Example:</b><br>Router(conf-voi-serv)# ip address trusted list                  | Enters ip address trusted list mode and allows to manually add additional valid IP addresses.                                                                                                                                                                                    |
| <b>Step 5</b> | <b>ipv4</b> { <ipv4 address> [ <network mask> ] }<br><b>Example:</b><br>Router(cfg-iptrust-list)# ipv4 192.168.10.20 | Allows you to add up to 100 IPv4 addresses in <b>ip address trusted list</b> . Duplicate IP addresses are not allowed in the ip address trusted list.<br><ul style="list-style-type: none"><li>• (Optional) <i>network mask</i>— allows to define a subnet IP address.</li></ul> |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(cfg-iptrust-list)# end                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                 |
| <b>Step 7</b> | <b>show ip address trusted list</b><br><b>Example:</b><br>Router# show ip address trusted list                       | Displays a list of valid IP addresses for incoming H.323 or SIP trunk calls.                                                                                                                                                                                                     |

## Example

The following example shows three IP addresses configured as trusted IP addresses:

```
Router#show ip address trusted list
IP Address Trusted Authentication
Administration State: UP
Operation State: UP
```

```
IP Address Trusted Call Block Cause: call-reject (21)
```

```
IP Address Trusted List:
```

```
ipv4 192.168.10.20
```

```
ipv4 192.168.10.21
```

```
ipv4 192.168.10.22
```

## Configure Direct Inward Dial for Incoming ISDN Calls

### Before you begin

- Direct-inward-dial isdn is not supported for incoming ISDN overlap dialing call.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice service pots**
4. *direct-inward-dial isdn*
5. **exit**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                            | Purpose                                                                                                                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                           | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                   | Enters global configuration mode.                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>voice service pots</b><br><b>Example:</b><br>Router(config)# voice service pots<br>Router(conf-voi-serv)# | Enters voice service configuration mode with voice telephone-service encapsulation type (pots).                                                                                                                                                                       |
| <b>Step 4</b> | <i>direct-inward-dial isdn</i><br><b>Example:</b><br>Router(conf-voi-serv)#direct-inward-dial isdn           | Enables direct-inward-dial (DID) for incoming ISDN number. The incoming ISDN (enbloc dialing) call is treated as if the digits were received from the DID trunk. The called number is used to select the outgoing dial peer. No dial tone is presented to the caller. |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b>                                                                               | Exits voice service pots configuration mode.                                                                                                                                                                                                                          |

|  | Command or Action           | Purpose |
|--|-----------------------------|---------|
|  | Router(conf-voi-serv)# exit |         |

### Example

```

!
voice service voip
 ip address trusted list
 ipv4 172.19.245.1
 ipv4 172.19.247.1
 ipv4 172.19.243.1
 ipv4 171.19.245.1
 ipv4 171.19.10.1
 allow-connections h323 to h323
 allow-connections h323 to sip
 allow-connections sip to h323
 allow-connections sip to sip
 supplementary-service media-renegotiate
 sip
 registrar server expires max 120 min 120
!
!
dial-peer voice 1 voip
 destination-pattern 5511...
 session protocol sipv2
 session target ipv4:1.3.45.1

!
dial-peer voice 100 pots
 destination-pattern 91...
 incoming called-number 2...
 forward-digits 4
!

```

## Block Secondary Dial tone on Analog and Digital FXO Ports

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice-port**
4. *no secondary dialtone*
5. **end**
6. **show run**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                   | Purpose                                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                  | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                     |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                          | Enters global configuration mode.                                                                                                       |
| <b>Step 3</b> | <b>voice-port</b><br><b>Example:</b><br>Router(config)#voice-p 2/0/0                                | Enters voice-port configuration mode.<br><ul style="list-style-type: none"><li>• Type your Analog or Digital FXO port number.</li></ul> |
| <b>Step 4</b> | <b>no secondary dialtone</b><br><b>Example:</b><br>Router((config-voiceport)# no secondary dialtone | Blocks the secondary dialtone on Analog and Digital FXO port.                                                                           |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(conf-voiceport)# exit                                       | Returns to privileged EXEC mode.                                                                                                        |
| <b>Step 6</b> | <b>show run</b><br><b>Example:</b><br>Router# show run   sec voice-port 2/0/0                       | Verifies that the secondary dial tone is disabled on the specific voice-port.                                                           |

## Example

```

Router# conf t
Router(config)#voice-p 2/0/0
Router(config-voiceport)# no secondary dialtone
!
end

Router# show run | sec voice-port 2/0/0
Foreign Exchange Office 2/0/0 Slot is 2, Sub-unit is 0, Port is 0
Type of VoicePort is FXO
Operation State is DORMANT
Administrative State is UP
...
Secondary dialtone is disabled

```

## Troubleshooting Tips for Toll Fraud Prevention

When incoming VOIP call is rejected by IP address trusted authentication, a specific internal error code (IEC) **1.1.228.3.31.0** is saved to the call history record. You can monitor the failed or rejected calls using the IEC support. Follow these steps to monitor any rejected calls:

### Procedure

**Step 1** Use the **show voice iec description** command to find the text description of an IEC code.

#### Example:

```
Router# show voice iec description 1.1.228.3.31.0
IEC Version: 1
Entity: 1 (Gateway)
Category: 228 (User is denied access to this service)
Subsystem: 3 (Application Framework Core)
Error: 31 (Toll fraud call rejected)
Diagnostic Code: 0
```

**Step 2** View the IEC statistics information using the **voice statistics type iec** command. The example below shows that 2 calls were rejected due to toll fraud call reject error code.

#### Example:

```
Router(config)#voice statistics type iec
Router(config)#end
Router#show voice statistics iec since-reboot
Router#show voice statistics iec since-restart

Internal Error Code counters

Counters since reboot:
 SUBSYSTEM Application Framework Core [subsystem code 3]
 [errcode 31] Toll fraud call rejected
```

**Step 3** Use the **enable IEC syslog** command to verify the syslog message logged when a call with IEC error is released.

#### Example:

```
Router# Enable iec syslog
Router (config)#voice iec syslog

Feb 11 01:42:57.371: %VOICE_IEC-3-GW: Application Framework Core:
Internal Error (Toll fraud call rejected): IEC=1.1.228.3.31.0 on
callID 288 GUID=DB3F10AC619711DCA7618593A790099E
```

**Step 4** Verify the source address of an incoming VOIP call using the **show call history voice last** command.

#### Example:

```
Router# show call history voice last 1

GENERIC:
SetupTime=3306550 ms
Index=6
...
InternalErrorCode=1.1.228.3.31.0
...
```

```
RemoteMediaIPAddress=1.5.14.13
...
```

**Step 5** IEC is saved to VSA of Radius Accounting Stop records. Monitor the rejected calls using the external RADIUS server.

**Example:**

```
Feb 11 01:44:06.527: RADIUS: Cisco AVpair [1] 36
"internal-error-code=1.1.228.3.31.0"
```

**Step 6** Retrieve the IEC details from cCallHistoryIec MIB object. More information on IEC is available at: [Cisco IOS Voice Troubleshooting and Monitoring Guide](#)

**Example:**

```
getmany 1.5.14.10 cCallHistoryIec
cCallHistoryIec.6.1 = 1.1.228.3.31.0
>getmany 172.19.156.132 cCallHistory
cCallHistorySetupTime.6 = 815385
cCallHistoryPeerAddress.6 = 1300
cCallHistoryPeerSubAddress.6 =
cCallHistoryPeerId.6 = 8000
cCallHistoryPeerIfIndex.6 = 76
cCallHistoryLogicalIfIndex.6 = 0
cCallHistoryDisconnectCause.6 = 15
cCallHistoryDisconnectText.6 = call rejected (21)
cCallHistoryConnectTime.6 = 0
cCallHistoryDisconnectTime.6 = 815387
cCallHistoryCallOrigin.6 = answer(2)
cCallHistoryChargedUnits.6 = 0
cCallHistoryInfoType.6 = speech(2)
cCallHistoryTransmitPackets.6 = 0
cCallHistoryTransmitBytes.6 = 0
cCallHistoryReceivePackets.6 = 0
cCallHistoryReceiveBytes.6 = 0
cCallHistoryReleaseSrc.6 = internalCallControlApp(7)
cCallHistoryIec.6.1 = 1.1.228.3.31.0

>getone 172.19.156.132 cvVoIPCallHistoryRemMediaIPAddr.6
cvVoIPCallHistoryRemMediaIPAddr.6 = 1.5.14.13
```

## Feature Information for Toll Fraud Prevention

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

**Table 39: Feature Information for Toll Fraud Prevention**

| Feature Name                                    | Cisco Unified CME Version | Feature Information                                                              |
|-------------------------------------------------|---------------------------|----------------------------------------------------------------------------------|
| Toll Fraud Prevention for Line Side Unified CME | 12.6                      | Introduced toll fraud prevention support for line side endpoints on Unified CME. |

| Feature Name                               | Cisco Unified CME Version | Feature Information                                   |
|--------------------------------------------|---------------------------|-------------------------------------------------------|
| Toll Fraud Prevention in Cisco Unified CME | 8.1                       | Introduced support for Toll Fraud Prevention feature. |

## CHAPTER 16

# Voice Mail Integration

This chapter describes how to integrate your voice-mail system with Cisco Unified Communications Manager Express (Cisco Unified CME).

- [Prerequisites for Voice Mail Integration, on page 535](#)
- [Information About Voice-Mail Integration, on page 536](#)
- [Configure Voice-Mail Integration, on page 542](#)
- [Configuration Examples for Voice-Mail Integration, on page 570](#)
- [Feature Information for Voice-Mail Integration, on page 573](#)

## Prerequisites for Voice Mail Integration

- Calls can be successfully completed between phones on the same Cisco Unified CME router.
- If your voice-mail system is something other than Cisco Unity Express, such as Cisco Unity, voice mail must be installed and configured on your network.
- If your voice-mail system is Cisco Unity Express:

### Note

When you order Cisco Unity Express, Cisco Unity Express software and the purchased license are installed on the module at the factory. Spare modules also ship with the software and license installed. If you are adding Cisco Unity Express to an existing Cisco router, you will be required to install hardware and software components.

- Interface module for Cisco Unity Express is installed. For information about the AIM-CUE or NM-CUE, access documents located at [http://www.cisco.com/en/US/products/hw/modules/ps2797/prod\\_installation\\_guides\\_list.html](http://www.cisco.com/en/US/products/hw/modules/ps2797/prod_installation_guides_list.html).
- The recommended Cisco IOS release and feature set plus the necessary Cisco Unified CME phone firmware files to support Cisco Unity Express are installed on the Cisco Unified CME router.

To determine whether the Cisco IOS software release and Cisco Unified CME software version are compatible with the Cisco Unity Express version, Cisco router model, and Cisco Unity Express hardware that you are using, see [Cisco Unity Express Compatibility Matrix](#).

To verify installed Cisco Unity Express software version, enter the Cisco Unity Express command environment and use the **show software version** user EXEC command. For information about the command environment, see the appropriate *Cisco Unity Express CLI Administrator Guide* at [http://www.cisco.com/en/US/docs/voice\\_ip\\_comm/unity\\_exp/roadmap/cuedocs.html](http://www.cisco.com/en/US/docs/voice_ip_comm/unity_exp/roadmap/cuedocs.html).

- The proper license for Cisco Unified CME, not Cisco Unified Communications Manager, is installed. To verify installed license, enter the Cisco Unity Express command environment and use the **show software license** user EXEC command. For information about the command environment, see the appropriate *Cisco Unity Express CLI Administrator Guide* at [http://www.cisco.com/en/US/docs/voice\\_ip\\_comm/unity\\_exp/roadmap/cuedocs.html](http://www.cisco.com/en/US/docs/voice_ip_comm/unity_exp/roadmap/cuedocs.html).

This is an example of the Cisco Unified CME license:

```
se-10-0-0-0> show software licenses
Core:
- application mode: CCME
- total usable system ports: 8

Voicemail/Auto Attendant:
- max system mailbox capacity time: 6000
- max general delivery mailboxes: 15
- max personal mailboxes: 50

Languages:
- max installed languages: 1
- max enabled languages: 1
```

- Voicemail and Auto Attendant (AA) applications are configured. For configuration information, see “Configuring the System Using the Initialization Wizard” in the appropriate Cisco Unity Express GUI Administrator Guide at [http://www.cisco.com/en/US/docs/voice\\_ip\\_comm/unity\\_exp/roadmap/cuedocs.html](http://www.cisco.com/en/US/docs/voice_ip_comm/unity_exp/roadmap/cuedocs.html).

## Information About Voice-Mail Integration

### Cisco Unity Connection Integration

Cisco Unity Connection transparently integrates messaging and voice recognition components with your data network to provide continuous global access to calls and messages. These advanced, convergence-based communication services help you use voice commands to place calls or listen to messages in “hands-free” mode and check voice messages from your desktop, either integrated into an e-mail inbox or from a Web browser. Cisco Unity Connection also features robust automated-attendant functions that include intelligent routing and easily customizable call-screening and message-notification options.

For instructions on how to integrate Cisco Unified CME with Cisco Unity Connection, see [Cisco CallManager Express 3.x Integration Guide for Cisco Unity Connection 1.1](#).

### Cisco Unity Express Integration

Cisco Unity Express offers easy, one-touch access to messages and commonly used voice-mail features that enable users to reply, forward, and save messages. To improve message management, users can create alternate greetings, access envelope information, and mark or play messages based on privacy or urgency. For instructions on how to configure Cisco Unity Express, see the administrator guides for [Cisco Unity Express](#).

For configuration information, see [“Enabling DTMF Integration Using SIP NOTIFY”](#).

**Note** Cisco Unified CME and Cisco Unity Express must both be configured before they can be integrated.

## Cisco Unity Integration

Cisco Unity is a Microsoft Windows-based communications solution that brings you voice mail and unified messaging and integrates them with the desktop applications you use daily. Cisco Unity gives you the ability to access all of your messages, voice, fax, and e-mail, by using your desktop PC, a touchtone phone, or the Internet. The Cisco Unity voice mail system supports voice-mail integration with Cisco Unified CME. This integration requires that you configure the Cisco Unified CME router and Cisco Unity software to get voice-mail service.

For configuration instructions, see [“Enabling DTMF Integration Using RFC 2833”](#).

## DTMF Integration for Legacy Voice-Mail Applications

For dual-tone multifrequency (DTMF) integrations, information on how to route incoming or forwarded calls is sent by a telephone system in the form of DTMF digits. The DTMF digits are sent in a pattern that is based on the integration file in the voice-mail system connected to the Cisco Unified CME router. These patterns are required for DTMF integration of Cisco Unified CME with most voice-mail systems. Voice-mail systems are designed to respond to DTMF after the system answers the incoming calls.

After configuring the DTMF integration patterns on the Cisco Unified CME router, you set up the integration files on the third-party legacy voice-mail system by following the instructions in the documents that accompany the voice-mail system. You must design the DTMF integration patterns appropriately so that the voice-mail system and the Cisco Unified CME router work with each other.

For configuration information, see [Enabling DTMF Integration for Analog Voice-Mail Applications](#).

## Mailbox Selection Policy

Typically a voice-mail system uses the number that a caller has dialed to determine the mailbox to which a call should be sent. However, if a call has been diverted several times before reaching the voice-mail system, the mailbox that is selected might vary for different types of voice-mail systems. For example, Cisco Unity Express uses the last number to which the call was diverted before it was sent to voice mail as the mailbox number. Cisco Unity and some legacy PBX systems use the originally called number as the mailbox number.

The Mailbox Selection Policy feature allows you to provision the following options from the Cisco Unified CME configuration.

- For Cisco Unity Express, you can select the originally dialed number.
- For PBX voice-mail systems, you can select the last number to which the call was diverted before it was sent to voice mail. This option is configured on the outgoing dial peer for the voice-mail system's pilot number.

- For Cisco Unity voice mail, you can select the last number to which the call was diverted before it was sent to voice mail. This option is configured on the ephone-dn that is associated with the voice-mail pilot number.

To enable Mailbox Selection Policy, see [“SCCP: Setting a Mailbox Selection Policy for Cisco Unity Express or a PBX Voice-Mail Number”](#) or [“SCCP: Setting Mailbox Selection Policy for Cisco Unity”](#).

## RFC 2833 DTMF MTP Pass through

In Cisco Unified CME 4.1, the RFC 2833 Dual-Tone Multifrequency (DTMF) Media Termination Point (MTP) Passthrough feature provides the capability to pass DTMF tones transparently between SIP endpoints that require transcoding or Resource Reservation Protocol (RSVP) agents.

This feature supports DTMF Relay across SIP WAN devices that support RFC 2833, such as Cisco Unity and SIP trunks. Devices registered to a Cisco Unified CME SIP back-to-back user agent (B2BUA) can exchange RFC 2833 DTMF MTP with other devices that are not registered with the Cisco Unified CME SIP B2BUA, or with devices that are registered in one of the following:

- Local or remote Cisco Unified CME
- Cisco Unified Communications Manager
- Third party proxy

By default, the RFC 2833 DTMF MTP Passthrough feature uses payload type 101 on MTP, and MTP accepts all the other dynamic payload types if it is indicated by Cisco Unified CME. For configuration information, see [Enabling DTMF Integration Using RFC 2833](#).

## MWI Line Selection

Message waiting indicator (MWI) line selection allows you to choose the phone line that is monitored for voice-mail messages and that lights an indicator when messages are present.

Before Cisco Unified CME 4.0, the MWI lamp on a phone running SCCP could be associated only with the primary line of the phone.

In Cisco Unified CME 4.0 and later versions, you can designate a phone line other than the primary line to be associated with the MWI lamp. Lines other than the one associated with the MWI lamp display an envelope icon when a message is waiting. A logical phone “line” is not the same as a phone button. A button with one or more directory numbers is considered one line. A button with no directory number assigned does not count as a line.

In Cisco Unified CME 4.0 and later versions, a SIP directory number that is used for call forward all, presence BLF status, and MWI features must be configured by using the **dn** keyword in the **number** command; direct line numbers are not supported.

For configuration information, see [SCCP: Configuring a Voice Mailbox Pilot Number](#) or [SIP: Configuring a Directory Number for MWI](#).

## AMWI

The AMWI (Audible Message Line Indicator) feature provides a special stutter dial tone to indicate message waiting. This is an accessibility feature for vision-impaired phone users. The stutter dial tone is defined as 10 ms ON, 100 ms OFF, repeat 10 times, then steady on.

In Cisco Unified CME 4.0(3), you can configure the AMWI feature on the Cisco Unified IP Phone 7911 and Cisco Unified IP Phone 7931G to receive audible, visual, or audible and visual MWI notification from an external voice-messaging system. AMWI cannot be enabled unless the **number** command is already configured for the IP phone to be configured.

Cisco Unified CME applies the following logic based on the capabilities of the IP phone and how MWI is configured:

- If the phone supports (visual) MWI and MWI is configured for the phone, activate the Message Waiting light.
- If the phone supports (visual) MWI only, activate the Message Waiting light regardless of the configuration.
- If the phone supports AMWI and AMWI is configured for the phone, send the stutter dial tone to the phone when it goes off-hook.
- If the phone supports AMWI only and AMWI is configured, send the stutter dial tone to the phone when it goes off-hook regardless of the configuration.

If a phone supports (visual) MWI and AMWI and both options are configured for the phone, activate the Message Waiting light and send the stutter dial tone to the phone when it goes off-hook.

For configuration information, see [SCCP: Configuring a Phone for MWI Outcall](#).

## SIP MWI Prefix Specification

Central voice-messaging servers that provide mailboxes for several Cisco Unified CME sites may use site codes or prefixes to distinguish among similarly numbered ranges of extensions at different sites. In Cisco Unified CME 4.0 and later versions, you can specify that your Cisco Unified CME system should accept unsolicited SIP Notify messages for MWI that include a prefix string as a site identifier.

For example, an MWI message might indicate that the central mailbox number 555-0123 has a voice message. In this example, the digits 555 are set as the prefix string or site identifier using the **mw prefix** command. The local Cisco Unified CME system is able to convert 555-0123 to 0123 and deliver the MWI to the correct phone. Without this prefix string manipulation, the system would reject an MWI for 555-0123 as not matching the local Cisco Unified CME extension 0123.

To enable SIP MWI Prefix Specification, see [Enabling SIP MWI Prefix Specification](#).

## SIP MWI - QSIG Translation

In Cisco Unified CME 4.1 and later, the SIP MWI - QSIG Translation feature extends MWI functionality for SIP MWI and QSIG MWI interoperability to enable sending and receiving MWI over QSIG to a PBX.

When the SIP Unsolicited NOTIFY is received from voice mail, the Cisco router translates this event to activate QSIG MWI to the PBX, via PSTN. The PBX will switch on, or off, the MWI lamp on the corresponding IP phone. This feature supports only Unsolicited NOTIFY. Subscribe NOTIFY is not supported by this feature.

In [Figure 18: SIP MWI to ISDN QSIG When Voice Mail and Cisco Router are On the Same LAN](#), on page 540, the Cisco router receives the SIP Unsolicited NOTIFY, performs the protocol translation, and initiates the QSIG MWI call to the PBX, where it is routed to the appropriate phone.

**Figure 18: SIP MWI to ISDN QSIG When Voice Mail and Cisco Router are On the Same LAN**

It makes no difference if the SIP Unsolicited NOTIFY is received via LAN or WAN if the PBX is connected to the Cisco router, and not to the remote voice-mail server.

In [Figure 19: SIP MWI to ISDN QSIG When PBX is Connected to a Remote Cisco Router](#), on page 540, a voice mail server and Cisco Unified CME are connected to the same LAN and a remote Cisco Unified CME is connected across the WAN. In this scenario, the protocol translation is performed at the remote Cisco router and the QSIG MWI message is sent to the PBX.

**Figure 19: SIP MWI to ISDN QSIG When PBX is Connected to a Remote Cisco Router**

## VMWI

There are two types of visual message waiting indicator (VMWI) features: Frequency-shift Keying (FSK) and DC voltage. The message-waiting lamp can be enabled to flash on an analog phone that requires an FSK message to activate a visual indicator. The DC Voltage VMWI feature is used to flash the message-waiting lamp on an analog phone which requires DC voltage instead of an FSK message. For all other applications, such as MGCP, FSK VMWI is used even if the voice gateway is configured for DC voltage VMWI. The configuration for DC voltage VMWI is supported only for Foreign Exchange Station (FXS) ports on the Cisco VG224 analog voice gateway with analog device version V1.3 and V2.1.

The Cisco VG224 can only support 12 Ringer Equivalency Number (REN) for ringing 24 onboard analog FXS voice ports. To support ringing and DC Voltage VMWI for 24 analog voice ports, stagger-ringing logic is used to maximize the limited REN resource. When a system runs out of REN because too many voice ports are being rung, the MWI lamp temporarily turns off to free up REN to ring the voice ports.

DC voltage VMWI is also temporarily turned off any time the port's operational state is no longer idle and onhook, such as when one of the following events occur:

- Incoming call on voice port
- Phone goes off hook
- The voice port is shut down or busied out

Once the operational state of the port changes to idle and onhook again, the MWI lamp resumes flashing until the application receives a requests to clear it; for example, if there are no more waiting messages.

For configuration information, see [Transfer to Voice Mail](#) .

## Transfer to Voice Mail

The Transfer to Voice Mail feature allows a phone user to transfer a caller directly to a voice-mail extension. The user presses the TrnsfVM softkey to place the call on hold, enters the extension number, and then commits the transfer by pressing the TrnsfVM softkey again. The caller hears the complete voice mail greeting. This feature is supported using the TrnsfVM softkey or feature access code (FAC).

For example, a receptionist might screen calls for five managers. If a call comes in for a manager who is not available, the receptionist can transfer the caller to the manager's voice-mail extension by using the TrnsfVM softkey and the caller hears the personal greeting of the individual manager.

For configuration information, see [Transfer to Voice Mail](#) .

## Live Record

The Live Record feature enables IP phone users in a Cisco Unified CME system to record a phone conversation if Cisco Unity Express is the voice mail system. An audible notification, either by announcement or by periodic beep, alerts participants that the conversation is being recorded. The playing of the announcement or beep is under the control of Cisco Unity Express.

Live Record is supported for two-party calls and ad hoc conferences. In normal record mode, the conversation is recorded after the LiveRcd softkey is pressed. This puts the other party on-hold and initiates a call to Cisco Unity Express at the configured live-record number. To stop the recording session, the phone user presses the LiveRcd softkey again, which toggles between on and off.

The Live-Record number is configured globally and must match the number configured in Cisco Unity Express. You can control the availability of the feature on individual phones by modifying the display of the LiveRcd softkey using an ephone template. This feature must be enabled on both Cisco Unified CME and Cisco Unity Express.

To enable Live Record in Cisco Unified CME, see [SCCP: Configuring Live Record](#).

## Cisco Unity Express AXL Enhancement

In Cisco Unified CME 7.0(1) and later versions, the Cisco Unity Express AXL enhancement in Cisco Unified CME provides better administrative integration between Cisco Unified CME and Cisco Unity Express by automatically synchronizing passwords.

No configuration is required to enable this feature.

# Configure Voice-Mail Integration

## Configure a Voice Mailbox Pilot Number on a SCCP Phone

To configure the telephone number that is speed-dialed when the Message button on a SCCP phone is pressed, perform the following steps.

**Note** The same telephone number is configured for voice messaging for all SCCP phones in Cisco Unified CME.

### Before you begin

- Voicemail phone number must be a valid number; directory number and number for voicemail phone number must be configured.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **voicemail** *phone-number*
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                | Purpose                                                                                                            |
|---------------|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                               | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal       | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service | Enters voice register global configuration mode to set parameters for all supported phones in Cisco Unified CME.   |
| <b>Step 4</b> | <b>voicemail</b> <i>phone-number</i><br><b>Example:</b>                          | Defines the telephone number that is speed-dialed when the Messages button on a Cisco Unified IP phone is pressed. |

|               | Command or Action                                                               | Purpose                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>Router(config-telephony)# voice mail 0123</code>                          | <ul style="list-style-type: none"> <li>• <i>phone-number</i>—Same phone number is configured for voice messaging for all SCCP phones in a Cisco Unified CME.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br><code>Router(config-telephony)# end</code> | Exits to privileged EXEC mode.                                                                                                                                          |

### What to do next

- (Cisco Unified CME 4.0 or a later version only) To set up a mailbox selection policy, see [SCCP: Configuring a Mailbox Selection Policy](#).
- To set up DTMF integration patterns for connecting to analog voice-mail applications, see [Enabling DTMF Integration for Analog Voice-Mail Applications](#).
- To connect to a remote SIP-based IVR or Cisco Unity, or to connect to a remote SIP-PSTN that goes through the PSTN to a voice-mail or IVR application, see [Enabling DTMF Integration Using RFC 2833](#).
- To connect to a Cisco Unity Express system, configure a nonstandard SIP NOTIFY format. See [Enabling DTMF Integration Using SIP NOTIFY](#).

## Configure a Mailbox Selection Policy on SCCP Phone

Perform *one* of the following tasks, depending on which voice-mail application is used:

- [Set a Mailbox Selection Policy for Cisco Unity Express or a PBX Voice-Mail Number](#)
- [Set a Mailbox Selection Policy for Cisco Unity](#)

### Set a Mailbox Selection Policy for Cisco Unity Express or a PBX Voice-Mail Number

To set a policy for selecting a mailbox for calls from a Cisco Unified CME system that are diverted before being sent to a Cisco Unity Express or PBX voice-mail pilot number, perform the following steps.

#### Restriction

In the following scenarios, the mailbox selection policy can fail to work properly:

- The last redirecting endpoint is not hosted on Cisco Unified CME. This may rarely occur with a PBX.
- A call is forwarded across several SIP trunks. Multiple SIP Diversion Headers (stacking hierarchy) are not supported in Cisco IOS software.
- A call is forwarded across non-Cisco voice gateways that do not support the optional H450.3 originalCalledNr field.

### Before you begin

Cisco Unified CME 4.0 or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice *tag* voip** or **dial-peer voice *tag* pots**
4. **mailbox-selection [*last-redirect-num* | *orig-called-num*]**
5. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 3</b> | <b>dial-peer voice <i>tag</i> voip</b> or <b>dial-peer voice <i>tag</i> pots</b><br><b>Example:</b><br><pre>Router(config)# dial-peer voice 7000 voip</pre> or<br><pre>Router(config)# dial-peer voice 35 pots</pre> | Enters dial-peer configuration mode. <ul style="list-style-type: none"> <li>• <i>tag</i>—identifies the dial peer. Valid entries are 1 to 2147483647.</li> </ul> <p><b>Note</b><br/>Use this command on the outbound dial peer associated with the pilot number of the voice-mail system. For systems using Cisco Unity Express, this is a VoIP dial peer. For systems using PBX-based voice mail, this is a POTS dial peer.</p>                                                                                                                            |
| <b>Step 4</b> | <b>mailbox-selection [<i>last-redirect-num</i>   <i>orig-called-num</i>]</b><br><b>Example:</b><br><pre>Router(config-dial-peer)# mailbox-selection orig-called-num</pre>                                            | Sets a policy for selecting a mailbox for calls that are diverted before being sent to a voice-mail line. <ul style="list-style-type: none"> <li>• <b>last-redirect-num</b>—(PBX voice mail only) The mailbox number to which the call will be sent is the last number to divert the call (the number that sends the call to the voice-mail pilot number).</li> <li>• <b>orig-called-num</b>—(Cisco Unity Express only) The mailbox number to which the call will be sent is the number that was originally dialed before the call was diverted.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone-dn)# end</pre>                                                                                                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**What to do next**

- To use voice mail on a SIP network that connects to a Cisco Unity Express system, configure a nonstandard SIP NOTIFY format. See [Enabling DTMF Integration Using SIP NOTIFY](#).

**Set a Mailbox Selection Policy for Cisco Unity**

To set a policy for selecting a mailbox for calls that are diverted before being sent to a Cisco Unity voice-mail pilot number, perform the following steps.

**Restriction**

This feature might not work properly in certain network topologies, including when:

- The last redirecting endpoint is not hosted on Cisco Unified CME. This may rarely occur with a PBX.
- A call is forwarded across several SIP trunks. Multiple SIP Diversion Headers (stacking hierarchy) are not supported in Cisco IOS software.
- A call is forwarded across other voice gateways that do not support the optional H450.3 originalCalledNr field.

**Before you begin**

- Cisco Unified CME 4.0 or a later version.
- Directory number to be configured is associated with a voice mailbox.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **exit**
4. **ephone-dn** *dn-tag*
5. **mailbox-selection** [*last-redirect-num*]
6. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                          | Purpose                                                                                                               |
|---------------|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                     |

|               | Command or Action                                                                                                                             | Purpose                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-dial-peer)# exit</code>                                                                 | Exits dial-peer configuration mode.                                                                                           |
| <b>Step 4</b> | <b>ephone-dn dn-tag</b><br><b>Example:</b><br><code>Router(config)# ephone-dn 752</code>                                                      | Enters ephone-dn configuration mode.                                                                                          |
| <b>Step 5</b> | <b>mailbox-selection [last-redirect-num]</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# mailbox-selection last-redirect-num</code> | Sets a policy for selecting a mailbox for calls that are diverted before being sent to a Cisco Unity voice-mail pilot number. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# end</code>                                                                   | Returns to privileged EXEC mode.                                                                                              |

### What to do next

- To use a remote SIP-based IVR or Cisco Unity, or to connect Cisco Unified CME to a remote SIP-PSTN that goes through the PSTN to a voice-mail or IVR application, see [Enabling DTMF Integration Using RFC 2833](#).

## Transfer to Voice Mail

To enable a phone user to transfer a call to voice mail by using the TrnsfVM softkey or a FAC, perform the following steps.

### Restriction

The TrnsfVM softkey is not supported on the Cisco Unified IP Phone 7905, 7912, or 7921, or analog phones connected to the Cisco VG224 or Cisco ATA. These phones support the trnsfvm FAC.

### Before you begin

- Cisco Unified CME 4.3 or a later version.
- Cisco Unity Express 3.0 or a later version, installed and configured.
- For information about standard and custom FACs, see [Configuring Feature Access Codes](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template template-tag**

4. **softkeys connected** { [Acct] [ConfList] [Confrn] [Endcall] [Flash] [HLog] [Hold] [Join] [LiveRcd] [Park] [RmLstC] [Select] [TrnsfVM] [Trnsfer] }
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **exit**
9. **telephony-service**
10. **voicemail** *phone-number*
11. **fac** { **standard** | **custom trnsfvm** *custom-fac* }
12. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# ephone-template 5                                                                                                                                                                                     | Enters ephone-template configuration mode to create an ephone template. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier for the ephone template. Range: 1 to 20.</li> </ul>                                                                                                                                                     |
| <b>Step 4</b> | <b>softkeys connected</b> { [Acct] [ConfList] [Confrn] [Endcall] [Flash] [HLog] [Hold] [Join] [LiveRcd] [Park] [RmLstC] [Select] [TrnsfVM] [Trnsfer] }<br><b>Example:</b><br>Router(config-ephone-template)# softkeys connected TrnsfVM Park Acct ConfList Confrn Endcall Trnsfer Hold | (Optional) Modifies the order and type of softkeys that display on an IP phone during the connected call state. <ul style="list-style-type: none"> <li>• You can enter any of the keywords in any order.</li> <li>• Default is all softkeys are displayed in alphabetical order.</li> <li>• Any softkey that is not explicitly defined is disabled.</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-ephone-template)# exit                                                                                                                                                                                                                 | Exits ephone-template configuration mode.                                                                                                                                                                                                                                                                                                                      |
| <b>Step 6</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br>Router(config)# ephone 12                                                                                                                                                                                                         | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number that identifies this ephone during configuration tasks.</li> </ul>                                                                                                                                                                                   |

|                | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b>  | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-ephone)# ephone-template 5                                       | Applies the ephone template to the phone.<br><ul style="list-style-type: none"> <li><i>template-tag</i>—Unique identifier of the ephone template that you created in <a href="#">Step 3, on page 547</a>.</li> </ul>                                                                                                                                                                                                                                                   |

| <b>Step 10</b> | <b>voicemail</b> <i>phone-number</i><br><b>Example:</b><br>Router(config-telephony)# voicemail 8900                                             | Defines the telephone number that is speed-dialed when the Messages button on a Cisco Unified IP phone is pressed.<br><ul style="list-style-type: none"> <li><i>phone-number</i>—Same phone number is configured for voice messaging for all SCCP phones in a Cisco Unified CME.</li> </ul>                                                                                                                                                                            |
| <b>Step 11</b> | <b>fac</b> { <b>standard</b>   <b>custom trnsfvm</b> <i>custom-fac</i> }<br><b>Example:</b><br>Router(config-telephony)# fac custom trnsfvm #22 | Enables standard FACs or creates a custom FAC or alias.<br><ul style="list-style-type: none"> <li><b>standard</b>—Enables standard FACs for all phones. Standard FAC for transfer to voice mail is *6.</li> <li><b>custom</b>—Creates a custom FAC for a FAC type.</li> <li><i>custom-fac</i>—User-defined code to be dialed using the keypad on an IP or analog phone. Custom FAC can be up to 256 characters long and contain numbers 0 to 9 and * and #.</li> </ul> |
| <b>Step 12</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Example

The following example shows a configuration where the display order of the TrnsfVM softkey is modified for the connected call state in ephone template 5 and assigned to ephone 12. A custom FAC for transfer to voice mail is set to #22.

```
telephony-service
max-ephones 100
max-dn 240
timeouts transfer-recall 60
voicemail 8900
max-conferences 8 gain -6
transfer-system full-consult
```

```

fac custom trnsfvm #22
!
!
ephone-template 5
 softkeys connected TrnsfVM Park Acct ConfList Confm Endcall Transfer Hold
 max-calls-per-button 3
 busy-trigger-per-button 2
!
!
ephone 12
 ephone-template 5
 mac-address 000F.9054.31BD
 type 7960
 button 1:10 2:7

```

### What to do next

- If you are finished modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [SCCP: Generating Configuration Files for SCCP Phones](#).
- For information on how phone users transfer a call to voice mail, see [Cisco Unified IP Phone documentation for Cisco Unified CME](#).

## Configure Live Record on SCCP Phones

To configure the Live Record feature so that a phone user can record a conversation by pressing the LiveRed softkey, perform the followings steps.

### Restriction

- Only one live record session is allowed for each conference.
- Only the conference creator can initiate a live record session. In an ad hoc conference, participants who are not the conference creator cannot start a live record session. In a two-party call, the party who starts the live record session is the conference creator.

### Note

For legal disclaimer information about this feature, see copyright information section.

### Before you begin

- Cisco Unified CME 4.3 or a later version.
- Cisco Unity Express 3.0 or a later version, installed and configured. For information on configuring Live Record in Cisco Unity Express, see [Configure Live Record](#) in the *Cisco Unity Express Voice-Mail and Auto-Attendant CLI Administrator Guide for 3.0 and Later Versions*.
- Ad hoc hardware conference resource is configured and ready to use. See [Configure Hardware Conferencing, on page 1377](#).
- If phone user wants to view the live record session, include ConfList softkey using the **softkeys** connected command.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **live record** *number*
5. **voicemail** *number*
6. **exit**
7. **ephone-dn** *dn-tag*
8. **number** *number* [**secondary** *number*] [**no-reg** [**both** | **primary**]]
9. **call-forward all** *target-number*
10. **exit**
11. **ephone-template** *template-tag*
12. **softkeys connected** { [**Acct**] [**ConfList**] [**Confrn**] [**Endcall**] [**Flash**] [**HLog**] [**Hold**] [**Join**] [**LiveRcd**] [**Park**] [**RmLstC**] [**Select**] [**TrnsfVM**] [**Trnsfer**] }
13. **exit**
14. **ephone** *phone-tag*
15. **ephone-template** *template-tag*
16. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                 | Purpose                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                        | Enters global configuration mode.                                                                                                                                                                                       |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                  | Enters telephony-service configuration mode.                                                                                                                                                                            |
| <b>Step 4</b> | <b>live record</b> <i>number</i><br><b>Example:</b><br>Router(config-telephony)# live record 8900 | Defines the extension number that is dialed when the LiveRcd softkey is pressed on an SCCP IP phone.                                                                                                                    |
| <b>Step 5</b> | <b>voicemail</b> <i>number</i><br><b>Example:</b><br>Router(config-telephony)# voicemail 8000     | Defines the extension number that is speed-dialed when the Messages button is pressed on an IP phone.<br><ul style="list-style-type: none"> <li>• <i>Number</i>—Cisco Unity Express voice-mail pilot number.</li> </ul> |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b>  | <b>exit</b><br><b>Example:</b><br><code>Router(config-telephony)# exit</code>                                                                                                                                                                                                                                                                                                           | Exits telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b>  | <b>ephone-dn <i>dn-tag</i></b><br><b>Example:</b><br><code>Router(config)# ephone-dn 10</code>                                                                                                                                                                                                                                                                                          | Creates a directory number that forwards all calls to the Cisco Unity Express voice-mail pilot number.                                                                                                                                                                                                                                                                                                                          |
| <b>Step 8</b>  | <b>number <i>number</i> [<i>secondary number</i>] [<i>no-reg</i> [<i>both</i>   <i>primary</i>]]</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# number 8900</code>                                                                                                                                                                                                           | Assigns an extension number to this directory number. <ul style="list-style-type: none"> <li>• <i>Number</i>—Must match the Live Record pilot-number configured in <a href="#">Step 4, on page 550</a>.</li> </ul>                                                                                                                                                                                                              |
| <b>Step 9</b>  | <b>call-forward all <i>target-number</i></b><br><b>Example:</b><br><code>Router(config-ephone-dn)# call-forward all 8000</code>                                                                                                                                                                                                                                                         | Forwards all calls to this extension to the specified voice-mail number. <ul style="list-style-type: none"> <li>• <i>target-number</i>—Phone number to which calls are forwarded. Must match the voice-mail pilot number configured in <a href="#">Step 5, on page 550</a>.</li> </ul> <p><b>Note</b><br/>Phone users can activate and cancel the call-forward-all state from the phone using the CFwdAll softkey or a FAC.</p> |
| <b>Step 10</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# exit</code>                                                                                                                                                                                                                                                                                                           | Exits ephone-dn configuration mode.                                                                                                                                                                                                                                                                                                                                                                                             |

### Example

The following example shows Live Record is enabled at the system-level for extension 8900. All incoming calls to extension 8900 are forwarded to the voice-mail pilot number 8000 when the LiveRcd softkey is pressed, as configured under ephone-dn 10. Ephone template 5 modifies the display order of the LiveRcd softkey on IP phones.

## Configure a Voice Mailbox Pilot Number on a SIP Phone

To configure the telephone number that is speed-dialed when the Message button on a SIP phone is pressed, follow the steps in this section.

**Note** The same telephone number is configured for voice messaging for all SIP phones in Cisco Unified CME. The **call forward b2bua** command enables call forwarding and designates that calls that are forwarded to a busy or no-answer extension be sent to a voicemail box.

### Before you begin

- Directory number and number for voicemail phone number must be configured.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **voicemail** *phone-number*
5. **exit**
6. **voice register dn** *dn-tag*
7. **call-forward b2bua busy** *directory-number*
8. **call-forward b2bua mailbox** *directory-number*
9. **call-forward b2bua noan** *directory-number* **timeout** *seconds*
10. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                              | Purpose                                                                                                                                                                                                                                         |
|---------------|----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                         | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                 | Enters global configuration mode.                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>voice register global</b><br><br><b>Example:</b><br>Router(config)# voice register global                   | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.                                                                                                                            |
| <b>Step 4</b> | <b>voicemail</b> <i>phone-number</i><br><br><b>Example:</b><br>Router(config-register-global)# voice mail 1111 | Defines the telephone number that is speed-dialed when the Messages button on a Cisco Unified IP phone is pressed.<br><br>• <i>phone-number</i> —Same phone number is configured for voice messaging for all SIP phones in a Cisco Unified CME. |

|                | Command or Action                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b>  | <b>exit</b><br><b>Example:</b><br>Router(config-register-global)# exit                                                                                          | Exits voice register global configuration mode.                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 6</b>  | <b>voice register dn <i>dn-tag</i></b><br><b>Example:</b><br>Router(config)# voice register dn 2                                                                | Enters voice register dn mode to define a directory number for a SIP phone, intercom line, voice port, or an MWI.                                                                                                                                                                                                                                                                       |
| <b>Step 7</b>  | <b>call-forward b2bua busy <i>directory-number</i></b><br><b>Example:</b><br>Router(config-register-dn)# call-forward b2bua busy 1000                           | Enables call forwarding for a SIP back-to-back user agent so that incoming calls to an extension that is busy will be forwarded to the designated directory number.                                                                                                                                                                                                                     |
| <b>Step 8</b>  | <b>call-forward b2bua mailbox <i>directory-number</i></b><br><b>Example:</b><br>Router(config-register-dn)# call-forward b2bua mailbox 2200                     | Designates the voice mailbox to use at the end of a chain of call forwards. <ul style="list-style-type: none"> <li>• Incoming calls have been forwarded to a busy or no-answer extension will be forwarded to the directory-number specified.</li> </ul>                                                                                                                                |
| <b>Step 9</b>  | <b>call-forward b2bua noan <i>directory-number</i> <i>seconds</i></b><br><b>Example:</b><br>Router(config-register-dn)# call-forward b2bua noan 2201 timeout 15 | Enables call forwarding for a SIP back-to-back user agent so that incoming calls to an extension that does not answer will be forwarded to the designated directory number. <ul style="list-style-type: none"> <li>• <i>seconds</i>—Number of seconds that a call can ring with no answer before the call is forwarded to another extension. Range: 3 to 60000. Default: 20.</li> </ul> |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-dn)# end                                                                                                | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                          |

#### What to do next

- To set up DTMF integration patterns for connecting to analog voice-mail applications, see [Enabling DTMF Integration for Analog Voice-Mail Applications](#).
- To use a remote SIP-based IVR or Cisco Unity, or to connect to a remote SIP-PSTN that goes through the PSTN to a voice-mail or IVR application, see [Enabling DTMF Integration Using RFC 2833](#).
- To connect to a Cisco Unity Express system, configure a nonstandard SIP NOTIFY format, see [Enabling DTMF Integration Using SIP NOTIFY](#).

## Enable DTMF Integration

Perform *one* of the following tasks, depending on which DTMF-relay method is required:

- [Enabling DTMF Integration for Analog Voice-Mail Applications](#)—To set up DTMF integration patterns for connecting to analog voice-mail applications.
- [Enabling DTMF Integration Using RFC 2833](#)—To connect to a remote SIP-based IVR or voice-mail application such as Cisco Unity or when SIP is used to connect Cisco Unified CME to a remote SIP-PSTN voice gateway that goes through the PSTN to a voice-mail or IVR application.
- [Enabling DTMF Integration Using SIP NOTIFY](#)—To configure a SIP dial peer to point to Cisco Unity Express.

## Enable DTMF Integration for Analog Voice-Mail Applications

To set up DTMF integration patterns for analog voice-mail applications, perform the following steps.

**Note** You can configure multiple tags and tokens for each pattern, depending on the voice-mail system and type of access.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vm-integration**
4. **pattern direct** *tag1* {CGN | CDN | FDN} [*tag2* {CGN | CDN | FDN}] [*tag3* {CGN | CDN | FDN}] [*last-tag*]
5. **pattern ext-to-ext busy** *tag1* {CGN | CDN | FDN} [*tag2* {CGN | CDN | FDN}] [*tag3* {CGN | CDN | FDN}] [*last-tag*]
6. **pattern ext-to-ext no-answer** *tag1* {CGN | CDN | FDN} [*tag2* {CGN | CDN | FDN}] [*tag3* {CGN | CDN | FDN}] [*last-tag*]
7. **pattern trunk-to-ext busy** *tag1* {CGN | CDN | FDN} [*tag2* {CGN | CDN | FDN}] [*tag3* {CGN | CDN | FDN}] [*last-tag*]
8. **pattern trunk-to-ext no-answer** *tag1* {CGN | CDN | FDN} [*tag2* {CGN | CDN | FDN}] [*tag3* {CGN | CDN | FDN}] [*last-tag*]
9. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action                                                          | Purpose                                                                                                               |
|--------|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                     |

|               | Command or Action                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>vm-integration</b><br><b>Example:</b><br><pre>Router(config) vm-integration</pre>                                                                                                                                              | Enters voice-mail integration configuration mode and enables voice-mail integration with DTMF and an analog voice-mail system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 4</b> | <b>pattern direct tag1 {CGN   CDN   FDN} [tag2 {CGN   CDN   FDN}] [tag3 {CGN   CDN   FDN}] [last-tag]</b><br><b>Example:</b><br><pre>Router(config-vm-integration) pattern direct 2 CGN *</pre>                                   | <p>Configures the DTMF digit pattern forwarding necessary to activate the voice-mail system when the user presses the messages button on the phone.</p> <ul style="list-style-type: none"> <li>The <i>tag</i> attribute is an alphanumeric string fewer than four DTMF digits in length. The alphanumeric string consists of a combination of four letters (A, B, C, and D), two symbols (* and #), and ten digits (0 to 9). The tag numbers match the numbers defined in the voice-mail system's integration file, immediately preceding either the number of the calling party, the number of the called party, or a forwarding number.</li> <li>The keywords, <b>CGN</b>, <b>CDN</b>, and <b>FDN</b>, configure the type of call information sent to the voice-mail system, such as calling number (CGN), called number (CDN), or forwarding number (FDN).</li> </ul> |
| <b>Step 5</b> | <b>pattern ext-to-ext busy tag1 {CGN   CDN   FDN} [tag2 {CGN   CDN   FDN}] [tag3 {CGN   CDN   FDN}] [last-tag]</b><br><b>Example:</b><br><pre>Router(config-vm-integration) pattern ext-to-ext busy 7 FDN * CGN *</pre>           | Configures the DTMF digit pattern forwarding necessary to activate the voice-mail system when an internal extension attempts to connect to a busy extension and the call is forwarded to voice mail.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|        | Command or Action                                                              | Purpose                                                   |
|--------|--------------------------------------------------------------------------------|-----------------------------------------------------------|
|        | Router(config-vm-integration)# pattern trunk-to-ext<br>no-answer 4 FDN * CGN * |                                                           |
| Step 9 | end<br><br>Example:<br>Router(config-vm-integration)# exit                     | Exits configuration mode and enters privileged EXEC mode. |

### What to do next

After configuring DTMF relay, you are ready to configure Message Waiting Indicator (MWI) notification for either the MWI outcall, unsolicited notify, or subscribe/notify mechanism. See [SCCP: Configuring a Phone for MWI Outcall](#).

## Enable DTMF Integration Using RFC 2833

To configure a SIP dial peer to point to Cisco Unity and enable SIP dual-tone multifrequency (DTMF) relay using RFC 2833, use the commands in this section on both the originating and terminating gateways.

This DTMF relay method is required in the following situations:

- When SIP is used to connect Cisco Unified CME to a remote SIP-based IVR or voice-mail application such as Cisco Unity.
- When SIP is used to connect Cisco Unified CME to a remote SIP-PSTN voice gateway that goes through the PSTN to a voice-mail or IVR application.

**Note** If the T.38 Fax Relay feature is also configured on this IP network, we recommend that you either configure the voice gateways to use a payload type other than PT96 or PT97 for fax relay negotiation, or depending on whether the SIP endpoints support different payload types, configure Cisco Unified CME to use a payload type other than PT96 or PT97 for DTMF.

### Before you begin

- Configure the **codec** or **voice-class codec** command for transcoding between G.711 and G.729.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice tag voip**
4. **description string**
5. **destination-pattern string**
6. **session protocol sipv2**
7. **session target { dns : address | ipv4 : destination-address }**
8. **dtmf-relay rtp-nte**
9. **dtmf-interworking rtp-nte**
10. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                         | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>dial-peer voice tag voip</b><br><br><b>Example:</b><br>Router (config)# dial-peer voice 123 voip                                                            | Enters dial-peer configuration mode to define a VoIP dial peer for the voice-mail system.<br><br>• <i>tag</i> —Defines the dial peer being configured. Range is 1 to 2147483647.                                                                                               |
| <b>Step 4</b> | <b>description string</b><br><br><b>Example:</b><br>Router (config-voice-dial-peer)# description CU pilot                                                      | (Optional) Associates a description with the dial peer being configured. Enter a string of up to 64 characters.                                                                                                                                                                |
| <b>Step 5</b> | <b>destination-pattern string</b><br><br><b>Example:</b><br>Router (config-voice-dial-peer)# destination-pattern 20                                            | Specifies the pattern of the numbers that the user must dial to place a call.<br><br>• <i>string</i> —Prefix or full E.164 number.                                                                                                                                             |
| <b>Step 6</b> | <b>session protocol sipv2</b><br><br><b>Example:</b><br>Router (config-voice-dial-peer)# session protocol sipv2                                                | Specifies that Internet Engineering Task Force (IETF) Session Initiation Protocol (SIP) is protocol to be used for calls between local and remote routers using the packet network.                                                                                            |
| <b>Step 7</b> | <b>session target { dns : address   ipv4 : destination-address }</b><br><br><b>Example:</b><br>Router (config-voice-dial-peer)# session target ipv4:10.8.17.42 | Designates a network-specific address to receive calls from the dial peer being configured.<br><br>• <b>dns : address</b> —Specifies the DNS address of the voice-mail system.<br><br>• <b>ipv4 : destination- address</b> —Specifies the IP address of the voice-mail system. |
| <b>Step 8</b> | <b>dtmf-relay rtp-nte</b><br><br><b>Example:</b><br>Router (config-voice-dial-peer)# dtmf-relay rtp-nte                                                        | Sets DTMF relay method for the voice dial peer being configured.<br><br>• <b>rtp-nte</b> — Provides conversion from the out-of-band SCCP indication to the SIP standard for DTMF relay (RFC 2833). Forwards DTMF tones by using                                                |

|                | Command or Action                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                  | <p>Real-Time Transport Protocol (RTP) with the Named Telephone Event (NTE) payload type.</p> <ul style="list-style-type: none"> <li>This command can also be configured in voice-register-pool configuration mode. For individual phones, the phone-level configuration for this command overrides the system-level configuration for this command.</li> </ul> <p><b>Note</b><br/>The need to use out-of-band conversion is limited to SCCP phones. SIP phones natively support in-band.</p> |
| <b>Step 9</b>  | <b>dtmf-interworking rtp-nte</b><br><br><b>Example:</b><br><pre>Router (config-voice-dial-peer)# dtmf-interworking rtp-nte</pre> | <p>(Optional) Enables a delay between the dtmf-digit begin and dtmf-digit end events in the RFC 2833 packets.</p> <ul style="list-style-type: none"> <li>This command is supported in Cisco IOS Release 12.4(15)XZ and later releases and in Cisco Unified CME 4.3 and later versions.</li> <li>This command can also be configured in voice-service configuration mode.</li> </ul>                                                                                                          |
| <b>Step 10</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router (config-voice-dial-peer)# end</pre>                                             | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### What to do next

After configuring DTMF relay, you are ready to configure Message Waiting Indicator (MWI) notification for either the MWI outcall, unsolicited notify, or subscribe/notify mechanism. See [SCCP: Configuring a Phone for MWI Outcall](#).

## Enable DTMF Integration Using SIP NOTIFY

To configure a SIP dial peer to point to Cisco Unity Express and enable SIP dual-tone multi-frequency (DTMF) relay using SIP NOTIFY format, follow the steps in this task.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice tag voip**
4. **description string**
5. **destination-pattern string**
6. **b2bua**
7. **session protocol sipv2**
8. **session target { dns : address | ipv4 : destination-address }**
9. **dtmf-relay sip-notify**

10. `codec g711ulaw`
11. `no vad`
12. `end`

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                     | Purpose                                                                                                                                                                                                                    |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal#</pre>                                                                                | Enters global configuration mode.                                                                                                                                                                                          |
| <b>Step 3</b> | <b>dial-peer voice tag voip</b><br><b>Example:</b><br><pre>Router (config)# dial-peer voice 2 voip</pre>                                                              | Enters dial-peer configuration mode to define a VoIP dial peer for the voice-mail system. <ul style="list-style-type: none"> <li>• <i>tag</i>—Defines the dial peer being configured. Range is 1 to 2147483647.</li> </ul> |
| <b>Step 4</b> | <b>description string</b><br><b>Example:</b><br><pre>Router (config-voice-dial-peer)# description cue pilot</pre>                                                     | (Optional) Associates a description with the dial peer being configured. Enter a string of up to 64 characters.                                                                                                            |
| <b>Step 5</b> | <b>destination-pattern string</b><br><b>Example:</b><br><pre>Router (config-voice-dial-peer)# destination-pattern 20</pre>                                            | Specifies the pattern of the numbers that the user must dial to place a call. <ul style="list-style-type: none"> <li>• <i>string</i>—Prefix or full E.164 number.</li> </ul>                                               |
| <b>Step 6</b> | <b>b2bua</b><br><b>Example:</b><br><pre>Router (config-voice-dial-peer)# b2bua</pre>                                                                                  | (Optional) Includes the Cisco Unified CME address as part of contact in 3XX response to point to Cisco Unity Express and enables SIP-to-SCCP call forward.                                                                 |
| <b>Step 7</b> | <b>session protocol sipv2</b><br><b>Example:</b><br><pre>Router (config-voice-dial-peer)# session protocol sipv2</pre>                                                | Specifies that Internet Engineering Task Force (IETF) Session Initiation Protocol (SIP) is protocol to be used for calls between local and remote routers using the packet network.                                        |
| <b>Step 8</b> | <b>session target { dns : address   ipv4 : destination-address }</b><br><b>Example:</b><br><pre>Router (config-voice-dial-peer)# session target ipv4:10.5.49.80</pre> | Designates a network-specific address to receive calls from the dial peer being configured. <ul style="list-style-type: none"> <li>• <i>dns : address</i>—Specifies the DNS address of the voice-mail system.</li> </ul>   |

|                | Command or Action                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                      | <ul style="list-style-type: none"> <li>• <b>ipv4: destination- address</b>—Specifies the IP address of the voice-mail system.</li> </ul>                                                                                                                                                                                                                                                                              |
| <b>Step 9</b>  | <b>dtmf-relay sip-notify</b><br><b>Example:</b><br><pre>Router (config-voice-dial-peer)# dtmf-relay sip-notify</pre> | Sets the DTMF relay method for the voice dial peer being configured. <ul style="list-style-type: none"> <li>• <b>sip-notify</b>— Forwards DTMF tones using SIP NOTIFY messages.</li> <li>• This command can also be configured in voice-register-pool configuration mode. For individual phones, the phone-level configuration for this command overrides the system-level configuration for this command.</li> </ul> |
| <b>Step 10</b> | <b>codec g711ulaw</b><br><b>Example:</b><br><pre>Router (config-voice-dial-peer)# codec g711ulaw</pre>               | Specifies the voice coder rate of speech for a dial peer being configured.                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 11</b> | <b>no vad</b><br><b>Example:</b><br><pre>Router (config-voice-dial-peer)# no vad</pre>                               | Disables voice activity detection (VAD) for the calls using the dial peer being configured.                                                                                                                                                                                                                                                                                                                           |
| <b>Step 12</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-voice-dial-peer)# end</pre>                                      | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                        |

### What to do next

After configuring DTMF relay, you are ready to configure Message Waiting Indicator (MWI). See [SCCP: Configuring a Phone for MWI Outcall](#).

## Configure a SCCP Phone for MWI Outcall

To designate a phone line or directory number on an individual SCCP phone to be monitored for voice-mail messages, or to enable audible MWI, perform the following steps.

### Restriction

- Audible MWI is supported only in Cisco Unified CME 4.0(2) and later versions.
- Audible MWI is supported only on Cisco Unified IP Phone 7931G and Cisco Unified IP Phone 7911.

### Before you begin

- Directory number and number for MWI line must be configured.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **mwi-line** *line-number*
5. **exit**
6. **ephone-dn** *dn-tag*
7. **mwi** {**off** | **on** | **on-off**}
8. **mwi-type** {**visual** | **audio** | **both**}
9. **end**

|---------------|---------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                     | you set in ephone-dn configuration mode has priority over the value set in ephone-dn-template mode.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 8</b> | <b>mwI-type</b> {visual   audio   both}<br><b>Example:</b><br><pre>Router(config-ephone-dn)# mwi-type audible</pre> | (Optional) Specifies which type of MWI notification to be received.<br><br><b>Note</b><br>This command is supported only on the Cisco Unified IP Phone 7931G and Cisco Unified IP Phone 7911.<br><br><b>Note</b><br>This command can also be configured in ephone-dn-template configuration mode. The value that you set in ephone-dn configuration mode has priority over the value set in ephone-dn-template mode. For configuration information, see <a href="#">Ephone-dn Templates</a> . |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone-dn)# end</pre>                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Enable MWI at the System-Level on SIP Phones

To enable a message waiting indicator (MWI) at a system-level, perform the following steps.

### Before you begin

- Cisco CME 3.4 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **mwi reg-e164**
5. **mwi stutter**
6. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                | Purpose                                                                 |
|---------------|----------------------------------|-------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode.<br><br>• Enter your password if prompted. |

|               | Command or Action                                                                                     | Purpose                                                                                                              |
|---------------|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
|               | <code>Router&gt; enable</code>                                                                        |                                                                                                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>               | Enters global configuration mode.                                                                                    |
| <b>Step 3</b> | <b>voice register global</b><br><b>Example:</b><br><code>Router(config)# voice register global</code> | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME. |
| <b>Step 4</b> | <b>mw reg-e164</b><br><b>Example:</b><br><code>Router(config-register-global)# mw reg-e164</code>     | Registers full E.164 number to the MWI server in Cisco Unified CME and enables MWI.                                  |
| <b>Step 5</b> | <b>mw stutter</b><br><b>Example:</b><br><code>Router(config-register-global)# mw stutter</code>       | Enables Cisco Unified CME router at the central site to relay MWI notification to remote SIP phones.                 |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-register-global)# end</code>                     | Exits to privileged EXEC mode.                                                                                       |

## Configure a Directory Number for MWI on SIP Phones

Perform *one* of the following tasks, depending on whether you want to configure MWI outcall or MWI notify (unsolicited notify or subscribe/notify) for SIP endpoints in Cisco Unified CME.

- [SIP: Defining Pilot Call Back Number for MWI Outcall](#)
- [SIP: Configuring a Directory Number for MWI NOTIFY](#)

### Define Pilot Call Back Number for MWI Outcall

To designate a phone line on an individual SIP directory number to be monitored for voice-mail messages, perform the following steps.

#### Restriction

- For Cisco Unified CME 4.1 and later versions, the Call Forward All, Presence, and MWI features require that SIP phones must be configured with a directory number by using the **number** command with the **dn** keyword; direct line numbers are not supported.

#### Before you begin

- Cisco CME 3.4 or a later version.
- Directory number and number for receiving MWI must be configured.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn *dn-tag***
4. **mw**
5. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                | Purpose                                                                                                                         |
|---------------|--------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                       | Enters global configuration mode.                                                                                               |
| <b>Step 3</b> | <b>voice register dn <i>dn-tag</i></b><br><b>Example:</b><br>Router(config)# voice register dn 1 | Enters voice register dn configuration mode to define a directory number for a SIP phone, intercom line, voice port, or an MWI. |
| <b>Step 4</b> | <b>mw</b><br><b>Example:</b><br>Router(config-register-dn)# mw                                   | Enables a specific directory number to receive MWI notification.                                                                |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone-dn)# end                                   | Exits to privileged EXEC mode.                                                                                                  |

## Configure a Directory Number for MWI NOTIFY

To identify the MWI server and specify a directory number for receiving MWI Subscribe/NOTIFY or MWI Unsolicited NOTIFY, follow the steps in this section.

**Note**

We recommend using the Subscribe/NOTIFY method instead of an Unsolicited NOTIFY when possible.

**Restriction**

- For Cisco Unified CME 4.1 and later versions, the Call Forward All, Presence, and MWI features require that SIP phones must be configured with a directory number by using the **number** command with the **dn** keyword; direct line numbers are not supported.
- The SIP MWI - QSIG Translation feature in Cisco Unified CME 4.1 does not support Subscribe NOTIFY.
- Cisco Unified IP Phone 7960, 7940, 7905, and 7911 support only Unsolicited NOTIFY for MWI.

**Before you begin**

- Cisco CME 3.4 or a later version.
- For Cisco Unified CME 4.0 and later, QSIG supplementary services must be configured on the Cisco router. For information, see [Enable H.450.7 and QSIG Supplementary Services at System-Level, on page 1184](#) or [Enable H.450.7 and QSIG Supplementary Services on a Dial Peer, on page 1185](#).
- Directory number and number for receiving MWI must be configured.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **sip-ua**
4. **mw-server** {*ipv4:destination-address* | *dns:host-name*} [**unsolicited**]
5. **exit**
6. **voice register dn** *dn-tag*
7. **mw**
8. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                          | Purpose                                                                                                               |
|---------------|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|

|               | Command or Action                                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>mwi-server</b> { <b>ipv4</b> : <i>destination-address</i>   <b>dns</b> : <i>host-name</i> }<br>[ <b>unsolicited</b> ]<br><br><b>Example:</b><br>Router(config-sip-ua) # mwi-server ipv4:1.5.49.200<br>or<br>Router(config-sip-ua) # mwi-server<br>dns:server.yourcompany.com unsolicited | Specifies voice-mail server settings on a voice gateway or UA.<br><br><b>Note</b><br>The <b>sip-server</b> and <b>mwi expires commands</b> under the telephony-service configuration mode have been migrated to <b>mwi-server</b> to support DNS format of the SIP server. |
| <b>Step 5</b> | <b>exit</b><br><br><b>Example:</b><br>Router(config-sip-ua) # exit                                                                                                                                                                                                                          | Exits to the next highest mode in the configuration mode hierarchy.                                                                                                                                                                                                        |
| <b>Step 6</b> | <b>voice register dn</b> <i>dn-tag</i><br><br><b>Example:</b><br>Router(config) # voice register dn 1                                                                                                                                                                                       | Enters voice register dn configuration mode to define a directory number for a SIP phone, intercom line, voice port, or an MWI.                                                                                                                                            |
| <b>Step 7</b> | <b>mwi</b><br><br><b>Example:</b><br>Router(config-register-dn) # mwi                                                                                                                                                                                                                       | Enables a specific directory number to receive MWI notification.                                                                                                                                                                                                           |
| <b>Step 8</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-register-dn) # end                                                                                                                                                                                                                       | Exits to privileged EXEC mode.                                                                                                                                                                                                                                             |

## Enable SIP MWI Prefix Specification

To accept unsolicited SIP Notify messages for MWI that include a prefix string as a site identifier, perform the following steps.

### Before you begin

- Cisco Unified CME 4.0 or a later version.
- Directory number for receiving MWI Unsolicited NOTIFY must be configured. For information, see [SIP: Configuring a Directory Number for MWI NOTIFY](#).

### SUMMARY STEPS

1. **enable**
2. **telephony-service**
3. **mwi prefix** *prefix-string*
4. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                     | Purpose                                                                                                                                                                                                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                    | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                          |
| <b>Step 2</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                      | Enters telephony-service configuration mode.                                                                                                                                                                                                                   |
| <b>Step 3</b> | <b>mwi prefix <i>prefix-string</i></b><br><b>Example:</b><br>Router(config-telephony)# mwi prefix 555 | Specifies a string of digits that, if present before a known Cisco Unified CME extension number, are recognized as a prefix.<br><ul style="list-style-type: none"> <li>• <i>prefix-string</i>—Digit string. The maximum prefix length is 32 digits.</li> </ul> |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                               |

## Configure VMWI on SIP Phones

To enable a VMWI, perform the following steps.

## Before you begin

- Cisco IOS Release 12.4(6)T or a later version

## SUMMARY STEPS

1. enable
2. configure terminal
3. voice-port *port*
4. mwi
5. vmwi dc-voltage or vmwi fsk
6. exit
7. sip-ua
8. mwi-server {*ipv4:destination-address* | *dns:host-name*} [*unsolicited*]
9. end

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                                     | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>voice-port</b> <i>port</i><br><b>Example:</b><br>Router(config)# voice-port 2/0                                                                                                                     | Enters voice-port configuration mode.<br><ul style="list-style-type: none"><li>• <i>port</i>—Syntax is platform-dependent. Type ? to determine.</li></ul>                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>mwi</b><br><b>Example:</b><br>Router(config-voiceport)# mwi                                                                                                                                         | Enables MWI for a specified voice port.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 5</b> | <b>vmwi dc-voltage</b> or <b>vmwi fsk</b><br><b>Example:</b><br>Router(config-voiceport)# vmwi dc-voltage                                                                                              | (Optional) Enables DC voltage or FSK VMWI on a Cisco VG224 onboard analog FXS voice port.<br><br>You do not need to perform this step for the Cisco VG202 and Cisco VG204. They support FSK only. VMWI is configured automatically when MWI is configured on the voice port.<br><br>This step is required for the VG224. If an FSK phone is connected to the voice port, use the <b>fsk</b> keyword. If a DC voltage phone is connected to the voice port, use the <b>dc-voltage</b> keyword. |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Router(config-sip-ua)# exit                                                                                                                                          | Exits to the next highest mode in the configuration mode hierarchy.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 7</b> | <b>sip-ua</b><br><b>Example:</b><br>Router(config)# sip-ua                                                                                                                                             | Enters Session Initiation Protocol user agent configuration mode for configuring the user agent.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 8</b> | <b>mwi-server</b> { <b>ipv4</b> : <i>destination-address</i>   <b>dns</b> : <i>host-name</i> }<br>[ <b>unsolicited</b> ]<br><b>Example:</b><br>Router(config-sip-ua)# mwi-server ipv4:1.5.49.200<br>or | Specifies voice-mail server settings on a voice gateway or user agent (ua).<br><br><b>Note</b><br>The <b>sip-server</b> and <b>mwi expires</b> commands under the telephony-service configuration mode have been migrated                                                                                                                                                                                                                                                                     |

|               | Command or Action                                                           | Purpose                                                                                     |
|---------------|-----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
|               | Router(config-sip-ua)# mwi-server<br>dns:server.yourcompany.com unsolicited | to <b>mwi-server</b> to support DNS format of the Session Initiation Protocol (SIP) server. |
| <b>Step 9</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-voiceport)# end          | Exits voice-port configuration mode and returns to privileged EXEC mode.                    |

## Verify Voice-Mail Integration

- Press the **Messages** button on a local phone in Cisco Unified CME and listen for the voice mail greeting.
- Dial an unattended local phone and listen for the voice mail greeting.
- Leave a test message.
- Go to the phone that you called. Verify that the [Message] indicator is lit.
- Press the **Messages** button on this phone and retrieve the voice mail message.

## Configuration Examples for Voice-Mail Integration

### Example for Setting up a Mailbox Selection Policy for SCCP Phones

The following example sets a policy to select the mailbox of the originally called number when a call is diverted to a Cisco Unity Express or PBX voice-mail system with the pilot number 7000.

```
dial-peer voice 7000 voip
 destination-pattern 7000
 session target ipv4:10.3.34.211
 codec g711ulaw
 no vad
 mailbox-selection orig-called-num
```

The following example sets a policy to select the mailbox of the last number that the call was diverted to before being diverted to a Cisco Unity voice-mail system with the pilot number 8000.

```
ephone-dn 825
 number 8000
 mailbox-selection last-redirect-num
```

### Example for Configuring Voice Mailbox for SIP Phones

The following example shows how to configure the call forward b2bua mailbox for SIP endpoints:

```
voice register global
 voicemail 1234
 !
 voice register dn 2
```

```

number 2200
call-forward b2bua all 1000
call-forward b2bua mailbox 2200
call-forward b2bua noan 2201 timeout 15
mwi

```

## Example for Configuring DTMF Integration Using RFC 2833

The following example shows the configuration for DTMF Relay using RFC 2833:

```

dial-peer voice 1 voip
 destination-pattern 4...
 session target ipv4:10.8.17.42
 session protocol sipv2
 dtmf-relay sip-notify rtp-nte

```

## Example for Configuring DTMF Integration Using SIP Notify

The following example shows the configuration for DTMF using SIP Notify:

```

dial-peer voice 1 voip
 destination-pattern 4...
 session target ipv4:10.5.49.80
 session protocol sipv2
 dtmf-relay sip-notify
 b2bua

```

## Example for Configuring DTMF Integration for Legacy Voice-Mail Applications

The following example sets up DTMF integration for an analog voice-mail system.

```

vm-integration
 pattern direct 2 CGN *
 pattern ext-to-ext busy 7 FDN * CGN *
 pattern ext-to-ext no-answer 5 FDN * CGN *
 pattern trunk-to-ext busy 6 FDN * CGN *
 pattern trunk-to-ext no-answer 4 FDN * CGN *

```

## Example for Enabling SCCP Phone Line for MWI

The following example enables MWI on ephone 18 for line 2 (button 2), which has overlaid ephone-dn. Only a message waiting for the first ephone-dn (2021) on this line will activate the MWI lamp. Button 4 is unused. The line numbers in this example are as follows:

- Line 1—Button 1—Extension 2020
- Line 2—Button 2—Extension 2021, 2022, 2023, 2024
- Line 3—Button 3—Extension 2021, 2022, 2023, 2024 (rollover line)
- Button 4—Unused
- Line 4—Button 5—Extension 2025

```

ephone-dn 20
 number 2020

ephone-dn 21

```

```

number 2021

ephone-dn 22
number 2022

ephone-dn 23
number 2023

ephone-dn 24
number 2024

ephone-dn 25
number 2025

ephone 18
button 1:20 2021,22,23,24,25 3x2 5:26
mwi-line 2

```

The following example enables MWI on ephone 17 for line 3 (extension 609). In this example, the button numbers do not match the line numbers because buttons 2 and 4 are not used. The line numbers in this example are as follows:

- Line 1—Button 1—Extension 607
- Button 2—Unused
- Line 2—Button 3—Extension 608
- Button 4—Unused
- Line 3—Button 5—Extension 609

```

ephone-dn 17
number 607

ephone-dn 18
number 608

ephone-dn 19
number 609

ephone 25
button 1:17 3:18 5:19
mwi-line 3

```

## Example for Configuring SIP MWI Prefix Specification

The following example identifies the SIP server for MWI notification at the IP address 172.16.14.22. It states that the Cisco Unified CME system will accept unsolicited SIP Notify messages for known mailbox numbers using the prefix 555.

```

sip-ua
mwi-server 172.16.14.22 unsolicited

telephony-service
mwi prefix 555

```

## Example for Configuring SIP Directory Number for MWI Outcall

The following example shows an MWI callback pilot number:

```
voice register dn
 number 9000...
 mwi
```

## Example for Configuring SIP Directory Number for MWI Unsolicited Notify

The following example shows how to specify voice-mail server settings on a UA. The example includes the unsolicited keyword, enabling the voice-mail server to send a SIP notification message to the UA if the mailbox status changes and specifies that voice dn 1, number 1234 on the SIP phone in Cisco Unified CME will receive the MWI notification:

```
sip-ua
 mwi-server dns:server.yourcompany.com expires 60 port 5060 transport udp unsolicited

voice register dn 1
 number 1234
 mwi
```

## Example for Configuring SIP Directory Number for MWI Subscribe/NOTIFY

The following example shows how to define an MWI server and specify that directory number 1, number 1234 on a SIP phone in Cisco Unified CME is to receive the MWI notification:

```
sip-ua
 mwi-server ipv4:1.5.49.200

voice register dn 1
 number 1234
 mwi
```

## Feature Information for Voice-Mail Integration

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 40: Feature Information for Voice-Mail Integration**

| Feature Name | Cisco Unified CME Version | Feature Information                                                                                                                         |
|--------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Audible MWI  | 4.0(2)                    | Provides support for selecting audible, visual, or audible and visual Message Waiting Indicator (MWI) on supported Cisco Unified IP phones. |

| Feature Name                        | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                 |
|-------------------------------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco Unity Express AXL Enhancement | 7.0(1)                    | Cisco Unified CME and Cisco Unity Express passwords are automatically synchronized. No configuration is required for this feature.                                                                                                  |
| DTMF Integration                    | 3.4                       | Added support for voice messaging systems connected via a SIP trunk or SIP user agent.<br><br>The standard Subscribe/NOTIFY method is preferred over an Unsolicited NOTIFY.                                                         |
|                                     | 2.0                       | DTMF integration patterns were introduced.                                                                                                                                                                                          |
| Live Record                         | 4.3                       | Enables IP phone users in a Cisco Unified CME system to record a phone conversation if Cisco Unity Express is the voice mail system.                                                                                                |
| Mailbox Selection Policy            | 4.0                       | Mailbox selection policy was introduced.                                                                                                                                                                                            |
| MWI                                 | 4.0                       | MWI line selection of a phone line other than the primary line on a SCCP phone was introduced.                                                                                                                                      |
|                                     | 3.4                       | Voice messaging systems (including Cisco Unity) connected via a SIP trunk or SIP user agent can pass a Message Waiting Indicator (MWI) that will be received and understood by a SIP phone directly connected to Cisco Unified CME. |
| SIP MWI Prefix Specification        | 4.0                       | SIP MWI prefix specification was introduced.                                                                                                                                                                                        |
| SIP MWI - QSIG Translation          | 4.1                       | Extends message waiting indicator (MWI) functionality for SIP MWI and QSIG MWI interoperability to enable sending and receiving of MWI over QSIG to PBX.                                                                            |
| Transfer to Voice Mail              | 4.3                       | Enables a phone user to transfer a caller directly to a voice-mail extension.                                                                                                                                                       |

## Security

This chapter describes the phone authentication support in Cisco Unified Communications Manager Express (Cisco Unified CME), Hypertext Transfer Protocol Secure (HTTPS) provisioning for Cisco Unified IP Phones, and the Media Encryption (SRTP) on Cisco Unified CME feature that provides the following secure voice call capabilities:

- Secure call control signaling and media streams in Cisco Unified CME networks using Secure Real-Time Transport Protocol (SRTP) and H.323 protocols.
- Secure supplementary services for Cisco Unified CME networks using H.323 trunks.
- Secure Cisco VG224 Analog Phone Gateway endpoints.
- [Prerequisites for Security, on page 575](#)
- [Restrictions for Security, on page 576](#)
- [Information About Security, on page 576](#)
- [Configure Security, on page 593](#)
- [Configuration Examples for Security, on page 638](#)
- [Where to Go Next, on page 654](#)
- [Feature Information for Security, on page 655](#)

## Prerequisites for Security

- Cisco Unified CME 4.0 or a later version for Phone Authentication.
- Cisco Unified CME 4.2 or a later version for Media Encryption (SRTP) on Cisco Unified CME.
- Cisco IOS feature set Advanced Enterprise Services (adventerprise9) or Advanced IP Services (advipservicesk9) on supported platforms.
- Firmware 9.0(4) or a later version must be installed on the IP phone for HTTPS provisioning.
- System clock must be set by using one of the following methods:
  - Configure Network Time Protocol (NTP). For configuration information, see [Enable Network Time Protocol, on page 140](#).
  - Manually set the software clock using the **clock set** command. For information about this command, see [Cisco IOS Network Management Command Reference](#).

# Restrictions for Security

## Phone Authentication

- Cisco Unified CME phone authentication is not supported on the Cisco IAD 2400 series or the Cisco 1700 series.

## Media Encryption

- Secure three-way software conferencing is not supported. A secure call beginning with SRTP will always fall back to nonsecure Real-Time Transport Protocol (RTP) when it is joined to a conference.
- If a party drops from a three-party conference, the call between the remaining two parties returns to secure if the two parties are SRTP-capable local Skinny Client Control Protocol (SCCP) endpoints to a single Cisco Unified CME and the conference creator is one of the remaining parties. If either of the two remaining parties are only RTP-capable, the call remains nonsecure. If the two remaining parties are connected through FXS, PSTN, or VoIP, the call remains nonsecure.
- Calls to Cisco Unity Connection are not secure.
- Music On Hold (MOH) is not secure.
- Video calls are not secure.
- Modem relay and T.3 fax relay calls are not secure.
- Media flow-around is not supported for call transfer and call forward.
- Conversion between inband tone and RFC 2833 DTMF is not supported. RFC 2833 DTMF handling is supported when encryption keys are sent to secure DSP Farm devices but is not supported for codec passthrough.
- Secure Cisco Unified CME supports SIP trunks and H.323 trunks only on the Cisco Integrated Services Router Generation 2 platform. Secure Unified CME is not supported on Cisco 4000 Series Integrated Services Routers.
- Secure calls are supported in the default session application only.

# Information About Security

## Unified CME Password Policy

From Unified CME 12.6 Release (Cisco IOS XE Gibraltar 16.11.1a) onwards, all configurations on Unified CME must meet the Unified CME password policy.

General password policy guidelines:

- Passwords must have a minimum of 6 alphanumeric characters, and a maximum of 15 alphanumeric characters.
- Passwords must not contain symbols or special characters.

- Passwords must contain at least one numeral, one uppercase alphabet, and one lowercase alphabet.

If the password is not configured as per the policy, the Unified CME router displays an error message:

```
Error: The password you have entered is incorrect.
Your password must contain:
1. A minimum of 6 and a maximum of 15 alphanumeric characters, excluding symbols and special
 characters.
2. A minimum of one numeral, one uppercase alphabet, and one lowercase alphabet.
```

**Note** The Unified CME password policy is applicable for Unified CME configurations on Cisco IOS XE 16.11.1a and later.

Unified CME password policy is not applicable in the following scenarios:

- Upgrade from an older IOS version to Cisco IOS XE 16.11.1a
- Downgrade from Cisco IOS XE 16.11.1a to an older version.

## Guidelines for Password Configuration and Encryption

Configure the passwords relevant to Unified CME using the CLI commands as follows:

- **voice reg pool** configuration mode
  - **username** *name* **password** [0|6] *password*
  - **ata-ivr-pwd** [0|6] *password*
- **voice register global** (for auto register) configuration mode
  - **password** [0|6] *password*
- **ephone** configuration mode
  - **username** *name* **password** [0|6] *password*
- **telephony-service** configuration mode
  - **ssh userid** *user-id-name* **password** [0|6] *password*
  - **service local-directory authenticate** *username* [0|6] *password*
  - **xml user** *username* **password** [0|6] *password* *privilege-level*
  - **standby user** *username* **password** [0|6] *password*
- Extension Mobility Related (under **telephony-service** configuration mode) configuration mode
  - **url authentication** *url-address* *application-name* **password** [0|6] *password*
  - **authentication credential** *application-name* **password** [0|6] *password*
- Extension Mobility Related (under **voice logout-profile** configuration mode) configuration mode

- **user name password [0|6] password**
- **voice user-profile** , **voice logout-profile** , and **voice reg pool** configuration mode
  - **pin [0|6] pin**
- **voice user-profile** configuration mode
  - **username name password [0|6] password**

The following are some of the configuration recommendations for Unified CME Password Policy:

- The **0** in the parameter **[0|6]** mentioned in the CLI command represents plain, unencrypted text and **6** represents level 6 password encryption.
- Apart from the parameter configurations (**[0|6]**) at the command level, the Unified CME router must be configured to support encryption. Configure the CLI command **encrypt password** to support type 6 encryption on the Unified CME router.
- The CLI command **encrypt password** is enabled by default on Unified CME router. However, you must mandatorily configure **key config-key password-encrypt [key]** and **password encryption aes** to support encryption on the Unified CME router. For a sample configuration, see [Example for Configuring Unified CME for Password Policy](#) , on page 639
- If the key used to encrypt the password is replaced with a new key (replace key or re-key), then the password is re-encrypted with the new key.
- You must adhere to CME Password Policy for both type 0 and type 6 parameters that you configure on Unified CME. For more information on CME Password Policy, see [Unified CME Password Policy](#), on page 576.

**Note** For the CLI command **ata-ivr-pwd** , you need to use a four digit character string as password. For more information, see the CLI command **ata-ivr-pwd** in [Unified CME Command Reference Guide](#).

The following table provides information on password encryption levels that are supported in Unified CME:

**Table 41: Password Encryption Configuration**

| User Input              | <b>encrypt password + key config-key password-encrypt [key] + password encryption aes</b>                                                                                                              | Password Encryption Status |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Encrypted text (Type 6) | <ul style="list-style-type: none"> <li>• <b>encrypt password</b> —Enabled</li> <li>• <b>key config-key password-encrypt [key]</b>—Enabled</li> <li>• <b>password encryption aes</b>—Enabled</li> </ul> | Encrypted                  |

| User Input              | <b>encrypt password + key config-key password-encrypt [key] + password encryption aes</b>                                                                                                               | Password Encryption Status |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Encrypted text (Type 6) | <ul style="list-style-type: none"> <li>• <b>encrypt password</b> —Disabled</li> <li>• <b>key config-key password-encrypt [key]</b>—Enabled</li> <li>• <b>password encryption aes</b>—Enabled</li> </ul> | Unencrypted (Plain Text)   |
| Plain text (Type 0)     | <ul style="list-style-type: none"> <li>• <b>encrypt password</b> —Disabled</li> <li>• <b>key config-key password-encrypt [key]</b>—Enabled</li> <li>• <b>password encryption aes</b>—Enabled</li> </ul> | Unencrypted (Plain Text)   |
| Plain text (Type 0)     | <ul style="list-style-type: none"> <li>• <b>encrypt password</b> —Enabled</li> <li>• <b>key config-key password-encrypt [key]</b>—Enabled</li> <li>• <b>password encryption aes</b>—Enabled</li> </ul>  | Encrypted                  |

**Note** Configure the CLI command **no encrypt password** to disable password encryption.

## Downgrade Consideration for Password Encryption

If you are performing a downgrade from Unified CME 12.6 to an earlier version, then you must execute the CLI command **no encrypt password**. If the CLI command **no encrypt password** is configured, the password is presented as plain text.

## Removal of Passwords and Keys from Logs

From Unified CME Release 12.6 onwards, passwords and sRTP keys are not printed to logs to enhance security of Unified CME. The information about keys is available only in the show commands from Unified CME 12.6 release onwards. The CLI command **show ephone offhook** for SCCP and **show sip-ua calls** for SIP are enhanced to display the keys that are in use per media stream, along with the sRTP Ciphers.

For a sample output, see [Example for Password and Key Removal from Logs, on page 638](#).

## Deprecation of CLI Commands

From Unified CME Release 12.6 onwards, the following CLI commands that are configured under **telephony-service** configuration mode are deprecated to enhance product security:

- **log password** *password-string*
- **xmltest**
- **xmlschema** *schema-url*
- **xmlthread** *number*

For more information on the deprecated commands, see [Cisco Unified Communications Manager Express Command Reference](#).

## Phone Authentication Overview

Phone authentication is a security infrastructure for providing secure SCCP signaling between Cisco Unified CME and IP phones. The goal of Cisco Unified CME phone authentication is to create a secure environment for a Cisco Unified CME IP telephony system.

Phone authentication addresses the following security needs:

- Establishing the identity of each endpoint in the system
- Authenticating devices
- Providing signaling-session privacy
- Providing protection for configuration files

Cisco Unified CME phone authentication implements authentication and encryption to prevent identity theft of the phone or Cisco Unified CME system, data tampering, call-signaling tampering, or media-stream tampering. To prevent these threats, the Cisco Unified IP telephony network establishes and maintains authenticated communication streams, digitally signs files before they are transferred to phones, and encrypts call signaling between Cisco Unified IP phones.

Cisco Unified CME phone authentication depends on the following processes:

- [Phone Authentication, on page 580](#)
- [File Authentication, on page 581](#)
- [Signaling Authentication, on page 581](#)

## Phone Authentication

The phone authentication process occurs between the Cisco Unified CME router and a supported device when each entity accepts the certificate of the other entity; only then does a secure connection between the entities occur. Phone authentication relies on the creation of a Certificate Trust List (CTL) file, which is a list of known, trusted certificates and tokens. Phones communicate with Cisco Unified CME using a Transport Layer Security (TLS) session connection, which requires that the following criteria be met:

- A certificate must exist on the phone.

- A phone configuration file must exist on the phone, and the Cisco Unified CME entry and certificate must exist in the file.

## File Authentication

The file authentication process validates digitally signed files that a phone downloads from a Trivial File Transfer Protocol (TFTP) server—for example, configuration files, ring list files, locale files, and CTL files. When the phone receives these types of files from the TFTP server, the phone validates the file signatures to verify that file tampering did not occur after the files were created.

## Signaling Authentication

The signaling authentication process, also known as signaling integrity, uses the TLS protocol to validate that signaling packets have not been tampered with during transmission. Signaling authentication relies on the creation of the CTL file.

## Public Key Infrastructure

Cisco Unified CME phone authentication uses the public-key-infrastructure (PKI) capabilities in Cisco IOS software for certificate-based authentication of IP phones. PKI provides customers with a scalable, secure mechanism for distributing, managing, and revoking encryption and identity information in a secure data network. Every entity (a person or a device) participating in the secure communication is enrolled in the PKI using a process in which the entity generates a Rivest-Shamir-Adleman (RSA) key pair (one private key and one public key) and has its identity validated by a trusted entity (also known as a certification authority [CA] or trustpoint).

After each entity enrolls in a PKI, every peer (also known as an end host) in a PKI is granted a digital certificate that has been issued by a CA.

When peers must negotiate a secure communication session, they exchange digital certificates. Based on the information in the certificate, a peer can validate the identity of another peer and establish an encrypted session with the public keys contained in the certificate.

## Phone Authentication Components

A variety of components work together to ensure secure communications in a Cisco Unified CME system. [Table 42: Cisco Unified CME Phone Authentication Components](#), on page 581 describes the Cisco Unified CME phone authentication components.

**Table 42: Cisco Unified CME Phone Authentication Components**

| Component   | Definition                                                                                                                                                                                                                                                                      |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| certificate | An electronic document that binds a user's or device's name to its public key. Certificates are commonly used to validate digital signatures. Certificates are needed for authentication during secure communication. An entity obtains a certificate by enrolling with the CA. |
| signature   | An assurance from an entity that the transaction it accompanies is authentic. The entity's private key is used to sign transactions and the corresponding public key is used for decryption.                                                                                    |

| Component                                                          | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RSA key pair                                                       | <p>RSA is a public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman.</p> <p>An RSA key pair consists of a public key and a private key. The public key is included in a certificate so that peers can use it to encrypt data that is sent to the router. The private key is kept on the router and used both to decrypt the data sent by peers and to digitally sign transactions when negotiating with peers.</p> <p>You can configure multiple RSA key pairs to match policy requirements, such as key length, key lifetime, and type of keys, for different certificate authorities or for different certificates.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| certificate server<br>trustpoint                                   | <p>A certificate server generates and issues certificates on receipt of legitimate requests. A trustpoint with the same name as the certificate server stores the certificates. Each trustpoint has one certificate plus a copy of the CA certificate.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| certification authority<br>(CA)                                    | <p>The root certificate server. It is responsible for managing certificate requests and issuing certificates to participating network devices. This service provides centralized key management for participating devices and is explicitly trusted by the receiver to validate identities and to create digital certificates. The CA can be a Cisco IOS CA on the Cisco Unified CME router, a Cisco IOS CA on another router, or a third-party CA.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| registration authority<br>(RA)                                     | <p>Records or verifies some or all of the data required for the CA to issue certificates. It is required when the CA is a third-party CA or Cisco IOS CA is not on the Cisco Unified CME router.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| certificate trust list<br>(CTL) file<br>CTL client<br>CTL provider | <p>A mandatory structure that contains the public key information (server identities) of all the servers with which the IP phone needs to interact (for example, the Cisco Unified CME server, TFTP server, and CAPF server). The CTL file is digitally signed by the SAST.</p> <p>After you configure the CTL client, it creates the CTL file and makes it available in the TFTP directory. The CTL file is signed using the SAST certificate's corresponding private key. An IP phone is then able to download this CTL file from the TFTP directory. The filename format for each phone's CTL file is CTLSEP&lt;mac-addr&gt;.tlv.</p> <p>When the CTL client is run on a router in the network that is not a Cisco Unified CME router, you must configure a CTL provider on each Cisco Unified CME router in the network. Similarly, if a CTL client is running on one of two Cisco Unified CME routers in a network, a CTL provider must be configured on the other Cisco Unified CME router. The CTL protocol transfers information to and from the CTL provider that allows the second Cisco Unified CME router to be trusted by phones and vice versa.</p> |
| certificate revocation<br>list (CRL)                               | <p>File that contains certificate expiration dates and used to determine whether a certificate that is presented is valid or revoked.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Component                                                                        | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| system administrator security token (SAST)                                       | Part of the CTL client that is responsible for signing the CTL file. The Cisco Unified CME certificate and its associated key pair are used for the SAST function. There are actually two SAST records pertaining to two different certificates in the CTL file for security reasons. They are known as SAST1 and SAST2. If one of the certificates is lost or compromised, then the CTL client regenerates the CTL file using the other certificate. When a phone downloads the new CTL file, it verifies with only one of the two original public keys that was installed earlier. This mechanism is to prevent IP phones from accepting CTL files from unknown sources. |
| certificate authority proxy function (CAPF)                                      | Entity that issues certificates (LSCs) to phones that request them. The CAPF is a proxy for the phones, which are unable to directly communicate with the CA. The CAPF can also perform the following certificate-management tasks: <ul style="list-style-type: none"> <li>• Upgrade existing locally significant certificates on the phones.</li> <li>• Retrieve phone certificates for viewing and troubleshooting.</li> <li>• Delete LSCs on the phone.</li> </ul>                                                                                                                                                                                                      |
| manufacture-installed certificate (MIC)<br>locally significant certificate (LSC) | Phones need certificates to engage in secure communications. Many phones come from the factory with MICs, but MICs may expire or become lost or compromised. Some phones do not come with MICs. LSCs are certificates that are issued locally to the phones using the CAPF server.                                                                                                                                                                                                                                                                                                                                                                                         |
| transport Layer Security (TLS) protocol                                          | IETF standard (RFC 2246) protocol, based on Netscape Secure Socket Layer (SSL) protocol. Figure 20: Cisco Unified CME Phone Authentication, on page 584 shows the components in a Cisco Unified CME phone authentication environment.

Figure 20: Cisco Unified CME Phone Authentication

## Phone Authentication Process

The following is a high-level summary of the phone-authentication process.

To enable Cisco Unified CME phone authentication:

1. Certificates are issued.

The CA issues certificates to Cisco Unified CME, SAST, CAPF, and TFTP functions.

2. The CTL file is created, signed and published.

- a. The CTL file is created by the CTL client, which is configuration driven. Its goal is to create a CTLfile.tlv for each phone and deposit it in the TFTP directory. To complete its task, the CTL client needs the certificates and public key information of the CAPF server, Cisco Unified CME server, TFTP server, and SASTs.
- b. The CTL file is signed by the SAST credentials. There are two SAST records pertaining to two different certificates in the CTL file for security reasons. If one of the certificates is lost or compromised, then the CTL client regenerates the CTL file using the other certificate. When a phone downloads the new CTL file, it verifies the download with only one of the two original public keys that was installed earlier. This mechanism prevents IP phones from accepting CTL files from unknown sources.

- c. The CTL file is published on the TFTP server. Because an external TFTP server is not supported in secure mode, the configuration files are generated by the Cisco Unified CME system itself and are digitally signed by the TFTP server's credentials. The TFTP server credentials can be the same as the Cisco Unified CME credentials. If desired, a separate certificate can be generated for the TFTP function if the appropriate trustpoint is configured under the CTL-client interface.
3. The telephony service module signs phone configuration files and each phone requests its file.
4. When an IP phone boots up, it requests the CTL file (CTLfile.tlv) from the TFTP server and downloads its digitally signed configuration file, which has the filename format of SEP<mac-address>.cnf.xml.sgn.
5. The phone then reads the CAPF configuration status from the configuration file. If a certificate operation is needed, the phone initiates a TLS session with the CAPF server on TCP port 3804 and begins the CAPF protocol dialogue. The certificate operation can be an upgrade, delete, or fetch operation. If an upgrade operation is needed, the CAPF server makes a request on behalf of the phone for a certificate from the CA. The CAPF server uses the CAPF protocol to obtain the information it needs from the phone, such as the public key and phone ID. After the phone successfully receives a certificate from the server, the phone stores it in its flash memory.
6. With the certificate in its flash, the phone initiates a TLS connection with the secure Cisco Unified CME server on a well-known TCP port (2443) if the device security mode settings in the .cnf.xml file are set to authenticated or encrypted. This TLS session is mutually authenticated by both parties. The IP phone knows the Cisco Unified CME server's certificate from the CTL file, which it initially downloaded from the TFTP server. The phone's LSC is a trusted party for the Cisco Unified CME server because the issuing CA certificate is present in the router.

## Startup Messages

If the certificate server is part of your startup configuration, you may see the following messages during the boot procedure:

```
% Failed to find Certificate Server's trustpoint at startup
% Failed to find Certificate Server's cert.
```

These messages are informational messages that show a temporary inability to configure the certificate server because the startup configuration has not been fully parsed yet. The messages are useful for debugging if the startup configuration has been corrupted.

## Configuration File Maintenance

In a secure environment, several types of configuration files must be digitally signed before they can be hosted and used. The filenames of all signed files have a .sgn suffix.

The Cisco Unified CME telephony service module creates phone configuration files (.cnf.xml suffix) and hosts them on a Cisco IOS TFTP server. These files are signed by the TFTP server's credentials.

In addition to the phone configuration files, other Cisco Unified CME configuration files such as the network and user-locale files must be signed. These files are internally generated by Cisco Unified CME, and the signed versions are automatically created in the current code path whenever the unsigned versions are updated or created.

Other configuration files that are not generated by Cisco Unified CME, such as `ringlist.xml`, `distinctiveringlist.xml`, audio files, and so forth, are often used for Cisco Unified CME features. Signed versions of these configuration files are not automatically created. Whenever a new configuration file that has not been generated by Cisco Unified CME is imported into Cisco Unified CME, use the **load-cfg-file** command, which does all of the following:

- Hosts the unsigned version of the file on the TFTP server.
- Creates a signed version of the file.
- Hosts the signed version of the file on the TFTP server.

You can also use the **load-cfg-file** command instead of the **tftp-server** command when only the unsigned version of a file needs to be hosted on the TFTP server.

## CTL File Maintenance

The CTL file contains the SAST records and other records. (A maximum of two SAST records may exist.) The CTL file is digitally signed by one of the SAST credentials that are listed in the CTL file before the CTL file is downloaded by the phone and saved in its flash. After receiving the CTL file, a phone trusts a newer or changed CTL file only if it is signed by one of the SAST credentials that is present in the original CTL file.

For this reason, you should take care to regenerate the CTL file only with one of the original SAST credentials. If both SAST credentials are compromised and a CTL file must be generated with a new credential, you must reset the phone to its factory defaults.

## CTL Client and Provider

The CTL client generates the CTL file. The CTL client must be provided with the names of the trustpoints it needs for the CTL file. It can run on the same router as Cisco Unified CME or on another, standalone router. When the CTL client runs on a standalone router (not a Cisco Unified CME router), you must configure a CTL provider on each Cisco Unified CME router. The CTL provider securely communicates the credentials of the Cisco Unified CME server functions to the CTL client that is running on another router.

When the CTL client is running on either a primary or secondary Cisco Unified CME router, you must configure a CTL provider on each Cisco Unified CME router on which the CTL client is not running.

The CTL protocol is used to communicate between the CTL client and a CTL provider. Using the CTL protocol ensures that the credentials of all Cisco Unified CME routers are present in the CTL file and that all Cisco Unified CME routers have access to the phone certificates that were issued by the CA. Both elements are prerequisites to secure communications.

To enable CTL clients and providers, see [Configure the CTL Client, on page 603](#) and [Configure the CTL Provider, on page 615](#).

## Manually Importing MIC Root Certificate

When a phone uses a MIC for authentication during the TLS handshake with the CAPF server, the CAPF server must have a copy of the MIC to verify it. Different certificates are used for different types of IP phones.

A phone uses a MIC for authentication when it has a MIC but no LSC. For example, you have a Cisco Unified IP Phone 7970 that has a MIC by default but no LSC. When you schedule a certificate upgrade with the authentication mode set to MIC for this phone, the phone presents its MIC to the Cisco Unified CME CAPF

server for authentication. The CAPF server must have a copy of the MIC's root certificate to verify the phone's MIC. Without this copy, the CAPF upgrade operation fails.

To ensure that the CAPF server has copies of the MICs it needs, you must manually import certificates to the CAPF server. The number of certificates that you must import depends on your network configuration. Manual enrollment refers to copy-and-paste or TFTP transfer methods.

To manually import the MIC root certificate, see [Manually Import the MIC Root Certificate, on page 622](#).

## Feature Design of Media Encryption

Companion voice security Cisco IOS features provide an overall architecture for secure end-to-end IP telephony calls on supported network devices that enable the following:

- SRTP-capable Cisco Unified CME networks with secure interoperability
- Secure Cisco IP phone calls
- Secure Cisco VG224 Analog Phone Gateway endpoints
- Secure supplementary services

These features are implemented using media and signaling authentication and encryption in Cisco IOS H.323 networks. H.323, the ITU-T standard that describes packet-based video, audio, and data conferencing, refers to a set of other standards, including H.450, to describe its actual protocols. H.323 allows dissimilar communication devices to communicate with each other by using a standard communication protocol and defines a common set of codecs, call setup and negotiating procedures, and basic data transport methods. H.450, a component of the H.323 standard, defines signaling and procedures that are used to provide telephony-like supplementary services. H.450 messages are used in H.323 networks to implement secure supplementary service support and also empty capability set (ECS) messaging for media capability negotiation.

## Secure Cisco Unified CME

The secure Cisco Unified CME solution includes secure-capable voice ports, SCCP endpoints, and a secure H.323 or SIP trunk between Cisco Unified CME and Cisco Unified Communications Manager for audio media. [Figure 21: Secure Cisco Unified CME System, on page 588](#) shows the components of a secure Cisco Unified CME system.

---

**Note** Secure Unified CME is not supported on Cisco 4000 Series Integrated Services Routers.

---

Figure 21: Secure Cisco Unified CME System

Secure Cisco Unified CME implements call control signaling using Transport Layer Security (TLS) or IPsec (IP Security) for the secure channel and uses SRTP for media encryption. Secure Cisco Unified CME manages the SRTP keys to endpoints and gateways.

The Media Encryption (SRTP) on Cisco Unified CME feature supports the following features:

- SCCP endpoints.
- Secure voice calls in a mixed shared line environment that allows both RTP- and SRTP-capable endpoints; shared line media security depends on the endpoint configuration.
- Secure supplementary services using H.450 including:
  - Call forward
  - Call transfer
  - Call hold and resume
  - Call park and call pickup
  - Nonsecure software conference

**Note** SRTP conference calls over H.323 may experience a zero- to two-second noise interval when the call is joined to the conference.

- Secure calls in a non-H.450 environment.
- Secure Cisco Unified CME interaction with secure Cisco Unity.
- Secure Cisco Unified CME interaction with Cisco Unity Express (interaction is supported and calls are downgraded to nonsecure mode).
- Secure transcoding for remote phones with DSP Farm transcoding configured.

These features are discussed in the following sections.

## Secure Supplementary Services

The Media Encryption (SRTP) feature supports secure supplementary services in both H.450 and non-H.450 Cisco Unified CME networks. A secure Cisco Unified CME network should be either H.450 or non-H.450, not a hybrid.

## Secure SIP Trunk Support on Cisco Unified CME

Prior to Cisco Unified CME Release 10 release, supplementary services were not supported on the secure SIP trunk of the secure SCCP Cisco Unified CME. This feature supports the following supplementary services in the secure SRTP and SRTP fallback modes on the SIP trunk of the SCCP Cisco Unified CME:

- Basic secure calls
- Call hold and resume
- Call transfer (blind and consult)
- Call forward (CFA,CFB,CFNA)
- DTMF support
- Call park and pickup
- Voice mail systems using CUE (works only with SRTP fallback mode)

To enable the supplementary services, use the existing “**supplementary-service media-renegotiate**” command as shown in the following example:

```
(config)# voice service voip
(conf-voi-serv)# no ip address trusted authenticate
(conf-voi-serv)# srtp
(conf-voi-serv)# allow-connections sip to sip
(conf-voi-serv)# no supplementary-service sip refer
(conf-voi-serv)# supplementary-service media-renegotiate
```

**Note**

In the SRTP mode, nonsecure media (RTP) format is not allowed across the secure SIP trunk. For Music On Hold, Tone On Hold, and Ring Back Tone, the tone is not played across the SIP trunk. In SRTP fallback mode, media across the secure SIP trunk is switched over to RTP if the remote end is nonsecure or while playing the MMusic On Hold, Tone On Hold, and Ring Back Tone.

**Restriction**

- Secure SIP trunk is supported only on SCCP Cisco Unified CME and not on SIP Cisco Unified CME. Secure SIP lines are not supported on the Cisco Unified CME mode.
- Secure Unified CME is not supported on Cisco 4000 Series Integrated Services Routers.
- Xcoder support is not available for playing secure tones (Music On Hold, Tone On Hold, and Ring Back Tone).
- Tones are not played in the SRTP mode because these tones are available only in non-secure (RTP) format.
- We recommend that you configure **no supplementary-service sip refer** command for SCCP Cisco Unified CME for the supplementary services.

## Secure Cisco Unified CME in an H.450 Environment

Signaling and media encryption among secure endpoints is supported, enabling supplementary services such as call transfer (H.450.2) and call forward (H.450.3) between secure endpoints. Call park and pick up use H.450 messages. Secure Cisco Unified CME is H.450-enabled by default; however, secure music on hold (MOH) and secure conferences (three-way calling) are not supported. For example, when supplementary services are initiated as shown in [Figure 22: Music on Hold in an H.450 Environment, on page 590](#), ECS and Terminal Capabilities Set (TCS) are used to negotiate the initially secure call between A and B down to RTP so A can hear MOH. When B resumes the call to A, the call goes back to SRTP. Similarly, when a transfer is initiated, the party being transferred is put on hold and the call is negotiated down to RTP. When the call is transferred, it goes back to SRTP if the other end is SRTP capable.

**Figure 22: Music on Hold in an H.450 Environment**

## Secure Cisco Unified CME in a Non H.450 Environment

Security for supplementary services requires midcall key negotiation or midcall media renegotiation. In an H.323 network where there are no H.450 messages, media renegotiation is implemented using ECS for scenarios such as mismatched codecs and secure calls. If you disable H.450 on the router globally, the configuration is applied to RTP and SRTP calls. The signaling path is hairpin on XOR for Cisco Unified CME and Cisco Unified Communications Manager. For example, in [Figure 23: Transfer in a Non-H.450 Environment, on page 591](#), the signaling path goes from A through B (the supplementary services initiator) to C. When deploying voice security in this scenario, consider that the media security keys will pass through XOR, that is, through B, the endpoint that issued the transfer request. To avoid the man-in-the-middle attack, the XOR must be a trusted entity.

Figure 23: Transfer in a Non-H.450 Environment

The media path is optional. The default media path for Cisco Unified CME is hairpin. However, whenever possible media flow around can be configured on Cisco Unified CME. When configuring media flow through, which is the default, remember that chaining multiple XOR gateways in the media path introduces more delay and thus reduces voice quality. Router resources and voice quality limit the number of XOR gateways that can be chained. The requirement is platform dependent and may vary between signaling and media. The practical chaining level is three.

A transcoder is inserted when there is a codec mismatch and ECS and TCS negotiation fails. For example, if Phone A and Phone B are SRTP capable, but Phone A uses the G.711 codec and Phone B uses the G.729 codec, a transcoder is inserted if Phone B has one. However, the call is negotiated down to RTP to fulfill the codec requirement so the call is not secure.

## Secure Transcoding for Remote Phones with DSP Farm Transcoding Configured

Transcoding is supported for remote phones that have the **dspfarm-assist** keyword of the **codec** command configured. A remote phone is a phone that is registered to a Cisco Unified CME and is residing on a remote location across the WAN. To save bandwidth across the WAN connection, calls to such a phone can be made to use the G.729r8 codec by configuring the **codec g729r8 dspfarm assist** command for the ephone. The **g729r8** keyword forces calls to such a phone to use the G.729 codec. The **dspfarm-assist** keyword enables using available DSP resources if an H.323 call to the phone needs to be transcoded.

**Note** Transcoding is enabled only if an H.323 call with a different codec from the remote phone tries to make a call to the remote phone. If a local phone on the same Cisco Unified CME as the remote phone makes a call to the remote phone, the local phone is forced to change its codec to G.729 instead of using transcoding.

Secure transcoding for point-to-point SRTP calls can only occur when both the SCCP phone that is to be serviced by Cisco Unified CME transcoding and its peer in the call are SRTP capable and have successfully negotiated the SRTP keys. Secure transcoding for point-to-point SRTP calls cannot occur when only one of the peers in the call is SRTP capable.

If Cisco Unified CME transcoding is to be performed on a secure call, the Media Encryption (SRTP) on Cisco Unified CME feature allows Cisco Unified CME to provide the DSP Farm with the encryption keys for the secure call as additional parameters so that Cisco Unified CME transcoding can be performed successfully. Without the encryption keys, the DSP Farm would not be able to read the encrypted voice data to transcode it.

**Note** The secure transcoding described here does not apply to IP-IP gateway transcoding.

Cisco Unified CME transcoding is different from IP-to-IP gateway transcoding because it is invoked for an SCCP endpoint only, instead of for bridging VoIP call legs. Cisco Unified CME transcoding and IP-to-IP gateway transcoding are mutually exclusive, that is, only one type of transcoding can be invoked for a call.

If no DSP Farm capable of SRTP transcoding is available, Cisco Unified CME secure transcoding is not performed and the call goes through using G.711.

For configuration information, see [Register the DSP Farm with Cisco Unified CME 4.2 or a Later Version in Secure Mode, on page 506](#).

## Secure Cisco Unified CME with Cisco Unity Express

Cisco Unity Express does not support secure signaling and media encryption. Secure Cisco Unified CME interoperates with Cisco Unity Express but calls between Cisco Unified CME and Cisco Unity Express are not secure.

In a typical Cisco Unity Express deployment with Cisco Unified CME in a secure H.323 network, Session Initiation Protocol (SIP) is used for signaling and the media path is G.711 with RTP. For Call Forward No Answer (CFNA) and Call Forward All (CFA), before the media path is established, signaling messages are sent to negotiate an RTP media path. If codec negotiation fails, a transcoder is inserted. The Media Encryption (SRTP) on Cisco Unified CME feature's H.323 service provider interface (SPI) supports fast start calls. In general, calls transferred or forwarded back to Cisco Unified CME from Cisco Unity Express fall into existing call flows and are treated as regular SIP and RTP calls.

The Media Encryption (SRTP) on Cisco Unified CME feature supports blind transfer back to Cisco Unified CME only. When midcall media renegotiation is configured, the secure capability for the endpoint is renegotiated regardless of which transfer mechanism, H.450.2 or Empty Capability Set (ECS), is used.

## Secure Cisco Unified CME with Cisco Unity

The Media Encryption (SRTP) on Cisco Unified CME feature supports Cisco Unity 4.2 or a later version and Cisco Unity Connection 1.1 or a later version using SCCP. Secure Cisco Unity for Cisco Unified CME acts like a secure SCCP phone. Some provisioning is required before secure signaling can be established. Cisco Unity receives Cisco Unified CME device certificates from the Certificate Trust List (CTL) and Cisco Unity certificates are inserted into Cisco Unified CME manually. Cisco Unity with SIP is not supported.

The certificate for the Cisco Unity Connection is in the Cisco Unity administration web application under the "port group settings."

## HTTPS Provisioning For Cisco Unified IP Phones

This section contains the following topics:

- [HTTPS support for an External Server, on page 592](#)
- [HTTPS Support in Cisco Unified CME, on page 593](#)

### HTTPS support for an External Server

There is an increasing need to securely access web content on Cisco Unified IP phones using HTTPS. The X.509 certificate of a third-party web server must be stored in the IP phone's CTL file to authenticate the web server but the **server** command used to enter trustpoint information cannot be used to import the certificate to the CTL file. Because the **server** command requires the private key from the third-party web server for certificate chain validation and you cannot obtain that private key from the web server, the **import certificate** command is added to save the trusted certificate in the CTL file.

For information on how to import a trusted certificate to an IP phone's CTL file for HTTPS provisioning, see [HTTPS Provisioning for Cisco Unified IP Phones, on page 632](#).

For information on phone authentication support in Cisco Unified CME, see [Phone Authentication Overview, on page 580](#).

## HTTPS Support in Cisco Unified CME

Cisco Unified IP phones use HTTP for some of the services offered by Cisco Unified CME. These services, which include local-directory lookup on Cisco Unified CME, My Phone Apps, and Extension Mobility, are invoked by pressing the "Services" button on the phones.

With Hypertext Transfer Protocol Secure (HTTPS) support in Cisco Unified CME 9.5 and later versions, these services can be invoked using an HTTPS connection from the phones to Cisco Unified CME.

**Note** Ensure that the configured phone is provisioned for HTTPS-based services that run on Cisco Unified CME before configuring HTTPS globally or locally. Please refer to the appropriate phone administrator guide to know if your Cisco Unified IP phone supports HTTPS access. HTTP services continue to run for other phones that do not support HTTPS.

For information on provisioning Cisco Unified IP phones for secure access to web content using HTTPS, see [HTTPS Provisioning for Cisco Unified IP Phones, on page 632](#).

For configuration examples, see [Example for Configuring HTTPS Support for Cisco Unified CME, on page 653](#).

# Configure Security

## Configure the Cisco IOS Certification Authority

To configure a Cisco IOS Certification Authority (CA) on a local or external router, perform the following steps.

**Note** If you use a third-party CA, follow the provider's instructions instead of performing these steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **crypto pki server *label***
5. **database level { *minimal* | *names* | *complete* }**
6. **database url *root-url***
7. **lifetime certificate *time***
8. **issuer-name CN=*label***

9. **exit**
10. **crypto pki trustpoint** *label*
11. **enrollment url** *ca-url*
12. **exit**
13. **crypto pki server** *label*
14. **grant auto**
15. **no shutdown**
16. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>ip http server</b><br><b>Example:</b><br>Router(config)# ip http server                                                                        | Enables the Cisco web-browser user interface on the local Cisco Unified CME router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>crypto pki server</b> <i>label</i><br><b>Example:</b><br>Router(config)# crypto pki server sanjose1                                            | Defines a label for the Cisco IOS CA and enters certificate-server configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 5</b> | <b>database level</b> { <b>minimal</b>   <b>names</b>   <b>complete</b> }<br><b>Example:</b><br>Router(config-cs-server)# database level complete | (Optional) Controls the type of data stored in the certificate enrollment database.<br><ul style="list-style-type: none"> <li>• <b>minimal</b>—Enough information is stored only to continue issuing new certificates without conflict. This is the default value.</li> <li>• <b>names</b>—In addition to the minimal information given, the serial number and subject name of each certificate are also provided.</li> <li>• <b>complete</b>—In addition to the information given in the minimal and names levels, each issued certificate is written to the database. If you use this keyword, you must also specify an external TFTP server in which to store the data by using the <b>database url</b> command.</li> </ul> |

|                | Command or Action                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b>  | <b>database url</b> <i>root-url</i><br><b>Example:</b><br><pre>Router(config-cs-server)# database url nvram:</pre>         | <p>(Optional) Specifies the location, other than NVRAM, where all database entries for the certificate server are to be written out.</p> <ul style="list-style-type: none"> <li>Required if you configured the <b>complete</b> keyword with the <b>database level</b> command in the previous step.</li> <li><i>root-url</i>—URL that is supported by the Cisco IOS file system and where database entries are to be written out. If the CA is going to issue a large number of certificates, select an appropriate storage location like flash or other storage device to store the certificates.</li> <li>When the storage location chosen is flash and the file system type on this device is Class B (LEFS), make sure to check free space on the device periodically and use the <b>squeeze</b> command to free the space used up by deleted files. This process may take several minutes and should be done during scheduled maintenance periods or off-peak hours.</li> </ul> |
| <b>Step 7</b>  | <b>lifetime certificate</b> <i>time</i><br><b>Example:</b><br><pre>Router(config-cs-server) lifetime certificate 888</pre> | <p>(Optional) Specifies the lifetime, in days, of certificates issued by this Cisco IOS CA.</p> <ul style="list-style-type: none"> <li><i>time</i>—Number of days until a certificate expires. Range is 1 to 1825 days. Default is 365. The maximum certificate lifetime is 1 month less than the lifetime of the CA certificate.</li> <li>Configure this command before the Cisco IOS CA is enabled by using the <b>no shutdown</b> command.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 8</b>  | <b>issuer-name</b> <i>CN=label</i><br><b>Example:</b><br><pre>Router(config-cs-server)# issuer-name CN=sanjose1</pre>      | <p>(Optional) Specifies a distinguished name (DN) as issuer name for the Cisco IOS CA.</p> <ul style="list-style-type: none"> <li>Default is already-configured label for the Cisco IOS CA. See <a href="#">Step 4, on page 594</a>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 9</b>  | <b>exit</b><br><b>Example:</b><br><pre>Router(config-cs-server)# exit</pre>                                                | Exits certificate-server configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 10</b> | <b>crypto pki trustpoint</b> <i>label</i><br><b>Example:</b><br><pre>Router(config)# crypto pki trustpoint sanjose1</pre>  | <p>(Optional) Declares a trustpoint and enters ca-trustpoint configuration mode.</p> <ul style="list-style-type: none"> <li>For local CA only. This command is not required for Cisco IOS CA on an external router.</li> <li>If you must use a specific RSA key for the Cisco IOS CA, use this command to create your own trustpoint</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                | Command or Action                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                                | by using the same label to be used with the <b>crypto pki server</b> command. If the router sees a configured trustpoint with the same label as the crypto pki server, it uses this trustpoint and does not automatically create a trustpoint.                                                                                                                                                  |
| <b>Step 11</b> | <b>enrollment url</b> <i>ca-url</i><br><b>Example:</b><br><pre>Router(config-ca-trustpoint)# enrollment url http://ca-server.company.com</pre> | Specifies the enrollment URL of the issuing Cisco IOS CA. <ul style="list-style-type: none"> <li>• For local Cisco IOS CA only. This command is not required for Cisco IOS CA on an external router.</li> <li>• <i>ca-url</i>—URL of the router on which the Cisco IOS CA is installed.</li> </ul>                                                                                              |
| <b>Step 12</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config-ca-trustpoint)# exit</pre>                                                                | Exits ca-trustpoint configuration mode.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 13</b> | <b>crypto pki server</b> <i>label</i><br><b>Example:</b><br><pre>Router(config)# crypto pki server sanjosel</pre>                              | Enters certificate-server configuration mode. <ul style="list-style-type: none"> <li>• <i>label</i>—Name of the Cisco IOS CA being configured.</li> </ul>                                                                                                                                                                                                                                       |
| <b>Step 14</b> | <b>grant auto</b><br><b>Example:</b><br><pre>Router(config-cs-server)# grant auto</pre>                                                        | (Optional) Allows certificates to be issued automatically to any requester. <ul style="list-style-type: none"> <li>• Default and recommended method is manual enrollment.</li> <li>• Use this command only when testing and building simple networks. Use the <b>no grant auto</b> command after configuration is complete to prevent certificates from being automatically granted.</li> </ul> |
| <b>Step 15</b> | <b>no shutdown</b><br><b>Example:</b><br><pre>Router(config-cs-server)# no shutdown</pre>                                                      | (Optional) Enables the Cisco IOS CA. <ul style="list-style-type: none"> <li>• Use this command only after you are finished configuring the Cisco IOS CA.</li> </ul>                                                                                                                                                                                                                             |
| <b>Step 16</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-cs-server)# end</pre>                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                |

### Example

The following partial output from the **show running-config** command shows the configuration for a Cisco IOS CA named sanjosel running on the local Cisco Unified CME router:

```
ip http server

crypto pki server sanjose1
 database level complete
 database url nvram:

crypto pki trustpoint sanjose1
 enrollment url http://ca-server.company.com

crypto pki server authority1
 no grant auto
 no shutdown
```

## Obtain Certificates for Server Functions

The CA issues certificates for the following server functions:

- Cisco Unified CME—Requires a certificate for TLS sessions with phones.
- TFTP—Requires a key pair and certificate for signing configuration files.
- HTTPS—Requires a key pair and certificate for signing configuration files.
- CAPF—Requires a certificate for TLS sessions with phones.
- SAST—Required for signing the CTL file. We recommend creating two SAST certificates, one for primary use and one for backup.

To obtain a certificate for a server function, perform the following steps for each server function.

**Note** You can configure a different trustpoint for each server function or you can configure the same trustpoint for more than one server function as shown in [Configuration Examples for Security, on page 638](#) at the end of this module.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *trustpoint-label*
4. **enrollment url** *url*
5. **revocation-check** *method1* [*method2* [*method3* ]]
6. **rsa** *keypair* *key-label* [*key-size* [*encryption-key-size* ]]
7. **exit**
8. **crypto pki authenticate** *trustpoint-label*
9. **crypto pki enroll** *trustpoint-label*
10. **exit**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>crypto pki trustpoint <i>trustpoint-label</i></b><br><b>Example:</b><br>Router(config)# crypto pki trustpoint capf                                           | Declares the trustpoint that the CA should use and enters ca-trustpoint configuration mode. <ul style="list-style-type: none"> <li>• <i>trustpoint-label</i>—Label for server function being configured.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 4</b> | <b>enrollment url <i>url</i></b><br><b>Example:</b><br>Router(config-ca-trustpoint)# enrollment url http://ca-server.company.com                                | Specifies the enrollment URL of the issuing CA. <ul style="list-style-type: none"> <li>• <i>url</i>—URL of the router on which the issuing CA is installed.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 5</b> | <b>revocation-check <i>method1</i> [<i>method2</i> [<i>method3</i>]]</b><br><b>Example:</b><br>Router(config-ca-trustpoint)# revocation-check none              | (Optional) Specifies the method to be used to check the revocation status of a certificate. <ul style="list-style-type: none"> <li>• <i>method</i>—If a second and third method are specified, each subsequent method is used only if the previous method returns an error, such as a server being down.</li> <li>• <b>cr1</b>—Certificate checking is performed by a certificate revocation list (CRL). This is the default behavior.</li> <li>• <b>none</b>—Certificate checking is not required.</li> <li>• <b>ocsp</b>—Certificate checking is performed by an Online Certificate Status Protocol (OCSP) server.</li> </ul> |
| <b>Step 6</b> | <b>rsakeypair <i>key-label</i> [<i>key-size</i> [<i>encryption-key-size</i>]]</b><br><b>Example:</b><br>Router(config-ca-trustpoint)# rsakeypair capf 1024 1024 | (Optional) Specifies a key pair to use with a certificate. <ul style="list-style-type: none"> <li>• <i>key-label</i>—Name of the key pair, which is generated during enrollment if it does not already exist or if the <b>auto-enroll regenerate</b> command is configured.</li> <li>• <i>key-size</i>—Size of the desired RSA key. If not specified, the existing key size is used.</li> <li>• <i>encryption-key-size</i>—Size of the second key, which is used to request separate encryption, signature keys, and certificates.</li> </ul>                                                                                   |

|                | Command or Action                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                                                 | <ul style="list-style-type: none"> <li>Multiple trustpoints can share the same key.</li> </ul>                                                                                                                                                                                                                                                |
| <b>Step 7</b>  | <b>exit</b><br><br><b>Example:</b><br>Router(config-ca-trustpoint)# exit                                                                                        | Exits ca-trustpoint configuration mode.                                                                                                                                                                                                                                                                                                       |
| <b>Step 8</b>  | <b>crypto pki authenticate trustpoint-label</b><br><br><b>Example:</b><br>Router(config)# crypto pki authenticate capf                                          | Retrieves the CA certificate, authenticates it, and checks the certificate fingerprint if prompted. <ul style="list-style-type: none"> <li>This command is optional if the CA certificate is already loaded into the configuration</li> <li><i>trustpoint-label</i>—Already-configured label for server function being configured.</li> </ul> |
| <b>Step 9</b>  | <b>crypto pki enroll trustpoint-label</b><br><br><b>Example:</b><br><br><b>crypto pki enroll trustpoint-label</b><br><br>Router(config)# crypto pki enroll capf | Enrolls with the CA and obtains the certificate for this trustpoint. <ul style="list-style-type: none"> <li><i>trustpoint-label</i>—Already-configured label for server function being configured.</li> </ul>                                                                                                                                 |
| <b>Step 10</b> | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                              |

### Example

The following partial output from the **show running-config** command show how to obtain certificates for a variety of server functions:

#### Obtaining a certificate for the CAPF server function

```
!configuring a trust point
crypto pki trustpoint capf-server
enrollment url http://192.168.1.1:80
revocation-check none
!authenticate w/ the CA and download its certificate
crypto pki authenticate capf-server
! enroll with the CA and obtain this trustpoint's certificate
crypto pki enroll capf-server
```

#### Obtaining a certificate for the Cisco Unified CME server function

```
crypto pki trustpoint cme-server
enrollment url http://192.168.1.1:80
revocation-check none

crypto pki authenticate cme-server
crypto pki enroll cme-server
```

### Obtaining a certificate for the TFTP server function

```
crypto pki trustpoint tftp-server
 enrollment url http://192.168.1.1:80
 revocation-check none

crypto pki authenticate tftp-server
crypto pki enroll tftp-server
```

### Obtaining a certificate for the first SAST server function (sast1)

```
crypto pki trustpoint sast1
 enrollment url http://192.168.1.1:80
 revocation-check none

crypto pki authenticate sast1
crypto pki enroll sast1
```

### Obtaining a certificate for the second SAST server function (sast2)

```
crypto pki trustpoint sast2
 enrollment url http://192.168.1.1:80
 revocation-check none

crypto pki authenticate sast2
crypto pki enroll sast2
```

## Configure Telephony-Service Security Parameters

To configure security parameters for telephony service, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **secure-signaling trustpoint *label***
5. **tftp-server-credentials trustpoint *label***
6. **device-security-mode {authenticated | none | encrypted}**
7. **cnf-file perphone**
8. **load-cfg-file *file-url* alias *file-alias* [sign] [create]**
9. **server-security-mode {erase | non-secure | secure}**
10. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                                                  | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 4</b> | <b>secure-signaling trustpoint label</b><br><b>Example:</b><br>Router(config-telephony)# secure-signaling trustpoint cme-sccp                     | Configures trustpoint to be used for secure signalling. <ul style="list-style-type: none"> <li>• <i>label</i>—Name of a configured PKI trustpoint with a valid certificate to be used for TLS handshakes with IP phones on TCP port 2443.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 5</b> | <b>tftp-server-credentials trustpoint label</b><br><b>Example:</b><br>Router(config-telephony)# tftp-server-credentials trustpoint cme-tftp       | Configures the TFTP server credentials (trustpoint) to be used for signing the configuration files. <ul style="list-style-type: none"> <li>• <i>label</i>—Name of a configured PKI trustpoint with a valid certificate to be used to sign the phone configuration files. This can be the CAPF trustpoint that was used in the previous step or any trustpoint with a valid certificate</li> </ul>                                                                                                                                                                                                                                                            |
| <b>Step 6</b> | <b>device-security-mode {authenticated   none   encrypted}</b><br><b>Example:</b><br>Router(config-telephony)# device-security-mode authenticated | Enables security mode for endpoints. <ul style="list-style-type: none"> <li>• <b>authenticated</b>—Instructs device to establish a TLS connection with no encryption. There is no Secure Real-Time Transport Protocol (SRTP) in the media path.</li> <li>• <b>none</b>—SCCP signaling is not secure. This is the default.</li> <li>• <b>encrypted</b>—Instructs device to establish an encrypted TLS connection to secure media path using SRTP.</li> <li>• This command can also be configured in ephone configuration mode. The value set in ephone configuration mode has priority over the value set in telephony-service configuration mode.</li> </ul> |

|                | Command or Action                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b>  | <b>cnf-file perphone</b><br><b>Example:</b><br><pre>Router(config-telephony)# cnf-file perphone</pre>                                                                                     | <p>Specifies that the system generate a separate XML configuration file for each IP phone.</p> <ul style="list-style-type: none"> <li>• Separate configuration files for each endpoint are required for security.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 8</b>  | <b>load-cfg-file file-url alias file-alias [sign] [create]</b><br><b>Example:</b><br><pre>Router(config-telephony)# load-cfg-file slot0:Ringlist.xml alias Ringlist.xml sign create</pre> | <p>(Optional) Signs configuration files that are not created by Cisco Unified CME. Also loads the signed and unsigned versions of a file on the TFTP server.</p> <ul style="list-style-type: none"> <li>• <b>file-url</b>—Complete path of a configuration file in a local directory.</li> <li>• <b>alias file-alias</b>—Alias name of the file to be served on the TFTP server.</li> <li>• <b>sign</b>—(Optional) The file needs to be digitally signed and served on the TFTP server.</li> <li>• <b>create</b>—(Optional) Creates the signed file in the local directory.</li> <li>• The first time that you use this command for each file, use the <b>create</b> and <b>sign</b> keywords. The <b>create</b> keyword is not maintained in the running configuration to prevent signed files from being recreated during every reload.</li> <li>• To serve an already-signed file on the TFTP server, use this command without the <b>create</b> and <b>sign</b> keywords.</li> </ul> |
| <b>Step 9</b>  | <b>server-security-mode { erase   non-secure   secure }</b><br><b>Example:</b><br><pre>Router(config-telephony)# server-security-mode non-secure</pre>                                    | <p>(Optional) Changes the security mode of the server.</p> <ul style="list-style-type: none"> <li>• <b>erase</b>—Deletes the CTL file.</li> <li>• <b>non-secure</b>—Nonsecure mode.</li> <li>• <b>secure</b>—Secure mode.</li> <li>• This command has no impact until the CTL file is initially generated by the CTL client. When the CTL file is generated, the CTL client automatically sets server security mode to secure.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone)# end</pre>                                                                                                                    | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Verify Telephony-Service Security Parameters

### Procedure

---

#### Step 1 **show telephony-service security-info**

Use this command to display the security-related information that is configured in telephony-service configuration mode.

##### Example:

```
Router# show telephony-service security-info
```

```
Skinny Server Trustpoint for TLS: cme-sccp
TFTP Credentials Trustpoint: cme-tftp
Server Security Mode: Secure
Global Device Security Mode: Authenticated
```

#### Step 2 **show running-config**

Use this command to display the running configuration to verify telephony and per-phone security configuration.

##### Example:

```
Router# show running-config
```

```
telephony-service
 secure-signaling trustpoint cme-sccp
 server-security-mode secure
 device-security-mode authenticated
 tftp-server-credentials trustpoint cme-tftp
 .
 .
 .
```

---

## Configure the CTL Client

Perform one of the following tasks, depending upon your network configuration:

- [Configure the CTL Client on a Cisco Unified CME Router, on page 603](#)
- [Configure the CTL Client on a Router That is Not a Cisco Unified CME Router, on page 606](#)

### Configure the CTL Client on a Cisco Unified CME Router

To configure a CTL client for creating a list of known, trusted certificates and tokens on a local Cisco Unified CME router, perform the following steps.

---

**Note** If you have primary and secondary Cisco Unified CME routers, you can configure the CTL client on either one of them.

---

## SUMMARY STEPS

1. enable
2. configure terminal
3. ctl-client
4. sast1 trustpoint *label*
5. sast2 trustpoint *label*
6. server {capf | cme | cme-tftp | tftp} *ip-address* trustpoint *trustpoint-label*
7. server cme *ip-address* username *name-string* password {0 | 1} *password-string*
8. regenerate
9. end

## DETAILED STEPS

## Procedure

|        | Command or Action                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 3 | <b>ctl-client</b><br><b>Example:</b><br>Router(config)# ctl-client                                             | Enters CTL-client configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 4 | <b>sast1 trustpoint <i>label</i></b><br><b>Example:</b><br>Router(config-ctl-client)# sast1 trustpoint sast1tp | Configures credentials for the primary SAST. <ul style="list-style-type: none"> <li>• <i>label</i>- Name of SAST1 trustpoint.</li> </ul> <b>Note</b><br>SAST1 and SAST2 certificates must be different from each other. The CTL file is always signed by SAST1. The SAST2 credentials are included in the CTL file so that if the SAST1 certificate is compromised, the file can be signed by SAST2 to prevent phones from being reset to the factory default. |
| Step 5 | <b>sast2 trustpoint <i>label</i></b><br><b>Example:</b><br>Router(config-ctl-client)# sast2 trustpoint         | Configures credentials for the secondary SAST. <ul style="list-style-type: none"> <li>• <i>label</i> - name of SAST2 trustpoint.</li> </ul> <b>Note</b><br>SAST1 and SAST2 certificates must be different from each other. The CTL file is always signed by SAST1. The SAST2 credentials are included in the CTL file so that if                                                                                                                               |

|               | Command or Action                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Step 6</b> | <b>server {capf   cme   cme-tftp   tftp} ip-address trustpoint trustpoint-label</b><br><br><b>Example:</b><br><pre>Router(config-ctl-client)# server capf 10.2.2.2 trustpoint capftp</pre>              | <p>Configures a trustpoint for each server function that is running locally on the Cisco Unified CME router.</p> <ul style="list-style-type: none"> <li>• <b>ip-address</b> - IP address of the Cisco Unified CME router. If there are multiple network interfaces, use the interface address in the local LAN to which the phones are connected.</li> <li>• <b>trustpoint trustpoint-label</b>- Name of the PKI trustpoint for the server function being configured.</li> <li>• Repeat this command for server each function that is running locally on the Cisco Unified CME router.</li> </ul>                                                                                                                                                                            |
| <b>Step 7</b> | <b>server cme ip-address username name-string password {0   1} password-string</b><br><br><b>Example:</b><br><pre>Router(config-ctl-client)# server cme 10.2.2.2 username user3 password 0 38h2KL</pre> | <p>(Optional) Provides information for another Cisco Unified CME router (primary or secondary) in the network.</p> <ul style="list-style-type: none"> <li>• <b>ip-address</b>- IP address of the othe Cisco Unified CME router.</li> <li>• <b>username name-string</b>- Username that is configured on the CTL provider.</li> <li>• <b>password</b>- Defines the way that you want the password to appear in <b>show</b> command output and not to the way that you enter the password. <ul style="list-style-type: none"> <li>• <b>0</b>- Not encrypted.</li> <li>• <b>1</b>- Encrypted using Message Digest 5 (MD5).</li> </ul> </li> <li>• <b>password-string</b>- Administrative password of the CTL provider running on the remote Cisco Unified CME router.</li> </ul> |
| <b>Step 8</b> | <b>regenerate</b><br><br><b>Example:</b><br><pre>Router(config-ctl-client)# regenerate</pre>                                                                                                            | Creates a new CTLFile.tlv after you make changes to the CTL client configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 9</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-ctl-client)# end</pre>                                                                                                                          | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Examples

The following sample output from the **show ctl-client** command displays the trustpoints in the system:

```
Router# show ctl-client
```

```
CTL Client Information
```

```

```

```
SAST 1 Certificate Trustpoint: cmeserver
SAST 1 Certificate Trustpoint: sast2
List of Trusted Servers in the CTL
CME 10.1.1.1 cmeserver
TFTP 10.1.1.1 cmeserver
CAPF 10.1.1.1 cmeserver
```

### What to do next

You are finished configuring the CTL client. See [Configure the CAPF Server, on page 608](#).

## Configure the CTL Client on a Router That is Not a Cisco Unified CME Router

To configure a CTL client on a stand-alone router that is not a Cisco Unified CME router, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ctl-client**
4. **sast1 trustpoint label**
5. **sast2 trustpoint label**
6. **server cme ip-address username name-string password {0 | 1} password-string**
7. **regenerate**
8. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                              | Purpose                                                                 |
|---------------|--------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><br>• Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                       |
| <b>Step 3</b> | <b>ctl-client</b><br><br><b>Example:</b><br>Router(config)# ctl-client         | Enters ctl-client configuration mode.                                   |
| <b>Step 4</b> | <b>sast1 trustpoint label</b>                                                  | Configures credentials for the primary SAST.                            |

|               | Command or Action                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

The CTL file is always signed by SAST1. The SAST2 credentials are included in the CTL file so that if the SAST1 certificate is compromised, the file can be signed by SAST2 to prevent phones from being reset to the factory default.</p>                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 6</b> | <b>server cme <i>ip-address</i> username <i>name-string</i> password { 0   1 } <i>password-string</i></b><br><br><b>Example:</b><br><pre>Router(config-ctl-client)# server cme 10.2.2.2<br/>username user3 password 0 38h2KL</pre> | <p>(Optional) Provides information about another Cisco Unified CME router (primary or secondary) in the network, if one exists.</p> <ul style="list-style-type: none"> <li>• <i>ip-address</i>—IP address of the other Cisco Unified CME router.</li> <li>• <b>username <i>name-string</i></b>—Username that is configured on the CTL provider.</li> <li>• <b>password</b>—Encryption status of the password string. <ul style="list-style-type: none"> <li>• <b>0</b>—Not encrypted.</li> <li>• <b>1</b>—Encrypted using Message Digest 5 (MD5).</li> </ul> </li> </ul> <p><b>Note</b><br/>This option refers to the way that you want the password to appear in show command output and not to the way that you enter the password in this command.</p> <ul style="list-style-type: none"> <li>• <i>password-string</i>—Administrative password of the CTL provider running on the remote Cisco Unified CME router.</li> </ul> |
| <b>Step 7</b> | <b>regenerate</b><br><br><b>Example:</b>                                                                                                                                                                                           | <p>Creates a new CTLFile.tlv after you make changes to the CTL client configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|               | Command or Action                                                   | Purpose                          |
|---------------|---------------------------------------------------------------------|----------------------------------|
|               | Router(config-ctl-client)# regenerate                               |                                  |
| <b>Step 8</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-ctl-client)# end | Returns to privileged EXEC mode. |

### Examples

The following sample output from the **show ctl-client** command displays the trustpoints in the system:

```
Router# show ctl-client
```

```
CTL Client Information
```

```

SAST 1 Certificate Trustpoint: cmeserver
SAST 1 Certificate Trustpoint: sast2
List of Trusted Servers in the CTL
CME 10.1.1.1 cmeserver
TFTP 10.1.1.1 cmeserver
CAPF 10.1.1.1 cmeserver
```

## Configure the CAPF Server

A certificate must be obtained for the CAPF server so that it can establish a TLS session with the phone during certificate operation. The CAPF server can install, fetch, or delete locally significant certificates (LSCs) on security-enabled phones. To enable the CAPF server on the Cisco Unified CME router, perform the following steps.

**Tip** When you use the CAPF server to install phone certificates, arrange to do so during a scheduled period of maintenance. Generating many certificates at the same time may cause call-processing interruptions.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **capf-server**
4. **trustpoint-label** *label*
5. **cert-enroll-trustpoint** *label password {0 | 1} password-string*
6. **source-addr** *ip-address*
7. **auth-mode** {*auth-string* | **LSC** | **MIC** | **none** | **null-string**}
8. **auth-string** {**delete** | **generate**} {**all** | *ephone-tag*} [*digit-string*]
9. **phone-key-size** {**512** | **1024** | **2048**}
10. **port** *tcp-port*
11. **keygen-retry** *number*
12. **keygen-timeout** *minutes*
13. **cert-oper** {**delete all** | **fetch all** | **upgrade all**}

## 14. end

Default is 3804.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 11</b> | <b>keygen-retry</b> <i>number</i><br><b>Example:</b><br>Router(config-capf-server)# keygen-retry 5                                                     | (Optional) Specifies the number of times that the server sends a key generation request. <ul style="list-style-type: none"> <li>• <i>number</i>—Number of retries. Range is 0 to 100. Default is 3.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 12</b> | <b>keygen-timeout</b> <i>minutes</i><br><b>Example:</b><br>Router(config-capf-server)# keygen-timeout 45                                               | (Optional) Specifies the amount of time that the server waits for a key generation response from the phone. <ul style="list-style-type: none"> <li>• <i>minutes</i>—Number of minutes before the generation process times out. Range is 1 to 120. Default is 30.</li> </ul>                                                                                                                                                                                                                                                                                                                              |
| <b>Step 13</b> | <b>cert-oper</b> { <b>delete all</b>   <b>fetch all</b>   <b>upgrade all</b> }<br><b>Example:</b><br>Router(config-capf-server)# cert-oper upgrade all | (Optional) Initiates the indicated certificate operation on all configured endpoints in the system. <ul style="list-style-type: none"> <li>• <b>delete all</b>—Remove all phone certificates.</li> <li>• <b>fetch all</b>—Retrieve all phone certificates for troubleshooting.</li> <li>• <b>upgrade all</b>—Upgrade all phone certificates.</li> <li>• This command can also be configured in ephone configuration mode to initiate certificate operations on individual phones. This command in ephone configuration mode has priority over this command in CAPF-server configuration mode.</li> </ul> |
| <b>Step 14</b> | <b>end</b><br><b>Example:</b><br>Router(config-capf-server)# end                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Verify the CAPF Server

Use the **show capf-server summary** command to display CAPF-server configuration information.

```
Router# show capf-server summary
```

```
CAPF Server Configuration Details
Trustpoint for TLS With Phone: tp1
Trustpoint for CA operation: ral
Source Address: 10.10.10.1
Listening Port: 3804
Phone Key Size: 1024
Phone KeyGen Retries: 3
Phone KeyGen Timeout: 30 minutes
```

## Configure Ephone Security Parameters

To configure security parameters for individual phones, perform the following steps for each phone.

### Before you begin

- Phones to be configured for security must be configured for basic calling in Cisco Unified CME. For configuration information, see [Configure Phones to Make Basic Call, on page 327](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **capf-ip-in-cnf**
5. **device-security-mode** { **authenticated** | **none** | **encrypted** }
6. **codec** { **g711ulaw** | **g722r64** | **g729r8** [**dspfarm-assist**] }
7. **capf-auth-str** *digit-string*
8. **cert-oper** { **delete** | **fetch** | **upgrade** } **auth-mode** { **auth-string** | **LSC** | **MIC** | **null-string** }
9. **reset**
10. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                     | Purpose                                                                                                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal        | Enters global configuration mode.                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>ephone</b> <i>phone-tag</i><br><br><b>Example:</b><br>Router(config)# ephone 24    | Enters ephone configuration mode.<br><br>• <i>phone-tag</i> —Unique identifier of phone to be configured.                                                                                                                                                                                               |
| <b>Step 4</b> | <b>capf-ip-in-cnf</b><br><br><b>Example:</b><br>Router(config-ephone)# capf-ip-in-cnf | (Optional) Enables the CAPF Server IP Address to be added to the CNF file for an SCCP phone. Upon successful registration, the SCCP phone downloads the LSC from the CAPF server. This CLI command is optional and required only if the phone has to register, download, and authenticate with the LSC. |

|               | Command or Action                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>device-security-mode { authenticated   none   encrypted }</b><br><br><b>Example:</b><br><pre>Router(config-ephone)# device-security-mode authenticated</pre> | <p>(Optional) Enables security mode for an individual SCCP IP phone.</p> <ul style="list-style-type: none"> <li>• <b>authenticated</b>—Instructs device to establish a TLS connection with no encryption. There is no Secure Real-Time Transport Protocol (SRTP) in the media path.</li> <li>• <b>none</b>—SCCP signaling is not secure. This is the default.</li> <li>• <b>encrypted</b>—Instructs device to establish an encrypted TLS connection to secure media path using SRTP.</li> <li>• This command can also be configured in telephony-service configuration mode. The value set in ephone configuration mode has priority over the value set in telephony-service configuration mode.</li> </ul>                                                                                                  |
| <b>Step 6</b> | <b>codec {g711ulaw   g722r64   g729r8 [ dspfarm-assist] }</b><br><br><b>Example:</b><br><pre>Router(config-ephone)# codec g711ulaw dspfarm-assist</pre>         | <p>(Optional) Sets the security mode for SCCP signaling for a phone communicating with the Cisco Unified CME router.</p> <ul style="list-style-type: none"> <li>• <b>dspfarm-assist</b>—Required for secure transcoding with Cisco Unified CME. Causes the system to attempt to use DSP Farm resources for transcoding the segment between the phone and the Cisco Unified CME router if G.711 is negotiated for the call. This keyword is ignored if the SCCP endpoint type is ATA, VG224, or VG248.</li> </ul>                                                                                                                                                                                                                                                                                             |
| <b>Step 7</b> | <b>capf-auth-str digit-string</b><br><br><b>Example:</b><br><pre>Router(config-ephone)# capf-auth-str 2734</pre>                                                | <p>(Optional) Defines a string to use as a personal identification number (PIN) for CAPF authentication.</p> <p><b>Note</b><br/>For instructions on how to enter the string on a phone, see <a href="#">Enter the Authentication String on the Phone, on page 621</a>.</p> <ul style="list-style-type: none"> <li>• <b>digit-string</b>—Digits that the phone user must dial for CAPF authentication. The length of string is 4 to 10 digits.</li> <li>• This command can also be configured in telephony-service configuration mode. The value set in ephone configuration mode has priority over the value set in telephony-service configuration mode.</li> <li>• You can also define a PIN for CAPF authentication by using the <b>auth-string</b> command in CAPF-server configuration mode.</li> </ul> |

|                | Command or Action                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b>  | <p><b>cert-oper</b> { <b>delete</b>   <b>fetch</b>   <b>upgrade</b> } <b>auth-mode</b> { <b>auth-string</b>   <b>LSC</b>   <b>MIC</b>   <b>null-string</b> }</p> <p><b>Example:</b></p> <pre>Router(config-ephone)# cert-oper upgrade auth-mode auth-string</pre> | <p>(Optional) Initiates the indicated certificate operation on the ephone being configured.</p> <ul style="list-style-type: none"> <li>• <b>delete</b>—Removes the phone certificate.</li> <li>• <b>fetch</b>—Retrieves the phone certificate for troubleshooting.</li> <li>• <b>upgrade</b>—Upgrades the phone certificate.</li> <li>• <b>auth-mode</b>—Type of authentication to use during CAPF sessions to verify endpoints that request certificates.</li> <li>• <b>auth-string</b>—Authentication string to be entered on the phone by the phone user. Use the <b>capf-auth-str</b> command to configure the auth-string. For configuration information, see <a href="#">Enter the Authentication String on the Phone, on page 621</a>.</li> <li>• <b>LSC</b>—Phone provides its phone certificate for authentication. Precedence is given to an LSC if one exists.</li> <li>• <b>MIC</b>—Phone provides its phone certificate for authentication. Precedence is given to an MIC if one exists. MIC's issuer certificate must be imported into a PKI trustpoint. For information, see <a href="#">Manually Import the MIC Root Certificate, on page 622</a>.</li> <li>• <b>null-string</b>—No authentication.</li> <li>• This command can also be configured in CAPF-server configuration mode to initiate certificate operations at a global level. This command in ephone configuration mode has priority over this command in CAPF-server configuration mode.</li> <li>• You can also use the <b>auth-mode</b> command in CAPF-server configuration mode to configure authentication at a global level.</li> </ul> |
| <b>Step 9</b>  | <p><b>reset</b></p> <p><b>Example:</b></p> <pre>Router(config-ephone)# reset</pre>                                                                                                                                                                                | Performs a complete reboot of the phone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 10</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(config-ephone)# end</pre>                                                                                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Verify Ephone Security Parameters

### Procedure

Use the **show capf-server auth-string** command to display configured authentication strings (PINs) that users enter at the phone to establish CAPF authentication.

#### Example:

```
Router# show capf-server auth-string
```

```
Authentication Strings for configured Ephones
Mac-Addr Auth-String

```

### What to do next

- When you have more than one Cisco Unified CME router in your network, you must configure a CTL provider on each Cisco Unified CME router that is not running the CTL client. To configure a CTL provider on each Cisco Unified CME router on which the CTL client is not running, see [Configure the CTL Provider, on page 615](#).
- If the CA is a third-party CA or if the Cisco IOS CA is on a Cisco IOS router external to the Cisco Unified CME router, you must configure an RA to issue certificates to phones. For information, see [Configure the Registration Authority, on page 618](#).
- If the specified authentication mode for the CAPF session is authentication-string, you must enter an authentication string on each phone that is receiving an updated LSC. For information, see [Enter the Authentication String on the Phone, on page 621](#).
- If the specified authentication mode for the CAPF session is MIC, the MIC's issuer certificate must be imported into a PKI trustpoint. For information, see [Manually Import the MIC Root Certificate, on page 622](#).
- To configure Media Encryption, see [Configure Media Encryption \(SRTP\) in Cisco Unified CME, on page 625](#).

## Configure the CTL Provider

When you have more than one Cisco Unified CME router in your network, you must configure a CTL provider on each Cisco Unified CME router that is not running the CTL client. To configure a CTL provider on each Cisco Unified CME router on which the CTL client is not running, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **credentials**
4. **ip source-address** [*ip-address* [**port** [*port-number*]]]
5. **trustpoint** *trustpoint-label*
6. **ctl-service admin username secret** {0 | 1 } *password-string*
7. **end**

## DETAILED STEPS

| Procedure     |                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Command or Action                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>credentials</b><br><b>Example:</b><br><pre>Router(config)# credentials</pre>                                                                                                           | Enters credentials-interface mode to configure a CTL provider.                                                                                                                                                                                                                                                                                                                  |
| <b>Step 4</b> | <b>ip source-address</b> [ <i>ip-address</i> [ <b>port</b> [ <i>port-number</i> ]]]<br><b>Example:</b><br><pre>Router(config-credentials)# ip source-address 172.19.245.1 port 2444</pre> | Identifies the local router on which this CTL provider is being configured. <ul style="list-style-type: none"> <li>• <i>ip-address</i>—Typically one of the addresses of the Ethernet port of the router.</li> <li>• <b>port</b> <i>port-number</i>—TCP port for credentials service communication. Default is 2444 and we recommend that you use the default value.</li> </ul> |
| <b>Step 5</b> | <b>trustpoint</b> <i>trustpoint-label</i><br><b>Example:</b><br><pre>Router(config-credentials)# trustpoint ctlpv</pre>                                                                   | Configures the trustpoint. <ul style="list-style-type: none"> <li>• <i>trustpoint-label</i>—Name of CTL provider trustpoint to be used for TLS sessions with the CTL client.</li> </ul>                                                                                                                                                                                         |
| <b>Step 6</b> | <b>ctl-service admin username secret</b> {0   1 } <i>password-string</i><br><b>Example:</b><br><pre>Router(config-credentials)# ctl-service admin user4 secret 0 c89L8o</pre>             | Specifies a username and password to authenticate the CTL client when it connects to retrieve the credentials during the CTL protocol. <ul style="list-style-type: none"> <li>• <i>username</i>—Name that will be used to authenticate the client.</li> </ul>                                                                                                                   |

|               | Command or Action                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Step 7</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-credentials)# end | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                             |

## Verify the CTL Provider

### Procedure

Use the **show credentials** command to display credentials settings.

#### Example:

```
Router# show credentials

Credentials IP: 172.19.245.1
Credentials PORT: 2444
Trustpoint: ct1pv
```

### What to do next

- If the CA is a third-party CA or if the Cisco IOS CA is on a Cisco IOS router external to the Cisco Unified CME router, you must configure an RA to issue certificates to phones. For information, see [Configure the Registration Authority, on page 618](#).
- If the specified authentication mode for the CAPF session is authentication-string, you must enter an authentication string on each phone that is receiving an updated LSC. For information, see [Enter the Authentication String on the Phone, on page 621](#).
- If the specified authentication mode for the CAPF session is MIC, the MIC's issuer certificate must be imported into a PKI trustpoint. For information, see [Manually Import the MIC Root Certificate, on page 622](#).
- To configure Media Encryption, see [Configure Media Encryption \(SRTP\) in Cisco Unified CME, on page 625](#).

## Configure the Registration Authority

A registration authority (RA) is the authority charged with recording or verifying some or all of the data required for the CA to issue certificates. In many cases the CA undertakes all of the RA functions itself, but where a CA operates over a wide geographical area or when there is security concern over exposing the CA at the edge of the network, it may be advisable to delegate some of the tasks to an RA and let the CA concentrate on its primary tasks of signing certificates.

You can configure a CA to run in RA mode. When the RA receives a manual or Simple Certificate Enrollment Protocol (SCEP) enrollment request, the administrator can either reject or grant it on the basis of local policy. If the request is granted, it is forwarded to the issuing CA, and the CA automatically generates the certificate and returns it to the RA. The client can later retrieve the granted certificate from the RA.

To configure an RA, perform the following steps on the Cisco Unified CME router.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *label*
4. **enrollment url** *ca-url*
5. **revocation-check** *method1* [*method2* [*method3*] ]
6. **serial-number** [**none**]
7. **rsa****keypair** *key-label* [*key-size* [*encryption-key-size*] ]
8. **exit**
9. **crypto pki server** *label*
10. **mode ra**
11. **lifetime certificate** *time*
12. **grant auto**
13. **no shutdown**
14. **end**

| <b>Step 9</b>  | <b>crypto pki server</b> <i>label</i><br><b>Example:</b><br><code>Router(config)# crypto pki server ral2</code>                | Defines a label for the certificate server and enters certificate-server configuration mode. <ul style="list-style-type: none"> <li>• <i>label</i>—Name for the trustpoint and RA. Use the same label that you previously created as a trustpoint and RA in <a href="#">Step 3, on page 618</a>.</li> </ul>                                                                                                      |
| <b>Step 10</b> | <b>mode ra</b><br><b>Example:</b><br><code>Router(config-cs-server)# mode ra</code>                                            | Places the PKI server into certificate-server mode for the RA.                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 11</b> | <b>lifetime certificate</b> <i>time</i><br><b>Example:</b><br><code>Router(config-cs-server)# lifetime certificate 1800</code> | (Optional) Specifies the lifetime, in days, of a certificate. <ul style="list-style-type: none"> <li>• <i>time</i>—Number of days until the certificate expires. Range is 1 to 1825. Default is 365. The maximum certificate lifetime is 1 month less than the lifetime of the CA certificate.</li> <li>• This command must be used before the server is enabled with the <b>no shutdown</b> command.</li> </ul> |
| <b>Step 12</b> | <b>grant auto</b><br><b>Example:</b><br><code>Router(config-cs-server)# grant auto</code>                                      | Allows a certificate to be issued automatically to any requester. <ul style="list-style-type: none"> <li>• Configure this command only during enrollment when testing and building simple networks.</li> <li>• As a security best practice, use the <b>no grant auto</b> command to disable this functionality after configuration so that certificates are not continually granted.</li> </ul>                  |
| <b>Step 13</b> | <b>no shutdown</b><br><b>Example:</b><br><code>Router(config-cs-server)# no shutdown</code>                                    | (Optional) Enables the certificate server. <ul style="list-style-type: none"> <li>• When prompted, provide input regarding acceptance of the CA certificate, the router certificate, the challenge password, and a password for protecting the private key.</li> <li>• Use this command only after you have completely configured your certificate server.</li> </ul>                                            |
| <b>Step 14</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-cs-server)# end</code>                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                 |

**What to do next**

- When you have more than one Cisco Unified CME router in your network, you must configure a CTL provider on each Cisco Unified CME router that is not running the CTL client. To configure a CTL provider on each Cisco Unified CME router on which the CTL client is not running, see [Configure the CTL Provider, on page 615](#).
- If the specified authentication mode for the CAPF session is authentication-string, you must enter an authentication string on each phone that is receiving an updated LSC. For information, see [Enter the Authentication String on the Phone, on page 621](#).
- If the specified authentication mode for the CAPF session is MIC, the MIC's issuer certificate must be imported into a PKI trustpoint. For information, see [Manually Import the MIC Root Certificate, on page 622](#).
- To configure Media Encryption, see [Configure Media Encryption \(SRTP\) in Cisco Unified CME, on page 625](#).

## Enter the Authentication String on the Phone

This procedure is required only for the one-time installation of an LSC on a phone and only if you configured the authentication mode for the CAPF session as authentication-string. The authentication string must be communicated to the phone user so that it can be entered on the phone before the LSC is installed.

**Note**

You can list authentication strings for phones by using the **show capf-server auth-string** command.

**Restriction**

- Authentication string applies for one-time use only.

**Before you begin**

- Signed image exists on the IP phone; see the Cisco Unified IP phone administration documentation that supports your phone model.
- IP phone is registered in Cisco Unified CME.
- CAPF certificate exists in the CTL file. For information, see [Configure the CTL Client, on page 603](#).
- Authentication string to be entered is configured using **auth-string** command in CAPF-server configuration mode or the **capf-auth-str** command in ephone configuration mode. For information, see [Configure Telephony-Service Security Parameters, on page 600](#).
- The **device-security-mode** command is configured using the **none** keyword. For information, see [Configure Telephony-Service Security Parameters, on page 600](#).

## Procedure

- 
- Step 1** Press the **Settings** button. On the Cisco Unified IP Phone 7921, press **Down Arrow** to access the **Settings** menu.
- Step 2** If the configuration is locked, press **\*\*#** (asterisk, asterisk, pound sign) to unlock it.
- Step 3** Scroll down the **Settings** menu. Highlight Security Configuration and press the **Select** softkey.
- Step 4** Scroll down the **Security Configuration** menu. Highlight LSC and press the **Update** softkey. On the Cisco Unified IP Phone 7921, press **\*\*#** to unlock the Security Configuration menu.
- Step 5** When prompted for the authentication string, enter the string provided by the system administrator and press the **Submit** softkey.
- The phone installs, updates, deletes, or fetches the certificate, depending on the CAPF configuration.
- You can monitor the progress of the certificate operation by viewing the messages that display on the phone. After you press **Submit**, the message “Pending” appears under the LSC option. The phone generates the public and private key pair and displays the information on the phone. When the phone successfully completes the process, the phone displays a successful message. If the phone displays a failure message, you entered the wrong authentication string or did not enable the phone for upgrade.
- You can stop the process by choosing Stop at any time.
- Step 6** Verify that the certificate was installed on the phone. From the **Settings** menu on the phone screen, choose **Model Information** and then press the **Select** softkey to display the Model Information.
- Step 7** Press the navigation button to scroll to LSC. The value for this item indicates whether LSC is Installed or Not Installed.
- 

## What to do next

- When you have more than one Cisco Unified CME router in your network, you must configure a CTL provider on each Cisco Unified CME router that is not running the CTL client. To configure a CTL provider on each Cisco Unified CME router on which the CTL client is not running, see [Configure the CTL Provider, on page 615](#).
- If the CA is a third-party CA or if the Cisco IOS CA is on a Cisco IOS router external to the Cisco Unified CME router, you must configure an RA to issue certificates to phones. For information, see [Configure the Registration Authority, on page 618](#).
- If the specified authentication mode for the CAPF session is MIC, the MIC’s issuer certificate must be imported into a PKI trustpoint. For information, see [Manually Import the MIC Root Certificate, on page 622](#).
- To configure Media Encryption, see [Configure Media Encryption \(SRTP\) in Cisco Unified CME, on page 625](#).

## Manually Import the MIC Root Certificate

The MIC root certificate must be present in the Cisco Unified CME router to allow Cisco Unified CME to authenticate the MIC that is presented to it. To manually import the MIC root certificate on the Cisco Unified CME router, perform the following steps for each type of phone that requires a MIC for authentication.

### Before you begin

One of the following must be true before you perform this task:

- The **device-security-mode** command is configured using the **none** keyword. For information, see [Configure Telephony-Service Security Parameters, on page 600](#).
- MIC is the specified authentication mode for phone authentication during a CAPF session.
- A phone's MIC, rather than an LSC, is used to establish the TLS session for SCCP signaling.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **revocation-check none**
5. **enrollment terminal**
6. **exit**
7. **crypto pki authenticate** *name*
8. Download the four MIC root certificate files. Cut and paste the appropriate text for each certificate. Accept the certificates.
9. **exit**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                                 | Purpose                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                            | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                    | Enters global configuration mode.                                                                                                                   |
| <b>Step 3</b> | <b>crypto pki trustpoint</b> <i>name</i><br><br><b>Example:</b><br>Router(config)# crypto pki trustpoint sanjose1 | Declares the CA that your router should use and enters ca-trustpoint configuration mode.<br><br>• <i>name</i> —Already-configured label for the CA. |
| <b>Step 4</b> | <b>revocation-check none</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# revocation-check none               | Specifies that revocation check is not performed and the certificate is always accepted.                                                            |
| <b>Step 5</b> | <b>enrollment terminal</b><br><br><b>Example:</b>                                                                 | Specifies manual (copy-and-paste) certificate enrollment.                                                                                           |

|               | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|--------|-------------------------------------------------------------------------|----------------------------------|
| Step 9 | <b>exit</b><br><br><b>Example:</b><br><code>Router(config)# exit</code> | Returns to privileged EXEC mode. |

#### What to do next

- When you have more than one Cisco Unified CME router in your network, you must configure a CTL provider on each Cisco Unified CME router that is not running the CTL client. To configure a CTL provider on each Cisco Unified CME router on which the CTL client is not running, see [Configure the CTL Provider, on page 615](#).
- If the CA is a third-party CA or if the Cisco IOS CA is on a Cisco IOS router external to the Cisco Unified CME router, you must configure an RA to issue certificates to phones. For information, see [Configure the Registration Authority, on page 618](#).
- If the specified authentication mode for the CAPF session is authentication-string, you must enter an authentication string on each phone that is receiving an updated LSC. For information, see [Enter the Authentication String on the Phone, on page 621](#).
- To configure Media Encryption, see [Configure Media Encryption \(SRTP\) in Cisco Unified CME, on page 625](#).

## Configure Media Encryption (SRTP) in Cisco Unified CME

To configure the network for secure calls between Cisco Unified CME systems across an H.323 trunk, perform the following steps on the Cisco Unified CME router.

**Restriction**

- Secure three-way software conferencing is not supported. A secure call beginning with SRTP always falls back to nonsecure Real-Time Transport Protocol (RTP) when it is joined to a conference.
- If a party drops from a three-party conference, the call between the remaining two parties returns to secure if the two parties are SRTP-capable local Skinny Client Control Protocol (SCCP) endpoints to a single Cisco Unified CME and the conference creator is one of the remaining parties. If either of the two remaining parties are only RTP-capable, the call remains nonsecure. If the two remaining parties are connected through FXS, PSTN, or VoIP, the call remains nonsecure.
- Calls to Cisco Unity Express are not secure.
- Music on Hold (MOH) is not secure.
- Video calls are not secure.
- Modem relay and T.3 fax relay calls are not secure.
- Media flow-around is not supported for call transfer and call forward.
- Conversion between inband tone and RFC 2833 DTMF is not supported. RFC 2833 DTMF handling is supported when encryption keys are sent to secure DSP Farm devices but is not supported for codec passthrough.
- Secure Cisco Unified CME does not support SIP trunks; only H.323 trunks are supported.
- Media Encryption (SRTP) supports secure supplementary services in both H.450 and non-H.450 Cisco Unified CME networks. A secure Cisco Unified CME network should be either H.450 or non-H.450, not a hybrid.
- Secure calls are supported in the default session application only.

**Before you begin**

- Cisco Unified CME 4.2 or a later version.
- To make secure H.323 calls, telephony-service security parameters must be configured. See [Configure Telephony-Service Security Parameters, on page 600](#).
- Compatible Cisco IOS Release on the Cisco VG224 Analog Phone Gateway. For information, see [Cisco Unified CME and Cisco IOS Release Compatibility Matrix](#).

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **supplementary-service media-renegotiate**
5. **srtp fallback**
6. **h323**
7. **emptycapability**
8. **exit**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                  | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>voice service voip</b><br><b>Example:</b><br>Router(config)# voice service voip                                                  | Enters voice-service configuration mode.<br><ul style="list-style-type: none"> <li>• The <b>voip</b> keyword specifies VoIP encapsulation.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 4</b> | <b>supplementary-service media-renegotiate</b><br><b>Example:</b><br>Router(conf-voi-serv)# supplementary-service media-renegotiate | Enables midcall renegotiation of SRTP cryptographic keys.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 5</b> | <b>srtp fallback</b><br><b>Example:</b><br>Router(conf-voi-serv)# srtp fallback                                                     | Globally enables secure calls using SRTP for media encryption and authentication and enables SRTP-to-RTP fallback to support supplementary services such as ringback tone and MOH.<br><ul style="list-style-type: none"> <li>• Skip this step if you are going to configure fallback on individual dial peers.</li> <li>• This command can also be configured in dial-peer configuration mode. This command in dial-peer configuration command takes precedence over this command in voice service voip configuration mode.</li> </ul> |
| <b>Step 6</b> | <b>h323</b><br><b>Example:</b><br>Router(conf-voi-serv)# h323                                                                       | Enters H.323 voice-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 7</b> | <b>emptycapability</b><br><b>Example:</b><br>Router(conf-serv-h323)# emptycapability                                                | Eliminates the need for identical codec capabilities for all dial peers in the rotary group.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 8</b> | <b>exit</b><br><b>Example:</b><br>Router(conf-serv-h323)# exit                                                                      | Exits H.323 voice-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**What to do next**

You have completed the required task for configuring Media Encryption (SRTP) on Cisco Unified CME. Configuring Cisco Unified CME SRTP Fallback for H.323 Dial Peers. You can now perform the following optional tasks:

- [Configure Cisco Unified CME SRTP Fallback for H.323 Dial Peers, on page 628](#)(Optional)
- [Configure Cisco Unity for Secure Cisco Unified CME Operation, on page 629](#)(Optional)

## Configure Cisco Unified CME SRTP Fallback for H.323 Dial Peers

To configure SRTP fallback for an individual dial peer, perform the following steps on the Cisco Unified CME router.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice class codec *tag***
4. **codec preference *value codec-type***
5. **exit**
6. **dial-peer voice *tag* voip**
7. **srtp fallback**
8. **voice-class codec *tag***
9. **exit**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                                 | Purpose                                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                            | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                    | Enters global configuration mode.                                                                                          |
| <b>Step 3</b> | <b>voice class codec <i>tag</i></b><br><br><b>Example:</b><br>Router(config)# voice class codec 1 | Enters voice-class configuration mode and assigns an identification tag number for a codec voice class.                    |
| <b>Step 4</b> | <b>codec preference <i>value codec-type</i></b><br><br><b>Example:</b>                            | Specifies a list of preferred codecs to use on a dial peer.<br><br>• Repeat this step to build a list of preferred codecs. |

| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config-voice-class)# exit</pre>                               | Exits voice-class configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 6</b> | <b>dial-peer voice tag voip</b><br><b>Example:</b><br><pre>Router(config)# dial-peer voice 101 voip</pre>   | Enters dial peer voice configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 7</b> | <b>srtp fallback</b><br><b>Example:</b><br><pre>Router(config-dial-peer)# srtp fallback</pre>               | <p>Enables secure calls that use SRTP for media encryption and authentication and specifies fallback capability.</p> <ul style="list-style-type: none"> <li>Using the <b>no srtp</b> command disables SRTP and causes the dial peer to fall back to RTP mode.</li> <li><b>fallback</b>—Enables fallback to nonsecure mode (RTP) on an individual dial peer. The <b>no srtp fallback</b> command disables fallback and SRTP.</li> <li>This command can also be configured in voice service voip configuration mode. This command in dial-peer configuration command takes precedence over this command in voice service voip configuration mode.</li> </ul> |
| <b>Step 8</b> | <b>voice-class codec tag</b><br><b>Example:</b><br><pre>Router(config-dial-peer)# voice-class codec 1</pre> | <p>Assigns a previously configured codec selection preference list (codec voice class) to a Voice over IP (VoIP) dial peer.</p> <ul style="list-style-type: none"> <li>The <i>tag</i> argument in this step is the same as the <i>tag</i> in Step 3.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 9</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config-dial-peer)# exit</pre>                                 | Exits dial-peer voice configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Configure Cisco Unity for Secure Cisco Unified CME Operation

This section contains the following tasks:

- [Prerequisites for Configuring Cisco Unity for Secure Cisco Unified CME Operation, on page 630](#)
- [Configure Integration Between Cisco Unified CME and Cisco Unity, on page 630](#)
- [Import the Cisco Unity Root Certificate to Cisco Unified CME, on page 630](#)
- [Configure Cisco Unity Ports for Secure Registration, on page 632](#)
- [Verify that Cisco Unity are Registering Securely, on page 632](#)

## Prerequisites for Configuring Cisco Unity for Secure Cisco Unified CME Operation

- Cisco Unity 4.2 or later version.

### Configure Integration Between Cisco Unified CME and Cisco Unity

To change the settings for the integration between Cisco Unified CME and Cisco Unity, perform the following steps on the Cisco Unity server:

#### Procedure

- 
- Step 1** If Cisco Unity Telephony Integration Manager (UTIM) is not yet open on the Cisco Unity server, choose **Programs > Cisco Unity > Manage Integrations** from the Windows Start menu. The UTIM window appears.
- Step 2** In the left pane, double-click **Cisco Unity Server**. The existing integrations appear.
- Step 3** Click **Cisco Unified Communications Manager** integration.
- Step 4** In the right pane, click the cluster for the integration.
- Step 5** Click the **Servers** tab.
- Step 6** In the Cisco Unified Communications Manager Cluster Security Mode field, click the applicable setting.
- Step 7** If you clicked **Non-secure**, click **Save** and skip the remaining steps in this procedure.
- If you clicked **Authenticated** or **Encrypted**, the Security tab and the Add TFTP Server dialog box appear. In the IP Address or Host Name field of the Add TFTP Server dialog box, enter the IP address (or DNS name) of the primary TFTP server for the Cisco Unified Communications Manager cluster and click **OK**.
- Step 8** If there are more TFTP servers that Cisco Unity will use to download the Cisco Unified Communications Manager certificates, click **Add**. The Add TFTP Server dialog box appears.
- Step 9** In the IP Address or Host Name field, enter the IP address (or DNS name) of the secondary TFTP server for the Cisco Unified Communications Manager cluster and click **OK**.
- Step 10** Click **Save**.
- Cisco Unity creates the voice messaging port device certificates, exports the Cisco Unity server root certificate, and displays the Export Cisco Unity Root Certificate dialog box.
- Step 11** Note the filename of the exported Cisco Unity server root certificate and click **OK**.
- Step 12** On the Cisco Unity server, navigate to the CommServer\SkinnyCerts directory.
- Step 13** Locate the Cisco Unity server root certificate file that you exported in Step 11.
- Step 14** Right-click the file and click **Rename**.
- Step 15** Change the file extension from .0 to .pem. For example, change the filename “12345.0” to “12345.pem” for the exported Cisco Unity server root certificate file.
- Step 16** Copy this file to a PC from which you can access the Cisco Unified CME router.
- 

### Import the Cisco Unity Root Certificate to Cisco Unified CME

To import the Cisco Unity root certificate to Cisco Unified CME, perform the following steps on the Cisco Unified CME router:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **revocation-check none**
5. **enrollment terminal**
6. **exit**
7. **crypto pki authenticate** *trustpoint-label*
8. Open the root certificate file that you copied from the Cisco Unity Server in [Step 16, on page 630](#).
9. You will be prompted to enter the CA certificate. Cut and paste the entire contents of the base 64 encoded certificate between BEGIN CERTIFICATE and END CERTIFICATE at the command line. Press **Enter** and type **quit**. The router prompts you to accept the certificate. Enter yes to accept the certificate.

## DETAILED STEPS

| Procedure |                                                                                                          |                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | Command or Action                                                                                        | Purpose                                                                                                                                                                                                                  |
| Step 1    | <b>enable</b><br><b>Example:</b><br>Router> enable                                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                    |
| Step 2    | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                               | Enters global configuration mode.                                                                                                                                                                                        |
| Step 3    | <b>crypto pki trustpoint</b> <i>name</i><br><b>Example:</b><br>Router(config)# crypto pki trustpoint PEM | Declares the trustpoint that your RA mode certificate server should use and enters ca-trustpoint configuration mode.<br><ul style="list-style-type: none"> <li>• <i>label</i>—Name for the trustpoint and RA.</li> </ul> |
| Step 4    | <b>revocation-check none</b><br><b>Example:</b><br>Router(ca-trustpoint)# revocation-check none          | (Optional) Specifies that certificate checking is not required.                                                                                                                                                          |
| Step 5    | <b>enrollment terminal</b><br><b>Example:</b><br>Router(ca-trustpoint)# enrollment terminal              | Specifies manual cut-and-paste certificate enrollment.                                                                                                                                                                   |
| Step 6    | <b>exit</b><br><b>Example:</b><br>Router(ca-trustpoint)# exit                                            | Exits ca-trustpoint configuration mode.                                                                                                                                                                                  |
| Step 7    | <b>crypto pki authenticate</b> <i>trustpoint-label</i><br><b>Example:</b>                                | Retrieves the CA certificate and authenticates it. Checks the certificate fingerprint when prompted.                                                                                                                     |

|               | Command or Action                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                 |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router(config)# crypto pki authenticate pem                                                                                                                                                                                                                                                                                | <ul style="list-style-type: none"> <li>• <i>trustpoint-label</i>—Already-configured name for the trustpoint and RA. See <a href="#">Step 3, on page 631</a>.</li> </ul> |
| <b>Step 8</b> | Open the root certificate file that you copied from the Cisco Unity Server in <a href="#">Step 16, on page 630</a> .                                                                                                                                                                                                       |                                                                                                                                                                         |
| <b>Step 9</b> | You will be prompted to enter the CA certificate. Cut and paste the entire contents of the base 64 encoded certificate between BEGIN CERTIFICATE and END CERTIFICATE at the command line. Press <b>Enter</b> and type <b>quit</b> . The router prompts you to accept the certificate. Enter yes to accept the certificate. | Completes the copying of the Cisco Unity root certificate to the Cisco Unified CME router.                                                                              |

## Configure Cisco Unity Ports for Secure Registration

To configure Cisco Unity ports for registration in secure mode, perform the following steps:

### Procedure

- 
- Step 1** Choose the Cisco voice-mail port that you want to update.
- Step 2** From the Device Security Mode drop-down list, choose **Encrypted**.
- Step 3** Click **Update**.
- 

## Verify that Cisco Unity are Registering Securely

Use the **show sccp connections** command to verify that Cisco Unity ports are registered securely with Cisco Unified CME.

In the following example, the secure value of the type field shows that the connections are secure.

```
Router# show sccp connections

sess_id conn_id stype mode codec ripaddr rport sport

16777222 16777409 secure-xcode sendrecv g729b 10.3.56.120 16772 19534
16777222 16777393 secure-xcode sendrecv g711u 10.3.56.50 17030 18464

Total number of active session(s) 1, and connection(s) 2
```

## HTTPS Provisioning for Cisco Unified IP Phones

To provision a Cisco Unified IP phone for secure access to web content using HTTPS, perform the following steps:

### Before you begin

- Firmware 9.0 (4) or a later version must be installed on the IP phone to prevent an infinite registration loop.

- Certificate file to be imported from flash memory to the IP phone must be in privacy-enhanced mail format.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **crypto pki server** *cs-label*
5. **database level** { **minimum** | **names** | **complete** }
6. **database url** *root url*
7. **grant auto**
8. **exit**
9. **crypto pki trustpoint** *name*
10. **enrollment url** *url*
11. **exit**
12. **crypto pki server** *cs-label*
13. **no shutdown**
14. **exit**
15. **crypto pki trustpoint** *name*
16. **enrollment url** *url*
17. **revocation-check** *method1* [*method2* [*method3*] ]
18. **rsa keypair** *key-label*
19. **exit**
20. **crypto pki authenticate** *name*
21. **crypto pki enroll** *name*
22. **crypto pki trustpoint** *name*
23. **enrollment url** *url*
24. **revocation-check** *method1* [*method2* [*method3*] ]
25. **rsa keypair** *key-label*
26. **exit**
27. **crypto pki authenticate** *name*
28. **crypto pki enroll** *name*
29. **ctl-client**
30. **sastl trustpoint** *label*
31. **sast2 trustpoint** *label*
32. **import certificate** *tag description* **flash:** *cert\_name*
33. **server application server address trustpoint** *label*
34. **regenerate**
35. **end**

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>ip http server</b><br><b>Example:</b><br>Router(config)# ip http server                                                                 | Enables the HTTP server on the Cisco Unified CME router.                                                                                                                                                                                                                          |
| <b>Step 4</b> | <b>crypto pki server</b> <i>cs-label</i><br><b>Example:</b><br>Router(config)# crypto pki server IOS-CA                                    | Enables a Cisco IOS certificate server and enters certificate server configuration mode.<br><ul style="list-style-type: none"><li>• <i>cs-label</i>—Name of the certificate server.</li></ul><br><b>Note</b><br>The certificate server name should not exceed 13 characters.      |
| <b>Step 5</b> | <b>database level</b> { <b>minimum</b>   <b>names</b>   <b>complete</b> }<br><b>Example:</b><br>Router(cs-server)# database level complete | Controls what type of data is stored in the certificate enrollment database.<br><ul style="list-style-type: none"><li>• <b>complete</b>—Each issued certificate is written to the database. If this keyword is used, you should enable the <b>database url</b> command.</li></ul> |
| <b>Step 6</b> | <b>database url</b> <i>root url</i><br><b>Example:</b><br>Router(cs-server)# database url flash:                                           | Specifies the location where database entries for the certificate server will be stored or published.<br><ul style="list-style-type: none"><li>• <i>root url</i>—Location where database entries will be written.</li></ul>                                                       |
| <b>Step 7</b> | <b>grant auto</b><br><b>Example:</b><br>Router(cs-server)# grant auto                                                                      | (Optional) Allows an automatic certificate to be issued to any requester. The recommended method and default if this command is not used is manual enrollment.                                                                                                                    |
| <b>Step 8</b> | <b>exit</b><br><b>Example:</b><br>Router(cs-server)# exit                                                                                  | Exits certificate server configuration mode.                                                                                                                                                                                                                                      |

|                | Command or Action                                                                                                                           | Purpose                                                                                                                                                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 9</b>  | <b>crypto pki trustpoint <i>name</i></b><br><b>Example:</b><br>Router(config)# crypto pki trustpoint IOS-CA                                 | Declares a trustpoint and enters ca-trustpoint configuration mode.<br><ul style="list-style-type: none"> <li>• <i>name</i>—Name for the trustpoint.</li> </ul>                                                                                                                      |
| <b>Step 10</b> | <b>enrollment url <i>url</i></b><br><b>Example:</b><br>Router(ca-trustpoint)# enrollment url<br>http://10.1.1.1:80                          | Specifies the enrollment parameters of a certification authority.<br><ul style="list-style-type: none"> <li>• <i>url</i>—Specifies the URL of the file system where your router should send certificate requests.</li> </ul>                                                        |
| <b>Step 11</b> | <b>exit</b><br><b>Example:</b><br>Router(ca-trustpoint)# exit                                                                               | Exits ca-trustpoint configuration mode.                                                                                                                                                                                                                                             |
| <b>Step 12</b> | <b>crypto pki server <i>cs-label</i></b><br><b>Example:</b><br>Router(config)# crypto pki server IOS-CA                                     | Enables a Cisco IOS certificate server and enters certificate server configuration mode.<br><ul style="list-style-type: none"> <li>• <i>cs-label</i>—Name of the certificate server.</li> </ul> <p><b>Note</b><br/>The certificate server name should not exceed 13 characters.</p> |
| <b>Step 13</b> | <b>no shutdown</b><br><b>Example:</b><br>Router(cs-server)# no shutdown                                                                     | Enables the Cisco IOS Certification Authority.                                                                                                                                                                                                                                      |
| <b>Step 14</b> | <b>exit</b><br><b>Example:</b><br>Router(cs-server)# exit                                                                                   | Exits certificate server configuration mode.                                                                                                                                                                                                                                        |
| <b>Step 15</b> | <b>crypto pki trustpoint <i>name</i></b><br><b>Example:</b><br>Router(config)# crypto pki trustpoint primary-cme                            | Declares a trustpoint and enters ca-trustpoint configuration mode.<br><ul style="list-style-type: none"> <li>• <i>name</i>—Name for the trustpoint.</li> </ul>                                                                                                                      |
| <b>Step 16</b> | <b>enrollment url <i>url</i></b><br><b>Example:</b><br>Router(ca-trustpoint)# enrollment url<br>http://10.1.1.1:80                          | Specifies the enrollment parameters of the certification authority.<br><ul style="list-style-type: none"> <li>• <i>url</i>—Specifies the URL of the file system where your router should send certificate requests.</li> </ul>                                                      |
| <b>Step 17</b> | <b>revocation-check <i>method1</i> [<i>method2</i> [<i>method3</i>]]</b><br><b>Example:</b><br>Router(ca-trustpoint)# revocation-check none | Checks the revocation status of a certificate.<br><ul style="list-style-type: none"> <li>• <b>none</b>—Certificate checking is not required.</li> </ul>                                                                                                                             |
| <b>Step 18</b> | <b>rsakeypair <i>key-label</i></b><br><b>Example:</b>                                                                                       | Specifies which RSA key pair to associate with the certificate.                                                                                                                                                                                                                     |

|                | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Router(ca-trustpoint)# rsakeypair primary-cme                                                                         | <ul style="list-style-type: none"> <li>• <i>key-label</i>—Name of the key pair, which is generated during enrollment if it does not already exist or if the <b>auto-enroll regenerate</b> command is configured.</li> </ul>                                                                     |
| <b>Step 19</b> | <b>exit</b><br><b>Example:</b><br>Router(ca-trustpoint)# exit                                                         | Exits ca-trustpoint configuration mode.                                                                                                                                                                                                                                                         |
| <b>Step 20</b> | <b>crypto pki authenticate name</b><br><b>Example:</b><br>Router(config)# crypto pki authenticate primary-cme         | Authenticates the certification authority by getting the authority's certificate. <ul style="list-style-type: none"> <li>• <i>name</i>—Name of the certification authority.</li> </ul>                                                                                                          |
| <b>Step 21</b> | <b>crypto pki enroll name</b><br><b>Example:</b><br>Router(config)# crypto pki enroll primary-cme                     | Obtains the certificates for the router from the certificate authority. <ul style="list-style-type: none"> <li>• <i>name</i>—Name of the certification authority. Use the same name as when you declared the certification authority using the <b>crypto pki trustpoint</b> command.</li> </ul> |
| <b>Step 22</b> | <b>crypto pki trustpoint name</b><br><b>Example:</b><br>Router(config)# crypto pki trustpoint sast-secondary          | Declares a trustpoint and enters ca-trustpoint configuration mode. <ul style="list-style-type: none"> <li>• <i>name</i>—Name for the trustpoint.</li> </ul>                                                                                                                                     |
| <b>Step 23</b> | <b>enrollment url url</b><br><b>Example:</b><br>Router(ca-trustpoint)# enrollment url http://10.1.1.1:80              | Specifies the enrollment parameters of a certification authority. <ul style="list-style-type: none"> <li>• <i>url</i>—Specifies the URL of the file system where your router should send certificate requests.</li> </ul>                                                                       |
| <b>Step 24</b> | <b>revocation-check method1 [method2[method3]]</b><br><b>Example:</b><br>Router(ca-trustpoint)# revocation-check none | Checks the revocation status of a certificate. <ul style="list-style-type: none"> <li>• <b>none</b>—Certificate checking is not required.</li> </ul>                                                                                                                                            |
| <b>Step 25</b> | <b>rsakeypair key-label</b><br><b>Example:</b><br>Router(ca-trustpoint)# rsakeypair sast-secondary                    | Specifies which RSA key pair to associate with the certificate. <ul style="list-style-type: none"> <li>• <i>key-label</i>—Name of the key pair, which is generated during enrollment if it does not already exist or if the <b>auto-enroll regenerate</b> command is configured.</li> </ul>     |
| <b>Step 26</b> | <b>exit</b><br><b>Example:</b><br>Router(ca-trustpoint)# exit                                                         | Exits ca-trustpoint configuration mode.                                                                                                                                                                                                                                                         |
| <b>Step 27</b> | <b>crypto pki authenticate name</b><br><b>Example:</b>                                                                | Authenticates the certification authority by getting the authority's certificate.                                                                                                                                                                                                               |

|                | Command or Action                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Example for Configuring Unified CME for Password Policy

The following is a sample configuration on Unified CME router to support password encryption:

```

Router(config)#key config-key password-encrypt <cisco123>
Router(config)#password encryption aes
Router(config)#telephony-service
Router(config-telephony)encrypt password

```

**Note** Configure **no encrypt password** for password unencryption (type 0) on the Unified CME router. If type 0 is configured, the password is displayed as unencrypted plain text.

## Example for Configuring Cisco IOS CA

```
crypto pki server iosca
 grant auto
 database url flash:
!
crypto pki trustpoint iosca
 revocation-check none
 rsakeypair iosca
!
crypto pki certificate chain iosca
 certificate ca 01
 308201F9 30820162 ...
```

## Example for Manually Importing MIC Root Certificate on the Cisco Unified CME Router

The following example shows three certificates imported to the router (7970, 7960, PEM):

```
Router(config)# crypto pki trustpoint 7970
Router(ca-trustpoint)# revocation-check none
Router(ca-trustpoint)# enrollment terminal
Router(ca-trustpoint)# exit
Router(config)# crypto pki authenticate 7970
```

Enter the base 64 encoded CA certificate.

End with a blank line or the word "quit" on a line by itself

```

**quit**

Certificate has the following attributes:

Fingerprint MD5: F7E150EA 5E6E3AC5 615FC696 66415C9F

Fingerprint SHA1: 1BE2B503 DC72EE28 0C0F6B18 798236D8 D3B18BE6

% Do you accept this certificate? [yes/no]: **y**

Trustpoint CA certificate accepted.

% Certificate successfully imported

```
Router(config)# crypto pki trustpoint 7960
Router(ca-trustpoint)# revocation-check none
Router(ca-trustpoint)# enrollment terminal
Router(ca-trustpoint)# exit
```

Trustpoint CA certificate accepted.

```
% Certificate successfully imported
```

Use the **show crypto pki trustpoint status** command to show that enrollment has succeeded and that five CA certificates have been granted. The five certificates include the three certificates just entered, the CA server certificate, and the router certificate.

```
Router# show crypto pki trustpoint status
```

```

## Example for Configuring HTTPS Support for Cisco Unified CME

Configurations similar to the following example are required before HTTPS support for services like local-directory lookup, My Phone Apps, and Extension Mobility in Cisco Unified CME can be configured at four different levels:

```

Router(config)# ip http server
Router(config)# crypto pki server IOS-CA
Router(cs-server)# database level complete
Router(cs-server)# database url flash:
Router(cs-server)# grant auto
Router(cs-server)# exit
Router(config)# crypto pki trustpoint IOS-CA
Router(ca-trustpoint)# enrollment url http://10.1.1.1:80
Router(ca-trustpoint)# exit
Router(config)# crypto pki server IOS-CA
Router(cs-server)# no shutdown
Router(cs-server)# exit
Router(config)# crypto pki trustpoint primary-cme
Router(ca-trustpoint)# enrollment url http://10.1.1.1:80
Router(ca-trustpoint)# revocation-check none
Router(ca-trustpoint)# rsa-keypair primary-cme
Router(ca-trustpoint)# exit
Router(config)# crypto pki authenticate primary-cme
Router(config)# crypto pki enroll primary-cme
Router(config)# crypto pki trustpoint sast-secondary
Router(ca-trustpoint)# enrollment url http://10.1.1.1:80
Router(ca-trustpoint)# revocation-check none

```

```

Router(ca-trustpoint)# rsakeypair sast-secondary
Router(ca-trustpoint)# exit
Router(config)# crypto pki authenticate sast-secondary
Router(config)# crypto pki enroll sast-secondary
Router(config)# ctl-client
Router(config-ctl-client)# sast1 trustpoint first-sast
Router(config-ctl-client)# sast2 trustpoint second-sast
Router(config-ctl-client)# server application 10.1.2.3 trustpoint first-sast
Router(config-ctl-client)# regenerate
Router(config-ctl-client)# end

```

#### For Cisco Unified SCCP IP Phones at the global level:

```

configure terminal
telephony-service
 cnf-file perphone
 service https

```

#### For Cisco Unified SCCP IP Phones at the ephone-template level:

```

configure terminal
ephone-template 1
 service https

```

#### For Cisco Unified SIP IP Phones at the global level:

```

configure terminal
voice register global
 service https

```

#### For Cisco Unified SIP IP Phones at the voice register template level:

```

configure terminal
voice register template 1
 service https

```

## Where to Go Next

### PKI Management

Cisco IOS public key infrastructure (PKI) provides certificate management to support security protocols such as IP Security (IPsec), secure shell (SSH), and secure socket layer (SSL).

### Cisco VG224 Analog Phone Gateway

- To configure secure endpoints on the Cisco VG224 Analog Phone Gateway, see the *Configuring Secure Signalling and Media Encryption on the Cisco VG224* section of [Supplementary Services Features for FXS Ports on Cisco IOS Voice Gateways Configuration Guide](#).

## Feature Information for Security

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 43: Feature Information for Security**

| Feature Name                                   | Cisco Unified CME Version | Feature Information                                                                                                           |
|------------------------------------------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Unified CME Password Policy                    | 12.6                      | Introduces password policy enforcement for Unified CME                                                                        |
| HTTPS Support in Cisco Unified CME             | 9.5                       | Introduces HTTPS support on Cisco Unified CME.                                                                                |
| HTTPS Provisioning for Cisco Unified IP Phones | 8.8                       | Allows you to import an IP phone's trusted certificate to an IP phone's CTL file using the <b>import certificate</b> command. |
| Media Encryption (SRTP) on Cisco Unified CME   | 4.2                       | Introduces media encryption on Cisco Unified CME.                                                                             |
| Phone Authentication                           | 4.0                       | Introduces phone authentication for Cisco Unified CME phones.                                                                 |

## CHAPTER 18

# Directory Services

- [Information About Directory Services, on page 657](#)
- [Configure Directory Services, on page 659](#)
- [Configuration Examples for Directory Services, on page 670](#)
- [Feature Information for Directory Services, on page 674](#)

## Information About Directory Services

### Local Directory

Cisco Unified CME automatically creates a local phone directory containing the telephone numbers that are assigned in the directory number configuration of the phone. You can make additional entries to the local directory in telephony services configuration mode. Additional entries can be nonlocal numbers such as telephone numbers on other Cisco Unified CME systems used by your company.

When a phone user selects the **Directories > Local Directory** menu, the phone displays a search page from Unified CME. After a user enters the search information, the phone sends the information to Cisco Unified CME, which searches for the requested number or name pattern in the directory number configuration and sends the response back to the phone, which displays the matched results. The phone can display up to 32 directory entries. If a search results in more than 32 entries, the phone displays an error message and the user must refine the search criteria to narrow the results.

The order of the names in the directory entries is first-name-first or last-name-first. Character strings for directory names can contain a spaces and a comma (,) and cannot contain an ampersand (&).

The local directory that is displayed on an IP phone is an XML page that is accessed through HTTP without password protection. The directory HTTP service can be disabled to suppress the availability of the local directory.

For configuration information, see [Configure Local Directory Service, on page 659](#).

From CME 12.0 onwards, an optional username and password can be configured for authenticating the local directory services.

For more information on the CLI command **service local-directoryauthenticateusername password**, see [Cisco Unified Communications Manager Express Command Reference](#).

## External Directory

Cisco Unified IP Phones can support URLs in association with the four programmable feature buttons on IP phones, including the Directories button. Operation of these services is determined by the Cisco Unified IP phone capabilities and the content of the referenced URL. Provisioning the directory URL to select an external directory resource disables the Cisco Unified CME local directory service.

## Called-Name Display

When phone agents answer calls for different departments or people, it is often helpful for them to see a display of the name, rather than the number of the called party. The Dialed Number Identification Service (or Called-Name Display) feature supports the display of the name associated with a called number for incoming calls to IP phones configured on a Unified CME. The display name is obtained from the list of Unified CME directory names using directory lookup.

You need to configure the CLI command **service dnis dir-lookup** under telephony-service configuration mode to use this directory lookup service. For more information on the CLI command **service dnis dir-lookup**, see [Cisco Unified Communications Manager Express Command Reference Guide](#).

If the display name for a called number is not available in Unified CME directory names, the display name can be added using the CLI command **directory entry**. For more information on the CLI command **directory entry**, see [Cisco Unified Communications Manager Express Command Reference Guide](#).

---

**Note** When a phone receives two simultaneous calls, there is a slight time difference between the calls being acknowledged by the phone. Called-name Display is only for the first call acknowledged by the phone. Even when the first call is disconnected and the second call is in ringing state, Called-name Display feature does not work for the second call.

---

For an example of Called-Name Display, see [Example for Called-Name Display for Voice Hunt Group](#), on [page 670](#)

The called-name display feature for ephone-dns can display either of the following types of name:

- Name for a directory number in a local directory
- Name associated with an overlay directory number. Calls to the first directory number in a set of overlay numbers will display a caller ID. Calls to the remaining directory numbers in the overlay set will display the name associated with the directory number.

This is an example of Called-Name Display for ephone-dns. If order-entry agents are servicing three catalogs with individual 800 numbers configured in one overlay ephone-dn set, they need to know which catalog is being called to give the correct greeting, such as “Thank you for calling catalog N. May I take your order?”

From Unified CME Release 12.0 onwards, the Dialed Number Identification Service feature is supported for phones configured under voice hunt group on Cisco 4000 Series Integrated Services Routers. The Dialed Number Identification Service is supported on Peer, Sequential, Parallel, and Longest-Idle voice hunt groups. Support is introduced for SIP Phones on Cisco IP Phones 7800 and 8800 Series as part of the Unified CME 12.0 Release. For information on configuring Called-Name Display feature, see [Called-Name Display](#), on [page 664](#).

## Directory Search

Cisco Unified CME 4.3 increases the number of entries supported in a search results list from 32 to up to 240 when using the directory search feature. For example, if a user enters **smith** as the last name, all 240 matches are displayed on eight different pages, with 30 entries per page. If multiple pages are required, the phone displays two new softkeys, “Next” and “Prev” that the phone user can press to move back and forth between the previous and next pages. Text such as “Page 2 of 3” displays to indicate the current and total pages on the search results.

## Configure Directory Services

### Configure Local Directory Service

To define the format for local directory names or block the local directory display on all phones, perform the following steps.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **directory {first-name-first | last-name-first}**
5. **no service local-directory**
6. **end**

#### DETAILED STEPS

| Procedure |                                                                                                                                     |                                                                                                                                              |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|           | Command or Action                                                                                                                   | Purpose                                                                                                                                      |
| Step 1    | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                             |
| Step 2    | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                      | Enters global configuration mode.                                                                                                            |
| Step 3    | <b>telephony-service</b><br><br><b>Example:</b><br>Router(config)# telephony-service                                                | Enters telephony-service configuration mode.                                                                                                 |
| Step 4    | <b>directory {first-name-first   last-name-first}</b><br><br><b>Example:</b><br>Router(config-telephony)# directory last-name-first | Defines the format for entries in the local directory. <ul style="list-style-type: none"><li>• Default is <b>first-name-first</b>.</li></ul> |

|               | Command or Action                                                                                                           | Purpose                                        |
|---------------|-----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
| <b>Step 5</b> | <b>no service local-directory</b><br><br><b>Example:</b><br><pre>Router(config-telephony)# no service local-directory</pre> | Disables local directory service on IP phones. |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-telephony)# end</pre>                                               | Returns to privileged EXEC mode.               |

## Define a Name for a Directory Number on SCCP Phone

To define a name to be used for caller-ID displays and as a local directory entry, perform the following steps.

### Restriction

- The name to be associated with a directory number cannot contain special characters, such as an ampersand (&). The only special characters allowed in the name are the comma (,) and the percent sign (%).

### Before you begin

- Cisco CME 3.0 or a later version.
- Directory number for which you are defining a directory entry must already have a number assigned by using the **number (ephone- dn)** command. For configuration information, see [Create Directory Numbers for SCCP Phones](#), on page 264.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn dn-tag**
4. **name name**
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                    | Purpose                                                                                                            |
|---------------|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br><pre>Router&gt; enable</pre> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|        | Command or Action                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Add an Entry to a Local Directory on SCCP Phone

To add an entry to the local directory, perform the following steps.

### Restriction

- If the directory entry being configured is to be used for called-name display, the number being configured must contain at least one wildcard character.
- Entry for local directory cannot include opening or closing quotation marks (‘ ’, “ ”, or ’”).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **directory entry {directory-tag number name name | clear}**

## 5. end

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Range is 1 to 250.</li> <li>• If this name is to be used for called-name display, the <i>number</i> associated with the names must contain at least one wildcard character.</li> <li>• <i>name</i>—1 to 24 alphanumeric characters, including spaces. Name cannot include opening or closing quotation marks ( , , , or ).</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                                                                                                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Configure External Directory Service on SCCP Phone

To enable an external directory resource on supported Cisco Unified IP phones and disable local directory services on those same phones, perform the following steps.

**Restriction**

- Provisioning of the directory URL to select an external directory resource disables the Cisco Unified CME local directory service.
- Configuring external directory service only works with non-Java based phones. Any Java based phone will display duplicate directories for the following:
  - Missed
  - Received
  - Placed

**Before you begin**

To use a Cisco Unified Communications Manager directory as an external directory source for Cisco Unified CME phones, the Cisco Unified Communications Manager must be made aware of the phones. You must list the MAC addresses of the Cisco Unified CME phones in the Cisco Unified Communications Manager and reset the phones from the Cisco Unified Communications Manager. It is not necessary for you to assign ephone-dns to the phones or for the phones to register with Cisco Unified Communications Manager.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **url directories *url***
5. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                | Purpose                                                             |
|---------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                               | Enables privileged EXEC mode.<br>• Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal       | Enters global configuration mode.                                   |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service | Enters telephony-service configuration mode.                        |

|               | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>url directories url</b><br><br><b>Example:</b><br><pre>Router(config-telephony)# url directories http://10.0.0.11/localdirectory</pre> | Associates a URL with the programmable Directories feature button on supported Cisco Unified IP phones in Cisco Unified CME. <ul style="list-style-type: none"> <li>Provisioning the directories URL to select an external directory resource disables the Cisco Unified CME local directory service.</li> <li>Operation of these services is determined by the Cisco Unified IP phone capabilities and the content of the specified URL.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-telephony)# end</pre>                                                             | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                            |

## Called-Name Display

To enable called-name display, perform the following steps.

### Restriction

- The **service dnis overlay** command can only be used to configure overlaid ephone-dns.

### Before you begin

- For directory numbers other than overlaid directory numbers—To display a name in the called-name display, the name to be displayed must be defined in the local directory. See [Add an Entry to a Local Directory on SCCP Phone, on page 661](#).
- For overlaid directory numbers—To display a name in the called-name display for a directory number that is in a set of overlaid directory numbers, the name to be displayed must be defined. See [Define a Name for a Directory Number on SCCP Phone, on page 660](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **service dnis dir-lookup**
5. **service dnis overlay**
6. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|---------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><code>Router&gt; enable</code>                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br><code>Router(config)#</code>                                         | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>service dnis dir-lookup</b><br><b>Example:</b><br><code>Router(config-telephony)# service dnis dir-lookup</code> | Specifies that incoming calls to a called number should display the name that was defined for this directory number with the <b>directory entry</b> command. <ul style="list-style-type: none"> <li>• If the <b>service dnis dir-lookup</b> and <b>service dnis overlay</b> commands are both used in one configuration, the <b>service dnis dir-lookup</b> command takes precedence.</li> </ul> |
| <b>Step 5</b> | <b>service dnis overlay</b><br><b>Example:</b><br><code>Router(config-telephony)# service dnis overlay</code>       | (For overlaid directory numbers only.) Specifies that incoming calls to a called number should display the name that was defined for this directory number with the <b>name</b> command. <p><b>Note</b><br/>If the <b>service dnis dir-lookup</b> and <b>service dnis overlay</b> commands are both used in one configuration, the <b>service dnis dir-lookup</b> command takes precedence.</p>  |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-telephony)# end</code>                                         | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                 |

# Verify Called-Name Display

## Procedure

- Step 1** Use the **show running-config** command to verify your configuration. Called-name display is shown in the telephony-service part of the output.

**Example:**

```
Router# show running-config
telephony-service
service dnis overlay
```

- Step 2** Use the **show telephony-service directory-entry** command to display current directory entries.

**Example:**

```
Router# show telephony-service directory-entry

directory entry 1 5550341 name doctor1
directory entry 2 5550772 name doctor1
directory entry 3 5550263 name doctor3
```

- Step 3** Use the **show telephony-service ephone-dn** command to verify that you have used at least one wildcard (period or .) in the ephone-dn primary or secondary number or to verify that you have entered a name for the number.

**Example:**

```
Router# show telephony-service ephone-dn

ephone-dn 2
number 5002 secondary 200.
name catalogN
huntstop
call-forward noan 5001 timeout 8
```

- Step 4** Use the **show ephone overlay** command to verify the contents of overlaid ephone-dn sets.

**Example:**

```
Router# show ephone overlay

ephone-1 Mac:0007.0EA6.353A TCP socket:[1] activeLine:0 REGISTERED
mediaActive:0 offhook:0 ringing:0 reset:0 reset_sent:0 paging 0 debug:0

IP:10.2.225.205 52486 Telecaster 7960 keepalive 2771 max_line 6
button 1: dn 11 number 60011 CH1 IDLE overlay
button 2: dn 17 number 60017 CH1 IDLE overlay
button 3: dn 24 number 60024 CH1 IDLE overlay
button 4: dn 30 number 60030 CH1 IDLE overlay
button 5: dn 36 number 60036 CH1 IDLE CH2 IDLE overlay
button 6: dn 39 number 60039 CH1 IDLE CH2 IDLE overlay
overlay 1: 11(60011) 12(60012) 13(60013) 14(60014) 15(60015) 16(60016)
overlay 2: 17(60017) 18(60018) 19(60019) 20(60020) 21(60021) 22(60022)
overlay 3: 23(60023) 24(60024) 25(60025) 26(60026) 27(60027) 28(60028)
overlay 4: 29(60029) 30(60030) 31(60031) 32(60032) 33(60033) 34(60034)
overlay 5: 35(60035) 36(60036) 37(60037)

```

## Define a Name for a Directory Number on SIP Phone

To define name for a directory number on a SIP phone, perform the following steps.

### Before you begin

- Cisco CME 3.4 or a later version.
- Directory number for which you are defining a name must already have a number assigned by using the **number (voice register dn)** command. For configuration information, see [Create Directory Numbers for SIP Phones, on page 275](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn** *dn-tag*
4. **name** *name*
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                                                                                |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                              | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                      | Enters global configuration mode.                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>voice register dn</b> <i>dn-tag</i><br><br><b>Example:</b><br>Router(config-register-global)# voice register dn<br>17                            | Enters voice register dn configuration mode to define a directory number for a SIP phone, intercom line, voice port, or a message-waiting indicator (MWI).                                                                             |
| <b>Step 4</b> | <b>name</b> <i>name</i><br><br><b>Example:</b><br>Router(config-register-dn)# name Smith, John<br>or<br>Router(config-register-dn)# name John Smith | Associates a name with a directory number in Cisco Unified CME and provides caller ID for calls originating from a SIP phone.<br><br>• Name must follow the order specified by using the <b>directory (telephony-service)</b> command. |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b>                                                                                                                   | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                                                              |

|  | Command or Action                            | Purpose |
|--|----------------------------------------------|---------|
|  | <code>Router(config-register-dn)# end</code> |         |

## Configure External Directory Service on SIP Service

To enable an external directory resource on supported Cisco Unified IP phones and disable local directory services on those same phones, perform the following steps.

### Restriction

- Provisioning of the directory URL to select an external directory resource disables the Cisco Unified CME local directory service.
- Supported only on Cisco Unified IP Phone 7960s and 7960Gs and Cisco Unified IP Phone 7940s and 7940Gs.

### Before you begin

Cisco CME 3.4 or a later version.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `voice register global`
4. `url directory url`
5. `end`

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                     | Purpose                                                                                                              |
|---------------|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><code>Router&gt; enable</code>                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>               | Enters global configuration mode.                                                                                    |
| <b>Step 3</b> | <b>voice register global</b><br><b>Example:</b><br><code>Router(config)# voice register global</code> | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME. |

|               | Command or Action                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>url directory url</b><br><br><b>Example:</b><br><pre>Router(config-register-global)# url directory http://10.0.0.11/localdirectory</pre> | Associates a URL with the programmable Directories feature button on supported Cisco Unified IP phones in Cisco Unified CME. <ul style="list-style-type: none"> <li>Provisioning the directory URL to select an external directory resource disables the Cisco Unified CME local directory service.</li> <li>Operation of these services is determined by the Cisco Unified IP phone capabilities and the content of the specified URL.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-register-global)# end</pre>                                                         | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Verify Directory Services

To verify the configuration for local directory services, perform the following steps.

### Procedure

#### Step 1 show running-config

This command displays the running configuration. Directory configuration commands are listed in the telephony-service portion of the output.

##### Example:

```
Router# show running-config
.
.
.
timeout busy 10
timeout ringing 100
caller-id name-only: enable
system message XYZ Company
web admin system name admin1 password admin1
web admin customer name Customer
edit DN through Web: enabled.
edit TIME through web: enabled.
Log (table parameters):
 max-size: 150
 retain-timer: 15
create cnf-files version-stamp Jan 01 2002 00:00:00
transfer-system full-consult
multicast moh 239.12.20.123 port 2000
fxo hook-flash
local directory service: enabled.
```

#### Step 2 show telephony-service

This command displays only the telephony-service configuration information.

- Step 3** Use the **show telephony-service directory-entry** command to display the entries made using the **directory entry** command.
- 

## Configuration Examples for Directory Services

### Example for Configuring Local Directory

The following example defines the naming order for the local directory on IP phones served by the Cisco Unified CME router:

```
telephony-service
directory last-name-first
```

The following example creates a directory of three telephone listings:

```
telephony-service
directory entry 1 14045550111 name Sales
directory entry 2 13125550122 name Marketing
directory entry 3 12135550144 name Support Center
```

The following example disables the local directory on IP phones served by the Cisco Unified CME router:

```
telephony-service
no service local-directory
```

### Example for Configuring Called-Name Display

This section contains the following examples:

#### Example for Called-Name Display for Voice Hunt Group

The following is an example of a voice hunt group configuration, where the CLI command **service dnis dir-lookup** allows the directory entry names to be displayed on the IP phones when a call is placed to a number declared using the CLI command **directory entry**. In this example, the pilot number is configured as 11... This means that the user can dial the numbers 1100 to 1199. When the user dials 1111, the directory name dept1 is displayed for the directory numbers 2001, 2002, and 2003. If user dials 1155, then the directory name dept2 is displayed and if user dials 5500, then the directory name dept3 is displayed for the directory numbers 2001, 2002, and 2003.

```
telephony-service
service dnis dir-lookup
directory entry 1 1111 name dept1
directory entry 2 1155 name dept2
directory entry 3 5500 name dept3

voice hunt-group 1 sequential
pilot 11..
list 2001, 2002, 2003
```

```
final 8888
timeout 10
```

## Example for Configuring First Ephone-dn in the Overlay Set

The following example shows a configuration for three phones that use the same set of overlaid ephone-dns for each phone's button 1.

```
telephony-service
 service dnis overlay

ephone-dn 1
 number 18005550100

ephone-dn 2
 name department1
 number 18005550101

ephone-dn 3
 name department2
 number 18005550102

ephone 1
 button 1ol,2,3

ephone 2
 button 1ol,2,3

ephone 3
 button 1ol,2,3
```

The default display for all three phones is the number of the first ephone-dn listed in the overlay set (18005550100). A call is made to the first ephone-dn (18005550100), and the caller ID (for example, 4085550123) is displayed on all three phones. The user for phone 1 answers the call. The caller ID (4085550123) remains displayed on phone 1, and the displays on phone 2 and phone 3 return to the default display (18005550100). A call to the next ephone-dn is made. The default display on phone 2 and phone 3 is replaced with the called ephone-dn's name (18005550101).

## Example for Configuring Directory Name for an Overlaid Ephone-dn Set

The following is an example of a configuration of overlaid ephone-dns that uses wildcards in the secondary numbers for the ephone-dns. The wildcards allow you to control the display according to the number that was dialed. The example is for a medical answering service with three IP phones that accept calls for nine doctors on one button. When a call to 5550001 rings on button 1 on ephone 1 through ephone 3, "doctor1" is displayed on all three ephones.

```
telephony-service
 service dnis dir-lookup

directory entry 1 5550001 name doctor1
directory entry 2 5550002 name doctor2
directory entry 3 5550003 name doctor3
directory entry 4 5550010 name doctor4
directory entry 5 5550011 name doctor5
directory entry 6 5550012 name doctor6

directory entry 7 5550020 name doctor7
directory entry 8 5550021 name doctor8
directory entry 9 5550022 name doctor9
```

```

ephone-dn 1
 number 5500 secondary 555000.

ephone-dn 2
 number 5501 secondary 555001.

ephone-dn 3
 number 5502 secondary 555002.

ephone 1
 button 101,2,3
 mac-address 1111.1111.1111

ephone 2
 button 101,2,3
 mac-address 2222.2222.2222

ephone 3
 button 101,2,3
 mac-address 3333.3333.3333

```

For more information about making directory entries, see [Local Directory, on page 657](#). For more information about overlaid ephone-dns, see [Call Coverage Features, on page 1223](#).

## Example for Configuring Directory Name for a Hunt Group with Overlaid Ephone-dns

The following example shows a hunt-group configuration for a medical answering service with two phones and four doctors. Each phone has two buttons, and each button is assigned two doctors' numbers. When a patient calls 5550341, Cisco Unified CME matches the hunt-group pilot secondary number (555....), rings button 1 on one of the two phones, and displays "doctor1."

```

telephony-service
 service dnis dir-lookup
 max-redirect 20
 directory entry 1 5550341 name doctor1
 directory entry 2 5550772 name doctor1
 directory entry 3 5550263 name doctor3
 directory entry 4 5550150 name doctor4

ephone-dn 1
 number 1001

ephone-dn 2
 number 1002

ephone-dn 3
 number 1003

ephone-dn 4
 number 104

ephone 1
 button 101,2
 button 203,4
 mac-address 1111.1111.1111

ephone 2
 button 101,2
 button 203,4
 mac-address 2222.2222.2222

```

```
ephone-hunt 1 peer
pilot 5100 secondary 555....
list 1001, 1002, 1003, 1004
final number 5556000
hops 5
preference 1
timeout 20
no-reg
```

For more information about hunt-group behavior, see [Call Coverage Features, on page 1223](#). Note that wildcards are used only in secondary numbers and cannot be used with primary numbers. For more information about making directory entries, see [Call Coverage Features, on page 1223](#). For more information about overlaid ephone-dns, see [Call Coverage Features, on page 1223](#).

## Example for Configuring Directory Name for Non-Overlaid Ephone-dns

The following is a configuration for three IP phones, each with two buttons. Button 1 receives calls from doctor1, doctor2, and doctor3, and button 2 receives calls from doctor4, doctor5, and doctor6.

```
telephony-service
service dnis dir-lookup
directory entry 1 5550001 name doctor1
directory entry 2 5550002 name doctor2
directory entry 3 5550003 name doctor3
directory entry 4 5550010 name doctor4
directory entry 5 5550011 name doctor5 directory entry 6 5550012 name doctor6

ephone-dn 1
number 1001 secondary 555000.

ephone-dn 2
number 1002 secondary 555001.

ephone 1
button 1:1
button 2:2
mac-address 1111.1111.1111

ephone 2
button 1:1
button 2:2
mac-address 2222.2222.2222

ephone 3
button 1:1
button 2:2
mac-address 3333.3333.3333
```

For more information about making directory entries, see [Local Directory, on page 657](#).

## Example for Configuring Ephone-dn Name for Overlaid Ephone-dns

The following example shows three phones that have button 1 assigned to pick up three 800 numbers for three different catalogs.

The default display for all four phones is the number of the first ephone-dn listed in the overlay set (18005550000). A call is made to the first ephone-dn (18005550000), and the caller ID (for example, 4085550123) is displayed on all phones. The user for phone 1 answers the call. The caller ID (4085550123) remains displayed on phone 1, and the displays on phone 2 and phone 3 return to the default display

(18005550000). A call to the second ephone-dn (18005550001) is made. The default display on phone 2 and phone 3 is replaced with the called ephone-dn's name (catalog1) and number (18005550001).

```
telephony-service
 service dnis overlay

ephone-dn 1
 number 18005550000

ephone-dn 2
 name catalog1
 number 18005550001

ephone-dn 3
 name catalog2
 number 18005550002

ephone-dn 4
 name catalog3
 number 18005550003

ephone 1
 button 101,2,3,4

ephone 2
 button 101,2,3,4

ephone 3
 button 101,2,3,4
```

For more information about overlaid ephone-dns, see [Call Coverage Features, on page 1223](#).

## Feature Information for Directory Services

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 44: Feature Information for Directory Services**

| Feature Name            | Unified CME Version | Feature Information                                                                                                                                                       |
|-------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Local Directory | 12.0                | The CLI command for accessing local directory service was enhanced to configure username and password, as <b>service local-directory authenticate username password</b> . |

| Feature Name                                          | Unified CME Version | Feature Information                                                                                                                                                                                                                                                         |
|-------------------------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Directory Search                                      | 7.0/4.3             | Number of entries supported in a search results list was increased from 32 to 240 when using directory search.                                                                                                                                                              |
| Called-Name Display                                   | 12.0                | Support for Called-Name Display on phones configured under voice hunt group.                                                                                                                                                                                                |
|                                                       | 3.2                 | Called-Name Display was introduced.                                                                                                                                                                                                                                         |
| Local Directory Service<br>External Directory Service | 4.0(2)              | Added support for transferring a call directly to a selected number listed in the directory. If directory transfer is not supported, the user must press Transfer and then use the keypad to manually enter the number of the monitored line to transfer the incoming call. |
|                                                       | 3.4                 | Added support of directory services for SIP phones directly connected in Cisco Unified CME.                                                                                                                                                                                 |
|                                                       | 3.0                 | The ability to add local directory entries in addition to those that are automatically added from phone configurations was introduced. Authentication for local directory display was introduced.                                                                           |
|                                                       | 2.1                 | The ability to block the display of the local directory on phones was introduced.                                                                                                                                                                                           |
|                                                       | 2.0                 | The specification of name format in the local directory was introduced.                                                                                                                                                                                                     |

## CHAPTER 19

# Do Not Disturb

- [Information About Do Not Disturb, on page 677](#)
- [Configure Do Not Disturb, on page 679](#)
- [Where to Go Next, on page 683](#)
- [Feature Information for Do Not Disturb, on page 684](#)

## Information About Do Not Disturb

### Do Not Disturb on SCCP Phone

The Do Not Disturb (DND) feature allows phone users to disable audible ringing for incoming calls. When DND is enabled, incoming calls do not ring on the phone, however there is visual alerting and the call information displays, and a call can be answered if desired. When a local IP phone calls another local IP phone that is in the DND state, the message “Ring out DND” displays on the calling phone indicating that the target phone is in the DND state.

Phone users can toggle DND on and off by using the DND softkey in the idle or ringing call states. A SCCP phone user can toggle DND on or off in the ringing state only if DND is not already active on the phone. If DND is already active when a new call comes in, the SCCP phone user cannot change the DND state by pressing the DND softkey.

If an SCCP phone user toggles DND on during an incoming call, the DND state remains active for the current call only. If a SIP phone user toggles DND on during an incoming call, the DND state remains active during the current call and for all future calls until the user explicitly toggles DND off.

Pressing the DND softkey during an incoming call forwards the call to the call-forward no answer destination if Call Forward No Answer is enabled. If Call Forward is not enabled, pressing the DND softkey disables audible ringing and visual alerting, but the call information is visible on the phone display.

In Cisco CME 3.2.1 and later versions, DND can be blocked from phones with the feature-ring function. A feature ring is a triple-pulse ring, a type of ring cadence in addition to internal call and external call ring cadences. For example, an internal call in the United States rings for 2 seconds on and 4 seconds off (single-pulse ring), and an external call rings for 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, and 0.2 seconds off (double-pulse ring).

The triple-pulse ring is used as an audio identifier for phone users. For example, each salesperson in a sales department could have an IP phone with a button sharing the same set of ephone-dns with the sales staff and another button for their private line for preferred customers. To help a salesperson identify an incoming call

to his or her private line, the private line can be configured with the feature-ring function. You can disable the DND function on feature-ring lines. In the preceding example, salespeople could activate DND on their phones and still hear calls to their private lines.

## Do Not Disturb on SIP Phone

In Cisco Unified CME 7.1 and later versions, the Do Not Disturb (DND) feature for SIP phones prevents incoming calls from audibly ringing a phone. When DND is enabled, the phone flashes an alert to visually indicate an incoming call instead of ringing and the call can be answered if desired. The message “Do Not Disturb is active” displays on the phone and calls are logged to the Missed Calls directory.

In versions earlier than Cisco Unified CME 7.1, the DND feature blocks incoming calls to a SIP phone with a busy tone. Cisco Unified CME rejects calls to all lines on the phone and plays a busy tone to the caller. Received calls are not logged to the Missed Calls directory on the phone.

DND applies to all lines on the phone. If DND and Call Forward All are both enabled on a phone, Call Forward All takes precedence on incoming calls.

You must enable DND for a SIP phone through Cisco Unified CME. The DND softkey displays by default on supported SIP phones in both the Ringing and idle states. You can remove or change the order of this softkey using a voice register template.

A phone user can toggle DND on and off at the phone by using the DND softkey. If a SIP phone user activates DND during an incoming call, the DND state remains active during the current call and for all future calls until the user explicitly toggles DND off.

If a phone user toggles DND on or off at the phone, Cisco Unified CME restores the DND state after the phone resets or restarts, if you save the running configuration before Cisco Unified CME reboots.

For configuration information, see [Configure Do Not Disturb on SIP Phones, on page 681](#).

**Table 45: DND Feature Comparison for SIP Phones, on page 678** compares the DND configuration for SIP phones with different phone load versions:

**Table 45: DND Feature Comparison for SIP Phones**

# Configure Do Not Disturb

## Blocking Do Not Disturb on SCCP Phone

To block DND on phones that have buttons configured for feature ringing, perform the following steps. DND is enabled by using the DND softkey on Cisco Unified IP phones that support softkeys.

### Restriction

- Phone users cannot enable DND for a shared line in a hunt group. The softkey displays in the idle and ringing states but does not enable DND for shared lines in hunt groups.

### Before you begin

- Cisco Unified 3.2.1 or a later version.
- Phone line must be configured for feature ring with the button f command.
- Call-forwarding no-answer must be set for a phone to use DND to forward calls. For configuration information, see [Configure Call Transfer and Forwarding, on page 1160](#). No other configuration is necessary for basic DND.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **no dnd feature-ring**
5. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action                                                              | Purpose                                                                                                          |
|--------|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                |
| Step 3 | <b>ephone</b> <i>phone-tag</i><br><br><b>Example:</b>                          | Enters ephone configuration mode.                                                                                |

|               | Command or Action                                                                                        | Purpose                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>Router(config)# ephone 10</code>                                                                   | <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies the ephone to be configured.</li> </ul> |
| <b>Step 4</b> | <b>no dnd feature-ring</b><br><b>Example:</b><br><code>Router(config-ephone)# no dnd feature-ring</code> | Enables ringing on phone buttons configured for feature ring when the phone is in DND mode.                                              |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-ephone)# end</code>                                 | Returns to privileged EXEC mode.                                                                                                         |

### Example

In the following configuration example, when DND is activated on ephone 1 and ephone 2, button 1 will ring, but button 2 will not.

```
ephone-dn 1
 number 1001

ephone-dn 2
 number 1002

ephone-dn 10
 number 1110
 preference 0
 no huntstop

ephone-dn 11
 number 1111
 preference 1

ephone 1
 button 1f1
 button 2o10,11
 no dnd feature-ring

ephone 2
 button 1f2
 button 2o10,11
 no dnd feature-ring
```

## Verify Do Not Disturb on SCCP Phones

### show ephone dnd

Use this command to display a list of SCCP phones that have DND enabled.

```
Router# show ephone dnd

ephone-1 Mac:0007.0EA6.353A TCP socket:[1] activeLine:0 REGISTERED
mediaActive:0 offhook:0 ringing:0 reset:0 reset_sent:0 paging 0 debug:0
```

```
IP:1.2.205.205 52486 Telecaster 7960 keepalive 2729 max_line 6 DnD
button 1: dn 11 number 60011 CH1 IDLE
```

## Configure Do Not Disturb on SIP Phones

To enable the Do Not Disturb (DND) feature on a SIP phone, perform the following steps.

### Restriction

- In versions earlier than Cisco Unified CME 7.1, you enable the DND softkey on SIP phones by using the **dnd-control** command.
- If you enable DND on the phone and remove the DND softkey, the user cannot toggle DND off at the phone.

### Cisco Unified IP Phone 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE

- For SIP phones using firmware 8.3 or a later version, the DND feature prevents calls from ringing; it does not block calls or play a busy tone to the caller.
- If DND is disabled by a phone user, it is not enabled after the phone resets or restarts. DND must be enabled both in Cisco Unified CME and by using the DND softkey on the phone.

### Before you begin

- Cisco CME 3.4 or a later version.
- Cisco Unified CME 7.1 or a later version to use the DND softkey.
- Call-forwarding busy must be set for a SIP IP phone to use DND to forward calls. For configuration information, see [Configure Call Transfer and Forwarding, on page 1160](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register template** *template-tag*
4. **softkeys idle** { [ *Cfwdall* ] [ **DND** ] [ *Gpickup* ] [ *Newcall* ] [ *Pickup* ] [ *Redial* ] }
5. **softkeys ringIn** [ *Answer* ] [ **DND** ]
6. **exit**
7. **voice register pool** *phone-tag*
8. **dnd**
9. **template** *template-tag*
10. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                | Purpose                                                                                                                                                                                                                           |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                       | Enters global configuration mode.                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>voice register template <i>template-tag</i></b><br><b>Example:</b><br>Router(config)# voice register template 5                               | Enters ephone-template configuration mode to create an ephone template.<br><ul style="list-style-type: none"><li>• <i>template-tag</i>—Unique identifier for the ephone template that is being created. Range: 1 to 10.</li></ul> |
| <b>Step 4</b> | <b>softkeys idle { [Cfwdall] [DND] [Gpickup] [Newcall] [Pickup] [Redial] }</b><br><b>Example:</b><br>Router(config-register-temp)# softkeys idle | Modifies the order and type of softkeys that display on a SIP phone during the idle call state.                                                                                                                                   |
| <b>Step 5</b> | <b>softkeys ringIn [Answer] [DND]</b><br><b>Example:</b><br><br>Router(config-register-temp)# softkeys ringin<br>dnd answer                      | Modifies the order and type of softkeys that display on a SIP phone during the ringing call state.                                                                                                                                |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Router(config-register-temp)# exit                                                                             | Exits ephone-template configuration mode.                                                                                                                                                                                         |
| <b>Step 7</b> | <b>voice register pool <i>phone-tag</i></b><br><b>Example:</b><br>Router(config)# voice register pool 1                                          | Enters voice register pool configuration mode to set parameters for the SIP phone.                                                                                                                                                |
| <b>Step 8</b> | <b>dnd</b><br><b>Example:</b><br>Router(config-register-pool)# dnd                                                                               | Enables DND on the phone.<br><ul style="list-style-type: none"><li>• If Call Forward No Answer is not configured for the extension, pressing the DND softkey mutes the ringer for incoming calls.</li></ul>                       |
| <b>Step 9</b> | <b>template <i>template-tag</i></b><br><b>Example:</b><br>Router(config-register-pool)# template 5                                               | Applies the ephone template to the phone.<br><ul style="list-style-type: none"><li>• <i>template-tag</i>—Unique identifier of the template that you created in <a href="#">Step 3, on page 682</a>.</li></ul>                     |

|         | Command or Action                                                      | Purpose                          |
|---------|------------------------------------------------------------------------|----------------------------------|
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-register-pool)# end | Returns to privileged EXEC mode. |

### Example

The following example shows DND is enabled on phone 130, and the DND softkey is modified in template 6, which is assigned to the phone:

```
voice register template 6
 softkeys idle Gpickup Pickup DND Redial
 softkeys ringIn DND Answer
!
voice register pool 130
 id mac 001A.A11B.500E
 type 7941
 number 1 dn 30
 template 6
 dnd
```

## Where to Go Next

### Agent Status Control for Ephone Hunt Groups and Cisco Unified CME B-ACD

Ephone hunt group agents can control their ready/not-ready status (their ability to receive calls) using the DND function or the HLog function of their phones. When they use the DND softkey, they do not receive calls on any extension on their phones. When they use the HLog softkey, they do not receive calls on hunt group extensions, but they do receive calls on other extensions. For more information on agent status control and the HLog function, see [Call Coverage Features, on page 1223](#).

### Call Forwarding

To use the DND softkey to forward calls, enable call-forwarding no-answer for SCCP phones or call-forward busy for SIP IP phones. See [Configure Call Transfer and Forwarding, on page 1160](#).

### Feature Access Codes (FACs)

DND can be activated and deactivated using a feature access code (FAC) instead of the DND softkey when standard or custom FACs are enabled. The following is the standard FAC for DND:

- DND \*\*7

See [Feature Access Codes, on page 751](#).

### Softkey Display

You can remove or change the position of the DND softkey. See [Customize Softkeys, on page 919](#).

## Feature Information for Do Not Disturb

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 46: Feature Information for Do Not Disturb**

| Feature Name   | Cisco Unified CME Version | Feature Information                                                                    |
|----------------|---------------------------|----------------------------------------------------------------------------------------|
| Do Not Disturb | 7.1                       | Enhanced DND support on SIP phones to allow incoming calls to visually flash an alert. |
|                | 3.4                       | Added support for Do-not-disturb (DND) softkey on SIP phones.                          |
|                | 3.2.1                     | DND bypass for feature-ring phones was introduced.                                     |
|                | 3.2                       | DND was introduced.                                                                    |

## CHAPTER 20

# Enhanced 911 Services

---

- [Prerequisites for Enhanced 911 Services, on page 685](#)
- [Restrictions for Enhanced 911 Services, on page 685](#)
- [Information About Enhanced 911 Services, on page 686](#)
- [Configure Enhanced 911 Services, on page 696](#)
- [Configuration Examples for Enhanced 911 Services, on page 713](#)
- [Feature Information for Enhanced 911 Services, on page 720](#)

## Prerequisites for Enhanced 911 Services

- SCCP or SIP phones must be registered to Cisco Unified CME.
- At least one CAMA or ISDN trunk must be configured from Cisco Unified CME to each of the 911 service provider's public safety answering point (PSAP).
- An Enhanced 911 network must be designed for each customer's voice network.
- Cisco Unified CME has an FXS, FXO, SIP, or H.323 trunk interface configured.

### Cisco Unified CME

- Cisco Unified CME 4.2 or a later version.

### Cisco Unified CME in SRST Fallback Mode

- Cisco Unified CME 4.1 or a later version, configured in SRST fallback mode. See [SRST Fallback Mode, on page 1513](#).

#### Note

For information about configuring ephones, ephone-dns, voice register pools, and voice register dns, see [Configure Phones to Make Basic Call, on page 327](#).

## Restrictions for Enhanced 911 Services

- Enhanced 911 Services for Cisco Unified CME does not interface with the Cisco Emergency Responder.

- The information about the most recent phone that called 911 is not preserved after a reboot of Cisco Unified CME.
- Cisco Emergency Responder does not have access to any updates made to the emergency call history table when remote Cisco Unified IP phones are in SRST fallback mode. Therefore, if the PSAP calls back after the IP phones register back to Cisco Unified Communications Manager, Cisco Emergency Responder has no history of those calls. As a result, those calls are not routed to the original 911 caller. Instead, the calls are routed to the default destination that is configured on Cisco Emergency Responder for the corresponding ELIN.
- For Cisco Unified Wireless 7920 and 7921 IP phones, a caller's location can only be determined by the static information configured by the system administrator. For more information, see [Precautions for Mobile Phones](#), on page 691.
- The extension numbers of 911 callers can be translated to only two emergency location identification numbers (ELINs) for each emergency response location (ERL). For more information, see [Overview of Enhanced 911 Services](#), on page 686.
- Using ELINs for multiple purposes can result in unexpected interactions with existing Cisco Unified CME features. These multiple uses of an ELIN can include configuring an ELIN for use as an actual phone number (ephone-dn, voice register dn, or FXS destination-pattern), a Call Pickup number, or an alias rerouting number. For more information, see [Multiple Usages of an ELIN](#), on page 693.
- Your configuration of Enhanced 911 Services can interact with existing Cisco Unified CME features and cause unexpected behavior. For a complete description of interactions between Enhanced 911 Services and existing Cisco Unified CME features, see [Interactions with Existing Cisco Unified CME Features](#), on page 693.

## Information About Enhanced 911 Services

### Overview of Enhanced 911 Services

Enhanced 911 Services enable 911 operators to:

- Immediately pinpoint the location of the 911 caller based on the calling number
- Callback the 911 caller if a disconnect occurs

Before this feature was introduced, Cisco Unified CME supported only outbound calls to 911. With basic 911 functionality, calls were simply routed to a public safety answering point (PSAP). The 911 operator at the PSAP then had to verbally gather the emergency information and location from the caller, before dispatching a response team from the ambulance service, fire department, or police department. Calls could not be routed to different PSAPs, based on the specific geographic areas that they cover.

With Enhanced 911 Services, 911 calls are selectively routed to the closest PSAP based on the caller's location. In addition, the caller's phone number and address automatically display on a terminal at the PSAP. Therefore, the PSAP can quickly dispatch emergency help, even if the caller is unable to communicate the location. Also, if the caller disconnects prematurely, the PSAP has the information it needs to contact the 911 caller.

To use Enhanced 911 Services, you must define an emergency response location (ERL) for each of the geographic areas needed to cover all of the phones supported by Cisco Unified CME. The geographic specifications for ERLs are determined by local law. For example, you might have to define an ERL for each

floor of a building because an ERL must be less than 7000 square feet in area. Because the ERL defines a known, specific location, this information is uploaded to the PSAP's database and is used by the 911 dispatcher to help the emergency response team to quickly locate a caller.

To determine which ERL is assigned to a 911 caller, the PSAP uses the caller's unique phone number, which is also known as the emergency location identification number (ELIN). Before you can use Enhanced 911 Services you must supply the PSAP with a list of your ELINs and street addresses for each ERL. This information is saved in the PSAP's automatic location identification (ALI) database. Typically, you give this information to the PSAP when your phone system is installed.

With the address information in the ALI database, the PSAP can find the caller's location and can also use the ELIN to callback the 911 caller within a specified time limit. This limit applies to the Last Caller table, which provides the PSAP with the 911 caller's ELIN. If no time limit is specified for the Last Caller table, the default expiry time is three hours.

In addition to saving call formation in the temporary Last Caller table, you can configure permanent call detail records. You can view the attributes in these records from RADIUS accounting, the syslog service, or Cisco IOS **show** commands.

You have the option of configuring zero, one, or two ELINs for each ERL. If you configure two ELINs, the system uses a round-robin algorithm to select which ELIN is sent to the PSAP. If you do not define an ELIN for an ERL, the PSAP sees the original calling number. You may not want to define an ELIN if Cisco Unified CME is using direct-inward-dial numbers or the call is from another Cisco voice gateway that has already translated the extension to an ELIN.

Optionally define a default ELIN that the PSAP can use if a 911 caller's IP phone's address does not match the IP subnet of any location in any zone. This default ELIN can be an existing ELIN that is already defined for one of the ERLs or it can be a unique ELIN. If no default ELIN is defined and the 911 caller's IP Address does not match any of the ERLs' IP subnets, a syslog message is issued stating that no default ELIN is defined, and the original ANI remains intact.

You can also define a designated callback number that is used when the callback information is lost in the Last Caller table because of an expiry timeout or system restart. You can use this designated callback number if the PSAP cannot reach the 911 caller at the caller's ELIN or the default ELIN for any other reason. You can further customize your system by specifying the expiry time for data in the Last Caller table and by enabling syslog messages that announce all emergency calls.

For large installations, you can optionally specify that calls from specific ERLs are routed to specific PSAPs. This is done by configuring emergency response zones, which lists the ERLs within each zone. This list of ERLs also includes a ranking of the locations which controls the order of ERL searches when there are multiple PSAPs. You do not need to configure emergency response zones if all 911 calls on your system are routed to a single PSAP.

One or more ERLs can be grouped into a zone which could be equivalent to the area serviced by a PSAP. When an outbound emergency call is placed, configured emergency response zones allow the searching of a subset of the ERLs in any order. The ERLs can be ranked in the order of desired usage.

Zones are also used to selectively route 911 calls to different PSAPs. You can configure selective routing by creating a zone with a list of unique locations and assigning each zone to a different outbound dial peer. In this case, zones route the call based on the caller's ERL. When an emergency call is made, each dial peer matching the called number uses the zone's list of locations to find a matching IP subnet to the calling phone's IP address. If an ERL and ELIN are found, the dial peer's interface is used to route the call. If no ERL or ELIN is found, the next matched dial peer checks its zone.

**Note**

- If a caller's IP address does not match any location in its dial-peers zone, the last dial peer that matched is used for routing and the default ELIN is used.
- If you want 911 calls from any particular phone to always use the same dial peer when you have multiple dial peers going to the same destination-pattern (911) and the zones are different, you must configure the preferred dial peer to be the highest priority by setting the preference field.

Duplicate location tags are not allowed in the same zone. However, the same location tag can be defined in multiple zones. You are allowed to enter duplicate location priorities in the same zone, however, the existing location's priority is then increased to the next number. For example, if you configure "location 36 priority 5" followed by "location 19 priority 5," location 19 has priority 5 and location 36 becomes priority 6. Also, if two locations are assigned priority 100, rather than bump the first location to priority 101, the first location becomes the first nonprioritized location.

[Figure 24: Implementation of Enhanced 911 for Cisco Unified CME, on page 688](#) shows an example configuration for 911 services. In this example, the phone system handles calls from multiple floors in multiple buildings. Five ERLs are defined, with one ELIN defined for each ERL. At the PSAP, the ELIN is used to find the caller's physical address from the ALI database. Building 2 is closer to the PSAP in San Francisco and Building 40 is closer to the PSAP in San Jose. Therefore, in this case, we recommend that you configure two emergency response zones to ensure that 911 calls are routed to the PSAP closest to the caller. In this example, you can configure an emergency response zone that includes all of the ERLs in building 2 and another zone that includes the ERLs in building 40. If you choose to not configure emergency response zones, 911 calls are routed based on matching the destination number configured for the outgoing dial peers.

**Figure 24: Implementation of Enhanced 911 for Cisco Unified CME**

## Call Processing for E911 Services

When a 911 call is received by Cisco Unified CME, the initial call processing is the same as for any other call. Cisco Unified CME takes the called-number and searches for dial peers that can be used to route the call to that called-number.

The Enhanced 911 feature also analyzes the outgoing dial peer to see if it is going to a PSAP. If the outgoing dial peer is configured with the **emergency response zone** command, the system is notified that the call needs Enhanced 911 handling. If the outgoing dial peer is not configured with the **emergency response zone** command, the Enhanced 911 functionality is not activated and the caller's number is not translated to an ELIN.

When the Enhanced 911 functionality is activated, the first step in Enhanced 911 handling is to determine which ERL is assigned to the caller. There are two ways to determine the caller's ERL.

- **Explicit Assignment**—If a 911 call arrives on an inbound dial peer that has an ERL assignment, this ERL is automatically used as the caller's location.
- **Implicit Assignment**—If a 911 call arrives from an IP phone, its IP address is determined and Enhanced 911 searches for the IP address of the caller's phone in one of the IP subnets configured in the ERLs. The ERLs are stored as an ordered list according to their tag numbers, and each subnet is compared to the caller's IP address in the order listed.

After the caller's ERL is determined, the caller's number is translated to that ERL's ELIN. If no ERLs are implicitly or explicitly assigned to a call, you can define a default ERL for IP phones. This default ERL does not apply to nonIP-phone endpoints, such as phones on VoIP trunks or FXS/FXO trunks.

After an ELIN is determined for the call, the following information is saved to the Last Caller table:

- Caller's ELIN
- Caller's original extension
- Time the call originated

The Last Caller table contains this information for the most recent emergency callers from each ERL. A caller's information is purged from the table when the specified expiry time has passed after the call was originated. If no time limit is specified, the default expiry time is three hours.

After the 911 call information is saved to the Last Caller table, the system determines whether an emergency response zone is configured that contains the caller's ERL. If no emergency response zone is configured with the ERL, all ERLs are searched sequentially to match the caller's IP address and then route the 911 call to the appropriate PSAP. If an ERL is included in a zone, the 911 call is routed to the PSAP associated with that zone.

After the 911 call is routed to appropriate PSAP, Enhanced 911 processing is complete. Call processing then proceeds as it does for basic calls, except that the ELIN replaces the original calling number for the outbound setup request.

[Figure 25: Processing a 911 Call, on page 690](#) summarizes the procedure for processing a 911 call.

Figure 25: Processing a 911 Call

The 911 operator is unable to find information about a call in the Last Caller table if the router was rebooted or specified expiry time (three hours by default) has passed after the call was originated. If this is the case, the 911 operator hears the reorder tone. To prevent the 911 operator from getting this tone, you can configure the default callback as described in [Customize E911 Settings, on page 707](#). Alternately, you can configure a call forward number on the dial peer that goes to an operator or primary contact at the business.

Because the 911 callback feature tracks the last caller by its extension number, if you change the configuration of your ephone-dns in-between a 911 call and a 911 callback and within the expiry time, the PSAP might not be able to successfully contact the last 911 caller.

If two 911 calls are made from different phones in the same ERL within a short period of time, the first caller's information is overwritten in the Last Caller table with the information for the second caller. Because the table can contain information about only one caller from each ERL, the 911 operator does not have the information needed to contact the first caller.

In most cases, if Cisco Emergency Responder is configured, you should configure Enhanced 911 Services with the same data for the ELIN and ERL as used by Cisco Emergency Responder.

## Precautions for Mobile Phones

Emergency calls placed from phones that have been removed from their primary site might not be answered by local safety authorities. IP phones should not be used to place emergency calls if removed from the site where it was initially configured. Therefore, we recommend that you require your mobile phone users to agree to a policy similar to the one stated below.

Telecommuters, remote office, and traveling personnel must place emergency calls on a locally configured hotel, office, or home phone (in other words, their landline). If they must use a remote IP phone for emergency calls while away from their configured site, they must be prepared to provide specific information regarding their location (their country, city, state, street address, and so on) to the answering safety authority or security operations center personnel.

By accepting this policy your mobile phone users are confirming that they:

- Understand this advisory
- Agree to take reasonable precautions to prevent use of any remote IP phone device for emergency calls when it is removed from its configured site

By not responding to or declining to accept this policy, your mobile phone users are confirming that they understand that all remote IP phone devices associated with them will be disconnected, and no future requests for these services will be fulfilled.

## Plan Your Implementation of Enhanced 911 Services

Before you configure Enhanced 911 Services for Cisco Unified CME:

### Procedure

#### Step 1

Make a list of your sites that are serviced by Cisco Unified CME, and the PSAPs serving each site.

Be aware that you must use a CAMA/PRI interface to connect to each PSAP. [Table 47: List of Sites and PSAPs, on page 691](#) shows an example of the information that you need to gather.

**Table 47: List of Sites and PSAPs**

| Building Name and Address                   | Responsible PSAP  | Interface to which Calls Are Routed |
|---------------------------------------------|-------------------|-------------------------------------|
| Building 2, 201 Maple Street, San Francisco | San Francisco, CA | Port 1/0:D                          |
| Building 40, 801 Main Street, San Jose      | San Jose, CA      | Port 1/1:D                          |

#### Step 2

Use local laws to determine the number of ERLs you need to configure.

According to the National Emergency Number Association (NENA) model legislation, make the location specific enough to provide a reasonable opportunity for the emergency response team to quickly locate a caller anywhere within it. [Table 48: ERL Calculation, on page 692](#) shows an example.

Table 48: ERL Calculation

| Building    | Size in Square Feet | Number of Floors | Number of ERLs Required |
|-------------|---------------------|------------------|-------------------------|
| Building 2  | 200,000             | 3                | 3                       |
| Building 40 | 7000                | 2                | 1                       |

**Step 3** (Optional) Assign one or two ELINs to each ERL.

You must contact your phone service provider to request phone numbers that are designated as ELINs.

**Step 4** (Optional) Assign each of your ERLs to an emergency response zone to enable 911 calls to be routed to the PSAP that is closest to the caller. Use the **voice emergency response zone** command.

**Step 5** Configure one or more dial peers for your 911 callers with the **emergency response zone** command.

You might need to configure multiple dial peers for different destination-patterns.

**Step 6** Configure one or more dial peers for the PSAP's 911 callbacks with the **emergency response callback** command.

**Step 7** Decide what method to use to assign ERLs to phones.

You have the following choices:

- For a group of phones that are on the same subnet, you can create an IP subnet in the ERL that includes each phone's IP address. Each ERL can have one or two unique IP subnets. This is the easiest option to configure. [Table 49: Definitions of ERL, Description, IP Subnets, and ELIN, on page 692](#) shows an example.

Table 49: Definitions of ERL, Description, IP Subnets, and ELIN

| ERL Number | Description           | IP Address Assignment         | ELIN                          |
|------------|-----------------------|-------------------------------|-------------------------------|
| 1          | Building 2, 1st floor | 10.5.124.xxx                  | 408 555-0142                  |
| 2          | Building 2, 2nd floor | 10.7.xxx.xxx                  | 408 555-0143                  |
| 3 & 4      | Building 2, 3rd floor | 10.8.xxx.xxx and 10.9.xxx.xxx | 408 555-0144 and 408 555-0145 |

- You can assign an ERL explicitly to a group of phones by using the ephone-template or voice register template configurations. Instead of assigning an ERL to phones individually, you can use these templates to save time if you want to apply the same set of features to several SCCP phones or SIP phones.
- You can assign an ERL to a phone individually. Depending on which type of phone you have, you can use one of three methods. You can assign an ERL to a phone's:
  - Dial-peer configuration
  - Ephone configuration (SCCP phones)
  - Voice register pool configuration (SIP phones)

[Table 50: Explicit ERL Assignment Per Phone, on page 693](#) shows examples of each of these options.

**Table 50: Explicit ERL Assignment Per Phone**

| Phone Configuration      | ERL |
|--------------------------|-----|
| Dial-peer voice 213 pots | 3   |
| Dial-peer voice 214 voip | 4   |
| Ephone 100               | 3   |
| Voice register pool 1    | 2   |

- Step 8** (Optional) Define a default ELIN to be sent to the PSAP for use if a 911 caller's IP phone's address does not match the IP subnet of any location in any zone.
- Step 9** (Optional) Define a designated callback number that is used if the callback information is removed from the Last Caller table because of an expiry timeout or system restart.
- Step 10** (Optional) Change the expiry time for data in the Last Caller table from the default time of three hours.
- Step 11** (Optional) Enable RADIUS accounting or the syslog service to permanently record call detail records.

## Interactions with Existing Cisco Unified CME Features

Enhanced 911 Services interacts with several Cisco Unified CME features. The interactions with each of the following features are described in separate sections below:

**Note** Your version of Cisco Unified CME may not support all of these features.

### Multiple Usages of an ELIN

**Note** We recommend that you do not use ELINs for any other purpose because of possible unexpected interactions with existing Cisco Unified CME features.

Examples of using ELINs for other purposes include configuring an ELIN for use as an actual phone number (ephone-dn, voice register dn, FXS destination-pattern), a Call Pickup number, or an alias rerouting number.

Using ELINs as an actual phone number causes problems when calls are made to that number. If a 911 call occurs and the last caller information has not expired from the Last Caller table, any outside callers will reach the last 911 caller instead of the actual phone. We recommend that you do not share the phone numbers used for ELINs with real phones.

There is no impact on outbound 911 calls if you use the same number for an ELIN and a real phone number.

### Number Translation

The Enhanced 911 feature translates the calling number to an ELIN during an outbound 911 call, and translates the called-number to the last caller's extension during a 911 callback (when the PSAP makes a callback to

the 911 caller). Alternative methods of number translation can conflict with the translation done by the Enhanced 911 software, such as:

- Dialplan-pattern—Prefixes a pattern to an extension configured under telephony-service
- Num-expansion—Expands extensions to full E.164 numbers
- Voice-port translation of called and calling numbers
- Outgoing number translation for dial peers
- Translate-profile for dial peers
- Voice translation profiles done for the dial peer, voice-port, POTS voice service, trunk group, trunk group member, voice source-group, call-manager-fallback, and ephone-dn
- Ephone-dn translation
- Voice register dn's outgoing translation

Configuring these translation features impacts the Enhanced 911 feature if they translate patterns that are part of your ELINs' patterns. For an outgoing 911 call, these features might translate an Enhanced 911 ELIN to a different number, giving the PSAP a number they cannot look-up in their ALI databases. If the 911 callback number (ELIN) is translated before Enhanced 911 callback processing, the Enhanced 911 feature is unable to find the last caller's history.

## Call Transfer

If a phone in a Cisco Unified CME environment performs a semi attended or consultative transfer to the PSAP that involves another phone that is in a different ERL, the PSAP will use the wrong ELIN. The PSAP will see the ELIN of the transferor party, not the transferred party.

There is no impact on 911 callbacks (calls made by the PSAP back to a 911 caller) or transfers that are made by the PSAP.

A 911 caller can transfer the PSAP to another party if there is a valid reason to do so. Otherwise, we recommend that the 911 caller remain connected to the PSAP at all times.

## Call Forward

There is no impact if an IP phone user calls another phone that is configured to forward calls to the PSAP.

If the PSAP makes a callback to a 911 caller that is using a phone that has Call Forward enabled, the PSAP is redirected to a party that is not the original 911 caller.

## Call Blocking Features

Outbound 911 calls can be blocked by features such as After-Hours Call Blocking if the system administrator does not create an exception to 911 calls.

911 callbacks will not reach the 911 caller if the phone is configured with a blocking feature (for example, Do Not Disturb).

## Call Waiting

After a 911 call is established with a PSAP, call waiting can interrupt the call. The 911 caller has the choice of putting the operator on hold. Although holding is not prohibited, we recommend that the 911 caller remain connected to the PSAP until the call is over.

## Three-Way Conference

Although the 911 caller is allowed to activate three-way conferencing when talking to the PSAP, we recommend that the 911 caller remain connected privately to the PSAP until the call is over.

## Dial-Peer Rotary

If a 911 caller uses a rotary phone, you must configure each dial peer with the **emergency response zone** command for the call to be processed as an Enhanced 911 call. Otherwise, calls received on dial peers that are not configured for Enhanced 911 functionality are treated as regular calls and there is no ELIN translation.

Do not configure two dial peers with the same destination-pattern to route to different PSAPs. The caller's number will not be translated to two different ELINs and the two dial peers will not route to different PSAPs. However, you can route calls to different PSAPs if you configure the dial peers with different destination-patterns (for example, 9911 and 95105558911). You might need to use the number translation feature or add prefix/forward-digits to change the 95105558911 to 9911 for the second dial peer if a specific called-number is required by the service provider.

**Caution**

We recommend that you do not configure the same dial peer using both the **emergency response zone** and **emergency response callback** commands.

## Dial Plan Patterns

Dial plan patterns expand the caller's original extension number into a fully qualified E.164 number. If an ERL is found for a 911 caller, the expanded number is translated to an ELIN.

For 911 callbacks, the called-number is translated to the 911 caller's expanded number.

## Caller ID Blocking

When you set Caller ID Blocking for an ephone or voice-port configuration, the far-end gateway device blocks the display of the calling party information. This feature is overridden when an Enhanced 911 call is placed because the PSAP must receive the ELIN (the calling party information).

The Caller ID Blocking feature does not impact callbacks.

## Shared Line

The Shared Line feature allows multiple phones to share a common directory number. When a shared line receives an incoming call, each phone rings. Only the first user that answers the call is connected to the caller.

The Shared Line feature does not affect outbound 911 calls.

For 911 callbacks, all phones sharing the directory number will ring. Therefore, someone who did not originate the 911 call might answer the phone and get connected to the PSAP. This could cause confusion if the PSAP needs to talk only with the 911 caller.

# Configure Enhanced 911 Services

## Configure the Emergency Response Location

Perform this procedure to create the ERL. The ERL defines an area that allows emergency teams to quickly locate a caller.

The ERL can define zero, one, or two ELINs. If one ELIN is defined, this ELIN is always used for phones calling from this ERL. If you define two ELINs, the system alternates using each ELIN for phones calling from this ERL. If you define no ELINs and phones use this ERL, the outbound calls do not have their calling numbers translated. The PSAP sees the original calling numbers for these 911 calls.

If multiple ERLs are created, the Enhanced 911 software uses the ERL tag number to determine which ELIN to use. The Enhanced 911 software searches the ERLs sequentially from tag 1 to 2147483647. The first ERL that has a subnet mask encompassing the caller's IP address is used for ELIN translation.

### Before you begin

- Cisco Unified CME 4.1 or a later version.
- The **address** and **name** commands are supported in Cisco Unified CME 4.2 and later versions.
- Plan your 911 configuration as described in [Plan Your Implementation of Enhanced 911 Services, on page 691](#)

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice emergency response location tag**
4. **elin** [ 1 | 2 ] *E.164-number*
5. **address** *address*
6. **name** *name*
7. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                          | Purpose                                                             |
|---------------|----------------------------------------------------------------------------|---------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br>• Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                   |

|               | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>voice emergency response location tag</b><br><b>Example:</b><br><pre>Router(config)# voice emergency response location 4</pre>                 | Enters emergency response location configuration mode to define parameters for an ERL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 4</b> | <b>elin [1   2] E.164-number</b><br><b>Example:</b><br><pre>Router(cfg-emrgncy-resp-location)# elin 14085550100</pre>                             | (Optional) Specifies the ELIN, an E.164 PSTN number that replaces the caller's extension. <ul style="list-style-type: none"> <li>• This number is displayed on the PSAP's terminal and is used by the PSAP to query the ALI database to locate the caller. It is also used by the PSAP for callbacks. You can define a second ELIN using the optional elin 2 command. If an ELIN is not defined for the ERL, the PSAP sees the original calling number.</li> </ul>                                                                                                                                 |
| <b>Step 5</b> | <b>address address</b><br><b>Example:</b><br><pre>Router(cfg-emrgncy-resp-location)# address I,604,5550100, ,184 ,Main St,Kansas City,KS,1,</pre> | (Optional) Defines a comma-separated string used for the automatic location identification (ALI) database upload of the caller's address. <ul style="list-style-type: none"> <li>• String must conform to the record format that is required by the service provider. The string maximum is 247 characters.</li> <li>• Address is saved as part of the E911 ERL configuration. When used with the <b>show voice emergency addresses</b> command, the address information can be saved to a text file.</li> <li>• This command is supported in Cisco Unified CME 4.2 and later versions.</li> </ul> |
| <b>Step 6</b> | <b>name name</b><br><b>Example:</b><br><pre>Router(cfg-emrgncy-resp-location)# name Bldg C, Floor 2</pre>                                         | (Optional) Defines a 30-character string used internally to identify or describe the emergency response location. <ul style="list-style-type: none"> <li>• This command is supported in Cisco Unified CME 4.2 and later versions.</li> </ul>                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><pre>Router(cfg-emrgncy-resp-location)# end</pre>                                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Configure Locations under Emergency Response Zones

In the configuration of emergency response zones, a list of locations within a zone is created using location tags. The zone configuration allows a ranking of the locations which controls the order of ERL searches when there are multiple PSAPs. The **zone** command is not used if all 911 calls on the system are routed to a single PSAP.

**Before you begin**

- Cisco Unified CME 4.2 or a later version
- Define your ERLs as described in [Configure the Emergency Response Location, on page 696](#).

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice emergency response zone tag**
4. **location location-tag [priority number]**
5. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                        | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>voice emergency response zone tag</b><br><b>Example:</b><br>Router(config)# voice emergency response zone 10           | Enters voice emergency response zone configuration mode to define parameters for an emergency response zone.<br><ul style="list-style-type: none"> <li>• <i>tag</i>—Range is 1-100.</li> </ul>                                                                                                                                                                         |
| <b>Step 4</b> | <b>location location-tag [priority number]</b><br><b>Example:</b><br>Router(cfg-emrgncy-resp-zone)# location 8 priority 2 | Each location tag must correspond to a location tag created using the <b>voice emergency response location</b> command.<br><ul style="list-style-type: none"> <li>• <i>number</i>—(optional) Ranks the location in the zone list. Range is 1-100, with 1 being the highest priority.</li> <li>• Repeat this command for each location included in the zone.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(cfg-emrgncy-resp-zone)# end                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                       |

## Configure Outgoing Dial Peers for Enhanced 911 Services

Depending on whether you decided to configure emergency response zones while you planned your 911 configuration as described in [Plan Your Implementation of Enhanced 911 Services, on page 691](#), use one of the following procedures:

- If you decided to not use zones, see [Configure Dial Peers for Emergency Calls, on page 699](#).
- If you decided to use zones, see [Configure Dial Peers for Emergency Response Zones, on page 700](#).

### Configure Dial Peers for Emergency Calls

Perform this procedure to create a dial peer for emergency calls to the PSAP. The destination-pattern of this dial peer is usually some variation of 911, such as 9911. This dial peer uses the port number of the CAMA or PRI network interface card. The new command **emergency response zone** specifies that this dial peer translates the calling number of any outgoing call's to an ELIN.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice** *number* **pots**
4. **destination-pattern** *n* **911**
5. **prefix** *number*
6. **emergency response zone**
7. **end**

#### DETAILED STEPS

| Procedure |                                                                                                                         |                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | Command or Action                                                                                                       | Purpose                                                                                                                                                                                                               |
| Step 1    | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                      | Enables privileged EXEC mode.<br>• Enter your password if prompted.                                                                                                                                                   |
| Step 2    | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                              | Enters global configuration mode.                                                                                                                                                                                     |
| Step 3    | <b>dial-peer voice</b> <i>number</i> <b>pots</b><br><b>Example:</b><br>Router(config)# dial-peer voice 911 pots         | Enters dial-peer configuration mode to define parameters for an individual dial peer.                                                                                                                                 |
| Step 4    | <b>destination-pattern</b> <i>n</i> <b>911</b><br><b>Example:</b><br>Router(config-dial-peer)# destination-pattern 9911 | Matches dialed digits to a telephony device. The digits included in this command specify the E.164 or private dialing plan telephone number. For Enhanced 911 Services, the digits are usually some variation of 911. |

|               | Command or Action                                                                                                   | Purpose                                                                                                                                                                                                            |
|---------------|---------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>prefix</b> <i>number</i><br><b>Example:</b><br><code>Router(config-dial-peer)# prefix 911</code>                 | (Optional) Includes a prefix that the system adds automatically to the front of the dial string before passing it to the telephony interface. For Enhanced 911 Services, the dial string is some variation of 911. |
| <b>Step 6</b> | <b>emergency response zone</b><br><b>Example:</b><br><code>Router(config-dial-peer)# emergency response zone</code> | Defines this dial peer as the one to use to route all ERLs defined in the system to the PSAP.                                                                                                                      |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-dial-peer)# end</code>                                         | Returns to privileged EXEC mode.                                                                                                                                                                                   |

## Configure Dial Peers for Emergency Response Zones

You can selectively route a 911 call based on the ERL by assigning different zones to dial peers. The **emergency response zone** command identifies the dial peer that routes the 911 call and the voice interface to use. Only ERLs that are defined in the zone can be routed on the dial peer. Callers dialing the same emergency number are routed to different voice interfaces based on the zone of the ERL.

### Before you begin

- Cisco Unified CME 4.2 or a later version
- Define your ERLs and emergency response zones as described in:
  - [Configure the Emergency Response Location, on page 696](#)
  - [Configure Locations under Emergency Response Zones, on page 697](#)

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice** *number* **pots**
4. **destination-pattern** *n911*
5. **prefix** *number*
6. **emergency response zone** *tag*
7. **end**

| <b>Step 1</b> | <b>enable</b>     | Enables privileged EXEC mode. |

|               | Command or Action                                                                                                    | Purpose                                                                                                                                                                                                       |
|---------------|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Router> enable                                                                                    | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                            |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                           | Enters global configuration mode.                                                                                                                                                                             |
| <b>Step 3</b> | <b>dial-peer voice <i>number</i> pots</b><br><b>Example:</b><br>Router(config)# dial-peer voice 911 pots             | Enters dial-peer configuration mode to define parameters for an individual dial peer.                                                                                                                         |
| <b>Step 4</b> | <b>destination-pattern <i>n911</i></b><br><b>Example:</b><br>Router(config-dial-peer)# destination-pattern 9911      | Matches dialed digits to a telephony device. The digits included in this command specify the E.164 or private dialing plan telephone number. For E911 services, the digits are usually some variation of 911. |
| <b>Step 5</b> | <b>prefix <i>number</i></b><br><b>Example:</b><br>Router(config-dial-peer)# prefix 911                               | (Optional) Includes a prefix that the system adds automatically to the front of the dial string before passing it to the telephony interface. For E911 services, the dial string is some variation of 911.    |
| <b>Step 6</b> | <b>emergency response zone <i>tag</i></b><br><b>Example:</b><br>Router(config-dial-peer)# emergency response zone 10 | Defines this dial peer as the one that is used to route ERLs defined for that zone. <ul style="list-style-type: none"> <li><i>tag</i>—Points to an existing configured zone. Range is 1-100.</li> </ul>       |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Router(config-dial-peer)# end                                                       | Returns to privileged EXEC mode.                                                                                                                                                                              |

## Configure a Dial Peer for Callbacks from the PSAP

Perform this procedure to create a dial peer for 911 callbacks from the PSAP. This dial peer enables the PSAP to use the ELIN to make callbacks. When a call arrives that matches this dial peer, the **emergency response callback** command instructs the system to find the last caller that used the ELIN and translate the destination number of the incoming call to the extension of the last caller.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice *number* pots**
4. **incoming called-number *number***
5. **direct-inward-dial**
6. **emergency response callback**
7. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                    | Enters global configuration mode.                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>dial-peer voice <i>number</i> pots</b><br><b>Example:</b><br>Router(config)# dial-peer voice 100 pots                      | Enters dial-peer configuration mode to define parameters for an individual dial peer.                                                                                                                                                           |
| <b>Step 4</b> | <b>incoming called-number <i>number</i></b><br><b>Example:</b><br>Router(config-dial-peer)# incoming called-number 4085550100 | (Optional) Selects the inbound dial peer based on the called number to identify the last caller. This number is the ELIN.                                                                                                                       |
| <b>Step 5</b> | <b>direct-inward-dial</b><br><b>Example:</b><br>Router(config-dial-peer)# direct-inward-dial                                  | (Optional) Enables the Direct Inward Dialing (DID) call treatment for the incoming called number. For more information, see the chapter <i>Configuring Voice Ports</i> in the <a href="#">Cisco Voice, Video, and Fax Configuration Guide</a> . |
| <b>Step 6</b> | <b>emergency response callback</b><br><b>Example:</b><br>Router(config-dial-peer)# emergency response callback                | Identifies a dial peer as an ELIN dial peer.                                                                                                                                                                                                    |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Router(config-dial-peer)# end                                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                |

## Assign ERLs to Phones

You must specify an ERL for each phone. The type of phones that you have determines which of the following tasks you use to associate an ERL with your phones, as explained in *Step 7* in [Plan Your Implementation of Enhanced 911 Services](#), on page 691.

- To create an IP subnet in the ERL that includes each phone's IP address, you must also configure each ERL to specify which phones are part of the ERL. See [Assign an ERL to a Phone's IP Subnet](#), on page 703. You can optionally specify up to two different subnets.
- To assign an ERL to a SIP phone, you must specify the ERL in the voice register pool configuration. See [Assign an ERL to a SIP Phone](#), on page 704.

- To assign an ERL to a SCCP phone, you must specify the ERL in the ephone configuration. See [Assign an ERL to a SCCP Phone, on page 705](#).
- To assign an ERL to a phone's dial peer, you must specify the ERL in the dial-peer configuration. See [Assign an ERL to a Dial Peer, on page 706](#).

## Prerequisites for Assigning ERLs to Phones

Define your ERLs and emergency response zones as described in the [Configure the Emergency Response Location, on page 696](#).

## Assign an ERL to a Phone's IP Subnet

Use this procedure when you have a group of phones that are on the same subnet. You can configure an ERL to be associated with one or two unique IP subnets. This indicates that all IP phones in a specific subnet use the ELIN defined in this ERL.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice emergency response location tag**
4. **subnet [1 | 2] IPaddress-mask**
5. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                 |
|--------|--------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                             | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                   |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>voice emergency response location tag</b><br><b>Example:</b><br>Router(config)# voice emergency response location 4         | Enters emergency response location configuration mode to define parameters for an ERL.                                                                                                                                                                                                                                  |
| Step 4 | <b>subnet [1   2] IPaddress-mask</b><br><b>Example:</b><br>Router(cfg-emrgncy-resp-location)# subnet 1 192.168.0.0 255.255.0.0 | Defines the groups of IP phones that are part of this location. You can create up to 2 different subnets.<br><ul style="list-style-type: none"> <li>• To include all IP phones on a single ERL, use the command <b>subnet 1 0.0.0.0 0.0.0.0</b> to configure a default subnet. This subnet does not apply to</li> </ul> |

|               | Command or Action                                                                        | Purpose                                                                 |
|---------------|------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
|               |                                                                                          | nonIP-phone endpoints, such as phones on VoIP trunks or FXS/FXO trunks. |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br><code>Router(cfg-emrgncy-resp-location)# end</code> | Returns to privileged EXEC mode.                                        |

## Assign an ERL to a SIP Phone

Perform this procedure if you chose to assign a specific ERL to a SIP phone instead of using the phone's IP address to match a subnet defined for an ERL. For more information about this decision, see [Step 7](#) in [Plan Your Implementation of Enhanced 911 Services, on page 691](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *tag*
4. **emergency response location** *tag*
5. **end**

### DETAILED STEPS

| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br><code>Router# configure terminal</code>                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>voice register pool</b> <i>tag</i><br><br><b>Example:</b><br><code>Router(config)# voice register pool 8</code>                                | Enters voice register pool mode to define parameters for an individual voice register pool.                                                                                                                                                                                                                                        |
| <b>Step 4</b> | <b>emergency response location</b> <i>tag</i><br><br><b>Example:</b><br><code>Router(config-register-pool)# emergency response location 12</code> | Assigns an ERL to a phone's voice register pool using an ERL's tag. <ul style="list-style-type: none"> <li>• <i>tag</i>—Range is 1 to 2147483647.</li> <li>• If the ERL's tag is not a configured tag, the phone is not associated to an ERL and the phone defaults to its IP address to find the inclusive ERL subnet.</li> </ul> |

|               | Command or Action                                                      | Purpose                                                                                                                                                                                                                                                                   |
|---------------|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                        | <ul style="list-style-type: none"> <li>This command can also be configured in voice register template configuration mode and applied to one or more phones. The voice register pool configuration has priority over the voice register template configuration.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-register-pool)# end | Returns to privileged EXEC mode.                                                                                                                                                                                                                                          |

## Assign an ERL to a SCCP Phone

Perform this procedure if you chose to assign an ERL to a SCCP phone instead of configuring an ERL to be associated with IP subnets. For more information about this decision, see *Step 7* in [Plan Your Implementation of Enhanced 911 Services](#), on page 691.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone tag**
4. **emergency response location tag**
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                                      | Purpose                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                         | Enters global configuration mode.                                                                                                                    |
| <b>Step 3</b> | <b>ephone tag</b><br><br><b>Example:</b><br>Router(config)# ephone 224                                                 | Enters ephone configuration mode to define parameters for an individual ephone.                                                                      |
| <b>Step 4</b> | <b>emergency response location tag</b><br><br><b>Example:</b><br>Router(config-ephone)# emergency response location 12 | Assigns an ERL to a phone's ephone configuration using an ERL's tag. <ul style="list-style-type: none"> <li>tag—Range is 1 to 2147483647.</li> </ul> |

|               | Command or Action                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                 | <ul style="list-style-type: none"> <li>If the ERL's tag is not a configured tag, the phone is not associated to an ERL and the phone defaults to its IP address to find the inclusive ERL subnet.</li> <li>This command can also be configured in ephone-template configuration mode and applied to one or more phones. The ephone configuration has priority over the ephone-template configuration.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-ephone)# end | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                 |

## Assign an ERL to a Dial Peer

Perform this procedure to assign an ERL to a FXS/FXO or VoIP dial peer. Because these interfaces do not have IP addresses associated with them, you must use this procedure instead of configuring an ERL to be associated with IP subnets. For more information about this decision, see *Step 7* in [Plan Your Implementation of Enhanced 911 Services](#), on page 691.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice tag type**
4. **emergency response location tag**
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                  | Purpose                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                     | Enters global configuration mode.                                                                                |
| <b>Step 3</b> | <b>dial-peer voice tag type</b><br><br><b>Example:</b><br>Router(config)# dial-peer voice 100 pots | Enters dial peer configuration mode to define parameters for an individual dial peer.                            |

|        | Command or Action                                                                                                                    | Purpose                                                                                                                                                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>emergency response location tag</b><br><br><b>Example:</b><br><pre>Router(config-dial-peer)# emergency response location 12</pre> | Assigns an ERL to a phone's dial peer configuration using an ERL's tag. The tag is an integer from 1 to 2147483647. If the ERL's tag is not a configured tag, no translation occurs and no Enhanced 911 information is saved to the last emergency caller table. |
| Step 5 | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-dial-peer)# end</pre>                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                 |

## Customize E911 Settings

The E911 settings you can customize are:

- **Elin:** The default ELIN. If a 911 caller's IP phone address does not match the subnet of any location in any zone, the default ELIN is used to replace the original automatic number identification (ANI). The default ELIN can be already defined in one of the ERLs or can be unique. If a default ELIN is not defined and there is no match for the 911 caller's IP address, the PSAP sees the ANI for callback purposes. A syslog message is sent requesting the default ELIN, and no caller location information is available to the PSAP.
- **Expiry:** The number of minutes a 911 call is associated to an ELIN in case of a callback from the 911 operator. The callback expiry can be changed from a default of 3 hours to any time between 2 minutes and 48 hours. The timer is started the moment the 911 call goes to the PSAP. The PSAP can call back the ELIN and reach the last caller within this expiry time.
- **Callback:** The default phone number to contact if a 911 callback cannot find the last 911 caller from the Last Caller table. This can happen if the callback occurs after a router has rebooted or if the expiration has elapsed.
- **Logging:** A syslog informational message is printed to the console every time an emergency call is made. Such a message is required for third party applications to send an e-mail or page to an in-house emergency administrator. This is a default feature that can be disabled using the **no logging** command. The following is an example of a syslog notification message:

```
%E911-5-EMERGENCY_CALL_PLACED: calling #[4085550100] called
#[911] ELIN [4085550199]
```

### Before you begin

- Cisco Unified CME 4.2 or a later version

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice emergency response settings**
4. **expiry time**
5. **callback number**

6. **logging**
7. **elin number**
8. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                           | Purpose                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                       | Enters global configuration mode.                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>voice emergency response settings</b><br><b>Example:</b><br><pre>Router(config)# voice emergency response settings</pre> | Enters voice emergency response settings mode to define settings you can customize for E911 calls.                                                                                                                                                                        |
| <b>Step 4</b> | <b>expiry time</b><br><b>Example:</b><br><pre>Router(cfg-emrgncy-resp-settings)# expiry 300</pre>                           | (Optional) Defines the time period (in minutes) that the emergency caller history information for each ELIN is stored in the Last Caller table. The time can be an integer in the range of 2 minutes to 2880 minutes. The default value is 180 minutes.                   |
| <b>Step 5</b> | <b>callback number</b><br><b>Example:</b><br><pre>Router(cfg-emrgncy-resp-settings)# callback 7500</pre>                    | (Optional) Defines the E.164 callback number (for example, a company operator or main help desk) if a 911 callback cannot find the last caller associated to the ELIN.                                                                                                    |
| <b>Step 6</b> | <b>logging</b><br><b>Example:</b><br><pre>Router(cfg-emrgncy-resp-settings)# no logging</pre>                               | (Optional) Enables syslog messages that announce every emergency call. The syslog messages can be tracked to send pager or e-mail notifications to an in-house support number. By default, logging is enabled. Use the <b>no</b> form of this command to disable logging. |
| <b>Step 7</b> | <b>elin number</b><br><b>Example:</b><br><pre>Router(cfg-emrgncy-resp-settings)# elin 4085550100</pre>                      | Specifies the E.164 number to be used as the default ELIN if no ERL has a subnet mask that matches the current 911 caller's IP phone address.                                                                                                                             |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><pre>Router (cfg-emrgncy-resp-settings)# end</pre>                                         | Returns to privileged EXEC mode.                                                                                                                                                                                                                                          |

## Using the Address Command for Two ELINS

For ERLs that have two ELINs defined, you cannot use just one **address** field to have two address entries for each ELIN in the ALI database. Instead of entering the specific phone number, a key phrase is entered to represent each ELIN. The **show voice emergency address** command produces output that replaces the key phrase with the ELIN information and generates two lines of addresses.

To define the expression, use the keyword *elin* (context-insensitive), followed by a period, the starting position of the ELIN to use, followed by another period, and finally the ending position of the ELIN. For example:

```
address I,ELIN.1.3,ELIN.4.7,678 ,Alder Drive ,Milpitas ,CA,95035
```

In the example, the second parameter of **address** following I are digits 1-3 of each ELIN. The third parameter are digits 4-7 of each ELIN. When you enter the **show voice emergency address** command, the output will replace the key phrase as seen in the following:

```
I,408,5550101,678,Alder Drive ,Milpitas ,CA,95035
I,408,5550190,678,Alder Drive ,Milpitas ,CA,95035
```

## Enable Call Detail Records

To conform to internal policy or external regulations, you may be required to save 911 call history data including the following information:

- Original caller's extension
- ELIN information
- ERL information (the integer tag and the text name)
- Original caller's phone IP address

These attributes are visible from the RADIUS accounting server and syslog server output, or by using the **show call history voice** command.

**Note** You must enable the RADIUS server or the syslog server to display these details. See your RADIUS or syslog server documentation.

## Output from a RADIUS Accounting Server

For RADIUS accounting, the emergency call information is under a feature-vsa record. The fields are:

- EMR: Emergency call
- CGN: Original calling number
- ELIN: Emergency line identification number; the translated number
- CDN: Called number
- ERL: Emergency response location tag number
- ERLN: Emergency response location name; the name entered for the ERL, if one exists

- CIP: Caller's IP address; nonzero for implicit ERL assignments
- ETAG: ERL tag; nonzero for explicit ERL assignments

The following shows an output example from a RADIUS server:

```
*Jul 18 15:37:43.691: RADIUS: Cisco AVpair [1] 202 "feature-vsa=fn:EMR
,ft:07/18/2007 15:37:32.227,frs:0,fid:6,fcid:A2444CAF347B11DC8822F63A1B4078DE,
legID:57EC,cgn:6045550101,elin:6045550199,cdn:911,erl:2,erln:Fisco,cip:1.5.6.200,etag:0"
```

## Output from a Syslog Server

If gateway accounting is directed to the syslog server, a **VOIP\_FEAT\_HISTORY** system message appears. The feature-vsa parameters are the same ones described for RADIUS accounting.

The following shows an output example from a syslog server:

```
*Jul 18 15:37:43.675: %VOIPAAA-5-VOIP_FEAT_HISTORY: FEAT_VSA=fn:EMR,ft:07/18/2007
15:37:32.227,frs:0,fid:6,fcid:A2444CAF347B11DC8822F63A1B4078DE,legID:57EC,cgn:6045550199,
elin:6045550100,cdn:911,erl:2,erln:ABCDEFGHIJKLMNQRSTUUVWXYZ123,cip:1.5.6.200,etag:0,
bguid:A23F6AD7347B11DC881DF63A1B4078DE
```

## Output from the show call history voice Command

View emergency call information on the gateway using **show call active voice** and **show call history voice**. Some emergency call information is already in existing fields. The original caller's number is under *OriginalCallingNumber*. The ELIN is at *TranslatedCallingNumber*. The four new fields are the ERL, ERL name, the calling phone's IP address, and any explicit ERL assignments. These fields only appear if an ELIN translation occurs. For example, any 911 calls from an ERL with no ELIN defined do not print the four emergency fields in the **show call** commands. If no ERLs match the calling phone and the default ELIN is used, the ERL field displays *No Match*.

The following shows an output example using the **show call history voice** command:

```
EmergencyResponseLocation=3 (Cisco Systems 3)
ERLAssignment=3
DeviceIPAddress=1.5.6.202
```

## Verify E911 Configuration

New **show** commands are introduced to display E911 configuration or usage.

- Use the **show voice emergency callers** command to see the translations made by outbound 911 calls. This command lists the originating number, the ELIN used, and the time for each 911 call. This history is active for only three hours after the call is placed. Expired calls are not shown in this output.

```
router# show voice emergency callers
```

```
EMERGENCY CALLS CALL BACK table
ELIN | CALLER | TIME
6045550100 | 6045550150 | Oct 12 2006 03:59:43
6045550110 | 8155550124 | Oct 12 2006 04:05:21
```

- Use the **show voice emergency** command to display IP addresses, subnet masks, and ELINs for each ERL.

```
Router# show voice emergency
```

```
EMERGENCY RESPONSE LOCATIONS
ERL | ELIN 1 | ELIN2 | SUBNET 1 | SUBNET 2
1 | 6045550101 | | 10.0.0.0 | 255.0.0.0
2 | 6045550102 | 6045550106 | 192.168.0.0 | 255.255.0.0
3 | | 6045550107 | 172.16.0.0 | 255.255.0.0
4 | 6045550103 | | 192.168.0.0 | 255.255.0.0
5 | 6045550105 | | 209.165.200.224 | 255.0.0.0
6 6045550198 | | 6045550109 | 209.165.201.0 | 255.255.255.224
```

- Use the **show voice emergency addresses** command to display address information for each ERL.

```
Router# show voice emergency addresses
```

```
3850 Zanker Rd, San Jose,604,5550101
225 W Tasman Dr, San Jose,604,5550102
275 W Tasman Dr, San Jose,604,5550103

zone 100
location 1 priority 1
location 2 priority 2
location 3 priority 3

```

## Troubleshooting Enhanced 911 Services

### Procedure

Use the **debug voice application error** and the **debug voice application callsetup** command. These are existing commands for calls made using the default session or TCL applications.

This example shows the debug output when a call to 911 is made:

```

Router# debug voice application error
Router# debug voice application callsetup

Nov 10 23:49:05.855: //emrgncy_resp_xlate_callingNum: InDialPeer[20001], OutDialPeer[911]
callingNum[6046692003]
Nov 10 23:49:05.855: //ER_HistTbl_Find_CallHistory: 6046699100
Nov 10 23:49:05.855: //59//Dest:/DestProcessEmergencyCall: Emergency Call detected: Using ELIN
6046699100

```

This example shows the debug output when a PSAP calls back an emergency caller:

```

Router# debug voice application error
Router# debug voice application callsetup

Nov 10 23:49:37.279: //emrgncy_resp_xlate_calledNum: calledNum[6046699100], dpeerTag[6046699]
Nov 10 23:49:37.279: //ER_HistTbl_Find_CallHistory: 6046699100
Nov 10 23:49:37.279: //HasERHistoryExpired: elapsedTime[10 minutes]
Nov 10 23:49:37.279: //67//Dest:/DestProcessEmergencyCallback: Emergency Response Callback:
Forward to 6046692003.
Nov 10 23:49:37.279: //67//Dest:/DestCaptureCallForward: forwarded to 6046692003 reason 1

```

## Error Messages

The Enhanced 911 feature introduces a new system error message. The following error message displays if a 911 callback cannot route to the last 911 caller because the saved history was lost because of a reboot, an expiration of an entry, or a software error:

```
%E911_NO_CALLER: Unable to contact last 911 caller.
```

# Configuration Examples for Enhanced 911 Services

## Example for Configuring Enhanced E911 Services with Cisco Unified CME 4.2

Emergency response settings are:

- default elin if no elin match is found: 604 555-0120
- expiry time for information in the Last Caller table: 180 minutes
- callback number if the PSAP operator must call back the 911 caller and the call back history has expired: 604 555-0199

Zone 1 has four locations, 1, 2, 3, and 4, and a name, address, and elin are defined for each location. Each of the four locations is assigned a priority. In this example, because location 4 has been assigned the highest priority, it is the first that is searched for IP subnet matches to identify the ELIN assigned to the 911 caller's phone. A dial peer is configured to route 911 calls to the PSAP (voice port 1/0/0). Callback dial peers are also configured.

```

## Example for Configuring Enhanced E911 Services with Cisco Unified CME 4.1 in SRST Fallback Mode

In this example, Enhanced 911 Services is configured to assign an ERL to the following:

- The 10.20.20.0 IP subnet
- Two dial peers
- An ephone
- A SIP phone

Router#**show running-config**

## Feature Information for Enhanced 911 Services

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

**Table 51: Feature Information for Enhanced 911 Services**

| Feature Name                                | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enhanced 911 Services for Cisco Unified CME | 4.2                       | <ul style="list-style-type: none"><li>• Assigns ERLs to zones to enable routing to the PSAP that is closest to the caller</li><li>• Customizes E911 by defining a default ELIN, identifying a designated number if the 911 caller cannot be reached on callback, specifying the expiry time for data in the Last Caller table, and enabling syslog messages that announce all emergency calls</li><li>• Expands the E911 location information to include name and address</li><li>• Uses templates to assign ERLs to a group of phones</li><li>• Adds new permanent call detail records</li></ul> |
| Enhanced 911 Services                       | 4.1                       | Enhanced 911 Services was introduced for Cisco Unified CME in SRST Fallback Mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## CHAPTER 21

# Extension Mobility

---

This chapter describes features in Cisco Unified Communications Manager Express (Cisco Unified CME) that provide support for phone mobility for end users.

- [Prerequisites for Configuring Extension Mobility, on page 723](#)
- [Restrictions for Configuring Extension Mobility, on page 723](#)
- [Information About Configuring Extension Mobility, on page 724](#)
- [Enable Extension Mobility, on page 728](#)
- [Configuration Examples for Extension Mobility, on page 741](#)
- [Where to Go Next, on page 743](#)
- [Feature Information for Extension Mobility, on page 743](#)

## Prerequisites for Configuring Extension Mobility

- Cisco Unified CME 4.2 or a later version.
- To use the phone user interface to configure personal speed dials directly on an Extension Mobility phone, Cisco Unified CME 4.3 or a later version must be installed.
- SIP phone support is available with Cisco Unified CME 8.6 or a later version.

## Restrictions for Configuring Extension Mobility

- Extension Mobility on remote Unified CME routers isn't supported. You can log in only to a local Cisco Unified IP phone.
- Extension Mobility isn't supported if you log in to a Cisco Unified IP phone in a different subnet.

# Information About Configuring Extension Mobility

## Extension Mobility

Extension Mobility in Cisco Unified CME 4.2 and later versions provides the benefit of phone mobility for end users.

A user login service allows phone users to temporarily access a physical phone other than their own phone and utilize their personal settings, such as directory number, speed-dial lists, and services, as if the phone is their own desk phone. The phone user can make and receive calls on that phone using the same personal directory number as is on their own desk phone.

Each Cisco Unified IP phone that is enabled for Extension Mobility is configured with a logout profile. This profile determines the default appearance of a phone that is enabled for Extension Mobility when there is no phone user logged into that phone. Minimally, the logout profile allows calls to emergency services such as 911. A single logout profile can be applied to multiple phones.

After a Cisco Unified IP phone that is enabled for Extension Mobility boots up, the Services feature button on the phone is configured with a login service URL hosted by Cisco Unified CME that points to the Extension Mobility Login page. No feature-button-specific configuration is required to add Extension Assigner to the Services feature button. The option for Extension Mobility appears last in the list of options displayed when the phone user presses the Services feature button.

A phone user logs in to a Cisco Unified IP phone that is enabled for Extension Mobility by pressing the Services button or a Unified CCX agent can log in using a Unified CCX Cisco Agent Desktop. User authentication and authorization is performed by Cisco Unified CME. If the login is successful, Cisco Unified CME retrieves the appropriate user profile, based on user name and password match, and replaces the phone's logout profile with the user profile.

After the phone user is logged in, the service URL points to a logout URL hosted by Cisco Unified CME to provide a logout prompt on the phone. Logging into a different device automatically closes the first session and start a new session on the new device. When a phone user is not logged in to any phone, incoming calls to the phone user's directory number are sent to the phone user's voice mailbox.

For button appearance, Extension Mobility associates directory numbers then speed-dial numbers in the logout profile or user profile to phone buttons. The sequence in which directory numbers are associated is based on line type and ring behavior as follows: first normal, then silent ring, beep ring, feature ring, monitor ring, and overlay, followed by speed dials. If the profile contains more numbers than there are buttons on the physical phone to which the profile is downloaded, the remaining numbers in the profile are ignored.

For configuration information, see [Enable Extension Mobility, on page 728](#).

## Personal Speed Dials on an Extension Mobility Phone

Unified CME phone users can use the Cisco IOS CLI commands to configure personal speed dials on an Extension Mobility phone.

In Cisco Unified CME 4.3 and later versions, Extension Mobility users can configure their own speed-dial settings directly on the phone. Speed-dial settings are added or modified on the phone by using a menu available with the Services feature button. Any changes to the speed-dial settings made through the phone user interface are applied to the user's profile in Extension Mobility. For information about using the phone user interface on a Cisco Unified IP phone, see [Cisco Unified IP Phone 7900 Series End-User Guides](#).

The phone user-interface is enabled by default on all phones with displays. You can disable the capability for an individual phone to prevent a phone user from accessing the interface. For configuration information, see [Enable Phone User Interface for Configuring Speed-Dial and Fast-Dial, on page 969](#).

## Cisco Unified CME Extension Mobility Enhancements

Enhancements to Extension Mobility in Cisco Unified CME 4.3 include the following:

- Configurable Automatic Logout
- Automatic Clear Call History

### Automatic Logout

Cisco Unified CME 4.3 and later versions includes an Automatic Timeout feature for Extension Mobility. After an automatic logout is executed, Cisco Unified CME sends the logout profile to the phone and restarts the phone. After an automatic logout, Extension Mobility users can log in again.

You can configure up to three different times on a 24-hour clock for automatically logging out Extension Mobility users based on time-of-day. The system clock triggers an alarm at the specified time and the EM Manager in Cisco Unified CME logs out every logged in Extension Mobility user in the system. If an Extension Mobility user is using the phone when automatic logout occurs, the user is logged out after the active call is completed.

For configuration information, see [Configure Cisco Unified CME for Extension Mobility, on page 728](#).

Users log out from Extension Mobility by pressing the Services button and choosing Logout. If a user does not manually log out before leaving the phone, the phone is idle and the individual's user profile remains loaded on that phone. To automatically log out individual users from idle Extension Mobility phones, configure an idle-duration timer for Extension Mobility. The timer monitors the phone and if the specified maximum idle time is exceeded, the EM Manager logs out the user. The idle-duration timer is reset whenever the phone goes offhook.

For configuration information, see [Configure a User Profile, on page 738](#).

### Automatic Clear Call History

In Cisco Unified CME 4.3 and later versions, the EM manager in Cisco Unified CME issues commands to phones to clear call history whenever a user logs out of Extension Mobility. An HTTP GET/POST is sent between the Extension Mobility phone and the authentication server in Cisco Unified CME. The authentication server authorizes the request and the call history is cleared based on the result.

You can configure Cisco Unified CME to disable Automatic Clear Call History. For configuration information, see [Configure Cisco Unified CME for Extension Mobility, on page 728](#).

## Privacy on an Extension Mobility Phone

In Cisco Unified CME 4.3 and later versions, the Privacy feature enables phone users to block other users from seeing call information or barging into a call on a shared octo-line directory number. When a phone receives an incoming call on a shared octo-line, the user can make the call private by pressing the Privacy feature button, which toggles between on and off to allow the user to alter the privacy setting on their phone. The privacy state is applied to all new calls and current calls owned by the phone user.

For Extension Mobility phones, you can enable the privacy button in the user profile and logout profile. To enable the privacy button, see [Configure a Logout Profile for an IP Phone, on page 731](#) and [Configure a User Profile, on page 738](#).

For more information about Privacy, see [Barge and Privacy, on page 1035](#).

## Extension Mobility for SIP Phones Enhancement

Cisco Unified CME 8.6 enhances the Extension Mobility feature to allow support for SIP phones.

Extension Mobility allows you to access any EM enabled physical phone and utilize your own personal settings, such as directory numbers, speed-dials, after-hour personal identification number (PIN), and feature button layout, as if the phone is your own desk phone.

A user login service allows you to temporarily access a physical phone other than your own phone and utilize your personal settings, such as directory number, speed-dial lists, and services, as if the phone is your own desk phone.

The features of Extension Mobility for SIP phones is identical to SCCP phones, only the configuration procedure is different. For information on configuring Extension Mobility for SIP phones, see [Configure Extension Mobility for SIP Phones, on page 735](#).

---

**Note** You can login to either an SCCP phone or a SIP phone with the same user profile.

---

---

**Note** Only the normal lines configured in your user profile are applied when you login to a SIP phone. Other lines such as overlay, monitor, and feature-ring lines are ignored.

---

---

**Note** Only Cfdall, Confrn, DnD, Endcall, Hold, NewcallGroup Pickup, Park, Privacy, Redial, and Trnsfer feature buttons configured in your user profile will be applied when you login to a SIP phone. Other feature buttons will be ignored.

---

## MIB Support for Extension Mobility in Cisco Unified SCCP IP Phones

In Cisco Unified CME 9.0 and later versions, new MIB objects are added to monitor Cisco Unified SCCP IP Extension Mobility (EM) phones. These enhancements allow the retrieval of the following information:

- user-profile tag for a Cisco Unified SCCP IP EM phone, when it is logged in
- logout-profile tag for a Cisco Unified SCCP IP EM phone
- DN and its type, and the overlay or call waiting numbers if applicable, for each user-profile
- DN and its type, and the overlay or call waiting numbers if applicable, for each logout-profile
- number of Cisco Unified SCCP IP phones configured as EM phones
- number of registered Cisco Unified SCCP IP EM phones

Table 52: MIB Variables and Object Identifiers for EM in Cisco Unified SCCP IP Phones , on page 727 lists the MIB variables and object identifiers for retrieving the new MIB database.

**Table 52: MIB Variables and Object Identifiers for EM in Cisco Unified SCCP IP Phones**

| MIB Variables               | Object identifiers              |
|-----------------------------|---------------------------------|
| ccmeEMUserProfileTag        | 1.3.6.1.4.1.9.9.439.1.1.43.1.19 |
| ccmeEMLogoutProfileTag      | 1.3.6.1.4.1.9.9.439.1.1.43.1.20 |
| ccmeEMUserDirNumConfTable   | 1.3.6.1.4.1.9.9.439.1.1.68      |
| ccmeEMUserDirNumConfEntry   | 1.3.6.1.4.1.9.9.439.1.1.68.1    |
| ccmeEMUserDirNum            | 1.3.6.1.4.1.9.9.439.1.1.68.1.3  |
| ccmeEMUserDirNumOverlay     | 1.3.6.1.4.1.9.9.439.1.1.68.1.4  |
| ccmeEMLogoutDirNumConfTable | 1.3.6.1.4.1.9.9.439.1.1.69      |
| ccmeEMLogoutDirNumConfEntry | 1.3.6.1.4.1.9.9.439.1.1.69.1    |
| ccmeEMLogoutDirNum          | 1.3.6.1.4.1.9.9.439.1.1.69.1.3  |
| ccmeEMLogoutDirNumOverlay   | 1.3.6.1.4.1.9.9.439.1.1.69.1.4  |
| ccmeEMphoneTot              | 1.3.6.1.4.1.9.9.439.1.2.9       |
| ccmeEMphoneTotRegistered    | 1.3.6.1.4.1.9.9.439.1.2.10      |

Table 53: Descriptions of MIB Variables for EM in Cisco Unified SCCP IP Phones, on page 727 provides a description of each of the MIB variables for EM in Cisco Unified SCCP IP Phones.

**Table 53: Descriptions of MIB Variables for EM in Cisco Unified SCCP IP Phones**

| MIB Variables               | Descriptions                                                       |
|-----------------------------|--------------------------------------------------------------------|
| ccmeEMUserProfileTag        | User-profile tag for the EM phone                                  |
| ccmeEMLogoutProfileTag      | Logout-profile tag for the EM phone                                |
| ccmeEMUserDirNumConfTable   | Table of entries for the EM phone's user profile                   |
| ccmeEMUserDirNumConfEntry   | A user-profile entry for the EM phone                              |
| ccmeEMUserDirNum            | A directory number for the user profile                            |
| ccmeEMUserDirNumOverlay     | Number type for the user profile, including the overlay identifier |
| ccmeEMLogoutDirNumConfTable | Table of entries for the EM phone's logout profile                 |
| ccmeEMLogoutDirNumConfEntry | A logout entry for the EM phone                                    |
| ccmeEMLogoutDirNum          | A directory number for the logout profile                          |

| MIB Variables             | Descriptions                                                         |
|---------------------------|----------------------------------------------------------------------|
| ccmeEMLogoutDirNumOverlay | Number type for the logout profile, including the overlay identifier |
| ccmeEMphoneTot            | Total number of EM phones                                            |
| ccmeEMphoneTotRegistered  | Total number of registered EM phones                                 |

Extension mobility is supported in Cisco Unified CME but not in Cisco Unified SRST.

# Enable Extension Mobility

## Configure Cisco Unified CME for Extension Mobility

To configure Extension Mobility in Cisco Unified CME, perform the following steps.

### Before you begin

- For authentication server in Cisco Unified CME, Cisco Unified CME 4.3 or a later version.
- For Automatic Logout, Cisco Unified CME 4.3 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **telephony-service**
5. **url authentication** *url-address application-name password*
6. **service phone webAccess 0**
7. **authentication credential** *application-name password*
8. **em keep-history**
9. **em logout** *time1 [time2 ] [time3 ]*
10. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                      | Purpose                                                                 |
|---------------|--------------------------------------------------------|-------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><br>• Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b>       | Enters global configuration mode.                                       |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Range: 00:00 to 24:00 on a 24-hour clock.</li> <li>• To configure a idle-duration timer for automatically logging out an individual user, see <a href="#">Configure a User Profile, on page 738</a>.</li> </ul> |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-telephony)# end</pre>                                                 | Exits configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Examples

The following example shows how to configure Cisco Unified CME 4.3 or a later version and Cisco Unity Express 3.2 or an earlier version to support Extension Mobility and Cisco VoiceView Express.

**Note** When running Extension Mobility and Cisco VoiceView Express 3.2 or an earlier version, you must also configure the **fallback-url** command in Cisco Unity Express. For configuration information, see the appropriate [Cisco Unity Express Administrator Guide](#).

Cisco Unified CME 4.3 or a later version

```
telephony-service
 url authentication http://192.0.2.0/voiceview/authentication/authenticate.do secretname
 psswrld
 authentication credentials secretname psswrld
```

Cisco Unity Express 3.2 or an earlier version

```
service phone-authentication
```

```
fallback-url http://192.0.2.0/CCMCIP/authenticate.asp?UserID=secretname&Password=psswr
```

## Configure a Logout Profile for an IP Phone

To create a logout profile to define the default appearance for a Cisco Unified IP phone that is enabled for Extension Mobility, perform the following steps.

### Restriction

- For button appearance, Extension Mobility associates directory numbers, then speed-dial definitions in the logout profile or user profile to phone buttons. The sequence in which directory numbers are associated is based on line type and ring behavior as follows: first normal, then silent ring, beep ring, feature ring, monitor ring, and overlay, followed by speed dials. If the profile contains more directory numbers and speed-dial numbers than there are buttons on the physical phone to which the profile is downloaded, not all numbers are downloaded to buttons.
- The first number to be configured for line appearance cannot be a monitored directory number.
- The user name parameter of any authentication credential must be unique. Do not use the same value for a user name when you configure any two or more authentication credentials in Cisco Unified CME, such as the user name in a logout or user profile for Extension Mobility.

### Before you begin

- All directory numbers to be included in a logout profile or a user profile must be already configured in Cisco Unified CME. For configuration information, see [Configure Phones to Make Basic Call, on page 327](#).
- For Privacy, on extension mobility phones, requires Cisco Unified 4.3 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice logout-profile** *profile-tag*
4. **user** *name* **password** *password*
5. **number** *number* **type** *type*
6. **speed-dial** *speed-tag number* [ **label** *label* ] [ **blf** ]
7. **pin** *number*
8. **privacy-button**
9. **end**

| <b>Step 6</b> | <b>speed-dial <i>speed-tag</i> <i>number</i> [ <i>label</i> <i>label</i> ] [ <i>blf</i> ]</b><br><b>Example:</b><br>Router(config-logout-profile)# speed-dial 1 2001<br>Router(config-logout-profile)# speed-dial 2 2002 blf                                                                                                                                                                                                                                  | (Optional) Creates speed-dial definition. <ul style="list-style-type: none"> <li>• <i>speed-tag</i>—Unique sequence number that identifies a speed-dial definition during configuration tasks. Range: 1 to 36.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                        |

|               | Command or Action                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                      | <ul style="list-style-type: none"> <li>• <b>number</b>—Digits to be dialed when the speed-dial button is pressed.</li> <li>• <b>label label</b>—(Optional) String that contains identifying text to be displayed next to the speed-dial button. Enclose the string in quotation marks if the string contains a space.</li> <li>• <b>blf</b>—(Optional) Enables Busy Lamp Field (BLF) monitoring for a speed-dial number.</li> </ul> |
| <b>Step 7</b> | <b>pin number</b><br><b>Example:</b><br><pre>Router(config-logout-profile)# pin 1234</pre>           | Sets a personal identification number (PIN) to be used by a phone user to disable the call blocking configuration for a Cisco Unified IP phone on which this profile is downloaded. <ul style="list-style-type: none"> <li>• <b>number</b>—Numeric string containing four to eight digits.</li> </ul>                                                                                                                               |
| <b>Step 8</b> | <b>privacy-button</b><br><b>Example:</b><br><pre>Router(config-logout-profile)# privacy-button</pre> | (Optional) Enables the privacy feature button on the IP phone. <ul style="list-style-type: none"> <li>• Enable this command only on phones that share an octo-line directory number.</li> <li>• This command is supported in Cisco Unified CME 4.3 and later versions.</li> </ul>                                                                                                                                                   |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-logout-profile)# end</pre>                       | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                      |

## Enable an IP Phone for Extension Mobility

To enable the Extension Mobility feature on an individual Cisco Unified IP phone in Cisco Unified CME, perform the following steps.

### Note

All SCCP Cisco Unified IP phones with displays that support URL provisioning for Feature buttons are supported by Extension Mobility, including the Cisco Unified Wireless IP Phone 7920, Cisco Unified Wireless IP Phone 7921, and Cisco IP Communicator.

### Restriction

- Extension Mobility is not supported on Cisco Unified IP phones without phone screens.
- Extension Mobility is not supported for analog devices.

**Before you begin**

- HTTP server is enabled on the Cisco Unified CME router. For configuration information, see [Configure Cisco Unified CME for Extension Mobility, on page 728](#).
- Logout profile to be assigned to a phone must be configured in Cisco Unified CME.
- Cisco IP Communicator to be enabled for Extension Mobility must be already registered in Cisco Unified CME.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **mac-address** *mac-address*
5. **type** *phone-type*
6. **logout-profile** *profile-tag*
7. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                                                 | Purpose                                                                                                                                                                                                                                                                              |
|---------------|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                            | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                    | Enters global configuration mode.                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>ephone</b> <i>phone-tag</i><br><br><b>Example:</b><br>Router(config)# ephone 1                                 | Enables phone configuration mode.<br><br>• <i>phone-tag</i> —Unique number that identifies this phone during configuration tasks. Range is 1 to maximum number supported phones, where maximum is platform and version dependent and defined by using the <b>max-ephone</b> command. |
| <b>Step 4</b> | <b>mac-address</b> <i>mac-address</i><br><br><b>Example:</b><br>Router(config-ephone)# mac-address 000D.EDAB.3566 | Associates a physical phone with this ephone configuration.                                                                                                                                                                                                                          |
| <b>Step 5</b> | <b>type</b> <i>phone-type</i><br><br><b>Example:</b><br>Router(config-ephone)# type 7960                          | Defines a phone type for the phone being configured.                                                                                                                                                                                                                                 |

|               | Command or Action                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b> | <b>logout-profile</b> <i>profile-tag</i><br><b>Example:</b><br>Router(config-ephone)# logout-profile 1 | Enables Cisco Unified IP phone for Extension Mobility and assigns a logout profile to this phone. <ul style="list-style-type: none"> <li><i>tag</i>—Unique identifier of logout profile to be used when no phone user is logged in to this phone. This tag number corresponds to a tag number created when this logout profile was configured by using the <b>voice logout-profile</b> command.</li> </ul> |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                            | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                             |

## Configure Extension Mobility for SIP Phones

To prepare Extension Mobility for use with SIP phones, perform the following steps.

### Before you begin

- Cisco IOS Release 15.1(4)M.
- Cisco Unified CME 8.6 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **voice register global**
5. **url authentication** *url-address*
6. **exit**
7. **telephony-service**
8. **authentication credential** *application-name password*
9. **em keep-history**
10. **em logout** *time1* [*time2*] [*time3*]
11. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                  | Purpose                                                                              |
|---------------|----------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><br><b>Note</b><br>Enter your password if prompted. |

|                | Command or Action                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b>  | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                               | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 3</b>  | <b>ip http server</b><br><b>Example:</b><br>Router(config)# ip http server                                                                                               | Enables the HTTP server on the Cisco Unified CME router which hosts the service URL for the Extension Mobility login and logout pages.                                                                                                                                                                                                                                                                              |
| <b>Step 4</b>  | <b>voice register global</b><br><b>Example:</b><br>Router(config)# voice register global                                                                                 | Defines global voice register commands.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 5</b>  | <b>url authentication url-address</b><br><b>Example:</b><br>Router(config-register-global)# url authentication<br>http://192.0.2.0/CCMCIP/authenticate.asp               | Instructs phones to send HTTP requests to the authentication server and the information at the specified URL is used to validate requests made to the phone web server. <ul style="list-style-type: none"> <li>• Required to support Automatic Clear Call history.</li> <li>• URL—URL address for the authentication server in Cisco Unified CME is <b>http://CMEIP Address/CCMCIP/authenticate.asp</b>.</li> </ul> |
| <b>Step 6</b>  | <b>exit</b><br><b>Example:</b><br>Router(config-register-global)# exit                                                                                                   | Exits voice register global configuration mode.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b>  | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                                                                         | Enters telephony service configuration mode.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 8</b>  | <b>authentication credential application-name password</b><br><b>Example:</b><br>Router(config-telephony)# authentication<br>credential <b>application-name password</b> | Specifies authorized credentials. Use credentials from Step 5.<br><b>Note</b><br>This step is needed only when you set the CME internal authentication server as your phone authentication server in Step 5.                                                                                                                                                                                                        |
| <b>Step 9</b>  | <b>em keep-history</b><br><b>Example:</b><br>Router(config-telephony)# em keep-history                                                                                   | (Optional) Specifies that Extension Mobility will keep, and not automatically clear, call histories when users log out from Extension Mobility phones.<br><b>Note</b><br>Default: Automatic Clear Call History is enabled.                                                                                                                                                                                          |
| <b>Step 10</b> | <b>em logout time1 [time2] [time3]</b><br><b>Example:</b>                                                                                                                | (Optional) Defines up to three time-of-day timers for automatically logging out all Extension Mobility users.                                                                                                                                                                                                                                                                                                       |

|                | Command or Action                                                               | Purpose                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <code>Router(config-telephony)# em logout 19:00 24:00</code>                    | <ul style="list-style-type: none"> <li><i>time</i>—Time of day after which logged-in users are automatically logged out from Extension Mobility. Range: 00:00 to 24:00 on a 24-hour clock.</li> </ul> |
| <b>Step 11</b> | <b>end</b><br><br><b>Example:</b><br><code>Router(config-telephony)# end</code> | Returns to privileged EXEC mode.                                                                                                                                                                      |

## Enable SIP Phones for Extension Mobility

To enable the Extension Mobility feature on a SIP phone in Cisco Unified CME, perform the following steps.

**Note** All Cisco Unified SIP phones with displays that support URL provisioning are supported by Extension Mobility.

### Before you begin

- HTTP server is enabled on the Cisco Unified CME router.
- Default logout and user profiles to be assigned to a phone must be configured in Cisco Unified CME.
- The voice register directory numbers in default logout and user profiles must be configured in Cisco Unified CME. To configure SIP directory numbers, see [Cisco Unified Communications Manager Express Command Reference Guide](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **id mac** *mac-address*
5. **type** *phone-type*
6. **logout-profile** *profile-tag*
7. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                      | Purpose                                                                                                            |
|---------------|------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br><code>Router&gt; enable</code> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>voice register pool <i>pool-tag</i></b><br><b>Example:</b><br>Router(config)# voice register pool 22        | Enables phone configuration mode. <ul style="list-style-type: none"> <li>• <i>pool-tag</i>—Unique number that identifies this register pool during configuration tasks. Range is 1 to 42.</li> </ul>                                                                                                                                                                                                                    |
| <b>Step 4</b> | <b>id mac <i>mac-address</i></b><br><b>Example:</b><br>Router(config-register-pool)# id mac 0123.4567.89AB     | Associates a physical phone with this ephone configuration. <ul style="list-style-type: none"> <li>• <i>mac-address</i>—mac address of the physical phone</li> </ul>                                                                                                                                                                                                                                                    |
| <b>Step 5</b> | <b>type <i>phone-type</i></b><br><b>Example:</b><br>Router(config-register-pool)# type 7970                    | Defines a phone type for the phone being configured.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 6</b> | <b>logout-profile <i>profile-tag</i></b><br><b>Example:</b><br>Router(config-register-pool)# logout-profile 22 | Enables Cisco Unified SIP phone for Extension Mobility and assigns a logout profile to this phone. <ul style="list-style-type: none"> <li>• <i>profile tag</i>—Unique identifier of a logout profile to be used when no phone user is logged in to this phone. This tag number corresponds to a tag number created when this logout profile was configured by using the <b>voice logout-profile</b> command.</li> </ul> |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                    | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                          |

## Configure a User Profile

To configure a user profile for a phone user who logs into a Cisco Unified IP phone that is enabled for Extension Mobility, perform the following steps.

**Note** Templates created using the **ephone-template** and **ephone-dn-template** commands can be applied to a user profile for Extension Mobility.

**Restriction**

- For button appearance, Extension Mobility associates directory numbers, then speed-dial definitions in the logout profile or user profile to phone buttons. The sequence in which directory numbers are associated is based on line type and ring behavior as follows: first normal, then silent ring, beep ring, feature ring, monitor ring, and overlay, followed by speed dials. If the profile contains more directory numbers and speed-dial numbers than there are buttons on the physical phone to which the profile is downloaded, not all numbers are downloaded to buttons.
- The first number to be configured for line appearance cannot be a monitored directory number.
- The user name parameter of any authentication credential must be unique. Do not use the same value for a user name when you configure any two or more authentication credentials in Cisco Unified CME, such as the user name in a logout or user profile for Extension Mobility.

**Before you begin**

- All directory numbers to be included in a logout profile or user profile must be already configured in Cisco Unified CME. For configuration information, see [Configure Phones to Make Basic Call, on page 327](#).
- For Automatic Logout, Cisco Unified CME 4.3 or a later version.
- For Privacy on extension mobility phones, Cisco Unified CME 4.3 or a later version.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice user-profile** *profile-tag*
4. **user name** **password** *password*
5. **number** *number* **type** *type*
6. **speed-dial** *speed-tag number* [ **label** *label* ] [ **blf** ]
7. **pin** *number*
8. **max-idle-time** *minutes*
9. **privacy-button**
10. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                      | Purpose                                                                                                                   |
|---------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                                                                                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>voice user-profile <i>profile-tag</i></b><br><b>Example:</b><br>Router(config)# voice user-profile 1                                                                                                                                                                                                                                                                                                                                           | Enters voice user-profile configuration mode for configuring a user profile for Extension Mobility. <ul style="list-style-type: none"> <li>• <i>profile-tag</i>—Unique number that identifies this profile during configuration tasks. Range: 1 to three times the maximum number supported phones, where maximum is platform dependent. Type ? to display value.</li> </ul>                                                                                                                                                                                                                                         |
| <b>Step 4</b> | <b>user <i>name</i> password <i>password</i></b><br><b>Example:</b><br>Router(config-user-profile)# user me password pass123                                                                                                                                                                                                                                                                                                                      | Creates credential to be authenticated by Cisco Unified CME before allowing the phone user to log into a Cisco Unified IP phone enabled for Extension Mobility. <ul style="list-style-type: none"> <li>• <i>name</i>—Unique alphanumeric string to identify a user for this authentication credential only.</li> <li>• <i>password</i>—Password for authorized user.</li> </ul>                                                                                                                                                                                                                                      |
| <b>Step 5</b> | <b>number <i>number</i> type <i>type</i></b><br><b>Example:</b><br>Router(config-user-profile)# number 2001 type silent-ring<br>Router(config-user-profile)# number 2002 type beep-ring<br>Router(config-user-profile)# number 2003 type feature-ring<br>Router(config-user-profile)# number 2004 type monitor-ring<br>Router(config-user-profile)# number 2005,2006 type overlay<br>Router(config-user-profile)# number 2007,2008 type cw-overly | Creates line definition. <ul style="list-style-type: none"> <li>• <i>number</i>—Directory number to be associated with and displayed next to a button on a phone that is configured with this profile.</li> <li>• [, ...<i>number</i>]—(Optional) For overlay lines only, with or without call waiting. The directory number that is far left in the command list is given the highest priority. Can contain up to 25 numbers. Individual numbers must be separated by commas (,)</li> <li>• <b>type <i>type</i></b>—Denotes characteristics to be associated with this line. Type ? for list of options.</li> </ul> |
| <b>Step 6</b> | <b>speed-dial <i>speed-tag</i> <i>number</i> [ <i>label</i> <i>label</i> ] [ <i>blf</i> ]</b><br><b>Example:</b><br>Router(config-user-profile)# speed-dial 1 3001<br>Router(config-user-profile)# speed-dial 2 3002 blf                                                                                                                                                                                                                          | Creates speed-dial definition. <ul style="list-style-type: none"> <li>• <i>speed-tag</i>—Unique sequence number that identifies a speed-dial definition during configuration tasks. Range: 1 to 36.</li> <li>• <i>number</i>—Digits to be dialed when the speed-dial button is pressed.</li> <li>• <b>label <i>label</i></b>—(Optional) String that contains identifying text to be displayed next to the speed-dial button. Enclose the string in quotation marks if the string contains a space.</li> </ul>                                                                                                        |

|                | Command or Action                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                      | <ul style="list-style-type: none"> <li>• <b>blf</b>—(Optional) Enables Busy Lamp Field (BLF) monitoring for a speed-dial number.</li> </ul>                                                                                                                                                                                                                                 |
| <b>Step 7</b>  | <b>pin</b> <i>number</i><br><b>Example:</b><br><code>Router(config-user-profile)# pin 12341</code>                   | Sets a personal identification number (PIN) to be used by a phone user to disable the call blocking configuration for a Cisco Unified IP phone on which this profile is downloaded. <ul style="list-style-type: none"> <li>• <i>number</i>—Numeric string containing four to eight digits.</li> </ul>                                                                       |
| <b>Step 8</b>  | <b>max-idle-time</b> <i>minutes</i><br><b>Example:</b><br><code>Router(config-user-profile)# max-idle-time 30</code> | (Optional) Creates an idle-duration timer for automatically logging out an Extension Mobility user. <ul style="list-style-type: none"> <li>• This command is supported in Cisco Unified CME 4.3 and later versions.</li> <li>• <i>minutes</i>—Maximum number of minutes after which a user is logged out from an idle Extension Mobility phone. Range:1 to 9999.</li> </ul> |
| <b>Step 9</b>  | <b>privacy-button</b><br><b>Example:</b><br><code>Router(config-user-profile)# privacy-button</code>                 | (Optional) Enables the privacy feature button on the IP phone. <ul style="list-style-type: none"> <li>• Enable this command only on phones that share an octo-line directory number.</li> <li>• This command is supported in Cisco Unified CME 4.3 and later versions.</li> </ul>                                                                                           |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-user-profile)# end</code>                                       | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                              |

## Configuration Examples for Extension Mobility

### Example for Configuring Extension Mobility for Use with SIP Phones

The following example shows a sample configuration for enabling Extension Mobility for use with SIP phones:

```

Router#en
Router#conf t
Enter configuration commands, one per line. End with CNTL/Z.

Router(config)#ip http server
Router(config)#voice register global
Router(config-register-global)$.2.0/CCMCIP/authenticate.asp admin password
Router(config-register-global)#exit
Router(config)#telephony-service

```

```
Router(config-telephony)#authentication credential admin password
Router(config-telephony)#em keep-history
Router(config-telephony)#em logout 19:00
Router(config-telephony)#end
```

## Example for Configuring SIP Phones for Use with Extension Mobility

The following example shows a sample configuration for enabling a SIP phone to use Extension Mobility:

```
Router#en
Router#conf t
Enter configuration commands, one per line. End with CNTL/Z.

Router#en
Router#conf t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#voice register pool 1
Router(config-register-pool)#id mac 12.34.56
Router(config-register-pool)#type 7960
Router(config-register-pool)#logout-profile 22
Enabling extension mobility will replace current phone configuration with logout
profile, continue?? [yes]: y
Router(config-register-pool)#end
```

## Example for Configuring Logout Profile

The following example shows the configuration for a logout profile that defines the default appearance for a Cisco Unified IP phone that is enabled for Extension Mobility. Which lines and speed-dial buttons in this profile are configured on a phone depends on the phone type. For example, for a Cisco Unified IP Phone 7970, all buttons are configured according to logout profile1. However, if the phone is a Cisco Unified IP Phone 7960, all six lines are mapped to phone buttons and the speed dial is ignored because there is no button available for speed dial.

```
voice logout-profile 1
pin 9999
user 23C2-8 password 43214
number 3001 type silent-ring
number 3002 type beep-ring
number 3003 type feature-ring
number 3004 type monitor-ring
number 3005,3006 type overlay
number 3007,3008 type cw-overly
speed-dial 1 2000
speed-dial 2 2001 blf
```

## Example for Enabling an IP Phone for Extension Mobility

The following example shows the ephone configurations for three IP phones. All three phones are enabled for Extension Mobility and share the same logout profile number 1, to be downloaded when these phones boot and when no phone user is logged into the phone.

```
ephone 1

## Example for Configuring User Profile

The following example shows the configuration for a user profile to be downloaded when a phone user logs into a Cisco Unified IP phone that is enabled for Extension Mobility. Which lines and speed-dial buttons in this profile are configured on a phone after the user logs in depends on the phone type. For example, if the user logs into a Cisco Unified IP Phone 7970, all buttons are configured according to voice-user profile1. However, if the phone user logs into a Cisco Unified IP Phone 7960, all six lines are mapped to phone buttons and the speed dial is ignored because there is no button available for speed dial.

```
voice user-profile 1
pin 12345
user me password pass123
number 2001 type silent-ring
number 2002 type beep-ring
number 2003 type feature-ring
number 2004 type monitor-ring
number 2005,2006 type overlay
number 2007,2008 type cw-overly
speed-dial 1 3001
speed-dial 2 3002 blf
```

## Where to Go Next

- If you created a new or modified an existing logout or user profile, you must restart the phones to propagate the changes. See [Reset and Restart Cisco Unified IP Phones, on page 409](#).
- If you enabled one or more Cisco Unified IP phones for Extension Mobility, generate a new configuration file and restart the phones. See [Configuration Files for Phones, on page 399](#).

## Feature Information for Extension Mobility

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 54: Feature Information for Extension Mobility**

| Feature Name                                                       | Cisco Unified CME Version | Modification                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Support for Extension Mobility in Cisco Unified SCCP IP Phones | 9.0                       | Adds new MIB objects to monitor Cisco Unified SCCP IP EM phones.                                                                                                                                                                                                                                                                                                                                                                    |
| Support for SIP phones                                             | 8.6                       | Adds support for SIP phones.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Extension Mobility Enhancement                                     | 7.0/4.3                   | Adds support for the following: <ul style="list-style-type: none"> <li>• Automatic Logout, including:</li> <li>• Configurable time-of-day timers for automatically logging out all Extension Mobility users.</li> <li>• Configurable idle-duration timer for logging out an individual user from an idle Extension Mobility phone.</li> <li>• Automatic Clear Call History when a user logs out from Extension Mobility.</li> </ul> |
| Phone User-Interface for Speed Dial                                | 7.0/4.3                   | Adds a phone user interface allowing Extension Mobility users to configure their own speed-dial settings directly on the phone.                                                                                                                                                                                                                                                                                                     |
| Extension Mobility                                                 | 4.2                       | Provides the benefit of phone mobility for end users by enabling the user to log into any local Cisco Unified IP Phone that is enabled for Extension Mobility.                                                                                                                                                                                                                                                                      |

## CHAPTER 22

# Fax Relay

---

This chapter describes how to enable Skinny Client Control Protocol (SCCP) Fax Relay for analog foreign exchange service (FXS) ports under the control of Cisco Unified CME.

- [Prerequisites for Fax Relay, on page 745](#)
- [Restrictions for Fax Relay, on page 746](#)
- [Information About Fax Relay, on page 746](#)
- [Configure Fax Relay, on page 748](#)
- [Configuration Examples for Fax Relay, on page 750](#)
- [Feature Information for Fax Relay, on page 750](#)

## Prerequisites for Fax Relay

- Cisco Unified CME 4.0(3) or a later version.
- If your voice gateway is a separate router than the Cisco Unified CME router, an IP voice image of Cisco IOS Release 12.4(11)T or later is required.
- SCCP Telephony Control (STC) application is enabled.

---

### Note

- For Cisco Unified CME versions before Cisco Unified CME 4.0(3), there are two manually-controlled options for setting up facsimiles:

- Fax Gateway Protocol

Configure the Cisco VG224, FXS port, or analog telephone adaptor (ATA) to use H.323 or Session Initiation Protocol (SIP) with a specific fax relay protocol. See [Fax, Modem, and Text Support over IP Configuration Guide](#).

- G.711 Fax Pass-Through with SCCP

This is the default setup for facsimile on the Cisco VG224 and FXS ports before Cisco Unified CME 4.0(3). See [Fax, Modem, and Text Support over IP Configuration Guide](#).

---

## Restrictions for Fax Relay

- RFC2833 dual tone multifrequency (DTMF) digit relay under Cisco Unified CME for SCCP FXS ports is not supported.
- SCCP FXS ports under Cisco Unified CME control do not natively support RFC2833 DTMF-relay. However, Cisco Unified CME can support conversion of DTMF digits to and from RFC2833 DTMF-relay on its H323 and SIP interfaces when used with SCCP-controlled FXS ports.
- Cisco Fax Relay is only supported on those Cisco IOS gateways and network modules listed in [Table 55: Supported Gateways, Modules, and VICs for Fax Relay](#), on page 747.

## Information About Fax Relay

### Fax Relay and Equipment

- The fax relay feature supports the use of existing customer premises equipment (CPE) in voice networks by allowing legacy analog phones attached to a Cisco IOS gateway to be controlled by Cisco Unified CME, and by providing feature interoperability between analog and IP endpoints.
- The voice gateway can be the same router that is being used for Cisco Unified CME or it may be a separate router (for example, the Cisco VG224).
- The fax relay feature facilitates replacement of the PSTN time-division multiplexing (TDM) infrastructure with VoIP.

### Feature Design of Cisco Fax Relay

Cisco Fax Relay is a proprietary fax relay implementation that uses Real-time Transport Protocol (RTP) to transport fax data. It is the default fax relay type on Cisco voice gateways and the only supported fax option for Cisco Unified CME 4.0(3) and later versions. The fax relay feature provides enhanced supplementary feature capability on analog ports connected to a Cisco integrated services router (ISR) or Cisco VG224 analog gateway. Calls through the analog FXS ports are controlled by the Cisco Unified CME system.

Before the introduction of SCCP-enhanced features, SCCP gateways supported fax pass-through only. SCCP-enhanced features add support for Cisco Fax Relay and Super Group 3 (SG3) to G3 fax relay. This feature allows the fax stream between two SG3 fax machines to negotiate down to G3 speeds (less than 14.4 kbps) allowing SG3 fax machines to interoperate over fax relay with G3 fax machines.

The SCCP telephony control (STC) application on the Cisco voice gateway presents the locally attached analog telephones as individual endpoints to the call-control system, which allows the analog phones to be controlled in the same way as IP phones. With this capability, gateway-attached endpoints share the same telephony features that are available on IP phones directly connected to Cisco Unified CME. SCCP-enhanced features provide analog endpoint to analog endpoint interoperability within the IP telephony network.

[Figure 26: Cisco Unified CME Fax Relay Deployment, on page 747](#) shows a multisite deployment of the fax relay feature in a Cisco Unified CME topology.

Figure 26: Cisco Unified CME Fax Relay Deployment

For information on configuring gateway-controlled fax relay features, see [Configure Fax Relay](#), on page 748.

## Supported Gateways, Modules, and Voice Interface Cards for Fax Relay

[Table 55: Supported Gateways, Modules, and VICs for Fax Relay](#), on page 747 lists supported gateways, modules, and voice interface cards (VICs).

Table 55: Supported Gateways, Modules, and VICs for Fax Relay

| Gateways                                                                                                                                                                     | Extension Modules | Network Modules and Expansion Modules                                                                 | VICs                                                                                                           |

## Configure Fax Relay

### Configure Fax Relay on SCCP Phones

#### SUMMARY STEPS

1. enable
2. configure terminal
3. voice service voip
4. fax protocol cisco
5. fax-relay sg3-to-g3

## 6. exit

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                             | Purpose                                                                                                                                                                                                                                                                              |
|---------------|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                    | Enters global configuration mode.                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>voice service voip</b><br><b>Example:</b><br>Router(config)# voice service voip            | Enters voice service configuration mode and specifies VoIP encapsulation.                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>fax protocol cisco</b><br><b>Example:</b><br>Router(config-voi-serv)# fax protocol cisco   | Specifies the Cisco-proprietary fax protocol as the fax protocol for SCCP analog endpoints.<br><ul style="list-style-type: none"> <li>• This command is enabled by default.</li> <li>• This is the only supported option for Cisco Unified CME 4.0(3) and later versions.</li> </ul> |
| <b>Step 5</b> | <b>fax-relay sg3-to-g3</b><br><b>Example:</b><br>Router(config-voi-serv)# fax relay sg3-to-g3 | (Optional) Enables the fax stream between two SG3 fax machines to negotiate down to G3 speeds.                                                                                                                                                                                       |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Router(config-voi-serv)# exit                               | Exits the current configuration mode.                                                                                                                                                                                                                                                |

## Verify and Troubleshoot Fax Relay Configuration

To verify the Cisco Fax Relay configuration, use the **show-running config** command. Sample output is located in the [Example for Configuring Fax Relay, on page 750](#).

Use the following commands to verify and troubleshoot SCCP gateway-controlled Fax Relay:

- **show voice call summary**—Displays fax relay voice port settings.
- **show voice dsp**—Displays fax relay digital signal processor (DSP) channel status.
- **debug voip application stcapp all**— Displays SCCP telephony control (STC) application fax relay information.

- **debug voip dsm all**—Displays fax relay DSP stream manager (DSM) messages.
- **debug voip dsmp all**—Displays fax relay distributed stream media processor (DSMP) messages.
- **debug voip hpi all**—Displays gateway DSP fax relay information on RTP packet events.
- **debug voip vtsp all**—Displays gateway voice telephony service provider (VTSP) debugging information for fax calls.

**Note**

For more information on these and other commands, see [Cisco IOS Voice Command Reference](#), [Cisco Unified Communications Manager Express Command Reference](#), and [Cisco IOS Configuration Fundamentals Command Reference](#).

## Configuration Examples for Fax Relay

### Example for Configuring Fax Relay

```
voice service voip
 fax-relay sg3-to-g3

ephone-dn 44
 number 1234
 name fax machine

ephone 33
 mac-address 1111.2222.3333
 button 1:44
 type anl
```

## Feature Information for Fax Relay

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 56: Feature Information for Cisco Fax Relay**

| Feature Name | Cisco Unified CME Version | Feature Information                                                                                       |
|--------------|---------------------------|-----------------------------------------------------------------------------------------------------------|
| Fax Relay    | 4.0(3)                    | Enables Fax Relay on analog FXS ports on Cisco IOS voice gateways under the control of Cisco Unified CME. |

## CHAPTER 23

# Feature Access Codes

---

- [Information About Feature Access Codes, on page 751](#)
- [Configure Feature Access Codes, on page 753](#)
- [Verify Feature Access Codes, on page 755](#)
- [Configuration Examples for Feature Access Codes, on page 756](#)
- [Feature Information for Feature Access Codes, on page 756](#)

## Information About Feature Access Codes

### Feature Access Codes

Feature Access Codes (FACs) are special patterns of characters for dialing from a phone keypad to invoke particular features. For example, you can press **\*\*1**, then press **2345** to forward all incoming calls to extension 2345.

Invokes FACs using a short sequence of digits for dialing the keypad on an analog phone. Similarly, on an IP phone you can select softkeys to invoke the same features. In Cisco Unified Communications Manager Express 4.0 and later, enable the same FACs that are available for analog phones on IP phones. It allows you to select a particular feature or activate and deactivate a function in the same manner regardless of the phone type.

Disable FACs on IP phones until they are explicitly enabled. You can enable all standard FACs for all registered SCCP phones in Cisco Unified Communications Manager Express. Similarly you can define a custom FAC or alias to enable one or more individual FACs.

All FACs except the call-park FAC are valid only immediately after a phone is off hook. The call-park FAC is considered transfer to a call-park slot and therefore is only valid after initiating transfer using the Transfer softkey (IP phones) or hookflash (analog phones).

---

**Note** Configured directory numbers on the Cisco Unified Communications Manager Express router cannot overlap with the numbers you assign for FAC Standard or FAC Custom in a FAC configuration. Also, ensure that the FAC code always starts with an asterisk, followed by digits.

---

**Note** For Custom FAC configuration, two FAC codes cannot overlap with one another. A sample configuration (with 54 overlapping) that you must avoid, is as follows:

```
telephony-service fac custom
dnd *54
ephone-hunt hlog-phone *5432
```

[Table 57: Standard Feature Access Codes, on page 752](#) Contains a list of the standard predefined FACs.

**Table 57: Standard Feature Access Codes**

| Standard FAC                       | Description                                                                                                                                                                                                                      |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| **1 plus optional extension number | Call Forward All.                                                                                                                                                                                                                |
| **2                                | Call forward all cancel.                                                                                                                                                                                                         |
| **3                                | Select a local group.                                                                                                                                                                                                            |
| **4 plus group number              | Select an incoming call in the specified pickup group. Specified pickup group must be already configured in Cisco Unified Communications Manager Express.                                                                        |
| **5 plus extension number          | Select a direct extension.                                                                                                                                                                                                       |
| **6 plus optional park-slot number | Call park, if you have an active call and if you press the Transfer softkey (IP phone) or hookflash (analog phone) before dialing this FAC. Configure the target park slot in Cisco Unified Communications Manager Express.      |
| **7                                | Do Not Disturb.                                                                                                                                                                                                                  |
| **8                                | Redial.                                                                                                                                                                                                                          |
| **9                                | Dial voicemail number.                                                                                                                                                                                                           |
| *3 plus hunt group pilot number    | Join ephone-hunt group. If you have created multiple hunt groups allowing dynamic membership, identify the joining hunt group by its pilot number.                                                                               |
| *4                                 | Activate or deactivate the hunt group logout functionality to toggle between ready or not-ready status of an extension when the hunt group agent is off-hook.                                                                    |
| *5                                 | Activate or deactivate a phone-level hunt group logout to toggle between ready or not-ready status of all extensions on an individual phone. The individual phone member must be of an ephone hunt group when the phone is idle. |
| *6                                 | Dials the voicemail number.                                                                                                                                                                                                      |
| #3                                 | Leave ephone-hunt group. Configure the Phone or extension number as a dynamic member of a hunt group.                                                                                                                            |

**Note** For FAC feature to work on SIP phones configuring **call-park system application** under **telephony-service** is mandatory. The following FAC is supported with SIP phones:

- **CALL\_PICKUP** - Allows a phone user to answer a call that is ringing on another phone by pressing the FAC digit **\*\*5** and then dialing the extension.
- **GROUP\_PICKUP** - Allows a phone user to answer a call that is ringing phone in any pickup group by pressing the FAC digit **\*\*3** and then dialing the pickup group number.
- **LOCAL\_GPICKUP** - Allows a phone user to select a call that is ringing on another phone by pressing the FAC digit **\*\*4** and then the asterisk (\*) if both phones are in the same pickup group.
- **DPARK\_RETRIEVE** - Allows a phone user to retrieve a parked call on an SCCP phone by pressing the FAC digit **\*0** and dialing the extension number of the call-park slot.
- **REGULAR\_PARK** - Allows a phone user to place a call on hold by pressing the FAC digit **\*\*6** at a special extension so it can be retrieved from any other phone in the system.
- **VOICE\_HUNTGRP\_JOIN** - Allows a phone user to join to or from voice hunt groups by selecting the Join FAC digit **\*3** which is displayed on the voice hunt group page.
- **VOICE\_HUNTGRP\_UNJOIN\_ALL** - Allows a phone user to unjoin from all voice hunt groups by selecting the unJoin FAC digit **#4** which is displayed on the voice hunt group page.
- **VOICE\_HUNTGRP\_UNJOIN\_PARTICULAR** - Allows a phone user to unjoin from a particular voice hunt group by selecting the unJoin FAC digit **#4** which is displayed on the voice hunt group page.
- **VOICE\_HUNTGRP\_TEMP\_LOGOUT** - Allows a phone user to use the HLog FAC digit **\*5** to change from the ready to not-ready status or from the not-ready to ready status.
- **SIP\_NIGHT\_SERVICE\_CODE** - Allows a phone user to enter a night-service code to toggle night-service treatment on and off from any phone that is assigned to the night service.

## Configure Feature Access Codes

To enable standard FACs or create custom FACs, perform the following steps:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **call-park system application**
5. **fac {standard | custom {alias alias-tag custom-fac to existing-fac [extra-digits] } | feature custom-fac } }**
6. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                                                                                          | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 4</b> | <b>call-park system application</b><br><b>Example:</b><br>Router(config-telephony)# call-park system application                                                                          | Configure <b>call-park system application</b> for FAC feature to work on SIP phones.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 5</b> | <b>fac {standard   custom {alias alias-tag custom-fac to existing-fac [extra-digits] }   feature custom-fac} }</b><br><b>Example:</b><br>Router(config-telephony)# fac custom callfwd *#5 | Enables standard FACs or creates a custom FAC or alias. <ul style="list-style-type: none"> <li>• <b>standard</b>—Enables standard FACs for all phones.</li> <li>• <b>custom</b>—Creates a custom FAC for a FAC type.</li> <li>• <b>alias</b>—Creates a custom FAC for an existing FAC or an existing FAC plus extra digits.</li> <li>• <i>alias-tag</i>—Unique identifying number for this alias. Range: 0 to 9.</li> <li>• <i>custom-fac</i>—User-defined code to be dialed using the keypad on an IP or analog phone. Custom FAC can be up to 256 characters long and contain numbers 0 to 9 and * and #.</li> <li>• <b>to</b>—Maps custom FAC to specified target.</li> <li>• <i>existing-fac</i>—Already configured custom FAC that is automatically dialed when the phone user dials the custom FAC being configured.</li> <li>• <i>extra-digits</i>—(Optional) Additional digits that are automatically dialed when the phone user dials the custom FAC being configured.</li> <li>• <i>feature</i>—Predefined alphabetic string that identifies a particular feature or function. Type ? for a list.</li> </ul> |

|        | Command or Action                                                  | Purpose                          |
|--------|--------------------------------------------------------------------|----------------------------------|
| Step 6 | <b>end</b><br><br><b>Example:</b><br>Router(config-telephony)# end | Returns to privileged EXEC mode. |

## Verify Feature Access Codes

To verify the FAC configuration, perform the following step.

### Procedure

#### show telephony-service fac

##### Example:

This command displays a list of FACs that are configured on the Cisco Unified CME router. The following example shows the output when standard FACs are enabled:

```
Router# show telephony-service fac
```

```
telephony-service fac standard
callfwd all **1
callfwd cancel **2
pickup local **3
pickup group **4
pickup direct **5
park **6
dnd **7
redial **8
voicemail **9
ephone-hunt join *3
ephone-hunt cancel #3
ephone-hunt hlog *4
ephone-hunt hlog-phone *5
trnsfvm *6
```

The following example shows the output when custom FACs are configured:

```
Router# show telephony-service fac
```

```
telephony-service fac custom
callfwd all #45
alias 0 #1 to **4121
alias 1 #2 to **4122
alias 4 #4 to **4124
```

# Configuration Examples for Feature Access Codes

## Example for Enabling Standard FACs for All Phones

The following example shows how to enable standard FACs for all phones:

```
Router# telephony-service
Router(config-telephony)# fac standard
fac standard is set!
Router(config-telephony)#
```

The following example shows how the standard FAC for the Call Forward All feature is changed to a custom FAC (#45). Then an alias is created to map a second custom fac to #45 plus an extension (1111). The custom FAC (#44) allows the phone user to press #44 to forward all calls to extension 1111, without requiring the phone user to dial the extra digits that are the extension number.

```
Router# telephony-service
Router(config-telephony)# fac custom callfwd all #45
fac callfwd all code has been configured to #45
Router(config-telephony)# fac custom alias 0 #44 to #451111
fac alias0 code has been configured to #44!
alias0 map code has been configured to #451111!
```

The following example shows how to define an alias for the group pickup of group 123. The alias substitutes the digits #4 for the standard FAC for group pickup (\*\*4) and adds the group number (123) to the dial pattern. Using this custom FAC, a phone user can dial #4 to pick up a ringing call in group 123, instead of dialing the standard FAC \*\*4 plus the group number 123.

```
Router# telephony-service
Router(config-telephony)# fac custom alias 5 #4 to **4123
```

## Feature Information for Feature Access Codes

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 58: Feature Information for Feature Access Codes**

| Feature Name                | Cisco Unified CME Version | Feature Information                       |
|-----------------------------|---------------------------|-------------------------------------------|
| Transfer to Voice Mail.     | 7.0/4.3                   | FAC for Transfer to Voice Mail was added. |
| Feature Access Codes (FACs) | 4.0                       | FACs were introduced.                     |

## CHAPTER 24

# Forced Authorization Code

---

- [Information About Forced Authorization Code, on page 757](#)
- [Configure Forced Authorization Code, on page 762](#)
- [Configuration Example for Forced Authorization Code, on page 766](#)
- [Feature Information for Forced Authorization Code, on page 767](#)

## Information About Forced Authorization Code

### Forced Authorization Code Overview

Cisco Unified CME 8.5 allows you to manage call access and call accounting through the Forced Authorization Code (FAC) feature. The FAC feature regulates the type of call a certain caller may place and forces the caller to enter a valid authorization code on the phone before the call is placed. FAC allows you to track callers dialing non-toll-free numbers, long distance numbers, and also for accounting and billing purposes.

In Cisco Unified CME and Cisco Voice Gateways, devices and endpoints are logically partitioned into different logical partitioning class of restriction (LPCOR) groups. For example, IP phones, Analog phones, PSTN trunks, and IP (h323/SIP) trunks as shown in [Figure 27: Forced Authorization Code Network Overview, on page 758](#), are partitioned into five LPCOR groups under the voice lpcor custom mode, such as:

- voice lpcor custom
- group 10 Manager
- group 11 LocalUser
- group 12 RemoteUser
- group 13 PSTNTrunk
- group 14 IPTrunk

Figure 27: Forced Authorization Code Network Overview

For each group, the LPCOR group policy of a routing endpoint is enhanced to define incoming calls from individual LPCOR groups that are restricted by FAC. A LPCOR group call to a destination is accepted only when a valid FAC is entered. FAC service for a routing endpoint is enabled through the service fac defined in a LPCOR group policy. For more information, see [Enable Forced Authorization Code \(FAC\) on LPCOR Groups, on page 762](#).

The following are the group policy rules applicable to the PSTNTrunk LPCOR group:

- FAC is required by PSTNTrunk if a call is initiated from either LocalUser or RemoteUser group.
- Any calls from Manager group are allowed to terminate to PSTNTrunk without restriction.
- Any incoming calls from either IPTrunk or PSTNTrunk group are rejected and terminated to PSTNTrunk group.

For information on configuring LPCOR groups and associating LPCOR group with different device types, see [Call Restriction Regulations, on page 1089](#).

## FAC Call Flow

FAC is required for an incoming call based on the LPCOR policy defined for the call destination. Once the authentication is finished, the success or failure status and the collected FAC digits are saved to the call detail records (CDRs).

Calls are handled by a new built-in application authorization package which first plays a user-prompt for the caller to enter a username (in digits), then the application plays a passwd-prompt for the caller to collect the password (in digits). The collected username and password digits are then used for FAC, see [Define Parameters for Authorization Package, on page 764](#).

When FAC authentication is successful, the outgoing call setup is continued to the same destination. If FAC authentication fails, the call is then forwarded to the next destination. FAC operations are invoked to the call if FAC service is enabled in the next destination and no valid FAC status is saved for the call.

Any calls failing because of FAC blocking are disconnected with a LPCOR Q.850 disconnect cause code. Once the FAC is invoked for a call, the collected authorization digits and the authentication status information is collected by call active or call history records. You can retrieve the FAC information through the **show call active voice** and **show call history voice** commands.

## Forced Authorization Code Specification

The authorization code used for call authentication must follow these specifications:

- The authorization code must be in numeric (0 – 9) format.
- A digit collection operation must be completed if either one of the following conditions occur:
  - maximum number of digits are collected
  - digit input times out
  - a terminating digit is entered

Once digit collection is completed, the authentication is done by either the external Radius server or Cisco Unified CME or Cisco Voice Gateways by using AAA Login Authentication setup. For more information on AAA login authentication methods, see [Configuring Authentication](#).

When authentication is done by local Cisco Unified CME or Cisco Voice Gateways, the **username ac-code password 0 password** command is required to authenticate the collected authorization code digits.

FAC data is stored through the CDR and new **AAA fac-digits** and **fac-status** attributes and are supported in a CDR STOP record. This CDR STOP record is formatted for file accounting, RADIUS or Syslog accounting purpose.

## FAC Requirement for Different Types of Calls

[Table 59: FAC Support for Different Types of Calls, on page 759](#) shows FAC support for different types of calls.

**Table 59: FAC Support for Different Types of Calls**

| Types of Calls                     | FAC Behavior for Different Calls                                                                                                                                                                                                                                                                           |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Basic Call                         | A calls B. B requires A to enter a FAC. A is routed to B only when A enters a valid FAC.                                                                                                                                                                                                                   |
| Call Forward All Call Forward Busy | When A (with no FAC) calls B, A is call forwarded to C: <ul style="list-style-type: none"> <li>• No FAC is required when B enables Call Forward All or Call Forward Busy to C.</li> <li>• FAC is required on A when A is call forwarded to C.</li> </ul>                                                   |

## Configure Forced Authorization Code

### Enable Forced Authorization Code (FAC) on LPCOR Groups

#### Restriction

Authenticated FAC data is saved to a call-log from which the authorization code is collected. When a call-forward or blind transfer call scenario triggers a new call due to the SIP notify feature, the same caller is required to enter the authorization code again for FAC authentication.

#### Warning

A FAC pin code must be unique and not the same as an extension number. Cisco Unified CME, Cisco Unified SRST, and Cisco Voice Gateways will not validate whether a collected FAC pin code matches an extension number.

#### Before you begin

- You must enable the voice lpcor enable command before configuring FAC.
- Trunks (IP and PSTN) must be associated with phones into different LPCOR groups. See [Associate a LPCOR Policy with Analog Phone or PSTN Trunk Calls, on page 1099](#) for more information.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **voice lpcor enable**
4. **voice lpcor custom**
5. **group number lpcor-group**
6. **exit**
7. **voice lpcor policy lpcor-group**
8. **accept lpcor-group fac**
9. **service fac**
10. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                   |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                       |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                 | Enters global configuration mode.                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>voice lpcor enable</b><br><b>Example:</b><br>Router(config)# voice lpcor enable                                                                                                                                                                                                         | Enables LPCOR functionality on the Cisco Unified CME router.                                                                                                                                                                                              |
| <b>Step 4</b> | <b>voice lpcor custom</b><br><b>Example:</b><br>Router(config)# voice lpcor custom                                                                                                                                                                                                         | Defines the name and number of LPCOR resource groups on the Cisco Unified CME router.                                                                                                                                                                     |
| <b>Step 5</b> | <b>group number lpcor-group</b><br><b>Example:</b><br>Router(cfg-lpcor-custom)#group 10 Manager<br>Router(cfg-lpcor-custom)#group 11 LocalUser<br>Router(cfg-lpcor-custom)#group 12 RemoteUser<br>Router(cfg-lpcor-custom)#group 13 PSTNTrunk<br>Router(cfg-lpcor-custom)#group 14 IPTrunk | Adds a LPCOR resource group to the custom resource list.<br><ul style="list-style-type: none"> <li><i>number</i>—Group number of the LPCOR entry. Range: 1 to 64.</li> <li><i>lpcor-group</i>—String that identifies the LPCOR resource group.</li> </ul> |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Router(conf-voi-serv)# exit                                                                                                                                                                                                                              | Exits voice-service configuration mode.                                                                                                                                                                                                                   |
| <b>Step 7</b> | <b>voice lpcor policy lpcor-group</b><br><b>Example:</b>                                                                                                                                                                                                                                   | Creates a LPCOR policy for a resource group.<br><ul style="list-style-type: none"> <li><i>lpcor-group</i>—Name of the resource group that you defined in Step 5.</li> </ul>                                                                               |

|                | Command or Action                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Step 10</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(config-ephone)# end</pre>                                                                                                                                                      | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Example****Example:**

```
Router# show voice lpcor policy
voice lpcor policy PSTNTrunk (group 13):
service fac is enabled
 (accept) Manager (group 10)
 (reject) LocalUser (group 11)
 (reject) RemoteUser (group 12)
 (accept) PSTNTrunk (group 13)
 (reject) IPTrunk (group 14)
```

## Define Parameters for Authorization Package

To define required parameters for user name and password, follow these steps:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **application**
4. **package auth**
5. **param passwd**
6. **param user-prompt** *filename*
7. **param passwd-prompt** *filename*
8. **param max-retries**
9. **param term-digit**
10. **param abort-digit**
11. **param max-digits**
12. **exit**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                               | Enters global configuration mode.                                                                                                                                                                                                                                                                        |
| <b>Step 3</b> | <b>application</b><br><b>Example:</b><br>Router(config)#application<br>Router(config-app)#                                               | Enters the application configuration mode.                                                                                                                                                                                                                                                               |
| <b>Step 4</b> | <b>package auth</b><br><b>Example:</b><br>Router(config-app)#package auth                                                                | Enters package authorization configuration mode.                                                                                                                                                                                                                                                         |
| <b>Step 5</b> | <b>param passwd</b><br><b>Example:</b><br>Router(config-app)#package param passwd 12345                                                  | Character string that defines a predefined password for authorization.<br><b>Note</b><br>Password digits collection is optional if password digits are predefined in the <b>param passwd</b> command.                                                                                                    |
| <b>Step 6</b> | <b>param user-prompt</b> <i>filename</i><br><b>Example:</b><br>Router(config-app-param)#param user-prompt<br>flash:en_bacd_enter_dest.au | Allows you to enter the user name parameters required for package authorization for FAC authentication.<br><ul style="list-style-type: none"> <li>• <b>user-prompt</b> <i>filename</i> — Plays an audio prompt requesting the caller to enter a valid username (in digits) for authorization.</li> </ul> |

|                | Command or Action                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                     |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b>  | <b>param passwd-prompt <i>filename</i></b><br><b>Example:</b><br><pre>Router(config-app-param)#param passwd-prompt flash:en_welcome.au</pre> | <p>Allows you to enter the password parameters required for package authorization for FAC authentication.</p> <ul style="list-style-type: none"> <li>• <b>passwd-prompt <i>filename</i></b>—Plays an audio prompt requesting the caller to enter a valid password (in digits) for authorization.</li> </ul> |
| <b>Step 8</b>  | <b>param max-retries</b><br><b>Example:</b><br><pre>Router(config-app-param)#param max-retries 0</pre>                                       | <p>Specifies number of attempts to re-enter an account or a password.</p> <ul style="list-style-type: none"> <li>• <b>max-entries</b>—Value ranges from 0-10, default value is 0.</li> </ul>                                                                                                                |
| <b>Step 9</b>  | <b>param term-digit</b><br><b>Example:</b><br><pre>Router(config-app-param)#param term-digit #</pre>                                         | <p>Specifies digit for terminating an account or a password digit collection.</p>                                                                                                                                                                                                                           |
| <b>Step 10</b> | <b>param abort-digit</b><br><b>Example:</b><br><pre>Router(config-app-param)#param abort-digit *</pre>                                       | <p>Specifies the digit for aborting username or password digit input. Default value is *.</p>                                                                                                                                                                                                               |
| <b>Step 11</b> | <b>param max-digits</b><br><b>Example:</b><br><pre>Router(config-app-param)#param max-digits 32</pre>                                        | <p>Maximum number of digits in a username or password. Range of valid value: 1 - 32. Default value is 32.</p>                                                                                                                                                                                               |
| <b>Step 12</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(conf-app-param)# exit</pre>                                                                    | <p>Exits package authorization parameter configuration mode.</p>                                                                                                                                                                                                                                            |

## Feature Information for Forced Authorization Code

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 60: Feature Information for Forced Authorization Code**

| Feature Name              | Cisco Unified CME Version | Modification                |
|---------------------------|---------------------------|-----------------------------|
| Forced Authorization Code | 8.5                       | Introduced the FAC feature. |

## CHAPTER 25

# Headset Auto Answer

- [Information About Headset Auto Answer, on page 769](#)
- [Configure Headset Auto Answer, on page 771](#)
- [Configuration Example for Headset Auto Answer, on page 772](#)
- [Feature Information for Headset Auto Answer, on page 773](#)

## Information About Headset Auto Answer

### Auto Answering Calls Using a Headset

In Cisco Unified CME 4.0 and later versions you can configure lines on specific phones to automatically connect to incoming calls when the headset key is activated. The phone cannot be busy with an active call and the headset key must be engaged to automatically answer calls. Incoming calls are automatically answered one by one on the phone as long as the headset light remains lit. For each ephone, you can specify one or more lines for headset auto answer.

After a phone is configured for headset auto answer, the phone user must press the headset key to start auto answer. The headset light is lit to indicate that auto answer is active for the lines that are designated in the configuration. When the phone auto answers a call, a *zip* tone is played to alert the phone user that a call is present. To stop auto answer, the phone user presses the headset key again and the headset light goes out. At this time, the phone user can answer calls in a normal manner using the handset.

### Difference Between a Line and a Button

Note that a line is similar to, but not exactly the same as, a button on the phone. A line represents a phone's capability to make a call connection, so each button that can make a call connection becomes a line. (For example, unoccupied buttons or speed-dial buttons are not lines.) Note also that a line is not the same as an ephone-dn. A button with overlaid ephone-dns is only one line, regardless of whether it has several ephone-dns (extension numbers) associated with it. In most cases an ephone's line numbers do match its button numbers, but in a few cases they do not.

[Figure 28: When is a Line the Same as a Button?, on page 770](#) illustrates a comparison of line numbers and button numbers for different types of ephone configurations.

**Figure 28: When is a Line the Same as a Button?**

Most of the time, a line number is the same as the button number on which it appears.

In this example, line 1 is button 1, line 2 is button 2, and line 3 is button 3.

```
ephone-dn 21
number 2001

ephone-dn 22
number 2002

ephone-dn 23
number 2003

ephone 2
button 1:21 2:22 3:23
headset auto-answer line 1
headset auto-answer line 2
```

But not always. In the following case, line 2 is button 3, because button 3 is the second button that has an ephone-dn to be connected to a phone call. Button 2 is unoccupied and cannot take calls.

```
ephone-dn 33
number 2889

ephone-dn 34
number 2887

ephone 2
button 1:33 3:34
headset auto-answer line 1
headset auto-answer line 2
```

In the following example, button 2 has three overlay ephone-dns (22, 23, and 24). Button 2 is defined as one line because only one of those ephone-dns can be connected to a call using this button at any one time.

```
ephone-dn 21
number 2001

ephone-dn 22
number 2002

ephone-dn 23
number 2003

ephone-dn 24
number 2004

ephone-dn 25
number 2005

ephone 2
button 1:21 2o22,23,24 3:25
headset auto-answer line 2
headset auto-answer line 3
```

An expansion, or rollover, line for overlaid ephone-dns also counts as one line. Button 2 in this example is also line 2.

```
ephone-dn 21
number 2001

ephone-dn 22
number 2002

ephone-dn 23
number 2003

ephone-dn 24
number 2004

ephone 2
button 1o21,22,23 2x1 3:24
headset auto-answer line 1
headset auto-answer line 2
```

# Configure Headset Auto Answer

## Enable Headset Auto Answer

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **headset auto-answer line** *line-number*
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                        |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                      | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br><pre>Router(config)# ephone 25</pre>                                             | Enters ephone configuration mode.<br><ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks. The maximum number of ephones for a particular Cisco Unified CME system is version- and platform-specific. For the range of values, see the CLI help.</li> </ul> |
| <b>Step 4</b> | <b>headset auto-answer line</b> <i>line-number</i><br><b>Example:</b><br><pre>Router(config-ephone)# headset auto-answer line 1</pre> | Specifies a line on an ephone that will be answered automatically when the headset button is depressed.<br><ul style="list-style-type: none"> <li>• <i>line-number</i>—Number of the phone line that should be automatically answered.</li> </ul> <p><b>Note</b><br/>Repeat this command to add additional lines.</p>                          |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone)# end</pre>                                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                               |

## Verify Headset Auto Answer

### Procedure

- Step 1** Use the **show running-config** command to verify your configuration. Headset auto answer is listed in the ephone portion of the output.

```
Router# show running-config

ephone 1
 headset auto-answer line 1
 headset auto-answer line 2
 headset auto-answer line 3
 headset auto-answer line 4
 username "Front Desk"
 mac-address 011F.92B0.BE03
 speed-dial 1 330 label "Billing"
 type 7960 addon 1 7914
 no dnd feature-ring
 keep-conference
 button 1f40 2f41 3f42 4:30
 button 5:405 7m20 8m21 9m22
 button 10m23 11m24 12m25 13m26
 button 14m499 15:1 16m31 17f498
 button 18s500
 night-service bell
```

- Step 2** Use the **show telephony-service ephone** command to display only the ephone configuration portion of the running configuration.

## Configuration Example for Headset Auto Answer

### Example for Enabling Headset Auto Answer

The following example enables headset auto answer on ephone 3 for line 1 (button 1) and line 4 (button 4).

```
ephone 3
 button 1:2 2:4 3:6 4o21,22,23,24,25
 headset auto-answer line 1
 headset auto-answer line 4
```

The following example enables headset auto answer on ephone 17 for line 2 (button 2), which has overlaid ephone-dns, and line 3 (button 3), which is an overlay rollover line.

```
ephone 17
 button 1:2 2o21,22,23,24,25 3x2
 headset auto-answer line 2
 headset auto-answer line 3
```

The following example enables headset auto answer on ephone 25 for line 2 (button 3) and line 3 (button 5). In this case, the button numbers do not match the line numbers because buttons 2 and 4 are not used.

```
ephone 25
 button 1:2 3:4 5:6

## Feature Information for Headset Auto Answer

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 61: Feature Information for Headset Auto Answer**

| Feature Name        | Cisco Unified CME Version | Feature Information                 |
|---------------------|---------------------------|-------------------------------------|
| Headset Auto Answer | 4.0                       | Headset auto answer was introduced. |

## CHAPTER 26

# Intercom Lines

---

- [Information About Intercom Lines, on page 775](#)
- [Configure Intercom Lines, on page 778](#)
- [Configuration Examples for Intercom Lines, on page 786](#)
- [Where to Go Next, on page 787](#)
- [Feature Information for Intercom Lines, on page 787](#)

## Information About Intercom Lines

### Intercom Auto-Answer Lines

An intercom line is a dedicated two-way audio path between two phones. Cisco Unified CME supports intercom functionality for one-way and press-to-answer voice connections using a dedicated pair of intercom directory numbers on two phones that speed-dial each other.

When an intercom speed dial button is pressed, a call is speed-dialed to the directory that is the other half of the dedicated pair. The called phone automatically answers the call in speaker-phone mode with mute activated, providing a one-way voice path from the initiator to the recipient. A beep is sounded when the call is auto-answered to alert the recipient to the incoming call. To respond to the intercom call and open a two-way voice path, the recipient deactivates the mute function by pressing the Mute button or, on phones such as the Cisco Unified IP Phone 7910, lifting the handset.

In Cisco CME 3.2.1 and later versions, you can deactivate the speaker-mute function on intercom calls. For example, if phone user 1 makes an intercom call to phone user 2, both users hear each other on connection when no-mute is configured. The benefit is that people who receive intercom calls can be heard without them having to disable the mute function. The disadvantage is that nearby background sounds and conversations can be heard the moment a person receives an intercom call, regardless of whether they are ready to take a call or not.

Intercom lines cannot be used in shared-line configurations. If a directory number is configured for intercom operation, it must be associated with one IP phone only. The intercom attribute causes an IP phone line to operate as an autodial line for outbound calls and as an autoanswer-with-mute line for inbound calls. [Figure 29: Intercom Lines, on page 776](#) shows an intercom between a receptionist and a manager.

To prevent an unauthorized phone from dialing an intercom line (and creating a situation in which a phone automatically answers a nonintercom call), you can assign the intercom a directory number that includes an alphabetic character. No one can dial the alphabetic character from a normal phone, but the phone at the other end of the intercom can be configured to dial the number that contains the alphabetic character through the

Cisco Unified CME router. For example, the intercom ephone-dns in [Figure 29: Intercom Lines, on page 776](#) are assigned numbers with alphabetic characters so that only the receptionist can call the manager on his or her intercom line, and no one except the manager can call the receptionist on his or her intercom line.

**Note** An intercom requires the configuration of two ephone-dns, one each on a separate phone.

**Figure 29: Intercom Lines**

## Whisper Intercom

When a phone user dials a whisper intercom line, the called phone automatically answers using speaker-phone mode, providing a one-way voice path from the caller to the called party, regardless of whether the called party is busy or idle.

Unlike the standard intercom feature, this feature allows an intercom call to a busy extension. The calling party can only be heard by the recipient. The original caller on the receiving phone does not hear the whisper page. The phone receiving a whisper page displays the extension and name of the party initiating the whisper page and Cisco Unified CME plays a zipzip tone before the called party hears the caller's voice. If the called party wants to speak to the caller, the called party selects the intercom line button on their phone. The lamp for intercom buttons are colored amber to indicate one-way audio for whisper intercom and green to indicate two-way audio for standard intercom.

You must configure a whisper intercom directory number for each phone that requires the Whisper Intercom feature. A whisper intercom directory number can place calls only to another whisper intercom directory number. Calls between a whisper intercom directory number and a standard directory number or intercom directory number are rejected with a busy tone.

This feature is supported in Cisco Unified CME 7.1 and later versions. For configuration information, see [Configure Whisper Intercom on SCCP Phones, on page 780](#).

## SIP Intercom

In Cisco Unified CME 8.8, the SIP Intercom feature is released as part of the 8.3(1) IP Phone firmware.

The SIP intercom line provides a one-way voice path from the caller to the called phone. When a phone user dials the intercom line, the called phone automatically answers the call in speaker-phone mode with Mute activated. If the called SIP phone is busy with a connected call or with an outgoing call that has not been connected, the call is whispered into the called phone.

As soon as the called phone auto-answers, the intercom call recipient has three options:

- Listen to the one-way audio of the intercom caller without answering.
- End the call by pressing the speaker-phone button or the EndCall softkey.
- Press the intercom button to create a two-way voice path and respond to the intercom caller.

If the called phone is busy when the intercom call arrives and a response is requested, the active call is put on hold and the outgoing call that is not connected yet is canceled before the intercom call is connected for a two-way voice path.

**Note** The lamp for the intercom line button displays an amber light for one-way intercom and green for a two-way voice path.

You should configure an intercom directory number to begin and end an intercom call for each phone that requires the Intercom feature. For configuration information, see [Configure Intercom Call Option on SIP Phones, on page 784](#).

However, a standard directory number without the intercom option configured can also place an intercom call. The called phone also has the option of responding to the call by pressing the intercom line button to establish a two-way voice path with the originator without the intercom option configured.

[Table 62: SIP-SCCP Interactions for the SIP Intercom Feature, on page 777](#) shows the supported SIP-SCCP interactions for the SIP Intercom feature.

**Table 62: SIP-SCCP Interactions for the SIP Intercom Feature**

| Originator                 | Terminator                 | Intercom      |
|----------------------------|----------------------------|---------------|
| SIP normal line            | SIP intercom line          | Supported     |
| SIP intercom line          | SIP intercom line          | Supported     |

| SCCP intercom line | SCCP normal line | Not Supported |

## Extension Number

The extension number of an intercom line can be included in an extension mobility user-profile or extension mobility logout-profile.

The BLF feature can define the extension number of an intercom line as a speed dial on a Cisco Unified CME phone, allowing the line status of the intercom line to be monitored.

For configuration information, see [Configure Extension Mobility for SIP Phones, on page 735](#).

# Configure Intercom Lines

## Configure an Intercom Auto-Answer Line on SCCP Phones

To enable a two-way audio path between two phones, perform the following steps for each Cisco Unified SCCP IP phone at both ends of the two-way voice path.

### Restriction

- Intercom lines cannot be dual-line.
- If a directory number is configured for intercom operation, it can be associated with only one Cisco Unified IP phone.
- Each phone, at both ends of the two-way voice path, requires a separate configuration.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *dn-tag*
4. **number** *number*
5. **name** *name*
6. **intercom** *extension-number* [ [**barge-in** [**no-mute**] | **no-auto-answer** | **no-mute**] [**label** *label*] ]  
| **label** *label*]
7. **exit**
8. **ephone** *phone-tag*
9. **button** *button-number: dn-tag* [ [*button-number: dn-tag*] ...]
10. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                            | Purpose                                                                                                                                                                                                                                                                                                               |
|---------------|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                       | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal               | Enters global configuration mode.                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>ephone-dn</b> <i>dn-tag</i><br><br><b>Example:</b><br>Router(config)# ephone-dn 11        | Enters ephone-dn configuration mode.<br><br>• Do not use the <b>dual-line</b> keyword with this command. Intercom ephone-dns cannot be dual-line.                                                                                                                                                                     |
| <b>Step 4</b> | <b>number</b> <i>number</i><br><br><b>Example:</b><br>Router(config-ephone-dn)# number A2345 | Assigns a valid intercom number.<br><br>• Using one or more alphabetic characters in an intercom number ensures that the number can only be dialed from the one other intercom number that is programmed to dial this number. The number cannot be dialed from a normal phone if it contains an alphabetic character. |
| <b>Step 5</b> | <b>name</b> <i>name</i><br><br><b>Example:</b><br>Router(config-ephone-dn)# name intercom    | Sets a name to be associated with the ephone-dn.<br><br>• This name is used for caller-ID displays and also shows up in the local directory associated with the ephone-dn.                                                                                                                                            |

|                | Command or Action                                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                       |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b>  | <b>intercom</b> <i>extension-number</i> [ [ <b>barge-in</b> [ <b>no-mute</b> ]   <b>no-auto-answer</b>   <b>no-mute</b> ] [ <i>label label</i> ] ]   <b>label</b> <i>label</i> ]<br><br><b>Example:</b><br>Router(config-ephone-dn)# intercom A2346 label Security | Defines the directory number that is speed-dialed for the intercom feature when this line is used.                                                                                                                                                            |
| <b>Step 7</b>  | <b>exit</b><br><br><b>Example:</b><br>Router(config-ephone-dn)# exit                                                                                                                                                                                               | Exits ephone-dn configuration mode.                                                                                                                                                                                                                           |
| <b>Step 8</b>  | <b>ephone</b> <i>phone-tag</i><br><br><b>Example:</b><br>Router(config)# ephone 24                                                                                                                                                                                 | Enters ephone configuration mode.                                                                                                                                                                                                                             |
| <b>Step 9</b>  | <b>button</b> <i>button-number: dn-tag</i> [ [ <i>button-number: dn-tag</i> ] ...]<br><br><b>Example:</b><br>Router(config-ephone)# button 1:1 2:4 3:14                                                                                                            | Assigns a button number to the intercom ephone-dn being configured. <ul style="list-style-type: none"> <li>• Use the colon separator (:) between the button number and the intercom ephone-dn tag to indicate a normal ring for the intercom line.</li> </ul> |
| <b>Step 10</b> | <b>end</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                                                                                                                          | Exits ephone configuration mode and enters privileged EXEC mode.                                                                                                                                                                                              |

## Configure Whisper Intercom on SCCP Phones

To enable the Whisper Intercom feature on a directory number, perform the following steps.

### Restriction

- Single-line phone models, such as the Cisco Unified IP Phone 7906 or 7911, are not supported.
- Whisper intercom directory numbers can place calls only to other whisper intercom numbers.
- A directory number can be configured as either a regular intercom or a whisper intercom, not both.
- Dual-line and octo-line directory numbers are not supported as intercom lines.
- Only one intercom call, either incoming or outgoing, is allowed on the phone at one time.
- Call features are not supported on intercom calls.

### Before you begin

- Cisco Unified CME 7.1 or a later version.
- IP phones require SCCP 12.0 or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn *dn-tag***
4. **whisper-intercom [*label string* | **speed-dial number** [*label string*]]**
5. **end**
6. **show ephone-dn whisper**

## DETAILED STEPS

## Example

The following example shows Whisper Intercom configured on extension 2004:

```
ephone-dn 24
 number 2004
 whisper-intercom label "sales"!
!
ephone 24
 mac-address 02EA.EAEA.0001
 button 1:24
```

# Configure an Intercom Auto-Answer Line on SIP Phones

To enable the Intercom Auto-Answer feature for Cisco Unified SIP IP phones, perform the following steps for each IP phone at both ends of the two-way voice path.

**Restriction**

- If a directory number is configured for intercom operation, it can be associated with only one Cisco Unified IP phone.
- Each phone, at each end of the two-way voice path, requires a separate configuration.

**Before you begin**

Cisco CME 3.4 or a later version.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice register dn *dn-tag***
4. **number *number***
5. **auto-answer**
6. **exit**
7. **voice register pool *pool-tag***
8. **id { *mac address* }**
9. **type *phone-type***
10. **number *tag* dn *dn-tag***
11. **end**

|----------------|----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b>  | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                |
| <b>Step 3</b>  | <b>voice register dn dn-tag</b><br><b>Example:</b><br><pre>Router(config-register-global)# voice register dn 1</pre> | Enters voice register dn configuration mode to define a directory number for a Cisco Unified SIP IP phone, intercom line, voice port, or an MWI.                                                                                                                                                                                                                 |
| <b>Step 4</b>  | <b>number number</b><br><b>Example:</b><br><pre>Router(config-register-dn)# number A5001</pre>                       | Defines a valid number for the directory number being configured. <ul style="list-style-type: none"> <li>To prevent non-intercom originators from manually dialing an intercom destination, the number string can contain alphabetic characters enabling the number to be dialed only by the Cisco Unified CME router and not from telephone keypads.</li> </ul> |
| <b>Step 5</b>  | <b>auto-answer</b><br><b>Example:</b><br><pre>Router(config-register-dn)# auto-answer</pre>                          | Enables the Intercom Auto-Answer feature on the directory number being configured.                                                                                                                                                                                                                                                                               |
| <b>Step 6</b>  | <b>exit</b><br><b>Example:</b><br><pre>Router(config-register-dn)# exit</pre>                                        | Exits voice register dn configuration mode.                                                                                                                                                                                                                                                                                                                      |
| <b>Step 7</b>  | <b>voice register pool pool-tag</b><br><b>Example:</b><br><pre>Router(config)# voice register pool 3</pre>           | Enters voice register pool configuration mode to set phone-specific parameters for a Cisco Unified SIP IP phone in Cisco Unified CME.                                                                                                                                                                                                                            |
| <b>Step 8</b>  | <b>id {mac address}</b><br><b>Example:</b><br><pre>Router(config-register-pool)# id mac 0009.A3D4.1234</pre>         | Explicitly identifies a locally available individual Cisco Unified SIP IP phone to support a degree of authentication.                                                                                                                                                                                                                                           |
| <b>Step 9</b>  | <b>type phone-type</b><br><b>Example:</b><br><pre>Router(config-register-pool)# type 7960-7940</pre>                 | Defines a phone type for the Cisco Unified SIP IP phone being configured.                                                                                                                                                                                                                                                                                        |
| <b>Step 10</b> | <b>number tag dn dn-tag</b><br><b>Example:</b><br><pre>Router(config-register-pool)# number 1 dn 17</pre>            | Associates a directory number with the Cisco Unified SIP IP phone being configured.                                                                                                                                                                                                                                                                              |

|         | Command or Action                                                                   | Purpose                                                                       |
|---------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| Step 11 | <b>end</b><br><br><b>Example:</b><br><code>Router(config-register-pool)# end</code> | Exits voice register pool configuration mode and enters privileged EXEC mode. |

## Configure Intercom Call Option on SIP Phones

### Restriction

- The Intercom feature is not supported on single-line phones because the intercom line cannot be the primary line of a Cisco Unified CME SIP IP phone.
- The intercom line cannot be shared among SIP phones.
- FAC is not supported on a SIP intercom call because the keys are disabled.

### Before you begin

- Cisco Unified CME 8.8 or a later version.
- 8.3(1) phone firmware or a later version is installed on the Cisco Unified SIP IP phone.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn** *dn-tag*
4. **number** *number*
5. **intercom** [**speed-dial** *digit-string*] [**label** *label-text*]
6. **exit**
7. **voice register pool** *pool-tag*
8. **id** {**network** *address mask mask* | **ip** *address mask mask* | **mac** *address*}
9. **type** *phone-type*
10. **number** *tag dn dn-tag*
11. **end**

| <b>Step 2</b>  | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b>  | <b>voice register dn dn-tag</b><br><b>Example:</b><br><pre>Router(config)# voice register dn 4</pre>                                                                      | Enters voice register dn configuration mode to define an extension for a SIP intercom line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 4</b>  | <b>number number</b><br><b>Example:</b><br><pre>Router(config-register-dn)# number 4001</pre>                                                                             | Associates a telephone or extension number with a Cisco Unified SIP phone in a Cisco Unified CME system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 5</b>  | <b>intercom [speed-dial digit-string] [label label-text]</b><br><b>Example:</b><br><pre>Router(config-register-dn)# intercom [speed-dial 4002] [label intercom4001]</pre> | <p>Enables the intercom call option on a Cisco Unified SIP IP phone.</p> <ul style="list-style-type: none"> <li>• (Optional) <b>speed-dial</b>—Enables the intercom line user to place a call to a pre-configured destination. If the speed dial is not configured, it simply initiates a new call on the intercom line and waits for the user to dial the destination number.</li> <li>• (Optional) <b>label label-text</b>—String that contains identifying text to be displayed next to the speed dial button. Enclose the string in quotation marks if the string contains a space.</li> </ul> |
| <b>Step 6</b>  | <b>exit</b><br><b>Example:</b><br><pre>Router(config-register-dn)# exit</pre>                                                                                             | Exits configuration mode to the next highest mode in the configuration mode hierarchy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 7</b>  | <b>voice register pool pool-tag</b><br><b>Example:</b><br><pre>Router(config)# voice register pool 3</pre>                                                                | Enters voice register pool configuration mode to set phone-specific parameters for a Cisco Unified SIP phone in Cisco Unified CME.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 8</b>  | <b>id {network address mask mask   ip address mask mask   mac address}</b><br><b>Example:</b><br><pre>Router(config-register-pool)# id mac 0009.A3D4.</pre>               | Explicitly identifies a locally available individual Cisco Unified SIP phone to support a degree of authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 9</b>  | <b>type phone-type</b><br><b>Example:</b><br><pre>Router(config-register-pool)# type 7940</pre>                                                                           | Defines a phone type for the Cisco Unified SIP phone being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 10</b> | <b>number tag dn dn-tag</b><br><b>Example:</b>                                                                                                                            | Associates a directory number tag with the Cisco Unified SIP IP phone being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                | Command or Action                                                    | Purpose                        |
|----------------|----------------------------------------------------------------------|--------------------------------|
|                | Router(config-register-pool)# number 1 dn 17                         |                                |
| <b>Step 11</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-register-dn)# end | Exits to privileged EXEC mode. |

## Configuration Examples for Intercom Lines

### Example for Configuring Intercom Lines

The following example shows an intercom between two Cisco Unified IP phones. In this example, ephone-dn 2 and ephone-dn 4 are normal extensions, while ephone-dn 18 and ephone-dn 19 are set as an intercom pair. Ephone-dn 18 is associated with line button 2 on Cisco Unified IP phone 4. ephone-dn 19 is associated with line button 2 on Cisco Unified IP phone 5. The two ephone-dns provide a two-way intercom between the two Cisco Unified IP phones.

```
ephone-dn 2
 number 5333

ephone-dn 4
 number 5222

ephone-dn 18
 number 5001
 name "intercom"
 intercom 5002 barge-in

ephone-dn 19
 name "intercom"
 number 5002
 intercom 5001 barge-in

ephone 4
 button 1:2 2:18

ephone 5
 button 1:4 2:19
```

### Example for Configuring SIP Intercom Support

The following example shows SIP Intercom configured on extension 1001:

```
voice register dn 1
 number 1001
 intercom [speed-dial 1002] [label intercom1001]

voice register pool 1
 id mac 001D.452D.580C
 type 7962
 number 1 dn 2
```

```
number 2 dn 1
```

## Where to Go Next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

### Paging

The paging feature sets up a one-way audio path to deliver information to a group of phones at one time. For more information, see [Paging, on page 851](#).

## Feature Information for Intercom Lines

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnnng.cisco.com/>. An account on Cisco.com is not required.

**Table 63: Feature Information for Intercom Lines**

| Feature Name     | Cisco Unified CME Version | Feature Information                                                                                                                                   |
|------------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP Intercom     | 8.8                       | Adds intercom support to Cisco Unified SIP IP phones connected to a Cisco Unified CME system.                                                         |
| Whisper Intercom | 7.1                       | Introduces whisper intercom feature.                                                                                                                  |
| Intercom Lines   | 3.4                       | Adds intercom feature, with no-mute function, for supported Cisco Unified IP phones that are connected to a Cisco Unified CME router and running SIP. |
|                  | 3.2.1                     | Introduces the no-mute function.                                                                                                                      |
|                  | 2.0                       | Introduces the Intercom feature.                                                                                                                      |

## CHAPTER 27

# Loopback Call Routing

- [Information About Loopback Call Routing, on page 789](#)
- [Configure Loopback Call Routing, on page 790](#)
- [Configuration Example for Loopback Call Routing, on page 794](#)
- [Feature Information for Loopback Call Routing, on page 794](#)

## Information About Loopback Call Routing

### Loopback Call Routing

Loopback call routing in a Cisco Unified CME system is provided through a mechanism called loopback-dn, which provides a software-based limited emulation of back-to-back physical voice ports connected together to provide a loopback call-routing path for voice calls.

Loopback call routing and loopback-dn restricts the passage of call-transfer and call-forwarding supplementary service requests through the loopback. Instead of passing these requests through, the loopback-dn mechanism attempts to service the requests locally. This allows loopback-dn configurations to be used in call paths where one of the external devices does not support call transfer or call forwarding (Cisco-proprietary or H.450-based). Control messages that request call transfer or call forwarding are intercepted at the loopback virtual port and serviced on the local voice gateway. If needed, this mechanism creates VoIP-to-VoIP call-routing paths.

Loopback call routing may be used for routing H.323 calls to Cisco Unity Express. For information on configuring Cisco Unity Express, see the [Cisco Unity Express](#) documentation.

**Note** A preferred alternative to loopback call routing was introduced in Cisco CME 3.1. This alternative blocks H.450-based supplementary service requests by using the following Cisco IOS commands: **no supplementary-service h450.2**, **no supplementary-service h450.3**, and **supplementary-service h450.12**. For more information, see [Configure Call Transfer and Forwarding, on page 1160](#).

Use of loopback-dn configurations within a VoIP network should be restricted to resolving critical network interoperability service problems that cannot otherwise be solved. Loopback-dn configurations are intended for use in VoIP network interworking where the alternative would be to make use of back-to-back-connected physical voice ports. Loopback-dn configurations emulate the effect of a back-to-back physical voice-port arrangement without the expense of the physical voice-port hardware. Because digital signal processors (DSPs) are not involved in loopback-dn arrangements, the configuration does not support interworking or transcoding

between calls that use different voice codecs. In many cases, use of back-to-back physical voice ports that do involve DSPs to resolve VoIP network interworking issues is preferred, because it introduces fewer restrictions in terms of supported codecs and call flows.

Loopback call routing requires two extensions (ephone-dns) to be separately configured, each as half of a loopback-dn pair. Ephone-dns that are defined as a loopback-dn pair can only be used for loopback call routing. In addition to defining the loopback-dn pair, you must specify preference, huntstop, class of restriction (COR), and translation rules.

# Configure Loopback Call Routing

## Enable Loopback Call Routing

To enable loopback call-routing, perform the following steps for each ephone-dn that is part of the loopback-dn pair.

|                    |                                             |
|--------------------|---------------------------------------------|
| <b>Restriction</b> | Loopback-dns do not support T.38 fax relay. |
|--------------------|---------------------------------------------|

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *dn-tag*
4. **number** *number* [**secondary number**] [**no-reg** [**both** | **primary** ]]
5. **caller-id** {**local** | **passthrough**}
6. **no huntstop**
7. **preference** *preference-order* [**secondary** *secondary-order*]
8. **cor** {**incoming** | **outgoing**} *cor-list-name*
9. **translate** {**called** | **calling**} *translation-rule-tag*
10. **loopback-dn** *dn-tag* [**forward** *number-of-digits* | **strip** *number-of-digits*] [**prefix** *prefix-digit-string*] [**suffix** *suffix-digit-string*] [**retry** *seconds*] [**auto-con** ] [**codec** {**g711alaw** | **g711ulaw**}]
11. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                      | Purpose                                                                                                                   |
|---------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|        | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 3 | <b>ephone-dn dn-tag</b><br><b>Example:</b><br><pre>Router(config)# ephone-dn 15</pre>                                                     | <p>Enters ephone-dn configuration mode, creates an ephone-dn, and optionally assigns it dual-line status.</p> <ul style="list-style-type: none"> <li>• <b>dn-tag</b>—Unique sequence number that identifies this ephone-dn during configuration tasks. Range is platform- and version-dependent.</li> </ul> <p><b>Note</b><br/>Ephone-dns used for loopback cannot be dual-line ephone-dns.</p>                                                                                                                                                                                                                                                                                                                                                   |
| Step 4 | <b>number number [secondary number] [no-reg [both   primary ]]</b><br><b>Example:</b><br><pre>Router(config-ephone-dn)# number 2001</pre> | <p>Associates a number with this extension (ephone-dn).</p> <ul style="list-style-type: none"> <li>• <b>number</b>—String of up to 16 digits that represents a telephone or extension number to be associated with this ephone-dn.</li> <li>• <b>secondary</b>—(Optional) Allows you to associate a second telephone number with an ephone-dn.</li> <li>• <b>no-reg</b>—(Optional) Specifies that this number should not register with the H.323 gatekeeper. The <b>no-reg</b> keyword indicates that only the secondary number should not register. The <b>no-reg both</b> keywords indicate that both numbers should not register, and the <b>no-reg primary</b> keywords indicate that only the primary number should not register.</li> </ul> |
| Step 5 | <b>caller-id {local   passthrough}</b><br><b>Example:</b><br><pre>Router(config-ephone-dn)# caller-id local</pre>                         | <p>Specifies caller-ID treatment for outbound calls originated from the ephone-dn. The default if this command is not used is as follows. For transferred calls, caller ID is provided by the number and name fields from the outbound side of the loopback-dn. For forwarded calls, caller ID is provided by the original caller ID of the incoming call. Settings for the <b>caller-id block</b> command and translation rules on the outbound side are executed.</p> <ul style="list-style-type: none"> <li>• <b>local</b>—Passes the local caller ID on redirected calls. This is the preferred usage.</li> <li>• <b>passthrough</b>—Passes the original caller ID on redirected calls.</li> </ul>                                            |
| Step 6 | <b>no huntstop</b><br><b>Example:</b><br><pre>Router(config-ephone-dn)# no huntstop</pre>                                                 | Disables huntstop and allows call hunting behavior for an extension (ephone-dn).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b>  | <b>preference</b> <i>preference-order</i> [ <b>secondary</b> <i>secondary-order</i> ]<br><br><b>Example:</b><br>Router(config-ephone-dn)# preference 1                                                                                                                                                                                                                                                                    | Sets dial-peer preference for an extension (ephone-dn). <ul style="list-style-type: none"> <li>• <i>preference-order</i>—Preference order for the primary number associated with an extension (ephone-dn). Range is 0 to 10, where 0 is the highest preference and 10 is the lowest preference. Default is 0.</li> <li>• <b>secondary</b> <i>secondary-order</i>—(Optional) Preference order for the secondary number associated with the ephone-dn. Range is 0 to 10, where 0 is the highest preference and 10 is the lowest preference. Default is 9.</li> </ul>                                                                                                                                                      |
| <b>Step 8</b>  | <b>cor</b> { <b>incoming</b>   <b>outgoing</b> } <i>cor-list-name</i><br><br><b>Example:</b><br>Router(config-ephone-dn)# cor incoming corlist1                                                                                                                                                                                                                                                                           | Applies a class of restriction (COR) to the dial peers associated with an extension. COR specifies which incoming dial peer can use which outgoing dial peer to make a call. Each dial peer can be provisioned with an incoming and an outgoing COR list.<br><br>For information about COR, see <a href="#">Dial Peer Configuration on Voice Gateway Routers</a> .                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 9</b>  | <b>translate</b> { <b>called</b>   <b>calling</b> } <i>translation-rule-tag</i><br><br><b>Example:</b><br>Router(config-ephone-dn)# translate called 1                                                                                                                                                                                                                                                                    | Selects an existing translation rule and applies it to a calling number or a number that has been called. This command enables the manipulation of numbers as part of a dial plan to manage overlapping or nonconsecutive numbering schemes. <ul style="list-style-type: none"> <li>• <b>called</b>—Translates the called number.</li> <li>• <b>calling</b>—Translates the calling number.</li> <li>• <i>translation-rule-tag</i>—Unique sequence number of the previously defined translation rule. Range is 1 to 2147483647.</li> </ul> <p><b>Note</b><br/>This command requires that you have previously defined appropriate translation rules using the <b>voice translation-rule</b> and <b>rule</b> commands.</p> |
| <b>Step 10</b> | <b>loopback-dn</b> <i>dn-tag</i> [ <b>forward</b> <i>number-of-digits</i>   <b>strip</b> <i>number-of-digits</i> ] [ <b>prefix</b> <i>prefix-digit-string</i> ] [ <b>suffix</b> <i>suffix-digit-string</i> ] [ <b>retry</b> <i>seconds</i> ] [ <b>auto-con</b> ]<br>[ <b>codec</b> { <b>g711alaw</b>   <b>g711ulaw</b> }]<br><br><b>Example:</b><br>Router(config-ephone-dn)# loopback-dn 24 forward 15 prefix 415353.... | Enables H.323 call transfer and call forwarding by using hairpin call routing for VoIP endpoints that do not support Cisco-proprietary or H.450-based call-transfer and call-forwarding. <ul style="list-style-type: none"> <li>• <i>dn-tag</i>—Unique sequence number that identifies the ephone-dn that is being paired for loopback with the ephone-dn that is being configured. The paired ephone-dn must be one that is already defined in the system.</li> </ul>                                                                                                                                                                                                                                                  |

|         | Command or Action                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         |                                   | <ul style="list-style-type: none"> <li>• <b>forward</b> <i>number-of-digits</i>—(Optional) Number of digits in the original called number to forward to the other ephone-dn in the loopback-dn pair. Range is 1 to 32. Default is to forward all digits.</li> <li>• <b>strip</b> <i>number-of-digits</i>—(Optional) Number of leading digits to be stripped from the original called number before forwarding to the other ephone-dn in the loopback-dn pair. Range is 1 to 32. Default is to not strip any digits.</li> <li>• <b>prefix</b> <i>prefix-digit-string</i>—(Optional) Defines a string of digits to add in front of the forwarded called number. Maximum number of digits in the string is 32. Default is that no prefix is defined.</li> <li>• <b>suffix</b> <i>suffix-digit-string</i>—(Optional) Defines a string of digits to add to the end of the forwarded called number. Maximum number of digits in the string is 32. Default is that no suffix is defined. If you add a suffix that starts with the pound character (#), the string must be enclosed in quotation marks.</li> <li>• <b>retry</b> <i>seconds</i>—(Optional) Number of seconds to wait before retrying the loopback target when it is busy or unavailable. Range is 0 to 32767. Default is that retry is disabled and appropriate call-progress tones are passed to the call originator.</li> <li>• <b>auto-con</b>—(Optional) Immediately connects the call and provides in-band alerting while waiting for the far-end destination to answer. Default is that automatic connection is disabled.</li> <li>• <b>codec</b>—(Optional) Explicitly forces the G.711 A-law or G.711 mu-law voice coding type to be used for calls that pass through the loopback-dn. This overrides the G.711 coding type that is negotiated for the call and provides conversion from mu-law to A-law, if needed. Default is that Real-Time Transport Protocol (RTP) voice packets are passed through the loopback-dn without considering the G.711 coding type negotiated for the calls.</li> <li>• <b>g711alaw</b>—G.711 A-law, 64000 bits per second, for T1.</li> <li>• <b>g711ulaw</b>—G.711 mu-law, 64000 bits per second, for E1.</li> </ul> |
| Step 11 | <b>end</b><br><br><b>Example:</b> | Exits to privileged exec mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|  | Command or Action                          | Purpose |
|--|--------------------------------------------|---------|
|  | <code>Router(config-ephone-dn)# end</code> |         |

## Verify Loopback Call Routing

### Procedure

Use the **show running-config** or **show telephony-service ephone-dn** command to display ephone-dn configurations.

## Configuration Example for Loopback Call Routing

### Example for Enabling Loopback Call Routing

The following example uses ephone-dns 15 and 16 as a loopback-dn pair. Calls are routed through this loopback ephone-dn pair in the following way:

- An incoming call to 4085552xxx enters the loopback pair through ephone-dn 16 and exits the loopback via ephone-dn 15 as an outgoing call to 2xxx (based on the forward 4 digits setting).
- An incoming call to 6xxx enters the loopback pair through ephone-dn 15 and exits the loopback via ephone-dn 16 as an outgoing call to 4157676xxx (based on the prefix 415767 setting).

```
ephone-dn 15
 number 6...
 loopback-dn 16 forward 4 prefix 415767
 caller-id local
 no huntstop
!
ephone-dn 16
 number 4085552...
 loopback-dn 15 forward 4
 caller-id local
 no huntstop
```

## Feature Information for Loopback Call Routing

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 64: Feature Information for Loopback Call Routing**

| Feature Name          | Cisco Unified CME Version | Feature Information                   |
|-----------------------|---------------------------|---------------------------------------|
| Loopback Call Routing | 2.0                       | Loopback call routing was introduced. |

## CHAPTER 28

# Multilevel Precedence and Preemption

This document describes the Multilevel Precedence and Preemption (MLPP) service introduced in Cisco Unified Communications Manager Express 7.1 (Cisco Unified CME).

- [Prerequisites for MLPP, on page 797](#)
- [Information About MLPP, on page 797](#)
- [Configure MLPP, on page 807](#)
- [Feature Information for MLPP, on page 820](#)

## Prerequisites for MLPP

- Cisco Unified CME 7.1
- Cisco IOS Release 12.4(24)T
- To use Cisco Unified CME basic automatic call distribution (B-ACD) and auto-attendant (AA) service as the MLPP attendant-console application, you must download and install the B-ACD scripts. These scripts are available from the Cisco Unified CME Software Download site at <https://software.cisco.com/download/home/277641082>.
- You can use your own audio files for the blocked precedence announcement and busy station not equipped for preemption announcement or you can use the audio files available from the Cisco Unified CME Software Download site at <https://software.cisco.com/download/home/277641082>.

## Information About MLPP

Multilevel Precedence and Preemption (MLPP) service allows validated users to place priority calls, and if necessary, to preempt lower-priority calls. Precedence indicates the priority level of a call. Preemption is the process of terminating a lower-precedence call so a call of higher precedence can proceed. This capability assures high-ranking personnel can communicate with critical organizations and personnel during network stress situations, such as a national emergency or degraded network situation.

## Precedence

Precedence indicates the priority level associated with an MLPP call. Phone users can apply a precedence level when making a call.

You define an MLPP access digit in Cisco Unified CME and assign a maximum precedence level to individual phones. Phone users request a precedence call by dialing the access code NP, where N specifies the pre-configured access digit and P specifies the requested precedence level, followed by the phone number.

Table 28-1 lists the precedence levels that can be associated with an MLPP call in the Defense Switched Network (DSN) domain.

**Table 65: DSN Precedence Levels**

| Level       | Precedence        |
|-------------|-------------------|
| 0<br>(high) | Flash<br>Override |
| 1           | Flash             |
| 2           | Immediate         |
| 3           | Priority          |
| 4 (low)     | Routine           |

Table 28-2 lists the precedence levels that can be associated with an MLPP call in the Defense Red Switched Network (DRSN) domain.

**Table 66: DRSN Precedence Levels**

| Level       | Precedence              |
|-------------|-------------------------|
| 0<br>(high) | Flash Override Override |
| 1           | Flash Override          |
| 2           | Flash                   |
| 3           | Immediate               |
| 4           | Priority                |
| 5 (low)     | Routine                 |

A precedence call is any call with a precedence level higher than Routine. If precedence is not specifically invoked, the system processes a call using normal call processing and call forwarding.

Emergency 911 calls are automatically assigned precedence level 0.

Cisco Unified CME provides precedence indications to the source and destination of a precedence call, respectively, if either has MLPP indication enabled. For the source, this indication includes a precedence ringback tone and display of the precedence level of the call, if the device supports display. For the destination, the indication includes a precedence ringer tone and display of the precedence level of the call, if the device supports display.

## Basic Precedence Call Setup

The following sequence of events occurs during the setup of a precedence call:

1. Phone user goes off hook and dials a precedence call. The call pattern is NP-xxxx, where N is the precedence access digit, P is the precedence level for the call, and xxx is the extension or phone number of the called party.
2. The calling party receives the precedence ringback tone and the precedence display while the call is processing.
3. The called party receives the precedence ringer tone and the precedence display that indicates the precedence call.

### Example

Party 1000 makes a precedence call to party 1001. To do so, party 1000 dials the precedence call pattern, such as 80-1001.

While the call processes, the calling party (1000) receives the precedence ringback tone and precedence display on their Cisco Unified IP Phone. After acknowledging the precedence call, the called party (1001) receives a precedence ringer tone and a precedence display on their Cisco Unified IP Phone.

## Preemption

Preemption is the process of terminating an active call of lower precedence so a call of higher precedence can proceed. Preemption includes the notification and acknowledgment of preempted users and the reservation of shared resources immediately after preemption and before call termination. Preemption can take one of the following two forms:

- **User Access Preemption**—This type of preemption applies to phones and other end-user devices. If a called party is busy with a lower precedence call, both the called party and the party to which it is connected, receive preemption notification and the existing call is cleared immediately.

For calls to Cisco Unified IP phones, the called party can hang up immediately to connect to the new higher precedence call, or if the called party does not hang up, Cisco Unified CME forces the phone on-hook after the configured preemption tone timer expires and connects the call.

For FXS ports, the called party must acknowledge the preemption by going on-hook, before being connected to the new higher precedence call.

- **Common Network Facility Preemption**—This type of preemption applies to trunks. If all channels of a PRI trunk are busy with calls of lower precedence, a call of lower precedence is preempted to complete the higher precedence call.

Cisco Unified CME selects a trunk by first searching for an idle channel on all corresponding trunks (based on matching the called number in the dial peer).

If an idle channel is not found, Cisco Unified CME performs a preemptive-search by searching one trunk at a time for an idle channel. If no idle-channel is available on a trunk, preemption is performed on the lowest of lower-precedence calls corresponding to the trunk. If none of the calls corresponding to the trunk is of lower precedence, the next trunk is searched and so on.

SCCP phones support up to eight calls per directory number. When all lines are busy and a higher precedence MLPP call comes in, Cisco Unified CME preempts a lower precedence call on one of the channels of the directory number.

The maximum precedence level that a user can assign to an MLPP call originating from a specific phone is set using ephone templates and applied to individual phones. Calls from directory numbers that are shared by SCCP phones can have different maximum precedence levels, based on the precedence level of the phone.

## Basic Preemption Call

Figure 28-1 shows an example of user access preemption.

**Figure 30: User Access Preemption Example**

In this example, the following sequence of events occurs:

1. User 1000 places a call with precedence level 1 (flash) to user 1001, and preemption is enabled for user 1001. In this example, user 1000 dials 81-1001 to place the precedence call.
2. User 1002 places a precedence call to user 1001 by dialing 80-1001. This call, which is of precedence level 0 (flash override), is a higher precedence call than the active precedence call.
3. Phone 1002 receives precedence display (flash override display), and the phones that are involved in the existing lower precedence call both play preemption tones (users 1000 and 1001).
4. To complete preemption, the parties who are involved in the lower precedence call hang up (users 1000 and 1001).
5. The higher level precedence call is offered to user 1001, who receives a precedence ringer tone (if MLPP indication is enabled). The calling party, user 1002, receives precedence ringback.

## DSN Dialing Format

Cisco Unified CME 8.0 and later releases provide complete support of the DSN dialing format, as outlined in Table 28-3.

**Table 67: DSN Dialing Format**

|                                                     |              |             |             |             |
|-----------------------------------------------------|--------------|-------------|-------------|-------------|
| [Access-digit {Precedence-level<br> Service-digit}] | [Route-code] | [Area-code] | Switch-code | Line-number |
|-----------------------------------------------------|--------------|-------------|-------------|-------------|

|             |            |            |            |            |     |      |
|-------------|------------|------------|------------|------------|-----|------|
| [N {P   S}] |            |            | [1X]       | [KXX]      | KXX | XXXX |
| N is 2 - 9  | P is 0 - 4 | S is 5 - 9 | X is 0 - 9 | K is 2 - 8 |     |      |

## Service Digit

The service digit provides information to the switch for connecting calls to government or public telephone services or networks. The services are reached through the trunk or route that is selected based on the dialed digits. Phone users request a service by dialing the access code NS, where N specifies the pre-configured access digit and S specifies the requested service, followed by the phone number.

Table 28-4 lists the service digits supported in Cisco Unified CME 8.0 and later versions.

**Table 68: Service Digit**

| Service Digit | Precedence           |
|---------------|----------------------|
| 5             | Off-net 700 services |
| 6             | Not assigned         |
| 7             | DSN CONUS FTS        |
| 8             | Not assigned         |
| 9             | Local PSTN           |

In Cisco Unified CME, the route pattern is configured to supply secondary dial-tone and the remainder of the digits are collected and passed to the PSTN trunk as the called number. The digits that follow the access digit and service digit must be NANP compliant (E.164 number).

Cisco Unified CME provides secondary dial tone after the two digits and then routes the call based on the remaining collected digits (using the dial plan configuration). These services are assumed to be reached through the trunk (or route) selected based on the dialed digits (dialed after the route digits).

## Route Code

The route code allows a phone user to inform the switch of special routing or termination requirements. The route code determines whether a call uses circuit-switched data or voice-grade trunking and can be used to disable echo suppressors and cancellers, and override satellite link control.

The first digit of the route code is 1. It is a required part of the dialing plan to inform the switch that the next digit, the route digit, provides network instructions for specialized routing. Phone users dial route codes in the form 1X, where X is the route digit. The supported route digits that a user can dial are 0 and 1.

Table 28-5 lists the route codes supported in Cisco Unified CME 8.0 and later versions:

**Table 69: Route Codes**

| Route Code | Use                  | Description                                                                                          |
|------------|----------------------|------------------------------------------------------------------------------------------------------|
| 10         | Voice call (default) | Any codec that carries voice or voice band data, such as G.711, G.729, or fax or modem pass-through. |

| Route Code | Use                   | Description                                                                                                                                    |
|------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 11         | Circuit-switched data | Any codec that carries unaltered DS0 traffic over IP (circuit emulation). For Cisco Unified CME, this is the audio/clearmode codec (RFC-4040). |

## Example for Dialing

If the first digit that the user dials is the configured access digit, this indicates an access code where the next digit is either a precedence digit or a service digit. If the next digit dialed is:

- 0-4—This is a precedence call. Cisco Unified CME sets the precedence indication, stores the precedence value, and discards the digits.
- 5-9—This is a call to a particular service. Cisco Unified CME passes the call to the designated trunk, discards the digits, and plays secondary dial tone.

If the first digit that the user dials or the next digit dialed after the access code is:

- 1—This is a route code and the next digit is a route digit. The supported route digits that a user can dial are 0 and 1. Cisco Unified CME stores the route code for use later in route selection, sets a trunk-type indication, and discards the route code digits.

If the first digit that the user dials or the next digit dialed after the access code or route code is:

- 2-8—This is the first digit of the area code or switch code. Area codes and switch codes in the DSN are allocated so there is no overlap. The area code and/or switch code are used for route selection.

## MLPP Service Domains

Cisco Unified CME 8.0 and later versions support MLPP service domains. A service domain consists of a group of MLPP subscribers and network resources. Calls and resources can only be preempted by higher-priority calls from MLPP subscribers within the same domain.

You can configure each device with a domain type, such as DSN or DRSN, and a domain identifier. You can assign a global MLPP domain type and identifier to the Cisco Unified CME router and assign different service domains to the individual phones registered to Cisco Unified CME through an ephone template. Calls from any phone that is not configured with a specific service domain use the global domain type and identifier.

The MLPP precedence and preemption applies only within the same domain. Only calls within the same domain can be preempted. If a call is placed between two subscribers with different MLPP service domains, Cisco Unified CME assigns the service domain of the originator to the call.

Figure 28-2 shows an example of preemption attempted across domains with different identifier numbers.

Figure 31: Service Domains with Different identifiers

In the example shown in [Figure 28-2](#), the following sequence of events occurs:

1. User 1000, from service domain 0100, places a call with precedence level 1 (flash) to user 1001 in service domain 0200. The call is assigned domain number 0100 because that is the service domain of the call originator.
2. User 1002, from domain number 0200, places a precedence call to user 1001. This call, which is of precedence level 0 (flash override), is a higher precedence call than the active precedence call.
3. The active call is not preempted because the incoming call is from a different service domain than the active call; a call from domain 0200 cannot preempt a call from domain 0100.

In the example shown in [Figure 28-3](#), the active call is not preempted because the incoming call is from a different domain type than the active call; a call from the DSN cannot preempt a call from the DRSN.

Figure 32: Service Domains with Different Domain Types

In the example shown in [Figure 28-4](#), the active call is successfully preempted because the incoming call has the same domain type and identifier as the active call.

Figure 33: Service Domains with Same Type and identifier

## MLPP Indication

For basic MLPP calls with MLPP indication enabled, Cisco Unified CME instructs SCCP phones to play the precedence ringer tone and display the precedence level.

For basic MLPP calls with preemption involved and MLPP indication enabled, Cisco Unified CME instructs both parties to play the preemption tone and display the precedence level of the MLPP call on the phone.

For an MLPP call with call waiting, if MLPP indication is enabled, Cisco Unified CME instructs SCCP phones to play priority the call waiting tone instead of the regular call waiting tone.

Users receive an error tone if they attempt to make a call with a higher level of precedence than the highest precedence level that is authorized for their phone.

For example, user 1002 dials 80 to start a precedence call. Eight (8) represents the precedence access digit, and zero (0) specifies the precedence level that the user attempts to use. If this user is not authorized to make level 0 (flash override) precedence calls, the user receives an error tone.

## MLPP Announcements

Users who are unable to place MLPP calls receive announcements that detail the reasons why a call was unsuccessful. [Table 28-6](#) lists the supported MLPP announcements.

Table 70: MLPP Announcements

| Announcement                          | Condition |
|---------------------------------------|-----------|
| Blocked Precedence Announcement (BPA) |           |

| Announcement                                                                                                                                                                                                                | Condition                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (Switch name and Location). Equal or higher precedence calls have prevented completion of your call. Please hang up and try again. This is a recording. (Switch name and Location).                                         | An equal or higher precedence call is in progress.                                                                                                                                                                                                                   |
|                                                                                                                                                                                                                             | Users receive the BPA if the destination party for the precedence call is off hook or if the destination party is busy with a precedence call of an equal or higher precedence.                                                                                      |
|                                                                                                                                                                                                                             | BPA is not played if the destination party is configured for Call Waiting or Call Forwarding, or uses automatic call diversion to an attendant-console service.<br><br>Supported in Cisco Unified CME 7.1 and later versions.                                        |
