## Automatic Call Diversion (Attendant Console)

Cisco Unified CME supports automatic diversion of all unanswered precedence calls above Routine to a designated directory number or attendant console after a selected period of time.

If automatic call diversion of MLPP calls is configured in Cisco Unified CME, it overrides the Call Forward settings on the phone for all incoming precedence calls above Routine and forwards these calls to the attendant-console application specified in the MLPP configuration. Cisco Unified CME treats MLPP calls with a precedence level of Routine as normal calls and honors the Call Forward setting configured on the phone.

How Cisco Unified CME handles forwarded MLPP calls depends on the following Call Forward options:

- **Call Forward All (CFA)**—Precedence calls are routed to the target number of the attendant console immediately. The CFA target is not used for MLPP calls.

- Call Forward Busy (CFB)—Precedence calls are forwarded to the configured CFB destination. If the CFB destination is Voice Mail or an off-net endpoint, the call is forwarded to the target number of the attendant-console service.
- Call Forward No Answer (CFNA)—Precedence calls are forwarded to the configured CFNA destination. If the CFNA destination does not answer before the CFNA timer expires, or it is voice mail or an off-net endpoint, the call is forwarded to the target number of the attendant-console service.

Calls diverted to the attendant console are indicated by a visual signal and placed in the queue for attendant service by precedence and time interval. The call with the highest precedence and longest holding time is answered first. Attendant Queue Announcement is played to calls waiting in the queue for attendant service. Call distribution is performed to reduce excessive waiting time and each attendant position operates from a common queue. Cisco Unified CME supports attendant console service for MLPP using Basic Automatic Call Distribution (B-ACD) and auto-attendant (AA) service.

## Configure MLPP

### Enable MLPP Service Globally in Cisco Unified CME

This task covers the basic steps necessary to enable MLPP on the router.

#### Restriction

- SIP phones are not supported.
- Cisco Unified IP Phone 6900 Series phones are not supported.
- Cisco Unified CME in SRST Fallback mode is not supported.
- Supports only ISDN PRI E1 and T1 interfaces.
- Supports MLPP service within the local Cisco Unified CME router only.
- Cisco Unified CME 7.1 supports only Basic Calls, Call Forward, Call Hold and Resume, Consultative Call-Transfer, and Call Waiting. Blind Transfer is not supported.
- Cisco Unified CME 8.0 and later versions support Three-Party Ad Hoc Conferencing and Call Pickup.
- Call Park Retrieval based on precedence level is not supported; Cisco Unified CME must be configured to accept only one call per park slot.

#### Before you begin

Trunks must belong to a trunk group and have preemption enabled. For configuration information, see [Enabling Preemption on the Trunk Group](#) in *Integrating Data and Voice Services for ISDN PRI Interfaces on Multiservice Access Routers*.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **voice mlpp**

7. **upa** *audio-url*
8. **service-domain** { *drsn* | *dsn* } **identifier** *domain-number*
9. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>voice mlpp</b><br><b>Example:</b><br>Router(config)# voice mlpp                               | Enters voice MLPP configuration mode.                                                                                                                                                                                                                                                                                                          |
| <b>Step 4</b> | <b>access-digit</b> <i>digit</i><br><b>Example:</b><br>Router(config-voice-mlpp)# access-digit 8 | Defines the access digit that phone users dial to make an MLPP call. <ul style="list-style-type: none"> <li><i>digit</i>—Single-digit number that users dial. Range: 0 to 9. Default: 0.</li> </ul> <p><b>Note</b><br/>Your domain type must support the access digit that you select. For example, the valid range for the DSN is 2 to 9.</p> |
| <b>Step 5</b> | <b>bnea</b> <i>audio-url</i><br><b>Example:</b><br>Router(config-voice-mlpp)# bnea flash:bnea.au | Specifies the audio file to play for the busy station not equipped for preemption announcement. <ul style="list-style-type: none"> <li><i>audio-url</i>—Location of the announcement audio file in URL format. Valid storage locations are TFTP, FTP, HTTP, and flash memory.</li> </ul>                                                       |
| <b>Step 6</b> | <b>bpa</b> <i>audio-url</i><br><b>Example:</b><br>Router(config-voice-mlpp)# bpa flash:bpa.au    | Specifies the audio file to play for the blocked precedence announcement.                                                                                                                                                                                                                                                                      |
| <b>Step 7</b> | <b>upa</b> <i>audio-url</i><br><b>Example:</b>                                                   | Specifies the audio file to play for the unauthorized precedence announcement.                                                                                                                                                                                                                                                                 |

|               | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>Router(config-voice-mlpp)# upa flash:upa.au</code>                                                                                                | <ul style="list-style-type: none"> <li>This command is supported in Cisco Unified CME 8.0 and later versions.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 8</b> | <b>service-domain { drsn   dsn } identifier domain-number</b><br><br><b>Example:</b><br><code>Router(config-voice-mlpp)# service-domain dsn 0010</code> | (Optional) Sets the global MLPP domain type and number. <ul style="list-style-type: none"> <li><b>drsn</b>—Defense Red Switched Network (DRSN).</li> <li><b>dsn</b>—Defense Switched Network (DSN). This is the default value.</li> <li><b>domain-number</b>—Number to identify the global domain, in three-octet format. Range: 0x000000 to 0xFFFFFFFF. Default: 0.</li> <li>A phone uses this global domain for MLPP calls if it is not configured with the <b>mlpp service-domain</b> command.</li> <li>This command is supported in Cisco Unified CME 8.0 and later versions.</li> </ul> |
| <b>Step 9</b> | <b>end</b><br><br><b>Example:</b><br><code>Router(config-voice-mlpp)# end</code>                                                                        | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Example

The following example shows MLPP enabled on the Cisco Unified CME router.

```
voice mlpp
 access-digit 8
 bpa flash:bpa.au
 bnea flash:bnea.au
 upa flash:upa.au
 service-domain dsn identifier 000010
```

## Enable MLPP Service on SCCP Phones

### Restriction

The **mlpp max-precedence** command is not supported in Cisco Unified CME 8.0 and later versions; it is replaced by the **mlpp service-domain** command.

### Before you begin

MLPP must be enabled globally on the Cisco Unified CME router. See [Enabling MLPP Service Globally in Cisco Unified CME](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. **mlpp service-domain** { *drsn* | *dsn* } **identifier** *domain-number* **max-precedence** *level*
5. **mlpp** **preemption**
6. **mlpp** **indication**
7. **exit**
8. **ephone** *phone-tag*
9. **ephone-template** *template-tag*
10. **restart**
11. **end**

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# ephone-template 15                                                                                                                                              | Enters ephone-template configuration mode to create an ephone template.<br><ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier for the ephone template that is being created. Range: 1 to 20.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 4</b> | <b>mlpp service-domain</b> { <i>drsn</i>   <i>dsn</i> } <b>identifier</b> <i>domain-number</i> <b>max-precedence</b> <i>level</i><br><b>Example:</b><br>Router(config-ephone-template)# mlpp service-domain dsn identifier 0010 max-precedence 0 | Sets the service domain and maximum precedence (priority) level for MLPP calls from this phone.<br><ul style="list-style-type: none"> <li>• <b>drsn</b>—Phone belongs to the Defense Red Switched Network (DRSN).</li> <li>• <b>dsn</b>—Phone belongs to the Defense Switched Network (DSN). This is the default value.</li> <li>• <i>domain-number</i>—Number to identify the global domain, in three-octet format. Range: 0x000000 to 0xFFFFFE.</li> <li>• <i>level</i>—Maximum precedence level. Phone user can specify a precedence level that is less than or equal to this value.</li> </ul> |

|                | Command or Action                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                         | <ul style="list-style-type: none"> <li>• DSN—Range: 0 to 4, where 0 is the highest priority.</li> <li>• DRSN—Range: 0 to 5, where 0 is the highest priority.</li> <li>• This command is supported in Cisco Unified CME 8.0 and later versions.</li> </ul>                                                         |
| <b>Step 5</b>  | <b>mlpp preempt</b><br><b>Example:</b><br><code>Router(config-ephone-template)# no mlpp preempt</code>                  | (Optional) Enables calls on the phone to be preempted. <ul style="list-style-type: none"> <li>• Preemption is enabled by default. Skip this step unless you want to disable preemption with the <b>no mlpp preempt</b> command.</li> </ul>                                                                        |
| <b>Step 6</b>  | <b>mlpp indication</b><br><b>Example:</b><br><code>Router(config-ephone-template)# no mlpp indication</code>            | (Optional) Enables the phone to play precedence and preemption tones, and display the preemption level of calls. <ul style="list-style-type: none"> <li>• MLPP indication is enabled by default. Skip this step unless you want to disable MLPP indication with the <b>no mlpp indication</b> command.</li> </ul> |
| <b>Step 7</b>  | <b>exit</b><br><b>Example:</b><br><code>Router(config-ephone-template)# exit</code>                                     | Exits ephone-template configuration mode.                                                                                                                                                                                                                                                                         |
| <b>Step 8</b>  | <b>ephone <i>phone-tag</i></b><br><b>Example:</b><br><code>Router(config)# ephone 36</code>                             | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks.</li> </ul>                                                                                                                             |
| <b>Step 9</b>  | <b>ephone-template <i>template-tag</i></b><br><b>Example:</b><br><code>Router(config-ephone)# ephone-template 15</code> | Applies an ephone template to the ephone that is being configured.                                                                                                                                                                                                                                                |
| <b>Step 10</b> | <b>restart</b><br><b>Example:</b><br><code>Router(config-ephone)# restart</code>                                        | Performs a fast reboot of this ephone. Does not contact the DHCP or TFTP server for updated information. <p><b>Note</b><br/>Restart all ephones using the <b>restart all</b> command in telephony-service configuration mode.</p>                                                                                 |
| <b>Step 11</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-ephone)# end</code>                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                  |

## Examples

The following example shows a basic configuration for three phones, all using template 1 with MLPP defined. [Figure 28-5](#) shows an example of a precedence call using this configuration.

```
voice mlpp
 access-digit 8
 bpa flash:BPA.au
 bnea flash:BNEA.au
 upa flash:UPA.au

ephone-template 1
 mlpp service-domain dsn identifier 000000 max-precedence 0
 !Configures MLPP domain as DSN, identifier as 000000, and max-precedence set to 0

ephone-dn 1
 number 1001

ephone-dn 2
 number 1002

ephone-dn 3 dual-line
 number 1003
 huntstop channel

ephone 1
 description Phone-A
 mac-address 1111.2222.0001
 button 1:1
 ephone-template 1
 ! MLPP configuration inherited from ephone-template 1

ephone 2
 description Phone-B
 mac-address 1111.2222.0002
 button 1:2
 ephone-template 1

ephone-3
 description Phone-C
 mac-address 1111.2222.0003
 button 1:3
 ephone-template 1
```

---

**Note**

The **huntstop channel** command must be configured on dual-line and octo-line directory numbers to preempt a call on those types of lines. Otherwise the dual-line or octo-line receives Call Waiting indication and the call is not preempted.

---

Figure 34: Preemption Call Example

In this example, the following sequence of events occurs:

1. Phone A places a precedence call to Phone C by dialing 831003 (access digit 8 + precedence level 3 + destination number 1003).  
Phone C answers the call.
2. Phone C hears the precedence ringer tone and Phone A hears the precedence ringback.
3. Phone B places a higher precedence call to Phone C by dialing 821003. Phone A and Phone C both hear the preemption tone for the duration of the **preemption tone timer** command (default value is three seconds).
4. Phone A is preempted after three seconds.
5. Phone C starts ringing (precedence ringer) and Phone B hears the precedence ringback.
6. Phone C answers the call.

## Enable MLPP Service on Analog FXS Phone Ports

### Before you begin

MLPP must be enabled globally on the Cisco Unified CME router. See [“Enabling MLPP Service Globally in Cisco Unified CME”](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice-port** *port*
4. **mlpp service-domain** { *drsn* | *dsn* } **identifier** *domain-number* **max-precedence** *level*
5. **mlpp** **preemption**

6. **mlpp indication**
7. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>voice-port port</b><br><b>Example:</b><br><pre>Router(config)# voice-port 0/1/0</pre>                                                                                                                    | Enters voice-port configuration mode. <ul style="list-style-type: none"> <li>• <i>Port</i> argument is platform-dependent; type ? to display syntax.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <b>mlpp service-domain { drsn   dsn } identifier domain-number max-precedence level</b><br><b>Example:</b><br><pre>Router(config-voiceport)# mlpp service-domain dsn identifier 0020 max-precedence 0</pre> | Sets the service domain and maximum precedence (priority) level for MLPP calls from this port. <ul style="list-style-type: none"> <li>• <b>drsn</b>—Port belongs to the Defense Red Switched Network (DRSN).</li> <li>• <b>dsn</b>—Port belongs to the Defense Switched Network (DSN).</li> <li>• <b>domain-number</b>—Number to identify the global domain, in three-octet format. Range: 0x000000 to 0xFFFFFFFF.</li> <li>• <b>level</b>—Maximum precedence level. Phone user can specify a precedence level that is less than or equal to this value.               <ul style="list-style-type: none"> <li>• DSN—Range: 0 to 4, where 0 is the highest priority.</li> <li>• DRSN—Range: 0 to 5, where 0 is the highest priority.</li> </ul> </li> <li>• This command is supported in Cisco Unified CME 8.0 and later versions.</li> </ul> |
| <b>Step 5</b> | <b>mlpp preemption</b><br><b>Example:</b><br><pre>Router(config-voiceport)# no mlpp preemption</pre>                                                                                                        | (Optional) Enables calls on the port to be preempted. <ul style="list-style-type: none"> <li>• Preemption is enabled by default. Skip this step unless you want to disable preemption with the <b>no mlpp preemption</b> command.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|               | Command or Action                                                                         | Purpose                                                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b> | <b>mlpp indication</b><br><b>Example:</b><br>Router(config-voiceport)# no mlpp indication | (Optional) Enables the phone to play precedence and preemption tones, and display the preemption level of calls. <ul style="list-style-type: none"> <li>MLPP indication is enabled by default. Skip this step unless you want to disable MLPP indication with the <b>no mlpp indication</b> command.</li> </ul> |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Router(config-voiceport)# end                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                |

### Example

The following example shows that the analog FXS phone connected to voice port 0/1/0 can make MLPP calls with the highest precedence and its calls cannot be preempted.

```
voice-port 0/1/0
 mlpp service-domain dsn identifier 000020 max-precedence 0
 no mlpp preemption
 station-id name uut1-fxs1
 caller-id enable
```

## Configure an MLPP Service Domain for Outbound Dial Peers

To assign a service domain to MLPP calls that must leave the Cisco Unified CME router through the trunk, perform the following steps for the corresponding dial peer.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice class mlpp tag**
4. **service-domain {drsn | dsn}**
5. **exit**
6. **dial-peer voice tag {pots | voip}**
7. **voice-class mlpp tag**
8. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                | Purpose                                                                                                          |
|---------------|----------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                       | Purpose                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router> enable                                                                                          |                                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                              | Enters global configuration mode.                                                                                                                                                                           |
| <b>Step 3</b> | <b>voice class mlpp tag</b><br><b>Example:</b><br>Router(config)# voice class mlpp 1                    | Creates a voice class for the MLPP service. <ul style="list-style-type: none"> <li>• <i>tag</i>—Unique number to identify the voice class. Range: 1 to 10000.</li> </ul>                                    |
| <b>Step 4</b> | <b>service-domain {drsn   dsn}</b><br><b>Example:</b><br>Router(config-voice-class)# service-domain dsn | Sets the network domain in the MLPP voice class. <ul style="list-style-type: none"> <li>• <b>drsn</b>—Defense Red Switched Network (DRSN).</li> <li>• <b>dsn</b>—Defense Switched Network (DSN).</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-voice-class)# exit                                      | Exits voice-class configuration mode.                                                                                                                                                                       |
| <b>Step 6</b> | <b>dial-peer voice tag {pots   voip}</b><br><b>Example:</b><br>Router(config)# dial-peer voice 101 voip | Enters dial peer voice configuration mode.                                                                                                                                                                  |
| <b>Step 7</b> | <b>voice-class mlpp tag</b><br><b>Example:</b><br>Router(config-dial-peer)# voice-class mlpp 1          | Assigns a previously configured MLPP voice class to a POTS or VoIP dial peer. <ul style="list-style-type: none"> <li>• <i>tag</i>—Unique number of the voice class that you created in Step 3.</li> </ul>   |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-dial-peer)# end                                          | Exits dial-peer voice configuration mode.                                                                                                                                                                   |

### Example

The following example shows an MLPP voice class defined for the DSN service domain. This voice class is assigned to a POTS dial peer so that calls leaving port 0/1/0 use the DSN protocol.

```
voice class mlpp 1
 service-domain dsn
 !
 !
dial-peer voice 1011 pots
 destination-pattern 19101
 voice-class mlpp 1
 port 0/1/0
```

## Configure MLPP Options

To configure optional MLPP features or modify default settings, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice mlpp**
4. **preemption trunkgroup**
5. **preemption user**
6. **preemption tone timer** *seconds*
7. **preemption reserve timer** *seconds*
8. **service-domain midcall-mismatch** { **method1** | **method2** | **method3** | **method4** }
9. **service-digit**
10. **route-code**
11. **attendant-console** *number* **redirect-timer** *seconds*
12. **ica** *audio-url*
13. **loc2** *audio-url*
14. **vca** *audio-url* **voice-class** *cause-code* *tag*
15. **end**

## Feature Information for MLPP

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnnng.cisco.com/>. An account on Cisco.com is not required.

Table 71: Feature Information for MLPP

| Feature Name               | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                                                                                                                   |

## CHAPTER 29

# Music on Hold

---

- [Prerequisites for Music on Hold, on page 823](#)
- [Restrictions for Music on Hold, on page 823](#)
- [Information About Music on Hold, on page 824](#)
- [Configure Music on Hold, on page 829](#)
- [Feature Information for Music on Hold, on page 849](#)

## Prerequisites for Music on Hold

- For Unified CME Release 11.6 and previous releases, phones receiving Music on Hold (MOH) in a system using G.729 require transcoding between G.711 and G.729. From Unified CME Release 11.7 onwards, transcoding is not required if G.729 codec format MOH file is configured on Unified CME. For information about transcoding, see [Configure Transcoding Resources, on page 489](#).
- Transcoding for MOH is supported on Cisco 4000 Series Integrated Services Router from Unified CME Release 11.7 onwards.

## Restrictions for Music on Hold

- IP phones do not support multicast at 224.x.x.x addresses.
- Cisco Unified CME 3.3 and earlier versions do not support MOH for local Cisco Unified CME phones that are on hold with other Cisco Unified CME phones; these parties hear a periodic repeating tone instead.
- Cisco Unified CME 4.0 and later versions support MOH for internal calls on SCCP Phones only if the **multicast moh** command is used to enable the flow of packets to the subnet on which the phones are located.
- Internal extensions that are connected through a Cisco VG224 Analog Voice Gateway or through a WAN (remote extensions) do not hear MOH on internal calls.
- Multicast MOH is not supported on a phone if the phone is configured with the **mtp** command or the **paging-dn** command with the **unicast** keyword.
- For calls from SCCP to SCCP phones, Unicast MoH is not supported. Multicast MoH is supported if it is enabled. If Multicast MoH is not enabled, Tone on Hold is supported.

- Multicast MOH is not supported on SIP Phones.
- Multicast MOH does not support co-location of tunnels on the same device.

### Restrictions for Music on Hold from a Live Feed on Cisco 4000 Series Integrated Services Routers

- MOH from a live feed supports only G.711 codec. Transcoding is required if the MOH playback party is on a codec other than g711ulaw or g711alaw.
- E&M is not supported on Cisco 4000 Series Integrated Services Routers. Only an FXO based live feed is supported.

**Note** Unified CME 12.6 on Cisco IOS XE Gibraltar 16.11.1a Release is not a recommended release for call flows that include Multicast Music On Hold.

## Information About Music on Hold

### Music on Hold Summary

MOH is an audio stream that is played to PSTN and VoIP G.711 or G.729 callers who are placed on hold by phones in a Cisco Unified CME system. This audio stream is intended to reassure callers that they are still connected to their calls.

Table 29-1 provides a summary of options for MOH for PSTN and multicast MOH for local IP phones.

**Table 72: Music on Hold (MOH)**

| Audio Source               | Description                                                                                                                                                                                                                                                        | How to Configure                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Flash memory               | No external audio input is required.                                                                                                                                                                                                                               | <a href="#">Configuring Music on Hold from an Audio File</a>                                                                      |
| Live feed                  | The multicast audio stream has minimal delay for local IP phones. The MOH stream for PSTN callers is delayed by a few seconds. If the live feed audio input fails, callers on hold hear silence.                                                                   | <a href="#">Configuring Music on Hold from a Live Feed</a>                                                                        |
| Live feed and flash memory | The live feed stream has a few seconds of delay for both PSTN and local IP phone callers. The flash MOH acts as backup for the live-feed MoH.<br><br>If MOH from a live feed is not found or fails, Unified CME switches to playback of MOH from the flash memory. | <a href="#">Configuring Music on Hold from an Audio File</a><br>and<br><a href="#">Configuring Music on Hold from a Live Feed</a> |

## Music on Hold

MOH is an audio stream that is played to PSTN and VoIP G.711 or G.729 callers who are placed on hold by phones in a Cisco Unified CME system. This audio stream is intended to reassure callers that they are still connected to their calls.

For Unified CME Release 11.6 and previous releases, when the phone receiving MOH is part of a system that uses a G.729 codec, transcoding is required between G.711 and G.729. The G.711 MOH must be translated to G.729. Note that because of compression, MOH using G.729 is of significantly lower fidelity than MOH using G.711. From Unified CME Release 11.7 onwards, transcoding is not required if G.711 and G.729 codec format MOH files are configured on Unified CME. For information about transcoding, see [Transcoding Resources](#).

The audio stream that is used for MOH can derive from one of two sources:

- Audio file—A MOH audio stream from an audio file is supplied from a .au or .wav file held in router flash memory. For configuration information, see ["Configuring Music on Hold from an Audio File"](#).
- Live feed—A MOH audio stream from a live feed is supplied from a standard line-level audio connection that is directly connected to the router through an FXO or “ear and mouth” (E&M) analog voice port. For configuration information, see [“Configuring Music on Hold from a Live Feed”](#).

---

**Note** E&M is not supported on Cisco 4000 Series Integrated Services Routers for Unified CME.

---

## Music on Hold from a Live Feed

The live-feed feature is typically used to connect to a CD jukebox player. To configure MOH from a live feed, you establish a voice port and dial peer for the call and also create a “dummy” ephone-dn. The ephone-dn must have a phone or extension number assigned to it so that it can make and receive calls, but the number is never assigned to a physical phone. Only one live MOH feed is supported per system.

Using an analog E&M port as the live-feed MOH interface requires the minimum number of external components. You connect a line-level audio feed (standard audio jack) directly to pins 3 and 6 of an E&M RJ-45 connector. The E&M voice interface card (VIC) has a built-in audio transformer that provides appropriate electrical isolation for the external audio source. An audio connection on an E&M port does not require loop-current. The **signal immediate** and **auto-cut-through** commands disable E&M signaling on this voice port. A G.711 audio packet stream is generated by a digital signal processor (DSP) on the E&M port.

---

**Note** E&M is not supported for MOH from a live feed on the Cisco 4000 Series Integrated Services Routers. Only an FXO based live MOH feed is supported.

---

If you use an FXO port as the live-feed MOH interface, connect the MOH source to the FXO port using a MOD-SC cable if the MOH source has a different connector than the FXO RJ-11 connector. MOH from a live feed is supported on the VIC2-2FXO, VIC2-4FXO, EM-HDA-3FXS/4FXO, EM-HDA-6FXO, and EM2-HDA-4FXO.

For Cisco 4000 Series Integrated Services Routers, MOH from a live feed is supported on the following Cisco network interface modules (NIMs):

- NIM-2FXO
- NIM-4FXO
- NIM-2FXS/4FXO
- NIM-2FXS/4FXOP

You can directly connect a live-feed source to an FXO port if the **signal loop-start live-feed** command is configured on the voice port; otherwise, the port must connect through an external third-party adapter to provide a battery feed. An external adapter must supply normal telephone company (telco) battery voltage with the correct polarity to the tip and ring leads of the FXO port and it must provide transformer-based isolation between the external audio source and the tip and ring leads of the FXO port.

Music from a live feed is continuously fed into the MOH playout buffer instead of being read from a flash file, so there is typically a 2-second delay. An outbound call to a MOH live-feed source is attempted (or reattempted) every 30 seconds until the connection is made by the directory number that has been configured for MOH. If the live-feed source is shut down for any reason, the flash memory source will be automatically activated.

A live-feed MOH connection is established as an automatically connected voice call that is made by the Unified CME MOH system or by an external source directly calling in to the live-feed MOH port. An MOH call can be from or to the PSTN or can proceed via VoIP with voice activity detection (VAD) disabled. The call is assumed to be an incoming call unless the optional **out-call** keyword is used with the **moh** command during configuration.

The Unified CME router uses the audio stream from the call as the source for the MOH stream, displacing any audio stream that is available from a flash file. An example of an MOH stream received over an incoming call is an external H.323-based server device that calls the ephone-dn to deliver an audio stream to the Cisco Unified CME router.

For configuration information, see [“Configuring Music on Hold from a Live Feed”](#).

For configuration example, see [Examples](#).

## Music on Hold from a Live Feed on Cisco 4000 Series Integrated Services Routers

From Unified CME Release 12.2 onwards, MOH from a live feed is supported on the Cisco 4000 Series Integrated Services Routers for all phone types (SIP, SCCP, PSTN, SIP Trunk). As part of the feature support introduced in Unified CME Release 12.2, only FXO based live feed is supported. If the FXO based live feed is not available, Unified CME switches to flash based MOH playback. If the MOH options are disabled, the caller does not hear either the tone on hold or the MOH playback.

If you configure both live feed and flash-based audio file as the source for MOH, the router seeks the live feed first. If the live feed is found, it displaces the audio file source. If the live feed is not found or fails at any time, the router falls back to the audio file source specified in the MOH audio file configuration. This is the recommended configuration.

MOH from a live feed supports only G.711 codec. If the MOH live feed over a SIP trunk has a codec other than G.711, transcoder insertion is required to play MOH from the live feed. TDM trunks support G.711 codecs. Hence, no transcoder insertion is required to play MOH for calls from a TDM trunk.

For an MOH from a live feed supported on the Cisco 4000 Series Integrated Services Routers:

- When the SIP trunk or line side has G.729 codec and a DSP resource is not available for transcoding, MOH is played from the G.729 codec format file in the router flash memory.

- When the SIP trunk or line side has G.729 codec and a DSP resource is available for transcoding, MOH from a live feed is played. If the MOH from live feed fails, MOH is played from the G.711 codec format file in the router flash memory using the DSP resource.
- When the SIP trunk or line side has a codec other than G.729 or G.711 and a DSP resource is not available for transcoding, MOH is not played (dead air).

## Multicast MOH

In Cisco CME 3.0 and later versions, you can configure the MOH audio stream as a multicast source. A Cisco Unified CME router that is configured for multicast MOH also transmits the audio stream on the physical IP interfaces of the specified router to permit access to the stream by external devices.

From Unified CME Release 12.2 (Cisco IOS XE Fuji 16.8.1 Release), you can configure MOH audio stream from a live feed as the multicast source. The live feed MoH is supported when a SCCP phone puts any remote party (SCCP phone, SIP phone, TDM trunk or SIP trunk) on hold. The MoH is sourced on multicast address, only if the remote party is SCCP phone. For other parties, it would be unicast address. The support is introduced on the Cisco 4000 Series Integrated Services Routers.

Certain IP phones do not support multicast MOH because they do not support IP multicast. In Cisco Unified CME 4.0 and later versions, you can disable multicast MOH to individual phones that do not support multicast. Callers hear a repeating tone when they are placed on hold.

## Music on Hold for SIP Phones

In Cisco Unified CME 4.1 and later versions, the MOH feature is supported when a call is put on hold from a SIP phone and when the user of a SIP phone is put on hold by a SIP, SCCP, or POTS endpoint. The holder (party that pressed the hold key) or holdee (party who is put on hold) can be on the same Cisco Unified CME or a different Cisco Unified CME connected through a SIP trunk. MOH is also supported for call transfers and conferencing, with or without a transcoding device.

Configuring MOH for SIP phones is the same as configuring MOH for SCCP phones. For configuration information, see [“How to Configure Music on Hold”](#).

## Music On Hold Enhancement

Cisco Unified CME 8.0 and later versions enhance the MOH feature by playing different media streams to PSTN and VoIP callers who are placed on hold. The MOH enhancement allows you to configure up to five additional media streams supplied from multiple media files stored in a router's flash memory and eliminates the need for separate routers for streaming MOH media files.

Cisco Unified CME 8.0 MOH enhancement allows you to create MOH groups and assign ephone extension numbers to these MOH groups to receive different media streams. Callers to the extension numbers configured under the MOH groups can listen to different MOH media streams when they are placed on hold.

You can configure up to five MOH groups. The size of each media source file can range between 64KB to 10MB long on the Cisco Unified CME router for ephones in different departments in a branch. A MOH group is linked to an ephone using the extension number of that ephone. For configuration information, see [“Configuring Music on Hold Groups to Support Different Media Sources”](#).

You can also configure individual directory numbers to select any MOH group as a MOH source on the Cisco Unified CME router. The extension number of a directory associates an ephone to a specific MOH

group and callers to these extension numbers can listen to different media streams when placed on hold. For configuration information, see [“Assigning a MOH Group to a Directory Number”](#).

Similarly, callers from internal directory numbers can listen to different media streams when a MOH group is assigned for an internal call. For configuration information, see [“Assigning a MOH Group to all Internal Calls \(SCCP Only\)”](#).

Following precedence rules are applicable when an ephone caller is placed on hold:

- **MOH group** defined for internal calls takes highest precedence.
- **MOH group** defined in ephone-dn takes the second highest precedence.
- **MOH group** defined in ephone-dn-template takes precedence if MOH group is not defined in ephone-dn or internal call.
- Extension numbers defined in a **MOH-group** has the least precedence.
- Phones not associated with any MOH groups default to the MOH parameters defined in the **moh** command under telephony-service configuration mode.

---

**Note** If a selected MOH group does not exist, the caller will hear tone on hold.

---

---

**Note** We recommend that departments in a branch must have mutually exclusive extension numbers and multicast destinations for configuring MOH groups.

---

## Caching MOH Files for Enhanced System Performance

Caching MOH files helps enhance the system performance by reducing the CPU usage. However, caching requires memory buffer to store a large MOH file. You can set up a buffer file size for caching MOH files that you might use in the future. The default MOH file buffer size is 64 KB (8 seconds). The maximum buffer size (per file) can be configured anywhere between 64 KB (8 seconds) to 10000 KB (approximately 20 minutes). You can use the **moh-file-buffer** command to allocate MOH file buffer for future MOH files, see [Configuring Buffer Size for MOH Files](#). To verify if a file is being cached and to update a cached moh-file, see [Verifying MOH File Caching](#).

---

**Note** If the file size is too large, buffer size falls back to 64 KB.

---

## Configure G.711 and G.729 Files for Music on Hold

From Cisco Unified CME 11.7 Release onwards, G.711 and G.729 codec format MOH files can be configured on Unified CME. For calls (line or trunk calls) that need to be placed on hold and MOH needs to be played, transcode insertion is not required if the codec used is G.729 or G.711. The new feature dynamically selects the matching codec (either G.729 or G.711) based on the codec used on phones or trunk. Transcode insertion

is required only if the codec on the phone playing Music on Hold is neither G.729 nor G.711. For more information on configuration of MOH, see [Configure Music on Hold, on page 829](#).

If G.711 and G.729 codec format MOH files are configured on Unified CME, you will need transcoding only to support other codec format MOH files, such as iLBC. You need the G.711 codec format MOH file to be configured under telephony-service for MOH to be supported on Unified CME.

**Note** You have to configure the primary G.711 codec format MOH file before configuring the G.729 or G.729A codec format MOH file.

We recommend that G.711 and G.729 codec format MOH files are available on the flash memory of Unified CME router.

**Note** In a scenario where a call between an SCCP line and SIP trunk has a codec other than G.729 or G.711, then MOH is not played when the SCCP line places the SIP phone on hold.

In a scenario where a call is placed between an SCCP line and a SIP line, and the call is placed on hold from the SIP end, MOH is played only from the G.711 codec format MOH file.

## Configure Music on Hold

### Configure Music on Hold from an Audio File to Supply Audio Stream

**Note** If you configure MOH from an audio file and from a live feed, the router seeks the live feed first. If a live feed is found, it displaces an audio file source. If the live feed is not found or fails at any time, the router falls back to the audio file source.

**Note** The MOH file packaged with the CME software is completely royalty free.

**Restriction**

- To change the audio file to a different file, you must remove the first file using the **no moh** command before specifying a second file. If you configure a second file without removing the first file, the MOH mechanism stops working and may require a router reboot to clear the problem.
- The volume level of a MOH file cannot be adjusted through Cisco IOS software, so it cannot be changed when the file is loaded into the flash memory of the router. To adjust the volume level of a MOH file, edit the file in an audio editor before downloading the file to router flash memory.

**Before you begin**

- SIP phones require Cisco Unified CME 4.1 or a later version.
- A music file must be in stored in the router's flash memory. This file should be in G.711 format. The file can be in .au or .wav file format, but the file format must contain 8-bit 8-kHz data; for example, ITU-T A-law or mu-law data format.
- From Cisco Unified CME Release 11.7 onwards, you can configure and store an MOH file in G.729 codec format in the router's flash memory. The G.729 file can be used as MOH source.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **moh filename**
5. **multicast moh ip-address port port-number [route ip-address-list]**
6. **exit**
7. **ephone phone-tag**
8. **multicast-moh**
9. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Step 5</b> | <p><b>multicast moh</b> <i>ip-address</i> <b>port</b> <i>port-number</i> [<b>route</b> <i>ip-address-list</i>]</p> <p><b>Example:</b></p> <pre>Router(config-telephony)# multicast moh 239.10.16.4 port 16384 route 10.10.29.17 10.10.29.33</pre> | <p>Specifies that this audio stream is to be used for multicast and also for MOH.</p> <p><b>Note</b><br/>This command is required to use MOH for internal calls and it must be configured after MOH is enabled with the <b>moh</b> command.</p> <ul style="list-style-type: none"> <li>• <i>ip-address</i>—Destination IP address for multicast.</li> <li>• <b>port</b> <i>port-number</i>—Media port for multicast. Range is 2000 to 65535. We recommend port 2000 because it is already used for normal RTP media transmissions between IP phones and the router.</li> </ul> <p><b>Note</b><br/>Valid port numbers for multicast include even numbers that range from 16384 to 32767. (The system reserves odd values.)</p> <ul style="list-style-type: none"> <li>• <b>route</b>—(Optional) List of explicit router interfaces for the IP multicast packets.</li> <li>• <i>ip-address-list</i>—(Optional) List of up to four explicit routes for multicast MOH. The default is that the MOH multicast stream is automatically output on the interfaces that correspond to the address that was configured with the <b>ip source-address</b> command.</li> </ul> <p><b>Note</b><br/>For MOH on internal calls, packet flow must be enabled to the subnet on which the phones are located.</p> |
| <b>Step 6</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config-telephony)# exit</pre>                                                                                                                                                               | Exits telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <p><b>ephone</b> <i>phone-tag</i></p> <p><b>Example:</b></p> <pre>Router(config)# ephone 28</pre>                                                                                                                                                 | Enters ephone configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 8</b> | <p><b>multicast-moh</b></p> <p><b>Example:</b></p> <pre>Router(config-ephone)# no multicast-moh</pre>                                                                                                                                             | <p>(Optional) Enables multicast MOH on a phone. This is the default.</p> <ul style="list-style-type: none"> <li>• This command is supported in Cisco Unified CME 4.0 and later versions.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|               | Command or Action                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                 | <ul style="list-style-type: none"> <li>The <b>no</b> form of this command disables MOH for phones that do not support multicast. Callers hear a repeating tone when they are placed on hold.</li> <li>This command can also be configured in ephone-template configuration mode. The value set in ephone configuration mode has priority over the value set in ephone-template mode.</li> </ul> |
| <b>Step 9</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-ephone)# end | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                |

### Examples

The following example enables music on hold and specifies the music file to use:

```
telephony-service
 moh minuet.wav
```

The following example enables MOH and specifies a multicast address for the audio stream:

```
telephony-service
 moh minuet.wav
 multicast moh 239.23.4.10 port 2000
```

## Configure Music on Hold from a Live Feed

To configure music on hold from a live feed, perform the following steps.

#### Note

If you configure MOH from an audio file and from a live feed, the router seeks the live feed first. If a live feed is found, it displaces an audio file source. If the live feed is not found or fails at any time, the router falls back to the audio file source.

#### Restriction

- A foreign exchange station (FXS) port cannot be used for a live feed.

### Before you begin

- SIP phones require Cisco Unified CME 4.1 or a later version.
- VIC2-2FXO, VIC2-4FXO, EM-HDA-3FXS/4FXO, EM-HDA-6FXO, or EM2-HDA-4FXO on Cisco Integrated Services Routers Generation 2 (ISR G2) family of routers.

NIM-2FXO, NIM-4FXO, NIM-2FXS/4FXO, and NIM-2FXS/4FXOP are the Cisco network interface modules (NIMs) supported on Cisco 4000 Series Integrated Services Routers.

- For a live feed from VoIP (over a SIP trunk), VAD must be disabled.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice-port** *port*
4. **input gain** *decibels*
5. **auto-cut-through**
6. **operation 4-wire**
7. **signal immediate**
8. **signal loop-start live-feed**
9. **no shutdown**
10. **exit**
11. **dial peer voice** *tag* **pots**
12. **destination-pattern** *string*
13. **port** *port*
14. **exit**
15. **ephone-dn** *dn-tag*
16. **number** *number*
17. **moh** [**out-call** *outcall-number*] [**ip** *ip-address* **port** *port-number* [**route** *ip-address-list* ]]
18. **exit**
19. **ephone** *phone-tag*
20. **multicast-moh**
21. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                    | Purpose                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                   | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal           | Enters global configuration mode.                                                                                                                                  |
| <b>Step 3</b> | <b>voice-port</b> <i>port</i><br><b>Example:</b><br>Router(config)# voice-port 1/1/0 | Enters voice-port configuration mode.<br><ul style="list-style-type: none"> <li>• <i>Port</i> argument is platform-dependent; type ? to display syntax.</li> </ul> |

|                | Command or Action                                                                                                              | Purpose                                                                                                                                                                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b>  | <b>input gain</b> <i>decibels</i><br><b>Example:</b><br><code>Router(config-voice-port)# input gain 0</code>                   | Specifies, in decibels, the amount of gain to be inserted at the receiver side of the interface. <ul style="list-style-type: none"> <li><i>decibels</i>—Acceptable values are integers –6 to 14.</li> </ul>                                              |
| <b>Step 5</b>  | <b>auto-cut-through</b><br><b>Example:</b><br><code>Router(config-voice-port)# auto-cut-through</code>                         | (E&M ports only) Enables call completion when a PBX does not provide an M-lead response. <ul style="list-style-type: none"> <li>MOH requires that you use this command with E&amp;M ports.</li> </ul>                                                    |
| <b>Step 6</b>  | <b>operation 4-wire</b><br><b>Example:</b><br><code>Router(config-voice-port)# operation 4-wire</code>                         | (E&M ports only) Selects the 4-wire cabling scheme. <ul style="list-style-type: none"> <li>MOH requires that you specify 4-wire operation with this command for E&amp;M ports.</li> </ul>                                                                |
| <b>Step 7</b>  | <b>signal immediate</b><br><b>Example:</b><br><code>Router(config-voice-port)# signal immediate</code>                         | (E&M ports only) For E&M tie trunk interfaces, directs the calling side to seize a line by going off-hook on its E-lead and to send address information as dual tone multifrequency (DTMF) digits.                                                       |
| <b>Step 8</b>  | <b>signal loop-start live-feed</b><br><b>Example:</b><br><code>Router(config-voice-port)# signal loop-start live-feed</code>   | (FXO ports only) Enables an MOH audio stream from a live feed to be directly connected to the router through an FXO port. <ul style="list-style-type: none"> <li>This command is supported in Cisco IOS Release 12.4(15)T and later releases.</li> </ul> |
| <b>Step 9</b>  | <b>no shutdown</b><br><b>Example:</b><br><code>Router(config-voice-port)# no shutdown</code>                                   | Activates the voice port. <ul style="list-style-type: none"> <li>To shut the voice port down and disable MOH from a live feed, use the <b>shutdown</b> command.</li> </ul>                                                                               |
| <b>Step 10</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-voice-port)# exit</code>                                                 | Exits voice-port configuration mode.                                                                                                                                                                                                                     |
| <b>Step 11</b> | <b>dial peer voice tag pots</b><br><b>Example:</b><br><code>Router(config)# dial peer voice 7777 pots</code>                   | Enters dial-peer configuration mode.                                                                                                                                                                                                                     |
| <b>Step 12</b> | <b>destination-pattern</b> <i>string</i><br><b>Example:</b><br><code>Router(config-dial-peer)# destination-pattern 7777</code> | Specifies either the prefix or the full E.164 telephone number to be used for a dial peer.                                                                                                                                                               |
| <b>Step 13</b> | <b>port</b> <i>port</i><br><b>Example:</b><br><code>Router(config-dial-peer)# port 1/1/0</code>                                | Associates the dial peer with the voice port that was specified in Step 3.                                                                                                                                                                               |

|                | Command or Action                                                                                                                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Range is 1 to 288.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 16</b> | <b>number <i>number</i></b><br><b>Example:</b><br><code>Router(config-ephone-dn)# number 5555</code>                                                                                                                                                                                                                      | Configures a valid extension number for this ephone-dn. <ul style="list-style-type: none"> <li>• This number is not assigned to any phone; it is only used to make and receive calls that contain an audio stream to be used for MOH.</li> <li>• <i>number</i>—String of up to 16 digits that represents a telephone or extension number to be associated with this ephone-dn.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 17</b> | <b>moh [<i>out-call outcall-number</i>] [<i>ip ip-address port port-number</i>] [<i>route ip-address-list</i>]</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# moh out-call 7777 ip 239.10.16.8 port 2311 route 10.10.29.3 10.10.29.45</code><br>or<br><code>Router(config-ephone-dn)# moh out-call 7777</code> | Specifies that this ephone-dn is to be used for an incoming or outgoing call that is the source for an MOH stream. <ul style="list-style-type: none"> <li>• (Optional) <b>out-call <i>outcall-number</i></b>—Indicates that the router is calling out for a live feed for MOH and specifies the number to be called. Forces a connection to the local voice port that was specified in Step 3. If this command is used without this keyword, the MOH stream is received from an incoming call.</li> <li>• (Optional) <b>ip <i>ip-address</i></b>—Destination IP address for multicast.<br/><br/>             If you are configuring MOH from a live feed and from an audio file for backup, do not configure a multicast IP address for this command. If the live feed fails or is not found, MOH will fall back to the ip address that you configured using the <b>multicast moh</b> command in telephony-service configuration mode. See <a href="#">“Configuring Music on Hold from an Audio File”</a>.<br/><br/>             If you specify an address for multicast with this command and a different address with the <b>multicast moh</b> command in telephony-service configuration mode, you can send the MOH audio stream to two multicast addresses.</li> <li>• (Optional) <b>port <i>port-number</i></b>—Media port for multicast. Range is 2000 to 65535. We recommend port 2000 because it is already used for RTP media transmissions between IP phones and the router.</li> </ul> |

|                | Command or Action                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                 | <ul style="list-style-type: none"> <li>(Optional) <b>route</b> <i>ip-address-list</i>—Indicates specific router interfaces on which to transmit the IP multicast packets. Up to four IP addresses can be listed. Default: The MOH multicast stream is automatically output on the interfaces that correspond to the address that was configured with the <b>ip source-address</b> command.</li> </ul>                                                                                                                                             |
| <b>Step 18</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# exit</code>                   | Exits ephone-dn configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 19</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br><code>Router(config)# ephone 28</code>     | Enters ephone configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 20</b> | <b>multicast-moh</b><br><b>Example:</b><br><code>Router(config-ephone)# no multicast-moh</code> | (Optional) Enables multicast MOH on a phone. This is the default. <ul style="list-style-type: none"> <li>This command is supported in Cisco Unified CME 4.0 and later versions.</li> <li>The <b>no</b> form of this command disables MOH for phones that do not support multicast. Callers hear a repeating tone when they are placed on hold.</li> <li>This command can also be configured in ephone-template configuration mode. The value set in ephone configuration mode has priority over the value set in ephone-template mode.</li> </ul> |
| <b>Step 21</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-ephone)# end</code>                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Examples

The following example enables MOH from an outgoing call on voice port 1/1/0 and dial peer 7777:

```
voice-port 1/1/0
 auto-cut-through
 operation 4-wire
 signal immediate
!
dial-peer voice 7777 pots
 destination-pattern 7777
 port 1/1/0
!
ephone-dn 55
 number 5555
 moh out-call 7777
```

The following example enables MOH from a live feed and if the live feed is not found or fails at any time, the router falls back to the music file (music-on-hold.au) and multicast address for the audio stream specified in the telephony-service configuration:

```
voice-port 0/1/0
 auto-cut-through
 operation 4-wire
 signal immediate
 timeouts call-disconnect 1
 description MOH Live Feed
!
dial-peer voice 7777 pots
 destination-pattern 7777
 port 0/1/0
!
telephony-service
 max-ephones 24
 max-dn 192
 ip source-address 10.232.222.30 port 2000
 moh music-on-hold.au
 multicast moh 239.1.1.1 port 2000
!
ephone-dn 52
 number 1
 moh out-call 7777
```

## Configure Music on Hold Groups to Support Different Media Sources

### Restriction

- Media files from live-feed source are not supported.
- Each MOH group must contain a unique flash media file name, extension numbers, and multicast destination. If you enter any extension ranges, MOH filenames, and multicast IP addresses that already exist in another MOH-group, an error message is issued and the new input in the current voice MOH-group is discarded.
- Media file CODEC format is limited to G.711 and G.729.

### Before you begin

- Cisco Unified CME 8.0 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice moh-group** *moh-group-tag*
4. **description** *string*
5. **moh** *filename*
6. **multicast moh** *ip-address* **port** *port-number* **route** *ip-address-list*
7. **extension-range** *starting-extension to ending-extension*
8. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 3</b> | <b>voice moh-group moh-group-tag</b><br><b>Example:</b><br><pre>Router(config-telephony)# voice moh-group 1</pre>                                                                                           | Enters the voice moh-group configuration mode. You can create up to five voice moh-groups for ephones receiving music on hold audio files when placed on hold. Range for the voice moh-groups is 1 to 5.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>description string</b><br><b>Example:</b><br><pre>Router(config-voice-moh-group)# description moh group for sales</pre>                                                                                  | (Optional) Allows you to add a brief description specific to a voice MOH group. You can use up to 80 characters to describe the voice MOH group.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 5</b> | <b>moh filename</b><br><b>Example:</b><br><pre>Router(config-voice-moh-group)# moh flash:/minuet.au</pre>                                                                                                   | Enables music on hold using the specified MOH source file. The MOH file must be in .au and .wav format. MOH filename length should not exceed 128 characters. You must provide the directory and filename of the MOH file in URL format. For example: <b>moh flash:/minuet.au</b> <ul style="list-style-type: none"> <li>• If you specify a file with this command and later want to use a different file, you must disable use of the first file with the <b>no moh</b> command before configuring the second file.</li> </ul>                                                     |
| <b>Step 6</b> | <b>multicast moh ip-address port port-number route ip-address-list</b><br><b>Example:</b><br><pre>Router((config-voice-moh-group)# multicast moh 239.10.16.4 port 16384 route 10.10.29.17 10.10.29.33</pre> | Specifies that this audio stream is to be used for multicast and also for MOH. <p><b>Note</b><br/>This command is required to use MOH for internal calls and it must be configured after MOH is enabled with the <b>moh</b> command.</p> <ul style="list-style-type: none"> <li>• <b>ip-address</b>—Destination IP address for multicast.</li> <li>• <b>port port-number</b>—Media port for multicast. Range is 2000 to 65535. We recommend port 2000 because it is already used for normal RTP media transmissions between IP phones and the router.</li> </ul> <p><b>Note</b></p> |

|               | Command or Action                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|               |                                                                                                                                                                                                                                       | <p>Valid port numbers for multicast include even numbers that range from 16384 to 32767. (The system reserves odd values.)</p> <ul style="list-style-type: none"> <li>• <b>route</b>—(Optional) List of explicit router interfaces for the IP multicast packets.</li> <li>• <b>ip-address-list</b>—(Optional) List of up to four explicit routes for multicast MOH. The default is that the MOH multicast stream is automatically output on the interfaces that correspond to the address that was configured with the <b>ip source-address</b> command.</li> </ul> <p><b>Note</b><br/>For MOH on internal calls, packet flow must be enabled to the subnet on which the phones are located.</p>                                                                                                                                                                                                                                                                   |
| <b>Step 7</b> | <p><b>extension-range</b> <i>starting-extension to ending-extension</i></p> <p><b>Example:</b></p> <pre>Router(config-voice-moh-group)#extension-range 1000 to 1999 Router(config-voice-moh-group)#extension-range 2000 to 2999</pre> | <p>(Optional) identifies MOH callers calling the extension numbers specified in a MOH group. Extension number must be in hexadecimal digits (0-9) or (A-F). Both extension numbers (starting extension and ending extension) must contain equal number of digits. Repeat this command to add additional extension ranges.</p> <ul style="list-style-type: none"> <li>• <b>starting-extension</b>—(Optional) Lists the starting extension number for a moh-group.</li> <li>• <b>ending-extension</b>—(Optional) Lists the ending extension number for a moh-group.</li> </ul> <p><b>Note</b><br/>The ending extension number must be greater than or equal to the starting extension number. Extension-ranges must not overlap with any other extension-range configured in any other MOH group.</p> <p><b>Note</b><br/>If extension range is defined and a moh-group is also defined in an <b>ephone-dn</b>, the <b>ephone-dn</b> parameters takes precedence.</p> |
| <b>Step 8</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(config-voice-moh-group)# end</pre>                                                                                                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Examples

In the following example, total six MOH groups are configured. MOH group 1 through 5 are configured under voice-moh-group configuration mode and MOH group 0 is the MOH source file configured under telephony-services.

```

router# show voice moh-group
telephony-service
moh alaska.wav
Moh multicast 239.1.1.1 port 16384 route 10.1.4.31 10.1.1.2

voice moh-group 1
description this moh group is for sales
moh flash:/hello.au
multicast moh 239.1.1.1 port 16386 route 239.1.1.3 239.1.1.3
extension-range 1000 to 1999
extension-range 2000 to 2999
extension-range 3000 to 3999
extension-range A1000 to A1999

voice moh-group 2
description (not configured)
moh flash1:/minuet.au
multicast moh 239.23.4.10 port 2000
extension-range 7000 to 7999
extension-range 8000 to 8999

voice moh-group 3
description This is for marketing
moh flash2:/happy.au
multicast moh 239.15.10.1 port 3000
extension-range 9000 to 9999

voice moh-group 4
description (not configured)
moh flash:/audio/sun.au
multicast moh 239.16.12.1 port 4000
extension-range 10000 to 19999

voice moh-group 5
description (not configured)
moh flash:/flower.wav
multicast moh 239.12.1.2 port 5000
extension-range 0012 to 0024
extension-range 0934 to 0964

=== Total of 6 voice moh-groups ===

```

## Assign a MOH Group to a Directory Number

### Restriction

- Do not use same extension number for different MOH groups.

### Before you begin

- Cisco Unified CME 8.0 or a later version.
- MOH groups must be configured under global configuration mode.

### SUMMARY STEPS

#### 1. enable

2. **configure terminal**
3. **ephone-dn tag**
4. **number**
5. **moh-group tag**
6. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>ephone-dn tag</b><br><b>Example:</b><br><pre>Router(config)# ephone-dn 1</pre>                                                | Enters <b>ephone-dn</b> configuration mode.<br><br>In ephone-dn configuration mode, you assign an extension number using the number command.<br><br>You can also configure a MOH group to an ephone-dn-template for use across a range of ephone-dns. If two different MOH groups are configured as a result of this command, the MOH group configured under the ephone-dn configuration takes precedence.<br><br><b>Note</b><br>MOH group configuration for ephone-template-dn configuration command is temporarily prohibited when any directory number using that template is on hold. |
| <b>Step 4</b> | <b>number</b><br><b>Example:</b><br><pre>Router(config)# ephone-dn 1 Router(config-ephone-dn)# number 1001</pre>                 | Allows you to define an extension number and associate this number to a telephone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 5</b> | <b>moh-group tag</b><br><b>Example:</b><br><pre>Router(config-telephony)#voice moh-group 1 Router(config-voice-moh-group)#</pre> | Allows you to assign a MOH group to a directory number. <ul style="list-style-type: none"> <li>• <b>MOH group tag</b>— identifies the unique number assigned to a MOH group for configuration tasks.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone)# end</pre>                                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Examples

In the following example different moh groups are assigned to different directory numbers (ephone-dn) moh group1 is assigned to ephone-dn 1, moh-group 4 is assigned to ephone-dn 4, and moh-group 5 is assigned to ephone-dn 5.

```
ephone-dn 1 octo-line
 number 7001
 name DN7001
 moh-group 1
!
ephone-dn 2 dual-line
 number 7002
 name DN7002
 call-forward noan 6001 timeout 4
!
ephone-dn 3
 number 7003
 name DN7003
 snr 7005 delay 3 timeout 10
 allow watch
 call-forward noan 8000 timeout 30
!
ephone-dn 4 dual-line
 number 7004
 allow watch
 call-forward noan 7001 timeout 10
 moh-group 4
!
ephone-dn 5
 number 7005
 name DN7005
 moh-group 5
!
```

# Assign a MOH Group to all Internal Calls Only to SCCP Phones

## Restriction

- Do not use same extension number for different MOH groups.

## Before you begin

- Cisco Unified CME 8.0 or a later version.
- MOH groups must be configured under global configuration mode.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **internal-call moh-group tag**

## 5. end

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                              | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config-telephony)# ephone-dn 1                                            | Enters telephony-service configuration mode.<br>In ephone-dn configuration mode, you assign an extension number using the number command.                                                                                                                                                                              |
| <b>Step 4</b> | <b>internal-call moh-group tag</b><br><b>Example:</b><br>Router(config)#<br>Router(config-telephony)# internal call moh-group 4 | Allows to assign a MOH-group for all internal directory numbers.<br><ul style="list-style-type: none"><li>• Moh group <i>tag</i>— identifies the unique number assigned to a MOH group for configuration tasks, Range for the tag is from 0 to 5, where 0 represents MOH configuration in telephony service.</li></ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                       |

## Examples

The following examples shows moh-group 4 configured for internal directory calls.

```
telephony-service
sdspfarm conference mute-on *6 mute-off *8
sdspfarm units 4
sdspfarm transcode sessions 2
sdspfarm tag 1 moto-HW-Conf
moh flash1:/minuet.au
Moh multicast 239.1.1.1 port 16384 route 10.1.4.31 10.1.1.2
internal-call moh-group 4
em logout 0:0 0:0 0:0
max-ephones 110
max-dn 288
ip source-address 15.2.0.5 port 2000
auto assign 1 to 1
caller-id block code *9999
```

```

service dss
timeouts transfer-recall 12

```

## Configure Buffer Size for MOH Files

### Restriction

- MOH file caching is prohibited if live-feed is enabled for MOH-group 0.
- MOH file buffer size must be larger than the MOH file (size) that needs to be cached.
- Sufficient system memory must be available for MOH file caching.

### Before you begin

- Cisco Unified CME 8.0 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **moh-file-buffer** *file size*
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                    | Purpose                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                   | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal           | Enters global configuration mode.                                                                                                                                          |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config-telephony)# ephone-dn 1 | Enters telephony-service configuration mode.<br>In ephone-dn configuration mode, you assign an extension number using the number command.                                  |
| <b>Step 4</b> | <b>moh-file-buffer</b> <i>file size</i><br><b>Example:</b>                           | (Optional) Allows to set a buffer for the MOH file size. You can configure a max file buffer size (per file) anywhere between 64 KB (8 seconds) to 10000 KB (approximately |

|               | Command or Action                                               | Purpose                                                                                                                                                                                      |
|---------------|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router(config-telephony)# moh-file-buffer 2000                  | 20 minutes), Default <b>moh-file-buffer</b> size is 64 KB (8 seconds).<br><br><b>Note</b><br>A large buffer size is desirable to cache the largest MOH file and a better system performance. |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-ephone)# end | Returns to privileged EXEC mode.                                                                                                                                                             |

### Examples

The following examples shows 90 KB as the configured moh-file-buffer size.

```
telephony-service
sdspfarm conference mute-on *6 mute-off *8
sdspfarm units 4
sdspfarm transcode sessions 2
sdspfarm tag 1 moto-HW-Conf
moh flash1:/minuet.au

## Verify MOH File Caching

### Procedure

Use the **show ephone moh** command to verify if the MOH file is being cached.

The following examples shows that the minuet.au music file in MOH group 1 is not cached. Follow steps a through d to verify the MOH file is being cached.

#### Example:

```
Router #show ephone moh
Skinny Music On Hold Status (moh-group 1)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/minuet.au (not cached) type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast 239.10.16.6 port 2000
```

- a) If the file is not cached as in MOH group 1 in the above example, then check file size in the flash.

**Example:**

```
Router#dir flash:/minuet.au
Directory of flash:/minuet.au 32 -rw- 1865696 Apr 25 2009 00:47:12 +00:00 moh1.au
```

- b) Under telephony-service, configure “moh-file-buffer <file size>”. Default file size is 64 KB (8 seconds). Make sure you enter a larger file size to cache large MOH files that you may use in future.

**Example:**

```
Router(config)# telephony-service
Router(config-telephony)# moh-file-buffer 2000
```

- c) Under voice moh-group <group tag>, configure “no moh”, and immediately configure “moh <filename>”. This allows the MOH server to read the file immediately from flash again.

**Example:**

```
Router(config-telephony)#voice moh-group 1
Router(config-voice-moh-group)#no moh
Router(config-voice-moh-group)#moh flash:/minuet.au
```

- d) Depending on the size of the file, you should see the MOH file caching after a few minutes (approximately, 2 minutes).

**Example:**

```
Router #show ephone moh
Skinny Music On Hold Status - group 1
Active MOH clients 0 (max 830), Media Clients 0
File flash:/moh1.au (cached) type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast 239.10.16.6 port 2000
```

**Note**

MOH file caching is prohibited under the following conditions: if live feed is configured in moh-group 0, If file buffer size smaller than file size, or insufficient system memory.

## Verify Music on Hold Group Configuration

### Procedure

#### Step 1

Use the **show voice moh-group** command to display one or the entire moh-group configuration.

The following example shows all six MOH groups with extension ranges, MOH files, and multicast destination addresses.

```
router# show voice moh-group
telephony-service
moh alaska.wav
Moh multicast 239.1.1.1 port 16384 route 10.1.4.31 10.1.1.2

voice moh-group 1
```

```

description this moh group is for sales
moh flash:/audio?minuet.au
multicast moh 239.1.1.1 port 16386 route 239.1.1.2 239.1.1.3
extension-range 1000 to 1999
extension-range 2000 to 2999
extension-range 3000 to 3999
extension-range 20000 to 22000
extension-range A1000 to A1999

voice moh-group 2
description (not configured)
moh flash:/audio/hello.au
multicast moh 239.23.4.10 port 2000
extension-range 7000 to 7999
extension-range 8000 to 8999

voice moh-group 3
description This is for marketing
moh flash:/happy.au
multicast moh 239.15.10.1 port 3000
extension-range 9000 to 9999

voice moh-group 4
description (not configured)
moh flash:/audio/sun.au
multicast moh 239.16.12.1 port 4000
extension-range 10000 to 19999

voice moh-group 5
description (not configured)
moh flash:/flower.wav
multicast moh 239.12.1.2 port 5000
extension-range 0012 to 0024
extension-range 0934 to 0964

=== Total of 6 voice moh-groups ===

```

- Step 2** Use the **show ephone moh** to display information about the different MOH group configured. The following example displays information about five different MOH groups.

```

Router # show ephone moh
Skinny Music On Hold Status (moh-group 1)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/minuet.au (not cached) type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast 239.10.16.6 port 2000

Skinny Music On Hold Status (moh-group 2)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/audio/hello.au type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast on 239.10.16.6 port 2000 via 0.0.0.0

Skinny Music On Hold Status (moh-group 3)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/bells.au type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast on 239.10.16.5 port 2000 via 0.0.0.0

Skinny Music On Hold Status (moh-group 4)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/3003.au type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast on 239.10.16.7 port 2000 via 0.0.0.0

```

```

Skinny Music On Hold Status (moh-group 5)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/4004.au type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast on 239.10.16.8 port 2000 via 0.0.0.0

```

**Step 3** Use the **show voice moh-group statistics** command to display the MOH subsystem statistics information.

In the following example, the MOH Group Streaming Interval Timing Statistics shows the media packet counts during streaming intervals. Each packet counter is of 32 bit size and holds a count limit of 4294967296. This means that with 20 milliseconds packet interval (for G.711), the counters will restart from 0 any time after 2.72 years (2 years 8 months). Use the clear voice moh-group statistics once in every two years to reset the packet counters.

MOH Group Packet Transmission Timing Statistics shows the maximum and minimum amount of time (in microseconds) taken by the MOH groups to send out media packets. The MOH Group Loopback Interval Timing Statistics is available when loopback interface is configured as part of the multicast MOH routes as in the case of SRST. These counts are loopback packet counts within certain streaming timing intervals.

```
router# show voice moh-group statistics
```

```
MOH Group Streaming Interval Timing Statistics:
```

| Grp# | ~19 msec | 20~39    | 40~59 | 60~99 | 100~199 | 200+ msec |
|------|----------|----------|-------|-------|---------|-----------|
| 0:   | 25835    | 17559966 | 45148 | 0     | 0       | 1         |
| 1:   | 19766    | 17572103 | 39079 | 0     | 0       | 1         |
| 2:   | 32374    | 17546886 | 51687 | 0     | 0       | 1         |
| 3:   | 27976    | 17555681 | 47289 | 0     | 0       | 1         |
| 4:   | 34346    | 17542940 | 53659 | 0     | 0       | 1         |
| 5:   | 14971    | 17581689 | 34284 | 0     | 0       | 1         |

```
MOH Group Packet Transmission Timing Statistics:
```

| Grp# | max(usec) | min(usec) |
|------|-----------|-----------|
| 0:   | 97        | 7.        |
| 1:   | 95        | 7.        |
| 2:   | 97        | 7.        |
| 3:   | 96        | 7.        |
| 4:   | 94        | 7.        |
| 5:   | 67        | 7.        |

```
MOH Group Loopback Interval Timing Statistics:
```

```
loopback event array: svc_index=1542, free_index=1549, max_q_depth=31
```

| Grp# | ~19 msec | 20~39   | 40~59 | 60~99 | 100~199 | 200+ msec |
|------|----------|---------|-------|-------|---------|-----------|
| 0:   | 8918821  | 8721527 | 10023 | 0     | 1       | 1         |
| 1:   | 9007373  | 8635813 | 7184  | 0     | 1       | 1         |
| 2:   | 8864760  | 8772851 | 12758 | 0     | 1       | 1         |
| 3:   | 8924447  | 8715457 | 10464 | 0     | 1       | 1         |
| 4:   | 8858393  | 8778957 | 13017 | 0     | 1       | 1         |
| 5:   | 9005511  | 8639936 | 4919  | 0     | 1       | 1         |

```
Statistics collect time: 4 days 2 hours 5 minutes 39 seconds.
```

**Step 4** Use the **clear voice moh-group statistics** command to clear the display of MOH subsystem statistics information.

For Example:

```
router# clear voice moh-group statistics
All moh group stats are cleared
```

---

## Feature Information for Music on Hold

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Table 73: Feature Information for Music on Hold

| Feature Name  | Cisco Unified CME Version | Feature Information                                                                                                                                                          |
|---------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Music on Hold | 12.2                      | Support for Music on Hold from a live feed on Unified CME is introduced on the Cisco 4000 Series Integrated Services Routers.                                                |
|               | 12.2                      | Support for Multicast Music on Hold from a live feed is introduced for SCCP to SCCP calls on the Cisco 4000 Series Integrated Services Routers.                              |
|               | 11.7                      | Support for configuration of G.711 and G.729 codec format MOH file on Unified CME is added.                                                                                  |
|               | 8.0                       | Music on hold from different media sources is added.                                                                                                                         |
|               | 4.1                       | Music on hold for SIP phones is supported.                                                                                                                                   |
|               | 4.0                       | <ul style="list-style-type: none"> <li>• Music on hold is introduced for internal calls.</li> <li>• The ability to disable multicast MOH per phone is introduced.</li> </ul> |
|               | 3.0                       | The ability to use a live audio feed as a multicast source is introduced.                                                                                                    |
|               | 2.1                       | Music on hold from a live audio feed is introduced for external calls.                                                                                                       |
|               | 2.0                       | Music on hold from an audio file is introduced for external calls.                                                                                                           |

## CHAPTER 30

# Paging

---

- [Restrictions for Paging, on page 851](#)
- [Information About Paging, on page 851](#)
- [Configure Paging, on page 854](#)
- [Configuration Examples for Paging, on page 863](#)
- [Where to Go Next, on page 867](#)
- [Feature Information for Paging, on page 868](#)

## Restrictions for Paging

- Paging is not supported on IP phones without speaker phones.
- Paging is not supported on Cisco Unified 3905 SIP IP phones.
- Paging is only supported on G711ulaw codec.
- Cisco Unified IP Conference Phone 8831 does not support paging when busy.
- Paging Group is supported in Unified CME, but not in Unified SRST.
- Paging is not supported on Cisco Unified 3905 SIP IP phones.
- Cisco Unified SCCP IP phones do not support Whisper Paging. Only idle IP phones can receive paging requests.

## Information About Paging

### Audio Paging

A paging number can be defined to relay audio pages to a group of designated phones. When a caller dials the paging number (ephone-dn), each idle IP phone that has been configured with the paging number automatically answers using its speaker-phone mode. Displays on the phones that answer the page show the caller ID that has been set using the **name** command under the paging ephone-dn. When the caller finishes speaking the message and hangs up, the phones are returned to their idle states.

Audio paging provides a one-way voice path to the phones that have been designated to receive paging. It does not have a press-to-answer option like the intercom feature. A paging group is created using a dummy ephone-dn, known as the paging ephone-dn, that can be associated with any number of local IP phones. The paging ephone-dn can be dialed from anywhere, including on-net.

After you have created two or more simple paging groups, you can unite them into combined paging groups. By creating combined paging groups, you provide phone users with the flexibility to page a small local paging group (for example, paging four phones in a store's jewelry department) or to page a combined set of several paging groups (for example, by paging a group that consists of both the jewelry department and the accessories department).

The paging mechanism supports audio distribution using IP multicast, replicated unicast, and a mixture of both (so that multicast is used where possible, and unicast is used for specific phones that cannot be reached using multicast).

Figure 35: Paging Group, on page 852 shows a paging group with two phones.

Figure 35: Paging Group

## Paging Group Support for Cisco Unified SIP IP Phones

Paging provides a one-way voice path from the paging phone to the paged phone. The paged phone automatically answers the page in speaker-phone mode with Mute activated.

The paged phone receives a page when it is idle or busy. When it is busy with a connected call, the user of the paged phone can hear both the active conversation and whisper paging.

Before Cisco Unified CME 9.0, you can specify a paging-dn tag and dial the paging extension number to page the Cisco Unified SCCP IP phone associated with the paging-dn tag or paging group using the **paging-dn** command in ephone or ephone-template configuration mode. You can also page a combined paging group composed of two or more previously established paging groups of Cisco Unified SCCP IP phone directory numbers using the **paging group** command in ephone-dn configuration mode.

In Cisco Unified CME 9.0 and later versions, support is extended so that you can specify a paging-dn tag and dial the paging extension number to page the Cisco Unified SIP IP phone associated with the paging-dn tag or paging group using the **paging-dn** command in voice register pool or voice register template configuration mode. Paging on Cisco Unified SIP IP phones support both unicast and multicast paging in the same way that these features are supported on Cisco Unified SCCP IP Phones.

In Cisco Unified CME 9.0 and later versions, support is also extended so that you can create a combined paging group composed of two or more previously established paging groups of ephone and voice register directory numbers using the same **paging group** command used for paging groups of Cisco Unified SCCP IP phone directory numbers.

---

**Note** The paging port for Cisco Unified SIP IP phones is an even number from 20480 to 32768. If you enter a wrong port number, a SIP REFER message request is sent to the IP phone but the Cisco Unified SIP IP phone is not paged.

---

With a paging-dn, there is only one paging endpoint and there is only one paging number for both Cisco Unified SCCP and Cisco Unified SIP IP phones. However, when paging to a Cisco Unified SIP shared line, each phone on the shared line is treated separately.

A phone that can be paged by two paging-dns receives the page from the first paging-dn and ignores the page from the second paging-dn. When the first paging-dn is disconnected, the phone can receive the page from the second paging-dn.

The paging group support for Cisco Unified SIP IP phones uses an ephone paging-dn to dial the paging number before branching out to each Cisco Unified SCCP and Cisco Unified SIP IP phone.

The show **ephone-dn paging** command displays which paging-dn is specified and which phone is being paged.

Because paging is not considered a call, a paging phone that is in a connected state can press another line to make a call using the phone's softkeys.

The Cisco Unified SIP IP phone Paging feature also supports:

- multicast paging (default)
- unicast paging

For more information, see [Configure Paging Group Support for SIP IP Phones, on page 858](#).

# Configure Paging

## Configure a Simple Paging Group on SCCP Phones

To set up a paging number that relays incoming pages to a group of phones, perform the following steps.

**Restriction** IP phones do not support multicast at 224.x.x.x addresses.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *paging-dn-tag*
4. **number** *number*
5. **name** *name*
6. **paging** [**ip** *multicast-address* **port** *udp-port-number*]
7. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                       | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal               | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 3</b> | <b>ephone-dn</b> <i>paging-dn-tag</i><br><br><b>Example:</b><br>Router(config)# ephone-dn 42 | Enters ephone-dn configuration mode.<br><br><ul style="list-style-type: none"> <li>• <i>paging-dn-tag</i>—A unique sequence number that identifies this paging ephone-dn during all configuration tasks. This is the ephone-dn that is dialed to initiate a page. This ephone-dn is not associated with a physical phone. Range is 1 to 288.</li> </ul> <p><b>Note</b><br/>Do not use the <b>dual-line</b> keyword with this command. Paging ephone-dns cannot be dual-line.</p> |

|               | Command or Action                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

This is the number that people call to initiate a page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 5</b> | <b>name</b> <i>name</i><br><b>Example:</b><br><code>Router(config-ephone-dn)# name paging4</code>                                                                                   | Assigns to the paging number a name to appear in caller-ID displays and directories.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 6</b> | <b>paging</b> [ <b>ip</b> <i>multicast-address</i> <b>port</b> <i>udp-port-number</i> ]<br><b>Example:</b><br><code>Router(config-ephone-dn)# paging ip 239.1.1.10 port 2000</code> | <p>Specifies that this ephone-dn is to be used to broadcast paging messages to the idle IP phones that are associated with the paging dn-tag. If the optional keywords and arguments are not used, IP phones are paged individually using IP unicast transmission (to a maximum of ten IP phones). The optional keywords and arguments are as follows:</p> <ul style="list-style-type: none"> <li>• <b>ip</b> <i>multicast-address</i> <b>port</b> <i>udp-port-number</i>—Specifies multicast broadcast using the specified IP address and UDP port. When multiple paging numbers are configured, each paging number must use a unique IP multicast address. We recommend port 2000 because it is already used for normal non-multicast RTP media streams between phones and the Cisco Unified CME router.</li> </ul> <p><b>Note</b><br/>IP phones do not support multicast at 224.x.x.x addresses.</p> <p><b>Note</b><br/>The correct paging port for the paging-dn of Cisco Unified SIP IP phones is an even number from 20480 to 32768. If you enter a wrong port number, a SIP REFER message request is sent to the IP phone but the Cisco Unified SIP IP phone is not paged.</p> |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-telephony)# end</code>                                                                                                         | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Configure a Combined Paging Group for SCCP Phones

To set up a combined paging group consisting of two or more simple paging groups, perform the following steps.

**Before you begin**

Simple paging groups must be configured. See [Configure a Simple Paging Group on SCCP Phones, on page 854](#).

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ephone-dn** *paging-dn-tag*
4. **number** *number*
5. **name** *name*
6. **paging group** *paging-dn-tag, paging-dn-tag* [ *[,paging-dn-tag]* ...]
7. **exit**
8. **ephone** *phone-tag*
9. **paging-dn** *paging-dn-tag* { **multicast** | **unicast** }
10. **exit**
11. Repeat Step 8 to Step 10 to add additional IP phones to a paging group.
12. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal               | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 3</b> | <b>ephone-dn</b> <i>paging-dn-tag</i><br><b>Example:</b><br>Router(config)# ephone-dn 42 | Enters ephone-dn configuration mode to create a paging number for a combined paging group.<br><ul style="list-style-type: none"> <li><i>paging-dn-tag</i>—A unique sequence number that identifies this paging ephone-dn during all configuration tasks. This is the ephone-dn that is dialed to initiate a page. This ephone-dn is not associated with a physical phone. Range is 1 to 288.</li> </ul> <p><b>Note</b><br/>Do not use the <b>dual-line</b> keyword with this command. Paging ephone-dns cannot be dual-line.</p> |

|               | Command or Action                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>number</b> <i>number</i><br><b>Example:</b><br><code>Router(config-ephone-dn)# number 3556</code>                                                                    | Defines an extension number associated with the combined group paging ephone-dn. This is the number that people call to initiate a page to the combined group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 5</b> | <b>name</b> <i>name</i><br><b>Example:</b><br><code>Router(config-ephone-dn)# name paging4</code>                                                                       | (Optional) Assigns to the combined group paging number a name to appear in caller-ID displays and directories.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 6</b> | <b>paging group</b> <i>paging-dn-tag, paging-dn-tag</i> [ <i>[,paging-dn-tag] ...</i> ]<br><b>Example:</b><br><code>Router(config-ephone-dn)# paging group 20,21</code> | <p>Sets the paging directory number for a combined group. This command combines the individual paging group ephone-dns that you specify into a combined group so that a page can be sent to more than one paging group at a time.</p> <ul style="list-style-type: none"> <li>• <i>paging-dn-tag</i>—Unique sequence number associated with the paging number for an individual paging group. Lists the paging-dn-tags of all the individual groups that you want to include in this combined group, separated by commas. You can include up to ten paging ephone-dn tags in this command.</li> </ul> <p><b>Note</b><br/>Configure the paging command for all ephone-dns in a paging group before configuring the paging group command for that group.</p> |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# exit</code>                                                                                           | Exits ephone-dn configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 8</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br><code>Router(config)# ephone 2</code>                                                                              | <p>Enters ephone configuration mode to add IP phones to the paging group.</p> <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number of a phone to receive audio pages when the paging ephone-dn is called.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 9</b> | <b>paging-dn</b> <i>paging-dn-tag</i> { <b>multicast</b>   <b>unicast</b> }<br><b>Example:</b><br><code>Router(config-ephone)# paging-dn 42 multicast</code>            | <p>Associates this ephone with an ephone-dn tag that is used for a paging ephone-dn (the number that people call to deliver a page). Note that the paging ephone-dn tag is not associated with a line button on this ephone.</p> <p>The paging mechanism supports audio distribution using IP multicast, replicated unicast, and a mixture of both (so that multicast is used where possible and unicast is allowed to specific phones that cannot be reached through multicast).</p> <ul style="list-style-type: none"> <li>• <i>paging-dn-tag</i>—Unique sequence number for a paging ephone-dn.</li> </ul>                                                                                                                                             |

|                | Command or Action                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                         | <ul style="list-style-type: none"> <li>• <b>multicast</b>—(Optional) Multicast paging for groups. By default, paging is transmitted to the Cisco Unified IP phone using multicast.</li> <li>• <b>unicast</b>—(Optional) Unicast paging for a single Cisco Unified IP phone. This keyword indicates that the Cisco Unified IP phone is not capable of receiving paging through multicast and requests that the phone receive paging through a unicast transmission directed to the individual phone.</li> </ul> <p><b>Note</b><br/>The number of phones supported through unicast is limited to a maximum of ten phones.</p> |
| <b>Step 10</b> | <b>exit</b><br><br><b>Example:</b><br>Router(config-ephone)# exit       | Exits ephone configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 11</b> | Repeat Step 8 to Step 10 to add additional IP phones to a paging group. | —                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 12</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-telephony)# end      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configure Paging Group Support for SIP IP Phones

To configure Paging group support for Unified SIP IP Phones, perform the following steps.

### Before you begin

Cisco Unified CME 9.0 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *dn-tag*
4. **number** *number*
5. **paging** [**ip** *multicast-address* **port** *udp-port-number*]
6. Repeat Step 3 to Step 5 to add more Cisco Unified SCCP IP phones to the paging group. Skip Step 7 for each IP phone except for the last one.
7. **paging group** *paging-dn-tag*, *paging-dn-tag*
8. **exit**
9. **voice register dn** *dn-tag*
10. **number** *number*

11. **exit**
12. Repeat Step 9 to Step 11 to associate more telephone or extension numbers with Cisco Unified SIP IP phones.
13. **voice register pool** *pool-tag*
14. **id mac** *address*
15. **type** *phone-type*
16. **number tag dn** *dn-tag*
17. **paging-dn** *paging-dn-tag*
18. Repeat Step 13 to Step 17 to register additional Cisco Unified SIP IP phones to ephone-dn paging directory numbers. Exit from voice register pool configuration mode after each additional phone is registered. After the last phone is added, go directly to Step 19.
19. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                            |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                              | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>ephone-dn</b> <i>dn-tag</i><br><b>Example:</b><br><pre>Router(config)# ephone-dn 20</pre>                                                                                       | Enters ephone-dn configuration mode. <ul style="list-style-type: none"> <li>• <i>dn-tag</i>—Unique number that identifies an ephone-dn during configuration tasks. Range is 1 to the number set by the <b>max-dn</b> command.</li> </ul>                                                                                                                                                                                                      |
| <b>Step 4</b> | <b>number</b> <i>number</i><br><b>Example:</b><br><pre>Router(config-ephone-dn)# number 2000</pre>                                                                                 | Associates a telephone or extension number with this ephone-dn. <ul style="list-style-type: none"> <li>• <i>number</i>—String of up to 16 characters that represents an E.164 telephone number. Normally, the string is composed of digits, but the string may contain alphabetic characters when the number is dialed only by the router, as with an intercom number. One or more periods (.) can be used as wildcard characters.</li> </ul> |
| <b>Step 5</b> | <b>paging</b> [ <b>ip</b> <i>multicast-address</i> <b>port</b> <i>udp-port-number</i> ]<br><b>Example:</b><br><pre>Router(config-ephone-dn)# paging ip 239.0.1.20 port 20480</pre> | Defines an extension (ephone-dn) as a paging extension that can be called to broadcast an audio page to a set of Cisco Unified IP phones. <ul style="list-style-type: none"> <li>• <b>ip</b> <i>multicast-address</i>—(Optional) Uses an IP multicast address to multicast voice packets for audio paging; for example, 239.0.1.1.</li> </ul>                                                                                                 |

|                | Command or Action                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                              | <p><b>Note</b><br/>IP phones do not support multicast at 224.x.x.x addresses. Default is that multicast is not used and IP phones are paged individually using IP unicast transmission (up to ten phones).</p> <ul style="list-style-type: none"> <li>• <b>port</b> <i>udp-port-number</i>—(Optional) Uses this UDP port for the multicast. Range: 2000 to 65535.</li> </ul> <p><b>Note</b><br/>If any of the paged phones is a Cisco Unified SIP IP phone, the correct paging port for the paging-dn is an even number from 20480 to 32768. If you enter a wrong port number, a SIP REFER message request is sent to the IP phone but the Cisco Unified SIP IP phone is not paged.</p> |
| <b>Step 6</b>  | Repeat Step 3 to Step 5 to add more Cisco Unified SCCP IP phones to the paging group. Skip Step 7 for each IP phone except for the last one. | —                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 7</b>  | <p><b>paging group</b> <i>paging-dn-tag, paging-dn-tag</i></p> <p><b>Example:</b></p> <pre>Router(config-ephone-dn)# paging group 20</pre>   | <p>Creates a combined paging group from two or more previously established paging sets.</p> <ul style="list-style-type: none"> <li>• <i>paging-dn-tag</i>—Comma-separated list of paging-dn-tags that have previously been associated with the paging extension of a paging set using the <b>paging-dn</b> command. You can include up to ten paging-dn-tags separated by commas; for example, 4, 6, 7, 8.</li> </ul>                                                                                                                                                                                                                                                                   |
| <b>Step 8</b>  | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config-ephone-dn)# exit</pre>                                                          | Exits ephone-dn configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 9</b>  | <p><b>voice register dn</b> <i>dn-tag</i></p> <p><b>Example:</b></p> <pre>Router(config)# voice register dn 1</pre>                          | <p>Enters voice register dn configuration mode.</p> <ul style="list-style-type: none"> <li>• <i>dn-tag</i>—Unique sequence number that identifies a particular directory number during configuration tasks. Range is 1 to 150 or the maximum defined by the <b>max-dn</b> command.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 10</b> | <p><b>number</b> <i>number</i></p> <p><b>Example:</b></p> <pre>Router(config-register-dn)# number 1201</pre>                                 | <p>Associates a telephone or extension number with a Cisco Unified SIP IP phone in a Cisco Unified CME system.</p> <ul style="list-style-type: none"> <li>• <i>number</i>—String of up to 16 characters that represents an E.164 telephone number. Normally, the string is composed of digits, but the string may contain alphabetic characters when the number is dialed only by the router, as with an intercom number.</li> </ul>                                                                                                                                                                                                                                                    |

|                | Command or Action                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 11</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config-register-dn)# exit</pre>                                                                                        | Exits voice register dn configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 12</b> | Repeat Step 9 to Step 11 to associate more telephone or extension numbers with Cisco Unified SIP IP phones.                                                          | —                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 13</b> | <b>voice register pool <i>pool-tag</i></b><br><b>Example:</b><br><pre>Router(config)# voice register pool 1</pre>                                                    | Enters voice register pool configuration mode and creates a pool configuration for a Cisco Unified SIP IP phone in Cisco Unified CME. <ul style="list-style-type: none"> <li>• <i>pool-tag</i>—Unique number assigned to the pool. Range: 1 to 100.</li> </ul> <b>Note</b><br>For Cisco Unified CME systems, the upper limit for this argument is defined by the <b>max-pool</b> command.                                                           |
| <b>Step 14</b> | <b>id mac <i>address</i></b><br><b>Example:</b><br><pre>Router(config-register-pool)# id mac 0019.305D.82B8</pre>                                                    | identifies a locally available Cisco Unified SIP IP phone. <ul style="list-style-type: none"> <li>• <i>mac address</i>—identifies the MAC address of a particular Cisco Unified SIP IP phone.</li> </ul>                                                                                                                                                                                                                                            |
| <b>Step 15</b> | <b>type <i>phone-type</i></b><br><b>Example:</b><br><pre>Router(config-register-pool)# type 7961</pre>                                                               | Defines a phone type for a Cisco Unified SIP IP phone. <ul style="list-style-type: none"> <li>• <i>phone-type</i>—Type of Cisco Unified SIP IP phone that is being defined.</li> </ul>                                                                                                                                                                                                                                                              |
| <b>Step 16</b> | <b>number <i>tag dn dn-tag</i></b><br><b>Example:</b><br><pre>Router(config-register-pool)# number 1 dn 1</pre>                                                      | Indicates the E.164 phone numbers that the registrar permits to handle the Register message from the Cisco Unified SIP IP phone. <ul style="list-style-type: none"> <li>• <i>tag</i>—identifies the telephone number when there are multiple number commands. Range: 1 to 10.</li> <li>• <i>dn dn-tag</i>—identifies the directory number tag for this phone number as defined by the <b>voice register dn</b> command. Range: 1 to 150.</li> </ul> |
| <b>Step 17</b> | <b>paging-dn <i>paging-dn-tag</i></b><br><b>Example:</b><br><pre>Router(config-register-pool)# paging-dn 20</pre>                                                    | Registers a Cisco Unified SIP IP phone to an ephone-dn paging directory number. <ul style="list-style-type: none"> <li>• <i>paging-dn-tag</i>—Ephone-dn tag designated as the paging ephone-dn to which a Cisco Unified SIP IP phone is registered.</li> </ul>                                                                                                                                                                                      |
| <b>Step 18</b> | Repeat Step 13 to Step 17 to register additional Cisco Unified SIP IP phones to ephone-dn paging directory numbers. Exit from voice register pool configuration mode | —                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                | Command or Action                                                                                 | Purpose                                                                       |
|----------------|---------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
|                | after each additional phone is registered. After the last phone is added, go directly to Step 19. |                                                                               |
| <b>Step 19</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-register-pool)# end                            | Exits voice register pool configuration mode and enters privileged EXEC mode. |

## Troubleshooting Tips

Use the **debug ephone paging** command to collect debugging information on paging for both Cisco Unified SIP IP and Cisco Unified SCCP IP phones.

## Verify Paging

### Procedure

- Step 1** Use the **show running-config** command to display the running configuration. Paging ephone-dns are listed in the ephone-dn portion of the output. Phones that belong to paging groups are listed in the ephone part of the output.

```
Router# show running-config
```

```
ephone-dn 48
 number 136
 name PagingCashiers
 paging ip 239.1.1.10 port 2000
```

```
ephone 2
 headset auto-answer line 1
 headset auto-answer line 4
 ephone-template 1
 username "FrontCashier"
 mac-address 011F.2A0.A490
 paging-dn 48
 type 7960
 no dnd feature-ring
 no auto-line
 button 1f43 2f44 3f45 4:31
```

- Step 2** Use the **show telephony-service ephone-dn** and **show telephony-service ephone** commands to display only the configuration information for ephone-dns and ephones.

# Configuration Examples for Paging

## Example for Configuring Simple Paging Group

The following example sets up an ephone-dn for multicast paging. This example creates a paging number for 5001 on ephone-dn 22 and adds ephone 4 as a member of the paging set. Multicast is set for the paging-dn.

```
ephone-dn 22
 name Paging Shipping
 number 5001
 paging ip 239.1.1.10 port 2000

ephone 4
 mac-address 0030.94c3.8724
 button 1:1 2:2
 paging-dn 22 multicast
```

In this example, paging calls to 2000 are multicast to Cisco Unified IP phones 1 and 2, and paging calls to 2001 go to Cisco Unified IP phones 3 and 4. Note that the paging ephone-dns (20 and 21) are not assigned to any phone buttons.

```
ephone-dn 20
 number 2000
 paging ip 239.0.1.20 port 2000

ephone-dn 21
 number 2001
 paging ip 239.0.1.21 port 2000

ephone 1
 mac-address 3662.024.6ae2
 button 1:1
 paging-dn 20

ephone 2
 mac-address 9387.678.2873
 button 1:2
 paging-dn 20

ephone 3
 mac-address 0478.2a78.8640
 button 1:3
 paging-dn 21

ephone 4
 mac-address 4398.b694.456
 button 1:4
 paging-dn 21
```

## Example for Configuring Combined Paging Groups

This example sets the following paging behavior:

- When extension 2000 is dialed, a page is sent to ephones 1 and 2 (single paging group).
- When extension 2001 is dialed, a page is sent to ephones 3 and 4 (single paging group).

- When extension 2002 is dialed, a page is sent to ephones 1, 2, 3, 4, and 5 (combined paging group).

Ephones 1 and 2 are included in paging ephone-dn 22 through the membership of ephone-dn 20 in the combined paging group. Ephones 3 and 4 are included in paging ephone-dn 22 through membership of ephone-dn 21 in the combined paging group. Ephone 5 is directly subscribed to paging-dn 22.

```
ephone-dn 20
 number 2000
 paging ip 239.0.1.20 port 2000
```

```
ephone-dn 21
 number 2001
 paging ip 239.0.1.21 port 2000
```

```
ephone-dn 22
 number 2002
 paging ip 239.0.2.22 port 2000
 paging group 20,21
```

```
ephone-dn 6
 number 1103
 name user3
```

```
ephone-dn 7
 number 1104
 name user4
```

```
ephone-dn 8
 number 1105
 name user5
```

```
ephone-dn 9
 number 1199
```

```
ephone-dn 10
 number 1198
```

```
ephone 1
 mac-address 1234.8903.2941
 button 1:6
 paging-dn 20
```

```
ephone 2
 mac-address CFBA.321B.96FA
 button 1:7
 paging-dn 20
```

```
ephone 3
 mac-address CFBB.3232.9611
 button 1:8
 paging-dn 21
```

```
ephone 4
 mac-address 3928.3012.EE89
 button 1:9
 paging-dn 21
```

```
ephone 5
 mac-address BB93.9345.0031
 button 1:10
 paging-dn 22
```

## Example for Configuring a Combined Paging Group of Cisco Unified SIP IP Phones and Cisco Unified SCCP IP Phones

The following example shows how to configure a combined paging group composed of Cisco Unified SIP IP phones and Cisco Unified SCCP IP phones.

In the following configuration tasks, paging sets 20 and 21 are defined and then combined into paging group 22. Paging set 20 has a paging extension of 2000. When someone dials extension 2000 to deliver a page, the page is sent to Cisco Unified SCCP IP phones (ephones) 1 and 2. Paging set 21 has a paging extension of 2001. When someone dials extension 2001 to deliver a page, the page is sent to ephones 3 and 4. Paging group 22 combines sets 20 and 21, and when someone dials its paging extension, 2002, the page is sent to all the phones in both sets and to ephone 5, which is directly subscribed to the combined paging group.

```
ephone-dn 20
 number 2000
 paging ip 239.0.1.20 port 2000

ephone-dn 21
 number 2001
 paging ip 239.0.1.21 port 2000

ephone-dn 22
 number 2002
 paging ip 239.0.2.22 port 2000
 paging group 20,21

ephone 1
 button 1:1
 paging-dn 20

ephone 2
 button 1:2
 paging-dn 20

ephone 3
 button 1:3
 paging-dn 21

ephone 4
 button 1:4
 paging-dn 21

ephone 5
 button 1:5
 paging-dn 22
```

The following configuration tasks show how to configure a combined paging group composed of Cisco Unified SCCP IP phone directory numbers only.

When extension 2000 is dialed, a page is sent to ephones 1 and 2 (first single paging group). When extension 2001 is dialed, a page is sent to ephones 3 and 4 (second single paging group). Finally, when extension 2002 is dialed, a page is sent to ephones 1, 2, 3, 4, and 5, producing the combined paging group (composed of the first single paging group, the second single paging group, and ephone 5).

Ephones 1 and 2 are included in paging ephone-dn 22 through the membership of ephone-dn 20 as paging group 20 in the combined paging group. Ephones 3 and 4 are included in paging ephone-dn 22 through membership of ephone-dn 21 as paging group 21 in the combined paging group. Ephone 5 is directly subscribed to paging-dn 22.

```
ephone-dn 20
 number 2000
 paging ip 239.0.1.20 port 20480

ephone-dn 21
 number 2001
 paging ip 239.1.1.21 port 20480

ephone-dn 22
 number 2002
 paging ip 239.1.1.22 port 20480
 paging group 20,21

ephone-dn 6
 number 1103

ephone-dn 7
 number 1104

ephone-dn 8
 number 1105

ephone-dn 9
 number 1199

ephone-dn 10
 number 1198

ephone 1
 mac-address 1234.8903.2941
 button 1:6
 paging-dn 20

ephone 2
 mac-address CFBA.321B.96FA
 button 1:7
 paging-dn 20

ephone 3
 mac-address CFBB.3232.9611
 button 1:8
 paging-dn 21

ephone 4
 mac-address 3928.3012.EE89
 button 1:9
 paging-dn 21

ephone 5
 mac-address BB93.9345.0031
 button 1:10
 paging-dn 22
```

In the following configuration tasks, the **paging group** command is used to configure combined paging groups composed of ephone and voice register directory numbers.

When extension 2000 is dialed, a page is sent to ephones 1 and 2 and voice register pools 1 and 2 (new first single paging group). When extension 2001 is dialed, a page is sent to ephones 3 and 4 and voice register pools 3 and 4 (new second single paging group). Finally, when extension 2002 is dialed, a page is sent to ephones 1, 2, 3, 4, and 5 and voice register pools 1, 2, 3, 4, and 5 (new combined paging group).

Ephones 1 and 2 and voice register pools 1 and 2 are included in paging ephone-dn 22 through the membership of ephone-dn 20 as paging group 20 in the combined paging group. Ephones 3 and 4 and voice register pools 3 and 4 are included in paging ephone-dn 22 through membership of ephone-dn 21 as paging group 21 in the combined paging group. Ephone 5 and voice register pool 5 are directly subscribed to paging-dn 22.

```
voice register dn 1
 number 1201

voice register dn 2
 number 1202

voice register dn 3
 number 1203

voice register dn 4
 number 1204

voice register dn 5
 number 1205

voice register pool 1

voice register pool 5
 id mac 0016.460D.E469
 type 7961
 number 1 dn 5
 paging-dn 22
```

## Where to Go Next

### Intercom

The intercom feature is similar to paging because it allows a phone user to deliver an audio message to a phone without the called party having to answer. The intercom feature is different than paging because the audio path between the caller and the called party is a dedicated audio path and because the called party can respond to the caller. See [Intercom Lines](#), on page 775.

### Speed Dial

Phone users who make frequent pages may want to include the paging ephone-dn numbers in their list of speed-dial numbers. See [Speed Dial, on page 957](#).

## Feature Information for Paging

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

**Table 74: Feature Information for Paging**

| Feature Name                                         | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                                                          |
|------------------------------------------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Paging                                               | 2.0                       | Paging was introduced.                                                                                                                                                                                                                                                       |
| Paging Group Support for Cisco Unified SIP IP Phones | 9.0                       | Allows you to specify a paging-dn tag and dial the paging extension number to page the Cisco Unified SIP IP phone associated with the paging-dn tag or paging group using the <b>paging-dn</b> command in voice register pool or voice register template configuration mode. |

## CHAPTER 31

# Presence Service

---

- [Prerequisites for Presence Service, on page 869](#)
- [Restrictions for Presence Service, on page 869](#)
- [Information About Presence Service, on page 869](#)
- [Configure Presence Service, on page 873](#)
- [Configuration Examples for Presence Service, on page 887](#)
- [Feature Information for Presence Service, on page 890](#)

## Prerequisites for Presence Service

- Cisco Unified CME 4.1 or a later version.

## Restrictions for Presence Service

- Presence features such as Busy Lamp Field (BLF) notification are supported for SIP trunks only; these features are not supported on H.323 trunks.
- Presence requires that SIP phones are configured with a directory number (using **dn** keyword in **number** command); direct line numbers are not supported.

## Information About Presence Service

### Presence Service

A presence service, as defined in RFC 2778 and RFC 2779, is a system for finding, retrieving, and distributing presence information from a source, called a presence entity (presentity), to an interested party called a watcher. When you configure presence in a Cisco Unified CME system with a SIP WAN connection, a phone user, or watcher, can monitor the real-time status of another user at a directory number, the presentity. Presence enables the calling party to know before dialing whether the called party is available. For example, a directory application may show that a user is busy, saving the caller the time and inconvenience of not being able to reach someone.

Presence uses SIP SUBSCRIBE and NOTIFY methods to allow users and applications to subscribe to changes in the line status of phones in a Cisco Unified CME system. Phones act as watchers and a presentity is identified by a directory number on a phone. Watchers initiate presence requests (SUBSCRIBE messages) to obtain the line status of a presentity. Cisco Unified CME responds with the presentity's status. Each time a status changes for a presentity, all watchers of this presentity are sent a notification message. SIP phones and trunks use SIP messages; SCCP phones use presence primitives in SCCP messages.

Presence supports Busy Lamp Field (BLF) notification features for speed-dial buttons and directory call lists for missed calls, placed calls, and received calls. SIP and SCCP phones that support the BLF speed-dial and BLF call-list features can subscribe to status change notification for internal and external directory numbers.

Figure 31-1 shows a Cisco Unified CME system supporting BLF notification for internal and external directory numbers. If the watcher and the presentity are not both internal to the Cisco Unified CME router, the subscribe message is handled by a presence proxy server.

**Figure 36: BLF Notification Using Presence**

The following line states display through BLF indicators on the phone:

- Line is idle—Displays when this line is not being used.
- Line is in-use—Displays when the line is in the ringing state and when a user is on the line, whether or not this line can accept a new call.
- BLF indicator unknown—Phone is unregistered or this line is not allowed to be watched.

Cisco Unified CME acts as a presence agent for internal lines (both SIP and SCCP) and as a presence server for external watchers connected through a SIP trunk, providing the following functionality:

- Processes SUBSCRIBE requests from internal lines to internal lines. Notifies internal subscribers of any status change.
- Processes incoming SUBSCRIBE requests from a SIP trunk for internal SCCP and SIP lines. Notifies external subscribers of any status change.
- Sends SUBSCRIBE requests to external presentities on behalf of internal lines. Relays status responses to internal lines.

Presence subscription requests from SIP trunks can be authenticated and authorized. Local subscription requests cannot be authenticated.

For configuration information, see [How to Configure Presence Service](#).

## BLF Monitoring of Ephone-DNs with DnD, Call Park, Paging, and Conferencing

In versions earlier than Cisco Unified CME 7.1, BLF monitoring does not provide notification of status changes when a monitored directory number becomes DnD-enabled, and the Busy Lamp Field (BLF) indicators for directory numbers configured as call-park slots, paging numbers, or ad hoc or meet-me conference numbers display only the unknown line-status.

Cisco Unified CME 7.1 and later versions support idle, in-use, and unknown BLF status indicators for monitored ephone-dns configured as call-park slots, paging numbers, and ad hoc or meet-me conference numbers. This allows an administrator (watcher) to monitor a call-park slot to see if calls are parked and not yet retrieved, which paging number is available for paging, or which conference number is available for a conference.

An ephone-dn configured as a park-slot is not registered with any phone. In Cisco Unified CME 7.1 and later versions, if a monitored park-slot is idle, the BLF status shows idle on the watcher. If there is a call parked on the monitored park-slot, the BLF status indicates in-use. If the monitored park-slot is not enabled for BLF monitoring with the **allow watch** command, the BLF indicator for unknown status displays on the watcher.

An ephone-dn configured for paging or conferencing is also not registered with any phone. The indicators for the idle, in-use, and unknown BLF status are displayed for the monitored paging number and ad hoc or meet-me conference numbers, as with the call-park slots.

Cisco Unified CME 7.1 and later versions support the Do Not Disturb (DnD) BLF status indicator for ephone-dns in the DnD state. When a user presses the DnD softkey on an SCCP phone, all directory numbers assigned to the phone become DnD-enabled and a silent-ring is played for all calls to any directory number on the phone. If a monitored ephone-dn becomes DnD-enabled, the corresponding BLF speed-dial lamp (if available) on the watcher displays solid red with the DnD icon for both the idle and in-use BLF status.

The BLF status notification occurs if the monitored ephone-dn is:

- The primary directory number on only one SCCP phone
- A directory number that is not shared
- A shared directory number and all associated phones are DnD-enabled

No new configuration is required to support these enhancements. For information on configuring BLF monitoring of directory numbers, see [BLF Monitoring for Speed-Dials and Call Lists](#).

[Table 31-1](#) compares the different BLF monitoring features that can be configured in Cisco Unified CME.

**Table 75: Feature Comparison of Directory Number BLF Monitoring**

| Monitor Mode (Button "m") | Watch Mode (Button "w") | BLF Monitoring |
|---------------------------|-------------------------|----------------|
| Basic Operation           |                         |                |

| Monitor Mode (Button “m”)                                                                                                                                                                                                                                                                                            | Watch Mode (Button “w”)                                                                                                                                                                                                                                                                                                                                                                                         | BLF Monitoring                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>SCCP phones only.</p> <p>Watches a single ephone-dn instance.</p> <p>If there are multiple ephone-dns with the same extension (such as in an overlay), this mode watches only a single ephone-dn (specified with the <b>button</b> command using m keyword).</p> <p>Does not indicate DND state of the phone.</p> | <p>SCCP phones only.</p> <p>Watches all activity on the phone for which the designated ephone-dn is the primary extension.</p> <p>(The ephone-dn is “primary” for a phone if the extension appears on button 1 or on the button indicated by the <b>auto-line</b> command.)</p> <p>Ephone-dn can be shared but cannot be the primary extension on any other phone.</p> <p>Indicates DND state of the phone.</p> | <p>SCCP and SIP phones.</p> <p>Watches all ephone-dn instances with the same (primary) extension number. The BLF lamp is on if any instance of the monitored extension is in use.</p> <p>Indicates DND state of the phone.</p> <p><b>Note</b><br/>BLF monitoring is supported only if the presence entity (presentity) is an SCCP phone. If you enable DND on a SIP phone, LED doesn’t glow. Hence, the phone user or administrator (watcher) isn’t notified.</p> |
| <b>Shared Lines</b>                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Can not distinguish which phone is using the ephone-dn if the DN is shared across multiple phones.                                                                                                                                                                                                                   | <p>Designed for cases where ephone-dns are shared across multiple phones.</p> <p>Each phone must have a unique primary ephone-dn.</p> <p>Used to indicate that a specific phone is in use as opposed (button m) to indicating that a specific ephone-dn is in use.</p>                                                                                                                                          | Cannot distinguish which phone is using the ephone-dn, if the DN is shared across multiple phones.                                                                                                                                                                                                                                                                                                                                                                |

Cannot monitor local and remote at the same time.                                                                                                                                                                                                                                                                                                                     |

## Device-Based BLF Monitoring

Device-based BLF monitoring provides a phone user or administrator (watcher) information about the status of a monitored phone (presentity). Cisco Unified CME 4.1 and later versions support BLF monitoring of directory numbers associated with speed-dial buttons, call logs, and directory listings. Cisco Unified CME 7.1 and later versions support device-based BLF monitoring, allowing a watcher to monitor the status of a phone, not only a line on the phone.

To identify the phone being monitored for BLF status, Cisco Unified CME selects the phone with the monitored directory number assigned to the first button, or the directory number whose button is selected by the **auto-line**

command (SCCP only). If more than one phone uses the same number as its primary directory number, the phone with the lowest phone tag is monitored for BLF status.

For Extension Mobility phones, the first number configured in the user profile indicates the primary directory number of the Extension Mobility phone. If the Extension Mobility phone is being monitored, the BLF status of the corresponding phone is sent to the watcher when an extension-mobility user logs in or out, is idle, or busy.

If a shared directory number is busy on a monitored SCCP phone, and the monitored device is on-hook, the monitored phone is considered idle.

When a monitored phone receives a page, if the paging directory number is also monitored, the BLF status of the paging directory number shows busy on the watcher.

If device-based monitoring is enabled on a directory number configured as a call-park slot, and there is a call parked on this park-slot, the device-based BLF status indicates busy.

All directory numbers associated with a phone are in the DnD state when the DnD softkey is pressed. If a monitored phone becomes DnD-enabled, watchers are notified of the DnD status change.

For configuration information, see [BLF Monitoring for Speed-Dials and Call Lists](#) or [SIP: Enabling BLF Monitoring for Speed-Dials and Call Lists](#).

## Phone User Interface for BLF-Speed-Dial

Cisco Unified CME 8.5 and later versions allows the extension mobility (EM) users to configure dn-based Busy Lamp Field (BLF)-speed-dial settings directly on the phone through the services feature button. BLF-speed-dial settings are added or modified (changed or deleted) on the phone using a menu available with the Services button. Any changes to the BLF-speed-dial settings made through the phone user interface are applied to the user's profile in extension mobility. You can configure the BLF-speed-dial menu for SCCP phones using the **blf-speed-dial** command in ephone or ephone-template mode. For more information, see [Enabling BLF-Speed-Dial Menu](#).

For information on how phone users configure BLF-speed-dial using the phone user-interface, see the [Cisco Unified IP Phone documentation](#) for Cisco Unified CME .

For phones that do not have EM feature, the BLF-speed-dial service is available in service url page. You can disable the BLF-speed-dial feature using the **no phone-ui blf-speed-dial** command on phones that do not have Extension Mobility.

## Configure Presence Service

### Enable Presence for Internal Lines

Perform the following steps to enable the router to accept incoming presence requests from internal watchers and SIP trunks.

**Note**

The command **presence call-list** is an optional configuration, and it is not required to enable Presence on Unified CME. To enable a phone to monitor the line status of directory numbers or call list, such as a missed calls, placed calls, or received calls list, you can configure **presence call-list**.

**Restriction**

- A presentity can be identified by a directory number only.
- BLF monitoring indicates the line status only.
- Instant Messaging is not supported.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **sip-ua**
4. **presence enable**
5. **exit**
6. **presence**
7. **max-subscription** *number*
8. **presence call-list**
9. **end**

| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-presence)# end</pre>                                             | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Enable a Directory Number to be Watched

To enable a line associated with a directory number to be monitored by a phone registered to a Cisco Unified CME router, perform the following steps. The line is enabled as a presentity and phones can subscribe to its line status through the BLF call-list and BLF speed-dial features. There is no restriction on the type of phone that can have its lines monitored; any line on any IP phone or on an analog phone on supported voice gateways can be a presentity.

### Restriction

- A presentity is identified by a directory number only.
- BLF monitoring indicates the line status only.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn *dn-tag* [ *dual-line* ] or voice register dn *dn-tag***

4. **number** *number*
5. **allow watch**
6. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>ephone-dn</b> <i>dn-tag</i> [ <b>dual-line</b> ] or <b>voice register dn</b> <i>dn-tag</i><br><b>Example:</b><br><pre>Router(config)# ephone-dn 1</pre> or<br><pre>Router(config)# voice register dn 1</pre> | Enters the configuration mode to define a directory number for an IP phone, intercom line, voice port, or a message-waiting indicator (MWI). <ul style="list-style-type: none"> <li>• <i>dn-tag</i>—identifies a particular directory number during configuration tasks. Range is 1 to the maximum number of directory numbers allowed on the router platform, or the maximum defined by the <b>max-dn</b> command. Type <b>?</b> to display range.</li> </ul> |
| <b>Step 4</b> | <b>number</b> <i>number</i><br><b>Example:</b><br><pre>Router(config-ephone-dn)# number 3001</pre> or<br><pre>Router(config-register-dn)# number 3001</pre>                                                     | Associates a phone number with a directory number to be assigned to an IP phone in Cisco Unified CME. <ul style="list-style-type: none"> <li>• <i>number</i>—String of up to 16 characters that represents an E.164 telephone number.</li> </ul>                                                                                                                                                                                                               |

The ephone-dn configuration has priority over the ephone-dn template configuration.</li> </ul>                                                                                        |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone-dn)# end</pre> or<br><pre>Router(config-register-dn)# end</pre>                                                                                      | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Enable BLF Monitor for Speed-Dials and Call Lists Using SCCP Phones

A watcher can monitor the status of lines associated with internal and external directory numbers (presentities) through the BLF speed-dial and BLF call-list presence features. To enable the BLF notification features on an IP phone using SCCP, perform the following steps.

### Restriction

- Device-based BLF monitoring for call lists is not supported.
- Device-based BLF-speed-dial monitoring is not supported for a remote watcher or presentity.

### BLF Call-List

- Not supported on Cisco Unified IP Phone 7905, 7906, 7911, 7912, 7931, 7940, 7960, or 7985, Cisco Unified IP Phone Expansion Modules, or Cisco Unified IP Conference Stations.

### BLF Speed-Dial

- Not supported on Cisco Unified IP Phone 7905, 7906, 7911, 7912, or 7985, or Cisco Unified IP Conference Stations.

### Cisco Unified IP Phone 7931

- BLF status is displayed through monitor lamp only; BLF status icons are not displayed.

### Before you begin

- Presence must be enabled on the Cisco Unified CME router. See [Enabling Presence for Internal Lines](#).
- A directory number must be enabled as a presentity with the **allow watch** command to provide BLF status notification. See [Enabling a Directory Number to be Watched](#).
- Device-based monitoring requires Cisco Unified CME 7.1 or a later version. All directory numbers associated with the monitored phone must be configured with the **allow watch** command. Otherwise, if any of the directory numbers is missing this configuration, an incorrect status could be reported to the watcher.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **button** *button-number* { *separator* } *dn-tag* [,*dn-tag*...] [ *button-number* { *x* } *overlay-button-number* ] [ *button-number*... ]
5. **blf-speed-dial** *tag number label string* [ **device** ]
6. **presence call-list**
7. **end**

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                                                                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>ephone <i>phone-tag</i></b><br><b>Example:</b><br><pre>Router(config)# ephone 1</pre>                                                                                                                                                                                                      | Enters ephone configuration mode to set phone-specific parameters for a SIP phone. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number of the phone to be configured. Range is version and platform-dependent; type ? to display range. You can modify the upper limit for this argument with the <b>max-ephones</b> command.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <b>button <i>button-number</i> {<i>separator</i>} <i>dn-tag</i> [,<i>dn-tag</i>...]</b><br><b>[<i>button-number</i> {<i>x</i>} <i>overlay-button-number</i>]</b><br><b>[<i>button-number</i>...]</b><br><b>Example:</b><br><pre>Router(config-ephone)# button 1:10 2:11 3b12 4o13,14,15</pre> | Associates a button number and line characteristics with a directory number on the phone. <ul style="list-style-type: none"> <li>• <i>button-number</i>—Number of a line button on an IP phone.</li> <li>• <i>separator</i>—Single character that denotes the type of characteristics to be associated with the button.</li> <li>• <i>dn-tag</i>—Unique sequence number of the ephone-dn that you want to appear on this button. For overlay lines (<i>separator</i> is <b>o</b> or <b>c</b>), this argument can contain up to 25 ephone-dn tags, separated by commas.</li> <li>• <i>x</i>—Separator that creates an overlay rollover button.</li> <li>• <i>overlay-button-number</i>—Number of the overlay button that should overflow to this button.</li> </ul> |
| <b>Step 5</b> | <b>blf-speed-dial <i>tag number label string</i> [<i>device</i>]</b><br><b>Example:</b><br><pre>Router(config-ephone)# blf-speed-dial 3 3001 label sales device</pre>                                                                                                                         | Enables BLF monitoring of a directory number associated with a speed-dial number on the phone. <ul style="list-style-type: none"> <li>• <i>tag</i>—Number that identifies the speed-dial index. Range: 1 to 33.</li> <li>• <i>number</i>—Telephone number to speed dial.</li> <li>• <i>string</i>—Alphanumeric label that identifies the speed-dial button. String can contain a maximum of 30 characters.</li> </ul>                                                                                                                                                                                                                                                                                                                                              |

|               | Command or Action                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                      | <ul style="list-style-type: none"> <li>• <b>device</b>—(Optional) Enables phone-based monitoring. This keyword is supported in Cisco Unified CME 7.1 and later versions.</li> </ul>                                                                                                                                                                                                                                                                                    |
| <b>Step 6</b> | <b>presence call-list</b><br><b>Example:</b><br><pre>Router(config-ephone)# presence call-list</pre> | Enables BLF monitoring of directory numbers that appear in call lists and directories on this phone. <ul style="list-style-type: none"> <li>• For a directory number to be monitored, it must have the <code>allow watch</code> command enabled.</li> <li>• To enable BLF monitoring for call lists on all phones in this Cisco Unified CME system, use this command in presence mode. See <a href="#">Enable Presence for Internal Lines, on page 873</a>.</li> </ul> |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone)# end</pre>                               | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Example

The following example shows that the directory numbers for extensions 2001 and 2003 are allowed to be watched and the BLF status of these numbers display on phone 1.

```
ephone-dn 201
number 2001
allow watch
!
!
ephone-dn 203
number 2003
allow watch
!
!
ephone 1
mac-address 0012.7F54.EDC6
blf-speed-dial 2 201 label "sales" device
blf-speed-dial 3 203 label "service" device
button 1:100 2:101 3b102
```

### What to do next

If you are done modifying parameters for SCCP phones in Cisco Unified CME, generate a new configuration profile by using the **create cnf-files** command and then restart the phones with the **restart** command. See [SCCP: Generating Configuration Files for SCCP Phones](#) and [SCCP: Using the restart Command](#).

## Enable BLF Monitoring for Speed-Dials and Call Lists on SIP Phones

A watcher can monitor the status of lines associated with internal and external directory numbers (presentities) through the BLF speed-dial and BLF call-list presence features. To enable the BLF notification features on a SIP phone, perform the following steps.

### Restriction

- Device-based BLF-speed-dial monitoring is not supported for a remote watcher or presentity.
- TCP based, device-based BLF-speed-dial monitoring is not supported on Unified CME.

### BLF Call-List

- Not supported on Cisco Unified IP Phone 7905, 7906, 7911, 7912, 7931, 7940, 7960, or 7985, Cisco Unified IP Phone Expansion Modules, or Cisco Unified IP Conference Stations.

### BLF Speed-Dial

- Not supported on Cisco Unified IP Phone 7905, 7906, 7911, 7912, or 7985, or Cisco Unified IP Conference Stations.

### Before you begin

- Presence must be enabled on the Cisco Unified CME router. See [Enabling Presence for Internal Lines](#).
- A directory number must be enabled as a presentity with the **allow watch** command to provide BLF status notification. See [Enabling a Directory Number to be Watched](#).
- SIP phones must be configured with a directory number under voice register pool configuration mode (use **dn** keyword in **number** command); direct line numbers are not supported.
- Device-based monitoring requires Cisco Unified CME 7.1 or a later version. All directory numbers associated with the monitored phone must be configured with the **allow watch** command. Otherwise, if any of the directory numbers is missing this configuration, an incorrect status could be reported to the watcher.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **number** *tag dn dn-tag*
5. **blf-speed-dial** *tag number label string* [**device**]
6. **presence call-list**
7. **end**

### What to do next

If you are done modifying parameters for SIP phones in Cisco Unified CME, generate a new configuration profile by using the **create profile** command and then restart the phones with the **restart** command. See [SIP: Generating Configuration Profiles for SIP Phones](#) and [SIP: Using the restart Command](#).

## Enable BLF-Speed-Dial Menu

### Restriction

- EM user cannot modify the logout profile from phone user interface (UI).
- Extension Mobility (EM) users must log into EM profile to update BLF-speed-dial number.

### Before you begin

- Cisco Unified CME 8.5 or later versions.

### SUMMARY STEPS

- enable**
- configure terminal**
- ephone** *phone-tag*
- blf-speed-dial** [*index index number*] [**phone-number** *number*] [**label** *label text*]
- end**

## Configure Presence to Watch External Lines

To enable internal watchers to monitor external directory numbers on a remote Cisco Unified CME router, perform the following steps.

### Before you begin

Presence service must be enabled for internal lines. See [Enabling Presence for Internal Lines](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **presence**
4. **server *ip-address***
5. **allow subscribe**
6. **watcher all**
7. **sccp blf-speed-dial retry-interval *seconds* limit *number***
8. **exit**
9. **voice register global**
10. **authenticate presence**
11. **authenticate credential *tag location***
12. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                     | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>presence</b><br><b>Example:</b><br>Router(config)# presence                                                                                                         | Enables presence service and enters presence configuration mode.                                                                                                                                                                                                                                                   |
| <b>Step 4</b> | <b>server ip-address</b><br><b>Example:</b><br>Router(config-presence)# server 10.10.10.1                                                                              | Specifies the IP address of a presence server for sending presence requests from internal watchers to external presentities.                                                                                                                                                                                       |
| <b>Step 5</b> | <b>allow subscribe</b><br><b>Example:</b><br>Router(config-presence)# allow subscribe                                                                                  | Allows internal watchers to monitor external directory numbers.                                                                                                                                                                                                                                                    |
| <b>Step 6</b> | <b>watcher all</b><br><b>Example:</b><br>Router(config-presence)# watcher all                                                                                          | Allows external watchers to monitor internal directory numbers.                                                                                                                                                                                                                                                    |
| <b>Step 7</b> | <b>sccp blf-speed-dial retry-interval seconds limit number</b><br><b>Example:</b><br>Router(config-presence)# sccp blf-speed-dial<br>retry-interval 90 limit number 15 | (Optional) Sets the retry timeout for BLF monitoring of speed-dial numbers on phones running SCCP.<br><ul style="list-style-type: none"><li>• <i>seconds</i>—Retry timeout in seconds. Range: 60 to 3600. Default: 60.</li><li>• <i>number</i>—Maximum number of retries. Range: 10 to 100. Default: 10.</li></ul> |
| <b>Step 8</b> | <b>exit</b><br><b>Example:</b><br>Router(config-presence)# exit                                                                                                        | Exits presence configuration mode.                                                                                                                                                                                                                                                                                 |
| <b>Step 9</b> | <b>voice register global</b><br><b>Example:</b><br>Router(config)# voice register global                                                                               | Enters voice register global configuration mode to set global parameters for all supported SIP phones in a Cisco Unified CME environment.                                                                                                                                                                          |

|                | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 10</b> | <b>authenticate presence</b><br><b>Example:</b><br><pre>Router(config-register-global)# authenticate presence</pre>                                    | (Optional) Enables authentication of incoming presence requests from a remote presence server.                                                                                                                                                                                                                                                                                                               |
| <b>Step 11</b> | <b>authenticate credential tag location</b><br><b>Example:</b><br><pre>Router(config-register-global)# authenticate credential 1 flash:cred1.csv</pre> | (Optional) Specifies the credential file to use for authenticating presence subscription requests. <ul style="list-style-type: none"> <li>• <i>tag</i>—Number that identifies the credential file to use for presence authentication. Range: 1 to 5.</li> <li>• <i>location</i>—Name and location of the credential file in URL format. Valid storage locations are TFTP, HTTP, and flash memory.</li> </ul> |
| <b>Step 12</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-register-global)# end</pre>                                                                        | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                               |

## Verify Presence Configuration

### Procedure

#### Step 1 show running-config

Use this command to verify your configuration.

```
Router# show running-config
!
voice register global
mode cme
source-address 10.1.1.2 port 5060
load 7971 SIP70.8-0-1-11S
load 7970 SIP70.8-0-1-11S
load 7961GE SIP41.8-0-1-0DEV
load 7961 SIP41.8-0-1-0DEV
authenticate presence
authenticate credential 1 tftp://172.18.207.15/labtest/cred1.csv
create profile sync 0004550081249644
.
.
.
presence
server 10.1.1.4
sccp blf-speed-dial retry-interval 70 limit 20
presence call-list
max-subscription 128
watcher all
allow subscribe
!
```

```
sip-ua
 presence enable
```

## Step 2 show presence global

Use this command to display presence configuration settings.

```
Router# show presence global
```

```
Presence Global Configuration Information:
=====
Presence feature enable : TRUE
Presence allow external watchers : FALSE
Presence max subscription allowed : 100
Presence number of subscriptions : 0
Presence allow external subscribe : FALSE
Presence call list enable : TRUE
Presence server IP address : 0.0.0.0
Presence sccp blfsd retry interval : 60
Presence sccp blfsd retry limit : 10
Presence router mode : CME mode
```

## Step 3 show presence subscription [details | presentity telephone-number | subid subscription-id summary]

Use this command to display information about active presence subscriptions.

```
Router# show presence subscription summary
```

```
Presence Active Subscription Records Summary: 15 subscription
Watcher Presentity SubID Expires SibID Status
===== =====
6002@10.4.171.60 6005@10.4.171.34 1 3600 0 idle

# Troubleshooting Presence Service

You can use the following commands to troubleshoot presence service:

- `debug presence {all | asnl | errors | event | info | timer | trace | xml}`
- `debug ephone blf [mac-address mac-address]`

## Feature Information for Presence Service

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 76: Feature Information for Presence Service**

| Feature Name                            | Cisco Unified CME Version | Modification                                                   |
|-----------------------------------------|---------------------------|----------------------------------------------------------------|
| Phone User Interface for BLF-Speed-Dial | 8.5                       | Added support for BLF Speed Dial through Phone User Interface. |

| Feature Name     | Cisco Unified CME Version | Modification                                                                                                                                                                                            |

| Presence Service | 4.1                       | Presence with BLF was introduced.                                                                                                                                                                       |

## CHAPTER 32

# Ringtones

---

- [Information About Ringtones, on page 893](#)
- [Configure Ringtones, on page 894](#)
- [Configuration Examples for Ringtones, on page 899](#)
- [Feature Information for Ringtones, on page 899](#)

## Information About Ringtones

### Distinctive Ringing

Distinctive ring is used to identify internal and external incoming calls. An internal call is defined as a call originating from any Cisco Unified IP phone that is registered in Cisco Unified CME or is routed through the local FXS port.

In Cisco CME 3.4 and earlier versions, the standard ring pattern is generated for all calls to local SCCP endpoints. In Cisco Unified CME 4.0, the following distinctive ring features are supported for SCCP endpoints:

- Specify one of three ring patterns to be used for all types of incoming calls to a particular directory number, on all phones on which the directory number appears. If a phone is already in use, an incoming call is presented as a call-waiting call and uses a distinctive call-waiting beep.
- Specify whether the distinctive ring is used only if the incoming called number matches the primary or secondary number defined for the ephone-dn. If no secondary number is defined for the ephone-dn, the secondary ring option has no effect.
- Associate a feature ring pattern with a specific button on a phone so that different phones that share the same directory number can use a different ring style.

For local SIP endpoints, the type of ring sound requested is signaled to the phone using an alert-info signal. If distinctive ringing is enabled, Cisco Unified CME generates the alert-info for incoming calls from any phone that is not registered in Cisco Unified CME, to the local endpoint. Alert-info from an incoming leg can be relayed to an outgoing leg with the internally generated alert-info taking precedence.

Cisco Unified IP phones use the standard Telcordia Technologies distinctive ring types.

## Customized Ringtones

Cisco Unified IP Phones have two default ring types: Chirp1 and Chirp2. Cisco Unified CME also supports customized ringtones using pulse code modulation (PCM) files.

An XML file called RingList.xml specifies the ringtone options available for the default ring on an IP phone registered to Cisco Unified CME. An XML file called DistinctiveRingList.xml specifies the ringtones available on each individual line appearance on an IP phone registered to Cisco Unified CME.

## On-Hold Indicator

On-hold indicator is an optional feature that generates a ring burst on idle IP phones that have placed a call on hold. An option is available to generate call-waiting beeps for occupied phones that have placed calls on hold. This feature is disabled by default. For configuration information, see [Configure On-Hold Indicator, on page 897](#).

LED color display for hold state, also known as I-Hold, is supported in Cisco Unified CME 4.0(2) and later versions. The I-Hold feature provides a visual indicator for distinguishing a local hold from a remote hold on shared lines on supported phones, such as the Cisco Unified IP Phone 7931G. This feature requires no additional configuration.

## Configure Ringtones

### Configure Distinctive Ringing

To set the ring pattern for all incoming calls to a directory number, perform the following steps.

#### Before you begin

Cisco Unified CME 4.0 or a later version.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn *dn-tag* [*dual-line*]**
4. **number *number* [*secondary number*] [*no-reg* [*both* | *primary*]]**
5. **ring {*external* | *internal* | *feature*} [*primary* | *secondary*]**
6. **end**

#### DETAILED STEPS

##### Procedure

|        | Command or Action      | Purpose                                                                 |
|--------|------------------------|-------------------------------------------------------------------------|
| Step 1 | enable<br><br>Example: | Enables privileged EXEC mode.<br><br>• Enter your password if prompted. |

|        | Command or Action                                                                                                               | Purpose                                                                                                                                                 |
|--------|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | Router> enable                                                                                                                  |                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                      | Enters global configuration mode.                                                                                                                       |
| Step 3 | <b>ephone-dn dn-tag [dual-line]</b><br><b>Example:</b><br>Router(config)# ephone-dn 29                                          | Enters ephone-dn configuration mode, creates an ephone-dn, and optionally assigns it dual-line status.                                                  |
| Step 4 | <b>number number [secondary number] [no-reg [both   primary]]</b><br><b>Example:</b><br>Router(config-ephone-dn)# number 2333   | Configures a valid extension number for this ephone-dn.                                                                                                 |
| Step 5 | <b>ring {external   internal   feature} [primary   secondary]</b><br><b>Example:</b><br>Router(config-ephone-dn)# ring internal | Designates which ring pattern to be used for all types of incoming calls to this directory number, on all phones on which the directory number appears. |
| Step 6 | <b>end</b><br><b>Example:</b><br>Router(config-ephone-dn)# end                                                                  | Returns to privileged EXEC mode.                                                                                                                        |

## Configure Customized Ringtones

To create a customized ringtone, perform the following steps.

### Before you begin

Cisco Unified CME 4.0 or a later version.

### Procedure

- Step 1** Create a PCM file for each customized ringtone (one ring per file). The PCM files must comply with the following format guidelines.
- Raw PCM (no header)
  - 8000 samples per second
  - 8 bits per sample
  - mLaw compression
  - Maximum ring size—16080 samples

- Minimum ring size—240 samples
- Number of samples in the ring must be evenly divisible by 240
- Ring should start and end at the zero crossing

Use an audio editing package that supports these file format requirements to create PCM files for customized phone rings.

Sample ring files are in the ringtone.tar file at <https://software.cisco.com/download/home/277641082>

**Step 2** Edit the RingList.xml and DistinctiveRingList.xml files using a text editor.

The RingList.xml and DistinctiveRingList.xml files contain a list of phone ring types. Each file shows the PCM file used for each ring type and the text that is displayed on the Ring Type menu on a Cisco Unified IP Phone for each ring.

Sample XML files are in the ringtone.tar file at <https://software.cisco.com/download/home/277641082>

The RingList.xml and DistinctiveRingList.xml files use the following format to specify customized rings:

```
<CiscoIPPhoneRingList>
 <Ring>
 <DisplayName/>
 <FileName/>
 </Ring>
</CiscoIPPhoneRingList>
```

The XML ring files use the following tag definitions:

- Ring files contain two fields, DisplayName and FileName, which are required for each phone ring type. Up to 50 rings can be listed.
- DisplayName defines the name of the customized ring for the associated PCM file that will be displayed on the Ring Type menu of the Cisco Unified IP Phone.
- FileName specifies the name of the PCM file for the customized ring to associate with DisplayName.
- The DisplayName and FileName fields can not exceed 25 characters.

The following sample RingList.xml file defines two phone ring types:

```
<CiscoIPPhoneRingList>
<Ring>
 <DisplayName>Piano1</DisplayName>
 <FileName>Piano1.raw</FileName>
</Ring>
<Ring>
 <DisplayName>Chime</DisplayName>
 <FileName>Chime.raw</FileName>
</Ring>
</CiscoIPPhoneRingList>
```

**Step 3** Copy the PCM and XML files to system Flash on the Cisco Unified CME router. For example:

```
copy tftp://192.168.1.1/RingList.xml flash:
copy tftp://192.168.1.1/DistinctiveRingList.xml flash:
copy tftp://192.168.1.1/Piano1.raw flash:
copy tftp://192.168.1.1/Chime.raw flash:
```

**Step 4** Use the **tftp-server** command to enable access to the files. For example:

```
tftp-server flash:RingList.xml
tftp-server flash:DistinctiveRingList.xml
tftp-server flash:Piano1.raw
tftp-server flash:Chime.raw
```

- Step 5** Reboot the IP phones. After reboot, the IP phones download the XML and ringtone files. Select the customized ring by pressing the Settings button followed by the Ring Type menu option on a phone.

## Configure On-Hold Indicator

The Call Hold feature is available by default. To define an audible indicator as a reminder that a call is waiting on hold, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn dn-tag [ dual-line ]**
4. **hold-alert timeout { idle | originator | shared | shared-idle } [ recurrence recurrence-timeout ] [ ring-silent-dn ]**
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                             | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                           |
| <b>Step 3</b> | <b>ephone-dn dn-tag [ dual-line ]</b><br><br><b>Example:</b><br>Router(config)# ephone-dn 20                                                                                                                       | Enters ephone-dn configuration mode, creates an ephone-dn, and optionally assigns it dual-line status.                                                                                                                                                                      |
| <b>Step 4</b> | <b>hold-alert timeout { idle   originator   shared   shared-idle } [ recurrence recurrence-timeout ] [ ring-silent-dn ]</b><br><br><b>Example:</b><br>Router(config-ephone-dn)# hold-alert 15 idle<br>recurrence 3 | Sets audible alert notification on the Cisco Unified IP phone for alerting the user about on-hold calls.<br><br><b>Note</b><br>From the perspective of the originator of the call on hold, the <b>originator</b> and <b>shared</b> keywords provide the same functionality. |

|               | Command or Action                                                   | Purpose                          |
|---------------|---------------------------------------------------------------------|----------------------------------|
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-ephone-dn) # end | Returns to privileged EXEC mode. |

## Enable Distinctive Ringing on SIP Phones

To set the ring pattern for distinguishing between external and internal incoming calls, perform the following steps.

**Restriction** bellcore-dr1 to bellcore-dr5 are the only Telcordia options that are supported for SIP phones.

### Before you begin

Cisco Unified CME 3.4 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **external-ring { bellcore-dr1 | bellcore-dr2 | bellcore-dr3 | bellcore-dr4 | bellcore-dr5 }**
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                 | Purpose                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                            | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                    | Enters global configuration mode.                                                                                         |
| <b>Step 3</b> | <b>voice register global</b><br><br><b>Example:</b><br>Router(config)# voice register global      | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.      |
| <b>Step 4</b> | <b>external-ring { bellcore-dr1   bellcore-dr2   bellcore-dr3   bellcore-dr4   bellcore-dr5 }</b> | Specifies the type of audible ring sound to be used for external calls                                                    |

|               | Command or Action                                                                        | Purpose                                                                                                         |
|---------------|------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br><pre>Router(config-register-global)# external-ring bellcore-dr3</pre> | <ul style="list-style-type: none"> <li>• Default—Internal ring sound is used for all incoming calls.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-register-global)# end</pre>      | Exits configuration mode and enters privileged EXEC mode.                                                       |

## Configuration Examples for Ringtones

### Example for Configuring Distinctive Ringing for Internal Calls

The following example sets distinctive ringing for internal calls on extension 2333.

```
ephone-dn 34
 number 2333
 ring internal
```

### Example for Configuring On-Hold Indicator

In the following example, extension 2555 is configured to not forward local calls that are internal to the Cisco Unified CME system. Extension 2222 dials extension 2555. If 2555 is busy, the caller hears a busy tone. If 2555 does not answer, the caller hears ringback. The internal call is not forwarded.

```
ephone-dn 25
 number 2555
 no forward local-calls
 call-forward busy 2244
 call-forward noan 2244 timeout 45
```

## Feature Information for Ringtones

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfngn.cisco.com/>. An account on Cisco.com is not required.

Table 77: Feature Information for Ringtones

| Feature Name         | Cisco Unified CME Version | Feature Information                                                                                                                                                                                     |
|----------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Distinctive Ringing  | 4.0                       | Supports ringtone choices for all incoming calls to an individual directory number, for all SCCP phones on which the directory number appears.                                                          |
|                      | 3.4                       | Generate the alert-info for incoming calls from any phone that is not registered in Cisco Unified CME, to local SIP endpoints.                                                                          |
| Customized Ringtones | 4.0                       | Customized Ringtones feature was introduced.                                                                                                                                                            |
| On-Hold Indicator    | 4.0(2)                    | Controls LED color display for hold state to provide visual indicator for distinguishing a local hold from a remote hold on shared lines on supported phones, such as the Cisco Unified IP Phone 7931G. |
|                      | 2.0                       | Audible on-hold indicator was introduced.                                                                                                                                                               |
|                      | 1.0                       | Call Hold was introduced.                                                                                                                                                                               |

## CHAPTER 33

# Single Number Reach

- [Information About Single Number Reach, on page 901](#)
- [Configure Single Number Reach, on page 905](#)
- [Feature Information for Single Number Reach, on page 917](#)

## Information About Single Number Reach

### Overview of Single Number Reach

The Single Number Reach (SNR) feature allows users to answer incoming calls to their extension on either their desktop IP phone or at a remote destination, such as a mobile phone. Users can pick up active calls on the desktop phone or the remote phone without losing the connection. This enables callers to dial a single number to reach the phone user. Calls that are not answered can be forwarded to voice mail.

Remote destinations may include the following devices:

- Mobile (cellular) phones.
- Smart phones.
- IP phones not belonging to the same Cisco Unified CME router as the desktop phone.
- Home phone numbers in the PSTN. Supported PSTN interfaces include PRI, BRI, SIP, and FXO.

For incoming calls to the SNR extension, Cisco Unified CME rings the desktop IP phone first. If the IP phone does not answer within the configured amount of time, it rings the configured remote number while continuing to ring the IP phone. Unanswered calls are sent to a configured voice-mail number.

The IP phone user has these options for handling calls to the SNR extension:

- Pull back the call from the remote phone—Phone user can manually pull back the call to the SNR extension by pressing the Resume softkey, which disconnects the call from the remote phone.
- Send the call to remote phone—Phone user can send the call to the remote phone by using the Mobility softkey. While connected to the call, the phone user can press the Mobility softkey and select **Send call to mobile**. The call is forwarded to the remote phone.
- Enable or disable Single Number Reach—While the IP phone is in the idle state, the user can toggle the SNR feature on and off by using the Mobility softkey. If the user disables SNR, Cisco Unified CME does not ring the remote number.

IP phone users can modify their own SNR settings directly from the phone by using the menu available with the Services feature button. You must enable the feature on the phone to allow a phone user to access the user interface.

This feature is supported in Cisco Unified CME 7.1 and later versions on SCCP IP phones that support softkeys.

## SNR Enhancements

Cisco Unified CME 8.5 supports the following enhancements in the Single Number Reach (SNR) feature:

### Hardware Conference

In Cisco Unified CME 8.5, you can send a call to a mobile phone after joining a hardware conference. After joining the hardware conference, all conference callers are blind-transferred to hardware DN. The call character of the ephone changes from incoming call to outgoing call and you are able to send a call to the mobile.

### Call Park, Call Pickup, and Call Retrieval

In earlier versions of Cisco Unified CME, Call Park, Call Pickup, and Call Retrieval features were not supported for SNR. Cisco Unified CME 8.5 and later versions allows you to park, pickup, or retrieve an SNR call,

Cisco Unified CME 8.5 enhances the SNR feature to allow you to see the local number on your cell phone instead of the calling party number. You can configure the `snr calling number local` command under `ephone-dn` configuration mode to view the caller ID of the SNR phone. For information on configuring SNR calling number local, see [Configure Single Number Reach Enhancements on SCCP Phones, on page 909](#).

### Answer Too Soon Timer

On non-FXO ports, you can set an `snr answer too soon` timer to prevent the calls from rolling to the voice mailbox of your cell phone. When the cell phone rolls to the voice mail within the answer too soon timer range (1 to 5 seconds), the mobile phone call leg is immediately disconnected. You can configure the `snr answer too soon` command under `ephone-dn` mode. For more information, see [Configure Single Number Reach Enhancements on SCCP Phones, on page 909](#). The answer-too soon timer is not applicable when sending the call to a mobile.

### SNR Phone Stops Ringing After Mobile Phone Answers

When SNR is deployed on non-FXO ports, if cell phone picks up an SNR call, you are connected to the call. The ephone stops ringing further and is placed on hold. You can configure the `snr ring-stop` command under `ephone-dn` configuration mode to stop the ephone from ringing and to place the phone on hold. For more information, see [Configure Single Number Reach Enhancements on SCCP Phones, on page 909](#).

## Single Number Reach for Cisco Unified SIP IP Phones

Before Cisco Unified CME 9.0, the Single Number Reach (SNR) feature enabled the user to be reached on two numbers: a regular directory number (DN) on the ephone and a public switched telephone network (PSTN) connection (either a PRI/BRI/FXO port or a SIP interface). For incoming calls to the ephone, the Cisco Unified CME called the ephone DN first. When the ephone DN did not answer within a configured time, the Cisco Unified CME called a preconfigured PSTN number while continually calling the ephone DN.

In Cisco Unified CME 9.0 and later versions, the following SNR features are supported for Cisco Unified SIP IP phones:

- Enable and disable the Extension Mobility (EM) feature on a Cisco Unified SIP IP phone—Use the Mobility softkey or PLK as a toggle or use the **mobility** and **no mobility** commands to enable or disable the Mobility feature on a Cisco Unified SIP IP phone.
- Manual pull back of a call on a mobile phone—Use the Resume softkey to manually bring a call back to the SNR DN.
- Send a call to a mobile PSTN phone—Send a call to the mobile PSTN phone using the Mobility softkey while the Cisco Unified SIP IP phone is on a call. Select “**Send call to mobile**” and the call is handed off to the mobile phone.
- Send a call to a mobile phone regardless of whether the SNR phone is the originating or the terminating side—Ensure that the SNR feature is configured in voice register dn or ephone-dn configuration mode to send a call to a mobile phone regardless of whether the SNR phone is the originating or terminating side. Use the Mobility softkey, select “**Send call to mobile**,” and the call is handed off to the mobile phone.

For calls from a PSTN, local, or VoIP phone to a Cisco Unified SIP IP phone configured as an SNR phone, the Cisco Unified CME calls the SIP SNR or the mobile phone DN.

When you answer the call on the SIP SNR phone, you can send the call to the PSTN/BRI/PRI/SIP phone.

When you answer the call on the mobile phone, the Resume softkey is displayed on the SIP SNR phone and allows the call to be pulled back to the SIP SNR phone. You can repeatedly pull the call back from the PSTN phone to the SIP SNR phone or from the SIP SNR phone to the PSTN phone.

If the cfwd-noan keyword is configured and both the mobile and SIP SNR phones do not answer, the call is redirected to a preconfigured extension number when the end of a preconfigured time delay is reached.

The following shows how SNR phones configured with Cisco Unified SIP IP phones behave differently from those configured with Cisco Unified SCCP IP phones when sending a call to a mobile:

- For Cisco Unified SCCP IP phones, the Resume softkey is displayed on the SCCP SNR phone as soon as the call is sent to the mobile phone.
- For Cisco Unified SIP IP phones, the Resume softkey is displayed on the SIP SNR phone as soon as the mobile phone answers the call.

---

**Note** When the Resume softkey is pressed, the call is returned to the SNR phone.

---

Cisco Unified CME 9.0 and later supports the SNR feature in Cisco Unified SIP 7906, 7911, 7941, 7942, 7945, 7961, 7962, 7965, 7970, 7971, 7975, 8961, 9951, and 9971 IP Phones.

---

**Note** Single Number Reach (SNR) support through MyPhoneApps on Unified CME is available for SIP Phones on the Cisco IP Phones 7800 and 8800 Series.

---

## Virtual SNR DN for Cisco Unified SCCP IP Phones

A virtual SNR DN is a DN not associated with any registered phone. It can be called, forwarded to a preconfigured mobile phone, or put on an Auto Hold state when the mobile phone answers the call or the time

delay is reached. In the Auto Hold state, the DN can either be floating or unregistered. A floating DN is a DN not configured for any phone while an unregistered DN is one associated with phones not registered to a Cisco Unified CME system.

Before Cisco Unified CME 9.0, an SNR DN feature did not launch when the SNR DN was not associated with any registered phone. Although a call could be forwarded to the mobile phone using the **call-forward busy** command, the SNR DN had to be configured under a phone. Users who were assigned floating DNs could not forward calls unless they had a phone assigned to them.

In Cisco Unified CME 9.0 and later versions, an SNR DN is not required to be associated with a registered phone to have the SNR DN feature launched. A call can be made to a virtual SNR DN and the SNR feature can be launched even when the SNR DN is not associated with any phone. A call to a virtual SNR DN can be forwarded to an auto-attendant service when the preconfigured mobile phone is out of service and the voice mail can be retrieved using the telephone or extension number assigned to the voice mailbox.

Although the virtual SNR DN feature is designed for SNR DNs that are not associated with registered phones, this feature also supports virtual SNR DNs that complete phone registration or login and registered DNs that become virtual when all associated registered phones become unregistered.

# Configure Single Number Reach

## Configure Single Number Reach on SCCP Phones

### Restriction

- Each IP phone supports only one SNR directory number.
- SNR feature is not supported for the following:
  - SCCP-controlled analog FXS phones
  - MLPP calls
  - Secure calls
  - Video calls
  - Hunt group directory numbers (voice or ephone)
  - MWI directory numbers
  - Trunk directory numbers
- An overlay set can support only one SNR directory number and that directory number must be the primary directory number.
- Call forward no answer (CFNA), configured with the **call-forward noan** command, is disabled if SNR is configured on the directory number. To forward unanswered calls to voice mail, use the **cfwd-noan** keyword in the **snr** command.
- Call forwarding of unanswered calls, configured with the **cfwd-noan** keyword in the **snr** command, is not supported for PSTN calls from FXO trunks because the calls connect immediately.
- Calls from an internal extension to an extension which is busy, is forwarded to the SNR destination even if **no forward local-calls** is configured under the Directory Number.
- Calls always remain private. If a call is answered on a remote phone, the desktop IP phone can not listen to the call unless it resumes the call.
- U.S. English is the only locale supported for SNR calls.

### Before you begin

- Cisco Unified CME 7.1 or a later version
- Cisco IP Communicator requires version 2.1.4 or later

### SUMMARY STEPS

1. **enable**
2. **configure terminal**

15. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                      | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                              | Enters global configuration mode.                                                                                                                                                                               |
| <b>Step 3</b> | <b>ephone-dn</b> <i>dn-tag</i><br><b>Example:</b><br>Router(config)# ephone-dn 10                                                                       | Enters directory number configuration mode.                                                                                                                                                                     |
| <b>Step 4</b> | <b>number</b> <i>number</i><br><b>Example:</b><br>Router(config-ephone-dn)# number 1001                                                                 | Associates an extension number with this directory number.<br><ul style="list-style-type: none"> <li><i>number</i>—String of up to 16 digits that represents an extension or E.164 telephone number.</li> </ul> |
| <b>Step 5</b> | <b>mobility</b><br><b>Example:</b><br>Router(config-ephone-dn)# mobility                                                                                | Enables the Mobility feature on the directory number.                                                                                                                                                           |
| <b>Step 6</b> | <b>snr</b> <i>e164-number</i> <b>delay</b> <i>seconds</i> <b>timeout</b> <i>seconds</i> [ <b>cfwd-noan</b> <i>extension-number</i> ]<br><b>Example:</b> | Enables SNR on the extension.<br><ul style="list-style-type: none"> <li><i>e164-number</i>—E.164 telephone number to ring if IP phone extension does not answer.</li> </ul>                                     |

|                | Command or Action                                                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <pre>Router(config-ephone-dn)# snr 4085550133 delay 5 timeout 15 cfwd-noan 2001</pre>                                                                                                                                                                                                   | <ul style="list-style-type: none"> <li>• <b>delay seconds</b>—Sets the number of seconds that the call rings the IP phone before ringing the remote phone. Range is from 0 to 10. Default: disabled.</li> <li>• <b>timeout seconds</b>—Sets the number of seconds that the call rings after the configured delay. Call continues to ring for this length of time on the IP phone even if the remote phone answers the call. Range is from 5 to 60. Default: disabled.</li> <li>• <b>cfwd-noan extension-number</b>—(Optional) Forwards the call to this target number if the phone does not answer after both the <b>delay</b> and <b>timeout</b> seconds have expired. This is typically the voice-mail number.</li> </ul> <p><b>Note</b><br/>The <b>cfwd-noan</b> option is not supported for calls from FXO trunks because the calls connect immediately.</p> |
| <b>Step 7</b>  | <b>snr calling-number local</b><br><br><b>Example:</b><br><pre>Router(config-ephone-dn)# snr calling-number local</pre>                                                                                                                                                                 | (Optional) Replaces the original calling party number with the SNR extension number in the caller ID display of the remote phone. <ul style="list-style-type: none"> <li>• This command is supported in Cisco Unified CME 8.0 and later versions.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 8</b>  | <b>exit</b><br><br><b>Example:</b><br><pre>Router(config-ephone-dn)# exit</pre>                                                                                                                                                                                                         | Exits ephone-dn configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 9</b>  | <b>ephone-template template-tag</b><br><br><b>Example:</b><br><pre>Router(config)# ephone-template 1</pre>                                                                                                                                                                              | Enters ephone-template configuration mode to create an ephone template. <ul style="list-style-type: none"> <li>• <b>template-tag</b>—Unique identifier for the ephone template that is being created. Range is from 1 to 20.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 10</b> | <b>softkeys connected { [Acct] [ConfList] [Confrn] [Endcall] [Flash] [HLog] [Hold] [Join] [LiveRcd] [Mobility] [Park] [RmLstC] [Select] [TrnsfVM] [Trnsfer] }</b><br><br><b>Example:</b><br><pre>Router(config-ephone-template)# softkeys connected endcall hold livercd mobility</pre> | Modifies the order and type of softkeys that display on an IP phone during the connected call state. <ul style="list-style-type: none"> <li>• Pressing the Mobility softkey during the connected call state forwards the call to the PSTN number defined in Step 6.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 11</b> | <b>softkeys idle { [Cfwdall] [ConfList] [Dnd] [Gpickup] [HLog] [Join] [Login] [Mobility] [Newcall] [Pickup] [Redial] [RmLstC] }</b><br><br><b>Example:</b>                                                                                                                              | Modifies the order and type of softkeys that display on an IP phone during the idle call state. <ul style="list-style-type: none"> <li>• Pressing the Mobility softkey during the idle call state enables the SNR feature. This key is a toggle; pressing it a second time disables SNR.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Example

The following example shows extension 1001 is enabled for SNR on IP phone 21. After a call rings at this number for 5 seconds, the call also rings at the remote number 4085550133. The call continues ringing on both phones for 15 seconds. If the call is not answered after a total of 20 seconds, the call no longer rings and it is forwarded to the voice-mail number 2001.

```

# Configure Single Number Reach Enhancements on SCCP Phones

## Restriction

- **Software Conference**— After a software conference is initiated and committed on an ephone, you cannot send the call to a mobile phone. You can only enable or disable mobility after software conference is committed.
- **SNR Call Pickup on FXO port**— For a call routed through FXO port to the PSTN, the call is signaled as “connected” as soon as FXO port is seized outbound. The mobile phone is on FXO interface and the call (session) is in active state as soon as FXO is in connect state. The ephone will be in ringing state but you can not pick up the ephone call.
- **Music on hold (MOH)** is not supported if the SNR call originates from the line side. MOH is supported on an SNR call if the call originates from the trunk side.

## Before you begin

Cisco Unified CME 8.5 or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn *dn-tag***
4. **number *number* [*secondary number*] [**no-reg** [**both** | **primary**]]**
5. **mobility**
6. **snr calling number *local***
7. **snr answer too soon *time***
8. **snr ring-stop**
9. **exit**

```

## Configure Single Number Reach on SIP Phones

### Restriction

- Hardware Conferencing and Privacy on Hold for Cisco Unified SIP IP phones are not supported.
- Mixed shared lines between Cisco Unified SIP and SCCP IP phones are not supported.
- Subscribe and Notify modes for SIP shared lines are not supported.
- Incoming calls from the H323 IP trunk are not supported.
- Media flow around for SIP-SIP trunk calls is not supported.
- SIP SNR phones that initiate software conferencing are unable to send or receive calls to or from mobile phones because the Cisco Unified SIP IP phones are put on hold after a software conference is committed.

### Before you begin

Cisco Unified CME 9.0 or a later version.

### SUMMARY STEPS

1. **enable**

| <b>Step 12</b> | <b>name</b> <i>name</i><br><b>Example:</b><br><pre>Router(config-register-dn)# name John Smith</pre>                                                                                                                          | Associates a name with a directory number in Cisco Unified CME. <ul style="list-style-type: none"> <li><i>name</i>—Name of the person associated with a given extension. Name must follow the order specified in the <b>directory</b> (telephony-service) command, either <b>first-name-first</b> or <b>last-name-first</b>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 13</b> | <b>mobility</b><br><b>Example:</b><br><pre>Router(config-register-dn)# mobility</pre>                                                                                                                                         | Enables the Mobility feature on an extension of a Cisco Unified SIP IP phone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 14</b> | <b>snr calling-number local</b><br><b>Example:</b><br><pre>Router(config-register-dn)# snr calling-number local</pre>                                                                                                         | Replaces the calling party number displayed on the configured mobile phone with the local SNR number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 15</b> | <b>snr</b> <i>e164-number</i> <b>delay</b> <i>seconds</i> <b>timeout</b> <i>seconds</i> [ <b>cfwd-noan</b> <i>extension-number</i> ]<br><b>Example:</b><br><pre>Router(config-register-dn)# snr 9900 delay 1 timeout 10</pre> | Enables the SNR feature on an extension of a Cisco Unified SIP IP phone. <ul style="list-style-type: none"> <li><i>e164-number</i>—E.164 telephone number to call when the Cisco Unified SIP IP phone extension does not answer.</li> <li><b>delay</b> <i>seconds</i>—Sets the number of seconds that the Cisco Unified SIP IP phone rings when called. When the time delay is reached, the call is transferred to the PSTN phone and the SNR directory number. Range: 0 to 30. Default: 5.</li> <li><b>timeout</b> <i>seconds</i>—Sets the number of seconds that the Cisco Unified SIP IP phone rings after the configured time delay. When the timeout value is reached, no call is displayed on the phone. You have to use the Resume softkey to pull back or the Mobility softkey to send the call to a mobile phone. Range: 30 to 60. Default: 60.</li> </ul> <p><b>Note</b><br/>When the default is enabled, the Cisco Unified SIP IP phone continues to ring for 60 seconds even if the remote phone answers the call.</p> <ul style="list-style-type: none"> <li><b>cfwd-noan</b> <i>extension-number</i>—(Optional) Forwards the call to the extension number when the phone does not answer after both the time delay and timeout values are reached. The extension number is typically the voice mail number.</li> </ul> <p><b>Note</b></p> |

|                | Command or Action                                                                                                    | Purpose                                                                                                                                                                                                   |
|----------------|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                      | This option is not supported for calls from FXO trunks because the calls connect immediately.                                                                                                             |
| <b>Step 16</b> | <b>snr ring-stop</b><br><b>Example:</b><br><code>Router(config-register-dn)# snr ring-stop</code>                    | Ends the ringing on a Cisco Unified SIP IP phone after the SNR call is answered on the configured mobile phone.                                                                                           |
| <b>Step 17</b> | <b>snr answer-too-soon time</b><br><b>Example:</b><br><code>Router(config-register-dn)# snr answer-too-soon 2</code> | Sets the time in which SNR calls are prevented from being diverted to the voice mailbox of a mobile phone. <ul style="list-style-type: none"> <li><i>time</i>—Time, in seconds. Range: 1 to 5.</li> </ul> |
| <b>Step 18</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-register-dn)# end</code>                                        | Exits voice register dn configuration mode and enters privileged EXEC mode.                                                                                                                               |

## Configure a Virtual SNR DN on SCCP Phones

### Restriction

- Virtual SNR DN only supports Cisco Unified SCCP IP phone DN.
- Virtual SNR DN provides no mid-call support.  
Mid-calls are either of the following:
  - Calls that arrive before the DN is associated with a registered phone and is still present after the DN is associated with the phone.
  - Calls that arrive for a registered DN that changes state from registered to virtual and back to registered.
- Mid-calls cannot be pulled back, answered, or terminated from the phone associated with the DN.
- State of the virtual DN transitions from ringing to hold or remains on hold as a registered DN.

### Before you begin

Cisco Unified CME 9.0 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn dn-tag**
4. **number number**
5. **mobility**
6. **snr mode [virtual]**

7. **snr** *e164-number* **delay** *seconds* **timeout** *seconds* [**cfwd-noan** *extension-number*]
8. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>ephone-dn</b> <i>dn-tag</i><br><b>Example:</b><br><pre>Router(config)# ephone-dn 10</pre>                                                                                                                                                    | Enters ephone-dn configuration mode to configure a directory number for an IP phone line. <ul style="list-style-type: none"> <li>• <i>dn-tag</i>—Unique number that identifies an ephone-dn during configuration tasks. Range is 1 to the number set by the <b>max-dn</b> command.</li> </ul>                                                                                                           |
| <b>Step 4</b> | <b>number</b> <i>number</i><br><b>Example:</b><br><pre>Router(config-ephone-dn)# number 1001</pre>                                                                                                                                              | Associates a telephone or extension number with this ephone-dn. <ul style="list-style-type: none"> <li>• <i>number</i>—String of up to 16 characters that represents an E.164 telephone number. Normally, the string is composed of digits, but the string may contain alphabetic characters when the number is dialed only by the router, as with an intercom number.</li> </ul>                       |
| <b>Step 5</b> | <b>mobility</b><br><b>Example:</b><br><pre>Router(config-ephone-dn)# mobility</pre>                                                                                                                                                             | Enables the Mobility feature on an extension of a Cisco Unified SCCP IP phone.                                                                                                                                                                                                                                                                                                                          |
| <b>Step 6</b> | <b>snr mode</b> [ <b>virtual</b> ]<br><b>Example:</b><br><pre>Router(config-ephone-dn)# snr mode virtual</pre>                                                                                                                                  | Sets the mode for the SNR directory number. <ul style="list-style-type: none"> <li>• <b>virtual</b>—Enables the virtual mode for an SNR DN when it is unregistered or floating.</li> </ul>                                                                                                                                                                                                              |
| <b>Step 7</b> | <b>snr</b> <i>e164-number</i> <b>delay</b> <i>seconds</i> <b>timeout</b> <i>seconds</i> [ <b>cfwd-noan</b> <i>extension-number</i> ]<br><b>Example:</b><br><pre>Router(config-ephone-dn)# snr 408550133 delay 5 timeout 15 cfwd-noan 2001</pre> | Enables the Single Number Reach feature on the extension of a Cisco Unified SCCP IP phone. <ul style="list-style-type: none"> <li>• <i>e164-number</i>—E.164 telephone number to ring if IP phone extension does not answer.</li> <li>• <b>delay seconds</b>—Sets the number of seconds that the call rings the IP phone before ringing the remote phone. Range: 0 to 10. Default: disabled.</li> </ul> |

|        | Command or Action                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        |                                                                    | <ul style="list-style-type: none"> <li>• <b>timeout</b> <i>seconds</i>—Sets the number of seconds that the call rings after the configured delay. Call continues to ring for this length of time on the IP phone even if the remote phone answers the call. Range: 5 to 60. Default: disabled.</li> <li>• <b>cfwd-noan</b> <i>extension-number</i>—(Optional) Forwards the call to this target number if the phone does not answer after both the delay and timeout seconds have expired. This is typically the voice mail number.</li> </ul> |
| Step 8 | <b>end</b><br><br><b>Example:</b><br>Router(config-ephone-dn)# end | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Feature Information for Single Number Reach

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

Table 78: Feature Information for Single Number Reach

| Feature Name                                        | Cisco Unified CME Version | Modification                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Single Number Reach for Cisco Unified SIP IP Phones | 9.0                       | <p>Supports the following SNR features for Cisco Unified SIP IP phones:</p> <ul style="list-style-type: none"> <li>• Enable and disable the EM feature.</li> <li>• Manual pull back of a call on a mobile phone.</li> <li>• Send a call to a mobile PSTN phone.</li> <li>• Send a call to a mobile phone regardless of whether the SNR phone is the originating or the terminating side.</li> </ul> |
| Virtual SNR DN for Cisco Unified SCCP IP Phones     |                           | Allows a call to be made to a virtual SNR DN and allows the SNR feature to be launched even when the SNR DN is not associated with any phone.                                                                                                                                                                                                                                                       |
| SNR Enhancements                                    | 8.5                       | <p>Added support for the following SNR enhancements:</p> <ul style="list-style-type: none"> <li>• Hardware Conference</li> <li>• Call Park, Call Pickup, and Call Retrieval</li> <li>• Answer Too Soon Timer</li> <li>• SNR Phone Stops Ringing After Mobile Phone Answers</li> </ul>                                                                                                               |
| Calling Number Local                                | 8.0                       | Added the <b>snr calling-number local</b> command to replace the calling party number with the SNR extension in the caller ID display.                                                                                                                                                                                                                                                              |
| Single Number Reach                                 | 7.1                       | Introduced the SNR feature.                                                                                                                                                                                                                                                                                                                                                                         |

## CHAPTER 34

# Customize Softkeys

- [Information About Softkeys, on page 919](#)
- [Configure Softkeys, on page 932](#)
- [Configuration Example for Softkeys, on page 951](#)
- [Feature Information for Softkeys, on page 955](#)

## Information About Softkeys

### Softkeys on IP Phones

You can customize the display and order of softkeys that appear during various call states on individual IP phones. Softkeys that are appropriate in each call state are displayed by default. Using phone templates, you can delete softkeys that would normally appear or change the order in which the softkeys appear. For example, you might want to display the **CFwdAll** and **Confrn** softkeys on a manager's phone and remove these softkeys from a receptionist's phone.

You can modify softkeys for the following call states:

- **Alerting**—When the remote point is being notified of an incoming call and the status of the remote point is being relayed to the caller as either ringback or busy.
- **Connected**—When the connection to a remote point is established.
- **Hold**—When a connected party is still connected but there is temporarily no voice connection.
- **Idle**—Before a call is made and after a call is completed.
- **Seized**—When a caller is attempting a call but has not yet been connected.
- **Remote-in-Use**—When another phone is connected to a call on an octo-line directory number shared by this phone (Cisco Unified CME 4.3 or a later version).
- **Ringing**—After a call is received and before the call is connected (Cisco Unified CME 4.2 or a later version).

Not all softkeys are available in all call states. Use the CLI help to see the available softkeys for each call state. The softkeys are as follows:

- **Acct**—Short for “account code.” Provides access to configured accounts.
- **Answer**—Picks up incoming call.
- **Barge**—Allows a user to join (barge) a call on a SIP shared line (Cisco Unified CME 7.1 or a later version).
- **Callback**—Requests callback notification when a busy called line becomes free.

- **CBarge**—Barges (joins) a call on a shared octo-line directory number (Cisco Unified CME 4.3 or a later version).
- **CFwdALL**—Short for “call forward all.” Forwards all calls.
- **ConfList**—Lists all parties in a conference (Cisco Unified CME 4.1 or a later version). Press **Update** softkey to update the list of parties in the conference, for instance, to verify that a party has been removed from the conference. Press **Remove** softkey to remove the appropriate parties.
- **Confrn**—Short for “conference.” Connects callers to a conference call.
- **Details**—Lists all the participants in a conference. This softkey is supported only on Cisco 7800 Series IP Phones. Press **Update** to update the list of parties in the conference. Press **Remove** softkey to remove the appropriate parties. The suboption **Remove** is available to the conference creator and phones that have **conference admin** configured.
- **DND**—Short for “do not disturb.” Enables the do-not-disturb features.
- **EndCall**—Ends the current call.
- **GPickUp**—Short for “group call pickup.” Selectively picks up calls coming into a phone number that is a member of a pickup group.
- **Flash**—Short for “hookflash.” Provides hookflash functionality for public switched telephone network (PSTN) services on calls connected to the PSTN via a foreign exchange office (FXO) port.
- **HLog**—Places the phone of an ephone-hunt group agent into the not-ready status or, if the phone is in the not-ready status, places the phone into the ready status.
- **Hold**—Places an active call on hold and resumes the call.
- **iDivert**—Immediately diverts a call to a voice messaging system (Cisco Unified CME 8.5 or a later version)
- **Join**—Joins an established call to a conference (Cisco Unified CME 4.1 or a later version).
- **LiveRcd**—Starts the recording of a call (Cisco Unified CME 4.3 or a later version).
- **Login**—Provides personal identification number (PIN) access to restricted phone features.
- **MeetMe**—Initiates a meet-me conference (Cisco Unified CME 4.1 or a later version).
- **Mobility**—Forwards a call to the PSTN number defined by the Single Number Reach (SNR) feature (Cisco Unified CME 7.1 or a later version).
- **NewCall**—Opens a line on a speakerphone to place a new call.
- **Park**—Places an active call on hold so it can be retrieved from another phone in the system.
- **PickUp**—Selectively picks up calls coming into another extension.
- **Redial**—Redials the last number dialed.
- **Resume**—Connects to the call on hold.
- **RmLstC**—Removes the last party added to a conference. This softkey only works for the conference creator (Cisco Unified CME 4.1 or a later version).
- **Select**—Selects a call or a conference on which to take action (Cisco Unified CME 4.1 or a later version).
- **Show detail**—Lists all the participants in a conference. This softkey is supported only on Cisco 8800 Series IP Phones. Press **Update** to update the list of parties in the conference. Press **Remove** softkey to remove the appropriate parties. The suboption **Remove** is available to the conference creator and phones that have **conference admin** configured.
- **Trnsfer**—Short for “call transfer.” Transfers an active call to another extension.
- **TrnsfVM**—Transfers a call to a voice-mail extension number (Cisco Unified CME 4.3 or a later version).

You change the softkey order by defining a phone template and applying the template to one or more phones. You can create up to 20 phone templates for SCCP phones and 10 templates for SIP phones. Only one template can be applied to a phone. If you apply a second phone template to a phone that already has a template applied to it, the second template overwrites the first phone template information. The new information takes effect

only after you generate a new configuration file and restart the phone; otherwise, the previously configured template remains in effect.

In Cisco Unified CME 4.1, customizing the softkey display for IP phones running SIP is supported only for the Cisco Unified IP Phones 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE.

For configuration information, see [Customize Softkeys, on page 919](#).

## Softkeys Introduced in Unified CME Release 12.3 and Later Releases

From Unified CME Release 12.3, support is introduced for Cisco IP Conference Phone 7832 and Cisco IP Conference Phone 8832. The following Softkeys are available on Cisco IP Conference Phone 7832 and Cisco IP Conference Phone 8832:

- Recents – Displays the call history.
- Contacts – Displays the directory list.
- Apps – Displays the service options (My Phone Apps, Extension Mobility).
- Favorites – Displays the configured speed dials.
- Messages – Provides voicemail accessibility.
- Settings – Displays the phone settings options.

The softkeys that are introduced in Unified CME Release 12.3 supports the following templates:

- Personal user softkey template
- Public user softkey template

The personal template supports all the softkeys necessary to provide full functionality of the phone. The public template supports a restricted softkey set, which is defined for basic conference room use cases. The personal softkey template is enabled by configuring the CLI command **softkeys personal-conf-user** under **voice register template** configuration mode. You can use the no form of the CLI command **softkeys personal-conf-user** to switch to the default configuration of public user softkey template. In a scenario where no configuration is provided, the default configuration of public user softkey template is applied. The softkeys that are introduced in Unified CME Release 12.3 are supported only on Cisco IP Conference Phones 7832 and 8832. Hence, **softkeys personal-conf-user** is an optional configuration that is required only when the phone template has to be applied to Cisco IP Conference Phones 7832 or 8832. For more information on configuring softkeys for SIP phones, see [Modify Softkey Display on SIP Phone, on page 935](#).

A personal user softkey template supports the following softkeys, apart from the softkeys supported on a public softkey user template:

- Messages
- CfwdAll
- DND
- Redial

The following is a sample configuration for a personal user softkey template:

```
voice register template 7
 softkeys personal-conf-user
```

For Unified CME Release 12.7 and later releases, Cisco IP Conference Phone 7832 and Cisco IP Conference Phone 8832 introduces support for:

- Custom softkey template

Custom softkey template is already supported on other SIP phones on Unified CME. Before Unified CME Release 12.7, the support on Cisco IP Conference Phone 7832 and Cisco IP Conference Phone 8832 was limited to personal user softkey template and public user softkey template. To enable custom softkey template, configure **softkeys** command under **voice register template** configuration mode.

The following is a sample configuration for a custom user softkey template:

```
voice register template 7
 softkeys hold {[Newcall]} {Resume}}
```

For more information on configuration of softkeys, see [Modify Softkey Display on SIP Phone, on page 935](#).

**Note** If you configure **softkeys personal-conf-user** command under **voice register template**, personal user softkey template is enabled. If you do not configure any of the softkeys command under **voice register template** configuration mode, the default public user softkey template is enabled.

## Account Code Entry

The Cisco Unified IP Phones 7940 and 7940G and the Cisco Unified IP Phones 7960 and 7960G allow phone users to enter account codes during call setup or when connected to an active call using the **Acct** softkey. Account codes are inserted into call detail records (CDRs) on the Cisco Unified CME router for later interpretation by billing software.

An account code is visible in the output of the **show call active** command and the **show call history** command for telephony call legs and is supported by the CISCO-VOICE-DIAL-CONTROL-MIB. The account code also appears in the “account-code” RADIUS vendor-specific attribute (VSA) for voice authentication, authorization, and accounting (AAA).

To enter an account code during call setup or when in a connected state, press the **Acct** softkey, enter the account code using the phone keypad, then press the # key to notify Cisco Unified CME that the last digit of the code has been entered. The account code digits are processed upon receipt of the # and appear in the show output after processing.

No configuration is required for this feature.

**Note** If the # key is not pressed, each account code digit is processed only after a timer expires. The timer is 30 seconds for the first digit entered, then *n* seconds for each subsequent digit, where *n* equals the number of seconds configured with the **timeouts interdigit (telephony-service)** command. The default value for the interdigit timeout is 10 seconds. The account code digits do not appear in the **show** command output until after being processed.

## Hookflash Softkey

The Flash softkey provides hookflash functionality for calls made on IP phones that use FXO lines attached to the Cisco Unified CME system. Certain PSTN services, such as three-way calling and call waiting, require hookflash intervention from a phone user.

When a Flash softkey is enabled on an IP phone, it can provide hookflash functionality during all calls except for local IP-phone-to-IP-phone calls. Hookflash-controlled services can be activated only if they are supported by the PSTN connection that is involved in the call. The availability of the Flash softkey does not guarantee that hookflash-based services are accessible to the phone user.

For configuration information, see [Enable Flash Softkey, on page 939](#).

## Feature Blocking

In Cisco Unified CME 4.0 and later versions, individual softkey features can be blocked on one or more phones. You specify the features that you want blocked by adding the **features blocked** command to an ephone template. The template is then applied under ephone configuration mode to one or more ephones.

If a feature is blocked using the **features blocked** command, the softkey is not removed but it does not function. For configuration information, see [Configure Feature Blocking, on page 941](#).

To remove a softkey display, use the appropriate **no softkeys** command. See [Modify Softkey Display on SCCP Phone, on page 932](#).

## Feature Policy Softkey Control

Cisco Unified CME 8.5 allows you to control the display of softkeys on the Cisco Unified SIP IP Phones 8961, 9951, and 9971 using the Feature Policy template. The Feature Policy template allows you to enable and disable a list of feature softkeys on Cisco Unified SIP IP Phones 8961, 9951, and 9971. [Table 79: Feature IDs and Default State of the Controllable Features, on page 923](#) lists the controllable feature softkeys with specific feature IDs and their default state on Cisco Unified SIP IP Phones 8961, 9951, and 9971.

**Table 79: Feature IDs and Default State of the Controllable Features**

| Feature ID | Feature Name | Description         | Default State on CME |
|------------|--------------|---------------------|----------------------|
| 1          | ForwardAll   | Forward all calls   | Enabled              |
| 2          | Park         | Parks a call        | Enabled              |
| 3          | iDivert      | Divert to Voicemail | Enabled              |
| 4          | ConfList     | Conference List     | Disabled             |
| 5          | SpeedDial    | Abbreviated Dial    | Disabled             |
| 6          | Callback     | Call back           | Disabled             |
| 7          | Redial       | Redial a call       | Enabled              |
| 8          | Barge        | Barge into a call   | Enabled              |

Cisco Unified CME uses the existing **softkey** command under voice register template configuration mode to control the controllable feature softkeys on phones. Cisco Unified CME generates a `featurePolicy<x>.xml` file for each voice register template `<x>` configured. The list of controllable softkey configurations are specified in the `featurePolicy<x>.xml` file. Phones need to reboot or reset to download the Feature Policy template file. For Cisco IP phones that do not have a Feature Policy template assigned to them, you can use the default Feature Policy template file (`featurePolicyDefault.xml` file).

## Immediate Divert for SIP IP Phones

The immediate divert (iDivert) feature allows you to immediately divert a call to a voice messaging system. You can divert a call by pressing the **iDivert** softkey on Cisco Unified SIP IP phones with voice messaging systems (Cisco Unity Express or Cisco Unity), such as 7940, 7040G, 7960 G, 7945, 7965, 7975, 8961, 9951, and 9971. When the call is diverted, the line becomes available to place or receive new calls.

The call that is diverted using the iDivert feature can be in ringing, active, or hold state. When the call diversion is successful, the caller receives greetings from the voice messaging system.

Callers can only divert the calls to their own voice mailbox. But calls on the receiver side can be diverted either to the voice mailbox of the caller who invoked the iDivert feature (last redirected party) or to the voice mailbox of the original called party.

The iDivert softkey is added to the phones when they register with Cisco Unified CME using `softkeyxxxx.xml` file. Cisco Unified CME generates the `softkeyxxxx.xml` file when the **create profile** command is executed in voice register global configuration mode. You can disable or change the position of the iDivert softkey on the phone's display using the **softkey** command. For more information, see [Configure Immediate Divert \(iDivert\) Softkey on SIP Phone, on page 943](#).

## Enhanced Immediate Divert (Enhanced iDivert)

The Enhanced iDivert feature is an enhanced version of the iDivert feature supported on Unified CME.

Enhanced iDivert is supported in Unified CME 8.5 and later releases. The support for Enhanced iDivert is across both SIP and SCCP phones. iDivert is supported as a softkey on Cisco Unified IP Phones. The feature is enabled by default on Unified CME, by using the **iDivert** softkey.

While iDivert immediately diverts a call to a voice messaging system, Enhanced iDivert feature allows you to immediately divert a call to the voice messaging system of the phone you dialed or to the voice messaging system of the phone to which call forward is set.

Consider a scenario with a voice message from Phone A to Phone B registered with Unified CME. Call forward is set from Phone B to Phone C, which is also registered to Unified CME. Both Phone B and C support voice messaging. When the voice message is delivered to the voice messaging server of Unified CME, Phone B forwards the message as it has **call-forward mailbox** configured. If Phone C presses the **iDivert** softkey, then Phone A gets an audio prompt. Using the Enhanced iDivert feature, the user at Phone A can decide if the voice message needs to be delivered to Phone A or Phone B.

## Programmable Line Keys ( PLK)

The Programmable Line Key (PLK) feature allows you to program feature buttons or services URL buttons on line key buttons. You can configure line keys with line buttons, speed dials, BLF speed dials, feature buttons, and URL buttons.

**Note** When button layout is not specified, buttons are assigned to the phone lines in the following order: line, speed-dial, blf-speed-dial, feature, and services URL buttons.

You can program a line key to function as a services URL button on your Cisco Unified phone using the **url-button** command (see [Configure Service URL Line Key Button on SCCP Phone, on page 945](#) and [Configure Service URL Line Key Button on SIP Phone, on page 946](#) ). Similarly, you can program a line key on your Cisco IP phone to function as a feature button using the **feature-button** command (see [Configure Feature Buttons on SCCP Phone Line Key, on page 948](#) and [Configure Feature Buttons on SIP Phone Line Key, on page 949](#) for more information).

You can also program line keys to function as feature buttons using the user-profile in phones that have Extension Mobility (EM) enabled on them. For configuring line keys to function as feature buttons on EM phones, see [Cisco Unified IP Phone documentation](#).

[Table 80: PLK Feature Availability on Different Phone Models, on page 925](#) lists the softkeys supported as PLKs on various Cisco Unified IP Phone models.

**Table 80: PLK Feature Availability on Different Phone Models**

| Softkeys Supported as Programmable Line Keys (PLK) | 7914, 7915, 7916 SCCP Phones | 7931 Phone                 | 6900 Series SCCP Phones    | 7942, 7962, 7965, 7975 SIP Phones | 8961, 9951, and 9971 SIP Phones |
|----------------------------------------------------|------------------------------|----------------------------|----------------------------|-----------------------------------|---------------------------------|
| Acct                                               | Supported                    | Supported                  | Supported                  | Not Supported                     | Not Supported                   |

<sup>12</sup> These phones are equipped with “conference” hard keys.

<sup>13</sup> These phones are equipped with “transfer” hard keys.

Cisco Unified IP Phones 7902, 7905, 7906, 7910, 7911, 7912, 7935, 7936, 7937, 7940, 7960, and 7985 do not support the PLK feature. The services URL button is not supported on the following Cisco Unified IP phones: 7920, 7921, 7925 (supports DnD and Privacy only), 3911, and 3951.

[Table 83: PLK Feature Availability on the Cisco Unified 7800, 8800 Series SIP IP Phones from Cisco Unified CME 11.0 Onwards](#), on page 929 lists the PLK features available on the Cisco Unified 7800 and 8800 series SIP IP Phones from Cisco Unified CME Release 11.0 onwards. As part of Unified CME Release 11.7, new phone support for Cisco IP Phones 8821, 8845, 8865 was introduced. With this addition, Unified CME supports all phone models in Cisco IP Phone 7800 Series and Cisco IP Phone 8800 Series.

## Configure Softkeys

### Modify Softkey Display on SCCP Phone

To modify the display of softkeys, perform the following steps.

**Restriction**

- Enable the ConfList and MeetMe softkeys only if you have hardware conferencing configured. For information on conferencing, see [Hardware Conference, on page 1360](#).
- The third softkey button on the Cisco Unified IP Phone 7905G and Cisco Unified IP Phone 7912G is reserved for the Message softkey. For these phones' templates, the third softkey button defaults to the Message softkey. For example, the **softkeys idle Redial Dnd Pickup Login Gpickup** command configuration displays, in order, the Redial, DND, Message, Pickup, Login, and GPickUp softkeys.
- The NewCall softkey cannot be disabled on the Cisco Unified IP Phone 7905G or Cisco Unified IP Phone 7912G.

**Before you begin**

- Cisco CME 3.2 or a later version.
- Cisco Unified CME 4.2 or a later version to enable softkeys during the ringing call state.
- Cisco Unified CME 4.3 or a later version to enable softkeys during the remote-in-use state.
- The HLog softkey must be enabled with the **hunt-group logout HLog** command before it will be displayed. For more information, see [Configure Ephone-Hunt Groups on SCCP Phones, on page 1276](#).
- The Flash softkey must be enabled with the **fxo hook-flash** command before it will be displayed. For configuration information, see [Enable Flash Softkey, on page 939](#).

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. **softkeys alerting** {[Acct] [Callback] [Endcall]}
5. **softkeys connected** {[Acct] [ConfList] [Confrn] [Endcall] [Flash] [Hlog] [Hold] [Join] [LiveRcd] [Park] [RmLstC] [Select] [TrnsfVM] [Transfer]}
6. **softkeys hold** {[Join] [Newcall] [Resume] [Select]}
7. **softkeys idle** {[Cfwdall] [ConfList] [Dnd] [Gpickup] [Hlog] [Join] [Login] [Newcall] [Pickup] [Redial] [RmLstC]}
8. **softkeys remote-in-use** {[CBarge] [Newcall]}
9. **softkeys ringing** {[Answer] [Dnd] [HLog]}
10. **softkeys seized** {[Callback] [Cfwdall] [Endcall] [Gpickup] [Hlog] [MeetMe] [Pickup] [Redial]}
11. **exit**
12. **ephone** *phone-tag*
13. **ephone-template** *template-tag*
14. **end**

**DETAILED STEPS****Procedure**

|        | Command or Action | Purpose                       |
|--------|-------------------|-------------------------------|
| Step 1 | <b>enable</b>     | Enables privileged EXEC mode. |

|               | Command or Action                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Router> enable                                                                                                                                                                                                                           | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                  | Enters global configuration mode.                                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>ephone-template template-tag</b><br><b>Example:</b><br>Router(config)# ephone-template 15                                                                                                                                                                | Enters ephone-template configuration mode to create an ephone template. <ul style="list-style-type: none"> <li>template-tag—Unique identifier for the ephone template that is being created. Range is 1 to 20.</li> </ul>                                                                                                              |
| <b>Step 4</b> | <b>softkeys alerting {[Acct] [Callback] [Endcall]}</b><br><b>Example:</b><br>Router(config-ephone-template)# softkeys alerting<br>Callback Endcall                                                                                                          | (Optional) Configures an ephone template for softkey display during the alerting call state. <ul style="list-style-type: none"> <li>You can enter any of the keywords in any order.</li> <li>Default is all softkeys are displayed in alphabetical order.</li> <li>Any softkey that is not explicitly defined is disabled.</li> </ul>  |
| <b>Step 5</b> | <b>softkeys connected {[Acct] [ConfList] [Confrn] [Endcall] [Flash] [Hlog] [Hold] [Join] [LiveRcd] [Park] [RmLstC] [Select] [TrnsfVM] [Trnsfer]}</b><br><b>Example:</b><br>Router(config-ephone-template)# softkeys connected<br>Endcall Hold Transfer Hlog | (Optional) Configures an ephone template for softkey display during the call-connected state. <ul style="list-style-type: none"> <li>You can enter any of the keywords in any order.</li> <li>Default is all softkeys are displayed in alphabetical order.</li> <li>Any softkey that is not explicitly defined is disabled.</li> </ul> |
| <b>Step 6</b> | <b>softkeys hold {[Join] [Newcall] [Resume] [Select]}</b><br><b>Example:</b><br>Router(config-ephone-template)# softkeys hold<br>Resume                                                                                                                     | (Optional) Configures an ephone template for softkey display during the call-hold state. <ul style="list-style-type: none"> <li>You can enter any of the keywords in any order.</li> <li>Default is all softkeys are displayed in alphabetical order.</li> <li>Any softkey that is not explicitly defined is disabled.</li> </ul>      |
| <b>Step 7</b> | <b>softkeys idle {[Cfwdall] [ConfList] [Dnd] [Gpickup] [Hlog] [Join] [Login] [Newcall] [Pickup] [Redial] [RmLstC]}</b><br><b>Example:</b><br>Router(config-ephone-template)# softkeys idle<br>Newcall Redial Pickup Cfwdall Hlog                            | (Optional) Configures an ephone template for softkey display during the idle state. <ul style="list-style-type: none"> <li>You can enter any of the keywords in any order.</li> <li>Default is all softkeys are displayed in alphabetical order.</li> <li>Any softkey that is not explicitly defined is disabled.</li> </ul>           |
| <b>Step 8</b> | <b>softkeys remote-in-use {[CBarge] [Newcall]}</b><br><b>Example:</b><br>Router(config-ephone-template)# softkeys<br>remote-in-use CBarge Newcall                                                                                                           | Modifies the order and type of softkeys that display on an IP phone during the remote-in-use call state.                                                                                                                                                                                                                               |

|                | Command or Action                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 9</b>  | <b>softkeys ringing</b> {[Answer] [Dnd] [HLog]}<br><b>Example:</b><br><pre>Router(config-ephone-template)# softkeys ringing Answer Dnd Hlog</pre>                                                                       | (Optional) Configures an ephone template for softkey display during the ringing state. <ul style="list-style-type: none"> <li>You can enter any of the keywords in any order.</li> <li>Default is all softkeys are displayed in alphabetical order.</li> <li>Any softkey that is not explicitly defined is disabled.</li> </ul> |
| <b>Step 10</b> | <b>softkeys seized</b> {[CallBack] [Cfwdall] [Endcall] [Gpickup] [Hlog] [MeetMe] [Pickup] [Redial]}<br><b>Example:</b><br><pre>Router(config-ephone-template)# softkeys seized Endcall Redial Pickup Cfwdall Hlog</pre> | (Optional) Configures an ephone template for softkey display during the seized state. <ul style="list-style-type: none"> <li>You can enter any of the keywords in any order.</li> <li>Default is all softkeys are displayed in alphabetical order.</li> <li>Any softkey that is not explicitly defined is disabled.</li> </ul>  |
| <b>Step 11</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config-ephone-template)# exit</pre>                                                                                                                                       | Exits ephone-template configuration mode.                                                                                                                                                                                                                                                                                       |
| <b>Step 12</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br><pre>Router(config)# ephone 36</pre>                                                                                                                               | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>phone-tag—Unique sequence number that identifies this ephone during configuration tasks.</li> </ul>                                                                                                                                                    |
| <b>Step 13</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br><pre>Router(config-ephone)# ephone-template 15</pre>                                                                                                   | Applies an ephone template to the ephone that is being configured.                                                                                                                                                                                                                                                              |
| <b>Step 14</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone)# end</pre>                                                                                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                |

### What to do next

If you are done modifying the parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for SCCP Phones, on page 400](#).

## Modify Softkey Display on SIP Phone

### Restriction

- This feature is supported only for Cisco Unified IP Phones 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE.
- You can download a custom softkey XML file from a TFTP server. However, if the softkey XML file contains an error, the softkeys might not work properly on the phone. We recommend the following procedure for creating a softkey template in Cisco Unified CME.
- HLog softkey is supported only on Cisco Unified IP Phones 7800 and 8800 series.

**Before you begin**

Cisco Unified CME 4.1 or a later version. From Cisco Unified CME Release 11.6 onwards, HLog softkey is supported. From Unified CME Release 12.3 onwards, the CLI command **softkeys personal-conf-user** is supported.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice register template** *template-tag*
4. **softkeys connected** {[Confrn] [Endcall] [Hold] [Trnsfer] [HLog] }
5. **softkeys hold** {[Newcall] {Resume}}
6. **softkeys idle** {[Cfwdall] [Newcall] [Redial] [HLog] }
7. **softkeys seized** {[Cfwdall] [Endcall] [Redial]}
8. **softkeys personal-conf-user**
9. **exit**
10. **voice register pool** *pool-tag*
11. **template** *template-tag*
12. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                 |

|                | <pre>Router(config-register-template)# softkeys hold Resume</pre>                                                                                                        | <ul style="list-style-type: none"> <li>• Default is that the NewCall and Resume softkeys are displayed in alphabetical order.</li> <li>• Any softkey that is not explicitly defined is disabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 6</b>  | <b>softkeys idle {[Cfwdall] [Newcall] [Redial] [HLog] }</b><br><b>Example:</b><br><pre>Router(config-register-template)# softkeys idle Newcall Redial Cfwdall HLog</pre> | (Optional) Configures a phone template for softkey display during the idle state. <ul style="list-style-type: none"> <li>• You can enter the keywords in any order.</li> <li>• Default is all softkeys are displayed in alphabetical order.</li> <li>• Any softkey that is not explicitly defined is disabled.</li> </ul>                                                                                                                                                                                                                                                                            |
| <b>Step 7</b>  | <b>softkeys seized {[Cfwdall] [Endcall] [Redial]}</b><br><b>Example:</b><br><pre>Router(config-register-template)# softkeys seized Endcall Redial Cfwdall</pre>          | (Optional) Configures a phone template for softkey display during the seized state. <ul style="list-style-type: none"> <li>• You can enter the keywords in any order.</li> <li>• Default is all softkeys are displayed in alphabetical order.</li> <li>• Any softkey that is not explicitly defined is disabled.</li> </ul>                                                                                                                                                                                                                                                                          |
| <b>Step 8</b>  | <b>softkeys personal-conf-user</b><br><b>Example:</b><br><pre>Router(config-register-template)# softkeys personal-conf-user</pre>                                        | (Optional) Configures a personal user phone template for softkey display. <ul style="list-style-type: none"> <li>• The CLI command is disabled by default, and applies a public user phone template.</li> <li>• When you configure the no form of this command, support switches to public user phone template.</li> <li>• When the CLI command <b>softkeys personal-conf-user</b> is configured, you cannot configure other state specific softkeys.</li> <li>• The CLI command is supported only for the Cisco IP Conference Phone 7832 and Cisco IP Conference Phone 8832 phone types.</li> </ul> |
| <b>Step 9</b>  | <b>exit</b><br><b>Example:</b><br><pre>Router(config-register-template)# exit</pre>                                                                                      | Exits voice register template configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 10</b> | <b>voice register pool <i>pool-tag</i></b><br><b>Example:</b><br><pre>Router(config)# voice register pool 36</pre>                                                       | Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 11</b> | <b>template <i>template-tag</i></b><br><b>Example:</b><br><pre>Router(config-register-pool)# template 9</pre>                                                            | Applies a SIP phone template to the phone you are configuring. <ul style="list-style-type: none"> <li>• <i>template-tag</i>— Template tag that was created with the <b>voice register template</b> command in Step 3 .</li> </ul>                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 12</b> | <b>end</b><br><b>Example:</b>                                                                                                                                            | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|  | Command or Action                 | Purpose |
|--|-----------------------------------|---------|
|  | Router(config-register-pool)# end |         |

### What to do next

If you are done modifying the parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#) .

## Verify Softkey Configuration

### Procedure

#### Step 1 show running-config

Use this command to verify your configuration. In the following example, the softkey display is modified in phone template 7 and the template is applied to SIP phone 2. All other phones use the default arrangement of softkeys.

#### Example:

```
Router# show running-config
!
voice register dn 1 dual-line
 ring feature secondary
 number 126 secondary 1261
 description Sales
 name Smith
 call-forward busy 500 secondary
 call-forward noan 500 timeout 10
 huntstop channel
 no huntstop
 no forward local-calls
!
!
voice register template 7
 session-transport tcp
 softkeys hold Resume Newcall
 softkeys idle Newcall Redial Cfwdall HLog
 softkeys connected Endcall Trnsfer Confrn Hold Hlog
 voicemail 52001 timeout 30
.
.
.
voice register pool 2
 id mac 0030.94C2.A22A
 number 1 dn 4
 template 7
 dialplan 3
!
```

#### Step 2 show telephony-service ephone-template or show voice register template *template-tag*

#### Example:

These commands display the contents of individual templates.

```
Router# show telephony-service ephone-template
```

```
ephone-template 1
softkey ringing Answer Dnd
conference drop-mode never
conference add-mode all
conference admin: No
Always send media packets to this router: No
Preferred codec: g711ulaw
User Locale: US
Network Locale: US
```

or

```
Router# show voice register template 7
Temp Tag 7
Config:
 Attended Transfer is enabled
 Blind Transfer is enabled
 Semi-attended Transfer is enabled
 Conference is enabled
 Caller-ID block is disabled
 DnD control is enabled
 Anonymous call block is disabled
 Voicemail is 52001, timeout 30
 KPML is disabled
 Transport type is tcp
 softkey connected Endcall Trnsfer Confrn Hold HLog
 softkey hold Resume Newcall
 softkey idle Newcall Redial Cfwdall HLog
```

---

## Enable Flash Softkey

---

|                    |                                            |
|--------------------|--------------------------------------------|
| <b>Restriction</b> | The IP phone must support softkey display. |
|--------------------|--------------------------------------------|

---

### Before you begin

To enable the Flash softkey, perform the following steps

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **fxo hook-flash**
5. **restart all**
6. **end**

## DETAILED STEPS

|---------------|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                          | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                  | Enters global configuration mode.                                                                                                                                                                             |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service            | Enters telephony-service configuration mode.                                                                                                                                                                  |
| <b>Step 4</b> | <b>fxo hook-flash</b><br><b>Example:</b><br>Router(config-telephony)# <b>fxo hook-flash</b> | Enables the Flash softkey on phones that support softkey display on PSTN calls using an FXO port.<br><b>Note</b><br>The Flash softkey display is automatically disabled for local IP-phone-to-IP-phone calls. |
| <b>Step 5</b> | <b>restart all</b><br><b>Example:</b><br>Router(config-telephony)# restart all              | Performs a fast reboot of all phones associated with this Cisco Unified CME router. Does not contact the DHCP or TFTP server for updated information.                                                         |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                              | Returns to privileged EXEC mode.                                                                                                                                                                              |

## Verify Flash Softkey Configuration

## Procedure

- Step 1** Use the **show running-config** command to display an entire configuration, including Flash softkey, which is listed in the telephony-service portion of the output.

**Example:**

```
Router# show running-config
telephony-service
fxo hook-flash
load 7960-7940 P00305000600
load 7914 S00103020002
```

```
max-ephones 100
max-dn 500
```

**Step 2** Use the **show telephony-service** command to show only the telephony-service portion of the configuration.

## Configure Feature Blocking

To configure feature blocking for SCCP phones, perform the following steps.

### Before you begin

Cisco Unified CME 4.0 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. **features blocked** [CFwdAll] [Confrn] [GpickUp] [Park] [PickUp] [Trnsfer]
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **restart**
9. Repeat Step 5 to Step 8 for each phone to which the template should be applied.
10. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                      | Purpose                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                 | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                         | Enters global configuration mode.                                                                                                                                                                                            |
| <b>Step 3</b> | <b>ephone-template</b> <i>template-tag</i><br><br><b>Example:</b><br>Router(config)# ephone-template 1 | Enters ephone-template configuration mode.<br><br><ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique sequence number that identifies this template during configuration tasks. | <b>Step 4</b> | <b>features blocked</b> [CFwdAll] [Confrn] [GpickUp] [Park] [PickUp] [Trnsfer]                         | Prevents the specified softkey from invoking its feature.<br><br><ul style="list-style-type: none"> <li>• <b>CFwdAll</b>—Call forward all calls.</li> </ul>                                                                  |

|                | Command or Action                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                             |
|----------------|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <b>Example:</b><br><pre>Router(config-ephone-template)# features blocked Park Trnsfer</pre>                          | <ul style="list-style-type: none"> <li>• <b>Confrn</b>—Conference.</li> <li>• <b>GpickUp</b>—Group call pickup.</li> <li>• <b>Park</b>—Call park.</li> <li>• <b>PickUp</b>—Directed or local call pickup. This includes pickup last-parked call and pickup from another extension or park slot.</li> <li>• <b>Trnsfer</b>—Call transfer.</li> </ul> |
| <b>Step 5</b>  | <b>exit</b><br><b>Example:</b><br><pre>Router(config-ephone-template)# exit</pre>                                    | Exits ephone-template configuration mode.                                                                                                                                                                                                                                                                                                           |
| <b>Step 6</b>  | <b>ephone <i>phone-tag</i></b><br><b>Example:</b><br><pre>Router(config)# ephone 25</pre>                            | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks. The maximum number of ephones for a particular Cisco Unified CME system is version- and platform-specific. For the range of values, see the CLI help.</li> </ul>         |
| <b>Step 7</b>  | <b>ephone-template <i>template-tag</i></b><br><b>Example:</b><br><pre>Router(config-ephone)# ephone-template 1</pre> | Applies an ephone template to an ephone. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Template number that you want to apply to this ephone.</li> </ul> <b>Note</b><br>To view your ephone-template configurations, use the <b>show telephony-service ephone-template</b> command.                                                  |
| <b>Step 8</b>  | <b>restart</b><br><b>Example:</b><br><pre>Router(config-ephone)# restart</pre>                                       | Performs a fast reboot of this ephone. Does not contact the DHCP or TFTP server for updated information. <b>Note</b><br>If you are applying the template to more than one ephone, you can use the <b>restart all</b> command in telephony-service configuration mode to reboot all the phones so they have the new template information.            |
| <b>Step 9</b>  | Repeat Step 5 to Step 8 for each phone to which the template should be applied.                                      | —                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone)# end</pre>                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                    |

## Verify Block Softkey Configuration

### Procedure

- Step 1** Use the **show running-config** command to display the running configuration, including ephone templates and ephone configurations.
- Step 2** Use the **show telephony-service ephone-template** command and the **show telephony-service ephone** command to display only the contents of ephone templates and the ephone configurations, respectively.

## Configure Immediate Divert (iDivert) Softkey on SIP Phone

To configure iDivert softkey (in connected state) on Cisco Unified SIP IP phones, perform the following step.

### Note

When one participant in a conference (Meetme, Ad Hoc, cBarge, or Join) presses the iDivert softkey, all remaining participants receive an outgoing greeting of the participant who pressed iDivert softkey.

### Restriction

- iDivert feature is disabled when **call-forward all** is activated for a phone.
- iDivert feature is not activated for the second call when **call-forward busy** is activated for a phone and the phone is busy with the first call.
- If iDivert softkey is pressed before call forward no answer (CFNA) timeout, then the call is forwarded to voice mail.
- The calling and called parties can divert the call to their voice messaging mailboxes if both the parties press the iDivert softkey at the same time. The voice messaging mailbox of the calling party will receive a portion of the outgoing greeting of the called party. Similarly, the voice messaging mailbox of the called party will receive a portion of the outgoing greeting of the calling party.
- iDivert softkey is not supported when SIP phones fall back to SRST mode in Cisco Unified CME.
- iDivert after connect towards the voicemail with transcoding is not supported.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register template** *template-tag*
4. **softkeys connected** [Confrn] [Endcall] [Hold] [Trnsfer] [iDivert]
5. **softkeys hold** [Newcall] {Resume} [ iDivert]
6. **softkeys ringing** [Answer] [DND] [iDivert]
7. **exit**
8. **voice register pool** *pool-tag*
9. **template** *template-tag*
10. **end**

## Configure Service URL Line Key Button on SCCP Phone

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone template** *template-tag*
4. **url-button** *index type* | url [name]
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                                   | Purpose                                                                                                                                                                                                                                                          |
|---------------|---------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br><code>Router&gt; enable</code>                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br><code>Router# configure terminal</code>                         | Enters global configuration mode.                                                                                                                                                                                                                                |
| <b>Step 3</b> | <b>ephone template</b> <i>template-tag</i><br><br><b>Example:</b><br><code>Router(config)# ephone template 5</code> | Enters ephone-template configuration mode to create an ephone template. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier for the ephone template that is being created. ### What to do next

If you are done configuring the URL buttons for phones in Cisco Unified CME, restart the phones.

## Configure Service URL Line Key Button on SIP Phone

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register template *template-tag***
4. **url-button [*index number*] [*url location*] [*url name*]**
5. **exit**
6. **voice register pool *phone-tag***
7. **template *template-tag***
8. **end**

Range: 1 to 8.</li> <li>• <i>url location</i>—Location of the URL.</li> <li>• <i>url name</i>—Service URL with maximum length of 31 characters.</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-register-temp)# exit                                                                                                | Exits voice register template configuration mode.                                                                                                                                                                                                                                           |
| <b>Step 6</b> | <b>voice register pool <i>phone-tag</i></b><br><b>Example:</b><br>Router(config)# voice register pool 12                                                            | Enters voice register pool configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number that identifies this voice register pool during configuration tasks.</li> </ul>                                                                                      |
| <b>Step 7</b> | <b>template <i>template-tag</i></b><br><b>Example:</b><br>Router(config-register-pool)# template 5                                                                  | Applies the SIP phone template to the phone. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier of the template that you created in Step 3.</li> </ul>                                                                                                          |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-pool)# end                                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                            |

## What to do next

If you are done configuring the URL buttons for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

# Configure Feature Buttons on SCCP Phone Line Key

## Restriction

- Answer, Select, cBarge, Join, and Resume features are not supported as PLKs.
- Feature buttons are only supported on Cisco Unified IP Phones 6911, 7941, 7942, 7945, 7961, 7962, 7965, 7970, 7971, and 7975 with SCCP v12 or later versions.
- Any features available through hard buttons are not provisioned. Use the `show ephone register detail` command to verify why the features buttons are not provisioned.
- Not all feature buttons are supported on Cisco Unified IP Phone 6911 phone. Call Forward, Pickup, Group Pickup, and MeetMe are the only feature buttons supported on the Cisco Unified IP Phone 6911.
- The **privacy-button** command is available on Cisco Unified IP phones running a SCCP Version 8 or later versions. The **privacy-button** command is overridden by any other available feature buttons.
- Locales are not supported on Cisco Unified IP Phone 7914.
- Locales are not supported for Cancel Call Waiting or Live Recording feature buttons.
- The feature state for DnD, Hlog, Privacy, Login, and Night Service feature buttons are indicated by an LED. For a list of LED behavior for PLK, see [Table 84: LED Behavior, on page 931](#)

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone template** *template-tag*
4. **feature-button index** *<feature identifier>* [**label** *<label>*]
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                       | Purpose                                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                  | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                          | Enters global configuration mode.                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>ephone template</b> <i>template-tag</i><br><br><b>Example:</b><br>Router(config)# ephone template 10 | Enters ephone-template configuration mode to create an ephone template.<br><br><ul style="list-style-type: none"> <li>• <i>template-tag</i>- Unique identifier for the ephone template that is being created. Range: 1 to 10</li> </ul> |

|               | Command or Action                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>feature-button index</b> <feature identifier> [ <b>label</b> <label>]<br><b>Example:</b><br><pre>Router(config-ephone-template) feature-button 1 label hold</pre> | Configures a feature button on a line key. <ul style="list-style-type: none"> <li>• <i>index</i>- Index number, one from 25 for a specific feature type.</li> <li>• <i>feature identifier</i>-Feature ID or stimulus ID.</li> <li>• <b>label</b> -Non-default text label.</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config-ephone-template)# exit</pre>                                                                                    | Exits ephone-template configuration mode.                                                                                                                                                                                                                                            |
| <b>Step 6</b> | <b>ephone phone-tag</b><br><b>Example:</b><br><pre>Router(config)# ephone 5</pre>                                                                                    | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>- Unique sequence number that identifies this ephone during configuration tasks.</li> </ul>                                                                                               |
| <b>Step 7</b> | <b>ephone-template template-tag</b><br><b>Example:</b><br><pre>Router(config-ephone)# ephone-template 10</pre>                                                       | Applies an ephone template to the ephone that is being configured.                                                                                                                                                                                                                   |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone)# end</pre>                                                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                     |

### What to do next

If you are done configuring the feature buttons for phones in Cisco Unified CME, restart the phones.

## Configure Feature Buttons on SIP Phone Line Key

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register template** *template-tag*
4. **feature-button** [*index*] [*feature identifier*]
5. **exit**
6. **voice register pool** *phone-tag*
7. **template** *template-tag*
8. **end**

If both configurations are applied, the feature button configuration under voice register pool takes precedence.</p>         |
| <b>Step 4</b> | <b>feature-button [<i>index</i>] [<i>feature identifier</i>]</b><br><b>Example:</b><br>Router(config-voice-register-template) feature-button 1 DnD<br>Router(config-voice-register-template) feature-button 2 EndCall<br>Router(config-voice-register-template) feature-button 3 Cfwdall | Configures a feature button on a line key. <ul style="list-style-type: none"> <li>• <i>index</i>—One of the 12 index numbers for a specific feature type.</li> <li>• <i>feature identifier</i> —Unique identifier for a feature. One of the following feature or stimulus IDs: Redial, Hold, Transfer, Cfwdall, Privacy, MeetMe, Confn, Park, Pickup, Gpickup, Mobility, Dnd, ConfList, RmLstC, CallBack, NewCall, EndCall, HLog, NiteSrv, Acct, Flash, Login, TrnsfVM, or LiveRcd.</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-register-temp)# exit                                                                                                                                                                                                                     | Exits voice register template configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 6</b> | <b>voice register pool <i>phone-tag</i></b><br><b>Example:</b><br>Router(config)# voice register pool 12                                                                                                                                                                                 | Enters voice register pool configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number that identifies this voice register pool during configuration tasks.</li> </ul>                                                                                                                                                                                                                                                                                         |
| <b>Step 7</b> | <b>template <i>template-tag</i></b><br><b>Example:</b><br>Router(config-register-pool)# template 5                                                                                                                                                                                       | Applies the template to the phone. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier of the template that you created in Step 3.</li> </ul>                                                                                                                                                                                                                                                                                                                       |

|        | Command or Action                                                      | Purpose                          |
|--------|------------------------------------------------------------------------|----------------------------------|
| Step 8 | <b>end</b><br><br><b>Example:</b><br>Router(config-register-pool)# end | Returns to privileged EXEC mode. |

#### What to do next

If you are done configuring the feature buttons for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#)

## Configuration Example for Softkeys

### Example for Modifying Softkey Display

The following example modifies the softkey display on four phones by creating two ephone templates. Ephone template 1 is applied to ephone 11, 13, and 15. Template 2 is applied to ephone 34. The softkey displays on all other phones use the default arrangement of keys.

```

ephone-template 1
softkeys idle Redial Newcall
softkeys connected Endcall Hold Trnsfer
ephone-template 2
softkeys idle Redial Newcall
softkeys seized Redial Endcall Pickup
softkeys alerting Redial Endcall
softkeys connected Endcall Hold Trnsfer
ephone 11
ephone-template 1
ephone 13
ephone-template 1
ephone 15
ephone-template 1
ephone 34
ephone-template 2

```

### Example for Modifying HLog Softkey for SCCP Phones

The following example establishes the appearance and order of softkeys for phones that are configured with ephone-template 7. The Hlog key is available when a phone is idle, when it has seized a line, or when it is connected to a call. Phones without softkeys can use the standard HLog codes to toggle ready and not-ready status.

```
telephony-service
```

```

hunt-group logout HLog
fac standard
.
.
ephone-template 7
softkeys connected Endcall Hold Transfer Hlog
softkeys idle Newcall Redial Pickup Cfwdall Hlog
softkeys seized Endcall Redial Pickup Cfwdall Hlog

```

## Example for Modifying HLog Softkey for SIP Phones

The following example establishes the appearance and order of softkeys for phones that are configured with voice register template 7. The Hlog key is available when a phone is idle, when there is a ringIn, or when it is connected to a call. Phones without softkeys can use the standard HLog codes to toggle ready and not-ready status.

```

telephony-service
 hunt-group logout HLog
 fac standard
 .
 .
voice register template 7
 softkeys connected Endcall Hold Transfer Hlog
 softkeys idle Newcall Redial Pickup Cfwdall Hlog
 softkeys ringIn Answer DND iDivert Hlog

```

## Example for Enabling Flash Softkey for PSTN Calls

The following example enables the Flash softkey for PSTN calls through an FXO voice port:

```

telephony-service
fxo hook-flash

```

## Example for Park and Transfer Blocking

The following example blocks the use of Park and Transfer softkeys on extension 2333:

```

ephone-template 1
features blocked Park Trnsfer
ephone-dn 2
number 2333
ephone 3
button 1:2
ephone-template 1

```

## Example for Conference Blocking

The following example blocks the conference feature on extension 2579, which is on an analog phone:

```
ephone-template 1
features blocked Confrn
ephone-dn 78
number 2579
ephone 3
ephone-template 1
mac-address C910.8E47.1282
type anl
button 1:78
```

## Example for Immediate Divert (iDivert) Configuration

The following example shows iDivert softkey in connected state:

```
Router# show voice register template 1
Temp Tag 1
Config:
 Attended Transfer is enabled
 Blind Transfer is enabled
 Semi-attended Transfer is enabled
Conference is enabled
Caller-ID block is disabled
 DnD control is enabled
 Anonymous call block is disabled
Softkeys connected iDivert
```

## Example for Configuring URL Buttons on a SCCP Phone Line Key

The following example shows three URL buttons configured for line keys:

```
!
!
!
ephone-template 5
url-button 1 em
url-button 2 mphoneapp mphoneapp
url-button 3 snr
!
ephone 36
ephone-template 5
```

## Example for Configuring URL Buttons on a SIP Phone Line Key

The following example shows URL buttons configured in voice register template 1:

```
Router# show run!voice register template 1
url-button 1 http://9.10.10.254:80/localdirectory/query My_Dir
url-button 5 http://www.yahoo.com Yahoo
!voice register pool 50
!
```

## Example for Configuring Feature Button on a SCCP Phone Line Key

The following example shows feature buttons configured for line keys:

```
!
!
!
ephone-template 10
 feature-button 1 Park
 feature-button 2 MeetMe
 feature-button 3 CallBack
!
!
ephone-template 10
```

## Example for Configuring Feature Button on a SIP Phone Line Key

The following example shows three feature buttons configured for line keys:

```
voice register template 5
 feature-button 1 DnD
 feature-button 2 EndCall
 feature-button 3 Cfdall
 feature-button 4 HLog
!!
voice register pool 12
 template 5
```

---

**Note** For more details on HLog functionality, see [Call Coverage Features, on page 1223](#) chapter.

---

### Where to Go Next

If you are done modifying the parameters for phones in CiscoUnifiedCME, generate a new configuration file and restart the phones. For more information, see [Generate Configuration Files for Phones, on page 400](#).

### Ephone Templates

The **softkeys** commands are included in ephone templates that are applied to one or more individual ephones. For more information about templates, see [Templates, on page 1423](#).

### HLog Softkey

The HLog softkey must be enabled with the **hunt-group logout HLog** command before it will be displayed. For more information, see [Configure Call Coverage Features, on page 1262](#).

## Feature Information for Softkeys

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 85: Feature Information for Softkeys**

| Feature Name                            | Cisco Unified CME Version | Feature Information                                                                                                           |
|-----------------------------------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Account Code Entry                      | 3.0                       | Account code entry was introduced.                                                                                            |
| Barge Softkey                           | 4.3                       | The Barge, LiveRcd, and TrnsfVM softkeys were added.                                                                          |
| Conferencing Softkeys                   | 4.1                       | The ConfList, Join, MeetMe, RmLstC, and Select softkeys were added.                                                           |
| Feature Blocking                        | 4.0                       | Feature blocking was introduced.                                                                                              |
| Feature Policy Softkey Control          | 8.5                       | Allows control display of softkeys on the Cisco Unified SIP IP Phones 8961, 9951, and 9971 using the feature policy template. |
| Flash Softkey                           | 3.0                       | Flash softkey was introduced.                                                                                                 |
| Immediate Divert Softkey for SIP Phones | 8.5                       | Added support for iDivert softkey for SIP IP phones.                                                                          |
| Programmable Line Keys                  | 8.5                       | Allows you to configure a feature button or a URL button on a line key on both SIP and SCCP IP Phones.                        |
| Programmable Line Keys Enhancement      | 8.8                       | Adds support for softkeys as programmable line keys on Cisco Unified 6945, 8941, and 8945 SCCP IP Phones.                     |

| Feature Name                                           | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Programmable Line Keys for Cisco Unified SIP IP Phones | 9.0                       | Adds support for softkeys as programmable line keys on Cisco Unified 6911, 6921, 6941, 6945, 6961, 8941, and 8945 SIP IP Phones.                                                                                                                                                                        |
| Softkey Display                                        | 12.3                      | Support added for the softkeys 'Recents', 'Contacts', 'Apps', 'Favorites', 'Messages', and 'Settings' on Cisco IP Conference Phones 7832 and 8832.                                                                                                                                                      |
|                                                        | 11.7                      | Support added for the softkeys 'Details' on Cisco IP Phone 7800 Series, and 'Show detail' on Cisco IP Phone 8800 Series.                                                                                                                                                                                |
|                                                        | 11.6                      | HLog Softkey support for SIP Phone was introduced.                                                                                                                                                                                                                                                      |
|                                                        | 4.1                       | Configurable softkey display for IP phones running SIP is supported for the Cisco Unified IP Phone 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE                                                                                                                                               |
|                                                        | 4.0                       | <ul style="list-style-type: none"> <li>• An optional HLog softkey was added to the connected, idle, and seized call states.</li> <li>• The ability to customize softkey display in the hold call state was added. The ability to customize softkey display in the hold call state was added.</li> </ul> |
|                                                        | 3.2                       | Configurable softkey display (the ability to customize softkey display in the alerting, connected, idle, and seized call states) was introduced.                                                                                                                                                        |

## CHAPTER 35

# Speed Dial

- [Information About Speed Dial, on page 957](#)
- [Configure Speed Dial, on page 961](#)
- [Configuration Examples for Speed Dial, on page 973](#)
- [Where to Go Next, on page 975](#)
- [Feature Information for Speed Dial, on page 975](#)

## Information About Speed Dial

### Speed Dial Summary

Speed dial allows a phone user to quickly dial a number from a list. The different types of speed dial are summarized in [Table 86: Speed Dial Types, on page 957](#).

**Table 86: Speed Dial Types**

| Speed Dial Type       | Availability of Numbers                                                                                                                                                                                                                                                                   | Description                                                                     | How Configured                                              |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|-------------------------------------------------------------|

| Monitor-Line Button for Speed Dial         | Speed dial entries are local to a specific IP phone.<br><br>There can be as many numbers as there are monitor lines on a phone.                                                                         | IP phone buttons that are configured as monitor lines can be used to speed-dial the line that is being monitored.                                                                                                                                                                                                                                                                                                                                                                                                                                         | No additional configuration required.                                                                                                                                                                                             |
| Direct Station Select (DSS) Service        | All phones on which speed-dial line or monitor line button is configured.                                                                                                                               | Allows phone user to fast transfer a call by pressing a single speed-dial line or monitor line button.                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="#">Enable DSS Service, on page 963</a>                                                                                                                                                                                   |

## Speed Dial Buttons and Abbreviated Dialing

In a Cisco Unified CME system, each phone can have up to 32 local speed-dial numbers (codes 1 to 32), up to 99 system-level speed-dial numbers (codes 1 to 99), or a combination of the two. If you program both a local and a system-level speed-dial number with the same speed-dial code (tag), the local number takes precedence. Typically you will want to reserve codes 1 to 32 for local, per-phone speed-dial numbers and use codes 33 to 99 for system-level speed-dial numbers so that there is no conflict.

On an IP phone, speed-dial entries are assigned to unused line buttons. Then, after all line buttons are used, subsequent entries are added but do not have an assigned line button. The speed-dial entry is not related to the physical button layout of the phone. Entries are assigned in order of speed-dial tag.

You can create local speed-dial codes with locked numbers that cannot be changed from the phone. You can also create empty local speed-dial codes on an IP phone without a telephone number. These empty speed-dial codes can be changed by the phone user to add a telephone number.

Changes to speed-dial entries are saved into the router's nonvolatile random-access memory (NVRAM) configuration after a timer-based delay.

For configuration information, see [Define Speed-Dial Buttons and Abbreviated Dialing on SCCP Phones](#), on page 965.

## Bulk-Loading Speed Dial Numbers

In Cisco Unified CME 4.0 and later versions, up to ten text files containing lists of many speed-dial numbers can be loaded into flash, slot, or TFTP locations to be accessed by phone users. The ten files can hold a total of up to 10,000 numbers. Each list holds numbers that are in an appropriate format for dialing from IP phones and SCCP-enabled analog phones.

Up to ten bulk speed-dial lists can be created. These lists might be corporate directory lists, regional lists, or local lists, for example. The speed-dial numbers in these lists can be system-level (available to all ephones) or personal (available to one or more specified ephones). Each list receives a unique speed-dial list ID number (sd-id) between 0 and 9.

Speed-dial list ID numbers that are not used for global speed-dial lists are available to identify personal, custom lists that are associated with individual phones.

Bulk speed-dial lists contain entries of speed-dial codes and the associated phone numbers to dial. Each entry in a speed-dial list must appear on a separate line. The fields in each entry are separated by commas (.). A line that begins with a semicolon (;) is handled as a comment. The format of each entry is shown in the following line.

```
index,digits,[name],[hide],[append]
```

[Table 87: Bulk Speed-Dial List Entry](#), on page 959 explains the fields in a bulk speed-dial list entry.

**Table 87: Bulk Speed-Dial List Entry**

| Field        | Description                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>index</i> | Zero-filled number that uniquely identifies this index entry. Maximum length: 4 digits. All index entries must be the same length. |

| Field         | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>digits</i> | Telephone number to dialed. Represents a fully qualified E.164 number. Use a comma (,) to represent a one-second pause. |
| <i>name</i>   | (Optional) Alphanumeric string to identify a name, up to 30 characters.                                                 |
| <b>hide</b>   | (Optional) Enter <b>hide</b> to block the display of the dialed number.                                                 |
| <b>append</b> | (Optional) Enter <b>append</b> to allow additional digits to be appended to this number when dialed.                    |

The following is a sample bulk speed-dial list:

```
01,5550140,voicemail,hide,append
90,914085550153,Cisco extension,hide,append
11,9911,emergency,hide,
91,9911,emergency,hide,
08,110,Paging,,append
```

To place a call to a speed-dial entry in a list, the phone user must first dial a prefix, followed by the list ID number, then the index for the bulk speed-dial list entry to be called.

For configuration information, see [Enable Bulk-Loading Speed-Dial, on page 967](#).

## Monitor-Line Button for Speed Dial

For Cisco CME 3.2 and later versions, a monitor-line button can be used to speed-dial the monitor line's number. A monitor line is a line that is shared by two people. Only one person can make and receive calls on the shared line at a time, while the other person, whose line is in monitor mode, is able to see that the line is in use. Speed dialing is available when monitor lines' lamps are off, indicating that the line is not in use. For example, an assistant who wants to talk with a manager can press an unlit monitor-line button to speed-dial the manager's number.

A monitor-line lamp is off or unlit only when its line is in the idle call state. The idle state occurs before a call is made and after a call is completed. For all other call states, the monitor-line lamp is on or lit.

The following example shows a monitor-line configuration. Extension 2311 is the manager's line, and ephone 1 is the manager's phone. The manager's assistant monitors extension 2311 on button 2 of ephone 2. When the manager is on the line, the lamp is lit on the assistant's phone. If the lamp is not lit, the assistant can speed-dial the manager by pressing button 2.

```
ephone-dn 11
 number 2311

ephone-dn 22
 number 2322

ephone 1
 button 1:11

ephone 2
 button 1:22 2m11
```

No additional configuration is required to enable a phone user to speed dial the number of a monitored shared line, when the monitored line is in an idle call state.

## DSS (Direct Station Select) Service

In Cisco Unified CME 4.0(2) and later versions, the DSS (Direct Station Select) Service feature allows the phone user to press a single speed-dial line button to transfer an incoming call when the call is in the connected state. This feature is supported on all phones on which monitor line buttons for speed dial or speed-dial line buttons are configured.

When the DSS service is enabled, the system automatically generates a simulated transfer key event when needed, eliminating the requirement for the phone user to press the Transfer button.

Disabling the service changes the behavior of the speed-dial line button on all IP phones so that a user pressing a speed-dial button in the middle of a connected call will play out the speed-dial digits into the call without transferring the call. When DSS service is disabled, the phone user must first press Transfer and then press the monitor or speed-dial line button to transfer the incoming call.

For configuration information, see [Enable a Local Speed Dial Menu, on page 961](#).

## Phone User-Interface for Speed Dial and Fast Dial

In Cisco Unified CME 4.3 and later versions, IP phone users can configure their own speed-dial and fast-dial settings directly from the phone. The speed-dial and fast-dial settings can be added or modified on the phone by using a menu available with the Services feature button. Extension Mobility users can add or modify speed-dial settings in their user profile after logging in. Fast-dial settings are not configurable from Extension Mobility phones, nor is the logout profile configurable from the phone.

The speed-dial and fast-dial feature in Unified CME gives phone users the convenience of configuring their speed-dial and fast-dial settings directly from their phones.

The speed-dial and fast-dial user interface is enabled by default on all phones with displays. You can disable the capability for an individual phone in Cisco Unified CME to prevent a phone user from accessing the interface. If a phone's speed-dial or fast-dial setting is configured with an ephone-template, the configuration from the phone applies only to the specific phone and does not change the ephone-template configuration.

For configuration information, see [Enable Phone User Interface for Configuring Speed-Dial and Fast-Dial, on page 969](#).

For information on how phone users configure speed-dial and fast-dial buttons using the phone user-interface, see the [Cisco Unified IP Phone documentation](#) for Cisco Unified CME.

## Configure Speed Dial

### Enable a Local Speed Dial Menu

To enable a local speed-dial menu for all phones, SCCP and SIP, in Cisco Unified CME, perform the following steps:

**Restriction**

- If a speed dial XML file contains incomplete information, for example the name or telephone number is missing for an entry, any information in the file that is listed after the incomplete entry is not displayed when the local speed dial directory option is used on a phone.
- Before Cisco Unified CME 4.1, local speed-dial menu is not supported on SIP phones.
- Before Cisco CME 3.3, analog phones are limited to nine speed-dial numbers.

**Before you begin**

An XML file called speeddial.xml must be created and copied to the TFTP server application on the Cisco Unified CME router. The contents of speeddial.xml must be valid as defined in the Cisco-specified directory DTD. See [Example for Enabling a Local Speed Dial Menu, on page 973](#) and the [Cisco Unified IP Phone Services Application Development Notes](#).

**SUMMARY STEPS**

1. **enable**
2. **copy tftp flash**
3. **configure terminal**
4. **ip http server**
5. **ip http path flash:**
6. **exit**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                       |

## Enable DSS Service

To enable DSS Service for all on all SCCP phones on which monitor line buttons for speed dial or speed-dial line buttons are configured, perform the following steps.

### Before you begin

Cisco Unified CME 4.0(2) or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **service dss**
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                      | Purpose                                                                 |
|---------------|--------------------------------------------------------|-------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><br>• Enter your password if prompted. |

|               | Command or Action                                                                             | Purpose                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>       | Enters global configuration mode.                                                                 |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br><code>Router(config)# telephony-service</code> | Enters telephony-service configuration mode.                                                      |
| <b>Step 4</b> | <b>service dss</b><br><b>Example:</b><br><code>Router(config-telephony)# service dss</code>   | Configures DSS (Direct Station Select) service globally for all phone users in Cisco Unified CME. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-telephony)# end</code>                   | Exits configuration mode and enters privileged EXEC mode.                                         |

## Enable a Personal Speed Dial Menu on SCCP Phones

To enable a personal speed-dial menu, perform the following steps.

### Restriction

- A personal speed-dial menu is available only on certain Cisco Unified IP phones, such as the 7940, 7960, 7960G, 7970G, and 7971G-GE. To determine whether personal speed-dial menu is supported on your IP phone, see the [Cisco Unified CME User Guides](#) for your IP phone model.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **fastdial** *dial-tag number name name-string*
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                               | Purpose                                                                                                               |
|---------------|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><code>Router# enable</code> | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>ephone phone-tag</b><br><b>Example:</b><br>Router(config)# ephone 1                                                          | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number of the phone for which you want to program personal speed-dial numbers.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 4</b> | <b>fastdial dial-tag number name name-string</b><br><b>Example:</b><br>Router(config-ephone)# <b>fastdial 1 5552 name Sales</b> | Creates an entry for a personal speed-dial number on this phone. <ul style="list-style-type: none"> <li>• <i>dial-tag</i>—Unique identifier to identify this entry during configuration. Range is 1 to 100.</li> </ul> <p><b>Note</b><br/>The range for dial-tag is 1 to 24 for Cisco Unified CME versions earlier than 10.5</p> <ul style="list-style-type: none"> <li>• <i>number</i>—Telephone number or extension to be dialed.</li> <li>• <b>name name-string</b>—Label to appear in the Personal Speed Dial menu, containing a string of up to 24 alphanumeric characters. Personal speed dial is handled through an XML request, so characters that have special meaning to HTTP, such as ampersand (&amp;), percent sign (%), semicolon (;), angle brackets (&lt; &gt;), and vertical bars (  ), are not allowed.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Define Speed-Dial Buttons and Abbreviated Dialing on SCCP Phones

To define speed-dial buttons and abbreviated dialing codes, perform the following steps for each speed-dial definition to be configured.

**Restriction**

- On-hook abbreviated dialing using the Abbr soft key is supported only on the following phones:
  - Cisco Unified IP Phone 7905G
  - Cisco Unified IP Phone 7912G
  - Cisco Unified IP Phone 7920G
  - Cisco Unified IP Phone 7970G
  - Cisco Unified IP Phone 7971G-GE
- System-level speed-dial codes cannot be changed by the phone user, at the phone.
- Before Cisco CME 3.3, analog phones were limited to nine speed-dial numbers.
- Before to Cisco CME 3.3, speed-dial entries that were in excess of the number of physical phone buttons available were ignored by IP phones.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **speed-dial** *speed-tag digit-string* [**label** *label-text* ]
5. **restart**
6. **exit**
7. **telephony-service**
8. **directory entry** { { *directory-tag number* **name** *name* } | **clear** }
9. **end**

**DETAILED STEPS****Procedure**

|               | Router(config)# ephone 55                                                                                                                                                       | <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies the phone on which you are adding speed-dial capability.</li> </ul>                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 4</b> | <b>speed-dial</b> <i>speed-tag digit-string [label label-text ]</i><br><b>Example:</b><br>Router(config-ephone)# speed-dial 1 +5001 label "Head Office"                         | Defines a unique speed-dial identifier, a digit string to dial, and an optional label to display next to the button. <ul style="list-style-type: none"> <li>• <i>speed-tag</i>—identifier for a speed-dial definition. Range is 1 to 33.</li> </ul>                                                                                                                                                                                                                                                                          |
| <b>Step 5</b> | <b>restart</b><br><b>Example:</b><br>Router(config-ephone)# restart                                                                                                             | Performs a fast reboot of this ephone. Does not contact the DHCP or TFTP server for updated information.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Router(config-ephone)# exit                                                                                                                   | Exits configuration mode to the next highest mode in the configuration mode hierarchy.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 7</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                                                                                | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 8</b> | <b>directory entry</b> { <i>directory-tag number name name</i> }   <b>clear</b> }<br><b>Example:</b><br>Router(config-telephony)# directory entry 45 8185550143 name Corp Acctg | Adds a system-level directory and speed-dial definition. <ul style="list-style-type: none"> <li>• <i>directory-tag</i>—Digit string that provides a unique identifier for this entry. Range is 1 to 99.</li> </ul> <p>If the same tags 1 through 33 are configured at a phone-level by using <b>speed-dial</b> command, and at a system-level by using this command, the local definition takes precedence. To prevent this conflict, we recommend that you use only codes 34 to 99 for system-level speed-dial numbers.</p> |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                                                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Enable Bulk-Loading Speed-Dial

To enable bulk-loading speed-dial numbers, perform the following steps:

### Restriction

- Bulk speed dial is not supported on FXO trunk lines.

**Before you begin**

- Cisco Unified CME 4.0 or a later version.
- The bulk speed-dial text files containing the lists must be available in a location that is available to the Cisco Unified CME router: flash, slot, or TFTP location.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **bulk-speed-dial list** *list-id location*
5. **bulk-speed-dial prefix** *prefix-code*
6. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                                                      | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>bulk-speed-dial list</b> <i>list-id location</i><br><b>Example:</b><br>Router(config-telephony)# bulk-speed-dial list 6<br>flash:sd_dept_0_1_8.txt | identifies the location of a bulk speed-dial list. <ul style="list-style-type: none"> <li>• <i>list-id</i>—Digit that identifies the list to be used. Range is 0 to 9.</li> <li>• <i>location</i>—Location of the bulk speed-dial text file in URL format. Valid storage locations are TFTP, Slot 0/1, and flash memory.</li> </ul> <p>This command can also be configured in ephone configuration mode for specific phones.</p> |
| <b>Step 5</b> | <b>bulk-speed-dial prefix</b> <i>prefix-code</i><br><b>Example:</b>                                                                                   | Sets the prefix code that phone users dial to access speed-dial numbers from a bulk speed-dial list.                                                                                                                                                                                                                                                                                                                             |

|               | Command or Action                                                  | Purpose                                                                                                                                                                                                         |
|---------------|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router(config-telephony)# bulk-speed-dial prefix #7                | <ul style="list-style-type: none"> <li><i>prefix-code</i>—One- or two-character access code for speed dial. Valid characters are digits from 0 to 9, asterisk (*), and pound sign (#). Default is #.</li> </ul> |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-telephony)# end | Returns to privileged EXEC mode.                                                                                                                                                                                |

## Verify Bulk Speed-Dial Parameters on SCCP Phones

### Procedure

#### show telephony-service bulk-speed-dial

Use this command to display information on speed-dial lists.

#### Example:

Router# **show telephony-service bulk-speed-dial summary**

| List-id | Entries | Size    | Reference | url                                            |
|---------|---------|---------|-----------|------------------------------------------------|
| 0       | 40      | 3840    | Global    | tftp://192.168.254.254/phonedirs/uut.csv       |
| 1       | 20      | 1920    | Global    | phoneBook.csv                                  |
| 8       | 15      | 1440    | Global    | tftp://192.168.254.254/phonedirs/big.txt       |
| 9       | 20      | 1920    | Global    | tftp://192.168.254.254/phonedirs/phoneBook.csv |
| 6       | 24879   | 2388384 | ephone-2  | tftp://192.168.254.254/phonedirs/big.txt1      |
| 7       | 20      | 1920    | ephone-2  | phoneBook.csv                                  |
| 6       | 24879   | 2388384 | ephone-3  | big.txt1                                       |
| 7       | 20      | 1920    | ephone-3  | phoneBook.csv                                  |

## Enable Phone User Interface for Configuring Speed-Dial and Fast-Dial

To enable a phone user to configure speed-dial and fast-dial numbers from a menu on their phone, perform the following steps. This feature is enabled by default. You must perform this task only if the feature was previously disabled on a phone.

#### Restriction

Extension Mobility users cannot configure fast-dial settings (for personal speed-dial) from their phone.

#### Before you begin

- Cisco Unified CME 4.3 or a later release.

- The Service URL must be configured. See [Provision URLs for Feature Buttons for SCCP Phones](#), on page 1469.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone *phone-tag***
4. **phone-ui speeddial-fastdial**
5. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                           | Purpose                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                                          | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                  | Enters global configuration mode.                                                                                                                                               |
| <b>Step 3</b> | <b>ephone <i>phone-tag</i></b><br><b>Example:</b><br>Router(config)# ephone 12                              | Enters ephone configuration mode.<br><ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number that identifies this ephone during configuration tasks.</li> </ul> |
| <b>Step 4</b> | <b>phone-ui speeddial-fastdial</b><br><b>Example:</b><br>Router(config-ephone)# phone-ui speeddial-fastdial | Enables a phone user to configure speed-dial and fast-dial numbers on their phone.<br><ul style="list-style-type: none"> <li>• This command is enabled by default.</li> </ul>   |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                 | Exits to privileged EXEC mode.                                                                                                                                                  |

### What to do next

For information on how phone users configure speed dial and fast dial buttons using the UI, see [Cisco Unified IP Phone documentation for Cisco Unified CME](#).

## Define Speed-Dial Buttons on SIP Phones

To define speed-dial buttons for Cisco SIP Phones, perform the following steps.

**Restriction**

- Certain SIP phones, such as the Cisco Unified IP Phone 7960 and 7940, cannot be configured to enable speed dialing. Phone users with these phones must manually configure speed-dial numbers by using the user interface at their Cisco Unified IP phone.
- On Cisco Unified IP phones, speed-dial definitions are assigned to available buttons that have not been assigned to actual extensions. Speed-dial definitions are assigned in the order of their identifier numbers.
- Phones with Cisco ATA devices are limited to a maximum of nine speed-dial numbers. Speed-dial numbers cannot be programmed by using the user interface at the phone.

**Before you begin**

Cisco CME 3.4 or a later version.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **speed-dial** *speed-tag digit-string* [**label** *label-text*]
5. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router# enable                                                                                                                               | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>voice register pool</b> <i>pool-tag</i><br><br><b>Example:</b><br>Router(config)# voice register pool 23                                                                          | Enters voice register pool configuration mode to set parameters for specified SIP phone.                                                                                                                                                                   |
| <b>Step 4</b> | <b>speed-dial</b> <i>speed-tag digit-string</i> [ <b>label</b> <i>label-text</i> ]<br><br><b>Example:</b><br>router(config-register-pool)# speed-dial 2 +5001<br>label "Head Office" | Creates a speed-dial definition in Cisco Unified CME for a SIP phone or analog phone that uses an analog adapter (ATA).<br><br>• <i>speed-tag</i> —Unique sequence number that identifies the speed-dial definition during configuration. Range is 1 to 5. |

|               | Command or Action                                                      | Purpose                                                   |
|---------------|------------------------------------------------------------------------|-----------------------------------------------------------|
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-register-pool)# end | Exits configuration mode and enters privileged EXEC mode. |

### Examples

The following example shows how to set speed-dial button 2 to dial the head office at extension 5001 and locks the setting so that the phone user cannot change the setting at the phone:

```
Router(config)# voice register pool 23
Router(config-register-pool)# speed-dial 2 +5001 label "Head Office"
```

## Enable a Personal Speed Dial Menu on SIP Phones

To enable a personal speed-dial menu, perform the following steps.

### Restriction

- A personal speed-dial menu is available only on certain Cisco Unified IP phones, such as the 7811, 7821, 7841, 7861, 8841, and 8861. To determine whether personal speed-dial menu is supported on your IP phone, see the [Cisco Unified CME User Guides](#) for your IP phone model.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **fastdial entry-tag number name name-string**
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                              | Purpose                                                                                                                   |

## Configuration Examples for Speed Dial

### Example for Enabling a Local Speed Dial Menu

The following commands enable the Cisco web browser and set the HTTP path to flash memory so that the speeddial.xml file in flash memory is accessible to IP phones:

```
ip http server
ip http path flash:
```

The following XML file—speeddial.xml, defines three speed-dial numbers that will appear to the user after they press the Directories button on an IP phone.

```
<CiscoIPPhoneDirectory>
<Title>Local Speed Dial</Title>
<Prompt>Record 1 to 1 of 1 </Prompt>

<DirectoryEntry>
 <Name>Security</Name>
 <Telephone>71111</Telephone>
</DirectoryEntry>
```

```

<DirectoryEntry>
 <Name>Marketing</Name>
 <Telephone>71234</Telephone>
</DirectoryEntry>

<DirectoryEntry>
 <Name>Tech Support</Name>
 <Telephone>71432</Telephone>
</DirectoryEntry>

</CiscoIPPhoneDirectory>

```

## Example for Configuring Personal Speed Dial Menu on SIP Phone

The following example creates a directory of three personal speed-dial listings for one IP phone:

```

ephone 1
 fastdial 1 5489 name Marketing
 fastdial 2 12125550155 name NY Sales
 fastdial 3 12135550112 name LA Sales

```

## Example for Configuring Speed-Dial Buttons and Abbreviated Dialing

The following example defines two locked speed-dial numbers with labels to appear next to the speed-dial buttons on ephone 1. These speed-dial definitions are assigned to the next empty buttons after all extensions are assigned. For instance, if two extensions are assigned on the Cisco Unified IP Phones 7960 and 7960G, these speed-dial definitions appear on the third and fourth buttons.

This example also defines two system-level speed-dial numbers with the **directory entry** command. One is a local extension and the other is a ten-digit telephone number.

```

ephone 1
 mac-address 1234.5678.ABCD
 button 1:24 2:25
 speed-dial 1 +5002 label Receptionist
 speed-dial 2 +5001 label Security

telephony-service
 directory entry 34 5003 name Accounting
 directory entry 45 8185550143 name Corp Acctg

```

## Example for Configuring Bulk-Loading Speed Dial

The following example changes the default bulk speed-dial prefix to #7 and enables global bulk speed-dial list number 6 for all phones. It also enables a personal bulk speed-dial list for ephone 25.

```

telephony-service
 bulk-speed-dial list 6 flash:sd_dept_01_1_87.txt
 bulk-speed-dial prefix #7

ephone-dn 3
 number 2555

ephone-dn 4
 number 2557

ephone 25

```

```
button 1:3 2:4
bulk-speed-dial list 7 flash:lmi_sd_list_08_24_95.txt
```

## Example for Configuring Speed-Dial and Fast-Dial User Interface

The following example shows that the user interface for speed-dial and fast-dial configuration is disabled on phone 12:

```
ephone 12
 no phone-ui speeddial-fastdial
 ephone-template 5
 mac-address 000F.9054.31BD
 type 7960
 button 1:10 2:7
```

## Where to Go Next

If you are finished creating or modifying speed-dial configurations for individual phones, you must reboot phones to download the modified configuration. See [Reset and Restart Cisco Unified IP Phones, on page 409](#).

### DSS Call Transfer

Monitor-line button speed dial, also known as direct station select (DSS) call transfer, allows you to use a monitored line button to speed-dial a call to that extension. If you want to allow consultation during DSS transfers, see [Information About Call Transfer and Forward, on page 1133](#).

## Feature Information for Speed Dial

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfngn.cisco.com/>. An account on Cisco.com is not required.

Table 88: Feature Information for Speed Dial

| Feature Name | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                                                                                                                                                              |
|--------------|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Speed Dial   | 4.3                       | Added user interface on SCCP phones for programming Speed Dial and Fast Dial.                                                                                                                                                                                                                                                                                                    |
|              | 4.1                       | Added support for local and personal speed-dial menus for SIP phones in Cisco Unified CME.                                                                                                                                                                                                                                                                                       |
|              | 4.0(2)                    | Added support for DSS Service which allows phone user to fast transfer a call by pressing a single speed-dial line or monitor line button.                                                                                                                                                                                                                                       |
|              | 4.0                       | Added support for bulk speed-dial list for SCCP phones in Cisco Unified CME.                                                                                                                                                                                                                                                                                                     |
|              | 3.4                       | Added support for speed dial buttons on SIP phones in Cisco Unified CME.                                                                                                                                                                                                                                                                                                         |
|              | 3.0                       | <ul style="list-style-type: none"> <li>• Added support for personal speed-dial from SCCP phones in Cisco Unified CME.</li> <li>• Number of speed-dial definitions that can be created was increased from 4 to 33.</li> <li>• The ability to program speed-dial numbers at the phone was introduced.</li> <li>• The ability to lock speed-dial numbers was introduced.</li> </ul> |
|              | 1.0                       | Speed dial using the <b>speed-dial</b> command was introduced.                                                                                                                                                                                                                                                                                                                   |

## CHAPTER 36

# Video Support

---

- [Prerequisites for Video Support, on page 977](#)
- [Restrictions for Video Support, on page 977](#)
- [Information About Video Support, on page 979](#)
- [Configure Video Support, on page 983](#)
- [Where to Go Next, on page 995](#)
- [Feature Information for Video Support, on page 995](#)

## Prerequisites for Video Support

- H.323 or SIP network for voice calls is operational.
- Cisco Unified CME 4.0 or a later version.
- Cisco Unified IP phones are registered in Cisco Unified CME.
- Connection between Cisco Unified Video Advantage (CUVA) 1.02 or a later version and the Cisco Unified IP Phone is up. From a PC with CUVA 1.02 or a later version installed, ensure that the line between the CUVA and the Cisco Unified P Phone is green.
- Correct video firmware is installed on the Cisco Unified IP Phone.
  - For Cisco Unified IP Phone 7940G and 7960G, 6.0(4) or a later version.
  - Cisco Unified IP Phone 7970G, 7.0(3) or a later version.
  - Cisco Unified IP Phone 7941G and 7961G, 7.0(3) or a later version.

---

**Note**

Other video-enabled endpoints registered with a Cisco Unified Communications Manager (Cisco Unified CM) can place video calls to Cisco Unified IP Phones only if the phones are registered with a Cisco Unified CME and the appropriate video firmware is installed on the Cisco Unified IP Phone.

---

## Restrictions for Video Support

- This feature supports only the following video codecs:

- H.261—Cisco Unified CME 4.0 and later versions
- H.263—Cisco Unified CME 4.0 and later versions
- H.264—Cisco Unified CME 7.1 and later versions
- This feature supports only the following video formats:
  - 4CIF—Resolution 704x576
  - 16CIF—Resolution 1408x1152
  - Common Intermediate Format (CIF)—Resolution 352x288
  - One-Quarter Common Intermediate Format (QCIF)—Resolution 176x144
  - Sub QIF (SQCIF)—Resolution 128x96
- The call start fast feature is not supported with an H.323 video connection. You must configure call start slow for H.323 video. For configuration information, see [Enable Support for Video Streams Across H.323 Networks, on page 990](#).
- Video capabilities are configured per phone, not per line.
- All call feature controls (for example, mute and hold) apply to both audio and video calls, if applicable.
- This feature does not support the following:
  - Dynamic addition of video capability—The video capability must be present before the call setup starts to allow the video connection.
  - T-120 data connection between two SCCP endpoints.
  - Video security
  - Far-end camera control (FECC) for SCCP endpoints.
  - Video codec renegotiation—The negotiated video codec must match or the call falls back to audio-only. The negotiated codec for the existing call can be used for a new call.
  - SIP endpoints— When a video-capable SCCP endpoint connects to a SIP endpoint, the call falls back to audio-only (prior to Cisco Unified CME 8.6).
  - Video supplementary services between Cisco Unified CME and Cisco Unified CM.
- If the Cisco Unified CM is configured for Media Termination Point (MTP) transcoding, a video call between Cisco Unified CME and Cisco Unified CM is not supported.
- Video telephony is not supported with Cisco Unified CME MTP and codec g729/dspfarm-assist configuration under ephone.
- If an SCCP endpoint calls an SCCP endpoint on the local Cisco Unified CME and one of the endpoints transferred across an H.323 network, a video-consult transfer between the Cisco Unified CME systems is not supported.
- When a video-capable endpoint connects to an audio-only endpoint, the call falls back to audio-only. During audio-only calls, video messages are skipped.

- For Cisco Unified CME, the video capabilities in the vendor configuration firmware is a global configuration. This means that, although video can be enabled per ephone, the video icon shows on all Cisco Unified IP phones supported by Cisco Unified CME.
- Because of the extra CPU consumption on RTP-stream mixing, the number of video calls supported on Cisco Unified CME crossing an H.323 network is less than the maximum number of ephones supported.
- Cisco Unified CME cannot differentiate audio-only streams and audio-in-video streams. You must configure the DSCP values of audio and video streams in the H.323 dial-peers.
- If RSVP is enabled on the Cisco Unified CME, a video call is not supported.
- A separate VoIP dial peer, configured for fast-connect procedures, is required to complete a video call from a remote H.323 network to a Cisco Unity Express system.
- Video call is enabled on Cisco Unified CME, when the active call is held and resumed.

## Information About Video Support

### Video Support Overview

Video support allows you to pass a video stream, with a voice call, between two video-capable SCCP endpoints and between SCCP and H.323 endpoints. Through the Cisco Unified CME router, the video-capable endpoints can communicate with each other locally to a remote H.323 endpoint through a gateway or through an H.323 network.

Video capabilities are disabled by default, and enabling video capabilities on Cisco Unified CME does not automatically enable video on all ephones. You must first enable video globally for all video-capable SCCP phones associated with a Cisco Unified CME router and then enable video for each phone individually. Video parameters, like maximum bit rate, are set at a system level.

For information about the global configuration for video capabilities, see [Enable System-Level Video Capabilities, on page 991](#).

For information about configuring an individual phone for video capabilities, see [Enable Video Capabilities on a Phone, on page 992](#).

---

**Note** After video is enabled globally, all video-capable ephones display the video icon.

---

### SIP Trunk Video Support

Cisco Unified CME 7.1 adds the following support for video calls:

- Support for video calls between SCCP endpoints across different Cisco Unified CME routers connected through a SIP trunk. All previously supported SCCP video endpoints and video codecs are supported.
- H.264 video support—H.264 provides high-quality images at low bit rates and is widely used in commercial video conferencing systems. The H.264 codec supports the following video calls:
  - SCCP to SCCP

- SCCP to SIP
- SCCP to H.323
- Dynamic payload negotiation for H.264 (both SCCP to SIP and SCCP to H323)

#### Restriction

- On Cisco Unified CME 8.6, calls made from SIP endpoints across a SIP trunk terminating on a non-CME endpoint (such as those controlled by a Cisco Unified CM or video conferencing MTU) require the following CLI to be configured to allow video:

```
voice service voip
 sip
 asymmetric payload full
```

- The **no supplementary-service sip moved-temporarily** and **no supplementary-service sip refer** commands are not supported for video calls through a SIP trunk.
- Supplementary services like call hold, call resume and call transfer are not supported on video calls between SCCP and SIP endpoints that are registered with CME. The call gets converted into audio-only mode when these supplementary services are invoked.

No new configuration is required to support these enhancements. For configuration information, see [Configure Video Support, on page 983](#).

## Matching Endpoint Capabilities

During phone registration, information about endpoint capabilities is stored in the Cisco Unified CME. These capabilities are used to match with other endpoints during call setup. Endpoints can update at any time; however, the router recognizes endpoint-capability changes only during call setup. If a video feature is added to a phone, the information about it is updated in the router's internal data structure but that information does not become effective until the next call. If a video feature is removed, the router continues to see the video capability until the call is terminated but no video stream is exchanged between the two endpoints.

**Note** The endpoint-capability match is executed each time a new call is set up or an existing call is resumed.

## Retrieving Video Codec Information

Voice gateways use dial-peer configurations to retrieve codec information for audio codecs. Video codec selection is done by the endpoints and is not controlled by the H.323 service-provider interface (SPI) through dial-peer or other configuration. The video-codec information is retrieved from the SCCP endpoint using a capabilities request during call setup.

## Call Fallback to Audio-Only

When a video-capable endpoint connects to an audio-only endpoint, the call falls back to an audio-only connection. Also, for certain features such as conferencing, where video support is not available, the call falls back to audio-only.

Cisco Unified CME routers use a call-type flag to indicate whether the call is video-capable or audio-only. The call-type flag is set to video when the video capability is matched or set to audio-only when connecting to an audio-only TDM or an audio-only SIP endpoint.

---

**Note** During an audio-only connection, all video-related media messages are skipped.

---

## Call Setup for Video Endpoints

The process for handling SCCP video endpoints is the same as that for handling SCCP audio endpoints. The video call must be part of the audio call. If the audio call setup fails, the video call fails.

During the call setup for video, media setup handling determines if a video-media-path is required. If so, the corresponding video-media-path setup actions are taken.

- For an SCCP endpoint, video-media-path setup includes sending messages to the endpoints to open a multimedia path and start the multimedia transmission.
- For an H.323 endpoint, video-media-path setup includes an exchange between the endpoints to open a logical channel for the video stream.

A call-type flag is set during call setup on the basis of the endpoint-capability match. After call setup, the call-type flag is used to determine whether an additional video media path is required. Call signaling is managed by the Cisco Unified CME router and the media stream is directly connected between the two video-enabled SCCP endpoints on the same router. Video-related commands and flow-control messages are forwarded to the other endpoint. Routers do not interpret these messages.

## Call Setup Between Two Local SCCP Endpoints

For interoperation between two local SCCP endpoints on the same router, video call setup uses all existing audio-call-setup handling, except during media setup. During media setup, a message is sent to establish the video-media-path. If the endpoint responds, the video-media-path is established and a start-multimedia-transmission function is called.

## Call Setup Between SCCP and H.323 Endpoints

Call setup between SCCP and H.323 endpoints is the same as it is between SCCP endpoints except that if video capability is selected, the event is posted to the H.323 call leg to send out a video open logical channel (OLC) and the gateway generates an OLC for the video channel. Because the router needs to both terminate and originate the media stream, video must be enabled on the router before call setup begins.

## Call Setup Between Two SCCP Endpoints Across an H.323 Network

If call setup between SCCP endpoints occurs across an H.323 network, the setup is a combination of the processes listed in the previous two sections. The router controls the video media setup between the two endpoints and the event is posted to the H.323 call leg so that the gateway can generate an OLC.

Because the endpoint capability negotiation and match occur after the H.323 connect message, video streams over H.323 network require slow-start on call setup procedures for Cisco Unified CME. An H.323 network can connect to a remote Cisco Unified CME router, Cisco Unified CM, remote IP to IP gateway, or a video-capable H.323 endpoint. For configuration information, see [Enable System-Level Video Capabilities, on page 991](#).

## SIP Endpoint Video and Camera Support for Cisco Unified IP Phones 8961, 9951, and 9971

Cisco Unified CME 8.6 and later versions add phone-based video support and Universal Serial Bus (USB) camera support for Cisco Unified IP Phones 8961, 9951, and 9971. The Cisco Unified IP Phones 8961, 9951, and 9971 display local video using the USB camera. Cisco Unified IP Phones 9951 and 9971 with phone load 9.1.1 decode remote incoming video RTP streams and display the video on the phone's display screen. However, the video and USB camera capabilities of these two phones are disabled on Cisco Unified CME by default and are enabled by setting up the video and camera parameters in the phone provisioning file.

Cisco Unified CME 8.6 supports local SIP-video-to-SIP-video calls and SIP-video-to-SCCP-CUVA-video calls on Cisco Unified IP Phones 8961, 9951, and 9971 on the line side. On the trunk side, SIP video call is only supported with SIP trunk. H323 trunk is not supported for video calls on Cisco Unified IP Phones 9951 and 9971.

The media path for SIP video call is flow through and media flow-around is not supported for SIP line in Cisco Unified CME.

## Video and Camera Configuration for Cisco Unified IP Phones

Cisco Unified CME uses the **video** and **camera** commands to allow video or camera to be enabled per phone, per template, or for global configuration. The **video** and **camera** commands are configured under the voice register pool, voice register template, and voice register global configuration modes. Once the commands are configured, the **create profile** command is required to have the phones provision file update with new configuration. For more information on enabling camera and video parameters on phones, see [Enable Video and Camera Support on Cisco Unified SIP Phones, on page 983](#).

The changes in video and camera configuration are applied to the phones when Cisco Unified CME sends the request to a phone through a service-control event in a SIP NOTIFY message. In earlier versions of Cisco Unified CME, SIP phones were required to reset and restart to update the new configuration parameters.

In Cisco Unified CME 8.6 and later versions, you use the **apply-config** command under voice register pool and voice register global configuration modes to dynamically apply the video and camera configuration changes to the phone configuration of Cisco Unified IP Phones 8961, 9951, and 9971 without restarting or resetting the phones and without causing any service interruption.

When Cisco Unified IP Phones 8961, 9971 and 9951 receive the apply-config request, the phones retrieve the new configuration file from the TFTP server and compare it with the existing configuration. The phones may restart themselves if there are any changes that requires a restart; otherwise, the phones apply the changes dynamically without restarting.

For more information, see [Apply Video and Camera Configuration to Cisco Unified SIP Phones, on page 987](#).

## Bandwidth Control for SIP Video Calls

Video call bandwidth control is critical when there is a limit in resources. Typically, video calls require much higher bandwidth usage than audio-only calls. Video calls on Cisco Unified IP Phones 9951 and 9971 can use up to 1 Mbps for VGA quality video compared to 64 kbps plus overhead for a G711 audio call.

In Cisco Unified CME 8.6, the Cisco Unified SIP IP Phones 9951 and 9971 with VGA resolution offer 1-Mbps maximum bit-rate and answer with a lower value of received offer and 1 Mbps. Phones transmit video resolution and frame rate is set according to the maximum bandwidth bit-rate negotiated in the SIP offer or answer. Cisco Unified CME controls the SIP global bandwidth by configuring the **bandwidth video tias-modifier bandwidth value** [**negotiate end-to-end**] command in voice register global configuration mode. The bandwidth control configuration is applied to the SIP phone dial-peer.

There are no new bandwidth changes in the SCCP CUA side and the bandwidth configuration works the same as in earlier versions of Cisco Unified CME.

For more information on configuring bandwidth control, see [Configure Video Bandwidth Control for SIP to SIP Video Calls, on page 988](#).

## Flow of the RTP Video Stream

For video streams between two local SCCP endpoints, the Real-Time Transport Protocol (RTP) stream is in flow-around mode. For video streams between SCCP and H.323 endpoints or two SCCP endpoints on different Cisco Unified CME routers, the RTP stream is in flow-through mode.

- Media flow-around mode enables RTP packets to stream directly between the endpoints of a VoIP call without the involvement of the gateway. By default, the gateway receives the incoming media, terminates the call, and then reoriginates it on the outbound call leg. In flow-around mode, only signaling data is passed to the gateway, improving scalability and performance.
- With flow-through mode, the video media path is the same as for an audio call. Media packets flow through the gateway, thus hiding the networks from each other.

Use the **show voip rtp connection** command to display information about RTP named-event packets, such as caller-ID number, IP address, and port for both the local and remote endpoints, as shown in the following sample output:

```
Router# show voip rtp connections

VoIP RTP active connections :
No. Callid dstCallid LocalRTP RmtRTP LocalIP RemoteIP
1 102 103 18714 18158 10.1.1.1 192.168.1.1
2 105 104 17252 19088 10.1.1.1 192.168.1.1
Found 2 active RTP connections
=====
```

## Configure Video Support

### Enable Video and Camera Support on Cisco Unified SIP Phones

To enable video and camera support on Cisco Unified SIP Phones such as 8845, 8865, 9951, and 9971, perform the following steps:

**Note**

- Shared line is not supported.
- Video transfer and forward supplementary service is not supported when **no supplementary-service sip refer/move-temporary** is configured.

**Before you begin**

- Cisco Unified CME 8.6 or a later version.
- The **mode cme** command is configured under voice register global configuration mode.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **camera**
5. **video**
6. **create profile**
7. **exit**
8. **voice register pool** *pool tag*
9. **id mac** *address*
10. **camera**
11. **video**
12. **exit**
13. **voice register template** *template-tag*
14. **camera**
15. **video**
16. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                          | Purpose                                                                                                               |
|---------------|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                     |

|                | Command or Action                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b>  | <b>voice register global</b><br><b>Example:</b><br><code>Router(config)#voice register global</code>        | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.                                                                                                                                                                                                                                                                                                                        |
| <b>Step 4</b>  | <b>camera</b><br><b>Example:</b><br><code>Router(config-register-global)#camera</code>                      | Enables the <b>camera</b> command under voice register global configuration mode.                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 5</b>  | <b>video</b><br><b>Example:</b><br><code>Router(config-register-global)#video</code>                        | Enables the <b>video</b> command under voice register global configuration mode.<br><br><b>Note</b><br>Make sure you configure <b>video</b> command without configuring the <b>camera</b> command so that Cisco Unified SIP phones can switch from phone-based video camera to CUVA. If you configure both <b>video</b> and <b>camera</b> commands together, you may need to manually remove the USB camera from Cisco Unified SIP phones . |
| <b>Step 6</b>  | <b>create profile</b><br><b>Example:</b><br><code>Router(config-register-global)# create profile</code>     | Generates provisioning files required for SIP phones and writes the file to the location specified with the <b>tftp-path</b> command.                                                                                                                                                                                                                                                                                                       |
| <b>Step 7</b>  | <b>exit</b><br><b>Example:</b><br><code>Router(config-register-global)#exit</code>                          | Exits voice register global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 8</b>  | <b>voice register pool pool tag</b><br><b>Example:</b><br><code>Router(config)#voice register pool 5</code> | Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone.                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 9</b>  | <b>id mac address</b><br><b>Example:</b><br><code>Router(config-register-pool)#id mac 0009.A3D4.1234</code> | Explicitly identifies a locally available individual SIP phone to support a degree of authentication.                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 10</b> | <b>camera</b><br><b>Example:</b><br><code>Router(config-register-pool)#camera</code>                        | Enables the <b>camera</b> command under voice register pool configuration mode.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 11</b> | <b>video</b><br><b>Example:</b><br><code>Router(config-register-pool)#video</code>                          | Enables the <b>video</b> command under voice register pool configuration mode.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 12</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-register-pool)#exit</code>                            | Exits voice register pool configuration mode.                                                                                                                                                                                                                                                                                                                                                                                               |

|                | Command or Action                                                                                                 | Purpose                                                                                                                                                                                                |
|----------------|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 13</b> | <b>voice register template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)voice register template 10 | Enters voice register template configuration mode to define a template of common parameters for SIP phones in Cisco Unified CME.<br><ul style="list-style-type: none"> <li>• Range: 1 to 5.</li> </ul> |
| <b>Step 14</b> | <b>camera</b><br><b>Example:</b><br>Router(config-register-template)#camera                                       | Configures the <b>camera</b> command under voice register template configuration mode.                                                                                                                 |
| <b>Step 15</b> | <b>video</b><br><b>Example:</b><br>Router(config-register-template)#video                                         | Configures the <b>video</b> command under voice register template configuration mode.                                                                                                                  |
| <b>Step 16</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-template)# end                                            | Returns to privileged EXEC mode.                                                                                                                                                                       |

### Examples

The following example shows the **camera** and **video** commands configured in voice register global configuration mode:

```
Router#show run
!
!
!
voice service voip
 allow-connections sip to sip
 fax protocol t38 version 0 ls-redundancy 0 hs-redundancy 0 fallback none
!
!
voice register global
 mode cme
 bandwidth video tias-modifier 512000 negotiate end-to-end
 max-pool 10
camera
video
!
voice register template 10
```

The following example shows the **video** and **camera** commands configured under voice register pool 5. You can also configure both **camera** and **video** commands under voice register template configuration mode.

```
Router#show run
!
!
!
voice service voip
 allow-connections sip to sip
 fax protocol t38 version 0 ls-redundancy 0 hs-redundancy 0 fallback none
!
!
```

```

voice register global
mode cme
bandwidth video tias-modifier 512000 negotiate end-to-end
max-pool 10

!
voice register pool 1
id mac 1111.1111.1111
!
voice register pool 4
!
voice register pool 5
logout-profile 58
id mac 0009.A3D4.1234
camera
video
!

```

### What to do next

To apply the video and camera configuration to your Cisco Unified SIP IP phones, see [Apply Video and Camera Configuration to Cisco Unified SIP Phones, on page 987](#).

## Apply Video and Camera Configuration to Cisco Unified SIP Phones

Apply-config is similar to resetting or restarting the phones and allowing the phones to update phone configuration files. Phones only reboot if needed. To apply video configuration to Cisco Unified IP phones 8845, 8865, 8961, 9951, and 9971, perform the following steps:

### Before you begin

Cisco Unified CME 8.6 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **apply-config**
5. **exit**
6. **voice register pool** *pool tag*
7. **apply-config**
8. **end**

### DETAILED STEPS

| Procedure |                   |                                                                                      |
|-----------|-------------------|--------------------------------------------------------------------------------------|
|           | Command or Action | Purpose                                                                              |
| Step 1    | <b>enable</b>     | Enables privileged EXEC mode.                                                        |
|           | <b>Example:</b>   | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                              | Purpose                                                                                                                                                                             |
|---------------|------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router> enable                                                                                 |                                                                                                                                                                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                     | Enters global configuration mode.                                                                                                                                                   |
| <b>Step 3</b> | <b>voice register global</b><br><b>Example:</b><br>Router(config)#voice register global        | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.                                                                |
| <b>Step 4</b> | <b>apply-config</b><br><b>Example:</b><br>Router(config-register-global)#apply-config          | Applies configuration for the Cisco Unified SIP IP phones and restarts all other SIP phones. The <b>apply-config</b> command acts as a reset if configured on any other phone type. |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(cfg-translation-rule)# exit                           | Exits voice register global configuration mode.                                                                                                                                     |
| <b>Step 6</b> | <b>voice register pool pool tag</b><br><b>Example:</b><br>Router(config)#voice register pool 5 | Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone.                                                                                     |
| <b>Step 7</b> | <b>apply-config</b><br><b>Example:</b><br>Router(config-register-pool)#apply-config            | Applies configuration for the Cisco Unified SIP IP phones and restarts all other SIP phones.                                                                                        |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-pool)# end                             | Returns to privileged EXEC mode.                                                                                                                                                    |

### Examples

The following example shows the **apply-config** command configured in voice register pool 5:

```
Router# configure terminal
Router(config)#voice register pool 5
Router(config-register-pool)#apply-config
```

## Configure Video Bandwidth Control for SIP to SIP Video Calls

To configure video bandwidth control for SIP to SIP video calls, perform the following steps:

### Before you begin

Cisco Unified CME 8.6 or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **bandwidth video tias-modifier** *bandwidth value* [**negotiate end-to-end**]
5. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                     |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                         | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                                                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                           |
| <b>Step 3</b> | <b>voice register global</b><br><br><b>Example:</b><br>Router(config)#voice register global                                                                                                                    | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.                                                                                                                                                                                        |
| <b>Step 4</b> | <b>bandwidth video tias-modifier</b> <i>bandwidth value</i> [ <b>negotiate end-to-end</b> ]<br><br><b>Example:</b><br>Router(config-register-global)#bandwidth video tias-modifier 512000 negotiate end-to-end | Allows to set the maximum video bandwidth bits per second for SIP phones.<br><br>• <i>bandwidth value</i> —Bandwidth value in bits per second. Range: 1 to 99999999.<br><br>• <b>negotiate end-to-end</b> —Bandwidth negotiation policy. Negotiates the minimum SIP-line video bandwidth in SDP end-to-end. |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-register-global)# end                                                                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                            |

## Examples

The following example shows the **bandwidth video tias-modifier** command configured under voice register global configuration mode:

```
Router#show run
!
!
!
```

```
voice service voip
 allow-connections sip to sip
 !
voice register global
 mode cme
 source-address 10.100.109.10 port 5060
 bandwidth video tias-modifier 512000 negotiate end-to-end
 max-dn 200
 max-pool 42
 create profile sync 0004625832149157
 !
voice register pool 1
 id mac 1111.1111.1111
 camera
 video
```

## Enable Support for Video Streams Across H.323 Networks

To enable slow connect procedures in Cisco Unified CME for H.323 networks and H.323 video endpoints, perform the following steps:

**Restriction** Tandberg versions E3.0 and E4.1 and Polycom Release version 7.5.2 are the only H.323 video endpoints supported by Cisco Unified CME.

### Before you begin

For video supplementary services across an H.323 network, H.450 (H.450.2, H.450.3, or H.450.1) standard protocol is required.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **h323**
5. **call start slow**
6. **end**

### DETAILED STEPS

| Procedure |                                   |                                                                     |
|-----------|-----------------------------------|---------------------------------------------------------------------|
|           | Command or Action                 | Purpose                                                             |
| Step 1    | <b>enable</b>                     | Enables privileged EXEC mode.<br>• Enter your password if prompted. |
|           | <b>Example:</b><br>Router> enable |                                                                     |

|               | Command or Action                                                                      | Purpose                                                                    |
|---------------|----------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal             | Enters global configuration mode.                                          |
| <b>Step 3</b> | <b>voice service voip</b><br><b>Example:</b><br>Router(config)# voice service voip     | Enters voice-service configuration mode.                                   |
| <b>Step 4</b> | <b>h323</b><br><b>Example:</b><br>Router(config-voi-serv)# h323                        | Enters H.323 voice-service configuration mode.                             |
| <b>Step 5</b> | <b>call start slow</b><br><b>Example:</b><br>Router(config-serv-h323)# call start slow | Forces an H.323 gateway to use slow-connect procedures for all VoIP calls. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-serv-h323)# end                         | Returns to privileged EXEC mode.                                           |

## Enable System-Level Video Capabilities

To enable video capabilities and set video parameters for all video-capable phones associated with a Cisco Unified CME router, perform the following steps:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **service phone videoCapability {0 | 1}**
5. **video**
6. **maximum bit-rate** *value*
7. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                  | Purpose                                                                                                             |
|---------------|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |

|               | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br><code>Router(config)# telephony-service</code>                                                 | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                  |
| <b>Step 4</b> | <b>service phone videoCapability {0   1}</b><br><b>Example:</b><br><code>Router(config-telephony)# service phone<br/>videoCapability 1</code> | Enables or disables video capability parameter for all applicable IP phones associated with a Cisco Unified CME router. <ul style="list-style-type: none"> <li>• The parameter name is word and case-sensitive.</li> <li>• <b>0</b>—Disable (default).</li> <li>• <b>1</b>—Enable.</li> </ul> |
| <b>Step 5</b> | <b>video</b><br><b>Example:</b><br><code>Router(config-telephony)# video</code>                                                               | (Optional) Enters video configuration mode. <ul style="list-style-type: none"> <li>• Required only if you want to modify the maximum value of the video bandwidth for all video-capable phones.</li> </ul>                                                                                    |
| <b>Step 6</b> | <b>maximum bit-rate <i>value</i></b><br><b>Example:</b><br><code>Router(conf-tele-video)# maximum bit-rate 256</code>                         | (Optional) Sets the maximum IP phone video bandwidth, in kilobits per second. <ul style="list-style-type: none"> <li>• <i>value</i>—Range: 0 to 10000000. Default: 10000000.</li> </ul>                                                                                                       |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><code>Router(conf-tele-video)# end</code>                                                                    | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                |

## Enable Video Capabilities on a Phone

To enable video for video-capable phones associated with a Cisco Unified CME router, perform the following steps for each phone.

### Before you begin

- Video capabilities are enabled at a system level. See [Enable System-Level Video Capabilities, on page 991](#).
- Use the **show ephone registered** command to identify individual video-capable SCCP phones, by ephone-tag, that are registered in Cisco Unified CME. The following example shows that ephone 1 has video capabilities and ephone 2 is an audio-only phone:

Router# **show ephone registered**

```

ephone-1 Mac:0011.5C40.75E8 TCP socket:[1] activeLine:0 REGISTERED in SCCP ver 6 + Video
 and Server in ver 5
mediaActive:0 offhook:0 ringing:0 reset:0 reset_sent:0 paging 0 debug:0 caps:7
IP:10.1.1.6 51833 7970 keepalive 35 max_line 8
button 1: dn 1 number 8003 CH1 IDLE CH2 IDLE

ephone-2 Mac:0006.D74B.113D TCP socket:[2] activeLine:0 REGISTERED in SCCP ver 6 and
 Server in ver 5
mediaActive:0 offhook:0 ringing:0 reset:0 reset_sent:0 paging 0 debug:0 caps:7
IP:10.1.1.4 51123 Telecaster 7960 keepalive 36 max_line 6
button 1: dn 2 number 8004 CH1 IDLE CH2 IDLE
button 2: dn 4 number 8008 CH1 IDLE CH2 IDLE
=====

```

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone *phone-tag***
4. **video**
5. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                             | Purpose                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal    | Enters global configuration mode.                                                                                                                                                   |
| <b>Step 3</b> | <b>ephone <i>phone-tag</i></b><br><b>Example:</b><br>Router(config)# ephone 6 | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies an ephone during configuration tasks.</li> </ul> |
| <b>Step 4</b> | <b>video</b><br><b>Example:</b><br>Router(config-ephone)# video               | Enables video capabilities on the specified ephone.                                                                                                                                 |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                   | Exits ephone configuration mode and enters privileged EXEC mode.                                                                                                                    |

# Verify Video Support

## Procedure

Use the **show running-config** command to verify the video settings in the configuration.

See the telephony-service portion of the output for commands that configure video support on the Cisco Unified CME.

See the ephone portion of the output for commands that configure video support for a specific ephone. The following example shows the telephony-service portion of the output:

### Example:

```
telephony-service
 video eo
 maximum bit-rate 256
 load 7960-7940 P00306000404
 max-ephones 24
 max-dn 24
 ip source-address 10.0.180.130 port 2000
 service phone videoCapability 1
 timeouts interdigit 4
 timeouts ringing 100
 create cnf-files version-stamp Jan 01 2002 00:00:00
 keepalive 60
 max-conferences 4 gain -6
 call-park system redirect
 call-forward pattern .T
 web admin system name cisco password cisco
 web customize load xml.jeff
 dn-webedit
 time-webedit
 transfer-system full-consult
 transfer-pattern .T
```

The following example shows the ephone portion of the output:

```
ephone 6
 video
 mac-address 000F.F7DE.CAA5
 type 7960
 button 1:6
```

## Troubleshooting Video Support

For SCCP endpoint troubleshooting, use the following **debug** commands:

- **debug cch323 video**—Enables video debugging trace on the H.323 service-provider interface (SPI).
- **debug ephone detail**—Debugs all Cisco Unified IP phones that are registered to the router, and displays error and state levels.
- **debug h225 asn1**—Displays Abstract Syntax Notation One (ASN.1) contents of H.225 messages that have been sent or received.

- **debug h245 asn1**—Displays ASN.1 contents of H.245 messages that have been sent or received.
- **debug voip ccapi inout**—Displays the execution path through the call-control application programming interface (CCAPI).

For ephone troubleshooting, use the following **debug** commands:

- **debug ephone message**—Enables message tracing between Cisco Unified IP phones.
- **debug ephone register**—Sets registration debugging for Cisco Unified IP phones.
- **debug ephone video**—Sets ephone video traces, which provide information about different video states for the call, including video capabilities selection, start, and stop.

For basic video-to-video call checking, use the following **show** commands:

- **show call active video**—Displays call information for SCCP video calls in progress.
- **show ephone offhook**—Displays information and packet counts for ephones that are off-hook.
- **show ephone registered SCCP**—Displays the status of registered ephones.
- **show ephone summary types**—Displays the number of SCCP phones configured along with the number of phones (registered and unregistered) pertaining to each type of phone.
- **show ephone summary brief**—Displays information about the SCCP phones
- **show ephone registered SCCP summary**—Displays information about the unregistered SCCP phones.
- **show ephone unregistered SCCP summary**—Displays information about the unregistered SCCP phones.
- **show voice register pool type summary**—Displays information about all configured SIP phones which includes SIP phones registered or unregistered with CME.
- **show voip rtp connections**—Displays information about RTP named-event packets, such as caller ID number, IP address, and port for both the local and remote endpoints.

## Where to Go Next

After enabling video for video-capable phones in Cisco Unified CME, you must generate a new configuration file. See [Generate Configuration Files for Phones, on page 400](#).

## Feature Information for Video Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

Table 89: Feature Information for Video Support

| Feature Name            | Cisco Unified CME Version | Feature Information                                                                                                                                                      |
|-------------------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| New Phone Support       | 12.0                      | Support was added for Cisco IP Phones 8845 and Cisco IP Phone 8865 on Cisco Integrated Services Router Generation 2 (T-Train Release, 15.7(3)M).                         |
| New Phone Support       | 11.7                      | Support was added for Cisco IP Phones 8845 and Cisco IP Phone 8865 on Cisco 4000 Series Integration Services Router.                                                     |
| SIP Trunk Video Support | 7.1                       | Support was added for video calls between SCCP endpoints across different Cisco Unified CME routers connected through a SIP trunk.<br><br>H.264 codec support was added. |
| Video Support           | 4.0                       | Video support was introduced.                                                                                                                                            |

## SSL VPN Client for SCCP IP Phones

- [Information About SSL VPN Client](#), on page 997
- [Configure SSL VPN Client](#), on page 999
- [Configure SSL VPN Client with DTLS on Cisco Unified CME as VPN Headend](#), on page 1018
- [Configuration Examples for SSL VPN Client](#), on page 1024
- [Feature Information for SSL VPN Client](#), on page 1027

### Information About SSL VPN Client

#### SSL VPN Support on Cisco Unified CME with DTLS

In Communications Manager Express 8.6 and later versions, Cisco Unified SCCP IP phones such as 7945, 7965, and 7975 located outside of the corporate network are able to register to Cisco Unified CME through an SSL VPN connection. The SSL VPN connection is set up between a phone and a VPN headend. The VPN headend can either be an Adaptive Secure Appliance (ASA 5500) or the Datagram Transport Layer Security (DTLS) enabled IOS SSL VPN router, see [Figure 37: VPN connection between Cisco Unified IP Phone and VPN head ends \(ASA and DTLS\)](#), on page 997. Support for VPN feature on ASA headend was added in Cisco Unified CME 8.5. For more information, see [SSL VPN Client for SCCP IP Phones](#), on page 997.

**Figure 37: VPN connection between Cisco Unified IP Phone and VPN head ends (ASA and DTLS)**

Cisco Unified CME 8.6 uses IOS SSL DTLS as a headend or gateway. To establish a VPN connection between a phone and a VPN head end, the phone must be configured with VPN configuration parameters. The VPN configuration parameters include VPN head end addresses, VPN head end credentials, user or phone ID, and credential policy. These parameters are considered as sensitive information and must be delivered in a secure environment using a signed configuration file or a signed and encrypted configuration file. The phone is required to be provisioned within the corporate network before the phone can be placed outside the corporate network.

After the phone is “staged” in a trusted environment, the phone can be deployed to a location where a VPN head end can be connected. The VPN configuration parameters for the phone dictate the user interface and behavior of the phone.

## Phone or Client Authentication

Phone authentication is required to verify that the remote phone trying to register with Cisco Unified CME via, VPN DTLS is a legitimate phone. Phone or client authentication can be done with the following types of authentication:

1. Username and Password Authentication.
2. Certificate-based authentication (where the phone's authentication is done using the LSC or MIC certificate on the phone). The certificated-based authentication consists of two levels:
  - Certificate only Authentication - Where only the LSC of the phone is used (the user is not required to enter a username or password on the phone.)
  - Certification with AAA or two-factor - Where the LSC of the phone and username and password combination is used to authenticate phone. Two-factor authentication can be performed with or without the username prefill. (With the username prefilled, the phone does not ask for a username and a username is picked up depending on the configuration under the relevant trustpoint.)

**Note** We recommend using LSC for certificate authentication. Use of MIC for certificate authentication is not recommended. We also recommend configuring ephone in “authenticated” (not encrypted) security mode when doing certificate authentication. More information on certificate-only authentication and two-factor authentication is available at the following location: [https://www.cisco.com/en/US/docs/ios/sec\\_secure\\_connectivity/configuration/guide/sec\\_ssl\\_vpn\\_ps6350\\_TSD\\_Products\\_Configuration\\_Guide\\_Chapter.html#wp1465191](https://www.cisco.com/en/US/docs/ios/sec_secure_connectivity/configuration/guide/sec_ssl_vpn_ps6350_TSD_Products_Configuration_Guide_Chapter.html#wp1465191).

You can set up Cisco Unified CME with an encrypted mode, but encrypted SCCP phone has limited media call-flow support. Using a phone with authenticated mode does not have any media-related call-flow limitations.

## SSL VPN Client Support on SCCP IP Phones

Cisco Unified CME 8.5 and later versions support Secure Sockets Layer (SSL) Virtual Private Network (VPN) on SCCP IP phones such as 7945, 7965, and 7975.

In Cisco Unified CME 8.5, SCCP IP phones outside of the corporate network can register with the Cisco Unified CME 8.5 through a VPN connection as shown in [Figure 38: Connection between a phone and a VPN head end, on page 999](#).

**Figure 38: Connection between a phone and a VPN head end**

An SSL VPN provides secure communication mechanism for data and other information transmitted between two endpoints. The VPN connection is set up between a SCCP IP phone and a VPN head end or VPN gateway. Cisco Unified CME 8.5 uses an Adaptive Security Appliances (ASA model 55x0) as a VPN head end or gateway.

To establish a VPN connection between a phone and a VPN gateway, the phone is required to be configured with VPN configuration parameters such as VPN gateway addresses, VPN head end credentials, user or phone ID, and credential policy. These parameters contain sensitive information and should be delivered in a secure environment using a signed configuration file or a signed and encrypted configuration file. The phone is required to be provisioned within the corporate network before the phone is placed outside the corporate network.

After the phone is provisioned in a trusted secure environment, the phone can be connected to Cisco Unified CME from any location, from where VPN head end can be reached. The VPN configuration parameters for the phone control the user interface and behavior of the phone. For more information on configuring the SSL VPN feature on SCCP IP phones, see [Configure ASA \(Gateway\) as VPN Headend, on page 1009](#).

You need to generate a trustpoint with exportable keys and use that as SAST1. For more information about CME System Administrator Security Token.

### Restrictions for Configuring SSL VPN Client for SCCP IP Phones

SSL VPN Client is not supported with Cisco 4000 Series Integrated Services Routers on Unified CME.

Only Site-to-Site VPN configuration is supported on Unified CME.

## Configure SSL VPN Client

### Configure SSL VPN Client with ASA as VPN Headend

To configure the SSL VPN feature on SCCP IP phones, follow these steps in the order in which they are presented here:

1. [Basic Configuration on Cisco Unified CME, on page 1000](#)

2. [Configure Cisco Unified CME as CA Server, on page 1005](#)
3. [Verify Phone Registration and Phone Load, on page 1008](#)
4. [Configure ASA \(Gateway\) as VPN Headend, on page 1009](#)
5. [Configure VPN Group and Profile on Cisco Unified CME, on page 1012](#)
6. [Associate VPN Group and Profile to SCCP IP Phone, on page 1014](#)
7. [Configure Alternate TFTP Address on Phone, on page 1017](#)
8. [Register Phone from a Remote Location, on page 1017](#)

## Prerequisites

- Cisco Unified CME 8.5 or later versions.
- Securityk9 license for ISR-G2 platforms.
- Cisco Unified SCCP IP phones 7942, 7945, 7962, 7965, and 7975 with phone image 9.0 or later.
- ASA 5500 series router with image asa828-7-k8.bin or higher.
- The package anyconnect-win-2.4.1012-k9.pkg is required for configuring the SSLVPN feature but would not be downloaded to the phone.
- You must request the appropriate ASA licenses (AnyConnect for Cisco VPN Phone) to be installed on an ASA in order to allow the VPN client to connect. Go to: [www.cisco.com/go/license](http://www.cisco.com/go/license) and enter the PAK and the new activation key will be e-mailed back to you.

### Note

A compatible Adaptive Security Device Manager (ASDM) Image is required if configuring through ASDM.

## Basic Configuration on Cisco Unified CME

The following steps are basic Cisco Unified configuration allowing the SSL VPN feature to be built on:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp pool** *pool-name*
4. **network** *ip-address* [*mask* | *prefix-length*]
5. **option 150 ip** *ip-address*
6. **default-router** *ip-address*
7. **exit**
8. **telephony-service**
9. **max-ephones** *max-phones*
10. **max-dn** *max-directory-numbers* [**preference** *preference-order*] [**no-reg primary** | **both**]
11. **ip source-address** *ip-address* **port** *port* [**any-match** | **strict-match**]
12. **cnf-file** {**perphone**}

13. **load** *[phone-type firmware-file]*
14. **no shutdown**
15. **exit**
16. **ephone-dn** *dn-tag* *[dual-line]*
17. **number** *number* *[secondary number]* *[no-reg [both | primary]]*
18. **ephone** *phone-tag*
19. **description** *string*
20. **device-security-mode** { **authenticated** | **none** | **encrypted** }
21. **mac-address** *mac-address*
22. **type** *phone-type* *[addon 1 module-type [2 module-type] ]*
23. **button** *button-number* { *separator* } *dn-tag* *[,dn-tag...]* *[button-number {x} overlay-button-number]*  
*[button-number...]*
24. **exit**
25. **telephony-service**
26. **create cnf-files**
27. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                              | Purpose                                                                                                                                                                                                                 |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                             | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                     | Enters global configuration mode.                                                                                                                                                                                       |
| <b>Step 3</b> | <b>ip dhcp pool</b> <i>pool-name</i><br><b>Example:</b><br>Router(config)# ip dhcp pool mypool                                                 | Creates a name for the DHCP server address pool and enters DHCP pool configuration mode.<br><b>Note</b><br>If you have already configured DHCP IP Address Pool, then skip Step 2 to Step 7 and continue from Step 8.    |
| <b>Step 4</b> | <b>network</b> <i>ip-address</i> <i>[mask   prefix-length]</i><br><b>Example:</b><br>Router(config-dhcp)#network 192.168.11.0<br>255.255.255.0 | Specifies the IP address of the DHCP address pool to be configured.                                                                                                                                                     |
| <b>Step 5</b> | <b>option 150 ip</b> <i>ip-address</i><br><b>Example:</b><br>Router(config-dhcp)# option 150 ip 192.168.11.1                                   | Specifies the TFTP server address from which the Cisco Unified IP phone downloads the image configuration file.<br><ul style="list-style-type: none"> <li>• This is your Cisco Unified CME router's address.</li> </ul> |

|                | Command or Action                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b>  | <b>default-router</b> <i>ip-address</i><br><b>Example:</b><br>Router(config-dhcp)# default router 192.168.11.1                                                                                                   | (Optional) Specifies the router that the IP phones will use to send or receive IP traffic that is external to their local subnet. <ul style="list-style-type: none"> <li>• If the Cisco Unified CME router is the only router on the network, this address should be the Cisco Unified CME IP source address. This command can be omitted if IP phones need to send or receive IP traffic only to or from devices on their local subnet.</li> <li>• The IP address that you specify for default router will be used by the IP phones for fallback purposes. If the Cisco Unified CME IP source address becomes unreachable, IP phones will attempt to register to the address specified in this command.</li> </ul> |
| <b>Step 7</b>  | <b>exit</b><br><b>Example:</b><br>Router(config-dhcp)# end                                                                                                                                                       | Exits DHCP pool configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 8</b>  | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                                                                                                                 | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 9</b>  | <b>max-ephones</b> <i>max-phones</i><br><b>Example:</b><br>Router(config-telephony)# max-ephones 24                                                                                                              | Sets the maximum number of phones that can register to Cisco Unified CME. <ul style="list-style-type: none"> <li>• Maximum number is platform and version-specific. Type ? for range.</li> <li>• In Cisco Unified CME 7.0/4.3 and later versions, the maximum number of phones that can register is different than the maximum number of phones that can be configured. The maximum number of phones that can be configured is 1000.</li> <li>• In versions earlier than Cisco Unified CME 7.0/4.3, this command restricted the number of phones that could be configured on the router.</li> </ul>                                                                                                                 |
| <b>Step 10</b> | <b>max-dn</b> <i>max-directory-numbers</i> [ <b>preference</b> <i>preference-order</i> ] [ <b>no-reg</b> <b>primary</b>   <b>both</b> ]<br><b>Example:</b><br>Router(config-telephony)# max-dn 24 no-reg primary | Limits number of directory numbers to be supported by this router. <ul style="list-style-type: none"> <li>• Maximum number is platform and version-specific. | <b>Step 26</b> | <b>create cnf-files</b><br><b>Example:</b><br>Router(config-telephony)# create cnf-files | Builds XML configuration files required for SCCP phones. |
| <b>Step 27</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                           | Returns to privileged EXEC mode.                         |

## Configure Cisco Unified CME as CA Server

The basic configuration on the CA server ensures IP connectivity, Network Time Protocol (NTP), time synchronization which are necessary for enabling the SSL VPN feature.

Though this section describes configuring CA server on the CME to provide certificate signing for both CME and ASA, in real world deployments third party CA is often used. The basic requirement is that CME and ASA each has an identity certificate signed by the third party CA, and both CME and ASA share the same CA certificate. That is, each device has a trustpoint containing the same CA certificate as well as an identity certificate signed by the same CA.

To configure the CA server, follow these steps:

### Procedure

**Step 1** Configure IP Address, NTP and HTTP Server on your Cisco Unified CME router:

#### Example:

```
Router(config)# Interface GigabitEthernet0/0
Router(config-if)# no ip address
Router(config-if)# interface GigabitEthernet0/0.10
Router(config-subif)# description DATA VLAN
Router(config-subif)# encapsulation dot1Q 10 native
Router(config-subif)# ip address 192.168.10.1 255.255.255.0

Router(config)# interface GigabitEthernet0/0.11
Router(config-subif)# description VOICE VLAN
Router(config-subif)# encapsulation dot1Q 11
Router(config-subif)# ip address 192.168.11.1 255.255.255.0

Router(config)# interface GigabitEthernet0/1
Router(config-if)# description INTERFACE CONNECTED TO ASA
Router(config-if)# ip address 192.168.20.1 255.255.255.0

Router(config)# ! Default router is ASA Inside Interface
Router(config)# ip route 0.0.0.0 0.0.0.0 192.168.20.254
Router(config)# clock timezone PST -8
Router(config)# clock summer-time PST recurring
```

```

Router# ! Set clock to current time
Router# clock set 10:10:00 15 oct 2010

Router(config)# ntp source GigabitEthernet0/1
Router(config)# ntp master 2

Router(config)# ip http server
Router(config)# ip domain-name cisco.com

```

**Note**

NTP synchronization will fail if you do not set the clock manually to match the time on Cisco Unified CME router.

**Step 2**

Configure Cisco Unified CME as CA Server. Both CME and ASA will enroll a certificate from the CA Server. The following sample configuration shows Cisco Unified CME being configured as the CA Server:

**Example:**

```

Router(config)# crypto pki server cme_root
Router(config)# database level complete
Router(cs-server)# database url nvram:
Router(cs-server)# grant auto
Router(cs-server)# lifetime certificate 7305
Router(cs-server)# lifetime ca-certificate 7305
Router(cs-server)# exit

Router(config)# crypto pki trustpoint cme_root
Router(ca-trustpoint)# enrollment url http://192.168.20.1:80
Router(ca-trustpoint)# revocation-check none
Router(ca-trustpoint)# rsakeypair cme_root
Router(cs-server)# exit

Router(config)# crypto pki server cme_root
Router(cs-server)#no shutdown
%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key
% or type Return to exit
Password: *****
Re-enter password: ****
% Generating 1024 bit RSA keys, keys will be non-exportable...
[OK] (elapsed time was 1 seconds)
Mar 10 16:44:00.576: %SSH-5-ENABLED: SSH 1.99 has been enabled% Exporting Certificate
Server signing certificate and keys...
% Certificate Server enabled.
Router(cs-server)#
Mar 10 16:44:41.812: %PKI-6-CS_ENABLED: Certificate server now enabled.

```

**Step 3**

Create a second trustpoint, then authenticate the trustpoint and enroll it with CA.

**Example:**

```

Router(config)# crypto pki trustpoint cme_cert
Router(ca-trustpoint)# enrollment url http://192.168.20.1:80
Router(ca-trustpoint)# revocation-check none
Router(ca-trustpoint)# exit

Router(config)# crypto pki authenticate cme_cert
Certificate has the following attributes:
Fingerprint MD5: 995C157D AABB8EE2 494E7B35 00A75A88
Fingerprint SHA1: F934871E 7E2934B1 1C0B4C9A A32B7316 18A5858F
% Do you accept this certificate? [yes/no]: yes
Trustpoint CA certificate accepted.

```

```

Router(config)# crypto pki enroll cme_cert
%
% Start certificate enrollment ..
% Create a challenge password.
You will need to verbally provide this password to the CA Administrator in order to revoke
your certificate. For security reasons your password will not be saved in the
configuration. Please make a note of it.
Password:
Jan 20 16:03:24.833: %CRYPTO-6-AUTOGEN: Generated new 512 bit key pair
Re-enter password:
% The subject name in the certificate will include: CME1.cisco.com
% Include the router serial number in the subject name? [yes/no]: no
% Include an IP address in the subject name? [no]: no
Request certificate from CA? [yes/no]: yes
% Certificate request sent to Certificate Authority
% The 'show crypto pki certificate verbose cme_cert' command will show the fingerprint.
! Verify Certificates

```

### Verify Certificates (Optional)

Use the **show crypto pki certificates** command on your Cisco Unified CME router to verify the certificates.

```

Router# sh crypto pki certificates
Certificate
Status: Available
Certificate Serial Number (hex): 07
Certificate Usage: General Purpose
Issuer:
cn=cme_root
Subject:
Name: CME1.cisco.com
hostname=CME1.cisco.com
Validity Date:
start date: 15:32:23 PST Apr 1 2010
end date: 09:44:00 PST Mar 10 2030
Associated Trustpoints: cisco2
Storage: nvram:cme_root#7.cer

```

```

Certificate

```

---

## Verify Phone Registration and Phone Load

### Procedure

---

**Step 1** Use the **show ephone** command to verify the phone registration details.

#### Example:

```

Router# show ephone

ephone-1[0] Mac:0022.555E.00F1 TCP socket:[2] activeLine:0 whisperLine:0 REGISTERED in SCCP ver 19/17
max_streams=5 mediaActive:0 whisper_mediaActive:0 startMedia:0 offhook:0 ringing:0 reset:0 reset_sent:0
paging 0 debug:0 caps:9
IP:192.168.11.4 * 49269 7965 keepalive 0 max_line 6 available_line 6
button 1: cw:1 ccw:(0 0) dn 1 number 1001 CH1 IDLE CH2 IDLE
Preferred Codec: g711ulaw
Lpcor Type: none

```

#### Note

Make sure the phone has the right phone firmware and verify if the phone registers locally with Cisco Unified CME.

**Step 2** Use the **show ephone phone load** command to verify phone load.

#### Example:

```

Router# show ephone phoneload

DeviceName CurrentPhoneload PreviousPhoneload LastReset
SEP0016C7EF9B13 9.0(1TD1.36S) 9.0(1TD1.36S) UCM-closed-TCP

```

---

## Configure ASA (Gateway) as VPN Headend

In this section ASA will be configured to authenticate and enroll a certificate from CME CA server. The fingerprint of the CA certificate will be the same as the CME root certificate, so that the phone can authenticate the certificates sent from ASA during TLS negotiation against the hash it has in store.

### Procedure

#### Step 1 Configure Interfaces, IP Routing, and NTP.

##### Example:

```
ciscoasa(config)# Interface Ethernet0/1
ciscoasa(config-if)# nameif Inside
ciscoasa(config-if)# description INTERFACE CONNECTED TO CUCME
ciscoasa(config-if)# security-level 100
ciscoasa(config-if)# ip address 192.168.20.254 255.255.255.0

ciscoasa(config)# interface Ethernet 0/0
ciscoasa(config-if)# description INTERFACE CONNECTED TO WAN
ciscoasa(config-if)# nameif Outside
ciscoasa(config-if)# security-level 0
ciscoasa(config-if)# ip address 9.10.60.254 255.255.255.0
ciscoasa(config)# router ospf 100
ciscoasa(config-router)# network 9.10.60.0 255.255.255.0 area 1

ciscoasa(config-if)# ntp server 192.168.20.1
```

#### Step 2 Create Trustpoint on ASA and obtain CME (CA) Certificate.

##### Example:

```
ciscoasa(config)# crypto key generate rsa label cmeasa
ciscoasa(config)# crypto ca trustpoint asatrust
ciscoasa(config)# ! Enrollment URL = CA Server = CUCME
ciscoasa(config-ca-trustpoint)# enrollment url http://192.168.20.1:80
ciscoasa(config-ca-trustpoint)# subject-name cn=cmeasa.cisco.com
ciscoasa(config-ca-trustpoint)# crl nocheck
ciscoasa(config-ca-trustpoint)# keypair cmeasa

ciscoasa (config)# crypto ca authenticate asatrust
INFO: Certificate has the following attributes:
Fingerprint: 27d00cdf 1144c8b9 90621472 786da0cf
Do you accept this certificate? [yes/no]: yes
! Enroll the Trustpoint
ciscoasa(config)# crypto ca enroll asatrust
% Start certificate enrollment ..
% Create a challenge password. You will need to verbally provide this
password to the CA Administrator in order to revoke your certificate.
For security reasons your password will not be saved in the configuration.
Please make a note of it.
Password: *****
Re-enter password: *****
% The subject name in the certificate will be: cn=cmeasa.cisco.com
% The fully-qualified domain name in the certificate will be: ciscoasa.cisco.com
% Include the device serial number in the subject name? [yes/no]: no
Request certificate from CA? [yes/no]: yes
% Certificate request sent to Certificate Authority
```

```
ciscoasa(config)# The certificate has been granted by CA!
ciscoasa# show crypto ca certificates
```

### Step 3 Verify Certificates (optional)

Use the **show crypto ca certificate** command on your ASA router to verify the certificates.

#### Example:

```
ciscoasa# show crypto ca certificate
Certificate
Status: Available
Certificate Serial Number: 03
Certificate Usage: General Purpose
Public Key Type: RSA (1024 bits)
Issuer Name:
cn=cme_root
Subject Name:
hostname=ciscoasa.cisco.com
cn=cmeasa.cisco.com
Validity Date:
start date: 09:04:40 PST Mar 10 2010
end date: 08:44:00 PST Mar 10 2030
Associated Trustpoints: asatrust

CA Certificate
Status: Available
Certificate Serial Number: 01
Certificate Usage: Signature
Public Key Type: RSA (1024 bits)
Issuer Name:
cn=cme_root
Subject Name:
cn=cme_root
Validity Date:
start date: 08:44:00 PST Mar 10 2010
end date: 08:44:00 PST Mar 10 2030
Associated Trustpoints: asatrust
```

### Step 4 Configure SSL Parameters.

#### Example:

```
ciscoasa(config)# ssl encryption 3des-sha1 aes128-sha1 aes256-sha1 des-sha1 null-sha1
ciscoasa(config)#
ciscoasa(config)# ssl trust-point asatrust
ciscoasa(config)# ssl trust-point asatrust inside
ciscoasa(config)# ssl trust-point asatrust outside
ciscoasa(config)# no ssl certificate-authentication interface outside port 443
ciscoasa(config)# ssl certificate-authentication interface inside port 443
```

### Step 5 Configure local IP address pool.

#### Example:

```
ciscoasa(config)# ip local pool SSLVPNphone_pool 192.168.20.50-192.168.20.70 mask
255.255.255.0
```

### Step 6 Configure Access List to prevent NAT traffic via VPN.

#### Example:

```
ciscoasa(config)# access-list no_nat_to_vpn extended permit ip any 9.10.60.0 255.255.255.0
ciscoasa(config)# ! 9.10.60.0/24 is the Outside subnet
ciscoasa(config)# nat (inside) 0 access-list no_nat_to_vpn
```

**Step 7**

Configure VPN. Follow this link for information on configuring VPN: <https://www.cisco.com/c/en/us/support/security/adaptive-security-appliance-asa-software/products-installation-and-configuration-guides-list.html>.

**Example:**

```
ciscoasa(config-webvpn)# enable inside
INFO: WebVPN and DTLS are enabled on 'Inside'.
ciscoasa(config-webvpn)# enable outside
INFO: WebVPN and DTLS are enabled on 'Outside'.
ciscoasa(config-webvpn)# svc image disk0:/anyconnect-win-2.4.1012-k9.pkg 1
ciscoasa(config-webvpn)# svc enable
ciscoasa(config-webvpn)# group-policy SSLVPNphone internal
ciscoasa(config)# group-policy SSLVPNphone attribute
ciscoasa(config-group-policy)# banner none
ciscoasa(config-group-policy)# vpn-simultaneous-logins 10
ciscoasa(config-group-policy)# vpn-idle-timeout none
ciscoasa(config-group-policy)# vpn-session-timeout none
ciscoasa(config-group-policy)# vpn-tunnel-protocol svc webvpn
ciscoasa(config-group-policy)# address-pools value SSLVPNphone_pool
ciscoasa(config-group-policy)# webvpn
ciscoasa(config-group-webvpn)# svc dtls enable
ciscoasa(config-group-webvpn)# svc keepalive 120
ciscoasa(config-group-webvpn)# svc ask none
ciscoasa(config-group-webvpn)#
```

**Step 8**

Configure SSL VPN tunnel. For more information, see <https://www.cisco.com/c/en/us/support/security/adaptive-security-appliance-asa-software/products-installation-and-configuration-guides-list.html>.

**Example:**

```
ciscoasa(config)# tunnel-group SSLVPN_tunnel type remote-access
ciscoasa(config)# tunnel-group SSLVPN_tunnel general-attributes
ciscoasa(config-tunnel-general)#
ciscoasa(config-tunnel-general)#
ciscoasa(config-tunnel-general)# address-pool SSLVPNphone_pool
ciscoasa(config-tunnel-general)# default-group-policy SSLVPNphone
ciscoasa(config-tunnel-general)# tunnel-group SSLVPN_tunnel webvpn-attributes
ciscoasa(config-tunnel-webvpn)# group-url https://9.10.60.254/SSLVPNphone enable
```

**Step 9**

Enable static route to Cisco Unified CME voice VLAN. For more information, see <https://www.cisco.com/c/en/us/support/security/adaptive-security-appliance-asa-software/products-installation-and-configuration-guides-list.html>.

**Example:**

```
ciscoasa(config)# route Inside 192.168.11.0 255.255.255.0 192.168.20.254 1
```

**Step 10**

Configure the ASA local database for users. For more information, see <https://www.cisco.com/c/en/us/support/security/adaptive-security-appliance-asa-software/products-installation-and-configuration-guides-list.html>.

**Example:**

```
ciscoasa(config)# username anyone password cisco
ciscoasa(config)# ! These credentials will be entered on the phone to log in.
ciscoasa(config)# username anyone attributes
ciscoasa(config-username)# vpn-group-policy SSLVPNphone
ciscoasa(config-username)# vpn-tunnel-protocol IPSec l2tp-ipsec svc webvpn
ciscoasa(config-username)# webvpn
```

```
ciscoasa(config-username-webvpn)# svc dtls enable
ciscoasa(config-username-webvpn)# svc ask none
```

**Step 11** Enable Inter-ASA media traffic.

**Example:**

```
ciscoasa(config)# same-security-traffic permit inter-interface
ciscoasa(config)# same-security-traffic permit intra-interface
```

## Configure VPN Group and Profile on Cisco Unified CME

In this section a VPN-group is configured which dictates the VPN gateway IP address, certificate hash algorithm and certificate trustpoint for phones. This information will be added to phone configuration later. To configure VPN group and profile on Cisco Unified CME, follow these steps:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **vpn-group tag**
5. **vpn-gateway [ number | url]**
6. **vpn-trustpoint { [number [raw | trustpoint]] }**
7. **vpn-hash-algorithm sha-1**
8. **exit**
9. **vpn-profile tag**
10. **host-id-check [enable | disable]**
11. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                     | Purpose                                                        |
|---------------|---------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal        | Enters global configuration mode.                              |
| <b>Step 3</b> | <b>voice service voip</b><br><br><b>Example:</b><br>Router(config)#voice service voip | Enters voice over IP configuration mode.                       |

|                | Command or Action                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b>  | <b>vpn-group</b> <i>tag</i><br><b>Example:</b><br>Router (conf-voi-serv) #vpn-group 1                                                                                                    | Enters vpn-group mode under voice over IP configuration mode.<br><ul style="list-style-type: none"> <li><i>tag</i>—vpn-group tag. Range: 1 or 2.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 5</b>  | <b>vpn-gateway</b> [ <i>number</i>   <i>url</i> ]<br><b>Example:</b><br>Router (conf-vpn-group) #vpn-gateway 1<br>https://9.10.60.254/SSLVPNphone                                        | Allows you to define gateway url for vpn.<br><ul style="list-style-type: none"> <li><i>number</i>—number—Number of gateways that can be defined as a vpn-gateway. Range is from 1 to 3.</li> <li><i>url</i>—VPN-gateway url. SSLVPNphone is the VPN group policy configured on ASA.</li> </ul>                                                                                                                                                                                                                                                       |
| <b>Step 6</b>  | <b>vpn-trustpoint</b> { [ <i>number</i> [ <i>raw</i>   <i>trustpoint</i> ] }<br><b>Example:</b><br>Router (conf-vpn-group) #vpn-trustpoint<br>?vpn-trustpoint 1 trustpoint cme_cert root | Allows you to enter a vpn-gateway trustpoint.<br><ul style="list-style-type: none"> <li><b>number</b>—Number of trustpoints allowed. Range: 1 to 10.</li> <li><b>raw</b>—allows you to enter vpn-gateway trustpoint in raw format.</li> <li><b>trustpoint</b>—allows you to enter VPN Gateway trustpoint as created in IOS format.</li> <li><b>root</b> – Since the CME root certificate has the same hash as ASA's CA certificate, therefore the "root" clause is configured to select the root certificate instead of leaf certificate.</li> </ul> |
| <b>Step 7</b>  | <b>vpn-hash-algorithm</b> <i>sha-1</i><br><b>Example:</b><br>Router (conf-vpn-group) #vpn-hash-algorithm<br>sha-1                                                                        | Allows you to enter vpn hash encryption for the trustpoints.<br><ul style="list-style-type: none"> <li><i>sha-1</i>—Encryption algorithm.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 8</b>  | <b>exit</b><br><b>Example:</b><br>Router (conf-vpn-group) #exit                                                                                                                          | Exits VPN-group configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 9</b>  | <b>vpn-profile</b> <i>tag</i><br><b>Example:</b><br>Router (conf-voi-serv) #vpn-profile 1                                                                                                | Enters VPN-profile configuration mode.<br><i>tag</i> —VPN-profile tag number. Range: 1-6.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 10</b> | <b>host-id-check</b> [ <i>enable</i>   <i>disable</i> ]<br><b>Example:</b><br>Router (conf-vpn-profile) #host-id-check<br>disable                                                        | Allows you to configure host id check option in VPN-profile.<br><ul style="list-style-type: none"> <li><i>disable</i>— Disable host ID check option.</li> <li><i>enable</i>— Enable host ID check option. Default is Enable.</li> </ul>                                                                                                                                                                                                                                                                                                              |

|                | Command or Action                                                   | Purpose                        |
|----------------|---------------------------------------------------------------------|--------------------------------|
| <b>Step 11</b> | <b>end</b><br><br><b>Example:</b><br>Router (conf-vpn-profile) #end | Exits to privileged EXEC mode. |

## Associate VPN Group and Profile to SCCP IP Phone

To associate VPN group and profile to SCCP IP phones, follow these steps:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **cnf-file perphone**
5. **ephone** *phone-tag*
6. **device-security-mode** {authenticated | none | encrypted}
7. **mac-address** [mac-address]
8. **type** *phone-type* **addon** 1 [*module-type* [2 *module-type*]]
9. **vpn-group** *tag*
10. **vpn-profile** *tag*
11. **button** *button-number*{*separator*}*dn-tag* [,*dn-tag*...][*button-number*{*x*}*overlay-button-number*]  
[*button-number*...]
12. **exit**
13. **telephony-service**
14. **create cnf-file**
15. **exit**
16. **ephone** *phone-tag*
17. **reset**
18. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                              | Purpose                                                        |
|---------------|--------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                              |

|               | Command or Action                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router# (config) telephony-service                                                        | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 4</b> | <b>cnf-file perphone</b><br><b>Example:</b><br>Router(config-telephony)# create cnf-files                                                | Builds the XML configuration files required for IP phones.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 5</b> | <b>ephone <i>phone-tag</i></b><br><b>Example:</b><br>Router(config)# ephone 1                                                            | Enters ephone configuration mode to set phone-specific parameters for an SCCP phone. <ul style="list-style-type: none"> <li><i>phone-tag</i>—Unique sequence number that identifies the phone. Range is version and platform-dependent; type ? to display range</li> </ul>                                                                                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <b>device-security-mode {authenticated   none   encrypted}</b><br><b>Example:</b><br>Router(config-telephony)# device-security-mode none | Enables security mode for endpoints. <ul style="list-style-type: none"> <li>authenticated—Instructs device to establish a TLS connection with no encryption. There is no Secure Real-Time Transport Protocol (SRTP) in the media path.</li> <li>none—SCCP signaling is not secure. This is the default.</li> <li>encrypted—Instructs device to establish an encrypted TLS connection to secure media path using SRTP.</li> <li>The value set for this command in ephone configuration mode has priority over the value set in telephony-service configuration mode.</li> </ul> |
| <b>Step 7</b> | <b>mac-address [mac-address]</b><br><b>Example:</b><br>Router(config-ephone)# mac-address 0022.555e.00f1                                 | Specifies the MAC address of the IP phone that is being configured                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 8</b> | <b>type <i>phone-type</i> add-on 1 [module-type [2 module-type]]</b><br><b>Example:</b><br>Router(config-ephone)# type 7965              | Specifies the type of phone. <ul style="list-style-type: none"> <li>Cisco Unified CME 4.0 and later versions—The only types to which you can apply an add-on module are 7960, 7961, 7961GE, and 7970.</li> <li>Cisco CME 3.4 and earlier versions—The only type to which you can apply an add-on module is 7960.</li> </ul>                                                                                                                                                                                                                                                    |
| <b>Step 9</b> | <b>vpn-group <i>tag</i></b><br><b>Example:</b><br>Router (config-ephone)# vpn-group 1                                                    | Enters vpn-group mode under voice over IP configuration mode. <ul style="list-style-type: none"> <li>tag—vpn-group tag. Range: 1 or 2.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Associate VPN Group and Profile to SCCP IP Phone

|                | Command or Action                                                                                                                                                                                        | Purpose                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 10</b> | <b>vpn-profile</b> <i>tag</i><br><b>Example:</b><br>Router (config-ephone) #vpn-profile 1                                                                                                                | Enters VPN-profile configuration mode.<br><ul style="list-style-type: none"> <li>• <i>tag</i>—VPN-profile tag number. Range: 1-6.</li> </ul>                                             |
| <b>Step 11</b> | <b>button</b> <i>button-number{separator}dn-tag</i><br><i>[,dn-tag...][button-number{x}overlay-button-number]</i><br><i>[button-number...]</i><br><b>Example:</b><br>Router (config-ephone) # button 1:5 | Associates a button number and line characteristics with an ephone-dn. Maximum number of buttons is determined by phone type.                                                            |
| <b>Step 12</b> | <b>exit</b><br><b>Example:</b><br>Router (config-ephone) exit                                                                                                                                            | Exits ephone configuration mode.                                                                                                                                                         |
| <b>Step 13</b> | <b>telephony-service</b><br><b>Example:</b><br>Router (config) # telephony-service                                                                                                                       | Enters telephony-service configuration mode.                                                                                                                                             |
| <b>Step 14</b> | <b>create cnf-file</b><br><b>Example:</b><br>Router (config-telephony) # create cnf-files                                                                                                                | Builds the XML configuration files required for IP phones. It is recommended to first clear the existing config files using “no create cnf-files” and then create again.                 |
| <b>Step 15</b> | <b>exit</b><br><b>Example:</b><br>Router (Config-telephony) exit                                                                                                                                         | Exits telephony service configuration mode.                                                                                                                                              |
| <b>Step 16</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br>Router (config) # ephone 1                                                                                                                          | Enters ephone configuration mode.<br><ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks.</li> </ul> |
| <b>Step 17</b> | <b>reset</b><br><b>Example:</b><br>Router (config-ephone) # reset                                                                                                                                        | Performs a complete reboot of the individual SCCP phone being configured.                                                                                                                |
| <b>Step 18</b> | <b>end</b><br><b>Example:</b><br>Router (config-ephone) # end                                                                                                                                            | Exits to privileged EXEC mode.                                                                                                                                                           |

## Configure Alternate TFTP Address on Phone

### Procedure

---

**Step 1** From the phone, go to:

**Example:**

**Settings > Network Configuration > IPv4 Configuration > Alternate TFTP**

Press \*\*# to unlock  
Select YES

If the phone is already registered, "TFTP Server 1" will already be populated. Otherwise, enter the CUCME address as the alternate TFTP Server 1.

**Step 2** Save the phone configuration.

**Step 3** Verify if the VPN is enabled from the phone.

**Example:**

**Settings > Security Configuration > VPN**

When you press "Enable" from this menu, it should prompt for username and password.

**Step 4** From the phone, go to:

**Example:**

**Settings > Network Configuration > IPv4 Configuration > Alternate TFTP**

Press \*\*# to unlock and select YES.

If the phone is already registered, "TFTP Server 1" will already be populated. Otherwise, enter the CUCME address as the alternate TFTP Server 1.

**Step 5** Save the configuration.

**Step 6** Connect the phone to the network from home or a remote location.

**Example:**

**Settings > Security Settings > VPN Configurations?**

Enable VPN  
Enter Username and Password. Phone will register with CUCME.

---

## Register Phone from a Remote Location

To register a Cisco Unified IP phone from a remote location, follow these steps:

### Procedure

---

**Step 1** Connect the phone to the network from a home or remote location. Phone receives DHCP.

- Step 2** Select **Settings** from the phone menu and go to **Security Settings**.
- Step 3** Select **VPN Configurations**, and then select **Enable VPN**.
- Step 4** Enter your username and password. Your phone will now register with Cisco Unified CME.
- 

## Configure SSL VPN Client with DTLS on Cisco Unified CME as VPN Headend

Before you begin, make sure you have configured the basic SSL VPN configuration on Cisco Unified CME (see [Basic Configuration on Cisco Unified CME, on page 1000](#)).

To configure the SSL VPN client with DTLS on SCCP IP phones, follow these steps in the order in which they are presented here:

- [Set Up the Clock, Hostname, and Domain Name, on page 1018](#)
- [Configure Trustpoint and Enroll with the Certificates, on page 1019](#)
- [Configure VPN Gateway, on page 1020](#)
- [Configure User Database, on page 1020](#)
- [Configure Virtual Context, on page 1021](#)
- [Configure Group Policy, on page 1021](#)
- [Verify the IOS SSL VPN Connection, on page 1021](#)
- [Configure Cisco Unified SCCP IP Phones for SSL VPN, on page 1022](#)
- [Configuration on Cisco Unified SCCP IP Phone, on page 1023](#)
- [Configure SSL VPN on Cisco Unified CME, on page 1023](#)

**Note** Depending upon the type of authentication you choose to configure, configuration steps 3 to step 11 may vary a little from the way they are documented in this section.

---

### Set Up the Clock, Hostname, and Domain Name

The clock, hostname, and domain name must be set up.

#### Procedure

---

- Step 1** The following example shows the hostname and domain name configured:

**Example:**

```
hostname Router2811
ip domain name cisco.com

Interfaces on the Router_2811:

interface FastEthernet0/0
ip address 1.5.37.13 255.255.0.0
duplex auto
speed auto

interface FastEthernet0/1
ip address 30.0.0.1 255.255.255.0
duplex auto
speed auto
```

## Step 2 Show clock on IOS:

### Example:

```
Router# show clock
*10:07:57.109 pacific Thu Oct 7 2010
```

#### a) Set clock directly:

##### Example:

```
Router# clock set 9:53:0 Oct 7 2010

Set time zone (Pacific Standard Time)
Router# configure terminal
Router(config)# clock timezone pst -8

(optional)
Set summer-time
Router# configure terminal
```

```
Router(config)# clock summer-time pst recurring
```

OR

```
Router(config)# clock summer-time pst date apr 11 2010 12:00 nov 11 2010 12:00
```

#### b) Set clock using NTP:

##### Example:

```
Router(config)# ntp server 192.18.2.1
Router(config)# ntp master 2
```

## Configure Trustpoint and Enroll with the Certificates

To configure a trustpoint and enroll with the certificate server, see [Configure Cisco Unified CME as CA Server, on page 1005](#). You can also use the default self-signed certificate generated by the webvpn. This default **trustpoint** is generated when the webvpn gateway **gateway name** command is entered for the first time.

**Note** The DTLS in IOS SSL VPN uses the child certificate during SSL authentication, therefore, you must select the “leaf” option when configuring the “vpn-trustpoint”.

## Configure VPN Gateway

The WebVPN gateway uses a default trustpoint name of SSL VPN.

When entering “webvpn gateway <name>”, a self-signed certificate is generated. The IP address must be a public IP address configured on an interface or loopback interface on the WebVPN gateway. The following example shows a public IP address configured on the WebVPN gateway:

```
Router(config)# webvpn gateway sslvpn_gw
Router(config-webvpn-gateway)# ip address 1.5.37.13 port 443
Router(config-webvpn-gateway)# ssl encryption 3des-sha1 aes-sha1
Router(config-webvpn-gateway)# ssl trustpoint cme_cert
Router(config-webvpn-gateway)# inservice
```

**Note** We recommend using Cisco Unified CME generated trustpoint rather than webvpn self generated trustpoint.

## Configure User Database

User database can be either locally configured on CME, or remotely from Radius server.

### Procedure

**Step 1** Configure the local database:

#### Example:

```
Router(config)# aaa new-model
username anyone password 0 cisco
aaa authentication login default local
```

**Step 2** Configure a remote AAA Radius server for authentication:

#### Example:

```
Router(config)# aaa new-model
aaa authentication login default group radius
radius-server host 172.19.159.150 auth-port 1923 acct-port 1924
radius-server key cisco
```

For more information, see <https://www.cisco.com/c/en/us/support/security/adaptive-security-appliance-asa-software/products-installation-and-configuration-guides-list.html>.

## Configure Virtual Context

Users can get access to the virtual context by specifying the “domain name” in the URL when accessing the WebVPN gateway such as: <https://1.5.37.13/SSLVPNphone>. The following example shows a virtual VPN context configured:

```
Router(config)# webvpn context sslvpn_context
ssl encryption 3des-sha1 aes-sha1
ssl authenticate verify all
gateway sslvpn_gw domain SSLVPNphone
inservice
```

When **inservice** was entered, the system prompted: **000304: Jan 7 00:30:01.206: %LINEPROTO-5-UPDOWN: Line protocol on Interface Virtual-Access1, changed state to up**

## Configure Group Policy

Because the SSL VPN client on phone operates in full-tunnel mode, WebVPN gateway supplies an IP address to each of the clients logged in to the gateway. Configure the following:

```
Router(config)# ip local pool SSLVPNphone_pool 30.0.0.50 30.0.0.70
Router(config)# webvpn context SSLVPNphone
Router(config-webvpn-context)# policy group SSLVPNphone
Router(config-webvpn-group)# functions svc-enabled
Router(config-webvpn-group)# hide-url-bar
Router(config-webvpn-group)# svc address-pool "SSLVPNphone_pool" netmask 255.255.255.0
Router(config-webvpn-group)# svc default-domain "cisco.com"
Router(config-webvpn-group)# exit
Router(config-webvpn-context)# default-group-policy SSLVPNphone
Router(config-webvpn-context)# no aaa authentication domain local
Router(config-webvpn-context)# gateway sslvpn_gw domain SSLVPNphone
```

If using only username and password authentication, configure:

```
Router(config-webvpn-context)# no authentication certificate
```

If using certificate-based authentication, configure:

```
Router(config-webvpn-context)# authentication certificate
Router(config-webvpn-context)# ca trustpoint cme_cert
Router(config-webvpn-context)# inservice
```

## Verify the IOS SSL VPN Connection

On your PC's browser (MS Internet Explorer), connect to <https://1.5.37.13/SSLVPN> phone and accept the certificate. To login, enter username and password, anyone and cisco. You should be able to see the home page of the IOS SSL VPN.

## Procedure

### Step 1 IOS WEBVPN DEBUG:

#### Example:

```
debug ssl openssl errors
debug ssl openssl msg
debug ssl openssl states

debug webvpn sdps
debug webvpn aaa (login authentication)

debug webvpn http verbose (for authentication)
debug webvpn webservice verbose
debug webvpn tunnel

debug crypto pki transactions
debug crypto pki validations
debug crypto pki messages
```

From PC browser, connect to IOS (on the 1.5.37.x network) through <https://1.5.37.13/SSLVPN> phone. The default banner pops up. Enter username and password.

### Step 2 Provide the default IP route. For example:

#### Example:

```
Router (c3745): ip route 30.0.0.0 255.255.255.0 FastEthernet0/
Router (c3745): ip route 10.0.0.0 255.255.255.0 1.5.37.11
```

(Must force this limited route or else it will fail).

## Configure Cisco Unified SCCP IP Phones for SSL VPN

## Procedure

**Step 1** Phone loads are available for download at [Cisco Unified Communications Manager Express Introduction](#).

**Step 2** Choose **Compatibility Information**.

**Step 3** Choose appropriate phone load version for your phone.

A generic software download is also available at [Product/Technology Support](#).

**Step 4** Choose **Voice and Unified Communications > IP Telephony > IP Phones**.

#### Note

We recommend downloading phone load version 8.4 before upgrading phone load version 8.3 to phone load version 9.0. Upgrading phone load to 9.0 without upgrading the phone load version to 8.4 will not work.

**Step 5** After a hard reset (press # while power up), the *term65.default.loads* can be used to load the rest of the images.

---

## Configuration on Cisco Unified SCCP IP Phone

### Procedure

---

- Step 1** Go to **Settings > Security configuration (4) > VPN Configuration (8)**.
- Step 2** Check the IP address of the VPN concentrator. It should point to the VPN headend.
- Step 3** Verify Alt-TFTP (under **Settings > Network Configuration > IPv4 Configuration**). Set the Alternate TFTP option to “Yes” to manually enter the TFTP server address. The associated IP address is the IP address of Cisco Unified CME.
- Step 4** Set the VPN setting to **enable**. The user interface shows, “Attempting VPN Connection...”.
- Step 5** Verify that the VPN connection is established. Go to **Settings > Network Configuration**. The “VPN” label shows “connected”.

### Note

If you are using phones in secure mode, remember to add the **capf-ip-in-cn** command under ephone configuration mode.

---

## Configure SSL VPN on Cisco Unified CME

To configure SSL VPN on Cisco Unified CME, see [Configure VPN Group and Profile on Cisco Unified CME, on page 1012](#).

Example:

```
voice service voip
 vpn-group 1
 vpn-gateway 1 https://1.5.37.13/SSLVPNphone
 vpn-trustpoint 1 trustpoint R2811_cert leaf
 vpn-profile 1
 host-id-check disable

crypto pki server R2811_root
 database level complete
 grant auto
 lifetime certificate 7305
 lifetime ca-certificate 7305
crypto pki token default removal timeout 0
!
crypto pki trustpoint R2811_root
 enrollment url http://30.0.0.1:80
 revocation-check none
 rsa-keypair R2811_root
!
crypto pki trustpoint R2811_cert
 enrollment url http://30.0.0.1:80
 serial-number
 revocation-check none
```

```

telephony-service
 cnf-file perphone

ephone 2
 device-security-mode none
 mac-address 001E.7AC4.DD25
 type 7965
 vpn-group 1
 vpn-profile 1
 button 1:5

telephony-service
 create cnf-files

ephone 2
 reset

```

## VPN Phone Redundancy Support for Cisco Unified CME with DTLS

VPN phone supports redundancy with IOS and Cisco Unified CME in two ways:

1. Using two or more vpn-gateway configurations in the same vpn-group.
2. Using Cisco Unified CME redundancy configuration and one or more vpn-gateway configurations. This requires the DTLS and SSL VPN headend IP to stay up, if only one vpn-gateway is used.

Cisco Unified CME redundancy works when you import a trustpoint from primary CME to secondary CME. For more information on redundant Cisco Unified CME, see [Redundant Cisco Unified CME Router for SCCP Phones, on page 165](#).

You need to generate a trustpoint with exportable keys and use that as sast1.

## Configuration Examples for SSL VPN Client

### Example for Configuring SSL VPN with ASA as VPN Headend

The following example shows how to configure CME using ASA as VPN Headend:

```

Router# show running config
!
!
!
crypto pki server cme_root
 database level complete
 no database archive
 grant auto
 lifetime certificate 7305
 lifetime ca-certificate 7305
!
crypto pki trustpoint cme_root
 enrollment url http://10.201.160.201:80
 revocation-check none
 rsakeypair cme_root
!
crypto pki trustpoint cme_cert
 enrollment url http://10.201.160.201:80

```

```

 revocation-check none
 !
 !
 !
 !
voice service voip
vpn-group 1
 vpn-gateway 1 https://10.201.174.36/SSLVPNphone
 vpn-trustpoint 1 trustpoint cme_cert root
 vpn-hash-algorithm sha-1
vpn-profile 1
 host-id-check disable
 sip
 !
 !
 !
ip http server
no ip http secure-server
!
telephony-service

 type 7965
 vpn-group 1
 vpn-profile 1
 button 1:1
 !
end

```

## Example for Configuring SSL VPN with DTLS on CME as VPN Headend

The following example shows how to configure CME using DTLS on CME as VPN Headend:

```

!
ip domain-name cisco.com
!
aaa new-model
!
!
aaa authentication login default local
!
!
!
crypto pki server cme_root
 database level complete
 no database archive

```

## Example for Configuring SSL VPN with DTLS on CME as VPN Headend

```

grant auto
lifetime certificate 7305
lifetime ca-certificate 7305
!

!
end

```

The following example shows the vpn configuration:

```

Router #show voice vpn
The Voice Service VPN Group 1 setting:
VPN Gateway 1 URL https://9.10.60.254/SSLVPNphone
VPN Trustpoint hash in sha-1
VPN Trustpoint 1 trustpoint cme_cert root fbUqFibtWtaYSGSlTP/UmsHcgYk= The Voice Service
VPN Profile 1 setting:
The host_id_check setting: 0

```

## Feature Information for SSL VPN Client

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

**Table 90: Feature Information for SSL VPN Client**

| Feature Name                             | Cisco Unified CME Versions | Feature Information                                |
|------------------------------------------|----------------------------|----------------------------------------------------|
| Support on Cisco Unified CME with DTLS   | 8.6                        | Introduced support on Cisco Unified CME with DTLS. |
| SSL VPN Client Support on SCCP IP Phones | 8.5                        | Introduced the SSL VPN Client Support feature.     |

## CHAPTER 38

# Automatic Line Selection

This chapter describes automatic line selection feature in Cisco Unified Communications Manager Express (Cisco Unified CME).

**Note** This feature is applicable for SCCP phones only. For newer SIP phones (Cisco Unified IP Phone 7800, 8800 series) with new user interface, this feature is not applicable. The user selects the line and the focus would be on that selected line. Both incoming and outgoing calls changes the focus based on the line selected or line answered.

- [Information About Automatic Line Selection, on page 1029](#)
- [Configure Automatic Line Selection, on page 1030](#)
- [Configuration Examples for Automatic Line Selection, on page 1032](#)
- [Feature Information for Automatic Line Selection, on page 1033](#)

## Information About Automatic Line Selection

### Automatic Line Selection for Incoming and Outgoing Calls

On multiline IP phones, lifting the handset automatically selects the first ringing line on the phone or, if no line is ringing, selects the first available idle line for outgoing calls. This is the default behavior for all multiline IP phones.

Under some circumstances, however, you might want to require that a line button be explicitly pressed to select an outgoing line or to answer an incoming call. In Cisco CME 3.0 and later, you have the flexibility to assign the type of line selection that each IP phone uses.

The Automatic Line Selection feature allows you to specify, on a per-phone basis, the line that is selected when you pick up a phone handset.

Any of the following behaviors can be assigned on a per-phone basis:

- Automatic line selection—Picking up the handset answers the first ringing line or, if no line is ringing, selects the first idle line. Use the **auto-line** command with no keyword or argument. This is the default.

- Manual line selection (no automatic line selection)—Pressing the Answer soft key answers the first ringing line, and pressing a line button selects a line for an outgoing call. Picking up the handset does not answer calls or provide dial tone. Use the **no auto-line** command.
- Automatic line selection for incoming calls only—Picking up the handset answers the first ringing line, but if no line is ringing, it does not select an idle line for an outgoing call. Pressing a line button selects a line for an outgoing call. Use the **auto-line incoming** command.
- Automatic line selection for outgoing calls only—Picking up the handset for an outgoing call selects the line associated with the *button-number* argument. If a button number is specified and the line associated with that button is unavailable (because it is a shared line in use on another phone), no dial tone is heard when the handset is lifted. You must press an available line button to make an outgoing call. Incoming calls must be answered by pressing the Answer soft key or pressing a ringing line button. Use the **auto-line** command with the *button-number* argument.
- Automatic line selection for incoming and outgoing calls—Pressing the Answer soft key or picking up the handset answers an incoming call on the line associated with the specified button. Picking up the handset for outgoing calls selects the line associated with the specified button. Use the **auto-line** command with the *button-number* argument and **answer-incoming** keyword.

# Configure Automatic Line Selection

## Enable Automatic Line Selection

To enable automatic line selection for answering incoming calls or making outgoing calls, perform the following steps:

### Restriction

Automatic line selection is bypassed if it is configured for a trunk directory number and the line is seized by pressing the Park or Callfwd soft keys. The first available directory number is seized.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone *phone-tag***
4. **auto-line [*button-number* [**answer-incoming**] | **incoming**]**
5. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action | Purpose                                                                              |
|--------|-------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>     | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b>   | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|        | Command or Action                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|----------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | Router> enable                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 3 | <b>ephone phone-tag</b><br><b>Example:</b><br>Router(config)# ephone 24                                                                | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number for the phone on which you want to configure automatic line selection.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 4 | <b>auto-line [button-number [answer-incoming]   incoming]</b><br><b>Example:</b><br>Router(config-ephone)# auto-line 5 answer-incoming | Assigns a type of line selection behavior to this phone. <ul style="list-style-type: none"> <li>• <b>auto-line</b>—Picking up the handset answers the first ringing line or, if no line is ringing, selects the first idle line. This is the default.</li> <li>• <b>auto-line button-number</b>—Picking up the handset for an outgoing call selects the line associated with the specified button. The default if this argument is not used is the topmost available line.</li> <li>• <b>auto-line button-number answer-incoming</b>—Picking up the handset answers the incoming call on the line associated with the specified button.</li> <li>• <b>auto-line incoming</b>—Picking up the handset answers the first ringing line but, if no line is ringing, does not select an idle line for an outgoing call. Pressing a line button selects a line for an outgoing call.</li> <li>• <b>no auto-line</b>—Disables automatic line selection. Pressing the Answer soft key answers the first ringing line, and pressing a line button selects a line for an outgoing call. Picking up the handset does not answer calls or provide dial tone.</li> </ul> |
| Step 5 | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Verify Automatic Line Selection

### Procedure

- Step 1** Use the **show running-config** command to verify your configuration. Automatic line selection is listed in the ephone portion of the output.

**Example:**

```
Router# show running-config
```

```
ephone 2
headset auto-answer line 1
headset auto-answer line 4
ephone-template 1
mac-address 011F.9010.1790
paging-dn 48
type 7960
no dnd feature-ring
no auto-line
```

**Step 2** Use the **show telephony-service ephone** command to display only ephone configuration information.

**Example:**

```
Router# show telephony-service ephone
```

```
ephone 4
device-security-mode none
username "Accounting"
mac-address FF0E.4857.5E91
button 1c34,35
no auto-line
```

## Configuration Examples for Automatic Line Selection

### Example for Automatic Line Selection

The following example assigns no automatic line selection to phones 1 and 2 and assigns automatic line selection for incoming calls only to phone 3:

```
ephone 1
mac-address 00e0.8646.9242
button 1:1 2:4 3:16
no auto-line
!
ephone 2
mac-address 01c0.4612.7142
button 1:5 2:4 3:16
no auto-line
!
ephone 3
mac-address 10b8.8945.3251
button 1:6 2:4 3:16
auto-line incoming
```

The following example enables automatic selection of line button 1 when the handset is lifted to answer incoming calls or to make outgoing calls.

```
ephone 1
mac-address 0001.0002.0003
```

```
type 7960
auto-line 1 answer-incoming
button 1:1 2:2 3:3
```

## Feature Information for Automatic Line Selection

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

**Table 91: Feature Information for Automatic Line Selection**

| Feature Name             | Cisco Unified CME Version | Feature Information                                                           |
|--------------------------|---------------------------|-------------------------------------------------------------------------------|
| Automatic Line Selection | 4.0                       | The <b>answer-incoming</b> keyword was added to the <b>auto-line</b> command. |
|                          | 3.1                       | The <i>button-number</i> argument was added to the <b>auto-line</b> command.  |
|                          | 3.0                       | Automatic line selection was introduced.                                      |

## CHAPTER 39

# Barge and Privacy

- [Information About Barge and Privacy, on page 1035](#)
- [Configure Barge and Privacy, on page 1038](#)
- [Feature Information for Barge and Privacy, on page 1048](#)

## Information About Barge and Privacy

### Barge and cBarge

The Barge feature enables phone users who share a directory number to join an active call on the shared line by pressing a softkey. When the initiator barges into a call, a conference is created between the barge initiator, the target party, and the other party connected in the call. Parties see the call information on their phones and, if the conference join tone is configured, hear a tone.

If a phone that is using the shared line has Privacy enabled, call information does not appear on the other phones that share the line and the call cannot be barged. Connected parties hear the barge tone (single beep) after the conference is set up. When a party leaves the conference, a barge leave tone is played to the remaining parties.

From Cisco Unified CME Release 11.7 onwards, cBarge feature is supported on Cisco 4000 Series Integrated Services Router.

From Cisco Unified CME Release 12.0 onwards, cBarge feature is supported with mixed shared line.

#### Note

- Cisco Unified IP Phone 69xx series do not support cBarge with Unified CME.
- Barge and Cbarge softkeys on SIP Phones are supported only on shared lines.

### Barge (SIP)

Barge uses the built-in conference bridge on the target phone (the phone that is being barged) which limits the number of users allowed to barge. A barge conference supports up to three parties. If more users want to join a call on a SIP shared line, cBarge must be used. The SIP phone requires the built-in conference bridge to use Barge. Barge is supported for SIP shared-line directory numbers only.

**Note** If a phone user barges into a barge conference, the conference is converted to a cBarge conference.

## cBarge (SCCP and SIP)

The cBarge feature uses a shared conference resource which allows more than one person to barge into the call. A cBarge conference supports the maximum number of parties provisioned on the centralized conference resource. The centralized conference resource must be provisioned to use cBarge. cBarge is supported on SCCP shared octo-line directory numbers and SIP shared-line directory numbers.

When any party releases from the call, the call remains a conference call if at least three participants remain on the line. If only two parties remain in the conference, they are reconnected as a point-to-point call, which releases the conference bridge resources. When the target party parks the call or joins the call with another call, the barge initiator and the other parties remain connected.

[Table 92: Barge and cBarge Call Differences between Built-In and Shared Conference Bridge, on page 1036](#) describes the differences between Barge using a built-in conference bridge and cBarge using a shared conference bridge.

**Table 92: Barge and cBarge Call Differences between Built-In and Shared Conference Bridge**

| Action                                              | Barge—Built-In Conference Bridge at Target Device                                        | cBarge—Shared Conference Bridge                                                                                                                          |
|-----------------------------------------------------|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Media break occurs during barge setup               | No                                                                                       | Yes                                                                                                                                                      |
| User receives a Barge tone, if configured           | Yes                                                                                      | Yes                                                                                                                                                      |
| Displays name at barge initiator phone              | To Barge                                                                                 | To Barge                                                                                                                                                 |
| Displays name at target phone                       | To/From Other                                                                            | To Barge                                                                                                                                                 |
| Displays name at other phones                       | To/From Target                                                                           | To Barge                                                                                                                                                 |
| Allows second barge setup to an already barged call | Yes                                                                                      | Yes                                                                                                                                                      |
| Maximum number of parties                           | 3                                                                                        | Maximum allowed by the shared conference resource.                                                                                                       |
| Initiator releases call                             | No media interruption occurs for the two original parties.                               | Media break occurs to release the shared conference bridge when only two parties remain and to reconnect the remaining parties as a point-to-point call. |
| Target releases call                                | Media break occurs to reconnect initiator with the other party as a point-to-point call. | Media break occurs to release the shared conference bridge when only two parties remain and to reconnect the remaining parties as a point-to-point call. |

| Action                                                                    | Barge—Built-In Conference Bridge at Target Device | cBarge—Shared Conference Bridge                                                                                                                          |
|---------------------------------------------------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Other party releases call                                                 | All three parties are released.                   | Media break occurs to release the shared conference bridge when only two parties remain and to reconnect the remaining parties as a point-to-point call. |
| Target puts call on hold and performs Transfer, Conference, or Call Park. | Initiator is released.                            | Initiator and the other party remain connected.                                                                                                          |

If no conference bridge is available, either built-in at the target device for barge or shared for cBarge, or the maximum number of participants is reached, Cisco Unified CME rejects the barge request and an error message displays on the initiating phone.

The barge and cBarge soft keys display by default when a phone user presses the shared-line button for an active remote-in-use call. The user selects either barge or cBarge to join the shared-line call. When there are multiple active calls on the shared line, the barge initiator can select which call to join by highlighting the call.

You can customize the soft key display with a soft key template. For configuration information, see [Configure the cBarge Soft Key on SCCP Phones, on page 1038](#) or [Enable Barge and cBarge Soft Keys on SIP Phones, on page 1040](#).

---

**Restriction** cBarge operation on an existing ad-hoc or meet-me conference is not supported.

---

## Privacy and Privacy on Hold

The privacy feature enables phone users to block other users who share a directory number from seeing call information, resuming a call, or barging into a call on the shared line. When a phone receives an incoming call on a shared line, the user can make the call private by pressing the Privacy feature button, which toggles between on and off to allow the user to alter the privacy setting on their phone. The privacy state is applied to all new calls and current calls owned by the phone user.

Privacy is supported on SCCP octo-line directory numbers and SIP shared-line directory numbers.

Privacy is enabled for all phones in the system by default. You can disable privacy globally and enable it only for specific phones, either individually or through a phone template. You can also enable the privacy button on specific phones. After a phone with the privacy button enabled registers with Cisco Unified CME, the line feature button on the phone gets labeled “Privacy,” a status icon displays, and if the button has a monitor lamp, it lights when privacy is active. For Extension Mobility phones, you can enable the privacy button in the user profile and logout profile.

The Privacy on Hold feature prevents other phone users from viewing call information or retrieving a call put on hold by another phone sharing the directory number. Privacy on Hold is disabled for all phones in the system by default. You can enable Privacy on Hold globally for all phones. To disable Privacy on Hold on individual phones, you must disable Privacy on those phones.

The Privacy feature applies to all shared lines on a phone. If a phone has multiple shared lines and Privacy is enabled, other phones cannot view or barge into calls on any of the shared lines.

For SCCP configuration information, see [Enable Privacy and Privacy on Hold on SCCP Phones, on page 1042](#).

For SIP configuration information, see [Enable Privacy and Privacy on Hold on SIP Phones, on page 1045](#).

# Configure Barge and Privacy

## Configure the cBarge Soft Key on SCCP Phones

To enable a phone user to join a call on an octo-line directory number by pressing the cBarge soft key, perform the following steps. The cBarge soft key is enabled by default. This task is required only if you want to change the order of the soft key display during the remote-in-use call state.

### Restriction

- Supported only on octo-line directory numbers.
- Not supported for meet-me conferences.
- Not supported if phone user is already connected to the same ad hoc conference on the octo-line.

### Before you begin

- Cisco Unified CME 7.0 or a later version.
- Octo-line directory number is configured. See [Create Directory Numbers for SCCP Phones, on page 264](#).
- Privacy is disabled on the phone. See [Privacy and Privacy on Hold, on page 1037](#).
- Ad hoc hardware conference resource is configured and ready to use. See [Configure Hardware Conferencing, on page 1377](#).
- Join and leave tones for hardware conference can be configured as barge entrance and exit tones. See [Configure Join and Leave Tones, on page 1378](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. **softkeys remote-in-use** { [**CBarge**] [**Newcall**] }
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                | Purpose                                                                                                                                                                                                                           |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                                                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                       | Enters global configuration mode.                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# ephone-template 5                                               | Enters ephone-template configuration mode to create an ephone template.<br><ul style="list-style-type: none"> <li><i>template-tag</i>—Unique identifier for the ephone template that is being created. Range: 1 to 20.</li> </ul> |
| <b>Step 4</b> | <b>softkeys remote-in-use</b> { [CBarge] [Newcall] }<br><b>Example:</b><br>Router(config-ephone-template)# softkeys remote-in-use CBarge Newcall | Modifies the order and type of soft keys that display on an IP phone during the remote-in-use call state.                                                                                                                         |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-ephone-template)# exit                                                                           | Exits ephone-template configuration mode.                                                                                                                                                                                         |
| <b>Step 6</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br>Router(config)# ephone 12                                                                   | Enters ephone configuration mode.<br><ul style="list-style-type: none"> <li><i>phone-tag</i>—Unique number that identifies this ephone during configuration tasks.</li> </ul>                                                     |
| <b>Step 7</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-ephone)# ephone-template 5                                        | Applies the ephone template to the phone.<br><ul style="list-style-type: none"> <li><i>template-tag</i>—Unique identifier of the ephone template that you created in Step 3.</li> </ul>                                           |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                                                      | Exits to privileged EXEC mode.                                                                                                                                                                                                    |

## Examples

The following example shows that ephone template 5 modifies the soft keys displayed for the remote-in-use call state and it is applied to ephone 12:

```

ephone-template 5
 softkeys remote-in-use CBarge Newcall
 softkeys hold Resume Newcall Join
 softkeys connected TrnsfVM Park Acct ConfList Confm Endcall Trnsfer Hold
 max-calls-per-button 3
 busy-trigger-per-button 2
!
!
ephone 12
 no phone-ui speeddial-fastdial
 ephone-template 5
 mac-address 000F.9054.31BD
 type 7960
 button 1:10 2:7

```

## Enable Barge and cBarge Soft Keys on SIP Phones

A phone user can join a call on a shared line by pressing the Barge or cBarge soft keys. The Barge and cBarge soft keys are enabled by default on supported SIP phones. Perform the following steps only if you want to change the order or appearance of soft keys displayed during the remote-in-use call state.

### Restriction

- Supported only on shared lines.

For Unified CME to support Barge functionality on Cisco IP Phone 7800 Series, you need to configure the CLI command **service phone LineKeyBarge 2** under **telephony-service** configuration mode.

```

telephony-service
 service phone LineKeyBarge 2

```

The CLI command **service phone LineKeyBarge 2** activates the Line keys on the Cisco IP Phone 7800 Series so that it displays the "remote-in-use" state softkeys correctly. When the command is not configured, the phones will not display the remote-in-use state softkeys. To update the phone configuration with the LineKeyBarge option, you need to execute the CLI command **create profile** under **voice register global** configuration mode.

### Note

If the remote-in-use state softkey configuration has both Barge and cBarge configured, then cBarge is taken as the preferential feature. The phones will ignore the Barge configuration.

### Before you begin

- Cisco Unified CME 7.1 or a later version.
- Shared directory number is configured. See [Create Directory Numbers for SIP Phones, on page 275](#).
- Ad hoc hardware conference resource is configured and ready to use. See [Configure Hardware Conferencing, on page 1377](#).
- Join and leave tones for hardware conference can be configured as barge entrance and exit tones. See [Configure Join and Leave Tones, on page 1378](#) in the *Cisco Unified CME System Administrator Guide*.

- For Barge and cBarge to work, privacy needs to be disabled under voice register global using the command **no privacy**. For configuring Privacy, See [Enable Privacy and Privacy on Hold on SIP Phones, on page 1045](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register template** *template-tag*
4. **softkeys remote-in-use** { [**Barge**] [**Newcall**] [**cBarge**] }
5. **exit**
6. **voice register pool** *phone-tag*
7. **template** *template-tag*
8. **end**

|           | Command or Action                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                    |
| Step 1    | <b>enable</b><br><b>Example:</b><br>Router# enable                                                                                                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                      |
| Step 2    | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                          |
| Step 3    | <b>voice register template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# voice register template 5                                                                | Enters voice register template configuration mode to create a voice register template.<br><ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier for the voice register template that is being created. Range: 1 to 10.</li> </ul> |
| Step 4    | <b>softkeys remote-in-use</b> { [ <b>Barge</b> ] [ <b>Newcall</b> ] [ <b>cBarge</b> ] }<br><b>Example:</b><br>Router(config-register-temp)# softkeys remote-in-use cBarge Newcall | Modifies the order and type of soft keys that display on a SIP phone during the remote-in-use call state.                                                                                                                                                  |
| Step 5    | <b>exit</b><br><b>Example:</b><br>Router(config-register-temp)# exit                                                                                                              | Exits voice register template configuration mode.                                                                                                                                                                                                          |
| Step 6    | <b>voice register pool</b> <i>phone-tag</i><br><b>Example:</b><br>Router(config)# voice register pool 12                                                                          | Enters voice register pool configuration mode.<br><ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number that identifies this voice register pool during configuration tasks.</li> </ul>                                                  |

|               | Command or Action                                                                                         | Purpose                                                                                                                                                                              |
|---------------|-----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b> | <b>template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-register-pool)# <b>template</b> 5 | Applies the voice register template to the phone. <ul style="list-style-type: none"> <li><i>template-tag</i>—Unique identifier of the template that you created in Step 3</li> </ul> |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-pool)# <b>end</b>                                 | Returns to privileged EXEC mode.                                                                                                                                                     |

### Examples

The following example shows that voice register template 5 modifies the soft keys displayed for the remote-in-use call state and it is applied to phone 120:

```
voice register template 5
 softkeys hold Resume Newcall
 softkeys connected Transfer Park Hold
 softkeys remote-in-use cBarge Barge
!
voice register pool 120
 id mac 0030.94C2.A22A
 type 7962
 number 1 dn 20
 template 5
```

## Enable Privacy and Privacy on Hold on SCCP Phones

To enable Privacy and Privacy on Hold on SCCP phones, perform the following steps.

- If all phones require access to privacy, leave the system-level **privacy** (telephony-service) command set to enabled (default value) and leave the phone-level **privacy** (ephone) command set to the default (use system value).
- If only specific phones require access to privacy, disable privacy at the system-level by using the **no privacy** command in telephony-service configuration mode and enable privacy at the phone-level by using the **privacy on** command in ephone or ephone-template configuration mode.
- Enable Privacy on Hold at the system-level. To disable Privacy on Hold on individual phones, you must disable Privacy on those phones.

#### Restriction

- Privacy and Privacy on Hold are supported for calls on shared octo-line directory numbers only.
- Privacy and Privacy on Hold are not supported on the Cisco Unified IP Phone 7935, 7936, 7937, or 7985, Nokia E61, analog phones connected to the Cisco VG224 or Cisco ATA, or any phone without a display.

**Before you begin**

- Cisco Unified CME 7.0 or a later version.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **privacy**
5. **privacy-on-hold**
6. **exit**
7. **ephone** *phone-tag*
8. **privacy** [**off** | **on**]
9. **privacy-button**
10. **end**

**DETAILED STEPS****Procedure**

|---------------|----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                                            |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                   |
| <b>Step 4</b> | <b>privacy</b><br><b>Example:</b><br>Router(config-telephony)# privacy           | (Optional) Enables privacy at the system-level for all phones.<br><ul style="list-style-type: none"><li>• This command is enabled by default.</li><li>• To enable privacy for individual phones only, disable privacy at the system-level with the <b>no privacy</b> command and enable it for individual phones as shown in Step 8.</li></ul> |
| <b>Step 5</b> | <b>privacy-on-hold</b><br><b>Example:</b>                                        | (Optional) Enables privacy on hold at the system-level for all phones.                                                                                                                                                                                                                                                                         |

|                | Command or Action                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <code>Router(config-telephony)# privacy-on-hold</code>                                         | <ul style="list-style-type: none"> <li>Blocks phone users on shared lines from viewing call information or retrieving calls on hold. Default is disabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 6</b>  | <b>exit</b><br><b>Example:</b><br><code>Router(config-telephony)# exit</code>                  | Exits telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 7</b>  | <b>ephone phone-tag</b><br><b>Example:</b><br><code>Router(config)# ephone 10</code>           | Enters ephone configuration mode. <ul style="list-style-type: none"> <li><i>phone-tag</i>—Unique number that identifies this ephone during configuration tasks.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 8</b>  | <b>privacy [off   on]</b><br><b>Example:</b><br><code>Router(config-ephone)# privacy on</code> | (Optional) Modifies privacy support on the specific phone. <ul style="list-style-type: none"> <li><b>off</b>—Disables privacy on the phone.</li> <li><b>on</b>—Enables privacy on the phone.</li> <li>System-level privacy setting is the default. Use this command only if you want to modify the system-level setting in Step 4 for a specific phone.</li> <li>Using the <b>no</b> form of this command to reset to the system-level value.</li> <li>This command can also be configured in ephone-template configuration mode and applied to one or more phones. The ephone configuration has priority over the ephone-template configuration.</li> </ul> |
| <b>Step 9</b>  | <b>privacy-button</b><br><b>Example:</b><br><code>Router(config-ephone)# privacy-button</code> | Enables the privacy feature button on the IP phone. <ul style="list-style-type: none"> <li>Enable this command only on phones that share an octo-line directory number.</li> <li>This command can also be configured in ephone-template configuration mode and applied to one or more phones. The ephone configuration has priority over the ephone-template configuration.</li> </ul>                                                                                                                                                                                                                                                                       |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-ephone)# end</code>                       | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Example

The following example shows privacy disabled at the system-level and enabled on an individual phone. It also shows Privacy on Hold enabled at the system-level.

```

telephony-service
 no privacy
 privacy-on-hold
 max-ephones 100
 max-dn 240
 timeouts transfer-recall 60
 voicemail 8900
 max-conferences 8 gain -6
 transfer-system full-consult
 fac standard
!
!
ephone 10
 privacy on
 privacy-button
 max-calls-per-button 3
 busy-trigger-per-button 2
 mac-address 00E1.CB13.0395
 type 7960
 button 1:7 2:10

```

## Enable Privacy and Privacy on Hold on SIP Phones

To enable Privacy and Privacy on Hold on SIP phones, perform the following steps.

- To enable Privacy on all phones, leave the system-level **privacy** (voice register global) command set to enabled (default value) and leave the phone-level **privacy** (voice register pool) command set to the default (use system value).
- To enable Privacy on specific phones only, disable privacy at the system-level by using the **no privacy** command in voice register global configuration mode and enable privacy at the phone-level by using the **privacy on** command in voice register pool or voice register template configuration mode.
- To enable Privacy on Hold on all phones, enable it at the system-level with the **privacy-on-hold** command. To disable Privacy on Hold on specific phones, disable Privacy on those phones using the **privacy off** command in voice register pool or voice register template configuration mode. Privacy must be enabled to support Privacy on Hold.

### Restriction

- Privacy and Privacy on Hold are supported for calls on shared-line directory numbers only.
- Privacy and Privacy on Hold are not supported on the Cisco Unified IP Phone 7935, 7936, 7937, or 7985, Nokia E6, analog phones connected to the Cisco VG224 or Cisco ATA, or any phone without a display.

### Before you begin

- Cisco Unified CME 7.1 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **voice register global**
4. **privacy**
5. **privacy-on-hold**
6. **exit**
7. **voice register pool** *phone-tag*
8. **privacy** { **off** | **on** }
9. **privacy-button**
10. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                           | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                                            |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                   | Enters global configuration mode.                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>voice register global</b><br><b>Example:</b><br>Router(config)# voice register global     | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                   |
| <b>Step 4</b> | <b>privacy</b><br><b>Example:</b><br>Router(config-register-global)# privacy                 | (Optional) Enables privacy at the system-level for all phones.<br><ul style="list-style-type: none"><li>• This command is enabled by default.</li><li>• To enable privacy for individual phones only, disable privacy at the system-level with the <b>no privacy</b> command and enable it for individual phones as shown in Step 8.</li></ul> |
| <b>Step 5</b> | <b>privacy-on-hold</b><br><b>Example:</b><br>Router(config-register-global)# privacy-on-hold | (Optional) Enables privacy on hold at the system-level for all phones.<br><ul style="list-style-type: none"><li>• Blocks phone users on shared lines from viewing call information or retrieving calls on hold. Default is disabled.</li></ul>                                                                                                 |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Router(config-register-global)# exit                       | Exits voice register global configuration mode.                                                                                                                                                                                                                                                                                                |
| <b>Step 7</b> | <b>voice register pool</b> <i>phone-tag</i>                                                  | Enters voice register pool configuration mode.                                                                                                                                                                                                                                                                                                 |

|                | Command or Action                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

max-pool 150
voicemail 8900
!
!
voice register pool 130
id mac 001A.A11B.500E
type 7941
```

```
number 1 dn 30
privacy ON
privacy-button
```

# Feature Information for Barge and Privacy

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

**Table 93: Feature Information for Barge and Privacy**

| Feature Name | Cisco Unified CME Version | Modification                                                                              |
|--------------|---------------------------|-------------------------------------------------------------------------------------------|
| Barge        | 12.0                      | Added cBarge support for mixed shared line.                                               |
|              | 11.7                      | Added support for cBarge on Cisco 4000 Series Integrated Services Router for Unified CME. |
|              | 7.1                       | Added Barge and cBarge support for SIP shared-line directory numbers.                     |
|              | 7.0/4.3                   | Added cBarge support for SCCP shared octo-line directory numbers.                         |
| Privacy      | 7.1                       | Added support for Privacy on SIP shared-line directory numbers.                           |
|              | 7.0/4.3                   | Added support for Privacy on SCCP shared octo-line directory numbers.                     |

# Call Blocking

- [Information About Call Blocking, on page 1049](#)
- [Configure Call Blocking, on page 1052](#)
- [Configuration Examples for Call Blocking, on page 1064](#)
- [Where to Go Next, on page 1066](#)
- [Feature Information for Call Blocking, on page 1066](#)

## Information About Call Blocking

### Call Blocking Based on Date and Time (After-Hours Toll Bar)

Call blocking to prevent unauthorized use of phones is implemented by matching dialed numbers against a pattern of specified digits and matching the time against the time of day and day of week or date that has been specified for Call Blocking. You can specify up to 32 patterns of digits for blocking.

When a user attempts to place a call to digits that match a pattern that has been specified for Call Blocking during a time period that has been defined for Call Blocking, a fast busy signal is played for approximately 10 seconds. The call is then terminated and the line is placed back in on-hook status.

The Cisco Unified CME session application accesses the current after-hours configuration and applies it to calls originated by phones that are registered to the Cisco Unified CME router. Call blocking applies to all IP phones in Cisco Unified CME, although individual IP phones can be exempted from all call blocking.

In Cisco CME 3.4 and later versions, the same time-based call-blocking mechanism that is provided for SCCP phone and on analog phones connected to SCCP-controlled analog telephone adaptors (Cisco ATA) or SCCP-controlled foreign exchange station (FXS) ports is expanded to SIP endpoints.

In Cisco CME 3.4 and later, call-blocking configuration applies to all SCCP, H.323, SIP and POTS calls that go through the Cisco Unified CME router. All incoming calls to the router, except calls from an exempt phone, are also checked against the after-hours configuration.

Prior to Cisco Unified CME 4.2(1), all Call Blocking features are implemented globally and uniformly on each phone in the system. All phones are similarly restricted according to time, date, location, and other call blocking characteristics. Call Blocking is not supported on ephone-dns that are configured to use the trunk feature, and Call Blocking did not apply to second-stage trunk dialing.

In Cisco Unified CME 4.2(1) and later versions, you have the flexibility to set different call block calendars and call block patterns to phones in different departments, to block certain trunk dialing as required, and to configure Call Blocking on a particular SCCP IP phone by creating and applying a template to that phone.

For configuration information, see [Configure Call Blocking, on page 1052](#).

## After-Hours Pattern-Blocking Support for Regular Expressions

In Cisco Unified CME 9.5, support for afterhours pattern blocking is extended to regular expression patterns for dial plans on Cisco Unified SIP phones and Cisco Unified SCCP IP phones. With this support, users can add a combination of fixed dial plans and regular expression-based dial plans.

When a call is initiated after hours, the dialed number is matched against a combination of dial plans. If a match is found, the call is blocked.

To enable regular expression patterns to be included when configuring afterhours pattern blocking, the **after-hours block pattern** command is modified to include regular expressions as a value for the *pattern* argument in the following command syntax:

**after-hours block pattern** *pattern-tag pattern*

This command is available in the following configuration modes:

- telephony-service—For both SCCP and SIP Phones.
- ephone-template—For SCCP phones only.

---

**Note** The maximum length of a regular expression pattern is 32 for both Cisco Unified SIP and Cisco Unified SCCP IP phones.

---

If calls to the following numbers are to be blocked after hours:

- numbers beginning with '0' and '00'
- numbers beginning with 1800, followed by four digits
- numbers 9876512340 to 9876512345

then the following configurations can be used:

- after-hours block pattern 1 0\*
- after-hours block pattern 2 00\*
- after-hours block pattern 3 1800....
- after-hours block pattern 4 987651234[0-5]

---

**Note** There is no change in the number of afterhours patterns that can be added. The maximum number is still 100.

---

After-hours block pattern 0\* blocks all numbers, and 00\* blocks any number starting from 0. 0\* and 00\* must not be denoted as regular expressions.

For more configuration examples, see [Example for Configuring After-Hours Block Patterns of Regular Expressions, on page 1066](#) section.

For a summary of the basic Cisco IOS regular expression characters and their functions, see [Cisco Regular Expression Pattern Matching Characters](#) section of *Terminal Services Configuration Guide*.

## Call Blocking Override

The after-hours configuration applies globally to all dial peers in Cisco Unified CME. You can disable the feature on phones using one of three mechanisms:

- directory number—To configure an exception for an individual directory number.
- phone-level—To configure an exception for all directory numbers associated to a Cisco Unified IP phone regardless of any configuration for an individual directory number.
- dial peer—To configure an exception for a particular dial peer.

Individual phone users can be allowed to override call blocking associated with designated time periods by entering personal identification numbers (PINs) that have been assigned to their phones. For IP phones that support soft keys, such as the Cisco Unified IP Phone 7940G and the Cisco Unified IP Phone 7960G, the call-blocking override feature allows individual phone users to override the call blocking that has been defined for designated time periods. The system administrator must first assign a personal identification number (PIN) to any phone that will be allowed to override Call Blocking.

Logging in to a phone with a PIN only allows the user to override call blocking that is associated with particular time periods. Blocking patterns that are in effect 7 days a week, 24 hours a day, and they cannot be overridden by using a PIN.

When PINs are configured for call-blocking override, they are cleared at a specific time of day or after phones have been idle for a specific amount of time. The time of day and amount of time can be set by the system administrator, or the defaults can be accepted.

For configuration information, see [Configure Call Blocking, on page 1052](#).

## Class of Restriction

Class of restriction (COR) is the capability to deny certain call attempts based on the incoming and outgoing class of restrictions provisioned on the dial peers. COR specifies which incoming dial peer can use which outgoing dial peer to make a call. Each dial peer can be provisioned with an incoming and an outgoing COR list.

COR functionality provides flexibility in network design by allowing users to block calls (for example, calls to 900 numbers) and allowing different restrictions to call attempts from different originators.

For SIP phones, multiple COR lists can be applied under the voice register pool. A maximum of ten lists (five incoming and five outgoing) can be defined. The final COR list that is applied depends on the DN that the phone registers with the CME. This DN should match any one of the ranges defined in the COR list under the voice register pool.

For SIP Phones on Unified CME Release 12.1 and later versions, COR lists can be applied under voice register template configuration mode as well. If the COR list is configured under voice register pool and voice register template, the configuration under voice register pool takes precedence. If the COR list configuration under voice register pool is removed, the configuration under voice register template is applied.

# Configure Call Blocking

## Configure Call Blocking

To define blocking patterns and time periods during which calls to matching patterns are blocked for all SCCP and SIP endpoints in Cisco Unified CME, to define blocking patterns to be matched to block calls from PSTN lines, and to deactivate logins on SCCP phones at a specific time or for a specified time period, perform the following steps.

### Restriction

- Prior to Cisco CME 3.3, Call Blocking is not supported on analog phones connected to Cisco ATAs or FXS ports in H.323 mode.
- Prior to Cisco CME 3.4, Call Blocking is not supported on SIP IP phones connected directly in Cisco Unified CME.
- Prior to Cisco Unified CME 4.2(1), selective Call Blocking on IP phones and PSTN trunk lines is not supported.

### Before you begin

- Dial-peers are configured to provide PSTN access using router voice-ports or H.323/SIP trunk connections.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony service**
4. **after-hours block pattern** *pattern-tag pattern* [7-24]
5. **after-hours date** *month date start-time stop-time*
6. **after-hours day** *day start-time stop-time*
7. **after-hours pstn-prefix** *tag pattern*
8. **login** [*timeout* [*minutes*] ] [**clear** *time*]
9. **end**

|               |                                                                                                                                        | ephone-template configuration mode has priority over the value set in telephony-service mode .                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 7</b> | <b>after-hours pstn-prefix tag pattern</b><br><b>Example:</b><br><pre>Router(config-telephony)# after-hours pstn_prefix 1 9</pre>      | Defines the leading digits of the pattern to be skipped when pattern matching dialed digits on a trunk ephone-dn. <ul style="list-style-type: none"> <li>• <i>tag</i>: Unique number pattern for PSTN call blocking. Define up to 4 call-blocking patterns in separate commands. Range is 1-4.</li> <li>• <i>pattern</i>: identifies the unique leading digits, normally used to dial a trunk PSTN line, that are blocked by this configuration.</li> </ul> |
| <b>Step 8</b> | <b>login [timeout [minutes]] [clear time]</b><br><b>Example:</b><br><pre>Router(config-telephony)# login timeout 120 clear 23:00</pre> | Deactivates all user logins at a specific time or after a designated period of idle time on a phone. <ul style="list-style-type: none"> <li>• For SCCP phones only. Not supported on SIP endpoints in Cisco Unified CME.</li> <li>• <i>minutes</i>—(Optional) Range: 1 to 1440. Default: 60. Before Cisco Unified CME 4.1, the minimum value for this argument was 5 minutes.</li> </ul>                                                                    |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-telephony)# end</pre>                                                              | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configure Call Blocking Exemption for a Dial Peer

To allow H.323 and SIP trunk calls to utilize the voice gateway in spite of the the after-hours configuration in Cisco Unified CME, follow the steps in this section.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice tag { pots | voatm | vofr | voip }**
4. **paramspace callsetup after-hours-exempt true**
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action | Purpose                       |
|---------------|-------------------|-------------------------------|
| <b>Step 1</b> | <b>enable</b>     | Enables privileged EXEC mode. |

|               | Command or Action                                                                                                                                      | Purpose                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Router> enable                                                                                                                      | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                             | Enters global configuration mode.                                                                                     |
| <b>Step 3</b> | <b>dial-peer voice tag { pots   voatm   voifr   voip }</b><br><b>Example:</b><br>Router(config)# dial peer voice 501 voip                              | Defines a particular dial peer, specifies the method of voice encapsulation, and enters dial-peer configuration mode. |
| <b>Step 4</b> | <b>paramspace callsetup after-hours-exempt true</b><br><b>Example:</b><br>Router(config-dialpeer)# <b>paramspace callsetup after-hours-exempt true</b> | Exempts a dial peer from Call Blocking configuration.                                                                 |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-dialpeer)# end<br>or<br>Router(config-register-dn)# end                                                 | Exits configuration mode and enters privileged EXEC mode.                                                             |

## Configure Call Blocking Override for All SCCP Phones

To define the Call Blocking override code to be entered by a phone user to override all call-blocking rules, perform the following steps.

### Restriction

- Call Blocking override is supported only on phones that support softkey display.
- If the after-hours override code is the same as the night-service code, after hours Call Blocking is disabled.
- Both override codes defined in telephony-service and override codes defined in ephone-template are enabled on all phones.
- If a global telephony-service override code overlaps an ephone-template override code and contains more digits, an outgoing call is disabled wherever the telephony-service override code is used on phones with the ephone template applied. For example, if the telephony-service override code is 6241 and the ephone-template override code is 62, those phones with the ephone template applied will sound a fast busy tone if the 6241 override code is dialed.

### Before you begin

- Cisco Unified CME 4.2(1) or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **after-hours override-code *pattern***
5. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br><pre>Router(config)# telephony-service</pre>                                               | Enters telephony service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 4</b> | <b>after-hours override-code <i>pattern</i></b><br><b>Example:</b><br><pre>Router(config-telephony)# after-hours override-code 1234</pre> | Defines the pattern of digits (0-9) that overrides an after-hours call blocking configuration. <ul style="list-style-type: none"> <li>• <i>pattern</i>: identifies the unique set of digits that, when dialed after pressing the login soft key, can override the after-hours call blocking configuration.</li> <li>• This command can also be configured in ephone-template configuration mode. The value set in ephone-template configuration mode has priority over the value set in telephony-service mode.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-telephony)# end</pre>                                                                 | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Configure Call Blocking Exemption for an Individual SCCP Phone

To exempt all directory numbers associated with an individual SCCP phone from the Call Blocking configuration, follow the steps in this section.

**Restriction**

- Call Blocking override is supported only on phones that support softkey display.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **after-hour exempt**
5. **pin** *pin-number*
6. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                       | Purpose                                                                                                                                                                                                  |
|---------------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                      | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal              | Enters global configuration mode.                                                                                                                                                                        |
| <b>Step 3</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br>Router(config)# ephone 4           | Enters ephone configuration mode.<br><ul style="list-style-type: none"> <li>• <i>phone-tag</i>—The unique sequence number for the phone that is to be exempt from call blocking.</li> </ul>              |
| <b>Step 4</b> | <b>after-hour exempt</b><br><b>Example:</b><br>Router(config-ephone)# after-hour exempt | Specifies that this phone is exempt from call blocking. Phones exempted in this manner are not restricted from any call-blocking patterns and no authentication of the phone user is required.           |
| <b>Step 5</b> | <b>pin</b> <i>pin-number</i><br><b>Example:</b><br>Router(config-ephone)# pin 5555      | Declares a personal identification number (PIN) that is used to log into an ephone.<br><ul style="list-style-type: none"> <li>• <i>pin-number</i>—Number from four to eight digits in length.</li> </ul> |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                             | Returns to privileged EXEC mode.                                                                                                                                                                         |

# Configure Call Blocking Exemption for an Individual SIP Phone or Directory Number

To exempt all extensions associated with an individual SIP phone or an individual directory number from the Call Blocking configuration, follow the steps in this section.

## Restriction

- The Login toll-bar override is not supported on SIP IP phones; there is no pin to bypass blocking on IP phones that are connected to Cisco Unified CME and running SIP.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag* or **voice register dn** *dn-tag*
4. **after-hour exempt**
5. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                        | Enters global configuration mode.                                                                                                                                                                                       |
| <b>Step 3</b> | <b>voice register pool</b> <i>pool-tag</i> or <b>voice register dn</b> <i>dn-tag</i><br><br><b>Example:</b><br>Router(config)# voice register pool 1<br><br>or<br>Router(config)# voice register dn 1 | Enters voice register pool configuration mode to set parameters for specified SIP phone.<br><br>or<br>Enters voice register dn mode to define a directory number for a SIP phone, intercom line, voice port, or an MWI. |
| <b>Step 4</b> | <b>after-hour exempt</b><br><br><b>Example:</b><br>Router(config-register-pool)# after-hour exempt<br><br>or<br>Router(config-register-dn)# after-hour exempt                                         | Exempts all numbers on a SIP phone from call blocking.<br><br>or<br>Exempts an individual directory number from call blocking.                                                                                          |

|        | Command or Action                                                                                                       | Purpose                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Router(config-register-pool)# end<br><br>or<br><br>Router(config-register-dn)# end | Exits configuration mode and enters privileged EXEC mode. |

## Verify Call Blocking Configuration

### Procedure

- Step 1** Use the **show running-config** command to display an entire configuration, including call-blocking number patterns and time periods and the phones that are marked as exempt from call blocking.

**Example:**

```
telephony-service
 fxo hook-flash
 load 7960-7940 P00305000600
 load 7914 S00103020002
 max-ephones 100
 max-dn 500
 ip source-address 10.115.43.121 port 2000
 timeouts ringing 10
 voicemail 7189
 max-conferences 8 gain -6
 moh music-on-hold.au
 web admin system name sys3 password sys3
 dn-webedit
 time-webedit
 transfer-system full-consult
 transfer-pattern .T
 secondary-dialtone 9
 after-hours block pattern 1 91900 7-24
 after-hours block pattern 2 9976 7-24
 after-hours block pattern 3 9011 7-24
 after-hours block pattern 4 91...976.... 7-24
 !
 create cnf-files version-stamp 7960 Jul 13 2004 03:39:28
```

- Step 2** Use the **show ephone login** command to display the login status of all phones.

**Example:**

```
Router# show ephone login

ephone 1 Pin enabled:TRUE Logged-in:FALSE
ephone 2 Pin enabled:FALSE
ephone 3 Pin enabled:FALSE
```

- Step 3** The **show voice register dial-peer** command displays all the dial peers created dynamically by SIP phones that have registered, along with configurations for after hours blocking.

# Apply Class of Restriction to a Directory Number on SCCP Phone

To apply a class of restriction to a directory number, perform the following steps.

## Restriction

- In a Call Redirection scenario (either Call Forward or Call Forward Busy), when you select an outgoing dial peer, CUCME considers the Class of Restriction applied on the originating extension instead of the one applied on the redirecting extension. This is because the redirecting extension is an intermediate dial peer that is used temporarily.

## Before you begin

- COR lists must be created in dial peers. For information, see [Class of Restrictions](#) section in the “*Dial Peer Configuration on Voice Gateway Routers*” document in the Cisco IOS Voice Configuration Library.
- Directory number to which COR is to be applied must be configured in Cisco Unified CME. For configuration information, see [Create Directory Numbers for SCCP Phones, on page 264](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn dn-tag**
4. **corlist {incoming | outgoing} cor-list-name**
5. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                | Purpose                                                                 |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                           | Enables privileged EXEC mode.<br><br>• Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                   | Enters global configuration mode.                                       |
| <b>Step 3</b> | <b>ephone-dn dn-tag</b><br><br><b>Example:</b><br>Router(config)# ephone-dn 12                                                   | Enters ephone-dn configuration mode.                                    |
| <b>Step 4</b> | <b>corlist {incoming   outgoing} cor-list-name</b><br><br><b>Example:</b><br>Router(config-ephone-dn)# corlist outgoing localcor | Configures a COR on the dial peers associated with an ephone-dn.        |

|        | Command or Action                                                               | Purpose                          |
|--------|---------------------------------------------------------------------------------|----------------------------------|
| Step 5 | <b>end</b><br><br><b>Example:</b><br><code>Router(config-ephone-dn)# end</code> | Returns to privileged EXEC mode. |

## Apply Class of Restriction to Directory Number on SIP Phones

To apply a class of restriction to virtual dial peers for directory numbers associated with a SIP IP phone connected to Cisco Unified CME, perform the following steps.

### Restriction

- In a Call Redirection scenario (either Call Forward or Call Forward Busy), when you select an outgoing dial peer, CUCME considers the Class of Restriction applied on the originating extension instead of the one applied on the redirecting extension. This is because the redirecting extension is an intermediate dial peer that is used temporarily.

### Before you begin

- Cisco unified CME 3.4 or a later version.
- COR lists must be created in dial peers. For information, see [Class of Restrictions](#) section in the “*Dial Peer Configuration on Voice Gateway Routers*” document in the *Cisco IOS Voice Configuration Library*.
- Individual phones to which COR is to be applied must be configured in Cisco Unified CME. For configuration information, see [Create Directory Numbers for SCCP Phones, on page 264](#).
- The COR list configuration under voice register template configuration mode is supported only for Unified CME 12.1 and later releases.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
  - **voice register pool** *pool-tag*
  - **voice register template** *template-tag*
4. **cor**{**incoming** | **outgoing**} *cor-list-name* {*cor-list-number starting-number* [- *ending-number* ] | **default**}
5. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | Enter one of the following commands: <ul style="list-style-type: none"> <li>• <b>voice register pool</b> <i>pool-tag</i></li> <li>• <b>voice register template</b> <i>template-tag</i></li> </ul> <b>Example:</b><br>Router(config)# <b>voice register pool 3</b> | Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone in Cisco Unified CME. <ul style="list-style-type: none"> <li>• <i>pool-tag</i>—Unique number assigned to the pool. Range is 1 to 100.</li> </ul> or<br>Enters voice register template configuration mode and defines a template of common parameters for Cisco Unified SIP IP phones. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Declares a template tag. Range is 1 to 10.</li> </ul> |
| <b>Step 4</b> | <b>cor</b> { <b>incoming</b>   <b>outgoing</b> } <i>cor-list-name</i><br>{ <i>cor-list-number starting-number</i> [- <i>ending-number</i> ]   <b>default</b> }<br><b>Example:</b><br>Router(config-register-pool)# cor incoming<br>call91191011                   | Configures a class of restriction (COR) for the dynamically created VoIP dial peers associated with directory numbers and specifies which incoming dial peer can use which outgoing dial peer to make a call. <ul style="list-style-type: none"> <li>• Each dial peer can be provisioned with an incoming and an outgoing COR list.</li> </ul>                                                                                                                                                          |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-pool)# end                                                                                                                                                                                                | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Verify Class of Restriction

## Procedure

- Step 1** Use the **show running-config** command or the **show telephony-service ephone-dn** command to verify whether the COR lists have been applied to the appropriate ephone-dns.

**Example:**

```
Router# show running-config
```

```
ephone-dn 23
 number 2835
 corlist outgoing 5x
```

**Step 2**

Use the **show dialplan dialpeer** command to determine which outbound dial peer is matched for an incoming call, based on the COR criteria and the dialed number specified in the command line. Use the **timeout** keyword to enable matching variable-length destination patterns associated with dial peers. This can increase your chances of finding a match for the dial peer number you specify.

**Example:**

```
Router# show dialplan dialpeer 300 number 1900111
```

```
VoiceOverIpPeer900
 information type = voice,
 description = '',
 tag = 900, destination-pattern = '1900',
 answer-address = '', preference=0,
 numbering Type = 'unknown'
 group = 900, Admin state is up, Operation state is up,
 incoming called-number = '', connections/maximum = 0/unlimited,
 DTMF Relay = disabled,
 modem passthrough = system,
 huntstop = disabled,
 in bound application associated: 'DEFAULT'
 out bound application associated: ''
 dnis-map =
 permission :both
 incoming COR list:maximum capability
 outgoing COR list:to900
 type = voip, session-target = 'ipv4:1.8.50.7',
 technology prefix:
 settle-call = disabled
 ...
 Time elapsed since last clearing of voice call statistics never
 Connect Time = 0, Charged Units = 0,
 Successful Calls = 0, Failed Calls = 0, Incomplete Calls = 0
 Accepted Calls = 0, Refused Calls = 0,
 Last Disconnect Cause is "",
 Last Disconnect Text is "",
 Last Setup Time = 0.
Matched: 1900111 Digits: 4
Target: ipv4:1.8.50.7
```

**Step 3**

Use the **show dial-peer voice** command to display the attributes associated with a particular dial peer.

**Example:**

```
Router# show dial-peer voice 100
```

```
VoiceEncapPeer100
 information type = voice,
 description = '',
 tag = 100, destination-pattern = '',
 answer-address = '', preference=0,
 numbering Type = 'unknown'
 group = 100, Admin state is up, Operation state is up,
```

```

Outbound state is up,
incoming called-number = `555....', connections/maximum = 0/unlimited,
DTMF Relay = disabled,
huntstop = disabled,
in bound application associated: 'vxml_inb_app'
out bound application associated: ''
dnis-map =
permission :both
incoming COR list:maximum capability
outgoing COR list:minimum requirement
type = pots, prefix = `',
forward-digits default
session-target = `', voice-port = `',
direct-inward-dial = disabled,
digit_strip = enabled,
register E.164 number with GK = TRUE

Connect Time = 0, Charged Units = 0,
Successful Calls = 0, Failed Calls = 0, Incomplete Calls = 0
Accepted Calls = 0, Refused Calls = 0,
Last Disconnect Cause is "",
Last Disconnect Text is "",
Last Setup Time = 0.

```

## Configuration Examples for Call Blocking

### Example for Configuring Call Blocking

The following example defines several patterns of digits for which outgoing calls are blocked. Patterns 1 and 2, which block calls to external numbers that begin with “1” and “011,” are blocked on Monday through Friday before 7 a.m. and after 7 p.m., on Saturday before 7 a.m. and after 1 p.m., and all day Sunday. Pattern 3 blocks calls to 900 numbers 7 days a week, 24 hours a day. The IP phone with tag number 23 and MAC address 00e0.8646.9242 is not restricted from calling any of the blocked patterns.

```

telephony-service
after-hours block pattern 1 91
after-hours block pattern 2 9011
after-hours block pattern 3 91900 7-24
after-hours day mon 19:00 07:00
after-hours day tue 19:00 07:00
after-hours day wed 19:00 07:00
after-hours day thu 19:00 07:00
after-hours day fri 19:00 07:00
after-hours day sat 13:00 12:00
after-hours day sun 12:00 07:00
!
ephone 23
mac 00e0.8646.9242
button 1:33
after-hour exempt
!
ephone 24
mac 2234.1543.6352
button 1:34

```

The following example deactivates a phone's login after three hours of idle time and clears all logins at 10 p.m.:

```
ephone 1
 pin 1000
!
telephony-service
 login timeout 180 clear 2200
```

## Example for Configuring Class of Restriction

The following example shows three dial peers for dialing local destinations, long distance, and 911. COR list user1 can access the dial peers used to call 911 and local destinations. COR list user2 can access all three dial peers. Ephone-dn 1 is assigned COR list user1 to call local destinations and 911, and ephone-dn 2 is assigned COR list user2 to call 911, local destinations, and long distance.

```
dial-peer cor custom
 name local
 name longdistance
 name 911
!
dial-peer cor list call-local
 member local
!
dial-peer cor list call-longdistance
 member longdistance
!
dial-peer cor list call-911
 member 911
!
dial-peer cor list user1
 member 911
 member local
!
dial-peer cor list user2
 member 911
 member local
 member longdistance
!
dial-peer voice 1 pots
 corlist outgoing call-longdistance
 destination-pattern 91.....
 port 2/0/0
 prefix 1
!
dial-peer voice 2 pots
 corlist outgoing call-local
 destination-pattern 9[2-9].....
 port 2/0/0
 forward-digits 7
!
dial-peer voice 3 pots
 corlist outgoing call-911
 destination-pattern 9911
 port 2/0/0
 prefix 911
!
ephone-dn 1
 corlist incoming user1
 corlist outgoing user1
!
ephone-dn 2
```

```
corlist incoming user2
corlist outgoing user2
```

## Example for Configuring After-Hours Block Patterns of Regular Expressions

The following example shows how to configure several afterhours block patterns of regular expressions:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Router(config)# telephony-service

Router(config-telephony)# after-hours block pattern 1 ?
WORD Specific block pattern or a regular expression for after-hour block
pattern

Router(config-telephony)# after-hours block pattern 1 1234
Router(config-telephony)# after-hours block pattern 2 .T
Router(config-telephony)# after-hours block pattern 3 987654([1-3])+
Router(config-telephony)# after-hours block pattern 4 98765432[1-9]
Router(config-telephony)# after-hours block pattern 5 98765(432|422|456)
```

## Where to Go Next

After modifying a configuration for a Cisco Unified IP phone connected to Cisco Unified CME, you must reboot the phone to make the changes take effect. For more information, see [Reset and Restart Cisco Unified IP Phones, on page 409](#).

### Soft Key Control

To move or remove the Login soft key on one or more phones, create and apply an ephone template that contains the appropriate **softkeys** commands.

For more information, see [Customize Softkeys, on page 919](#).

### Ephone-dn Templates

The **corlist** command can be included in an ephone-dn template that is applied to one or more ephone-dns. For more information, see [Templates, on page 1423](#).

## Feature Information for Call Blocking

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

Table 94: Feature Information for Call Blocking

| Feature Name         | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                                                                            |
|----------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call Blocking        | 4.2(1)                    | Added support for selective call blocking on IP phones and PSTN trunk lines.                                                                                                                                                                                                                   |
|                      | 3.4                       | <ul style="list-style-type: none"> <li>• Support for Call Blocking on SIP IP phones connected directly in Cisco Unified CME was introduced.</li> <li>• All incoming calls to the router, except calls from an exempt phone, are also checked against the after-hours configuration.</li> </ul> |
|                      | 3.3                       | Added support for Call Blocking on analog phones connected to Cisco ATAs or FXS ports in H.323 mode.                                                                                                                                                                                           |
|                      | 3.0                       | <ul style="list-style-type: none"> <li>• Call blocking based on date and time was introduced.</li> <li>• Override of Call Blocking was introduced.</li> </ul>                                                                                                                                  |
| Class of Restriction | 12.1                      | Added support for COR configuration in voice register template configuration mode for Unified CME.                                                                                                                                                                                             |
|                      | 3.4                       | Added support for COR on SIP IP Phones connected directly in Cisco Unified CME.                                                                                                                                                                                                                |
|                      | 2.0                       | Class of restriction was introduced.                                                                                                                                                                                                                                                           |

## Information About Call Park

### Call Park Enhancements in Cisco Unified CME 7.1

Cisco Unified CME 7.1 adds Call Park support for SIP phones, introduces Park Reservation Groups, and enhances the Directed Call Park feature. Park slots can be shared among SCCP and SIP phones. For example, a call parked on a SCCP phone can be retrieved by a SIP phone on the same Cisco Unified CME router. Call Park features are available on SCCP and SIP phones that support the Park soft key. The Park soft key displays on supported phones by default.

Table describes how phone users park and retrieve calls in Cisco Unified CME 7.1 and later versions compared to previous versions. For SCCP phones, the only change is in how users perform Directed Call Park Retrieval. The Call Park method supported in previous versions of Cisco Unified CME is enabled by default. You can change the park and retrieval method only when there are no parked calls.

| Feature                           | Cisco Unified CME 7.1 and Later Versions (SCCP and SIP Phones) <sup>14</sup>                                                                                                                                                                                                                      | Before Cisco Unified CME 7.1 (SCCP Phones Only)                                                                                                                                                                                                            |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call Park (Basic)                 | Press Park soft key to park the call.                                                                                                                                                                                                                                                             | Press Park soft key to park the call.                                                                                                                                                                                                                      |
| Call Park Retrieval <sup>15</sup> | Do one of the following: <ul style="list-style-type: none"><li>• Dial the park slot extension (SCCP and SIP).</li><li>• Press Pickup soft key and dial park-slot extension (SCCP only).</li><li>• Press Pickup soft key and the asterisk (*) on phone that parked the call (SCCP only).</li></ul> | Do one of the following: <ul style="list-style-type: none"><li>• Dial the park slot extension.</li><li>• Press Pickup soft key and dial park-slot extension.</li><li>• Press Pickup soft key and the asterisk (*) on phone that parked the call.</li></ul> |

| Feature                      | Cisco Unified CME 7.1 and Later Versions (SCCP and SIP Phones) <sup>14</sup> | Before Cisco Unified CME 7.1 (SCCP Phones Only)       |
|------------------------------|------------------------------------------------------------------------------|-------------------------------------------------------|
| Directed Call Park           | Press Transfer soft key and dial park-slot extension.                        | Press Transfer soft key and dial park-slot extension. |
| Directed Call Park Retrieval | Dial the retrieval FAC and park-slot extension.                              | Same as Basic Call Park Retrieval.                    |

<sup>14</sup> You must enable the **call-park system application** command.

<sup>15</sup> SCCP phones support the Pickup soft key for Park Retrieval only if the **service directed-pickup** command is configured (default). Otherwise, the Pickup soft key initiates Local Group Pickup.

To enable Call Park features, see [Enable Call Park or Directed Call Park, on page 1076](#).

## Basic Call Park

The Call Park feature allows a phone user to place a call on hold at a special extension so it can be retrieved from any other phone in the system. A user parks the call at the extension, known as the **call-park** slot, by pressing the Park soft key. Cisco Unified CME chooses the next available call-park slot and displays that number on the phone. A user on another phone can then retrieve the call by dialing the extension number of the call-park slot.

You can define either a single extension number or a range of extension numbers to use as call-park slots. Each call-park slot can hold one call at a time so the number of calls that users can park is equal to the number of slots you create. If the secondary number is used to group calls together, calls are retrieved in the order in which they were parked; the call that has been parked the longest is the first call retrieved from the call-park slot.

A caller who is parked in a park slot hears the music-on-hold (MOH) audio stream if the call uses the G.711 codec or if the call uses G.729 with transcoding; otherwise, callers hear a tone on hold. Users who attempt to park a call at a busy slot hear a busy tone.

Call-park slots can also be monitored by assigning the call-park slot to a monitor button using the **button m** command. The line status shows “in use” when a call is parked in the monitored slot. A call that is parked on the monitored call-park slot can be picked up by pressing the assigned monitor button.

You can create a call-park slot that is reserved for use by one extension by assigning that slot a number whose last two digits are the same as the last two digits of the extension. When an extension starts to park a call, the system searches first for a call-park slot that has the same final two digits as the extension. If no such call-park slot exists, the system chooses an available call-park slot.

Multiple call-park slots can be created with the same extension number so that more than one call can be parked for a particular department or group of people at a known extension number. For example, at a hardware store, calls for the plumbing department can be parked at extension 101, calls for lighting can be parked at 102, and so forth. Everyone in the plumbing department knows that calls parked at 101 are for them and can pick up calls from extension 101. When multiple calls are parked at the same call-park slot number, they are picked up in the order in which they were parked; that is, the call that has been parked the longest is the first call picked up from that call-park slot number.

If multiple call-park slots use the same extension number, you must configure each ephone-dn that uses the extension number with the **no huntstop** command, except for the last ephone-dn to which calls are sent. In addition, each ephone-dn must be configured with the **preference** command. The preference numeric values must increase to match the order of the ephone-dns. That is, the lowest ephone-dn tag park-slot must have the

lowest numeric preference number, and so forth. Without the configuration of the **preference** and **huntstop** commands, all calls that are parked after a second call has been parked will generate a busy signal. The caller who is being transferred to park will hear a busy signal, while the phone user who parked the call will receive no indication that the call was lost.

A reminder ring can be sent to the extension that parked the call by using the **timeout** keyword with the **park-slot** command. The **timeout** keyword and argument set the interval length during which the call-park reminder ring is timed out or inactive. If the **timeout** keyword is not used, no reminder ring is sent to the extension that parked the call. The number of timeout intervals and reminder rings are configured with the **limit** keyword and argument. For example, a limit of 3 timeout intervals sends 2 reminder rings (interval 1, ring 1, interval 2, ring 2, interval 3). The **timeout** and **limit** keywords and arguments also set the maximum time that calls stay parked. For example, a timeout interval of 10 seconds and a limit of 5 timeout intervals (**park-slot timeout 10 limit 5**) will park calls for approximately 50 seconds.

The reminder ring is sent only to the extension that parked the call unless the **notify** keyword is also used to specify an additional extension number to receive a reminder ring. When an additional extension number is specified using the **notify** keyword, the phone user at that extension can retrieve a call from this slot by pressing the PickUp soft key and the asterisk (\*) key.

You can define both the length of the timeout interval for calls parked at a call-park slot and the number of timeout intervals that should occur before the call is either recalled or transferred. If you specify a transfer target in the **park-slot** command, the call is transferred to the specified target after the timeout intervals expire rather than to the primary number of the parking phone.

If a name has been specified for the call-park slot using the **name** command, that name will be displayed on a recall or transfer rather than an extension number.

You can also specify an alternate target extension at which to transfer a parked call if the recall or transfer target is in use (ringing or connected). For example, a call is parked at the private park slot for the phone with the primary extension of 2001, as shown in [Figure 39: Dedicated Call Park Example, on page 1075](#). After the timeouts expire, the system attempts to recall the call to extension 2001, but that line is connected to another call. The system then transfers the call to the alternate target, extension 3784.

## View Active Parked Calls

You can view the list of active parked calls on SIP and SCCP phones using the phone menu by pressing the **Service** button on the phone and navigating to **My Phone Apps > Park List**.

To recall a call from the list of parked calls, you can select the desired call and press the **Pickup** soft key.

To refresh the list of parked calls you can press the **Update** soft key in the menu.

Latest parked call will be displayed on top of the list.

### Note

This feature can be configured as PLK button for SCCP and SIP Phone. For more information see [Configure Feature Button on a Cisco Unified SCCP Line Key, on page 1458](#) and [Configure Feature Button on a Cisco Unified SIP Phone Line Key, on page 1456](#).

## Configure User Interface to View Active List of Parked Calls

This feature enables a user to view the list of active parked calls and is enabled by default.

**Note** You must perform this task only if the feature was previously disabled on a phone.

This feature is enabled by default for SCCP and SIP phones. For SCCP phones, this feature can be enabled and disabled. However, SIP phones do not have the enable or disable option.

**Restriction**

- If there are more than 20 active calls parked, then only the first 20 active parked calls will be displayed.
- Dedicated, private call-park slots configured using the reserved-for command are not supported on the phone's display.

**Before you begin**

- Cisco Unified CME 10.5 or a later version.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **phone-ui** park-list
5. **end**

**DETAILED STEPS**

**Procedure**

|               | Command or Action                                                                         | Purpose                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                        | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                | Enters global configuration mode.                                                                                                                                               |
| <b>Step 3</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br>Router(config)# ephone 12            | Enters ephone configuration mode.<br><ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number that identifies this ephone during configuration tasks.</li> </ul> |
| <b>Step 4</b> | <b>phone-ui</b> park-list<br><b>Example:</b><br>Router(config-ephone)# phone-ui park-list | Enables a phone user to view the list of active parked calls.<br><ul style="list-style-type: none"> <li>• This command is enabled by default.</li> </ul>                        |

|        | Command or Action                                                | Purpose                        |
|--------|------------------------------------------------------------------|--------------------------------|
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Router(config-ephone) # end | Exits to privileged EXEC mode. |

## Directed Call Park

The Directed Call Park feature allows a phone user to transfer a call to a specific call-park slot using the Transfer soft key. For example, a customer calls a retail store and asks for the sporting goods department. The operator who answers the call transfers the call to one of the park-slots associated with the sporting goods department and pages the sporting goods department to retrieve the call. You can configure phones that support the directed call-park Busy Lamp Field (BLF) to monitor the busy and idle status of specific directed call-park slots.

In versions before Cisco Unified CME 4.0, callers can directly dial call-park slot numbers to be placed in park. If another call is already parked in the slot, the caller hears a busy tone.

In Cisco Unified CME 4.0 to Cisco Unified CME 7.0, users retrieve a call from a directed call-park slot by dialing the park-slot extension or using the PickUp soft key and dialing the park-slot extension. If no call is parked in the slot, the caller hears a busy tone.

In Cisco Unified CME 7.1 and later versions, users retrieve a call from a directed call-park slot by dialing a feature access code (FAC) and the number of the call-park slot.

Cisco Unified CME supports Directed Call Park from remote phones, however only phones that are local to the directed call-park slot can retrieve a call.

## Park Reservation Groups

Cisco Unified CME 7.1 and later versions allow you to assign ownership to call-park slots by using Park Reservation Groups. A park slot configured with a park reservation group can only be used by phones configured with the same park reservation group. A park slot without a park reservation group can be used by any phone not assigned to a park reservation group.

In versions earlier than Cisco Unified CME 7.1, you could reserve a dedicated call-park slot for a specific phone based on its primary line. All lines on that phone could use the dedicated park slot. The new Park Reservation Group feature in Cisco Unified CME 7.1 provides an enhanced method of reserving park slots that replaces the use of dedicated park slots.

Park reservation groups are not supported for directed call-park slots.

**Note** The reservation-group is used so that the phone with a reservation group is allowed to park to park-slot(s) within the same reservation group.

Any phone within the same CME can retrieve any parked calls. So the rule is applied when you park the call, not when you retrieve the call.

## Dedicated Call-Park Slots

A dedicated, private call-park slot can be configured for an ephone using the **reserved-for** keyword in the **park-slot** command. The dedicated call-park slot is associated with the primary extension of the ephone. All extensions on this phone can park calls in the dedicated park slot. The extensions on this phone are the only extensions that can park a call in the dedicated park slot. Only one call at a time can be parked in a park slot; a busy tone is returned to any attempt to park a call in a slot that is already in use.

Calls can be parked in dedicated call-park slots using any of the following methods (the extension doing the parking must be on a phone whose primary extension is associated with a dedicated park slot).

- With an active call, an IP phone user presses the Park soft key.
- With an active call, an IP phone user presses the Transfer soft key and a standard or custom FAC (feature access code) for the call-park feature. The standard FAC for call park is **\*\*6**.
- With an active call, an analog phone user presses hookflash and the standard or custom FAC for the call park feature.

Calls can be retrieved from dedicated call-park slots using any of the following methods:

- An IP phone user presses the Pickup soft key and dials the park-slot number.
- An IP phone user presses the New Call soft key and dials the park-slot number.
- An analog phone user lifts the handset, presses the standard or custom FAC for directed call pickup, and dials the park-slot number. The standard FAC for directed pickup is **\*\*5**.

If no dedicated park slot is found anywhere in the Cisco Unified CME system for an ephone-dn that is attempting to park a call, the system uses the standard call-park procedure; that is, the system searches for a preferred park slot (one with an ephone-dn number that matches the last two digits of the ephone-dn attempting to park the call) and if none is found, uses any available call-park slot.

[Figure 39: Dedicated Call Park Example, on page 1075](#) shows an example of a dedicated call-park slot.

If the configuration specifies that a call should be recalled to the parking phone after the timeout intervals expire, the call is always returned to the phone's primary extension number, regardless of which extension on the phone did the parking. [Figure 39: Dedicated Call Park Example, on page 1075](#) shows an ephone that is configured with the extension numbers 2001, 2002, and 2003, and a private call-park slot at extension 3333. The private park slot has been set up to recall calls to the parking phone when the parked call's timeouts expire. In the example, extension 2003 parks a call using the Park soft key. When the timeout intervals expire, the call rings back on extension 2001.

The configuration in [Figure 39: Dedicated Call Park Example, on page 1075](#) specifies that the call will recall or transfer from the park slot after 3 times the 60-second timeout, or after 180 seconds. Also, before the exhaustion of the 3 timeouts the phone will receive reminder notifications that a parked call is waiting. The reminders are sent after each 60-second timeout interval expires (that is, at 60 seconds and at 120 seconds). You may want to set the **timeout** command with a limit of 1 instead, so that the call simply parks and recalls or transfers without sending a reminder ring.

Figure 39: Dedicated Call Park Example

## Call-Park Blocking

In Cisco Unified CME 4.0 and later versions, individual ephones can be prevented from making transfers to call-park slots by using the **transfer-park blocked** command. This command prevents transfers to park that use the Transfer soft key and a call-park slot number, while allowing call-parks that use only the Park soft key. (To prevent use of the Park soft key, use an ephone template to remove it from the phone. See [Customize Softkeys](#), on page 919.)

An exception is made for phones with reserved, or dedicated, park slots. If the **transfer-park blocked** command is used on an ephone that has a dedicated park slot, the phone is blocked from parking calls at park slots other than the phone's dedicated park slot but can still park calls at its own dedicated park slot.

## Call-Park Redirect

By default, H.323 and SIP calls that use the call-park feature use hairpin call forwarding or transfer to park calls and to pick up calls from park. The **call-park system redirect** command allows you to specify that these calls should use H.450 or the SIP Refer method of call forwarding or transfer. The **no** form of the command returns the system to the default behavior.

## Call Park Recall Enhancement

In Cisco Unified CME 9.5 and lower versions, a parked call could not be recalled by or transferred to the phone that put the call in park or the original phone that transferred the call when the destination phone was offhook or ringing.

In Cisco Unified CME 9.5, the **recall force** keyword is added to the **call-park system** command in telephony-service configuration mode to allow a user to force the recall or transfer of a parked call to the phone that put the call in park or the phone with the reserved-for number as its primary DN when the destination phone is available to answer the call. For more configuration examples, see [Example for Configuring Call Park Recall](#), on page 1085.

Prior to Unified CME 10.5, the ring tones for Call Park Recall and incoming calls were the same. In Unified CME 10.5, a new ring tone is introduced for park recall to assist the user to distinctly identify the type of call. No configurations are required to activate this feature. The ringtone for SCCP endpoints is a feature-ring and for SIP endpoints the ringtone is a Bellcore-dr2.

The Distinctive Call Park Recall feature is supported on all phone families for SCCP endpoints. For SIP phones, the feature is supported on Cisco IP Phone 7800 Series, 8900 Series and 9900 Series phones.

---

**Note** Cisco IP Phone 8800 Series phones do not support Distinctive Call Park Recall feature.

---

## Park Monitor

In Cisco Unified CME 8.5 and later versions, the park monitor feature allows you to park a call and monitor the status of the parked call until the parked call is retrieved or abandoned. When a Cisco Unified SIP IP Phone 8961, 9951, or 9971 parks a call using the park soft key, the park monitoring feature monitors the status of the parked call. The park monitoring call bubble is not cleared until the parked call gets retrieved or is abandoned by the parkee. This parked call can be retrieved using the same call bubble on the parker's phone to monitor the status of the parked call.

Once a call is parked, Cisco Unified CME sends a SIP NOTIFY message to the parker phone indicating the "parked" event along with the park slot number so that the parker phone can display the park slot number as long as the call remains parked.

When a parked call is retrieved, Cisco Unified CME sends another SIP NOTIFY message to the parker phone indicating the "retrieved" event so that the phone can clear the call bubble. When a parked call is disconnected by the parkee, Cisco Unified CME sends a SIP NOTIFY message to the parker phone indicating the "abandoned" event and the parker phone clears the call bubble upon cancellation of the parked call.

When a parked call is recalled or transferred, Cisco Unified CME sends a SIP NOTIFY message to the parker phone indicating the "forwarded" event so that parker phone can clear the call bubble during park, recall, and transfer. You can also retrieve a parked call from the parker phone by directly selecting the call bubble or pressing the resume soft key on the phone.

---

**Note** Park Monitor is supported in Cisco IP Phone 7800 Series and Cisco Unified IP Phone 9900 Series. However, Cisco IP Phone 8800 Series do not support Park Monitor feature.

---

## Configure Call Park

### Enable Call Park or Directed Call Park

To enable Call Park on SCCP or SIP phones, perform the following steps.

**Restriction**

- For SIP phones, the Park soft key is not supported for Cisco Unified IP Phone 7905, 7912, 7921, 7940, or 7960.
- Park Retrieval is supported only on local phones. Phones can park calls remotely to another Cisco Unified CME router but only phones that are registered to the local router hosting the call-park slots can retrieve a call.
- In versions earlier than Cisco Unified CME 7.1, Call Park and Directed Call Park shared the same call-park slots. In Cisco Unified CME 7.1 and later versions, if a user attempts to transfer a call to a basic park slot when using Directed Call Park, Cisco Unified CME considers that a Park Retrieval.
- A user can retrieve a parked call on an SCCP phone by pressing the Pickup soft key and dialing the extension number of the call-park slot or an asterisk (\*) only if the **service directed-pickup** command is enabled (default). Otherwise this initiates a local group pickup.
- Park Reservation Groups are not supported with Directed Call Park.
- Different directory numbers with the same extension number must have the same Call Park configuration.
- Calls from H.323 trunks are not supported on SIP phones.
- Hold Pickup is not supported with the **call-park system application** command.

**Before you begin**

- SIP phones require Cisco Unified CME 7.1 or a later version.
- IP phone must support the Park soft key. The Park soft key displays by default on supported SCCP and SIP phones. If previously disabled, you must use the **softkeys connected** command to enable the Park soft key.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **call-park system { application | redirect }**
5. **fac { standard | custom dpark-retrieval custom-fac }**
6. **exit**
7. **ephone-dn dn-tag [ dual-line ]**
8. **number number [ secondary number ] [ no-reg [ both | primary ] ]**
9. **park-slot [ directed ] [ reservation-group group-number ] [ reserved-for extension-number ] [ [ timeout seconds limit count ] [ notify extension-number [ only ] ] [ recall ] [ transfer extension-number ] [ alternate extension-number ] [ retry seconds limit count ] ]**
10. **exit**
11. **ephone phone-tag or voice register pool phone-tag**
12. **park reservation-group group-number**
13. **end**

## Examples for Basic Call Park, Directed Call Park and Park Reservation Groups

### Basic Call Park

The following example shows three basic call-park slots that can be used by either SCCP or SIP phones. Any phone can retrieve calls parked at these extensions.

```
ephone-dn 23
 number 8123
 park-slot timeout 10 limit 2 recall
 description park slot for Sales
!
ephone-dn 24
 number 8124
 park-slot timeout 10 limit 2 recall
 description park slot for Sales
!
ephone-dn 25
 number 8125
 park-slot timeout 15 limit 3 recall retry 10 limit 2
 description park slot for Service
```

### Directed Call Park

The following example shows that the enhanced Call Park and Directed Call Park features in Cisco Unified CME 7.1 and later versions is enabled with the **call-park system application** command in telephony-service configuration mode. Two call-park slots, extension 3110 and 3111, can be used to park calls for the pharmacy using Directed Call Park.

```
telephony-service
load 7960-7940 P00308000500
max-ephones 100
max-dn 240
ip source-address 10.7.0.1 port 2000
cnf-file location flash:
cnf-file perphone
voicemail 8900
max-conferences 8 gain -6
call-park system application
transfer-system full-consult
fac standard
create cnf-files version-stamp 7960 Sep 25 2007 21:25:47
!
!
ephone-dn 10
number 3110
park-slot directed
description park-slot for Pharmacy
!
ephone-dn 11
number 3111
park-slot directed
description park-slot for Pharmacy
```

### Park Reservation Groups

The following example shows park reservation groups set up for two call-park slots. Extension 8126 is configured for group 1 and assigned to phones 3 and 4. Extension 8127 is configured for group 2 and assigned to phones 10 and 11. When calls for the Pharmacy are parked at extension 8126, only phones 3 and 4 can retrieve them.

```
ephone-dn 26
number 8126
park-slot reservation-group 1 timeout 15 limit 2 transfer 8100
description park slot for Pharmacy
!
ephone-dn 27
number 8127
park-slot reservation-group 2 timeout 15 limit 2 transfer 8100
description park slot for Auto
!
!

button 1:3
!
!
ephone 4
park reservation-group 1
mac-address 0030.94C3.053E
type 7962
```

```

button 1:4
!
!
ephone 10
 park reservation-group 2
 mac-address 00E1.CB13.0395
 type 7960
 button 1:10
!
!
ephone 11
 park reservation-group 2
 mac-address 0016.9DEF.1A70
 type 7960
 button 1:11

```

## Verify Call Park

### Procedure

**Step 1** Use the **show running-config** command to verify your configuration. Call-park slots are listed in the ephone-dn portion of the output.

**Example:**

```

Router# show running-config

!
ephone-dn 23
 number 853
 park-slot timeout 10 limit 1 recall
 description park slot for Sales
!
!
ephone-dn 24
 number 8126
 park-slot reserved-for 126 timeout 10 limit 1 transfer 8145
!
!
ephone-dn 25
 number 8121 secondary 121
 park-slot reserved-for 121 timeout 30 limit 1 transfer 8145
!
!
ephone-dn 26
 number 8136 secondary 136
 park-slot reserved-for 136 timeout 10 limit 1 recall
!
!
ephone-dn 30 dual-line
 number 451 secondary 501
 preference 10
 huntstop channel
!
!
ephone-dn 31 dual-line
 number 452 secondary 502
 preference 10

```

```

 huntstop channel
 !

```

**Step 2** Use the **show telephony-service ephone-dn** command to display call park configuration information.

**Example:**

```

Router# show telephony-service ephone-dn

ephone-dn 26
 number 8136 secondary 136
 park-slot reserved-for 136 timeout 10 limit 1 recall

```

## Configure Timeout Duration for Recalled Calls

To set a timeout duration for no response for a recalled call, perform the following steps. This command is also applicable to all IP phones where a call in ringing state if not answered, is automatically disconnected after the timeout duration.

This feature is enabled by default. You must perform this task only if the feature was previously disabled on a phone.

### Before you begin

Cisco Unified CME 10.5 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone ring timeouts** *seconds*
4. **exit**

### DETAILED STEPS

| Procedure |                                               |                                                                                                                       |
|-----------|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
|           | Command or Action                             | Purpose                                                                                                               |
| Step 1    | <b>enable</b>                                 | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
|           | <b>Example:</b><br>Router> enable             |                                                                                                                       |
| Step 2    | <b>configure terminal</b>                     | Enters global configuration mode.                                                                                     |
|           | <b>Example:</b><br>Router# configure terminal |                                                                                                                       |

|               | Command or Action                                                                                | Purpose                                                |
|---------------|--------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>Step 3</b> | <b>ephone ring timeouts</b> <i>seconds</i><br><b>Example:</b><br>Router(config)# ring timeout 25 | Enters a timeout period before disconnecting the call. |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br>Router(config-ephone)# exit                                    | Exits to privileged EXEC mode.                         |

### Example

The following example shows that the ring timeouts command is enabled on phone:

```
ephone-dn 10 dual-line
number 1001
no huntstop
huntstop channel

```

## Troubleshooting Call Park

### Procedure

#### Step 1 show ephone-dn park

Use this command to display configured call-park slots and their status.

```
Router# show ephone-dn park

DN 50 (1560) park-slot state IDLE
Notify to () timeout 30 limit 10
```

#### Step 2 Use the **debug ephone** commands to observe messages and states associated with an ephone. For more information, see [Cisco Unified CME Command Reference](#).

## Configuration Examples for Call Park

### Example for Configuring Basic Call Park

The following example creates a call-park slot with the number 1560. After a call is parked at this number, the system provides 10 reminder rings at intervals of 30 seconds to the extension that parked the call.

```
ephone-dn 50
```

```
number 1560
park-slot timeout 30 limit 10
```

## Example for Blocking Phone From Using Call Park

The following example prevents ephone 25 and extensions 234, 235, and 236 from parking calls at any call-park slots.

```
ephone-dn 11
 number 234

ephone-dn 12
 number 235

ephone-dn 13
 number 236

ephone 25
 button 1:11 2:12 3:13
 transfer-park blocked
```

The following example sets up a dedicated park slot for the extensions on ephone 6 and blocks transfers to call park from extensions 2977, 2978, and 2979 on that phone. Those extensions can still park calls at the phone's dedicated park slot by using the Park soft key or the Transfer soft key and the FAC for call park.

```
ephone-dn 3
 number 2558
 name Park 2977
 park-slot reserved-for 2977 timeout 60 limit 3 recall alternate 3754

ephone-dn 4
 number 2977

ephone-dn 5
 number 2978

ephone-dn 6
 number 2979

ephone 6
 button 1:4 2:5 3:6
 transfer-park blocked
```

## Example for Configuring Call-Park Redirect

The following example specifies that H.323 and SIP calls that are parked should use H.450 or the SIP Refer method to when they are parked or picked up.

```
telephony-service
call-park system redirect
```

## Example for Configuring Call Park Recall

The following example shows how to force the recall of a call previously parked when the phone was busy:

```
Router# configure terminal
```

```
Router(config)# telephony-service
Router(config-telephony)# call-park system ?
recall Configure parameters for recall
Router(config-telephony)# call-park system recall ?
force Force recall for busy call park initiator
Router(config-telephony)# call-park system recall force
```

## Where to Go Next

### Controlling Use of the Park Soft Key

To block the functioning of the call park (Park) soft key without removing the key display, create and apply an ephone template that contains the **features blocked** command. For more information, see [Customize Softkeys, on page 919](#).

To remove the call park (Park) soft key from one or more phones, create and apply an ephone template that contains the appropriate **softkeys** command. For more information, see [Customize Softkeys, on page 919](#).

### Ephone Templates

The **transfer-park blocked** command, which blocks transfers to call-park slots, can be included in ephone templates that are applied to individual ephones.

The Park soft key can be removed from the display of one or more phones by including the appropriate **softkeys** command in an ephone template and applying the template to individual ephones.

For more information, see [Templates, on page 1423](#).

### Feature Access Codes

You can park calls using a feature access code (FAC) instead of a soft key on the phone if standard or custom FACs have been enabled for your system. The call-park FAC is considered a transfer to a call-park slot and therefore is valid only after the Transfer soft key (IP phones) or hookflash (analog phones) has been used to initiate a transfer. The following are the standard FACs for call park:

- Dedicated park slot—Standard FAC is \*\*6.
- Any available park slot—Standard FAC is \*\*6 plus optional park-slot number.

For more information about FACs, see [Feature Access Codes, on page 751](#).

## Feature Information for Call Park

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

Table 95: Feature Information for Call Park

| Feature Name                 | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                |
|------------------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call Park Recall Enhancement | 9.5                       | Added recall force keyword to the call-park system command.                                                                                                                                                                        |
| Call Park                    | 8.5                       | Support for Park Monitor was introduced.                                                                                                                                                                                           |
|                              | 7.1                       | Adds Call Park support for SIP phones, introduces Park Reservation Groups, and enhances Directed Call Park.                                                                                                                        |
|                              | 4.0                       | Dedicated call-park slots, alternative recall locations, and call-park blocking were introduced. Direct calls to park slots are now interpreted as attempts to pick up parked calls rather than attempts to be parked at the slot. |
|                              | 3.2.1                     | Monitoring of call-park slots was introduced.                                                                                                                                                                                      |
|                              | 3.1                       | Call park was introduced.                                                                                                                                                                                                          |

## CHAPTER 42

# Call Restriction Regulations

- [Prerequisites for LPCOR, on page 1089](#)
- [Information About LPCOR, on page 1089](#)
- [Configure LPCOR, on page 1096](#)
- [Configuration Examples for LPCOR, on page 1113](#)
- [Feature Information for LPCOR, on page 1131](#)

## Prerequisites for LPCOR

- Cisco IOS Release 15.0(1)XA or a later release.
- Cisco Unified CME 8.0 or a later version.

## Information About LPCOR

### LPCOR Overview

The Telecom Regulatory Authority of India (TRAI) has regulations that restrict the mixing of voice traffic between the PSTN and VoIP networks. Previously, this required a user to have two phones to handle both PSTN and VoIP calls; an IP phone connected to the Electronic Private Automatic Branch Exchange (EPABX) for intra-office and inter-office VoIP calls and a separate phone connected to a PABX for PSTN calls, as shown in [Figure 40: Separate PBX and EPABX Systems, on page 1090](#).

New regulations allow for a single network infrastructure and single EPABX to connect to both the PSTN and VoIP networks by using a logical partitioning between the PSTN and IP leased lines.

The logical partitioning class of restriction (LPCOR) feature enables a single directory number on an IP phone or analog phone registered to Cisco Unified CME to connect to both PSTN and VoIP calls according to the connection restrictions specified by TRAI regulations. Cisco Unified CME can support both VoIP and PSTN calls while restricting the mixing of voice traffic between the PSTN and VoIP networks and preventing PSTN calls from connecting to remote locations over an IP trunk, as shown in [Figure 41: Single EPAPX System with PSTN and VoIP Calls Partitioning, on page 1090](#).

Figure 40: Separate PBX and EPABX Systems

Figure 41: Single EPAPX System with PSTN and VoIP Calls Partitioning

## LPCOR Policy and Resource Groups

Cisco Unified CME supports a high-level class of restriction by allowing you to logically partition its resources (PSTN trunks, IP trunks, IP phones, and analog phones) into different groups. The resources of each group are scalable based on the voice interface, trunk group, or IP address subnet. In general, you should not have to modify your existing dial plan to support LPCOR functionality. The dial peer class of restriction (COR) feature remains unchanged when the LPCOR feature is added to Cisco Unified CME.

LPCOR control is based on the location of resources, where calls are originating and terminating. You must partition the resources of the Cisco Unified CME router into different resource groups and then create a LPCOR policy for each group to which you want to apply call restrictions.

You create a LPCOR policy matrix for individual resource groups by defining its LPCOR policy to either accept or reject calls that originate from any of the other resource groups. You can define one LPCOR policy for each resource group.

The same LPCOR policy is applied to multiple directory numbers from the same resource. For example, if multiple directory numbers are defined for a SCCP phone, the same LPCOR policy is enforced for all calls to the different directory numbers on the SCCP phone.

In the following example, PSTN trunks, IP trunks (H.323 and SIP), analog FXS phones, and IP phones for a Cisco Unified CME router are partitioned into five different resource groups (RG1 to RG5).

**Table 96: LPCOR Policy Matrix Example**

| Resource Groups | RG1        | RG2        | RG3       | RG4 | RG5       |
|-----------------|------------|------------|-----------|-----|-----------|
| RG1             | <b>Yes</b> | No         | Yes       | No  | Yes       |
| RG2             | Yes        | Yes        | <b>No</b> | Yes | No        |
| RG3             | Yes        | <b>Yes</b> | Yes       | Yes | No        |
| RG4             | No         | No         | No        | Yes | Yes       |
| RG5             | No         | Yes        | Yes       | Yes | <b>No</b> |

LPCOR validation is done at the target destination based on the configured LPCOR policy matrix. For example:

- Call from RG1 to target RG1 is allowed
- Call from RG2 to target RG3 is not allowed
- Call from RG3 to target RG2 is allowed
- Call from RG5 to target RG5 is not allowed

## Default LPCOR Policy

The default LPCOR policy means that there are no restrictions between the call source and its target destination. When a call is presented to a target destination, Cisco Unified CME bypasses LPCOR validation if either the incoming call is not associated with a LPCOR policy or the LPCOR policy is not defined for the target destination.

TRAI regulations allow the same directory number on a local IP phone or SCCP analog Foreign Exchange Station (FXS) phone in Cisco Unified CME to handle both PSTN and VoIP calls. Locally connected phones do not have to be associated with any resource group.

## How LPCOR Policies are Associated with Resource Groups

Call restrictions are applied to LPCOR resource groups based on the location of the resources. You create LPCOR policies that define the call restrictions to apply to calls that originate or terminate at the following types of resources.

### Analog Phones

TRAI regulations allow an analog FXS phone to accept both PSTN and VoIP calls if the phone is locally registered to Cisco Unified CME. Locally connected phones do not have to be associated with any resource group; the default LPCOR policy is applied to this phone type.

A specific LPCOR policy can be defined through the voice port or trunk group. For configuration information, see [Associate a LPCOR Policy with Analog Phone or PSTN Trunk Calls, on page 1099](#).

### IP Phones

LPCOR supports both SCCP and SIP IP phones. TRAI regulations allow an IP phone to accept both PSTN and VoIP calls if the IP phone is registered locally to Cisco Unified CME through the LAN. If the IP phone is registered to Cisco Unified CME through the WAN, PSTN calls must be blocked from the remote IP phones.

If an IP phone always registers to Cisco Unified CME from the same local or remote region, the phone is provisioned with a static LPCOR policy. For configuration information, see [Associate a LPCOR Policy with IP Phone or SCCP FXS Phone Calls, on page 1105](#).

If the phone is a mobile-type IP phone and moves between the local and remote regions, such as an Extension Mobility phone, Cisco IP Communicator softphone, or a remote teleworker phone, the LPCOR policy is provisioned dynamically based on the IP phone's currently registered IP address. For configuration information, see [Associate LPCOR with Mobile Phone Calls, on page 1109](#).

### PSTN Trunks

An incoming LPCOR resource group is associated with a PSTN trunk (digital or analog) through the voice port or trunk group.

When a call is routed to the PSTN network, the LPCOR policy of the target PSTN trunk can block calls from any resource group it is not explicitly configured to accept. Outgoing calls from a PSTN trunk are associated with a LPCOR policy based on either the voice port or trunk group, whichever is configured in the outbound POTS dial-peer.

For configuration information, see [Associate a LPCOR Policy with Analog Phone or PSTN Trunk Calls, on page 1099](#).

### VoIP Trunks

An incoming VoIP trunk call (H.323 or SIP) is associated with a LPCOR policy based on the remote IP address as follows:

#### Incoming H.323 trunk call

- IP address of the previous hub or originating gateway

### Incoming SIP trunk call

- IP address of the originating gateway
- Hostname from the earliest Via header of an incoming INVITE message. If the hostname is in domain name format, a DNS query is performed to resolve the name into an IP address.

Cisco Unified CME uses the resolved hostname or resolved IP address to determine the LPCOR policy based on the entries in the IP-trunk subnet table. If the LPCOR policy cannot be found through the IP address or hostname, the incoming H.323 or SIP trunk call is associated with the incoming LPCOR policy configured in voice service configuration mode.

The LPCOR policy of the VoIP target is determined through the configuration of the outbound VoIP dial-peer. The default LPCOR policy is applied to the VoIP target if an outgoing LPCOR policy is not defined in the target VoIP dial-peer.

For configuration information, see [Associate a LPCOR Policy with VoIP Trunk Calls, on page 1102](#).

## LPCOR Support for Supplementary Services

[Table 97: Supplementary Services Support with LPCOR, on page 1093](#) describes LPCOR support for calls using supplementary services.

**Table 97: Supplementary Services Support with LPCOR**

| Feature       | Description                                                                                                                                                                                                                                                                                                                              | SCCP Phone | SIP Phone |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-----------|
| Basic Call    | Cisco Unified CME invokes the LPCOR policy validation if both the incoming call and target destination are associated with a LPCOR policy.<br><br>If the LPCOR policy validation fails, cause-code 63 (no service available) or the user-defined cause-code is returned to the remote switch. The call can hunt to the next destination. | Yes        | Yes       |
| Call Forward  | When a call is forwarded to a new destination, Cisco Unified CME invokes the LPCOR policy validation between the source and the forwarding target. The call is not forwarded to the target if the LPCOR policy is restricted.                                                                                                            | Yes        | Yes       |
| Call Transfer | Blind and Consultative Call Transfer is restricted if the LPCOR policy validation fails between the transferee and transfer-to parties.<br><br>For consultative call transfers, the reorder tone plays and an error message displays on the transferor phone. The call is not disconnected between the transferee and transferor.        | Yes        | Yes       |

| Feature                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | SCCP Phone | SIP Phone       |
|---------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-----------------|
| Ad Hoc Conference (software-based, 3-party)                         | Cisco Unified CME invokes the LPCOR policy validation for each call joined to a conference. A call is blocked from joining the conference if the LPCOR policy validation fails.                                                                                                                                                                                                                                                                                                                      | Yes        | No              |
| Ad Hoc Conference (hardware-based)                                  | <p>The reorder tone plays and the conference cannot complete message displays on the IP phone that initiated the conference. The call is resumed by the transferor who initiated the conference.</p> <p><b>Note</b><br/>If the LPCOR policy validation fails during a blind transfer setup to a conference bridge, the call is released.</p> <p><b>Note</b><br/>LPCOR validation is not supported for additional call transfer or conference operations from a 3-party software conference call.</p> | Yes        | Yes             |
| Meet-Me Conference                                                  | <p>LPCOR policy of each conference party is validated when a new call is joined to a conference. The call is blocked from joining the conference if the LPCOR policy validation fails.</p> <p>The reorder tone plays and the conference cannot complete message displays on the IP phone that initiated the Meet-Me conference.</p>                                                                                                                                                                  | Yes        | Yes (join only) |
| Call Pickup/Group Pickup (Cisco Unified CME 7.1 and later versions) | <p>Call Pickup and Pickup Groups enable phone users to answer a call that is ringing on a different extension. The pickup is blocked if the LPCOR policy validation between the call and the pickup phone fails.</p> <p>The reorder tone plays and the unknown number message displays on the IP phone that attempts the call pickup.</p>                                                                                                                                                            | Yes        | Yes             |
| Call Park (Cisco Unified CME 7.1 and later versions)                | <p>Phone users can place a call on hold at a special extension so it can be retrieved by other phones.</p> <p>A phone is not allowed to retrieve a parked call if the LPCOR policy validation fails. The reorder tone plays and the unknown number message displays on the IP phone that attempts to retrieve the parked call. The call remains parked at the call-park slot.</p>                                                                                                                    | Yes        | Yes             |
| Call Park Retrieval                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Yes        | Yes             |
| Hunt Group Pilot (ephone hunt group)                                | Supported for sequential and longest idle hunt groups. The LPCOR policy validation is performed when a call is directed to a SCCP endpoint through the ephone hunt-group.                                                                                                                                                                                                                                                                                                                            | Yes        | No              |

| Feature                             | Description                                                                                                                                                                                                                                                                                                         | SCCP Phone | SIP Phone |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-----------|
| Hunt Group Pilot (voice hunt group) | Supported for parallel hunt groups only. A hunt target can be a SCCP phone, SIP phone, VoIP trunk, or PSTN trunk. The LPCOR policy validation is performed between the call and the pilot hunt target. A call is blocked from a target if the LPCOR policy is restricted.                                           | Yes        | Yes       |
| Shared Line                         | Phones with a shared directory number must have the same LPCOR policy.                                                                                                                                                                                                                                              | Yes        | Yes       |
| CBarge                              | Phone users who share a directory number can join an active call on the shared line. Phones must have the same LPCOR policy.                                                                                                                                                                                        | Yes        | Yes       |
| Third-Party Call Control            | Cisco Unified CME supports out-of-dialog refer (OOD-R) by a remote call-control system. The LPCOR validation is performed during the second outbound call setup after the first outbound call is established. The OOD-R request fails if the LPCOR policy between the first and second outbound call is restricted. | Yes        | Yes       |

## Phone Display and Warning Tone for LPCOR

Cisco Unified CME plays the reorder tone to callers when it blocks calls due to LPCOR policy authentication. [Table 98: Message Display for Blocked LPCOR Calls, on page 1095](#) lists the message that displays on the phone when a call is blocked.

**Table 98: Message Display for Blocked LPCOR Calls**

| Call Block Type    | Phone Display Message      |                 |
|--------------------|----------------------------|-----------------|
|                    | SCCP Phone                 | SIP Phone       |
| Call Transfer      | Unable to Transfer         | Transfer Failed |
| Conference         | Cannot Complete Conference |                 |
| Meet-Me Conference | No Screen Display Update   |                 |
| Pickup             | Unknown Number             |                 |
| Park               | Unknown Number             |                 |

## LPCOR VSAs

New vendor-specific attributes (VSAs) for the LPCOR policy associated with a call are included in the call detail records (CDRs) generated by Cisco Unified CME for Remote Authentication Dial-in User Services (RADIUS) accounting. A null value is used for call legs without an associated LPCOR policy, which is the default LPCOR value. The incoming or outgoing LPCOR policy of a call is added to RADIUS stop records.

Table 99: VSAs Supported by Cisco Voice Calls , on page 1096 lists the new VSAs.

Table 99: VSAs Supported by Cisco Voice Calls

| Attribute       | VSA No. (Decimal) | Format for Value or Text | Sample Value or Text | Description                                                                                               |
|-----------------|-------------------|--------------------------|----------------------|-----------------------------------------------------------------------------------------------------------|
| in-lpcor-group  | 1                 | String                   | pstn_group           | Logical partitioning class of restriction (LPCOR) resource-group policy associated with an incoming call. |
| out-lpcor-group | 1                 | String                   | voip_group           | LPCOR resource-group policy associated with an outgoing call.                                             |

## Configure LPCOR

### Define a LPCOR Policy

To enable LPCOR functionality and define a policy for each resource group that requires call restrictions, perform the following task. You can define one LPCOR policy for each resource group. Do not create a LPCOR policy for resource groups that do not require call restrictions. A target resource group without a LPCOR policy can accept incoming calls from any other resource group.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice lpcor enable**
4. **voice lpcor call-block cause** *cause-code*
5. **voice lpcor custom**
6. **group** *number lpcor-group*
7. **exit**
8. **voice lpcor policy** *lpcor-group*
9. **accept** *lpcor-group*
10. **end**

#### DETAILED STEPS

##### Procedure

|        | Command or Action                                      | Purpose                                                                                                                   |
|--------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|                | Command or Action                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b>  | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                  | Enters global configuration mode.                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b>  | <b>voice lpcor enable</b><br><b>Example:</b><br><pre>Router(config)# voice lpcor enable</pre>                                          | Enables LPCOR functionality on the Cisco Unified CME router.                                                                                                                                                                                                                                                                               |
| <b>Step 4</b>  | <b>voice lpcor call-block cause <i>cause-code</i></b><br><b>Example:</b><br><pre>Router(config)# voice lpcor call-block cause 79</pre> | (Optional) Defines the cause code to use when a call is blocked because LPCOR validation fails. <ul style="list-style-type: none"> <li>• Range: 1 to 180. Default: 63 (serv/opt-unavail-unspecified). Type ? to display a description of the cause codes.</li> </ul>                                                                       |
| <b>Step 5</b>  | <b>voice lpcor custom</b><br><b>Example:</b><br><pre>Router(config)# voice lpcor custom</pre>                                          | Defines the name and number of LPCOR resource groups on the Cisco Unified CME router.                                                                                                                                                                                                                                                      |
| <b>Step 6</b>  | <b>group <i>number</i> <i>lpcor-group</i></b><br><b>Example:</b><br><pre>Router(cfg-lpcor-custom)# group 1 pstn_trunk</pre>            | Adds a LPCOR resource group to the custom resource list. <ul style="list-style-type: none"> <li>• <i>number</i>—Group number of the LPCOR entry. Range: 1 to 64.</li> <li>• <i>lpcor-group</i>—String that identifies the LPCOR resource group.</li> </ul>                                                                                 |
| <b>Step 7</b>  | <b>exit</b><br><b>Example:</b><br><pre>Router(cfg-lpcor-custom)# exit</pre>                                                            | Exits LPCOR custom configuration mode.                                                                                                                                                                                                                                                                                                     |
| <b>Step 8</b>  | <b>voice lpcor policy <i>lpcor-group</i></b><br><b>Example:</b><br><pre>Router(config)# voice lpcor policy pstn_trunk</pre>            | Creates a LPCOR policy for a resource group. <ul style="list-style-type: none"> <li>• <i>lpcor-group</i>—Name of the resource group that you defined in Step 6.</li> </ul>                                                                                                                                                                 |
| <b>Step 9</b>  | <b>accept <i>lpcor-group</i></b><br><b>Example:</b><br><pre>Router(cfg-lpcor-policy)# accept analog_phone</pre>                        | Allows a LPCOR policy to accept calls associated with the specified resource group. <ul style="list-style-type: none"> <li>• Default: Calls from other groups are rejected; calls from the same resource group are accepted.</li> <li>• Repeat this command for each resource group whose calls you want this policy to accept.</li> </ul> |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br><pre>Router(cfg-lpcor-policy)# end</pre>                                                              | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                           |

## Examples

The following example shows a LPCOR configuration where resources are partitioned into five groups. Three of the resource groups have LPCOR policies that limit the calls they can accept. The other two groups, `ipphone_local` and `analog_phone`, can accept calls from any of the other resource groups because they do not have a LPCOR policy defined.

```
voice lpcor enable
voice lpcor call-block cause invalid-number
voice lpcor custom
 group 1 pstn_trunk
 group 2 analog_phone
 group 3 iptrunk
 group 4 ipphone_local
 group 5 ipphone_remote
!
voice lpcor policy pstn_trunk
 accept analog_phone
 accept ipphone_local
!
voice lpcor policy iptrunk
 accept analog_phone
 accept ipphone_local
 accept ipphone_remote
!
voice lpcor policy ipphone_remote
 accept iptrunk
 accept analog_phone
 accept ipphone_local
```

The following example shows a LPCOR configuration where resources are partitioned into the following four policy groups:

- `siptrunk`—Accepts all IP trunk calls.
- `h323trunk`—Accepts all IP trunk calls.
- `pstn`—Blocks all IP trunk and voice-mail calls.
- `voicemail`—Accepts both IP trunk and PSTN calls.

```
voice lpcor enable
voice lpcor custom
 group 1 siptrunk
 group 2 h323trunk
 group 3 pstn
 group 4 voicemail
!
voice lpcor policy siptrunk
 accept h323trunk
 accept voicemail
!
voice lpcor policy h323trunk
 accept siptrunk
 accept voicemail
!
voice lpcor policy pstn
!
voice lpcor policy voicemail
```

```
accept siptrunk
accept h323trunk
accept pstn
```

The following example shows a LPCOR policy that is configured to reject calls associated with itself. Devices that belong to the `local_phone` resource group cannot accept calls from each other.

```
voice lpcor policy local_phone
no accept local_phone
accept analog_phone
```

## Associate a LPCOR Policy with Analog Phone or PSTN Trunk Calls

To associate a LPCOR policy with calls that originate or terminate at an analog phone or PSTN trunk, perform the following task. You can apply a specific LPCOR policy through the voice port or trunk group to remote analog phones or to local analog phones that you do not want to associate with the default LPCOR policy.

**Note** For an analog FXS phone that is locally registered to Cisco Unified CME through the LAN, see [Associate a LPCOR Policy with IP Phone or SCCP FXS Phone Calls, on page 1105](#).

Incoming calls from an analog phone or PSTN trunk are associated with a LPCOR resource group based on the following configurations, in the order listed:

1. Voice port
2. Trunk group

Outgoing calls from an analog phone or PSTN trunk are associated with a LPCOR policy based on the voice port or trunk group configuration in the outbound POTS dial-peer:

- If the outbound dial-peer is configured with the **port** command, an outgoing call uses the LPCOR policy specified in the voice port.
- If the outbound dial-peer is configured with the **trunkgroup** command, the call uses the LPCOR policy specified in the trunk group.

### Before you begin

The LPCOR policy must be defined. See [Define a LPCOR Policy, on page 1096](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **trunk group** *name*
4. **lpcor incoming** *lpcor-group*
5. **lpcor outgoing** *lpcor-group*
6. **exit**
7. **voice-port** *port*
8. **lpcor incoming** *lpcor-group*

9. **lpcor outgoing** *lpcor-group*
10. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                    | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                            | Enters global configuration mode.                                                                                                                                  |
| <b>Step 3</b> | <b>trunk group</b> <i>name</i><br><b>Example:</b><br>Router(config)# trunk group isdn1                                | Enters trunk-group configuration mode to define a trunk group.                                                                                                     |
| <b>Step 4</b> | <b>lpcor incoming</b> <i>lpcor-group</i><br><b>Example:</b><br>Router(config-trunk-group)# lpcor incoming isdn_group1 | Associates a LPCOR resource-group policy with an incoming call.                                                                                                    |
| <b>Step 5</b> | <b>lpcor outgoing</b> <i>lpcor-group</i><br><b>Example:</b><br>Router(config-trunk-group)# lpcor outgoing isdn_group1 | Associates a LPCOR resource-group policy with an outgoing call.                                                                                                    |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Router(config-trunk-group)# exit                                                    |                                                                                                                                                                    |
| <b>Step 7</b> | <b>voice-port</b> <i>port</i><br><b>Example:</b><br>Router(config)# voice-port 0/1/0                                  | Enters voice-port configuration mode.<br><ul style="list-style-type: none"> <li>• <i>Port</i> argument is platform-dependent; type ? to display syntax.</li> </ul> |
| <b>Step 8</b> | <b>lpcor incoming</b> <i>lpcor-group</i><br><b>Example:</b><br>Router(config-voiceport)# lpcor incoming vp_group3     | Associates a LPCOR resource-group policy with an incoming call.                                                                                                    |
| <b>Step 9</b> | <b>lpcor outgoing</b> <i>lpcor-group</i><br><b>Example:</b><br>Router(config-voiceport)# lpcor outgoing vp_group3     | Associates a LPCOR resource-group policy with an outgoing call.                                                                                                    |

|         | Command or Action                                                  | Purpose                          |
|---------|--------------------------------------------------------------------|----------------------------------|
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-voiceport)# end | Returns to privileged EXEC mode. |

## Examples for Configuring LPCOR for a PSTN Trunk and Analog Phones

### PSTN Trunks

#### Analog Phones

The following example shows a configuration for a PSTN trunk. Outbound calls from dial peer 201 use LPCOR policy isdn\_group1 because dial peer 201 is configured with trunk group isdn1. Outbound calls from dial peer 202 use LPCOR policy vp\_group3 because dial peer 202 is configured with voice port 3/1:15. A dial peer can be configured with either a voice port or trunk group; it cannot use both.

```
trunk group isdn1
 lpcor incoming isdn_group1
 lpcor outgoing isdn_group1
!
interface Serial2/0:15
 isdn incoming-voice voice
 trunk-group isdn1
...
voice-port 3/1:15
 lpcor incoming vp_group3
 lpcor outgoing vp_group3
!
!
dial-peer voice 201 pots
description TG outbound dial-peer
destination-pattern 201T
trunkgroup isdn1
!
dial-peer voice 202 pots
description VP outbound dial-peer
destination-pattern 202T
port 3/1:15
```

The following example shows a LPCOR configuration for analog phones:

```
trunk group analog1
 lpcor incoming analog_group1
 lpcor outgoing analog_group1
!
voice-port 1/0/0
!
voice-port 1/0/1
!
voice-port 1/1/0
 lpcor incoming vp_group1
 lpcor outgoing vp_group1
!
dial-peer voice 100 pots
```

```

description VP dial-peer
destination-pattern 100
port 1/0/0
!
dial-peer voice 101 pots
description VP dial-peer
destination-pattern 101
port 1/0/1
!
dial-peer voice 110 pots
description VP dial-peer
destination-pattern 110
port 1/1/0
!
dial-peer voice 300 pots
description TG outbound dial-peer
destination-pattern 300
trunk-group analog1

```

## Associate a LPCOR Policy with VoIP Trunk Calls

To associate a LPCOR policy with calls that originate or terminate at a VoIP trunk (H.323 or SIP), perform the following task.

Incoming VoIP trunk calls are associated with a LPCOR policy based on the following configurations, in the order listed:

1. IP-trunk subnet table
2. Voice service voip configuration

Outgoing VoIP trunk calls are associated with a LPCOR policy based on the following configurations, in the order listed:

1. Outbound VoIP dial peer
2. Default LPCOR policy (no LPCOR policy is applied)

### Restriction

- The LPCOR IP-trunk subnet table is not supported for calls with an IPv6 address. The LPCOR policy specified with the **lpcor incoming** command in voice service configuration mode is supported for IPv6 trunk calls.
- Only a single LPCOR policy is applied to outgoing IP trunk calls if the outbound VoIP dial-peer is configured with the **session target** command using the **sip-server** or **ras** keyword.
- If a dial peer COR and LPCOR are both defined in a dial peer, the dial peer COR configuration has priority over LPCOR. For example, if the dial peer COR restricts the call and LPCOR allows the call, the call fails because of the dial peer COR before ever considering LPCOR.

### Before you begin

The LPCOR policy must be defined. See [Define a LPCOR Policy, on page 1096](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice lpcor ip-trunk subnet incoming**
4. **index** *index-number lpcor-group { ipv4-address network-mask | hostname hostname }*
5. **exit**
6. **voice service voip**
7. **lpcor incoming** *lpcor-group*
8. **exit**
9. **dial-peer voice tag voip**
10. **lpcor outgoing** *lpcor-group*
11. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                                    | Purpose                                                                                                               |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                                   | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                           | Enters global configuration mode.                                                                                     |
| <b>Step 3</b> | <b>voice lpcor ip-trunk subnet incoming</b><br><b>Example:</b><br>Router(config)# voice lpcor ip-trunk subnet incoming                                                                               | Creates a LPCOR IP-trunk subnet table for incoming calls from a VoIP trunk.                                           |
| <b>Step 4</b> | <b>index</b> <i>index-number lpcor-group { ipv4-address network-mask   hostname hostname }</i><br><b>Example:</b><br>Router(cfg-lpcor-iptrunk-subnet)# index 1 h323_group1 172.19.33.0 255.255.255.0 | Adds a LPCOR resource group to the IP trunk subnet table.                                                             |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(cfg-lpcor-iptrunk-subnet)# exit                                                                                                                             | Exits LPCOR custom configuration mode.                                                                                |
| <b>Step 6</b> | <b>voice service voip</b><br><b>Example:</b><br>Router(config)# voice service voip                                                                                                                   | Enters voice-service configuration mode to specify the VoIP encapsulation type.                                       |

|                | Command or Action                                                                                                   | Purpose                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <b>Step 7</b>  | <b>lpcor incoming <i>lpcor-group</i></b><br><b>Example:</b><br>Router(conf-voi-serv)# lpcor incoming voip_trunk_1   | Associates a LPCOR resource-group policy with an incoming call.           |
| <b>Step 8</b>  | <b>exit</b><br><b>Example:</b><br>Router(conf-voi-serv)# exit                                                       | Exits voice-service configuration mode.                                   |
| <b>Step 9</b>  | <b>dial-peer voice <i>tag</i> voip</b><br><b>Example:</b><br>Router(config)# dial-peer voice 233 voip               | Enters dial-peer configuration mode to define a dial peer for VoIP calls. |
| <b>Step 10</b> | <b>lpcor outgoing <i>lpcor-group</i></b><br><b>Example:</b><br>Router(config-dial-peer)# lpcor outgoing h323_group1 | Associates a LPCOR resource-group policy with an outgoing call.           |
| <b>Step 11</b> | <b>end</b><br><b>Example:</b><br>Router(config-dial-peer)# end                                                      | Returns to privileged EXEC mode.                                          |

### Examples

The following example shows a LPCOR configuration for VoIP trunks:

```
voice lpcor ip-trunk subnet incoming
 index 1 h323_group1 172.19.33.0 255.255.255.0
 index 2 sip_group1 172.19.22.0 255.255.255.0
 index 3 sip_group2 hostname sipexample
!
voice service voip
 lpcor incoming voip_trunk_1
!
dial-peer voice 233 voip
 description H323 trunk outbound dial-peer
 destination-pattern 233T
 session target ipv4:172.19.33.233
 lpcor outgoing h323_group1
!
dial-peer voice 2255 voip
 description SIP trunk outbound dial-peer
 destination-pattern 255T
 session protocol sipv2
 session target ipv4:172.19.33.255
 lpcor outgoing sip_group1
```

## Associate a LPCOR Policy with IP Phone or SCCP FXS Phone Calls

To associate a LPCOR policy with calls that originate or terminate at a local or remote IP phone or local SCCP analog (FXS) phone, perform the following task.

According to TRAI requirements, an IP phone or a SCCP FXS phone can accept both PSTN and VoIP calls if it is locally registered to Cisco Unified CME through the LAN. If a phone is registered to Cisco Unified CME through the WAN, then PSTN calls must be blocked from that remote phone.

### Restriction

- Phones that share a directory number must be configured with the same LPCOR policy. A warning message displays if you try to configure a different LPCOR policy between IP phones that share the same directory number.
- Local and remote IP phones cannot use the same LPCOR policy.
- Software-based three-party ad hoc conferencing is not supported on SIP phones.
- Hardware-based ad hoc conferencing is not supported on SIP phones.
- LPCOR feature is not supported on voice gateways such as the Cisco VG224 or Cisco integrated service router if the voice gateway is registered to Cisco Unified Communications Manager. Cisco Unified Communications Manager does not support LPCOR.
- If a third-party call-control application makes two separate calls to Cisco Unified CME and performs a media bridging between the two calls, LPCOR validation is not supported because Cisco Unified CME is not aware of the bridging.

### Before you begin

- The LPCOR policy must be defined. See [Define a LPCOR Policy, on page 1096](#).
- SCCP FXS phones are configured with the **type anl** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag* or **voice register pool** *phone-tag*
4. **lpcor type** { **local** | **remote** }
5. **lpcor incoming** *lpcor-group*
6. **lpcor outgoing** *lpcor-group*
7. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action | Purpose                       |
|--------|-------------------|-------------------------------|
| Step 1 | <b>enable</b>     | Enables privileged EXEC mode. |

|               | Command or Action                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Step 7</b> | <b>end</b><br><br><b>Example:</b><br><br>Router(config-ephone)# end<br><br>or<br><br>Router(config-register-pool)# end | Returns to privileged EXEC mode.                                                                                                                                                                                                                                  |

### Example for Configuring LPCOR on SCCP Phone, SIP Phones, and SCCP FXS Phones

#### SCCP

#### SIP

#### SCCP FXS Analog

The following example shows a LPCOR configuration for two SCCP phones. One configuration is applied directly to the phone and the other is applied through a phone template:

```
ephone-template 1
 lpcor type local
 lpcor incoming ephone_group1
 lpcor outgoing ephone_group1
!
ephone 1
 mac-address 00E1.CB13.0395
 ephone-template 1
 type 7960
 button 1:1
!
ephone 2
 lpcor type remote
 lpcor incoming ephone_group2
 lpcor outgoing ephone_group2
 mac-address 001C.821C.ED23
 type 7960
 button 1:2
```

The following example shows a LPCOR configuration for two SIP phones:

```
voice register template 1
 lpcor type local
 lpcor incoming test_group
 lpcor outgoing test_group
!
voice register pool 3
 id mac 001B.D584.E80A
```

```

type 7960
number 1 dn 2
template 1
codec g711ulaw
!
voice register pool 4
lpcor type remote
lpcor incoming remote_group3
lpcor outgoing remote_group3
id mac 0030.94C2.9A55
type 7960
number 1 dn 2
dtmf-relay rtp-nt

```

The following example shows a LPCOR configuration for two SCCP FXS phones connected to a Cisco VG224 and controlled by Cisco Unified CME:

```

dial-peer voice 102 pots
service stcapp
port 1/0/2
!
ephone 5
lpcor type local
lpcor incoming analog_vg224
lpcor outgoing analog_vg224
mac-address F9E5.8B28.2402
ephone-template 1
max-calls-per-button 2
type anl
button 1:5
!
ephone 6
lpcor type local
lpcor incoming analog_vg224
lpcor outgoing analog_vg224
mac-address F9E5.8B28.2403
ephone-template 1
max-calls-per-button 2
type anl
button 1:6

```

Figure 42: SCCP FXS Phones Managed by Cisco Unified CME, on page 1108 shows an example of a network with SCCP FXS phones managed by Cisco Unified CME.

**Figure 42: SCCP FXS Phones Managed by Cisco Unified CME**

## Associate LPCOR with Mobile Phone Calls

To associate a LPCOR policy with calls that originate or terminate at a mobile-type phone, perform the following task.

A mobile-type phone can register to Cisco Unified CME through either the LAN or WAN. For example an Extension Mobility phone, Cisco IP Communicator softphone, or a remote teleworker phone.

Incoming and outgoing calls to and from a mobile-type phone are associated with a LPCOR policy based on the following configurations, in the order listed:

1. IP-phone subnet table
2. Default LPCOR policy for mobile-type phones

|                    |                                                                                  |
|--------------------|----------------------------------------------------------------------------------|
| <b>Restriction</b> | The LPCOR IP-phone subnet table is not supported for calls with an IPv6 address. |
|--------------------|----------------------------------------------------------------------------------|

### Before you begin

The LPCOR policy must be defined. See [Define a LPCOR Policy, on page 1096](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag* or **voice register pool** *phone-tag*
4. **lpcor type mobile**
5. **exit**
6. **voice lpcor ip-phone subnet** { **incoming** | **outgoing** }
7. **index** *index-number* *lpcor-group* { *ipv4-address network-mask* [**vrf** *vrf-name*] | **dhcp-pool** *pool-name* }
8. **exit**
9. **voice lpcor ip-phone mobility** { **incoming** | **outgoing** } *lpcor-group*
10. **exit**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                          | Purpose                                                             |
|---------------|----------------------------------------------------------------------------|---------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br>• Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                   |

|                | Command or Action                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b>  | <b>ephone <i>phone-tag</i> or voice register pool <i>phone-tag</i></b><br><b>Example:</b><br><pre>Router(config)# ephone 1</pre> or<br><pre>Router(config)# voice register pool 1</pre>                                                          | <p>Enters ephone configuration mode to set phone-specific parameters for an SCCP phone.</p> <p>or</p> <p>Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone.</p> <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies the phone. Range is version and platform-dependent; type ? to display range.</li> </ul> |
| <b>Step 4</b>  | <b>lpcor type mobile</b><br><b>Example:</b><br><pre>Router(config-ephone)# lpcor type mobile</pre>                                                                                                                                               | <p>Sets the LPCOR type for a mobile-type phone.</p> <ul style="list-style-type: none"> <li>• This command can also be configured in ephone-template or voice register template configuration mode and applied to one or more phones. The phone configuration has precedence over the template configuration.</li> </ul>                                                                               |
| <b>Step 5</b>  | <b>exit</b><br><b>Example:</b><br><pre>Router(config-ephone)# exit</pre>                                                                                                                                                                         | Exits the phone configuration.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 6</b>  | <b>voice lpcor ip-phone subnet {incoming   outgoing}</b><br><b>Example:</b><br><pre>Router(config)# voice lpcor ip-phone subnet incoming</pre>                                                                                                   | Creates a LPCOR IP-phone subnet table for calls to or from a mobile-type phone.                                                                                                                                                                                                                                                                                                                       |
| <b>Step 7</b>  | <b>index <i>index-number</i> lpcor-group {<i>ipv4-address</i> <i>network-mask</i> [<i>vrfvrf-name</i>]   dhcp-pool <i>pool-name</i>}</b><br><b>Example:</b><br><pre>Router(cfg-lpcor-ipphone-subnet)# index 1 local_group1 dhcp-pool pool1</pre> | Adds a LPCOR group to the IP-phone subnet table.                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 8</b>  | <b>exit</b><br><b>Example:</b><br><pre>Router(cfg-lpcor-ipphone-subnet)# exit</pre>                                                                                                                                                              | Exits LPCOR IP-phone configuration mode.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 9</b>  | <b>voice lpcor ip-phone mobility {incoming   outgoing} lpcor-group</b><br><b>Example:</b><br><pre>Router(config)# voice lpcor ip-phone mobility incoming remote_group1</pre>                                                                     | Sets the default LPCOR policy for mobile-type phones.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 10</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config)# exit</pre>                                                                                                                                                                                | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                        |

## Examples

The following example shows the configuration for three mobile-type phones:

```
ephone 270
 lpcor type mobile
 mac-address 1234.4321.6000
 type 7960
 button 1:6
 mtp
 codec g729r8 dspfarm-assist
 description teleworker remote phone
ephone 281
 lpcor type mobile
 mac-address 0003.4713.5554
 type CIPC
 button 1:5
...
voice register pool 6
 lpcor type mobile
 id mac 0030.94C2.9A66
 type 7960
 number 1 dn 3
 dtmf-relay rtp-nte
```

The following example shows a LPCOR IP-phone subnet configuration with a single shared IP address pool. Any mobile-type IP phones with a shared IP address from DHCP pool1 are considered local IP phones and are associated with the local\_group1 LPCOR policy. Other mobile-type IP phones without a shared IP address are considered remote IP phones and are associated with remote\_group1, the default LPCOR policy for mobile-type phones.

```
ip dhcp pool pool1
 network 10.0.0.0 255.255.0.0
 option 150 ip 10.0.0.1
 default-router 10.0.0.1
!
!
voice lpcor ip-phone subnet incoming
 index 1 local_group1 dhcp-pool pool1
!
voice lpcor ip-phone subnet outgoing
 index 1 local_group1 dhcp-pool pool1
!
voice lpcor ip-phone mobility incoming remote_group1
voice lpcor ip-phone mobility outgoing remote_group1
```

The following example shows a LPCOR IP-phone subnet configuration with a separate IP address DHCP pools. Any mobile-type IP phones with separate DHCP pools are considered local IP phones and are assigned the local\_group1 LPCOR policy. Other mobile-type IP phones without a DHCP address are considered remote IP phones and are assigned the remote\_group1 LPCOR policy.

```
ip dhcp pool client1
 network 10.0.0.0 255.255.0.0
 mac-address 0003.4713.5554
 option 150 ip 10.0.0.1
 default-router 10.0.0.1
!
```

```

ip dhcp pool client2
 network 10.0.0.0 255.255.0.0
 mac-address 0030.94C2.9A66
 option 150 ip 10.0.0.1
 default-router 10.0.0.1
!
!
voice lpcor ip-phone subnet incoming
 index 1 local_group1 dhcp-pool client1
 index 2 local_group1 dhcp-pool client2
!
voice lpcor ip-phone subnet outgoing
 index 1 local_group1 dhcp-pool client1
 index 2 local_group1 dhcp-pool client2
!
voice lpcor ip-phone mobility incoming remote_group1
voice lpcor ip-phone mobility outgoing remote_group1

```

The following example shows a LPCOR IP phone subnet configuration with both an IP address network mask and a single shared-address DHCP pool. A specific LPCOR policy can be associated with an IP phone by matching the IP address network mask in the IP-phone subnet table. LPCOR policy `local_group2` is associated with the local IP phone with IP address 10.0.10.23. LPCOR `local_group2` is associated with the other local IP phones through the DHCP-pool match.

```

ip dhcp pool pool1
 network 10.0.0.0 255.255.0.0
 option 150 ip 10.0.0.1
 default-router 10.0.0.1
!
!
voice lpcor ip-phone subnet incoming
 index 1 local_g2 10.0.10.23 255.255.255.0 vrf vrf-group2
 index 2 remote_g2 172.19.0.0 255.255.0.0
 index 3 local_g1 dhcp-pool pool1
!
voice lpcor ip-phone subnet outgoing
 index 1 local_g4 10.1.10.23 255.255.255.0 vrf vrf-group2
 index 2 remote_g4 172.19.0.0 255.255.0.0
 index 3 local_g5 dhcp-pool pool1
!
voice lpcor ip-phone mobility incoming remote_g1
voice lpcor ip-phone mobility outgoing remote_g1

```

## Verify LPCOR Configuration

Use the following **show** commands to display LPCOR configuration information and to verify the LPCOR policy associated with calls.

- **show call active voice**—Displays the LPCOR information for incoming and outgoing call legs (VoIP, ephone, SIP, PSTN).
- **show call history voice**—Displays the LPCOR information for incoming and outgoing call legs (VoIP, ephone, SIP, PSTN). Also displays the LPCOR call-block cause code if the call is blocked due to LPCOR policy validation.
- **show dial-peer voice**—Displays configuration settings for voice dial peers including the LPCOR setting for incoming and outgoing calls.

- **show trunk group**—Displays configuration settings for trunk groups including the LPCOR setting for incoming and outgoing calls.
- **show voice lpcor**—Displays information about LPCOR calls including the LPCOR policy associated with each resource group and directory number, and statistics for failed calls.
- **show voice port**—Displays configuration settings for voice ports including the LPCOR setting for incoming and outgoing calls.

## Configuration Examples for LPCOR

### Example for Configuring LPCOR for Cisco Unified CME

Figure 43: LPCOR Resource Grouping in Cisco Unified CME Network, on page 1113 shows an example of a Cisco Unified CME network using LPCOR. This network is organized into the following four LPCOR resource groups:

- **local\_group**—Analog and IP phones, including a mobile-type phone, connected locally to Cisco Unified CME.
- **psn\_group**—Trunks between the PSTN and Cisco Unified CME.
- **remote\_group**—IP phones, including a mobile-type phone, and a SIP proxy server connected remotely to Cisco Unified CME through the WAN.
- **voice\_mail\_group**—Cisco Unity Express voice-mail system connected remotely to Cisco Unified CME through the WAN.

Figure 43: LPCOR Resource Grouping in Cisco Unified CME Network

Figure 44: LPCOR Policy Logic, on page 1114 illustrates the access policy between resource groups that provides the following call requirements:

- Blocks calls between remote\_group and pstn\_group
- Blocks calls from voice\_mail\_group to pstn\_group and remote\_group
- Allows calls between local\_group and remote\_group
- Allows calls between local\_group and pstn\_group
- Allows all calls to voice\_mail\_group

Figure 44: LPCOR Policy Logic

The following output shows the LPCOR configuration for this example and describes the steps. Comments describing the configuration are included in the output.

1. Enable LPCOR functionality in Cisco Unified CME and define custom LPCOR group.

```

voice lpcor enable
!
voice lpcor custom
group 1 pstn_group
group 2 local_group
group 3 remote_group
group 4 voice_mail_group
!
#Allow calls only from local group to PSTN group
voice lpcor policy pstn_group
accept local_group
!
Allow calls from PSTN, remote, and voice_mail groups to local group
voice lpcor policy local_group
accept pstn_group
accept remote_group
accept voice_mail_group
!
Allow calls only from local group to remote group
voice lpcor policy remote_group
accept local_group
!
Allow calls from PSTN, remote, and local groups to voice_mail group

```

```
voice lpcor voice_mail_group
 accept pstn_group
 accept local_group
 accept remote_group
!
```

## 2. Assign LPCOR to the phone, trunk, and IP resources.

```
analog phone5
voice-port 1/0/0
 lpcor incoming local_group
 lpcor outgoing local_group
!
analog phone6
voice-port 1/0/1
 lpcor incoming local_group
 lpcor outgoing local_group
!
TDM trunks
voice-port 2/1:23
 lpcor incoming pstn_group
 lpcor outgoing pstn_group
!
!
Specific LPCOR setting for incoming calls from voice_mail_group
voice lpcor ip-trunk subnet incoming
 voice_mail_group 172.19.28.11 255.255.255.255
!
!
Default LPCOR setting for any incoming VoIP calls
voice service voip
 lpcor incoming remote_group
!
Cisco Unified CME is DHCP server
ip dhcp pool client1
 network 10.0.0.0 255.255.0.0
 mac-address 0003.4713.5554
 option 150 ip 10.0.0.1
 default-router 10.0.0.1
!
IP phone1 (local)
ephone 1
 lpcor type local
 lpcor incoming local_group
 lpcor outgoing local_group
!
IP phone2 (mobile)
ephone 2
 lpcor type mobile
!
IP phone3 (remote)
ephone 3
 lpcor type remote
 lpcor incoming remote_group
 lpcor outgoing remote_group
!
IP phone4 (mobile)
ephone 4
 lpcor type mobile
!
IP-phone subnet tables for mobile IP phones
voice lpcor ip-phone subnet incoming
 local_group dhcp-pool pool1
!
```

```

voice lpcor ip-phone subnet outgoing
 local_group dhcp-pool client1
!
Default LPCOR policy for mobile IP phones that
are not provisioned through IP-phone subnet tables
voice lpcor ip-phone mobility incoming remote_group
voice lpcor ip-phone mobility outgoing remote_group

```

### 3. Define outgoing LPCOR setting for outgoing VoIP calls.

```

VoIP outbound dial-peer to Cisco Unity Express mail
dial-peer voice 1234 voip
 destination-pattern 56800
 session target ipv4:172.19.281.1
 pcor outgoing voice_mail_group
!
VoIP outbound dial-peer to SIP proxy
dial-peer voice 1255 voip
 destination-pattern 1255T
 session protocol sipv2
 session target sip-server
 lpcor outgoing remote

```

## Example for Configuring LPCOR on Cisco 3800 Series Integrated Services Router

## Feature Information for LPCOR

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

*Table 100: Feature Information for LPCOR*

| Feature Name                                       | Cisco Unified CME Version | Feature Information                   |
|----------------------------------------------------|---------------------------|---------------------------------------|
| Call Restriction Regulations for Cisco Unified CME | 8.0                       | Introduced support for LPCOR feature. |

## CHAPTER 43

# Call Transfer and Forward

- [Information About Call Transfer and Forward, on page 1133](#)
- [Configure Call Transfer and Forwarding, on page 1160](#)
- [Configuration Examples for Call Transfer and Forwarding, on page 1204](#)
- [Where to Go Next, on page 1216](#)
- [Feature Information for Call Transfer and Forwarding, on page 1217](#)

## Information About Call Transfer and Forward

### Call Forward

Call forward feature diverts calls to a specified number under one or more of the following conditions:

- **All calls**—When all-call call forwarding is activated by a phone user, all incoming calls are diverted. The target destination for diverted calls can be specified in the router configuration or by the phone user with a soft key or feature access code. The most recently entered destination is recognized by Cisco Unified CME, regardless of how it was entered.
- **No answer**—Incoming calls are diverted when the extension does not answer before the timeout expires. The target destination for diverted calls is specified in the router configuration.
- **Busy**—Incoming calls are diverted when the extension is busy and call waiting is not active. The target destination for diverted calls is specified in the router configuration.
- **Night service**—All incoming calls are automatically diverted during night-service hours. The target destination for diverted calls is specified in the router configuration.

A directory number can have all four types of call forwarding defined at the same time with a different forwarding destination defined for each type of call forwarding. If more than one type of call forwarding is active at one time, the order for evaluating the different types is as follows:

1. Call forward night-service
2. Call forward all
3. Call forward busy and call forward no-answer

H.450.3 capabilities are enabled globally on the router by default, and can be disabled either globally or for individual dial peers. You can configure incoming patterns for using the H.450.3 standard. Calling-party numbers that do not match the patterns defined with this command are forwarded using Cisco-proprietary call forwarding for backward compatibility. For information about configuring H.450.3 on a Cisco Unified CME system, see [Enable Call Forwarding for a Directory Number, on page 1167](#).

## Selective Call Forward

You can apply call forward to a busy or no-answer directory number based on the number that is dialed to reach the directory number: the primary number, the secondary number, or either of those numbers expanded by a dial-plan pattern.

Cisco Unified CME automatically creates one POTS dial peer for each ephone-dn when it is assigned a primary number. If the ephone-dn is assigned a secondary number, it creates a second POTS dial peer. If the **dialplan-pattern** command is used to expand the primary and secondary numbers for ephone-dns, it creates two more dial peers, resulting in the creation of the following four dial peers for the ephone-dn:

- A POTS dial peer for the primary number
- A POTS dial peer for the secondary number
- A POTS dial peer for the primary number as expanded by the **dialplan-pattern** command
- A POTS dial peer for the secondary number as expanded by the **dialplan-pattern** command

Call forwarding is normally applied to all dial peers created for an ephone-dn. Selective call forwarding allows you to apply call forwarding for busy or no-answer calls only for the dial peers you have specified, based on the called number that was used to route the call to the ephone-dn.

For example, the following commands set up a single ephone-dn (ephone-dn 5) with four dial peers:

```
telephony-service
 dialplan-pattern 1 40855501.. extension-length 4 extension-pattern 50..

ephone-dn 5
 number 5066 secondary 5067
```

In this example, selective call forwarding can be applied so that calls are forwarded when:

- callers dial the primary number 5066.
- when callers dial the secondary number 5067.
- when callers dial the expanded numbers 4085550166 or 4085550167.

For configuration information, see [Enable Call Forwarding for a Directory Number, on page 1167](#).

## Call Forward Unregistered

The Call Forward Unregistered (CFU) feature allows you to forward a call to a different number if the directory number (DN) is not associated with a phone or if the associated phone is not registered to Cisco Unified CME. The CFU feature is very useful for wireless phone users when the wireless phone is out of the access point or phone shuts down automatically because of an automatic shutdown feature. The service is not available and the call can be forwarded to the CFU destination. Any unregistered or floating DN can be forwarded using the CFU feature.

An unregistered DN indicates that none of its associated phones are registered to the Cisco Unified CME. A registered phone will become unregistered when the Cisco Unified CME sends an unregistration request or

responses to a phone's unregistration request. Cisco Unified CME sends an unregistration request under the following circumstances:

- When the keepalive timer expires.
- When a user issues a reset or restart command on the phone.
- When an extension mobility (EM) user logs into the phone. (All DN's configured under the logout-profile are unregistered except for the shared ones that are associated with other registered phones.)
- When an EM user logs out of the phone. (All DN's configured under the user-profile are unregistered except for the shared ones that are associated with other registered phones.)

There is always a gap between the time the phone loses its connection with Cisco Unified CME and the time when Cisco Unified CME claims the phone is unregistered. The length of the gap depends on the keepalive timer. Cisco Unified CME considers the phone as registered and tries to associate DN's until the keepalive timer expires. You can configure the expiration for the keepalive timer using the `registrar server expires max <seconds> min <seconds>` command under `sip` in voice service voip mode for SIP IP phones. For more information, see [Example for Configuring Keepalive Timer Expiration in SIP Phones, on page 1216](#).

Cisco Unified CME 8.6 supports the CFU feature on SIP IP phones using the call-forward b2bua unregistered command under voice register dn tag. The CFU feature supports overlap dialing and en-bloc dialing. A call to a floating DN is forwarded to its CFU destination, if configured. Calls to a DN out of service point or phones losing connection are not forwarded to a CFU number until the phone becomes unregistered. For more information on configuring call-forward unregistered, see [Example for Configuring Call Forward Unregistered for SIP IP Phones, on page 1215](#).

---

**Note** In earlier versions of Cisco Unified CME, a busy tone was played for callers when the callers are unable to reach the SCCP phone number. In Cisco Unified CME 8.6 and later versions, a fast busy tone is played instead of a busy tone for callers who are unable to reach the phone.

---

## B2BUA Call Forward for SIP Devices

Cisco Unified CME 3.4 and later versions acts as both UA server and UA client; that is, as a B2BUA. Calls into a SIP phone can be forwarded to other SIP or SCCP devices (including Cisco Unity or Cisco Unity Express, third-party voice mail systems, an auto attendant or an IVR system, such as Cisco Unified IPCC and Cisco Unified IPCC Express). In addition, SCCP phones can be forwarded to SIP phones.

Cisco Unity or other voice-messaging systems connected by a SIP trunk or SIP user agent are able to pass an MWI to a SIP phone when a call is forwarded. The SIP phone then displays the MWI when indicated by the voice-messaging system.

The call-forward busy response is triggered when a call is sent to a SIP phone using a VoIP dial peer and a busy response is received back from the phone. SIP-to-SIP call forwarding is invoked only if the phone is dialed directly. Call forwarding is not invoked when the phone number is called through a sequential, longest-idle, or peer hunt group.

You can configure call forwarding for an individual directory number, or for every number on a SIP phone. If the information is configured in both, the information under voice register dn takes precedence over the information configured under voice register pool.

For configuration information, see [Configure SIP-to-SIP Phone Call Forwarding, on page 1195](#).

## Call Forward All Synchronization for SIP Phones

The Call Forward All feature allows users to forward all incoming calls to a phone number that they specify. This feature is supported on all SIP phones and can be provisioned from either Cisco Unified CME or the individual SIP phone. Before Cisco Unified CME 4.1, there was no method for exchanging the Call Forward All configuration between Cisco Unified CME and the SIP phone. If Call Forward All was enabled on the phone, the configuration in Cisco Unified CME was not updated; conversely, the configuration in Cisco Unified CME was not sent to the phone.

In Cisco Unified CME 4.1 and later, the following enhancements are supported for the Cisco Unified IP Phone 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE to keep the configuration consistent between Cisco Unified CME and the SIP phone:

- When Call Forward All is configured on Cisco Unified CME with the **call-forward b2bua all** command, the configuration is sent to the phone which updates the CfwdAll soft key to indicate that Call forward All is enabled. Because Call Forward All is configured on a per line basis, the CfwdAll soft key is updated only when Call Forward All is enabled for the primary line.
- When a user enables Call Forward All on a phone using the CfwdAll soft key, the uniform resource identifier (URI) for the service (defined with the **call-feature-uri** command) and the call forward number (unless Call Forward All is disabled) is sent to Cisco Unified CME. It updates its voice register pool and voice register dn configuration with the **call-forward b2bua all** command to be consistent with the phone configuration.
- Call Forward All supports KPML so that a user does not need to press the Dial or # key, or wait for the interdigit timeout, to configure the Call Forward All number. Cisco Unified CME collects the Call Forward All digits until it finds a match in the dial peers.

For configuration information, see [Configure Call-Forwarding-All Softkey URI on SIP Phones, on page 1200](#).

## Call Transfer

When you are connected to another party, call transfer allows you to shift the connection of the other party to a different number. Call transfer methods must inter-operate with systems in the other networks with which you interface. Cisco CME 3.2 and later versions provide full call-transfer and call-forwarding interoperability with call processing systems that support H.450.2, H.450.3, and H.450.12 standards. For call processing systems that do not support H.450 standards, Cisco CME 3.2 and later versions provide VoIP-to-VoIP hairpin call routing.

Call transfers can be blind or consultative. A blind transfer is one in which the transferring extension connects the caller to a destination extension before ringback begins. A consultative transfer is one in which the transferring party either connects the caller to a ringing phone (ringback heard) or speaks with the third party before connecting the caller to the third party.

You can configure blind or consultative transfer on a system-wide basis or for individual extensions. For example, in a system that is set up for consultative transfer, a specific extension with an auto-attendant that automatically transfers incoming calls to specific extension numbers can be set to use blind transfer, because auto-attendants do not use consultative transfer.

## Call Transfer Blocking

Transfers to all numbers except those on local phones are automatically blocked by default. During configuration, you can allow transfers to nonlocal numbers. In Cisco Unified CME 4.0 and later versions, you can prevent individual phones from transferring calls to numbers that are globally enabled for transfer. This ensures that individual phones do not incur toll charges by transferring calls outside the Cisco Unified CME

system. Call transfer blocking can be configured for individual phones or configured as part of a template that is applied to a set of phones.

Another way to eliminate toll charges on call transfers is to limit the number of digits that phone users can dial when transferring calls. For example, if you specify a maximum of eight digits in the configuration, users who are transferring calls can dial one digit for external access and seven digits more, which is generally enough for a local number but not a long-distance number. In most locations, this plan will limit transfers to nontoll destinations. Long-distance calls, which typically require ten digits or more, will not be allowed. This configuration is only necessary when global transfer to numbers outside the Cisco Unified CME system has been enabled using the **transfer-pattern** (telephony-service) command. Transfers to numbers outside the Cisco Unified CME system are not permitted by default.

For configuration information, see [Configure Call Transfer Options for SCCP Phones, on page 1172](#).

## Trunk-to-Trunk Transfer Blocking for Toll Fraud Prevention on Cisco Unified SIP IP Phones

In Cisco Unified CME 4.0 trunk-to-trunk transfer blocking for toll bypass fraud prevention is supported on Cisco Unified Skinny Client Control Protocol (SCCP) IP phones.

In Cisco Unified CME 9.5, trunk-to-trunk transfer blocking for toll bypass fraud prevention is also supported on Cisco Unified Session Initiation Protocol (SIP) IP phones.

In Cisco Unified CME 10.5, trunk-to-trunk conference blocking is also supported on Cisco Unified Skinny Client Control Protocol (SCCP) and Cisco Unified Session Initiation Protocol (SIP) IP phones.

[Table 101: Configuration Modes for Transfer-Blocking Commands, on page 1137](#) lists the transfer-blocking commands and the appropriate configuration modes for Cisco Unified CME and Cisco Unified SRST.

**Table 101: Configuration Modes for Transfer-Blocking Commands**

| Commands                        | Cisco Unified CME                                                           |
|---------------------------------|-----------------------------------------------------------------------------|
| <b>transfer-pattern</b>         | telephony-service                                                           |
| <b>transfer max-length</b>      | voice register pool<br>or<br>voice register template                        |
| <b>transfer-pattern blocked</b> | voice register pool<br>or<br>voice register template                        |
| conference transfer-pattern     | telephony-service                                                           |
| <b>conference max-length</b>    | ephone<br>ephone-template<br>voice register pool<br>voice register template |

| Commands                          | Cisco Unified CME                                                           |
|-----------------------------------|-----------------------------------------------------------------------------|
| <b>conference-pattern blocked</b> | ephone<br>ephone-template<br>voice register pool<br>voice register template |

**Note** The call transfer and conference restrictions apply when transfers or conferences are initiated toward external parties, like a PSTN trunk, a SIP trunk, or an H.323 trunk. The restrictions do not apply to transfers to local extensions.

## Transfer Pattern

The **transfer-pattern** command for Cisco Unified SCCP IP phones is extended to Cisco Unified SIP IP phones.

The **transfer-pattern** command specifies the directory numbers for call transfer. The command can be configured up to 32 times using the following command syntax:

```
transfer-pattern transfer-pattern [blind]
```

**Note** The **blind** keyword in the **transfer-pattern** command applies to Cisco Unified SCCP IP phones only and does not apply to Cisco Unified SIP IP phones.

With the **transfer-pattern** command configured, only call transfers to numbers that match the configured transfer pattern are allowed to take place. With the transfer pattern configured, all or a subset of transfer numbers can be dialed and the transfer to a remote party can be initiated.

**Note** In Cisco Unified CME 9.5 and later versions, Cisco Unified SIP IP phones and Cisco Unified SCCP IP phones registered to the same Cisco Unified CME are considered local and do not require transfer-pattern configuration.

The following are examples of configurable transfer patterns:

- **.T**—This configuration allows call transfers to any destinations with one or more digits, like 123, 877656, or 76548765.
- **919.....**—This configuration only allows call transfers to remote numbers beginning with “919” and followed by eight digits, like 91912345678. However, call transfers to 9191234 or 919123456789 are not allowed.

## Backward Compatibility

To maintain backward compatibility, all call transfers from Cisco Unified SIP IP phones to any number (local or over trunk) are allowed when no transfer patterns are configured through the **transfer-pattern**, **transfer-pattern blocked**, or **transfer max-length** commands.

For Cisco Unified SCCP IP phones, call transfers over trunk continue to be blocked when no transfer patterns are configured.

## Dial Plans

Whatever dial plan is used for external calls, the same numbers should be configured as specific numbers using the **transfer-pattern** command.

If a dial plan requires “9” to be dialed before an external call is made, then “9” should be a prefix of the transfer-pattern number. For example, 12345678 is an external number that requires “9” to be dialed before the external call can be made so the transfer-pattern number should be 912345678.

---

**Note** In Cisco Unified CME 9.5 and later versions, once transfer patterns are configured in telephony-service configuration mode, the transfer patterns apply to both Cisco Unified SCCP IP phones and Cisco Unified SIP IP phones.

---

## Transfer Max-Length

The **transfer max-length** command is used to indicate the maximum length of the number being dialed for a call transfer. When only a specific number of digits are to be allowed during a call transfer, a value between 3 and 16 is configured. When the number dialed exceeds the maximum length configured, then the call transfer is blocked.

For example, the maximum length is configured as 5, then only call transfers from Cisco Unified SIP IP phones up to a five-digit directory number are allowed. All call transfers to directory numbers with more than five digits are blocked.

---

**Note** If only transfer max length is configured and conference max-length is not configured, then transfer max-length takes effect for transfers and conferences.

---

## Conference Max-Length

Conference calls are allowed when:

- both **conference transfer-pattern** and **transfer-pattern** commands are configured
- dialed digits match the configured transfer pattern

When conference max-length command is configured, the Cisco Unified CME will allow the conferences only if the dialed digits are within the max-length limit.

If configured, the conference max-length command does not impact call transfers.

---

**Note** If both **conference max-length** and **transfer max-length** commands are configured, the conference **max-length** command takes precedence for conferences.

---

## Conference-Pattern Blocked

The `conference-pattern blocked` command is used to prevent extensions on an ephone or a voice register pool from initiating conferences.

The following table summarizes the behavior of the **conference-pattern blocked** command in relation to **no conference-pattern blocked**, **conference max-length**, **no conference max-length**, and **transfer max-length** commands.

|                                                     | <b>conference max-length</b>                                                     | <b>no conference max-length</b>                                                |
|-----------------------------------------------------|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>No conference-pattern blocked (default case)</b> | Allowing/Blocking of conference call depends on configured conference max-length | Allowing/Blocking of conference call depends on configured transfer max-length |
| <b>conference-pattern blocked</b>                   | No conference calls allowed for SIP and SCCP phones.                             |                                                                                |

|                                                                                                                                            | <b>Max-length &lt;= allowed max-length</b> |            | <b>Max-length &gt; allowed max-length</b> |            |
|--------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|------------|-------------------------------------------|------------|
|                                                                                                                                            | Transfer                                   | Conference | Transfer                                  | Conference |
| Transfer max-length + No Conference max-length (use transfer max-length for conference cases too, as conference max-length not configured) | Y                                          | Y          | N                                         | N          |
| No transfer max-length + Conference max-length (conference max-length has precedence over transfer max-length for conference)              | Y                                          | Y          | Y                                         | N          |
| No transfer max-length + Conference max-length (conference max-length has precedence over transfer max-length for conference)              | Y                                          | Y          | N                                         | N          |

|                                                            |                                                |
|------------------------------------------------------------|------------------------------------------------|
| No transfer<br>max-length + No<br>conference<br>max-length | All transfer and conference calls are allowed. |
|------------------------------------------------------------|------------------------------------------------|

## Configure the Maximum Number of Digits for a Conference Call

### Before you begin

- Cisco Unified CME 10.5 or a later version.
- The conference transfer-pattern command must be configured.
- The transfer-pattern command must be configured.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
  - **voice register pool** *pool-tag*
  - **voice register template** *template-tag*
  - **ephone** *phone-tag*
  - **ephone template** *template-tag*
4. **conference max-length** value
5. **exit**

Range is 1 to 100. |

|               | Command or Action                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br><pre>Router(config)# voice register pool 25</pre>                                                      | or<br>Enters voice register template configuration mode and defines a template of common parameters for Cisco Unified SIP IP phones. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Declares a template tag. Range is 1 to 10.</li> </ul> or<br>Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks. The maximum number of ephones is version and platform-specific. Type? to display range.</li> </ul> |
| <b>Step 4</b> | <b>conference max-length</b> value<br><b>Example:</b><br><pre>Router(config-register-pool)# conference max-length 6</pre> | Allows the conference calls from Cisco IP phones to specified directory numbers of phones. <ul style="list-style-type: none"> <li>• <b>conference max-length</b>—Specifies the maximum number of digits while making a conference call. Range is 3 to 16.</li> </ul>                                                                                                                                                                                                                                                                        |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config-register-pool)# exit</pre>                                           | Exits voice register pool configuration mode and enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configure Conference Blocking Options for Phones

To prevent extensions from making conference calls to directory numbers that are otherwise allowed globally.

### Before you begin

- Cisco Unified CME 10.5 or a later version.
- The conference transfer-pattern command must be configured.
- The transfer-pattern command must be configured.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
  - **voice register pool** *pool-tag* or
  - **voice register template** *template-tag*
  - **ephone** *phone-tag*
  - **ephone template** *template-tag*

4. **conference-pattern blocked**
5. **exit**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><code>Router&gt; enable</code>                                                                                                                                                                                                                                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>                                                                                                                                                                                                                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | Enter one of the following commands: <ul style="list-style-type: none"> <li>• <b>voice register pool</b> <i>pool-tag</i> or</li> <li>• <b>voice register template</b> <i>template-tag</i></li> <li>• <b>ephone</b> <i>phone-tag</i></li> <li>• <b>ephone template</b> <i>template-tag</i></li> </ul> <b>Example:</b><br><code>Router(config)# voice register pool 25</code> | Enters voice register pool configuration mode and creates a pool configuration for a Cisco Unified SIP IP phone in Cisco Unified CME or for a set of Cisco Unified SIP IP phones in Cisco Unified SIP SRST. <ul style="list-style-type: none"> <li>• <b>pool-tag</b>—Unique number assigned to the pool. Range is 1 to 100.</li> </ul> or<br>Enters voice register template configuration mode and defines a template of common parameters for Cisco Unified SIP IP phones. <ul style="list-style-type: none"> <li>• <b>template-tag</b>—Declares a template tag. Range is 1 to 10.</li> </ul> or<br>Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <b>phone-tag</b>—Unique sequence number that identifies this ephone during configuration tasks. The maximum number of ephones is version and platform-specific. Type? to display range.</li> </ul> |
| <b>Step 4</b> | <b>conference-pattern blocked</b><br><b>Example:</b><br><code>Router(config-register-pool)#</code>                                                                                                                                                                                                                                                                          | Blocks conference calls to external numbers. <ul style="list-style-type: none"> <li>• <b>conference-pattern block</b>—Prevents extensions on an ephone or a voice register pool from initiating conferences.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-register-pool)# exit</code>                                                                                                                                                                                                                                                                                           | Exits voice register pool configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Transfer-Pattern Blocked

When the **transfer-pattern blocked** command is configured for a specific phone, no call transfers are allowed from that phone over the trunk.

This feature forces unconditional blocking of all call transfers from the specific phone to any other non-local numbers (external calls from one trunk to another trunk). No call transfers from this specific phone are possible even when a transfer pattern matches the dialed digits for transfer.

[Table 102: Behaviors of Cisco Unified IP Phones for Specific Configurations, on page 1144](#) compares the behaviors of Cisco Unified SCCP and SIP IP phones for specific configurations.

**Table 102: Behaviors of Cisco Unified IP Phones for Specific Configurations**

| Configuration                                              | Cisco Unified SCCP IP Phones                                                                                                                         | Cisco Unified SIP IP Phones                                                                                                                                                                                               |
|------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Specific transfer patterns are configured.                 | Call transfers to specific external entities are allowed.                                                                                            | Call transfers to specific external entities are allowed.                                                                                                                                                                 |
| The <b>transfer-pattern blocked</b> command is configured. | All non-local call transfers are blocked.<br><br><b>Note</b><br>The configuration reverts to the default, where no transfer patterns are configured. | All non-local call transfers are blocked.<br><br><b>Note</b><br>The configuration unconditionally blocks all non-local call transfers. It does not return to the default, where all non-local call transfers are allowed. |

## Conference Transfer-Pattern

When both the **transfer-pattern** and **conference transfer-pattern** commands are configured and the dialed digits match the configured transfer pattern, conference calls are allowed. However, when the dialed digits do not match any of the configured transfer pattern, the conference call is blocked.

For configuration information, see [Specify Transfer Patterns for Trunk-to-Trunk Calls and Conferences for SIP, on page 1174](#) and [Conference-Pattern Blocked, on page 1140](#) and [Conference Max-Length, on page 1139](#).

For configuration examples, see [Example for Configuring Conference Transfer Patterns, on page 1205](#), [Example for Configuring Maximum Length of Transfer Number, on page 1205](#), [Example for Configuring Transfer Patterns, on page 1205](#), and [Example for Blocking All Call Transfers, on page 1206](#).

## Call Transfer Recall on SCCP Phones

The Call Transfer Recall feature in Cisco Unified CME 4.3 and later versions returns a transferred call to the phone that initiated the transfer if the destination is busy or does not answer. After a phone user completes a transfer to a directory number on a local phone, if the transfer-to party does not answer before the configured recall timer expires, the call is directed back to the transferor phone. The message “Transfer Recall From xxxx” displays on the transferor phone.

The transfer-to directory number cannot have Call Forward Busy enabled, or it cannot be a hunt group pilot number. If the transfer-to directory number has Call Forward No Answer (CFNA) enabled, Cisco Unified CME recalls the call only if the transfer-recall timeout is set to less than the CFNA timeout. If the transfer-recall

timeout is set to more than the CFNA timeout, the call is forwarded to the CFNA target number after the transfer-to party does not answer.

If the transferor phone is busy, Cisco Unified CME attempts the recall again after the transfer-recall timeout value expires. Cisco Unified CME attempts a recall up to three times. If the transferor phone remains busy, the call is disconnected after the third recall attempt.

The transferor phone and transfer-to phone must be registered to the same Cisco Unified CME, however the transferee phone can be remote.

For configuration information, see [Enable Call Transfer and Forwarding on SCCP Phones at System-Level, on page 1160](#).

## Call Transfer Recall on SIP Phones

From Unified CME 11.6 onwards, Call Transfer Recall feature is supported on SIP phones. This feature returns a transferred call to the phone that initiated the transfer if the destination is busy or does not answer. After a phone user completes a transfer to a directory number on a local SIP phone, and if the transfer-to party does not answer before the configured recall timer expires, the call is directed back to the transferor phone. The message "Transfer Recall From xxxx" displays on the transferor phone.

The Call Transfer Recall in SIP phones is achieved using the CLI **timeouts transfer-recall** command in voice register dn or voice register global configuration modes.

The transfer-to directory number cannot have Call Forward Busy enabled, or it cannot be a hunt group pilot number. The transferor phone and transfer-to phone must be registered to the same Cisco Unified CME, however the transferee phone can be remote. If the transfer-to directory number has Call Forward No Answer (CFNA) enabled, Cisco Unified CME recalls the call only if the transfer-recall timeout is set to less than the CFNA timeout. If the transfer-recall timeout is set to more than the CFNA timeout, the call is forwarded to the CFNA target number after the transfer-to party does not answer. If the transfer-recall timeout is equal to the CFNA timeout, the call is forwarded to the CFNA target number as the CFNA timeout expires before the transfer-recall timeout.

When Call Forward All is configured in Cisco Unified CME, the call is forwarded directly to call forward target number irrespective of whether the phone is busy or idle. In this scenario, transfer recall is not applicable after the call is forwarded.

If the transferor phone is busy, Cisco Unified CME attempts the recall again after the transfer-recall timeout value expires. Cisco Unified CME attempts a recall up to three times. If the transferor phone remains busy, the call is disconnected after the third recall attempt. Also, if the transferor phone is a shared line, and if one of the phones is idle, the transfer recall is directed to the transferor phone that is idle.

When Single Number Reach (SNR) is configured in Cisco Unified CME, the desk IP Phone rings first. If the desk IP Phone does not answer within the configured SNR timer expiry value, the configured remote number (mobile) starts ringing while continuing to ring the desk IP Phone. If both the extensions does not answer the call, transfer recall is directed back to the transferor phone. Transfer recall does not happen if the desk IP Phone or remote phone (mobile) is busy. Also, transfer recall does not happen if one of the SNR extensions answers the call.

For configuration information, see [Enable Call-Transfer Recall on SIP Phones at System-Level, on page 1166](#).

From Cisco Unified CME release 11.6 onwards, call transfer recall feature supports mixed deployment of SCCP and SIP phones. In a mixed deployment scenario, you can have a SIP phone as transferor and with an SCCP phone being transfer-to or vice versa.

In mixed mode, if the transfer recall is performed with multiple SIP or SCCP transferors and a single transfer-to SCCP phone, transfer recall display messages are displayed on both the transferors. Here, transfer recall

happens for all the calls when the destination is busy or does not answer the call. In the case of single transfer-to SIP phones, only the first phone call is recalled even if dual-line is configured.

## Consultative-Transfer Enhancements in Cisco Unified CME 4.3 and Later Versions

Cisco Unified CME 4.3 modifies the digit-collection process for consultative call transfers. After a phone user presses the Transfer soft key to make a consultative transfer, a new consultative call leg is created and the Transfer soft key is not displayed again until the dialed digits of the transfer-to number are matched to a transfer pattern and the consultative call leg is in the alerting state.

Transfer-to digits dialed by the phone user are no longer buffered. The dialed digits, except the call park FAC code, are collected on the seized consultative call-leg until the digits match a pattern for consultative transfer, blind transfer, park-slot transfer, park-slot transfer blocking, or PSTN transfer blocking. The existing pattern matching process is unchanged, and you have the option of using this new transfer digit-collection method or reverting to the former method.

Before Cisco Unified CME 4.3, the consultative transfer feature collects dialed digits on the original call leg until the digits either match a transfer pattern or blocking pattern. When the transfer-to number is matched, and PSTN blocking is not enabled, the original call is put on hold and an idle line or channel is seized to send the dialed digits from the buffer.

The method of matching a pattern for consultative transfer, blind transfer, park-slot transfer, park-slot transfer blocking, PSTN transfer blocking, and after-hours blocking remain the same. When the transfer-to number matches the pattern for a blind transfer or park-slot transfer, Cisco Unified CME terminates the consultative call leg and transfers the call.

After the transfer-to digits are collected, if the transfer is not committed before the transfer-timeout expires in 30 seconds, the consultation call leg is disconnected.

These enhancements are supported only if:

- The **transfer-system full-consult** command (default) is set in telephony-service configuration mode.
- The **transfer-mode consult** command (default) is set for the transferor's directory number (ephone-dn).
- An idle line or channel is available for seizing, digit collection, and dialing.

Cisco Unified CME 4.3 and later versions enable these transfer enhancements by default.

To revert to the digit-collection method used in previous versions of Cisco Unified CME, see [Enable Call Transfer and Forwarding on SCCP Phones at System-Level, on page 1160](#).

## Consultative Transfer With Direct Station Select

Direct Station Select (DSS) is a feature that allows a multi-button phone user to transfer calls to an idle monitored line by pressing the Transfer key and the appropriate monitored line button. A monitored line is one that appears on two phones; one phone can use the line to make and receive calls and the other phone simply monitors whether the line is in use. For Cisco CME 3.2 and later versions, consultative transfers can occur during Direct Station Select (transferring calls to idle monitored lines).

If the person sharing the monitored line does not want to accept the call, the person announcing the call can reconnect to the incoming call by pressing the EndCall soft key to terminate the announcement call and pressing the Resume soft key to reconnect to the original caller.

Direct Station Select consultative transfer is enabled with the **transfer-system full-consult dss** command, which defines the call transfer method for all lines served by the router. The **transfer-system full-consult dss** command supports the **keep-conference** command. See [Configure Hardware Conferencing, on page 1377](#).

## H.450.2 and H.450.3 Support

H.450.2 is a standard protocol for exchanging call-transfer information across a network, and H.450.3 is a standard protocol for exchanging call-forwarding information across a network. Cisco CME 3.0 and later versions support the H.450.2 call-transfer standards and the H.450.3 call-forwarding standards that were introduced in Cisco ITS V2.1. Using the H.450.2 and H.450.3 standards to manage call transfer and forwarding in a VoIP network provides the following benefits:

- The final call path from the transferred party to the transfer destination is optimal, with no hairpinned routes or excessive use of resources.
- Call parameters (for example, codec) can be different for the different call legs.
- This solution is scalable.
- There is no limit to the number of times a call can be transferred.

Considerations for using the H.450.2 and H.450.3 standards include the following:

- Cisco IOS Release 12.2(15)T or a later release is required on all voice gateways in the network.
- Support of H.450.2 and H.450.3 is required on all voice gateways in the network. H.450.2 and H.450.3 are used regardless of whether the transfer-to or forward-to target is on the same Cisco Unified CME system as the transferring party or the forwarding party, so the transferred party must also support H.450.2 and the forwarded party must also support H.450.3. The exception is calls that can be reoriginated through hairpin call routing or through the use of an H.450 tandem gateway.
- Call forwarding over SIP networks uses the *302 Moved Temporarily* SIP response, which works in a manner similar to the way in which the H.450.3 standard is used for H.323 networks. To enable call forwarding, you must specify a pattern that matches the calling-party numbers of the calls that you want to be able to forward.
- Cisco Unified CME supports all SIP Refer method call transfer scenarios, but you must ensure that call transfer is enabled using H.450.2 standards.
- H.450 standards are not supported by Cisco Unified Communications Manager, Cisco BTS, or Cisco PGW, although hairpin call routing or an H.450 tandem gateway can be set up to handle calls to and from those types of systems.

The following series of figures depicts a call being transferred using H.450.2 standards. [Figure 45: Call Transfer Using H.450.2: A Calls B, on page 1148](#) shows A calling B. [Figure 46: Call Transfer Using H.450.2: B Consults with C, on page 1148](#) shows B consulting with C and putting A on hold. [Figure 47: Call Transfer Using H.450.2: B Transfers A to C, on page 1148](#) shows that B has connected A and C, and [Figure 48: Call Transfer Using H.450.2: A and C Are Connected, on page 1148](#) shows A and C directly connected, with B no longer involved in the call.

**Figure 45: Call Transfer Using H.450.2: A Calls B****Figure 46: Call Transfer Using H.450.2: B Consults with C****Figure 47: Call Transfer Using H.450.2: B Transfers A to C****Figure 48: Call Transfer Using H.450.2: A and C Are Connected**

## Tips for Using H.450 Standards

Use H.450 standards when a network meets the following conditions:

- The router that you are configuring uses Cisco CME 3.0 or a later version, or Cisco ITS V2.1.
- For Cisco CME 3.0 or Cisco ITS V2.1 systems, all endpoints in the network must support H.450.2 and H.450.3 standards. For Cisco CME 3.1 or later systems, if some of the endpoints do not support H.450 standards (for example, Cisco Unified Communications Manager, Cisco BTS, or Cisco PGW), you can use hairpin call routing or an H.450 tandem gateway to handle transfers and forwards with those endpoints. Also, either you must explicitly disable H.450.2 and H.450.3 on the dial peers that handle those calls or you must enable H.450.12 capability to automatically detect the calls that support H.450.2 and H.450.3 and those calls that do not.

Support for the H.450.2 standard and the H.450.3 standard is enabled by default and can be disabled globally or for individual dial peers. For configuration information, see [Enable Call Transfer and Forwarding on SCCP Phones at System-Level, on page 1160](#).

## Transfer Method Recommendations by Cisco Unified CME Version

You must specify the method to use for call transfers: H.450.2 standard signaling or Cisco proprietary signaling, and whether transfers should be blind or allow consultation. [Table 103: Transfer Method Recommendations, on page 1149](#) summarizes transfer method recommendations for all Cisco Unified CME versions.

**Table 103: Transfer Method Recommendations**

| Cisco Unified CME Version | transfer-system Command Default | transfer-system Keyword to Use           | Transfer Method Recommendation                                                                                                                                                                                                                                                                                                                                                                                                            |

## H.450.12 Support

Cisco CME 3.1 and later versions support the H.450.12 call capabilities standard, which provides a means to advertise and dynamically discover H.450.2 and H.450.3 capabilities in voice gateway endpoints on a call-by-call basis. When discovered, the calls associated with non-H.450 endpoints can be directed to use non-H.450 methods for transfer and forwarding, such as hairpin call routing or H.450 tandem gateway.

When H.450.12 is enabled, H.450.2 and H.450.3 services are disabled for call transfers and call forwards unless a positive H.450.12 indication is received from all other VoIP endpoints involved in the call. If a positive H.450.12 indication is received, the router uses the H.450.2 standard for call transfers and the H.450.3 standard for call forwarding. If a positive H.450.12 indication is not received, the router uses the alternative method that you have configured for call transfers and forwards, either hairpin call routing or an H.450 tandem gateway.

You can have either of the following situations in your network:

- All gateway endpoints support H.450.2 and H.450.3 standards. In this situation, no special configuration is required because support for H.450.2 and H.450.3 standards is enabled on the Cisco CME 3.1 or later router by default. H.450.12 capability is disabled by default, but it is not required because all calls can use H.450.2 and H.450.3 standards.
- Not all gateway endpoints support H.450.2 and H.450.3 standards. Therefore, specify how non-H.450 calls are to be handled by choosing one of the following options:
  - Enable the H.450.12 capability in Cisco CME 3.1 and later to dynamically determine, on a call-by-call basis, whether each call has H.450.2 and H.450.3 support. If H.450.12 is enabled and a call is determined to have H.450 support, the call is transferred using H.450.2 standards or forwarded using H.450.3 standards. See [Enable H.450.12 Capabilities, on page 1178](#).

Support for the H.450.12 standard is disabled by default and can be enabled globally or for individual dial peers.

If the call does not have H.450 support, it can be handled by a VoIP-to-VoIP connection that you configure using dial peers and [Enable H.323-to-H.323 Connection Capabilities, on page 1180](#). The connection can be used for hairpin call routing or routing to an H.450 tandem gateway.

- Explicitly disable H.450.2 and H.450.3 capability on a global basis or by individual dial peer, which forces all calls to be handled by a VoIP-to-VoIP connection that you configure using dial peers and the [Enable H.323-to-H.323 Connection Capabilities, on page 1180](#). This connection can be used for hairpin call routing or routing to an H.450 tandem gateway.

## Hairpin Call Routing

Cisco CME 3.1 and later supports hairpin call routing using a VoIP-to-VoIP connection to transfer and forward calls that cannot use H.450 standards. When a call that originally terminated on a voice gateway is transferred or forwarded by a phone or other application attached to the gateway, the gateway reoriginates the call and routes the call as appropriate, making a VoIP-to-VoIP, or hairpin, connection. This approach avoids any protocol dependency on the far-end transferred-party endpoint or transfer-destination endpoint. Hairpin routing of transferred and forwarded calls also causes the generation of separate billing records for each call leg, so that the transferred or forwarded call leg is typically billed to the user who initiates the transfer or forward.

In Cisco CME 3.2 and later versions, transcoding between G.711 and G.729 is supported when one leg of a VoIP-to-VoIP hairpin call uses G.711 and the other leg uses G.729.

Hairpin call routing provides the following benefits:

- Call transfer and forwarding is provided to non-H.450 endpoints, such as Cisco Unified Communications Manager, Cisco BTS, or Cisco PGW.
- The network can also contain Cisco CME 3.0 or Cisco ITS 2.1 systems.

Hairpin call routing has the following disadvantages:

- End-to-end signaling and media delay are increased significantly.
- A single hairpinned call uses as much WAN bandwidth as two directly connected calls.

VoIP-to-VoIP hairpin connections can be made using dial peers if the **allow-connections h323 to h323** command is enabled and at least one of the following is true:

- H.450.12 is used to detect calls on which H.450.2 or H.450.3 is not supported by the remote system.
- H.450.2 or H.450.3 is explicitly disabled.
- Cisco Unified CME automatically detects that the remote system is a Cisco Unified Communications Manager.

[Figure 49: Hairpin with H.323: A Calls B, on page 1152](#) shows a call that is made from A to B. [Figure 50: Hairpin with H.323: Call is Forwarded to C, on page 1152](#) shows that B has forwarded all calls to C. [Figure 51: Hairpin with H.323: A is Connected to C via B, on page 1152](#) shows that A and C are connected by an H.323 hairpin.

**Figure 49: Hairpin with H.323: A Calls B****Figure 50: Hairpin with H.323: Call is Forwarded to C****Figure 51: Hairpin with H.323: A is Connected to C via B**

## Tips for Using Hairpin Call Routing

Use hairpin call routing when a network meets the following three conditions:

- The router that you are configuring uses Cisco CME 3.1 or a later version.
- Some or all calls require VoIP-to-VoIP routing because they cannot use H.450 standards, which can happen for any of the following reasons:
  - H.450 capabilities have been explicitly disabled on the router.
  - H.450 capabilities do not exist in the network.
  - H.450 capabilities are supported on some endpoints and not supported on other endpoints, including those handled by Cisco Unified Communications Manager, Cisco BTS, and Cisco PGW. When some endpoints support H.450 and others do not, you must enable H.450.12 capabilities on the router to detect which endpoints are H.450-capable or designate some dial peers as H.450-capable.

For more information about enabling H.450.12 capabilities, see [Enable H.450.12 Capabilities, on page 1178](#).

- No voice gateway is available to act as an H.450 tandem gateway.

For information about configuring Cisco Unified CME to forward calls using local hairpin routing, see [Forward Calls Using Local Hairpin Routing, on page 1182](#).

Support for VoIP-to-VoIP connections is disabled by default and can be enabled globally. For configuration information, see [Enable H.323-to-H.323 Connection Capabilities, on page 1180](#).

## Calling Number Local

In a scenario where calls are forwarded using local hairpin call routing, you can use the Calling Number Local feature. Calling Number Local replaces a calling-party number and name with the forwarding-party number and name (the local number and name). For ephone-dns, the CLI command **calling-number local** is configured under telephony-service configuration to enable the feature. For more information, see [Cisco Unified Communications Manager Express Command Reference](#).

From Cisco Unified CME Release 12.0 onwards, calling number local feature is supported for voice register DNs as well. For voice register DNs, the CLI command **calling-number local** is configured in voice register global configuration mode. For more information, see [Cisco Unified Communications Manager Express Command Reference](#).

When the CLI command **calling-number local** is enabled, the calling number is replaced with the forwarding party's number. If the forwarded number is over a trunk, toll charges may be applied on the forwarding number.

## H.450 Tandem Gateways

H.450 tandem gateways address the limitations of hairpin call routing using a manner similar to hairpin call routing but without the double WAN link traversal created by hairpin connections. An H.450 tandem gateway is an additional voice gateway that serves as a “front-end” for a call processor that does not support the H.450 standards, such as Cisco Unified Communications Manager, Cisco BTS Softswitch (Cisco BTS), or Cisco PSTN Gateway (Cisco PGW). Transferred and forwarded calls that are intended for non-H.450 endpoints are terminated instead on the H.450 tandem gateway and reoriginated there for delivery to the non-H.450 endpoints. The H.450 tandem gateway can also serve as a PSTN gateway.

An H.450 tandem gateway is configured with a dial peer that points to the Cisco Unified Communications Manager or other system for which the H.450 tandem gateway is serving as a front end. The H.450 tandem voice gateway is also configured with dial peers that point to all the Cisco Unified CME systems in the private H.450 network. In this way, Cisco Unified CME and the Cisco Unified Communications Manager are not directly linked to each other, but are instead both linked to an H.450 tandem gateway that provides H.450 services to the non-H.450 platform.

An H.450 tandem gateway can also work as a PSTN gateway for remote Cisco Unified CME systems and for Cisco Unified Communications Manager (or other non-H.450 system). Use different inbound dial peers to separate Cisco Unified Communications Manager-to-PSTN G.711 calls from tandem gateway-to-Cisco Unified CME G.729 calls.

**Note** An H.450 tandem gateway that is used in a network to support non-H.450-capable call processing systems requires the Integrated Voice and Video Services feature license. This feature license, which was introduced in March 2004, includes functionality for H.323 gatekeeper, IP-to-IP Gateway, and H.450 tandem gateway. With Cisco IOS Release 12.3(7)T, an H.323 gatekeeper feature license is required with a JSX Cisco IOS image on the selected router. Consult your Cisco Unified CME SE regarding the required feature license. With Cisco IOS Release 12.3(7)T, you cannot use Cisco Unified CME and H.450 tandem gateway functionality on the same router.

VoIP-to-VoIP connections can be made for an H.450 tandem gateway if the **allow-connections h323 to h323** command is enabled and one or more of the following is true:

- H.450.12 is used to dynamically detect calls on which H.450.2 or H.450.3 is not supported by the remote VoIP system.
- H.450.2 or H.450.3 is explicitly disabled.
- Cisco CME 3.1 or later automatically detects that the remote system is a Cisco Unified Communications Manager.

For Cisco CME 3.1 and earlier, the only type of VoIP-to-VoIP connection supported by Cisco Unified CME is H.323-to-H.323. For Cisco CME 3.2 and later versions, H.323-to-SIP connections are allowed only for Cisco Unified CME systems running Cisco Unity Express.

[Figure 52: H.450 Tandem Gateway, on page 1155](#) shows a tandem voice gateway that is located between the central hub of the network of a CPE-based Cisco CME 3.1 or later network and a Cisco Unified Communications Manager network. This topology would work equally well with a Cisco BTS or Cisco PGW in place of the Cisco Unified Communications Manager.

In the network topology in [Figure 52: H.450 Tandem Gateway, on page 1155](#), the following events occur (refer to the event numbers on the illustration):

1. A call is generated from extension 4002 on phone 2, which is connected to a Cisco Unified Communications Manager. The H.450 tandem gateway receives the H.323 call and, acting as the H.323 endpoint, the H.450 tandem gateway handles the call connection to a Cisco Unified IP phone in a CPE-based Cisco CME 3.1 or later network.
2. The call is received by extension 1001 on phone 3, which is connected to Cisco Unified CME 1. Extension 1001 performs a consultation transfer to extension 2001 on phone 5, which is connected to Cisco Unified CME 2.
3. When extension 1001 transfers the call, the H.450 tandem gateway receives an H.450.2 message from extension 1001.
4. The H.450 tandem gateway terminates the call leg from extension 1001 and reoriginates a call leg to extension 2001, which is connected to Cisco Unified CME 2.
5. Extension 4002 is connected with extension 2001.

**Figure 52: H.450 Tandem Gateway**

### Tips for Using H.450 Tandem Gateways

Use this procedure when a network meets the following conditions:

- The router that you are configuring uses Cisco CME 3.1 or a later version.
- Some endpoints in the network are not H.450-capable, including those handled by Cisco Unified Communications Manager, Cisco BTS, and Cisco PGW.

Support for VoIP-to-VoIP connections is disabled by default and can be enabled globally. For more information, see [Enable H.323-to-H.323 Connection Capabilities, on page 1180](#).

Use dial peers to set up an H.450 tandem gateway. See [Dial Peers, on page 1155](#).

## Dial Peers

Dial peers describe the virtual interfaces to or from which a call is established. All voice technologies use dial peers to define the characteristics associated with a call leg. Attributes applied to a call leg include specific quality of service (QoS) features, compression/decompression (codec), voice activity detection (VAD), and fax rate. Dial peers are also used to establish the routing paths in your network, including special routing paths such as hairpins and H.450 tandem gateways. Dial peer settings override the global settings for call forward and call transfer.

## Q Signaling Supplementary Services

Q Signaling (QSIG) is an intelligent inter-PBX signaling system widely adopted by PBX vendors. It supports a range of basic services, generic functional procedures, and supplementary services. Cisco Unified CME 4.0 introduces supplementary services features that allow Cisco Unified CME phones to seamlessly interwork using QSIG with phones connected to a PBX. One benefit is that IP phones can use a PBX message center with proper MWI notifications. [Figure 53: Cisco Unified CME System with PBX, on page 1156](#) illustrates a topology for a Cisco Unified CME system with some phones under the control of a PBX.

**Figure 53: Cisco Unified CME System with PBX**

The following QSIG supplementary service features are supported in Cisco Unified CME systems. They follow the standards from the European Computer Manufacturers Association (ECMA) and the International Organization for Standardization (ISO) on PRI and BRI interfaces.

- Basic calls between IP phones and PBX phones.
- Calling Line/Name identification (CLIP/CNIP) presented on an IP phone when called by a PBX phone; in the reverse direction, such information is provided to the called endpoint.
- Connected Line/Name identification (COLP/CONP) information provided when a PBX phone calls an IP phone and is connected; in the reverse direction, such information presented on an IP phone.
- Call Forward using QSIG and H.450.3 to support any combination of IP phone and PBX phone, including an IP phone in the Cisco Unified CME system that is connected to a PBX or an IP phone in another Cisco Unified CME system across an H.323 network.
- Call forward to the PBX message center according to the configured policy. The other two endpoints can be a mixture of IP phone and PBX phones.
- Hairpin call transfer, which interworks with a PBX in transfer-by-join mode. Note that Cisco Unified CME does not support the actual signaling specified for this transfer mode (including the involved FACILITY message service APDUs) which are intended for an informative purpose only and not for the transfer functionality itself. As a transferrer (XOR) host, Cisco Unified CME simply hairpins two call legs to create a connection; as a transferee (XEE) or transfer-to (XTO) host, it will not be aware of a transfer that is taking place on an existing leg. As a result, the final endpoint may not be updated with the accurate identity of its peer. Both blind transfer and consult transfer are supported.

- Message-waiting indicator (MWI) activation or deactivation requests are processed from the PBX message center.
- The PBX message center can be interrogated for the MWI status of a particular ephone-dn.
- A user can retrieve voice messages from a PBX message center by making a normal call to the message center access number.

For information about enabling QSIG supplementary services, see [Enable H.450.7 and QSIG Supplementary Services at System-Level, on page 1184](#) and [Enable H.450.7 and QSIG Supplementary Services on a Dial Peer, on page 1185](#).

## Disable SIP Supplementary Services for Call Forward and Call Transfer

If a destination gateway does not support supplementary services, you can disable REFER messages for call transfers and the redirect responses for call forwarding from being sent by Cisco Unified CME.

For configuration information, see [Disable SIP Supplementary Services for Call Forward and Call Transfer, on page 1187](#).

## Typical Network Scenarios for Call Transfer and Call Forwarding

In a mixed network that involves two or more types of call agents or call-control systems, there can be communication protocol discrepancies and dependencies, and therefore the opportunity for interoperability errors. These discrepancies show up most often when a call is being transferred or forwarded. This section provides descriptions of the specific mixed-network scenarios you might encounter when configuring a router running Cisco CME 3.1 or a later version. Each of the following sections point to the configuration instructions necessary to ensure call transfer and forwarding capabilities throughout the network.

### Note

Cisco Communications Manager Express 3.2 (Cisco CME 3.2) and later versions provide full call-transfer and call-forwarding with call processing systems on the network that support H.450.2, H.450.3, and H.450.12 standards. For interoperability with call processing systems that do not support H.450 standards, Cisco CME 3.2 and later versions provide VoIP-to-VoIP hairpin call routing without requiring the special Tool Command Language (Tcl) script that was needed in earlier versions of Cisco Unified CME.

### Cisco CME 3.1 or Later and Cisco IOS Gateways

In a network with Cisco CME 3.1 or a later version and Cisco IOS gateways, all systems that might participate in calls that involve call transfer and call forwarding are capable of supporting the H.450.2, H.450.3, and H.450.12 standards. This is the simplest environment for operating the Cisco CME 3.1 or later features.

Configuration for this type of network consists of:

1. Setting up call-transfer and call-forwarding parameters for transfers and forwards that are initiated on this router (H.450.2 and H.450.3 capabilities for transferred parties, transfer destinations, forwarded parties, and forwarding destinations are enabled by default). See [Enable Call Transfer and Forwarding on SCCP Phones at System-Level, on page 1160](#).
2. Enabling H.450.12 globally to detect any calls on which H.450.2 and H.450.3 standards are not supported. Although this step is optional, we recommend it. See [Enable H.450.12 Capabilities, on page 1178](#).
3. Optionally setting up VoIP-to-VoIP connections (hairpin call routing or H.450 tandem gateway) to route calls that do not support H.450.2 or H.450.3 standards. See [Enable H.323-to-H.323 Connection Capabilities, on page 1180](#).
4. Setting up dial peers to manage call legs within the network.

## Cisco CME 3.0 or an Earlier Version and Cisco IOS Gateways

Before Cisco CME 3.1, H.450.2 and H.450.3 standards are used for all calls by default and routers do not support the H.450.12 standard.

Configuration for this type of network consists of:

- Setting up call-transfer and call-forwarding parameters for transfers and forwards that are initiated on this router (H.450.2 and H.450.3 capabilities for transferred parties, transfer destinations, forwarded parties, and forwarding destinations are enabled by default). See [Enable Call Transfer and Forwarding on SCCP Phones at System-Level, on page 1160](#)
- Enabling H.450.12 in advertise-only mode on Cisco CME 3.1 or later systems. As each Cisco CME 3.0 system is upgraded to Cisco CME 3.1 or later, enable H.450.12 in advertise-only mode. Note that no checking for H.450.2 or H.450.3 support is done in advertise-only mode. When all Cisco CME 3.0 systems in the network have been upgraded to Cisco CME 3.1 or later, remove the advertise-only restriction. See [Enable H.450.12 Capabilities, on page 1178](#)
- Optionally setting up VoIP-to-VoIP connections (hairpin call routing or H.450 tandem gateway) to route calls that cannot use H.450.2 or H.450.3 standards. See [Enable H.323-to-H.323 Connection Capabilities, on page 1180](#)
- Setting up dial peers to manage call legs within the network.

## Cisco CME 3.1 or Later, Non-H.450 Gateways, and Cisco IOS Gateways

In a network with Cisco CME 3.1 or later, non-H.450 gateways, and Cisco IOS gateways, the H.450.2 and H.450.3 services are provided only to calling endpoints that use H.450.12 to explicitly indicate that they are capable of H.450.2 and H.450.3 operations. Because the Cisco BTS and Cisco PGW do not support the H.450.12 standard, calls to and from these systems that involve call transfer or forwarding are handled using H.323-to-H.323 hairpin call routing.

Configuration for this type of network consists of:

1. Setting up call-transfer and call-forwarding parameters for transfers and forwards that are initiated on this router (H.450.2 and H.450.3 capabilities for transferred parties, transfer destinations, forwarded parties, and forwarding destinations are enabled by default). Optionally disable H.450.2 and H.450.3 capabilities on dial peers that point to non-H.450-capable systems such as Cisco Unified Communications Manager, Cisco BTS, or Cisco PGW. See [Enable Call Transfer and Forwarding on SCCP Phones at System-Level, on page 1160](#).
2. Enabling H.450.12 to detect any calls on which H.450.2 and H.450.3 standards are not supported, either globally or for specific dial peers. See [Enable H.450.12 Capabilities, on page 1178](#).
3. Setting up VoIP-to-VoIP connections (hairpin call routing or H.450 tandem gateway) to route calls that do not support H.450.2 or H.450.3 standards. See [Enable H.323-to-H.323 Connection Capabilities, on page 1180](#).
4. Setting up dial peers to manage call legs within the network.

### Note

If your network contains a Cisco Unified Communications Manager, also see the instructions in the [Enable Interworking with Cisco Unified Communications Manager, on page 1189](#).

## Cisco Unified CME, Non-H.450 Gateways, and Cisco IOS Gateways

**Note** Cisco CME 3.0 and Cisco ITS V2.1 systems do not have H.450.12 capabilities.

In a network that contains a mix of Cisco Unified CME versions and at least one non-H.450 gateway, the simplest configuration approach is to globally disable all H.450.2 and H.450.3 services and force H.323-to-H.323 hairpin call routing for all transferred and forwarded calls. In this case, you would enable H.450.12 detection capabilities globally. Alternatively, you could select to enable H.450.12 capability for specific dial peers. In this case, you would not configure H.450.12 capability globally; you would leave it in its default disabled state.

Configuration for this type of network consists of:

1. Setting up call-transfer and call-forwarding parameters for transfers and forwards that are initiated on this router (H.450.2 and H.450.3 capabilities for transferred parties, transfer destinations, forwarded parties, and forwarding destinations are enabled by default). See [Enable Call Transfer and Forwarding on SCCP Phones at System-Level, on page 1160](#).
2. Enabling H.450.12 to detect any calls on which H.450.2 and H.450.3 standards are not supported, either globally or on specific dial peers. See [Enable H.450.12 Capabilities, on page 1178](#)
3. Setting up VoIP-to-VoIP connections (hairpin call routing or H.450 tandem gateway) to route all transferred and forwarded calls. See [Enable H.323-to-H.323 Connection Capabilities, on page 1180](#).
4. Setting up dial peers to manage call legs within the network.

**Note** If your network contains a Cisco Unified Communications Manager, also see the instructions in the [Enable Interworking with Cisco Unified Communications Manager, on page 1189](#).

## Cisco CME 3.1 or Later, Cisco Unified Communications Manager, and Cisco IOS Gateways

In a network with Cisco CME 3.1 or later, Cisco Unified Communications Manager, and Cisco IOS gateways, Cisco CME 3.1 and later versions support automatic detection of calls to and from Cisco Unified Communications Manager using proprietary signaling elements that are included with the standard H.323 message exchanges. The Cisco CME 3.1 or later system uses these detection results to determine the H.450.2 and H.450.3 capabilities of calls rather than using H.450.12 supplementary services capabilities exchange, which Cisco Unified Communications Manager does not support. If a call is detected to be coming from or going to a Cisco Unified Communications Manager endpoint, the call is treated as a non-H.450 call. All other calls in this type of network are treated as though they support H.450 standards. Therefore, this type of network should contain only Cisco CME 3.1 or later and Cisco Unified Communications Manager call-processing systems.

Configuration for this type of network consists of:

1. Setting up call-transfer and call-forwarding parameters for transfers and forwards that are initiated on this router (H.450.2 and H.450.3 capabilities for transferred parties, transfer destinations, forwarded parties, and forwarding destinations are enabled by default). See [Enable Call Transfer and Forwarding on SCCP Phones at System-Level, on page 1160](#)
2. Enabling H.450.12 to detect any calls on which H.450.2 and H.450.3 standards are not supported, either globally or on specific dial peers. See [Enable H.450.12 Capabilities, on page 1178](#)

3. Setting up VoIP-to-VoIP connections (hairpin call routing or H.450 tandem gateway) to route all transferred and forwarded calls that are detected as being to or from Cisco Unified Communications Manager. See [Enable H.323-to-H.323 Connection Capabilities, on page 1180](#)
4. Setting up specific parameters for Cisco Unified Communications Manager. See [Enable Cisco Unified Communications Manager to Interwork with Cisco Unified CME, on page 1193](#)
5. Setting up dial peers to manage call legs within the network.

### Cisco CME 3.0 or an Earlier Version, Cisco Unified Communications Manager, and Cisco IOS Gateways

Calls between the Cisco Unified Communications Manager and the older Cisco CME 3.0 or Cisco ITS V2.1 networks need special consideration. Because Cisco CME 3.0 and Cisco ITS V2.1 systems do not support automatic Cisco Unified Communications Manager detection and also do not natively support H.323-to-H.323 call routing, alternative arrangements are required for these systems.

To configure call transfer and forwarding on the Cisco CME 3.0 router, you can select from the following three options:

- Use a Tcl script to handle call transfer and forwarding by invoking Tcl-script-based H.323-to-H.323 hairpin call routing (app-h450-transfer.2.0.0.9.tcl or a later version). Enable this script on all VoIP dial peers and also under telephony-service mode, and set the local-hairpin script parameter to 1.
- Use a loopback-dn mechanism.
- Configure a loopback call path using router physical voice ports.

All three options force use of H.323-to-H.323 hairpin call routing for all calls regardless of whether the call is from a Cisco Unified Communications Manager or other H.323 endpoint (including Cisco CME 3.1 or later).

## Configure Call Transfer and Forwarding

### Enable Call Transfer and Forwarding on SCCP Phones at System-Level

To enable H.450 call transfers and forwards for transferring or forwarding parties; that is, to allow transfers and forwards to be initiated from a Cisco Unified CME system, perform the following steps.

---

**Note** H.450.2 and H.450.3 capabilities are enabled by default for transferred or forwarded parties and transfer-destination or forward-destination parties. Dial peer settings override the global setting.

---

**Restriction**

- Call transfers are handled differently depending on the Cisco Unified CME version. See [Transfer Method Recommendations by Cisco Unified CME Version, on page 1149](#) for recommendations on selecting a transfer method for your Cisco Unified CME version.
- The **transfer-system local-consult** command is not supported if the transfer-to destination is on the Cisco ATA, Cisco VG224, or a SCCP-controlled FXS port.
- The H.450.2 and H.450.3 standards are not supported by Cisco Unified Communications Manager, Cisco BTS, or Cisco PGW.
- In versions earlier than Cisco Unified CME 4.2, the caller ID displays correctly only after connect; caller ID does not display correctly at Call Transfer or Call Forward.

**Call-Transfer Recall**

- Requires Cisco Unified CME 4.3 or a later version.
- Transferor and transfer-to party must be on the same Cisco Unified CME router; transferee party can be remote to the Cisco Unified CME router.
- Transfer recall is not supported if the transfer-to party has Call Forward Busy enabled, or if the transfer-to party is a hunt group pilot number.
- If the transfer-to party has Call Forward No Answer enabled, Cisco Unified CME recalls a transferred call only if the transfer-recall timeout is set to less than the timeout value set with the **call-forward noan** command.
- Recall timer for trunk-line directory number has precedence (set on transferor using **trunk** command with **transfer-timeout** keyword) over the transfer-recall timer. Transfer recall is not initiated for hairpin transfers.

**Before you begin**

Cisco CME 3.0 or a later version, or Cisco ITS V2.1.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **transfer-system** { **blind** | **full-blind** | **full-consult** [ **dss** ] | **local-consult** }
5. **transfer-pattern** *transfer-pattern* [ **blind** ]
6. **call-forward pattern** *pattern*
7. **timeouts transfer-recall** *seconds*
8. **transfer-digit-collect** { **new-call** | **orig-call** }
9. **exit**
10. **voice service voip**
11. **supplementary-service h450.2**
12. **supplementary-service h450.3**
13. **exit**

14. `dial-peer voice tag voip`
15. `supplementary-service h450.2`
16. `supplementary-service h450.3`
17. `end`

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br><pre>Router(config)# telephony-service</pre>                                                                                | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 4</b> | <b>transfer-system{blind   full-blind   full-consult [ dss ]   local-consult }</b><br><b>Example:</b><br><pre>Router(config-telephony)# transfer-system full-consult</pre> | Specifies the call transfer method. <ul style="list-style-type: none"> <li>• <b>blind</b>—Calls are transferred without consultation using the Cisco proprietary method and a single phone line. This is the default in versions earlier than Cisco Unified CME 4.0.</li> <li>• <b>full-blind</b>—Calls are transferred without consultation using H.450.2 standard methods.</li> <li>• <b>full-consult</b>—Calls are transferred with consultation using H.450.2 standard methods and a second phone line if available. Calls fall back to full-blind if the second line is unavailable. This is the default in Cisco Unified CME 4.0 and later versions. Transfer-system needs to be set at full-consult for the “transfer by directory” to work. Transfer by directory is supported by full-consult or blind transfer. If you want to transfer using directory/placed/missed/received calls, the transfer-system needs to be set at full-consult for this to work appropriately. When changed to full-consult, you can do “blind transfer” by selecting the number from the directory and when the other phone rings, you can press the softkey “Transfer” and the call will be transferred to the number selected and then you can hang up.</li> </ul> |

|        | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        |                                                                                                                                                     | <ul style="list-style-type: none"> <li>• <b>dss</b>—(Optional) Calls are transferred with consultation to idle monitored lines. All other call-transfer behavior is identical to full-consult.</li> <li>• <b>local-consult</b>—Calls are transferred with local consultation using a second phone line if available. The calls fall back to blind for nonlocal consultation or nonlocal transfer target. Not supported if transfer-to destination is on the Cisco ATA, Cisco VG224, or a SCCP-controlled FXS port.</li> <li>• Cisco CME 3.0 and later versions—Use only the <b>full-blind</b> or <b>full-consult</b> keyword.</li> <li>• Before Cisco CME 3.0—Use the <b>local-consult</b> or <b>blind</b> keyword. (Cisco ITS 2.1 can use the <b>full-blind</b> or <b>full-consult</b> keyword by also using the Tcl script in the file called app-h450-transfer.x.x.x.x.zip.)</li> </ul>                                                                                                                |
| Step 5 | <b>transfer-pattern</b> <i>transfer-pattern</i> [ <b>blind</b> ]<br><br><b>Example:</b><br><pre>Router(config-telephony)# transfer-pattern .T</pre> | <p>Allows transfer of telephone calls by Cisco Unified IP phones to specified phone number patterns. If no transfer pattern is set, the default is that transfers are permitted only to other local IP phones.</p> <ul style="list-style-type: none"> <li>• <b>transfer-pattern</b>—String of digits for permitted call transfers. Wildcards are allowed. A pattern of .T transfers all calling parties using the H.450.2 standard.</li> <li>• <b>blind</b>—(Optional) When H.450.2 consultative call transfer is configured, forces transfers that match the pattern specified in this command to be executed as blind transfers. Overrides settings made using the <b>transfer-system</b> and <b>transfer-mode</b> commands.</li> </ul> <p><b>Note</b><br/>For transfers to nonlocal numbers, transfer-pattern digit matching is performed before translation-rule operations. Therefore, you should specify in this command the digits actually entered by phone users before they are translated.</p> |
| Step 6 | <b>call-forward pattern</b> <i>pattern</i><br><br><b>Example:</b><br><pre>Router(config-telephony)# call-forward pattern .T</pre>                   | <p>Specifies the H.450.3 standard for call forwarding.</p> <ul style="list-style-type: none"> <li>• <b>pattern</b>—Digits to match for call forwarding using the H.450.3 standard. If an incoming calling-party number matches the pattern, it can be forwarded using the H.450.3 standard. A pattern of .T forwards all calling parties using the H.450.3 standard.</li> </ul> <p>Calling-party numbers that do not match the patterns defined with this command are forwarded using Cisco proprietary call forwarding for backward compatibility.</p> <p><b>Note</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                | Command or Action                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|---------|---------------------------------------------------------------------------------|----------------------------------|
| Step 17 | <b>end</b><br><br><b>Example:</b><br><code>Router(config-dial-peer)# end</code> | Returns to privileged EXEC mode. |

## Enable Call-Transfer Recall on SIP Phones at System-Level

To enable call-transfer recalls to be initiated from a Cisco Unified CME system, perform the following steps.

### Note

- Transferor and transfer-to party must be on the same Cisco Unified CME router; transferee party can be remote to the Cisco Unified CME router.
- Transfer recall is not supported if the transfer-to party has Call Forward Busy enabled, or if the transfer-to party is a hunt group pilot number.

### Before you begin

Cisco Unified CME 11.6 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **timeouts transfer-recall** *seconds*
5. **exit**
6. **voice service voip**
7. **no supplementary-service sip refer**
8. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action                                                                           | Purpose                                                                                                                   |
|--------|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br><code>Router&gt; enable</code>                      | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br><code>Router# configure terminal</code> | Enters global configuration mode.                                                                                         |

|               | Command or Action                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Enable Call Forwarding for a Directory Number

To define the conditions and target numbers for call forwarding for individual ephone-dns, and set other restrictions for call forwarding, perform the following steps.

### Note

When defining call forwarding to nonlocal numbers, it is important to note that pattern digit matching is performed before translation-rule operations. Therefore, you should specify in this command the digits actually entered by phone users before they are translated.

**Restriction**

- Call forwarding is invoked only if that phone is dialed directly. Call forwarding is not invoked when the phone number is called through a sequential, longest-idle, or peer hunt group.
- If call forwarding is configured for hunt group member, call forward is ignored by the hunt group.
- Calls from an internal extension to an extension which is busy, is forwarded to the SNR destination even if no forward local-calls is configured under the Directory Number.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **call-forward pattern** *pattern*
5. **exit**
6. **ephone-dn** *dn-tag* [**dual-line**]
7. **number** *number* [**secondary number**] [**no-reg** [**both** | **primary**]]
8. **call-forward all** *target-number*
9. **call-forward busy** *target-number* [**primary** | **secondary**] [**dialplan-pattern**]
10. **call-forward noan** *target-number* **timeout** *seconds* [**primary** | **secondary**] [**dialplan-pattern**]
11. **call-forward night-service** *target-number*
12. **call-forward max-length** *length*
13. **no forward local-calls**
14. **end**

**DETAILED STEPS****Procedure**

## Call Transfer for a Directory Number

To enable call transfer for a specific directory number, perform the following steps. This procedure overrides the global setting for blind or consultative transfer for individual directory numbers.

### Before you begin

Call transfer must be enabled globally. See [Enable Call Transfer and Forwarding on SCCP Phones at System-Level, on page 1160](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn dn-tag [dual-line]**
4. **transfer-mode {blind | consult}**
5. **timeouts transfer-recall seconds**
6. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|---------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>ephone-dn dn-tag [dual-line]</b><br><b>Example:</b><br>Router(config)# ephone-dn 20                              | Enters ephone-dn configuration mode, creates an ephone-dn, and optionally assigns it dual-line status. <ul style="list-style-type: none"> <li>• <b>dual-line</b>—(Optional) Enables an ephone-dn with one voice port and two voice channels, which supports features such as call waiting, call transfer, and conferencing with a single ephone-dn.</li> </ul>                                                                                                                                                                                                               |
| <b>Step 4</b> | <b>transfer-mode {blind   consult}</b><br><b>Example:</b><br>Router(config-ephone-dn)# transfer-mode blind          | Specifies the type of call transfer for an individual directory number using the H.450.2 standard, allowing you to override the global setting. <ul style="list-style-type: none"> <li>• Default: system-level value set with the <b>transfer-system</b> command.</li> </ul>                                                                                                                                                                                                                                                                                                 |
| <b>Step 5</b> | <b>timeouts transfer-recall seconds</b><br><b>Example:</b><br>Router(config-ephone-dn)# timeouts transfer-recall 30 | (Optional) Enables call-transfer recall and sets the number of seconds that Cisco Unified CME waits before recalling a transferred call if the transfer-to party does not answer or is busy. <ul style="list-style-type: none"> <li>• <b>seconds</b>—Duration, in seconds, to wait before recalling a transferred call. Range: 1 to 1800. Default: 0 (disabled).</li> <li>• This command is supported in Cisco Unified CME 4.3 and later versions.</li> <li>• This command can also be configured in ephone-dn-template and telephony-service configuration mode.</li> </ul> |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone-dn)# end                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Configure Call Transfer Options for SCCP Phones

To specify a maximum number of digits for transfer destinations or block transfers to external destinations by individual phones, perform the following steps.

### Before you begin

- Transfers made to speed-dial numbers are not blocked when the **transfer-pattern blocked** command is used.
- Transfers made using speed-dial are not blocked by the **after-hours block pattern** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. **transfer-pattern blocked**
5. **transfer max-length** *digit-length*
6. **exit**
7. **ephone** *phone-tag*
8. **ephone-template** *template-tag*
9. **restart**
10. **end**

|               | Command or Action                                                                                              | Purpose                                                                                                                                                                                                       |
|---------------|----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                             | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                     | Enters global configuration mode.                                                                                                                                                                             |
| <b>Step 3</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# ephone-template 1             | Enters ephone-template configuration mode.<br><ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique number that identifies this template during configuration tasks. Range: 1 to 20.</li> </ul> |
| <b>Step 4</b> | <b>transfer-pattern blocked</b><br><b>Example:</b><br>Router(config-ephone-template)# transfer-pattern blocked | (Optional) Prevents directory numbers on the phone to which this template is applied from transferring calls to patterns specified in the <b>transfer-pattern</b> (telephony-service) command.<br><b>Note</b> |

|                | Command or Action                                                                                                                     | Purpose                                                                                                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                       | This command is also available in ephone configuration mode to block external transfers from individual phones without using a template.                                                                                                                                      |
| <b>Step 5</b>  | <b>transfer max-length</b> <i>digit-length</i><br><b>Example:</b><br><pre>Router(config-ephone-template)# transfer max-length 8</pre> | (Optional) Specifies the maximum number of digits the user can dial when transferring a call. <ul style="list-style-type: none"> <li>• <i>digit-length</i>—Number of digits allowed in a number to which a call is being transferred. Range: 3 to 16. Default: 16.</li> </ul> |
| <b>Step 6</b>  | <b>exit</b><br><b>Example:</b><br><pre>Router(config-ephone-template)# exit</pre>                                                     | Exits ephone-template configuration mode.                                                                                                                                                                                                                                     |
| <b>Step 7</b>  | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br><pre>Router(config)# ephone 25</pre>                                             | Enters ephone configuration mode.                                                                                                                                                                                                                                             |
| <b>Step 8</b>  | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br><pre>Router(config-ephone)# ephone-template 1</pre>                  | Applies a template to a phone. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Template number that you want to apply to this phone.</li> </ul>                                                                                                                  |
| <b>Step 9</b>  | <b>restart</b><br><b>Example:</b><br><pre>Router(config-ephone)# restart</pre>                                                        | Performs a fast reboot of this phone without contacting the DHCP server for updated information.<br><br>Repeat Step 6 to Step 9 for each phone on which you want to limit transfer capabilities.                                                                              |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ephone)# end</pre>                                                                | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                |

## Verify Call Transfer for SCCP Phones

### Procedure

- Step 1** Use the **show running-config** command to verify your configuration. Transfer method and patterns are listed in the telephony-service portion of the output. You can also use the **show telephony-service** command to display this information.

**Example:**

```
Router# show running-config
!
telephony-service
fxo hook-flash
load 7910 P00403020214
```

```

load 7960-7940 P00305000600
load 7914 S00103020002
load 7905 CP7905040000SCCP040701A
max-ephones 100
max-dn 500
ip source-address 10.115.33.177 port 2000
max-redirect 20
no service directed-pickup
timeouts ringing 10
voicemail 7189
max-conferences 8 gain -6
moh music-on-hold.au
web admin system name cisco password cisco
dn-webedit
time-webedit
transfer-system full-consult
transfer-pattern 92.....
transfer-pattern 91.....
transfer-pattern 93.....
transfer-pattern 94.....
transfer-pattern 95.....
transfer-pattern 96.....
transfer-pattern 97.....
transfer-pattern 98.....
transfer-pattern 99.....
transfer-pattern .T
secondary-dialtone 9
!
create cnf-files version-stamp 7960 Jul 13 2004 03:39:28

```

- Step 2** If you have used the **transfer-mode** command to override the global transfer mode for an individual ephone-dn, use the **show running-config** or **show telephony-service ephone-dn** command to verify that setting.

**Example:**

```

Router# show running-config
!
ephone-dn 40 dual-line
number 451
description Main Number
huntstop channel
no huntstop
transfer-mode blind

```

- Step 3** Use the **show telephony-service ephone-template** command to view ephone-template configurations.

## Specify Transfer Patterns for Trunk-to-Trunk Calls and Conferences for SIP

|                    |                                                                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Restriction</b> | Call transfer and conference restrictions apply when transfers or conferences are initiated toward external parties, like a PSTN trunk, a SIP trunk, or an H.323 trunk. The restrictions do not apply to transfers to local extensions. |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Before you begin**

Cisco Unified CME 9.5 or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **transfer-pattern** *transfer-pattern*
5. **exit**
6. Enter one of the following commands:
  - **voice register pool** *pool-tag*
  - **voice register template** *template-tag*
  - **ephone** *phone tag*
  - **ephone-template** *template-tag*
7. **transfer max-length** *max-length*
8. **exit**
9. **telephony-service**
10. **conference transfer-pattern**
11. **end**

| <b>Step 11</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(config-telephony)# end</pre>                                                                                                                                                                                                                                                                                                 | Exits telephony-service configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Conference Max-Length

Conference calls are allowed when:

- both **conference transfer-pattern** and **transfer-pattern** commands are configured
- dialed digits match the configured transfer pattern

When conference max-length command is configured, the Cisco Unified CME will allow the conferences only if the dialed digits are within the max-length limit.

If configured, the conference max-length command does not impact call transfers.

**Note** If both **conference max-length** and **transfer max-length** commands are configured, the conference **max-length** command takes precedence for conferences.

## Block Trunk-to-Trunk Call Transfers for SIP

To block call transfers to external destinations, perform the following steps.

**Restriction** Call transfer restrictions apply when transfers are initiated toward external parties, like a PSTN trunk, a SIP trunk, or an H.323 trunk. The restrictions do not apply to transfers to local extensions.

### Before you begin

Cisco Unified CME 9.5 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
  - **voice register pool** *pool-tag*
  - **voice register template** *template-tag*
4. **transfer-pattern blocked**
5. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action                    | Purpose                                                                                                          |

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 3</b> | Enter one of the following commands: <ul style="list-style-type: none"> <li>• <b>voice register pool</b> <i>pool-tag</i></li> <li>• <b>voice register template</b> <i>template-tag</i></li> </ul> <b>Example:</b><br>Router(config)# voice register template 5 | Enters voice register pool configuration mode and creates a pool configuration for a Cisco Unified SIP IP phone in Cisco Unified CME or for a set of Cisco Unified SIP IP phones in Cisco Unified SIP SRST. <ul style="list-style-type: none"> <li>• <i>pool-tag</i>—Unique number assigned to the pool. Range is 1 to 100.</li> </ul> Enters voice register template configuration mode and defines a template of common parameters for Cisco Unified SIP IP phones. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Declares a template tag. Range is 1 to 10.</li> </ul> |
| <b>Step 4</b> | <b>transfer-pattern blocked</b><br><b>Example:</b><br>Router(config-register-temp)# transfer-pattern blocked                                                                                                                                                   | Blocks all call transfers for a specific Cisco Unified SIP IP phone or a set of Cisco Unified SIP IP phone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-temp)# end                                                                                                                                                                                             | Exits voice register template configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Enable H.450.12 Capabilities

To enable H.450.12 capabilities globally or by individual dial peer when not all gateway endpoints in your network support H.450.2 and H.450.3 standards, perform the following steps. H.450.12 capabilities are disabled by default to minimize the risk of compatibility issues with other types of H.323 systems. Settings for individual dial peers override the global setting.

|                    |                                                             |
|--------------------|-------------------------------------------------------------|
| <b>Restriction</b> | Cisco CME 3.0 and earlier versions do not support H.450.12. |
|--------------------|-------------------------------------------------------------|

### SUMMARY STEPS

1. enable
2. configure terminal
3. voice service voip
4. supplementary-service h450.12 [advertise-only]
5. exit

6. **dial-peer voice tag voip**
7. **supplementary-service h450.12**
8. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><code>Router&gt; enable</code>                                                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>voice service voip</b><br><b>Example:</b><br><code>Router(config)# voice service voip</code>                                               | (Optional) Enters voice service configuration mode to establish global call transfer and forwarding parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 4</b> | <b>supplementary-service h450.12 [advertise-only]</b><br><b>Example:</b><br><code>Router(conf-voi-serv)# supplementary-service h450.12</code> | (Optional) Enables H.450.12 supplementary services capabilities globally for VoIP endpoints.<br><ul style="list-style-type: none"> <li>• This command enables call-by-call detection of H.450 capabilities when some endpoints in your mixed network are H.450-capable and other endpoints are not. This command is disabled by default.</li> <li>• <b>advertise-only</b>—(Optional) Advertises H.450 capabilities to the remote end but does not require H.450.12 responses. Use this keyword on Cisco CME 3.1 or later systems if you have a mixed network containing Cisco CME 3.0 systems.</li> </ul> This command is also used in dial-peer configuration mode to affect an individual dial peer. |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><code>Router(conf-voi-serv)# exit</code>                                                                    | (Optional) Exits voice-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <b>dial-peer voice tag voip</b><br><b>Example:</b><br><code>Router(config)# dial-peer voice 1 voip</code>                                     | (Optional) Enters dial-peer configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|               | Command or Action                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b> | <b>supplementary-service h450.12</b><br><br><b>Example:</b><br><pre>Router(config-dial-peer)# supplementary-service h450.12</pre> | <p>(Optional) Enables H.450.12 supplementary services capabilities for an individual dial peer. This command is disabled by default.</p> <p>This command is also used in voice-service configuration mode to enable H.450.12 services globally.</p> <ul style="list-style-type: none"> <li>• If this command is enabled globally and enabled on a dial peer, the functionality is enabled for the dial peer.</li> <li>• If this command is enabled globally and disabled on a dial peer, the functionality is enabled for the dial peer.</li> <li>• If this command is disabled globally and enabled on a dial peer, the functionality is enabled for the dial peer.</li> <li>• If this command is disabled globally and disabled on a dial peer, the functionality is disabled for the dial peer. | <b>Step 8</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-dial-peer)# end</pre>                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Enable H.323-to-H.323 Connection Capabilities

Vo IP-to-VoIP connections permit the termination and reorigination of transferred and forwarded calls over the VoIP network. VoIP-to-VoIP connections are used for hairpin call routing and for H.450 tandem gateways. The only type of VoIP-to-VoIP connection that is supported by Cisco CME 3.1 or a later version is H.323-to-H.323 connection.

VoIP-to-VoIP connections are disabled on the router by default, and they must be explicitly enabled to make use of hairpin call routing or an H.450 tandem gateway. In addition, you must configure a mechanism to direct transferred or forwarded calls to the hairpin or the H.450 tandem gateway, using one of the following methods:

- Enable H.450.12 capabilities globally or on the routes that your transfers and forwards take. See [Enable H.450.12 Capabilities, on page 1178](#).
- Explicitly disable H.450.2 and H.450.3 capabilities globally or on the routes that your transfers and forwards take. See [Enable Call Transfer and Forwarding on SCCP Phones at System-Level, on page 1160](#).

**Restriction**

- Codecs on all the VoIP dial peers of the H.450 tandem gateway must be the same.
- Only one codec type is supported in the VoIP network at a time, and there are only two codec choices: G.711 (A-law or mu-law) or G.729.
- Transcoding is not supported.
- Codec renegotiation is not supported. For example, if an H.323 call that uses a G.729 codec is received by a Cisco Unified CME system and is forwarded to a voice-mail system that requires a G.711 codec, the codec cannot be renegotiated from G.729 to G.711.
- H.323-to-SIP hairpin call routing is supported only with Cisco Unity Express. For more information, see [Integrating Cisco CallManager Express with Cisco Unity Express](#).
- Cisco Unified Communications Manager must use a media termination point (MTP), intercluster trunk (ICT) mode, and slow start.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **allow-connections h323 to h323**
5. **end**

|---------------|--------------------------------------------------------------------|----------------------------------|
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-voi-serv) # end | Returns to privileged EXEC mode. |

## Forward Calls Using Local Hairpin Routing

When Cisco Unified CME is used to forward calls that originate on phones that do not support the H.450.3 standard such as Cisco Unified Communications Manager phones, local hairpin routing must be used to forward the calls. For calling parties whose numbers match the pattern specified, the system automatically detects whether H.450.3 is supported and uses the appropriate method to forward calls.

To enable hairpin routing, you must denote the originating and terminating legs of the hairpin. To forward calls to Cisco Unity Express, connections must be allowed to a SIP trunk.

Optionally, you can disable the use of H.450.3 but this is not required because the system automatically detects calls on which H.450.3 is not supported and local hairpin routing is required when the calling-party numbers match the pattern specified.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **call-forward pattern** *pattern*
5. **calling-number local**
6. **exit**
7. **voice service voip**
8. **allow connections** *from-type to to-type*
9. **supplementary-service h450.3**
10. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                              | Purpose                                                                                                                   |
|---------------|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                         |

|               | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br><code>Router(config)# telephony-service</code>                                                       | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 4</b> | <b>call-forward pattern <i>pattern</i></b><br><b>Example:</b><br><code>Router(config-telephony)# call-forward pattern 6000</code>                   | <p>Specifies the calling-party numbers for which to allow call forwarding with automatic detection of whether H.450.3 is supported. If H.450.3 is supported, H.450.3 is used for the forward and, if not, local hairpin is used.</p> <ul style="list-style-type: none"> <li>• <i>pattern</i>—Digits to match for call forwarding. A pattern of .T forwards all calling parties.</li> </ul>                                                                                        |
| <b>Step 5</b> | <b>calling-number local</b><br><b>Example:</b><br><code>Router(config-telephony)# calling-number local</code>                                       | <p>(Optional) Replaces a calling-party number and name with the forwarding-party (local) number and name for hairpin-forwarded calls only.</p> <ul style="list-style-type: none"> <li>• Before Cisco CME 3.3, this command must be used with Tool Command Language (Tcl) script <code>app-h450-transfer.2.0.0.7</code> or a later version. The <code>local-hairpin attribute-value (AV)</code> pair must be set to 1.</li> </ul>                                                  |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-telephony)# exit</code>                                                                       | Exits telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 7</b> | <b>voice service voip</b><br><b>Example:</b><br><code>Router(config)# voice service voip</code>                                                     | Enters voice-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 8</b> | <b>allow connections <i>from-type</i> to <i>to-type</i></b><br><b>Example:</b><br><code>Router(conf-voi-serv)# allow connections h323 to sip</code> | <p>Allows connections between specific types of endpoints in a network.</p> <ul style="list-style-type: none"> <li>• <i>from-type</i>—Originating endpoint type. Valid choices are <b>h323</b> and <b>sip</b>.</li> <li>• <i>to-type</i>—Terminating endpoint type. Valid choices are <b>h323</b> and <b>sip</b>.</li> </ul>                                                                                                                                                      |
| <b>Step 9</b> | <b>supplementary-service h450.3</b><br><b>Example:</b><br><code>Router(conf-voi-serv)# no supplementary-service h450.3</code>                       | <p>(Optional) Enables H.450.3 supplementary services capabilities exchange globally. This is the default. Use the <b>no</b> form of this command to disable H.450.3 capabilities globally. This command can also be used in dial-peer configuration mode to disable H.450.3 functionality for a single dial peer.</p> <p><b>Note</b><br/>If this command is disabled globally and either enabled or disabled on a dial peer, the functionality is disabled for the dial peer.</p> |

|         | Command or Action                                                  | Purpose                        |
|---------|--------------------------------------------------------------------|--------------------------------|
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-voi-serv) # end | Exits to privileged EXEC mode. |

## Enable H.450.7 and QSIG Supplementary Services at System-Level

To enable H.450.7 capabilities and QSIG supplementary services on all dial peers, perform the following steps.

### Restriction

- QSIG integration supports SCCP phones only.
- QSIG integration is exclusive; once QSIG integration is configured, QSIG transit node capability is disabled. There is no dial-peer control to enable either transit or originate/terminate capability on a call by call basis.
- If you enable QSIG supplementary services at a system-level, you cannot disable the capability on individual dial peers.

### Before you begin

Cisco Unified CME 4.0 or a later version.

### SUMMARY STEPS

1. enable
2. configure terminal
3. voice service voip
4. supplementary-service h450.7
5. qsig decode
6. exit
7. voice service pots
8. supplementary-service qsig call-forward
9. end

### DETAILED STEPS

#### Procedure

|        | Command or Action                                      | Purpose                                                                                                                   |
|--------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                     | Purpose                                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                            | Enters global configuration mode.                                                                      |
| <b>Step 3</b> | <b>voice service voip</b><br><b>Example:</b><br>Router(config)# voice service voip                                                    | Enters VoIP voice-service configuration mode to define global call transfer and forwarding parameters. |
| <b>Step 4</b> | <b>supplementary-service h450.7</b><br><b>Example:</b><br>Router(config-voi-serv)# supplementary-service h450.7                       | Enables H.450.7 supplementary services capabilities exchange at a system-level.                        |
| <b>Step 5</b> | <b>qsig decode</b><br><b>Example:</b><br>Router(config-voi-serv)# qsig decode                                                         | Enables decoding for QSIG supplementary services.                                                      |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Router(config-voi-serv)# exit                                                                       | Exits VoIP voice-service configuration mode.                                                           |
| <b>Step 7</b> | <b>voice service pots</b><br><b>Example:</b><br>Router(config)# voice service pots                                                    | Enters POTS voice-service configuration mode to define global call transfer and forwarding parameters. |
| <b>Step 8</b> | <b>supplementary-service qsig call-forward</b><br><b>Example:</b><br>Router(config-voi-serv)# supplementary-service qsig call-forward | Enables QSIG call-forwarding supplementary services (ISO 13873) to forward calls to another number.    |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Router(config-voi-serv)# end                                                                         | Exits to privileged EXEC mode.                                                                         |

## Enable H.450.7 and QSIG Supplementary Services on a Dial Peer

To enable H.450.7 capabilities and QSIG supplementary services on an individual dial peer, perform the following steps.

**Restriction**

- QSIG integration supports SCCP phones only.
- QSIG integration is exclusive; once QSIG integration is configured, QSIG transit node capability is disabled. There is no dial-peer control to enable either transit or originate/terminate capability on a call by call basis.
- If you enable QSIG supplementary services at a system-level, you cannot enable or disable the capability on individual dial peers.

**Before you begin**

Cisco Unified CME 4.0 or a later version.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **qsig decode**
5. **exit**
6. **dial-peer voice tag voip**
7. **supplementary-service h450.7**
8. **exit**
9. **dial-peer voice tag pots**
10. **supplementary-service qsig call-forward**
11. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                  | Purpose                                                                                                               |

| <b>Step 4</b>  | <b>qsig decode</b><br><b>Example:</b><br><code>Router(config-voi-serv)# qsig decode</code>                                                          | Enables decoding for QSIG supplementary services.                                                   |
| <b>Step 5</b>  | <b>exit</b><br><b>Example:</b><br><code>Router(config-voi-serv)# exit</code>                                                                        | Exits VoIP voice-service configuration mode.                                                        |
| <b>Step 6</b>  | <b>dial-peer voice tag voip</b><br><b>Example:</b><br><code>Router(config)# dial-peer voice 1 voip</code>                                           | Enters dial-peer configuration mode to define parameters for an individual dial peer.               |
| <b>Step 7</b>  | <b>supplementary-service h450.7</b><br><b>Example:</b><br><code>Router(config-dial-peer)# supplementary-service h450.7</code>                       | Enables H.450.7 supplementary services capabilities exchange on a single dial peer.                 |
| <b>Step 8</b>  | <b>exit</b><br><b>Example:</b><br><code>Router(config-dial-peer)# exit</code>                                                                       | Exits dial-peer configuration mode.                                                                 |
| <b>Step 9</b>  | <b>dial-peer voice tag pots</b><br><b>Example:</b><br><code>Router(config)# dial-peer voice 2 pots</code>                                           | Enters dial-peer configuration mode to define parameters for an individual dial peer.               |
| <b>Step 10</b> | <b>supplementary-service qsig call-forward</b><br><b>Example:</b><br><code>Router(config-dial-peer)# supplementary-service qsig call-forward</code> | Enables QSIG call-forwarding supplementary services (ISO 13873) to forward calls to another number. |
| <b>Step 11</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-dial-peer)# end</code>                                                                         | Exits to privileged EXEC mode.                                                                      |

## Disable SIP Supplementary Services for Call Forward and Call Transfer

To disable REFER messages for call transfers or redirect responses for call forwarding from being sent to the destination by Cisco Unified CME, perform the following steps. You can disable these supplementary features if the destination gateway does not support them.

**Restriction**

- In Cisco Unified CME 4.2 and 4.3, when the **supplementary-service sip refer** command is enabled (default) and both the caller being transferred (transferee) and the phone making the transfer (transferor) are SIP, but the transfer-to phone is SCCP, Cisco Unified CME hairpins the call to the transfer-to phone after receiving the REFER request from transferor instead of sending the REFER request to the transferee.

**Before you begin**

Cisco Unified CME 4.1 or a later version.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
  - **voice service voip**
  - **dial-peer voice tag voip**
4. **no supplementary-service sip moved-temporarily**
5. **no supplementary-service sip refer**
6. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                              |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                        | Enters global configuration mode.                                                                                                                                                    |
| <b>Step 3</b> | Enter one of the following commands: <ul style="list-style-type: none"> <li>• <b>voice service voip</b></li> <li>• <b>dial-peer voice tag voip</b></li> </ul> <b>Example:</b><br>Router(config)# voice service voip or<br>Router(config)# dial-peer voice 99 voip | Enters voice-service configuration mode to set global parameters for VoIP features.<br><br>or<br><br>Enters dial peer configuration mode to set parameters for a specific dial peer. |
| <b>Step 4</b> | <b>no supplementary-service sip moved-temporarily</b><br><b>Example:</b>                                                                                                                                                                                          | Disables SIP redirect response for call forwarding either globally or for a dial peer.                                                                                               |

|               | Command or Action                                                                                                                                                                                        | Purpose                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <pre>Router(conf-voi-serv)# no supplementary-service sip moved-temporarily or Router(config-dial-peer)# no supplementary-service sip moved-temporarily</pre>                                             | Sending redirect message to the destination is the default behavior.                                                                                       |
| <b>Step 5</b> | <b>no supplementary-service sip refer</b><br><br><b>Example:</b><br><pre>Router(conf-voi-serv)# no supplementary-service sip refer or Router(config-dial-peer)# no supplementary-service sip refer</pre> | Disables SIP REFER message for call transfers either globally or for a dial peer.<br><br>Sending REFER message to the destination is the default behavior. |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-voi-serv)# end or Router(config-dial-peer)# end</pre>                                                                                            | Exits to privileged EXEC mode.                                                                                                                             |

## Enable Interworking with Cisco Unified Communications Manager

If Cisco CME 3.1 or later and Cisco Unified Communications Manager are used in the same network, some additional configuration is necessary, as described in the following sections:

- [Configure Cisco CME 3.1 or Later to Interwork with Cisco Unified Communications Manager, on page 1190](#)
- [Enable Cisco Unified Communications Manager to Interwork with Cisco Unified CME, on page 1193](#)
- [Troubleshooting Call Transfer and Forward Configuration, on page 1194](#)

[Figure 54: Network with Cisco Unified CME and Cisco Unified Communications Manager, on page 1190](#) shows a network containing Cisco Unified CME and Cisco Unified Communications Manager systems.

Figure 54: Network with Cisco Unified CME and Cisco Unified Communications Manager

### Prerequisites

- Cisco Unified CME must be configured to forward calls using local hairpin routing. For configuration information, see [Forward Calls Using Local Hairpin Routing, on page 1182](#).

## Configure Cisco CME 3.1 or Later to Interwork with Cisco Unified Communications Manager

All of the commands in this section are optional because they are set by default to work with Cisco Unified Communications Manager. They are included here only to explain how to implement optional capabilities or return non default settings to their defaults.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **h323**
5. **telephony-service ccm-compatible**
6. **h225 h245-address on-connect**
7. **exit**
8. **supplementary-service h225-notify cid-update**

9. **exit**
10. **voice class h323 tag**
11. **telephony-service ccm-compatible**
12. **h225 h245-address on-connect**
13. **exit**
14. **dial-peer voice tag voip**
15. **supplementary-service h225-notify cid-update**
16. **voice-class h323 tag**
17. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 3</b> | <b>voice service voip</b><br><b>Example:</b><br>Router(config)# voice service voip                                     | Enters voice-service configuration mode to establish global parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>h323</b><br><b>Example:</b><br>Router(conf-voi-serv)# h323                                                          | Enters H.323 voice-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 5</b> | <b>telephony-service ccm-compatible</b><br><b>Example:</b><br>Router(conf-serv-h323)# telephony-service ccm-compatible | (Optional) Globally enables a Cisco CME 3.1 or later system to detect Cisco Unified Communications Manager and exchange calls with it. This is the default configuration. <ul style="list-style-type: none"> <li>• Use the <b>no</b> form of this command to disable Cisco Unified Communications Manager detection and exchange. We do not recommend using the <b>no</b> form of the command.</li> <li>• Using this command in an H.323 voice class definition allows you to specify this behavior for an individual dial peer.</li> </ul> |
| <b>Step 6</b> | <b>h225 h245-address on-connect</b><br><b>Example:</b>                                                                 | (Optional) Globally enables a delay for the H.225 message exchange of an H.245 transport address until a call is connected. The delay allows                                                                                                                                                                                                                                                                                                                                                                                                |

|                | Command or Action                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Step 12</b> | <b>h225 h245-address on-connect</b><br><br><b>Example:</b><br><pre>Router(config-voice-class)# h225 h245-address on-connect</pre>                                  | (Optional) Enables the calls that use this dial peer to delay the exchange of H.225 messages that contain the H.245 transport address until calls are connected, when this voice class is applied to a dial peer. The delay allows the playing of local ringback for calls from Cisco Unified Communications Manager. This is the default configuration.<br><br><ul style="list-style-type: none"> <li>The <b>no</b> form of this command disables the delay. We do not recommend using the <b>no</b> form of the command.</li> </ul> |
| <b>Step 13</b> | <b>exit</b><br><br><b>Example:</b><br><pre>Router(config-voice-class)# exit</pre>                                                                                  | Exits voice-class configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 14</b> | <b>dial-peer voice tag voip</b><br><br><b>Example:</b><br><pre>Router(config)# dial-peer voice 28 voip</pre>                                                       | (Optional) Enters dial-peer configuration mode to set parameters for an individual dial peer.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 15</b> | <b>supplementary-service h225-notify cid-update</b><br><br><b>Example:</b><br><pre>Router(config-dial-peer)# no supplementary-service h225-notify cid-update</pre> | (Optional) Enables H.225 messages with caller-ID updates to Cisco Unified Communications Manager for a specific dial peer. This is the default configuration.<br><br><ul style="list-style-type: none"> <li>The <b>no</b> form of the command disables caller-ID updates. We do not recommend using the <b>no</b> form of the command.</li> </ul>                                                                                                                                                                                     |
| <b>Step 16</b> | <b>voice-class h323 tag</b><br><br><b>Example:</b><br><pre>Router(config-dial-peer)# voice-class h323 48</pre>                                                     | (Optional) Applies the previously defined voice class with the specified tag number to this dial peer.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 17</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-dial-peer)# end</pre>                                                                                      | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### What to do next

Set up Cisco Unified Communications Manager using the configuration procedure in the [Enable Cisco Unified Communications Manager to Interwork with Cisco Unified CME, on page 1193](#).

## Enable Cisco Unified Communications Manager to Interwork with Cisco Unified CME

To enable Cisco Unified Communications Manager to interwork with Cisco CME 3.1 or a later version, perform the following steps in addition to the normal Cisco Unified Communications Manager configuration.

## Procedure

- 
- Step 1** Set Cisco Unified Communications Manager service parameters. From Cisco Unified Communications Manager Administration, choose Service Parameters. Choose the Cisco Unified Communications Manager service, and make the following settings:
- Set the H323 FastStart Inbound service parameter to False.
  - Set the Send H225 User Info Message service parameter to H225 Info for Ring Back.
- Step 2** Configure Cisco Unified CME as an ICT in the Cisco Unified Communications Manager network. For information about different intercluster trunk types and configuration instructions, see [Cisco Unified Communications Manager documentation](#).
- Step 3** Ensure that the Cisco Unified Communications Manager network uses an MTP. The MTP is required to provide DSP resources for transcoding and for sending and receiving G.729 calls to Cisco Unified CME. All media streams between Cisco Unified Communications Manager and Cisco Unified CME must pass through the MTP because Cisco CME 3.1 does not support transcoding. For more information, see [Cisco Unified Communications Manager documentation](#).
- Step 4** Set up dial peers to establish routing using the instructions in the Dial Peer Configuration on Voice Gateway Routers guide.
- 

## Troubleshooting Call Transfer and Forward Configuration

### Procedure

- 
- Step 1** If you encounter lack of ringback on direct calls from a Cisco Unified Communications Manager phone to an IP phone on a Cisco Unified CME system, check the **show running-config** command output to ensure that the following two commands do *not* appear: **no h225 h245-address on-connect** and **no telephony-service ccm-compatible**. These commands should be enabled, which is their default state.
- Step 2** Use the **debug h225 asn1** command to display the H.323 messages that are sent from the Cisco Unified CME system to the Cisco Unified Communications Manager system to see if the H.245 address is being sent too early.
- Step 3** For calls that are routed using VoIP-to-VoIP connections, use the **show voip rtp connections detail** command to display the call identification number, IP addresses, and port numbers involved for all VoIP call legs. This command includes VoIP-to-POTS and VoIP-to-VoIP call legs. The following is sample output for this command:

```
Router# show voip rtp connections detail
VoIP RTP active connections :
No. CallId dstCallId LocalRTP RmtRTP LocalIP RemoteIP
1 7 8 16586 22346 172.27.82.2 172.29.82.2
2 8 7 17010 16590 172.27.82.2 209.165.202.129

Found 2 active RTP connections
```

- Step 4** Use the **show call prompt-mem-usage detail** command to see information on ringback tone generation that uses the interactive voice response (IVR) prompt playback mechanism. This ringback is needed for hairpin transfers that are committed during the alerting-of-the-transfer-destination phase of the call and for calls to destinations that do not provide in-band ringback tone, such as IP phones (FXS analog ports do provide in-band ringback tone). Ringback tone is played to the transferred party by the Cisco Unified CME system that performs the transfer (the system attached to the transferring

party). The system automatically generates tone prompts as needed based on the network-locale setting for the Cisco Unified CME system.

If you are not getting ringback tone when you should, use the **show call prompt-mem-usage** command to ensure that the correct prompt is loaded and playing. The following sample output indicates that a prompt is playing (“Number of prompts playing”) and indicates the country code used for the prompt (GB for Great Britain) and the codec.

```
Router# show call prompt-mem-usage detail
Prompt memory usage:

 config'd wait active free mc total ms total
file(s) 0200 0001 -001 00200 00001 00002
memory 02097152 00003000 00000000 02094152 00003000
Prompt load counts: (counters reset 0)
success 0(1st try) 0(2nd try), failure 0
Other mem block usage:

```

## Configure SIP-to-SIP Phone Call Forwarding

To configure SIP-to-SIP call forwarding using a back-to-back user agent (B2BUA) which allows call forwarding on any dial peer, perform the following steps.

### Restriction

- SIP-to-SIP call forwarding is invoked only if that phone is dialed directly. Call forwarding is not invoked when the phone number is called through a sequential, longest-idle, or peer hunt group.
- If call forwarding is configured for a hunt group member, call forward is ignored by the hunt group.
- In Cisco Unified CME 4.1 and later versions, Call Forward All requires SIP phones to be configured with a directory number (using **dn** keyword in **number** command); direct line numbers are not supported.

### Before you begin

- Cisco CME 3.4 or a later version.
- Connections between specific types of endpoints in a Cisco IP-to-IP gateway must be configured by using the **allow-connections** command. For configuration information, see [Enable Calls in Your VoIP Network, on page 132](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn** *dn-tag*
4. **call-forward b2bua all** *directory- number*
5. **call-forward b2bua busy** *directory- number*
6. **call-forward b2bua mailbox** *directory- number*
7. **call-forward b2bua night-service** *directory- number*
8. **call-forward b2bua noan** *directory- number* **timeout** *seconds*
9. **call-forward b2bua unreachable** *directory- number*
10. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                |                                                                      | register dn takes precedence over the configuration under voice register pool. <ul style="list-style-type: none"> <li>This command was removed in Cisco Unified CME 4.1.</li> </ul> |
| <b>Step 10</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-register-dn)# end | Exits to privileged EXEC mode.                                                                                                                                                      |

## Configure Call Forward Unregistered for SIP IP Phones

### Before you begin

- Cisco Unified CME 8.6 or a later version.

### SUMMARY STEPS

- enable
- configure terminal
- voice register dn *tag*
- call-forward b2bua unregistered *directory-number*
- end

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                 | Purpose                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>  |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                    | Enters global configuration mode.                                                                                 |
| <b>Step 3</b> | <b>voice register dn <i>tag</i></b><br><br><b>Example:</b><br>Router(config)#voice register dn 20 | Enters voice register dn mode to define a directory number for a SIP phone, intercom line, voice port, or an MWI. |

|               | Command or Action                                                                                                                                    | Purpose                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>call-forward b2bua unregistered</b> <i>directory-number</i><br><b>Example:</b><br>Router(config-register-dn)#call-forward b2bua unregistered 2345 | Enables call forwarding for a SIP back-to-back user agent so that all incoming calls are forwarded to the unregistered directory-number. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                                                          | Returns to privileged EXEC mode.                                                                                                         |

## Troubleshooting Tips for Call Forward Unregistered

- Use the **show dial-peer voice summary** command to check whether a CFU dial peer is created or removed.
- Enable **deb voice reg event**, **deb voice reg state**, and **deb voice reg error** commands to trace the creation and deletion of the CFU dial peer.
- Enable **deb voice reg event**, **deb voip ccapi inout**, **deb voip app callsetup**, **deb voip app core**, **deb voip app state**, and **deb voip app error** commands to trace the call flow for CFU.

## Configure Keepalive Timer Expiration in SIP Phones

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **sip**
5. **registrar server** [**expires** [**max seconds**] [**min seconds**]]
6. **end**

|               | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>voice service voip</b><br><b>Example:</b><br>Router(conf)# voice service voip                                                                    | Enters voice-service configuration mode and specifies voice-over-IP encapsulation.                                                                                                                                                                                                                                                                                                 |
| <b>Step 4</b> | <b>sip</b><br><b>Example:</b><br>Router(conf-serv)# sip                                                                                             | Enters SIP configuration mode.                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 5</b> | <b>registrar server [expires [max seconds] [min seconds] ]</b><br><b>Example:</b><br>Router(conf-serv-sip)# registrar server expires max 250 min 75 | Enables SIP registrar functionality in Cisco Unified CME. <ul style="list-style-type: none"> <li>• expires—(Optional) Sets the active time for an incoming registration.</li> <li>• max sec—(Optional) Maximum time for a registration to expire, in seconds. Range: 120 to 86400.</li> <li>• min sec—(Optional) Minimum time for a registration to expire, in seconds.</li> </ul> |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router (conf-serv-sip)# end                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                   |

## Configure Call-Forwarding-All Softkey URI on SIP Phones

To specify the uniform resource identifier (URI) for the call forward all (CfwdAll) softkey on supported SIP phones, perform the following steps. This URI and the call forward number is sent to Cisco Unified CME when a user enables Call Forward All on a SIP phone.

### Restriction

- This feature is supported only on Cisco Unified IP Phone 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE.
- If a user enables Call Forward All using the CfwdAll softkey, it is enabled on the primary line.

### Before you begin

- Cisco Unified CME 4.1 or a later version.
- The **mode cme** command must be enabled in Cisco Unified CME.
- Call Forward All must be enabled on the directory number. For information, see [Configure SIP-to-SIP Phone Call Forwarding, on page 1195](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**

4. **call-feature-uri cfwdall** *service-uri*
5. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                           | Purpose                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                                                                                          | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                     |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                  | Enters global configuration mode.                                                                                                         |
| <b>Step 3</b> | <b>voice register global</b><br><b>Example:</b><br>Router(config)# voice register global                                                                    | Enters voice register global configuration mode to set global parameters for all supported SIP phones in a Cisco Unified CME environment. |
| <b>Step 4</b> | <b>call-feature-uri cfwdall</b> <i>service-uri</i><br><b>Example:</b><br>Router(config-register-global)# call-feature-uri cfwdall http://1.4.212.11/cfwdall | Specifies the URI for soft keys on SIP phones connected to a Cisco Unified CME router.                                                    |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-global)# end                                                                                        | Exits to privileged EXEC mode.                                                                                                            |

## Specify Number of 3XX Responses To be Handled on SIP Phones

To specify how many subsequent 3XX responses an originating SIP phone can handle for a single call when the terminating side is a forwarding party which does not use B2BUA, perform the following steps.

### Before you begin

- Cisco CME 3.4 or a later version.
- The **mode cme** command must be enabled

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **phone-redirect-limit** *number*

## 5. end

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                          | Purpose                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                                                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                 | Enters global configuration mode.                                                                                                                                              |
| <b>Step 3</b> | <b>voice register global</b><br><b>Example:</b><br>Router(config)# voice register global                                   | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME.                                                           |
| <b>Step 4</b> | <b>phone-redirect-limit <i>number</i></b><br><b>Example:</b><br>Router(config-register-global) #<br>phone-redirect-limit 8 | Changes the default number of 3XX responses a SIP phone that originates a call can handle for a single call.<br><ul style="list-style-type: none"> <li>• Default: 5</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-global) # end                                                      | Exits to privileged EXEC mode.                                                                                                                                                 |

## Configure Call Transfer on SIP Phones

To create and apply a template to enable call transfer softkeys on an individual SIP phone in Cisco Unified CME, perform the following steps.

**Restriction**

- Blind transfer is not supported on certain phones such as Cisco Unified IP Phone 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, or 7971GE.
- In Cisco Unified CME 4.1, the soft key display can be customized only for certain IP phones, such as Cisco Unified IP Phone 7911G, 7941G, 7941GE, 7961G, 7961GE, 7970G, and 7971GE. For configuration information, see [Modify Softkey Display on SIP Phone, on page 935](#).

**Before you begin**

Cisco CME 3.4 or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register template** *template-tag*
4. **transfer-attended**
5. **transfer-blind**
6. **exit**
7. **voice register pool** *pool-tag*
8. **template** *template-tag*
9. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                  | Purpose                                                                                                                                                                                             |
|---------------|--------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                                                 | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                         | Enters global configuration mode.                                                                                                                                                                   |
| <b>Step 3</b> | <b>voice register template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# voice register template 1 | Enters voice register template configuration mode to define a template of common parameters for SIP phones in Cisco Unified CME.<br><ul style="list-style-type: none"><li>• Range: 1 to 5</li></ul> |
| <b>Step 4</b> | <b>transfer-attended</b><br><b>Example:</b><br>Router(config-register-template)# transfer-attended                 | Enable a soft key for attended transfer on any supported SIP phone that uses a template in which this command is configure.                                                                         |
| <b>Step 5</b> | <b>transfer-blind</b><br><b>Example:</b><br>Router(config-register-template)# transfer-blind                       | Enable a soft key for blind transfer on any supported SIP phone that uses a template in which this command is configure.                                                                            |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Router(config-register-template)# exit                                           | Exits configuration mode to the next highest mode in the configuration mode hierarchy.                                                                                                              |
| <b>Step 7</b> | <b>voice register pool</b> <i>pool-tag</i><br><b>Example:</b><br>Router(config)# <b>voice register pool</b> 3      | Enters voice register pool configuration mode to set phone-specific parameters for SIP phones.                                                                                                      |

|               | Command or Action                                                                                                    | Purpose                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b> | <b>template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-register-pool)# <b>voice register pool 1</b> | Applies a template created with the <b>voice register template</b> command.<br><ul style="list-style-type: none"> <li><i>template-tag</i>—Range: 1 to 5</li> </ul> |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-pool)# <b>end</b>                                            | Exits to privileged EXEC mode.                                                                                                                                     |

## Configuration Examples for Call Transfer and Forwarding

### Example for Configuring H.450.2 and H.450.3 Support

The following example sets all transfers and forwards that are initiated by a Cisco CME 3.0 or later system to use the H.450 standards, globally enables H.450.2 and H.450.3 capabilities, and disables those capabilities for dial peer 37. The **supplementary-service** commands under voice-service configuration mode are not necessary because these values are the default, but they are shown here for illustration.

```
telephony-service
transfer-system full-consult
transfer-pattern .T
call-forward pattern .T
!
voice service voip
supplementary-service h450.2
supplementary-service h450.3
!
dial-peer voice 37 voip
destination-pattern 555....
session target ipv4:10.5.6.7
no supplementary-service h450.2
no supplementary-service h450.3
```

### Example for Configuring Basic Call Forwarding

The following example sets up forwarding for extension 2777 to extension 2513 on all calls, busy, and no answer. During night service hours, calls are forwarded to a different number, extension 2879.

```
ephone-dn 20
number 2777
call-forward all 2513
```

```
call-forward busy 2513
call-forward noan 2513 timeout 45
call-forward night-service 2879
```

## Example for Configuring Call Forwarding Blocked for Local Calls

In the following example, extension 2555 is configured to not forward local calls that are internal to the Cisco Unified CME system. Extension 2222 dials extension 2555. If 2555 is busy, the caller hears a busy tone. If 2555 does not answer, the caller hears ringback. The internal call is not forwarded.

```
ephone-dn 25
number 2555
no forward local-calls
call-forward busy 2244
call-forward noan 2244 timeout 45
```

## Example for Configuring Transfer Patterns

The following example shows how to configure transfer patterns beginning with 1234:

```
Router# configure terminal
Router(config)# telephony-service
Router(config-telephony)# transfer-pattern 1234
```

## Example for Configuring Maximum Length of Transfer Number

The following example shows how to configure the maximum length of the transfer number under voice register pool 1. Because the maximum length is configured as 5, only call transfers to Cisco Unified SIP IP phones with a five-digit directory number are allowed. All call transfers to directory numbers with more than five digits are blocked.

```
Router# configure terminal
Router(config)# voice register pool 1
Router(config-register-pool)# transfer max-length 5
```

The following example shows how to configure the maximum length of the transfer number for a set of phones under voice register template 2:

```
Router# configure terminal
Router(config)# voice register template 2
Router(config-register-temp)# transfer max-length 10
```

## Example for Configuring Conference Transfer Patterns

The following example configures transfer patterns that allow conference calls:

```
Router# configure terminal
Router(config)# telephony-service
Router(config-telephony)# transfer-pattern 1357
```

```
Router(config-telephony)# transfer-pattern 222...
Router(config-telephony)# conference transfer-pattern
```

## Example for Blocking All Call Transfers

The following example shows how to block all call transfers for voice register pool 5:

```
Router(config)# voice register pool 5
Router(config-register-pool)# transfer-pattern ?
blocked global transfer pattern not allowed
Router(config-register-pool)# transfer-pattern blocked
```

The following example shows how to block all call transfers for a set of Cisco Unified SIP IP phones defined by voice register template 9:

```
Router(config)# voice register template 9
Router(config-register-temp)# transfer-pattern ?
blocked global transfer pattern not allowed
Router(config-register-temp)# transfer-pattern blocked
```

## Example for Configuring Selective Call Forwarding

The following example sets call forwarding on busy and no answer for ephone-dn 38 only for its primary number, 2777. Callers who dial 2778 will hear a busy signal if the ephone-dn is busy or ringback if there is no answer.

```
ephone-dn 38
number 2777 secondary 2778
call-forward busy 3000 primary
call-forward noan 3000 primary timeout 45
```

## Example for Configuring Call Transfer

The following example limits transfers from ephone 6, extension 2977, to numbers containing a maximum of 8 digits.

```
telephony-service
load 7910 P00403020214
load 7960-7940 P00305000600
load 7914 S00103020002
load 7905 CP7905040000SCCP040701A
load 7912 CP7912040000SCCP040701A
max-ephones 100
max-dn 500
ip source-address 10.104.8.205 port 2000
max-redirect 20
system message XYZ Inc.
create cnf-files version-stamp 7960 Jul 13 2004 03:39:28
```

```

time-webedit
transfer-system full-consult
transfer-pattern 91.....
transfer-pattern 92.....
transfer-pattern 93.....
transfer-pattern 94.....
transfer-pattern 95.....
transfer-pattern 96.....
transfer-pattern 97.....
transfer-pattern 98.....
transfer-pattern 99.....
secondary-dialtone 9
fac standard
ephone-template 2
transfer max-length 8
ephone-dn 4
number 2977
ephone 6
button 1:4
ephone-template 2
```

## Example for Configuring Call Transfer Recall for SCCP Phones

The following example shows that transfer recall is enabled globally. After 60 seconds an unanswered call is forwarded back to the phone that initiated the transfer (transferor).

```
telephony-service
max-ephones 100
max-dn 240
timeouts transfer-recall 60
max-conferences 8 gain -6
transfer-system full-consult
```

The following example shows that transfer recall is enabled for extension 1030 (ephone-dn 103), which is assigned to ephone 3. If extension 1030 forwards a call and the transfer-to party does not answer, after 60 seconds the unanswered call is sent back to extension 1030 (transferor). The **timeouts transfer-recall** command can also be set in an ephone-dn template and applied to one or more directory numbers.

```
ephone-dn 103
```

```

number 1030
name Smith, John
timeouts transfer-recall 60
!
ephone 3
mac-address 002D.264E.54FA
type 7962
button 1:103

```

## Example for Configuring Call-Transfer Recall for SIP Phones

The following example shows that transfer recall is enabled globally. After 20 seconds, an unanswered call is forwarded back to the phone that initiated the transfer (transferor).

```

voice register global
mode cme
source-address 8.39.17.29 port 5060
timeouts transfer-recall 20
max-dn 100
max-pool 100
tftp-path flash:
create profile sync 0342574150542703
keepalive 140
auto-register

```

The following example shows that transfer recall is enabled for extension 111 (voice register dn 1). If extension 111 forwards a call to voice register dn 2 and the transfer-to party does not answer, after 20 seconds the unanswered call is sent back to extension 111 (transferor).

```

voice register dn 1
timeouts transfer-recall 20
number 111
voice register dn 2
number 222

```

## Example for Enabling H.450.12 Capabilities

The following example globally disables H.450.12 capabilities and then enables them only on dial peer 24.

```

voice service voip
no supplementary-service h450.12
!
dial-peer voice 24 voip
destination-pattern 555....
session target ipv4:10.5.6.7
supplementary-service h450.12

```

## Example for Enabling H.450.7 and QSIG Supplementary Services

The following example implements QSIG supplementary services on extension 74367 and globally enables H.450.7 supplementary services and QSIG call-forwarding supplementary services.

```
telephony-service
voicemail 74398
transfer-system full-consult
ephone-dn 25
number 74367
mwi qsig
call-forward all 74000
voice service voip
supplementary-service h450.7
voice service pots
supplementary-service qsig call-forward
```

## Example for Configuring Cisco Unified CME and Cisco Unified Communications Manager in Same Network

The following example shows a running configuration for a Cisco CME 3.1 or later router that has a Cisco Unified Communications Manager in its network.

```
Router# show running-config

## Example for Configuring Call Forward to Cisco Unity Express

The following example enables the ability to forward calls that originate from Cisco Unified Communications Manager phones and are routed through a Cisco Unified CME system to a Cisco Unity Express extension. Call forwarding is enabled for all calling parties, H.450.3 is disabled, and connections are allowed to SIP endpoints.

```
telephony-service
 call-forward pattern .T

voice service voip
 no supplementary-service h450.3
 allow connections from h323 to sip
```

## Example for Configuring Call Forward Unregistered for SIP IP Phones

The following example shows CFU configured for voice register dn 20:

```
!
!
!
voice service voip
 allow-connections sip to sip
 sip
 registrar server expires max 250 min 75
!
!
voice register global
 mode cme
 source-address 10.100.109.10 port 5060
 bandwidth video tias-modifier 256 negotiate end-to-end
 max-dn 200
 max-pool 42
 url directory http://1.4.212.11/localdirectory
 create profile sync 0004625832149157
!
voice register dn 20
 number 10
 call-forward b2bua unregistered 2345
!
voice register pool 1
 number 1 dn 20
 id mac 1111.1111.1111
```

```

camera
video
!
voice register pool 2
id mac 0009.A3D4.1234

```

## Example for Configuring Keepalive Timer Expiration in SIP Phones

The following example shows the minimum and maximum registrar server expiration time for SIP phones:

```

Router#show run
!
!
!
!
!
!
voice service voip
allow-connections sip to sip
sip
registrar server expires max 250 min 75
!
!
voice register global
mode cme
source-address 10.100.109.10 port 5060
bandwidth video tias-modifier 256 negotiate end-to-end
max-dn 200

```

## Where to Go Next

If you are finished modifying the configuration, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

### Softkeys

To block the function of the call-forward-all or transfer softkey without removing the key display or to remove the softkey from one or more phones, see [Customize Softkeys, on page 919](#).

### Feature Access Codes (FACs)

Phone users can activate and deactivate a phone's call-forward-all setting by using a feature access code (FAC) instead of a soft key on the phone if standard or custom FACs have been enabled for your system. The following are the standard FACs for call forward all:

- **callfwd all**—Call forward all calls. Standard FAC is \*\*1 plus an optional target extension.

- **callfwd cancel**—Cancel call forward all calls. Standard FAC is \*\*2.

For more information about FACs, see [Feature Access Codes, on page 751](#).

### Night Service

Calls can be automatically forwarded during night service hours, but you must define the night-service periods, which are the dates or days and hours during which night service will be active. For instance, you may want to designate night service periods that include every weeknight between 5 p.m. and 8 a.m. and all day every Saturday and Sunday. For more information, see [Configure Call Coverage Features, on page 1262](#).

## Feature Information for Call Transfer and Forwarding

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 104: Feature Information for Call Transfer and Forwarding**

| Feature Name                                                                              | Cisco Unified CME Version | Feature Information                                                                                                                             |
|-------------------------------------------------------------------------------------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Calling Number Local                                                                      | 12.0                      | Introduced support to configure Calling Number Local feature for Voice Register DNs.                                                            |
| Call Transfer Recall on SIP Phones                                                        | 11.6                      | Call Transfer Recall feature returns a transferred call to the phone that initiated the transfer if the destination is busy or does not answer. |
| Trunk-to-Trunk Transfer Blocking for Toll Fraud Prevention on Cisco Unified SIP IP Phones | 9.5                       | Introduced support Trunk-to-Trunk Transfer Blocking for Toll Fraud Prevention on Cisco Unified SIP IP Phones.                                   |

| Feature Name    | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call Forwarding | 4.1                       | <ul style="list-style-type: none"> <li>• Call Forward All synchronization between Cisco Unified CME and SIP phones was added.</li> <li>• Disabling SIP supplementary services for call forward and call transfer was added.</li> </ul>                                                                                                  |
|                 | 4.0                       | <ul style="list-style-type: none"> <li>• Automatic call forwarding during night service was introduced.</li> <li>• Selective call forwarding was introduced.</li> <li>• Forwarding of local (internal) calls can be blocked.</li> <li>• H.450.7 standards support and QSIG supplementary services capability was introduced.</li> </ul> |
|                 | 3.4                       | Calls into a SIP device can be forwarded to other SIP or SCCP devices including Cisco Unity, third- party voice mail systems, or an auto-attendant (AA) or other interactive voice response (IVR) devices. SCCP devices may also be forwarded to SIP devices.                                                                           |
|                 | 3.1                       | <ul style="list-style-type: none"> <li>• Number of digits that can be entered using the CfwdALL (call-forward all) soft key can be limited.</li> <li>• H.450.12 standards support, which provide dynamic detection of H.450.2 and H.450.3 capabilities on a call-by-call basis, was introduced.</li> </ul>                              |
|                 | 3.0                       |                                                                                                                                                                                                                                                                                                                                         |

| Feature Name              | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                                                                                                                            |
|---------------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Information About Call Coverage Features

### Call Coverage Summary

Call coverage features are used to ensure that all incoming calls to Cisco Unified CME are answered by someone, regardless of whether the called number is busy or does not answer.

Some single-dialed-number call coverage features, such as hunt groups, can send incoming calls to a single extension to a pool of phone agents, while other features, such as call hunt, call waiting, and call forwarding increase the chance of a call being answered by giving it another chance for a connection if the dialed number is not available.

Multiple-dialed-number call coverage features, such as call pickup, night service, and overlaid directory numbers, provide different ways for one person to answer incoming calls to multiple numbers.

Any of the call coverage features can be combined with other call coverage features and with shared lines and secondary numbers to design the call coverage plan that is best suited to your needs.

[Table 105: Call Coverage Feature Summary, on page 1224](#) summarizes call coverage features.

Table 105: Call Coverage Feature Summary

| Feature         | Description                                                                                                                                                                    | Example                                                                                                                                                                                                                                                                                                                                                                | How Configured                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call Forwarding | Calls are automatically diverted to a designated number on busy, no answer, all calls, or only during night-service hours.                                                     | Extension 3444 is configured to send calls to extension 3555 when it is busy or does not answer.                                                                                                                                                                                                                                                                       | <a href="#">Enable Call Forwarding for a Directory Number, on page 1167</a><br>or<br><a href="#">Configure SIP-to-SIP Phone Call Forwarding, on page 1195</a> |
| Call Hunt       | System automatically searches for an available directory number from a matching group of directory numbers until the call is answered or the hunt is stopped.                  | Three ephone-dns have the same extension number, 755. One is on the manager's phone and the others are on the assistants' phones. Preference and huntstop are used to make sure that calls always come to the manager's phone first but if they can't be answered, they will ring on the first assistant's phone and if not answered, on the second assistant's phone. | <a href="#">Configure Call Hunt on SCCP Phones, on page 1262</a><br>or<br><a href="#">Configure Call Hunt on SIP Phones, on page 1265</a>                     |
| Call Pickup     | Calls to unstaffed phones can be answered by other phone users using a soft key or by dialing a short code.                                                                    | Extension 201 and 202 are both in pickup group 22. A call is received by 201, but no one is there to answer. The agent at 202 presses the GPickUp soft key to answer the call.                                                                                                                                                                                         | <a href="#">Enable Call Pickup, on page 1266</a>                                                                                                              |
| Call Waiting    | Calls to busy numbers are presented to phone users, giving them the option to answer them or let them be forwarded.                                                            | Extension 564 is in conversation when a call-waiting beep is heard. The phone display shows the call is from extension 568 and the phone user decides to let the call go to voice mail.                                                                                                                                                                                | <a href="#">Configure Call-Waiting Indicator Tone on SCCP Phone, on page 1270</a><br>or<br><a href="#">Enable Call Waiting on SIP Phones, on page 1275</a>    |
| CiscoCME B-ACD  | Calls to a pilot number are automatically answered by an interactive application that presents callers with a menu of choices before sending them to a queue for a hunt group. | The DID number 555-0125 is the pilot number for the XYZ Company. Incoming calls to this pilot number hear a menu of choices; they can press 1 for sales, 2 for service, or 3 to leave a message. The call is forwarded appropriately when callers make a choice.                                                                                                       | See <a href="#">Cisco Unified CME B-ACD and Tcl Call-Handling Applications</a> .                                                                              |

| Feature             | Description                                                                                                                             | Example                                                                                                                                                                                                                                                                                                           | How Configured                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Hunt Groups         | Calls are forwarded through a pool of agents until answered or sent to a final number.                                                  | Extension 200 is a pilot number for the sales department. Extensions 213, 214, and 215 belong to sales agents in the hunt group. When a call to extension 200 is received, it proceeds through the list of agents until one answers. If all the agents are busy or do not answer, the call is sent to voice mail. | <a href="#">Configure Ephone-Hunt Groups on SCCP Phones, on page 1276</a><br>or<br><a href="#">Configure Voice-Hunt Groups, on page 1286</a> |
| Night Service       | Calls to ephone-dns and voice register dns that are not staffed during certain hours can be answered by other phones using call pickup. | Extension 7544 is the cashier's desk but the cashier only works until 3 p.m. A call is received at 4:30 p.m. and the service manager's phone is notified. The service manager uses call pickup to answer the call.                                                                                                | <a href="#">Configure Night Service on SCCP Phones, on page 1299</a><br><a href="#">Configure Night Service on SIP Phones, on page 1303</a>  |
| Overlaid Ephone-dns | Calls to several numbers can be answered by a single agent or multiple agents.                                                          | Extensions 451, 452, and 453 all appear on button 1 of a phone. A call to any of these numbers can be answered from button 1.                                                                                                                                                                                     | <a href="#">Configure Overlaid Ephone-dns on SCCP Phones, on page 1312.</a>                                                                  |

## Out-of-Dialog REFER

Out-of-dialog REFER (OOD-R) allows remote applications to establish calls by sending a REFER message to Cisco Unified CME without an initial INVITE. After the REFER is sent, the remainder of the call setup is independent of the application and the media stream does not flow through the application. The application using OOD-R triggers a call setup request that specifies the Referee address in the Request-URI and the Refer-Target in the Refer-To header. The SIP messaging used to communicate with Cisco Unified CME is independent of the end-user device protocol which can be SIP, SCCP, H.323, or POTS. Click-to-dial is an example of an application that can be created using OOD-R.

A click-to-dial application allows users to combine multiple steps into one click for a call setup. For example, a user can click a web-based directory application from their PC to look up a telephone number, off-hook their desktop phone, and dial the called number. The application initiates the call setup without the user having to out-dial from their own phone. The directory application sends a REFER message to Cisco Unified CME which sets up the call between both parties based on this REFER.

[Figure 55: Click-to-Dial Application using Out-of-Dialog REFER, on page 1226](#) shows an example of OOD-R being used by a click-to-dial application. In this scenario, the following events occur (refer to the event numbers in the illustration):

1. Remote user clicks to dial.
2. Application sends out-of-dialog REFER to Cisco Unified CME 1.
3. Cisco Unified CME 1 connects to SIP phone 1 (Referee).
4. Cisco Unified CME 1 sends INVITE to Cisco Unified CME 2.
5. Cisco Unified CME 2 sends INVITE to SIP phone 2 (Refer-Target) and the call is accepted.

6. Voice path is created between the two SIP phones.

**Figure 55: Click-to-Dial Application using Out-of-Dialog REFER**

The initial OOD-R request can be authenticated and authorized using RFC 2617-based digest authentication. To support authentication, Cisco Unified CME retrieves the credential information from a text file stored in flash. This mechanism is used by Cisco Unified CME in addition to phone-based credentials. The same credential file can be shared by other services that require request-based authentication and authorization such as presence service. Up to five credential files can be configured and loaded into the system. The contents of these five files are mutually exclusive, meaning the username and password pairs must be unique across all the files. The username and password pairs must also be different than those configured for SCCP or SIP phones in a Cisco Unified CME system.

For configuration information, see [Enable Out-Of-Dialog REFER, on page 1316](#).

## Call Hunt

Call hunt allows you to use multiple directory numbers to provide coverage for a single called number. You do this by assigning the same number to several primary or secondary ephone-dns or by using wildcards in the number associated with the directory numbers.

Calls are routed based on a match between the number dialed and the destination patterns that are associated with dial peers. Through the use of wildcards in destination patterns, multiple dial peers can match a particular called number. Call hunt is the ability to search through the dial peers that match the called number until the call is answered. Call hunt uses a technique called preference to control the order in which dial peers are matched to an incoming call and a technique called huntstop to determine when the search for another matching peer ends.

In Cisco Unified CME, incoming calls search through the virtual dial peers that are automatically created when you define directory numbers. These virtual dial peers are not directly configurable; you must configure the directory number to control call hunt for virtual dial peers.

Channel huntstop is used to stop the search for the two channels of a dual-line directory number. Channel huntstop keeps incoming calls from hunting to the second channel if the first channel is busy or does not answer. This keeps the second channel free for call transfer, call waiting, or three-way conferencing.

Huntstop prevents hunt-on-busy from redirecting a call from a busy phone into a dial peer that has been setup with a catch-all default destination.

For configuration information, see [Configure Call Hunt on SCCP Phones, on page 1262](#) or [Configure Call Hunt on SIP Phones, on page 1265](#).

## Call Pickup

Call Pickup allows a phone user to answer a call that is ringing on another phone. Cisco Unified CME 7.1 introduces Call Pickup features for SIP phones. SCCP phones support three types of Call Pickup:

- **Directed Call Pickup**—Call pickup, explicit ringing extension. Any local phone user can pick up a ringing call on another phone by pressing a soft key and then dialing the extension. A phone user does not need to belong to a pickup group to use this method. The soft key that the user presses, either GPickUp or PickUp, depends on your configuration.
- **Group Pickup, Different Group**—Call pickup, explicit group ringing extension. A phone user can answer a ringing phone in any pickup group by pressing the GPickUp soft key and then dialing the pickup group number. If there is only one pickup group defined in the Cisco Unified CME system, the phone user can pick up the call simply by pressing the GPickUp soft key. A phone user does not need to belong to a pickup group to use this method.
- **Local Group Pickup**—Call pickup, local group ringing extension. A phone user can pick up a ringing call on another phone by pressing a soft key and then the asterisk (\*) if both phones are in the same pickup group. The soft key that the user presses, either GPickUp or PickUp, depends on your configuration.

---

**Note** SIP phones only support local pickup and group pickup. Directed call pickup is not supported.

---

The specific soft keys used to access different Call Pickup features on SCCP and SIP phones depends on the configuration in Cisco Unified CME. See the **service directed-pickup** command in [Cisco Unified CME Command Reference](#) for a description.

You can assign each directory number to only one pickup group and a directory number must have a pickup group configured to use Local Group Pickup. There is no limit to the number of directory numbers that can be assigned to a single pickup group, or to the number of pickup groups that can be defined in a Cisco Unified CME system.

If more than one call is ringing on the same number, the calls are picked up in the order in which they were received; the call that has been ringing the longest is the first call picked up from that extension number. Remote call pickup is not supported.

Call Pickup features are enabled globally for all phones through Cisco Unified CME. The PickUp and GpickUp soft keys display on supported SCCP and SIP phones by default and can be modified by using a phone template. For configuration information, see [Enable Call Pickup, on page 1266](#).

[Figure 56: Call Pickup, on page 1228](#) shows four call-pickup scenarios.

Figure 56: Call Pickup

**Call Pickup, No Group or Unknown Group**

- ① Extension 5555 rings.
- ② User at phone 4 presses PickUp soft key and dials 5555.

```
ephone-dn 55
number 5555
pickup-group 33
```

```
ephone-dn 56
number 5556
pickup-group 33
```

```
ephone-dn 57
number 5557
pickup-group 44
```

**Call Pickup in the Same Group**

- ① Extension 5555 rings.
- ② User at phone 2 presses GPickUp soft key and \* (asterisk).

```
ephone-dn 58
number 5558
```

```
.
```

```
ephone 1
mac-address 1111.1111.1111
button 1:55
```

```
ephone 2
mac-address 2222.2222.2222
button 1:56
```

```
ephone 3
mac-address 3333.3333.3333
button 1:57
```

**Call Pickup from a Different Group**

- ① Extension 5555 rings.
- ② User at phone 3 presses GPickUp soft key and dials 33.

```
ephone 4
mac-address 4444.4444.4444
button 1:58
```

```
.
```

**Call Pickup, a Single Group for All Cisco CME Phones**

- ① Extension 5555 rings.
- ② User at phone 2 presses GPickUp soft key.

This scenario assumes that every phone in the Cisco CME system is in pickup group 33, which differs slightly from the sample configuration shown to the right.

15688

## Call Waiting

Call waiting allows phone users to be alerted when they receive an incoming call while they are on another call. Phone users hear a call-waiting tone when another party is trying to reach them and, on IP phones, see the calling party information on the phone screen.

Call-waiting calls to IP phones with soft keys can be answered using the Answer soft key. Call-waiting calls to analog phones controlled by Cisco Unified CME systems are answered using hookflash. When phone users answer a call-waiting call, their original call is automatically put on hold. If a phone user does not respond to a call-waiting notification, the call is forwarded as specified in the **call-forward noan** command for that extension.

For an IP phone running SCCP, call waiting for single-line ephone-dns requires two ephone-dns to handle the two calls. Call waiting on a dual-line ephone-dn requires only one ephone-dn because the two channels of the ephone-dn handle the two calls. The audible call-waiting indicator can be either a call-waiting beep or a call-waiting ring. For configuration information, see [Configure Call-Waiting Indicator Tone on SCCP Phone, on page 1270](#).

For a SIP phone, call waiting is automatically enabled when you configure a voice register pool. For SIP phones directly connected to Cisco Unified CME, call waiting can be disabled at the phone-level. For configuration information, see [Enable Call Waiting on SIP Phones, on page 1275](#).

For information on call waiting using Overlaid ephone-dns, see [Overlaid Ephone-dns, on page 1257](#).

### Call-Waiting Beep for SCCP Phones

Call-waiting beeps are enabled by default. You can disable the call-waiting beeps that are generated from and accepted by directory numbers. If beep generation is disabled, incoming calls to the directory number do not generate call-waiting beeps. If beep acceptance is disabled, the phone user does not hear beeps when using the directory number for an active call.

[Table 106: Call-Waiting Beep Behavior , on page 1229](#) shows the possible beep behaviors of one ephone-dn calling another ephone-dn that is connected to another caller.

**Table 106: Call-Waiting Beep Behavior**

| Ephone-dn 1 Configuration | Ephone-dn 2 Configuration                                | Active Call on DN | Incoming Call on DN | Expected Behavior |
|---------------------------|----------------------------------------------------------|-------------------|---------------------|-------------------|
| —                         | no call-waiting beep                                     | DN 1              | DN 2                | No beep           |
| no call-waiting beep      | —                                                        | DN 1              | DN 2                | No beep           |
| —                         | no call-waiting beep generate                            | DN 1              | DN 2                | No beep           |
| —                         | no call-waiting beep accept                              | DN 1              | DN 2                | Beep              |
| —                         | no call-waiting beep acceptno call-waiting beep generate | DN 1              | DN 2                | No beep           |
| no call-waiting beep      | —                                                        | DN 1              | DN 1                | No beep           |

| Ephone-dn 1 Configuration                                 | Ephone-dn 2 Configuration | Active Call on DN | Incoming Call on DN | Expected Behavior |
|-----------------------------------------------------------|---------------------------|-------------------|---------------------|-------------------|
| no call-waiting beep generate                             | —                         | DN 1              | DN 1                | No beep           |
| no call-waiting beep accept                               | —                         | DN 1              | DN 1                | No beep           |
| no call-waiting beep accept no call-waiting beep generate | —                         | DN 1              | DN 1                | No beep           |
| no call-waiting beep generate                             | —                         | DN 1              | DN 2                | Beep              |
| no call-waiting beep accept                               | —                         | DN 1              | DN 2                | No beep           |
| —                                                         | no call-waiting beep      | DN 1              | DN 1                | Beep              |

## Call-Waiting Ring for SCCP Phones

Instead of the standard call-waiting beep sound through the handset, you can use a short ring for call-waiting notification. The default is for directory numbers to accept call interruptions, such as call waiting, and to issue a beeping sound for notification.

To use a ring sound, the directory number must accept call-waiting indicator tones. For configuration information, see [Configure Call-Waiting Indicator Tone on SCCP Phone, on page 1270](#) or [Enable Call Waiting on SIP Phones, on page 1275](#).

## Cancel Call Waiting

Cancel Call Waiting (CCW) enables an SCCP phone user to disable Call Waiting for a call they originate. The user activates CCW, and thereby disables call waiting, by pressing the cancel call waiting (CW Off) soft key or by dialing the feature access code (FAC) before placing a call. Call Waiting is inactive during that call; anyone calling the user receives normal busy treatment and no call waiting tone interrupts the user's active call. CCW automatically deactivates when the user disconnects from the call. CCW is supported on all lines that support the Call Waiting feature, including dual-lines and octo-lines.

This feature is supported in Cisco Unified CME 8.0 and later versions for SCCP IP phones and SCCP analog phones; it is not supported on SIP phones.

For configuration information, see [Configure Cancel Call Waiting on SCCP Phone, on page 1272](#).

## Callback Busy Subscriber

This feature allows callers who dial a busy extension number to request a callback from the system when the called number is available. Callers can also request callbacks for extensions that do not answer, and the system will notify them after the called phone is next used.

There can be only one callback request pending against a particular extension number, although a caller can initiate more than one callback to different numbers. If a caller attempts to place a callback request on a number that already has a pending callback request, the caller hears a fast-busy tone. If the called number has call forwarding enabled, the callback request is placed against the final destination number.

No configuration is required for this feature. To display a list of phones that have pending callback requests, use the **show ephone-dn callback** command.

## Hunt Groups

Hunt groups allow incoming calls to a specific number (pilot number) to be directed to a defined group of extension numbers.

Incoming calls are redirected from the pilot number to the first extension number as defined by the configuration. If the first number is busy or does not answer, the call is redirected to the next phone in the list. A call continues to be redirected on busy or no answer from number to number in the list until it is answered or until the call reaches the number that is defined as the final number.

The redirect from one directory number to the next in the list is also known as a *hop*. You can set the maximum number of redirects for specific peer or longest-idle hunt groups, and for the maximum number of redirects allowed in a Cisco Unified CME system, both inside and outside hunt groups. If a call makes the maximum number of hops or redirects without being answered, the call is dropped.

In Cisco Unified CME 9.0 and later versions, support for call statistics is added for voice hunt groups. To write all the ephone and voice hunt group statistics to a file, the **ephone-hunt statistics write-all** command is enhanced and renamed to **hunt-group statistics write-all** command. If applicable, the TFTP statistics report consists of both ephone and voice hunt group statistics.

In Cisco Unified CME 9.5 and later versions, the command **hunt-group statistics write-v2** is added to write all ephone hunt group statistics to a file along with total logged in and logged out time for agents. The command was enhanced in Unified CME Release 11.5 to add statistics for total logged in and logged out time for voice hunt group.

The **show telephony-service all** command is also enhanced to display the total number of ephone and voice hunt groups that have statistics collection turned on.

The **statistics collect** command under voice hunt-group configuration mode is introduced to enable the collection of call statistics for a voice hunt group.

The **show voice hunt-group statistics** command is introduced to display call statistics from voice hunt groups.

For Unified CME 11.5 and later versions, the **overwrite-dyn-stats (voice hunt-group)** command is introduced to overwrite statistics of previously joined dynamic agent with stats of newly joined dynamic agents for voice hunt group. The statistics for a dynamic agent are overwritten only when all the 32 available slots are used. For more information, see [Cisco Unified Communications Manager Express Command Reference Guide](#).

For Unified CME 12.2 and later versions, Sequential, Parallel, Peer, and Longest Idle voice hunt groups support SIP shared line and mixed shared line (SIP and SCCP Phones) directory numbers. All shared line features such as Hold and Remote resume, Barge, cBarge, Privacy, and calls through B-ACD is supported for calls that are placed through voice hunt groups.

The following are the known behavior patterns for the voice hunt group enhancement with shared line support, introduced in Unified CME Release 12.2:

- When you press the Decline softkey on one of the shared line DN (configured across phones) in a voice hunt group for an incoming call, the shared line DN on the other phones continue ringing. This behavior is typical to shared line DN in a voice hunt group. For all shared lines that are not part of a voice hunt group, when you press the Decline softkey, all the corresponding shared line DN stop ringing.
- Hlog feature is not supported on a shared DN. If a phone configured with Hlog has a shared DN as part of voice hunt group, then the Hlog functionality is supported only for the other lines that are part of voice hunt group on that phone.

For information on displaying statistics for hunt groups, see [Cisco Unified CME B-ACD and Tel Call-Handling Applications](#).

There are four different types of hunt groups. Each type uses a different strategy to determine the first number that rings for successive calls to the pilot number, as described below.

- **Sequential Hunt Groups**—Numbers always ring in the left-to-right order in which they are listed when the hunt group is defined. The first number in the list is always the first number to be tried when the pilot number is called. Maximum number of hops is not a configurable parameter for sequential hunt groups. [Figure 57: Sequential hunt Group, on page 1234](#) shows an illustrated example.
- **Peer Hunt Groups**—The first number to ring is the number to the right of the directory number that was the last to ring when the pilot number was last called. Ringing proceeds in a circular manner, left to right, for the number of hops specified in the hunt group configuration. [Figure 58: Peer hunt Group, on page 1235](#) shows an illustrated example.
- **Longest-idle Hunt Groups**—Calls go first to the number that has been idle the longest for the number of hops specified when the hunt group was defined. The longest-idle time is determined from the last time that a phone registered, reregistered, or went on-hook. [Figure 59: Longest-idle hunt Group, on page 1236](#) shows an illustrated example.
- **Parallel Hunt Groups (Call Blast)**—Calls ring all numbers in the hunt group simultaneously.

Ephone Hunt-group chains can be configured in any length, but the actual number of hops that can be reached in a chain is determined by the **max-redirect** command configuration. In the following example, a maximum redirect number 15 or greater must be configured for callers to reach the final 5000 number. If a lower number is configured, the call disconnects.

```
ephone-hunt 1 sequential
pilot 8000
list 8001, 8002, 8003, 8004
final 9000
```

```
ephone-hunt 2 sequential
pilot 9000
list 9001, 9002, 9003, 9004
final 7000
```

```
ephone-hunt 3 sequential
pilot 7000
list 7001, 7002, 7003, 7004
final 5000
```

Cisco Unified CME 4.3 and later versions support the following Voice Hunt-Group features:

- Call Forwarding to a Parallel Voice Hunt-Group (Call Blast)
- Call Transfer to a Voice Hunt-Group
- Member of Voice Hunt-Group can be a SIP phone, SCCP phone, FXS analog phone, DS0-group, PRI-group, or SIP trunk.

- Unified CME supports chaining (nesting) of a voice hunt group with another voice hunt group. The chaining of voice hunt groups is established by configuring the final number of the first voice hunt group as the pilot number of the second voice hunt group.

**Note** For Unified CME B-ACD, the final destination for voice hunt groups is determined by the B-ACD service.

- Unified CME supports the chaining (nesting) of a maximum of two voice hunt groups. The configuration ensures that there is no looping of calls placed to a voice hunt group.

## Ephone-Hunt Groups and Voice Hunt-Groups Comparison

SIP phones support Voice Hunt-Groups. SCCP phones support Ephone-Hunt Groups, and in Cisco Unified CME 4.3 and later versions, SCCP phones also support Voice Hunt-Groups. [Table 107: Feature Comparison of Ephone-Hunt Groups and Voice Hunt-Groups, on page 1233](#) compares the features of Ephone-Hunt Groups and Voice Hunt-Groups.

**Table 107: Feature Comparison of Ephone-Hunt Groups and Voice Hunt-Groups**

| Feature                                        | Ephone Hunt                                                                   | Voice Hunt Group                   |
|------------------------------------------------|-------------------------------------------------------------------------------|------------------------------------|

## Sequential Hunt Groups

In a sequential hunt group, extensions always ring in the order in which they are listed, left to right, when the hunt group is defined. The first number in the list is always the first number to be tried when the pilot number is called. Maximum number of hops is not a configurable parameter for sequential hunt groups.

From Unified CME 12.2 onwards, sequential voice hunt groups support shared lines and mixed shared lines. When calls are placed on a sequential voice hunt group and a shared DN is part of the hunt group, the call is placed sequentially. For the shared DN, the call would ring on all phones part of this shared DN. If none of the phones answer, then call would continue to the next DN in the hunt group.

**Note** Consecutive numbers of the same phone cannot be members of a Sequential Voice Hunt Group when present call idle state (configured using the CLI command **present-call idle-phone**) is set to true. The limitation applies to both SIP and SCCP phones.

**Figure 57: Sequential hunt Group**

- ① Any phone dials the pilot number, 5601.
- ② Extension 5001, the leftmost number in the hunt group list, rings first on phone 1. If extension 5001 is busy or does not answer, the call is redirected to extension 5002 on phone 2.
- ③ If extension 5002 on phone 2 is busy or does not answer, the call is redirected to extension 5017 on phone 3.
- ④ If phone 3 is busy or does not answer, the call is redirected to the final number, extension 6000, which is associated with a voice-mail server.

## Peer Hunt Groups

In a peer hunt group, extensions ring in a round-robin order. The first extension to ring is the number in the list to the right of the last extension to ring when the pilot number was last called. Ringing proceeds in a circular manner, left to right, for the number of hops specified when the hunt group was defined.

From Unified CME 12.2 onwards, peer voice hunt groups support shared and mixed shared lines. When calls are placed on a peer voice hunt group and a shared DN is part of the hunt group, the call is placed in a round-robin order. For the shared DN, the call would ring on all phones part of this shared DN. If none of the phones answer, then call would continue to the next DN in the hunt group.

[Figure 58: Peer hunt Group, on page 1235](#) illustrates a peer hunt group.

**Figure 58: Peer hunt Group**

- ① Any phone dials the pilot number, 5601, which is not associated with a physical phone instrument.
- ② Extension 5017 on phone 3 is selected to ring first because extension 5002 was the last number to ring the last time that the pilot number was called.
- ③ If extension 5017 is busy or does not answer, the call is redirected to extension 5044 on phone 4 (first hop).
- ④ If extension 5044 is busy or does not answer, the call is redirected to extension 5001 on phone 1 (second hop).
- ⑤ If extension 5001 is busy or does not answer, the call has reached the maximum number of hops (3), and it is redirected to the final number, extension 6000, which is associated with a voice-mail server.

## Longest-Idle Hunt Groups

In a longest-idle hunt group, the algorithm for choosing the next extension to receive a call is based on a comparison of on-hook time stamps. The extension with the smallest on-hook time stamp value is chosen when the next call comes to the hunt group.

The default behavior is that an on-hook time stamp value for an extension is updated only when the agent answers a call. In Cisco Unified CME 4.0 and later versions, you can specify that an on-hook time stamp is updated when a call rings an extension and also when a call is answered by an agent.

From Unified CME 12.2 onwards, longest-idle voice hunt groups support shared lines and mixed shared lines. When calls are placed on a longest-idle voice hunt group and a shared DN is part of the hunt group, the call is placed based on a comparison of on-hook time stamps. For the shared DN, the call would ring on all phones part of this shared DN. If none of the phones answer, then call would continue to the next DN in the hunt group.

Figure 59: Longest-idle hunt Group, on page 1236 illustrates a longest-idle hunt group.

Figure 59: Longest-idle hunt Group

- ① Any phone dials the pilot number, 5601, which is not associated with a physical phone instrument.
- ② Extension 5001 on phone 1 is selected to ring first because it has been idle the longest.
- ③ If extension 5001 does not answer, the call is redirected to extension 5002 on phone 2 because it has been idle the longest (first hop).
- ④ If extension 5002 does not answer, the call is redirected to extension 5044 on phone 4 because it has been idle the longest (second hop).
- ⑤ If extension 5044 does not answer, the call has reached the maximum number of hops (3), and it is redirected to the final number, extension 6000, which is associated with a voice-mail server.

## Parallel Hunt Groups (Call Blast)

In a parallel hunt group, calls simultaneously ring multiple phones. Using parallel hunt groups is also referred to as application-level forking because it enables the forking of a call to multiple destinations. In versions earlier than Cisco Unified CME 4.3, only SIP phones support parallel hunt groups. In Unified CME 4.3 and later versions, SCCP phones also support voice hunt groups.

You can enable functionality similar to parallel hunt groups on SCCP phones by using the ephone-dn overlay feature for shared lines. See [Shared- Line Overlays](#), on page 1259.

From Unified CME 12.2 onwards, parallel voice hunt groups support shared lines and mixed shared lines. For parallel voice hunt groups, a maximum of 32 call blasts is supported, including shared-line and normal directory numbers. For example, consider a voice hunt group configured with 20 directory numbers, including 3 shared-lines assigned across three different phones. In this scenario, the count of shared line directory numbers is considered as 9 (3\*3). Then, the total count of call blasts in this hunt group is 26 directory numbers (17 + 9). When the call blast limit of 32 is exceeded, then call is not placed for those voice hunt group directory numbers that exceed the limit.

In the following parallel hunt group example, when callers dial extension 1000, extension 1001, 1002, and so on ring simultaneously. The first extension to answer is connected. If none of the extensions answers, the call is forwarded to extension 2000, which is the number for the voice-mail service.

```

voice hunt-group 4 parallel
 pilot 1000
 list 1001, 1002, 1003, 1004
 final 2000

```

timeout 20

The number of ringing calls that a parallel hunt group can support depends on whether call-waiting is enabled on the SIP phones.

If call-waiting is enabled (the default), parallel hunt groups support multiple calls up to the limit of call-waiting calls supported by a particular SIP phone model. You may not want to use unlimited call-waiting, however, with parallel hunt-groups if agents do not want a large number of waiting calls when they are already handling a call.

If call waiting is disabled, parallel hunt groups support only one call at a time in the ringing state. After a call is answered (by one of the phones in the hunt group), a second call is allowed. The second and subsequent calls ring only the idle phones in the hunt group, and bypass the busy phone that answered the first call (because this phone is connected to the first call). After the second call is answered, a third call is allowed, and so on until all the phones in the parallel hunt group are busy. The hunt group does not accept further calls until at least one phone returns to the idle/on-hook state.

When two or more phones within the same parallel hunt group attempt to answer the same call, only one phone can connect to the call. Phones that fail to connect must return to the on-hook state before they can receive subsequent calls. Calls that arrive before a phone is placed on-hook are not presented to the phone. For example, if a second call arrives after Phone 1 has answered the original call, but before Phone 2 goes back on-hook, the second call bypasses Phone 2 (because it is offhook).

When a phone returns to the idle/on-hook state, it does not automatically re-synchronize to the next call waiting to be answered. For example, in the previous scenario, if the second call is still ringing Phone 3 when Phone 2 goes on-hook, Phone 2 does not ring because it was offhook when the second call arrived.

For configuration information, see [Configure Voice-Hunt Groups, on page 1286](#).

## View and Join for Voice Hunt Groups

You can view voice hunt group related information on SIP and SCCP phones using the phone menu. The following information related to hunt groups can be viewed on the phone display:

- Name
- Pilot number
- Status

If voice hunt groups have been configured, the user can view the voice hunt group information using the service button on the phone, by navigating to **My Phone Apps > Voice Hunt Groups**. On selecting the voice hunt group option, a list of voice hunt groups will be displayed.

A voice hunt group includes the name of the hunt group, the pilot number and also the status of the DN indicating if the DN is a member of the hunt group. This information is displayed in the following method:

- If DN is a static member of the hunt group, then status is displayed with # (hash) symbol.
- If DN is dynamic member, the status is displayed with \* (asterisk) symbol.

The following operations can be performed on the phone user interface:

- User can join or unjoin to or from voice hunt groups by selecting the **Join** or **Unjoin** softkey which is displayed on the voice hunt group page. The user can select the required voice hunt group using the up and down buttons.

- User can access the next or previous records of voice hunt groups by selecting the **Next/Previous** softkey options.

To display voice hunt-group information on the phone, user needs to configure **phone-display** command under voice hunt-groups.

### Restrictions and Limitations

- A DN can join a maximum of six voice hunt groups.
- The displayed hunt group information is applicable only for the primary line of the phone.
- A primary DN can join or unjoin a voice hunt group using the **Service** button on the phone. If a phone is configured with multiple DNs, then DNs other than the primary DN can join the voice hunt groups by dialing the FAC standards.
- The voice hunt group information display feature is applicable only on the phones that support **My Phone Apps** menu. For example, 78xx, 88xx phone families are supported. However, 69xx, 39xx phone families are not supported.

## Enable User Interface to View, Join, and Unjoin Voice Hunt Groups on SCCP Phone

This feature enables an SCCP phone user to view information related to the voice hunt groups and join or unjoin voice hunt groups from a menu on their phone. This feature is enabled by default. You must perform this task only if the feature was previously disabled on a phone.

### Before you begin

Cisco Unified CME 10.5 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone *phone-tag***
4. **phone-ui voice-hunt-groups**
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                      | Purpose                                                                                                                   |
|---------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                         | Purpose                                                                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                | Enters global configuration mode.                                                                                                                                       |
| <b>Step 3</b> | <b>ephone <i>phone-tag</i></b><br><b>Example:</b><br>Router(config)# ephone 12                            | Enters ephone configuration mode.<br><br>• <i>phone-tag</i> —Unique number that identifies this ephone during configuration tasks.                                      |
| <b>Step 4</b> | <b>phone-ui voice-hunt-groups</b><br><b>Example:</b><br>Router(config-ephone)# phone-ui voice-hunt-groups | Enables a SCCP phone user to view information related to voice hunt groups and also join or unjoin from voice hunt groups.<br><br>• This command is enabled by default. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                               | Exits to privileged EXEC mode.                                                                                                                                          |

**Example**

The following example shows that the **voice-hunt-groups** command is enabled on an SCCP phone.

```
ephone-dn 10 dual-line
 number 1001
 no huntstop
 huntstop channel
ephone-dn 11 dual-line
```

**Note** From Cisco Unified CME Release 10.5 onwards, SIP phones will display voice hunt group information, by default.

## Configure Service URL Button On SCCP Phone Line Key

To implement service PLK feature line key buttons on Cisco Unified SCCP Phones, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone template *template-tag***
4. **url-button *index type* | url [name]**
5. **exit**

6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|               | Command or Action                                                                                                      | Purpose                                                                                                                                             |
|---------------|------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>Router(config)#ephone 36</code>                                                                                  | <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks.</li> </ul> |
| <b>Step 7</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br><code>Router(config-ephone)# ephone-template 5</code> | Applies an ephone template to the ephone that is being configured.                                                                                  |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-ephone)# end</code>                                               | Returns to privileged EXEC mode.                                                                                                                    |

### Example

The following example shows three URL buttons configured for line keys:

```
!
!
!
ephone-template 5
url-button 1 em
url-button 2 mphoneapp mphoneapp
url-button 3 snr
url-button 4 voicehuntgroups
url-button 5 park-list
!
ephone 36
ephone-template 5
```

### What to do next

If you are done configuring the url buttons for phones in Cisco Unified CME, restart the phones.

## Configure Service URL Button On SIP Phone Line Key

To implement service URL feature line key buttons on Cisco Unified IP Phones, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register template** *template-tag*
4. **url-button** [*index number*] [*url location*] [*label*]
5. **exit**
6. **voice register pool** *phone-tag*
7. **template** *template-tag*
8. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                            |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                                                                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                                                                                                                               | Enters global configuration mode.                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>voice register template <i>template-tag</i></b><br><b>Example:</b><br><pre>Router(config)# voice register template 5</pre>                                                                                                                                                                                       | Enters ephone-template configuration mode to create an ephone template. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier for the ephone template that is being created. Range: 1 to 10.</li> </ul>                                                                                   |
| <b>Step 4</b> | <b>url-button [<i>index number</i>] [<i>url location</i>] [<i>label</i>]</b><br><b>Example:</b><br><pre>Router(config-register-temp)url-button 1 http://x.x.x.x:80/CMEserverForPhone/vhg_root_menu VHG_List  Router(config-register-temp)url-button 2 http://x.x.x.x:80/CMEserverForPhone/park_list Park_List</pre> | Configures a service url feature button on a line key. <ul style="list-style-type: none"> <li>• x.x.x.x—CME IP address.</li> <li>• Index number—Unique index number ranging from 1 to 8.</li> <li>• URL <i>location</i>—Location of the URL.</li> <li>• label—A label name which is displayed on phone.</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config-register-temp)# exit</pre>                                                                                                                                                                                                                                     | Exits ephone-template configuration mode.                                                                                                                                                                                                                                                                          |
| <b>Step 6</b> | <b>voice register pool <i>phone-tag</i></b><br><b>Example:</b><br><pre>Router(config)# voice register pool 12</pre>                                                                                                                                                                                                 | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number that identifies this ephone during configuration tasks.</li> </ul>                                                                                                                                       |
| <b>Step 7</b> | <b>template <i>template-tag</i></b><br><b>Example:</b><br><pre>Router(config-register-pool)# template 5</pre>                                                                                                                                                                                                       | Applies the ephone template to the phone. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier of the template that you created in Step 3.</li> </ul>                                                                                                                                    |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-register-pool)# end</pre>                                                                                                                                                                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                   |

### Example

The following example shows URL buttons configured in the voice register template 1:

```
Router# show run
!
voice register template 1

url-button 1 http://x.x.x.x:80/CMEServerForPhone/vhg_root_menu VHG_List
url-button 2 http://x.x.x.x:80/CMEServerForPhone/park_list Park_List
url-button 5 http://www.cisco.com Cisco
!
voice register pool 50
!
```

### What to do next

If you are done configuring the URL buttons for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

## Display Support for the Name of a Called Voice Hunt-Group

A voice hunt-group is associated with a pilot number. But because there is no association with the name of the voice hunt-group when calls are forwarded from the voice hunt-group to the final number, the forwarding number is sent without the name of the forwarding party. The final number may be in the form of a voice mail, a Basic Automatic Call Distribution (BACD) script, or another extension.

In Cisco Unified CME 9.5, the display of the name of the called voice hunt-group pilot is supported by configuring the following command in voice hunt-group or the ephone-hunt configuration mode:

**[no] name** *“primary pilot name”* [**secondary** *“secondary pilot name”*]

The secondary name is optional and when the secondary pilot name is not explicitly configured, the primary pilot name is applicable to both pilot numbers.

The following example configures the primary pilot name for both the primary and secondary pilot numbers:

```
name SALES
```

The following example configures different names for the primary and secondary pilot numbers:

```
name SALES secondary SALES-SECONDARY
```

---

**Note** Use quotes (") when input strings have spaces in between as shown in the next three examples.

---

The following example associates a two-word name for the primary pilot number and a one-word name for the secondary pilot number:

```
name "CUSTOMER SERVICE" secondary CS
```

The following example associates a one-word name for the primary pilot number and a two-word name for the secondary pilot number:

```
name FINANCE secondary "INTERNAL ACCOUNTING"
```

The following example associates two-word names for the primary and secondary pilot numbers:

```
name "INTERNAL CALLER" secondary "EXTERNAL CALLER"
```

For configuration information, see [Associate a Name with a Called Voice Hunt-Group, on page 1297](#).

For more configuration examples, see [Example for Associating a Name with a Called Voice Hunt-Group, on page 1324](#).

For configuration information, see [Configure Ephone-Hunt Groups on SCCP Phones, on page 1276](#).

The following **show** commands are modified to reflect the configured primary and secondary pilot names:

- **show ephone-hunt**
- **show voice hunt-group**

The information related to the name of the ephone-hunt group and voice hunt-group are sent to the phone and displayed on the phone's user interface.

#### Restriction

- Display support applies to Cisco Unified SCCP IP phones in voice hunt-group and ephone-hunt configuration modes but are not supported in Cisco Unified SIP IP phones.
- Called name and called number information displayed on the caller's phone follows existing behavior, where the called names and called numbers are updated so that a sequential hunt reflects the name and number of the ringing phone.

## Support for Voice Hunt Group Descriptions

In Cisco Unified CME 9.5, a description can be specified for a voice hunt group using the **description** command in voice hunt-group configuration mode.

For a configuration example, see [Example for Specifying a Description for a Voice Hunt-Group, on page 1325](#).

## Prevent Local Call Forwarding to the Final Agent in a Voice Hunt-Groups

Local or internal calls are calls originating from a Cisco Unified SIP or Cisco Unified SCCP IP phone in the same Cisco Unified CME system.

Before Cisco Unified CME 9.5, the **no forward local-calls** command was configured in ephone-hunt group to prevent a local call from being forwarded to the next agent.

In Cisco Unified CME 9.5, local calls are prevented from being forwarded to the final destination using the **no forward local-calls to-final** command in parallel configuration mode or the sequential voice hunt-group configuration mode.

When the **no forward local-calls to-final** command is configured in sequential voice hunt-group configuration mode, local calls to the hunt-group pilot number are sent sequentially only to the list of members of the group using the rotary-hunt technique. In case all the group members of the voice hunt group are busy, the caller hears a busy tone. If any of the group members are available but do not answer, the caller hears a ringback tone and is eventually disconnected after the specified timeout. The call is not forwarded to the final number.

When the **no forward local-calls to-final** command is configured in parallel voice hunt-group configuration mode, local calls to the hunt-group pilot number are sent simultaneously to the list of members of the group using the blast technique. In case all the group members of the voice hunt group are busy, the caller hears a busy tone. If any of the group members are available but do not answer, the caller hears a ringback tone and is eventually disconnected after the specified timeout. The call is not forwarded to the final number.

For configuration information, see [Prevent Local Call Forwarding to Final Agent in Voice Hunt-Groups, on page 1298](#).

For a configuration example, see [Example for Preventing Local Call Forwarding in Parallel Voice Hunt-Groups, on page 1324](#).

## Enhancement of Support for Voice Hunt Group Agent Statistics

Before Cisco Unified CME Release 11.5, total logged in and total logged out time statistics were supported only for ephone hunt group agents. In Cisco Unified CME 11.5, support for Total logged in and Total logged out time statistics is added for voice hunt group agents also.

- The output of the **show voice-hunt tag statistics** command is modified to display the additional information in the statistics.

For more configuration examples, see [Example for Call Statistics From a Voice Hunt Group, on page 1331](#).

## Enhancement of Support for Ephone-Hunt Group Agent Statistics

Before Cisco Unified CME 9.5, statistics were maintained for each ephone hunt group and each ephone-hunt group agent. Some of the statistics included the number of maximum and minimum agents, average time to answer, average time in a call, and average time on hold.

In Cisco Unified CME 9.5, support for hunt group agent statistics of Cisco Unified SCCP IP phones is enhanced to include the following information:

- Total logged in time—On an hourly basis, displays the duration (in seconds) since a specific agent logged into a hunt group.
- Total logged out time—On an hourly basis, displays the duration (in seconds) since a specific agent logged out of a hunt group.

The output of the **show ephone-hunt tag statistics** command is modified to display the additional information in the statistics.

For more configuration examples, see [Example for Displaying Total Logged-In Time and Total Logged-Out Time for Each Hunt-Group Agent, on page 1326](#).

### Restriction

- Statistics collection for Cisco Unified SCCP and SIP IP phones in Cisco Unified SRST are not supported.

## Hunt Group Agent Availability Options

Three options increase the flexibility of hunt group agents by allowing them to dynamically join and leave hunt groups or to temporarily enter a not-ready state in which they do not receive calls.

[Table 108: Comparison of Hunt Group Agent Availability Features , on page 1246](#) compares the following agent availability features:

- [Dynamic Ephone Hunt Group Membership](#), on page 1248
- [Dynamically Join or Unjoin Multiple Voice Hunt Groups](#), on page 1248
- [Agent Status Control for Ephone Hunt Group](#), on page 1250
- [Agent Status Control for Voice Hunt Group](#), on page 1250
- [Automatic Agent Status Not-Ready for Ephone Hunt Group](#), on page 1253

**Table 108: Comparison of Hunt Group Agent Availability Features**

| <b>Comparison Factor</b>            | <b>Dynamic Membership</b>                                                                                                                                                                                                                                                                                                                               | <b>Agent Status Control</b>                                                                                                                                                                                                                                                                        | <b>Automatic Agent Status Not-Ready</b>                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>                      | Allows an authorized agent to join and leave hunt groups.                                                                                                                                                                                                                                                                                               | Allows an agent to manually activate a toggle to temporarily enter a not-ready state, in which hunt-group calls bypass the agent's phone.                                                                                                                                                          | Automatically puts an agent's phone in a not-ready state after a specified number of hunt-group calls are unanswered by the agent's phone.                                                                                                                                                                                                                              |
| <b>Example</b>                      | Agent A joins a hunt group at 8 a.m. and takes calls until 1 p.m., when he leaves the hunt group. While Agent A is a member of the hunt group, he occupies one of the wildcard slots in the list of numbers configured for the hunt group. At 1 p.m., Agent B joins the hunt group using the same wildcard slot that Agent A relinquished when he left. | Agent A takes a coffee break at 10 a.m. and puts his phone into a not-ready status while he is on break. When he returns he puts his phone back into the ready status and immediately starts receiving hunt-group calls again. He retained his wildcard slot while he was in the not-ready status. | Agent B is suddenly called away from her desk before she can manually put her phone into the not-ready status. After a hunt-group call is unanswered at Agent B's phone, the phone is automatically placed in the not-ready status and it is not presented with further hunt-group calls. When Agent B returns, she manually puts her phone back into the ready status. |
| <b>Hunt-group slot availability</b> | An agent joining a hunt group occupies a wildcard slot in the hunt group list. An agent leaving the group relinquishes the slot, which becomes available for another agent.                                                                                                                                                                             | An agent who enters the not-ready state does not give up a slot in the hunt group. The agent continues to occupy the slot regardless of whether the agent is in the not-ready status.                                                                                                              | An agent who enters the not-ready does not give up a slot in the hunt group. The agent continues to occupy the slot regardless of whether the agent is in the not-ready status.                                                                                                                                                                                         |

| Comparison Factor              | Dynamic Membership                                                                                                                                                                                                                                                                                                  | Agent Status Control                                                                                                                                                                                                                                                                                                                       | Automatic Agent Status Not-Ready                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Optional customizations</b> | The system administrator can establish custom FACs for agents to use to enter or leave a hunt group.                                                                                                                                                                                                                | The system administrator can use the <b>softkeys</b> commands to change the position or prevent the display of the HLog soft key on individual phones.                                                                                                                                                                                     | The system administrator can use the <b>auto logout</b> command to specify the number of unanswered calls that will trigger an agent status change to not-ready and whether this feature applies to dynamic hunt-group members, static hunt-group members, or both.<br><br>The system administrator can use the <b>hunt-group logout</b> command to specify whether an automatic change to the not-ready status also places a phone in DND mode. |

## Dynamic Ephone Hunt Group Membership

Hunt groups allow you to set up pools of extension numbers to answer incoming calls. Up to 20 wildcard slots can be entered in the list of hunt group extension numbers to allow dynamic group membership, in which authorized phone users can join a hunt group whenever a vacant wildcard slot is available and they can leave when they like. Each phone user who joins a group occupies one slot. If no slots are available, a user who tries to join a group hears a busy signal.

Allowing dynamic membership in a hunt group is a three-step process:

1. Use the **list** command in ephone-hunt configuration mode to specify up to 20 wildcard slots in the hunt group.
2. Use the **ephone-hunt login** command under each directory number that should be allowed to dynamically join and leave hunt groups. Directory numbers are disallowed from joining ephone hunt groups by default, so you have to explicitly allow this behavior for each directory number that you want to be able to log in to ephone hunt groups.
3. Use the **fac standard** command to enable standard FACs or the **fac custom** command to define custom FACs. FACs must be enabled so that agents can use them to join and leave ephone hunt groups.

To dynamically join an ephone hunt group, a phone user dials a standard or custom FAC for joining an ephone hunt group. The standard FAC to join an ephone hunt group is \*3.

If multiple ephone hunt groups have been created that allow dynamic membership, the phone user must also dial the ephone hunt group pilot number. For example, if the following ephone hunt groups are defined, a phone user dials \*38000 to join the Sales hunt group:

```
voice hunt-group 24 sequential
pilot 8000
list 8001, 8002, *, *
description Sales Group
final 9000
```

```
voice hunt-group 25 sequential
pilot 7000
list 7001, 7002, *, *
description Service Group
final 9000
```

To leave an ephone hunt group, a phone user dials the standard or custom FAC. The standard FAC to leave an ephone hunt group is #3. See [Customize Softkeys, on page 919](#).

**Note** The Dynamic Membership feature is different from the Agent Status Control feature and the Automatic Agent Status Not-Ready feature. [Table 108: Comparison of Hunt Group Agent Availability Features](#), on page 1246 compares the features.

## Dynamically Join or Unjoin Multiple Voice Hunt Groups

In Cisco Unified CME 10.5 and later versions, support for phones to dynamically join the voice hunt groups is added. This feature is supported on both the SIP and SCCP phones. A single DN can dynamically join and unjoin multiple voice hunt groups. You can perform this action on a maximum of six different voice hunt groups.

A single SCCP or SIP DN can join multiple voice hunt groups dynamically by using the existing FAC standards with pilot number of voice hunt groups. A primary DN of a phone can also join and unjoin the voice hunt group using the Join or Unjoin soft key that are available on the Voice Hunt Group information display page in the My Phone App menu by using the service button.

From Cisco Unified CME Release 10.5 onwards, a status message is displayed on the SCCP phone when a dynamic agent joins a hunt group. The support for status message display for a dynamic agent joining a hunt group on the SIP phone is supported from Cisco Unified CME Release 11.6 onwards.

If a SIP or mixed shared line DN (multi-line) joins multiple voice hunt groups, the phone displays the called number information on the phone's interface for 5 seconds. For SCCP phones, the voice hunt group-related information is displayed for the primary line of the phone.

Hunt groups allow you to set up pools of extension numbers to answer incoming calls. You can enter up to 32 wildcard slots in the list of voice hunt group extension numbers to allow dynamic group membership, in which phone users can join or unjoin a voice hunt group whenever a vacant wildcard slot is available. Each phone user who joins a group occupies one slot. If no slots are available, a user who tries to join a group will fail to join.

Allowing dynamic membership in a voice hunt group is a three-step process:

1. Use the **list** command in voice-hunt configuration mode to specify up to 32 wildcard slots in the hunt group.
2. Use the **voice-hunt-groups login** command under each directory number that should be allowed to dynamically join and unjoin hunt groups. Directory numbers are not allowed from joining voice hunt groups by default, so you have to explicitly allow this behavior for each directory number that you want to be able to join or unjoin a voice hunt groups.
3. Use the **fac standard** command to enable standard FACs or the **fac custom** command to define custom FACs. FACs must be enabled so that agents can use them to join and unjoin hunt groups.

To dynamically join a voice hunt group, a phone user dials a standard or custom FAC for joining a voice hunt group. The standard FAC to join a voice hunt group is \*3.

If multiple voice hunt groups have been configured with dynamic agents, the phone user must also dial the voice hunt group pilot number. If only one voice hunt group is configured with dynamic agent, on SIP phone only FAC is sufficient. Whereas, on SCCP phone, pilot number is mandatory. For example, if the following voice hunt groups are defined, a phone user dials \*38000 to join the Sales hunt group:

```
voice hunt-group 24 sequential
pilot 8000
list 8001, 8002, *, *
description Sales Group
final 9000
```

```
voice hunt-group 25 sequential
pilot 7000
list 7001, 7002, *, *
description Service Group
final 9000
```

To unjoin a voice hunt group, a phone user dials the standard or custom FAC. The standard FAC to unjoin from all the hunt groups is #3. See [Customize Softkeys, on page 919](#). If a DN joins multiple voice hunt groups, then to unjoin from a specific voice hunt group the user can dial the standard FAC #4 followed by the pilot number.

From Unified CME 12.2 onwards, SIP, SCCP, and mixed (both SIP and SCCP) shared DN's can Join or Unjoin a voice hunt group dynamically.

## Agent Status Control for Ephone Hunt Group

The Agent Status Control feature allows ephone hunt group agents to control whether their phones are in the ready or not-ready status. A phone in the ready status is available to receive calls from the hunt group. A phone in the not-ready status blocks calls from the hunt group. Agents should use the not-ready status for short breaks or other temporary interruptions during which they do not want to receive hunt-group calls.

Agents who put their phones into the not-ready status do not relinquish their slots in the hunt group list.

Agents use the HLog soft key or the DND soft key to put a phone into the not-ready status. When the HLog soft key is used to put a phone in the not-ready status, it does not receive hunt group calls but can receive other calls. If the DND soft key is used, the phone does not receive any calls until it is returned to the ready status. The HLog and DND soft keys toggle the feature: if the phone is in the ready status, pressing the key puts the phone in the not-ready status and vice-versa.

The DND soft key is visible on phones by default, but the HLog soft key must be enabled in the configuration using the **hunt-group logout** command, which has the following options:

- **HLog**—Enables both an HLog soft key and a DND soft key on phones in the idle, seized, and connected call states. When you press the HLog soft key, the phone is changed from the ready to not-ready status or from the not-ready to ready status. When the phone is in the not-ready status, it does not receive calls from the hunt group, but it is still able to receive calls that do not come through the hunt group (calls that directly dial its extension). The DND soft key is also available to block all calls to the phone if that is the preferred behavior.
- **DND**—Enables only a DND soft key on phones. The DND soft key also changes a phone from the ready to not-ready status or from the not-ready to ready status, but the phone does not receive any incoming calls, including those from outside hunt groups.

Phones without soft-key displays can use a FAC to toggle their status from ready to not-ready and back to ready. The **fac** command is configured under telephony-service configuration mode to enable the standard set of FACs or to create custom FACs. The standard FAC to toggle the not-ready status at the directory number (extension) level is \*4 and the standard FAC to toggle the not-ready status at the ephone level (all directory numbers on the phone) is \*5. See [Where to Go Next, on page 1342](#).

**Note** The Agent Status Control feature is different from the Dynamic Membership feature and the Automatic Agent Status Not-Ready feature. [Table 108: Comparison of Hunt Group Agent Availability Features](#), on page 1246 compares the features.

## Agent Status Control for Voice Hunt Group

The Agent Status Control feature allows voice hunt group agents to control whether their phones are in the ready or not-ready status. A phone in the ready status is available to receive calls from the hunt group. A phone in the not-ready status blocks calls from the hunt group. Agents should use the not-ready status for short breaks or other temporary interruptions during which they do not want to receive hunt-group calls.

Agents who put their phones into the not-ready status do not relinquish their slots in the hunt group list.

Agents use the HLog softkey or the DND softkey to put a phone into the not-ready status. When the HLog softkey is used to put a phone in the not-ready status, it does not receive hunt group calls but can receive other

calls. When Agent use DND button, phone will be put into Not-Ready state and Hunt group calls will not be routed. However normal or direct calls are still routed, but without audio notifications.

The DND softkey is visible on phones by default, but the HLog softkey must be enabled in the configuration using the **hunt-group logout** command, which has the following options:

- **HLog**—Enables both an HLog softkey and a DND softkey on phones in the idle, ringing, and connected call states. When you press the HLog softkey, the phone is changed from the ready to not-ready status or from the not-ready to ready status. When the phone is in the not-ready status, it does not receive calls from the hunt group, but it is still able to receive calls that do not come through the hunt group (calls that directly dial its extension). DND softkey suppresses audio notifications for direct calls.
- **DND**—Enables only a DND softkey on phones. The DND softkey also changes a phone from the ready to not-ready status or from the not-ready to ready status for voice hunt group calls. Phones receive those calls that directly dial the extension.

Phones without soft-key displays can use a FAC to toggle their status from ready to not-ready and back to ready. The **fac** command configured under telephony-service configuration mode must be used to enable the standard set of FACs or to create custom FACs. The standard FAC to toggle the not-ready status is \*4 and the standard FAC to toggle the not-ready status at the phone level (all directory numbers on the phone) is \*5. See [Where to Go Next, on page 1342](#).

From Cisco Unified CME 10.5 onwards, SCCP and SIP phones are supported with Agent Status Control for voice hunt group. SCCP phone can log in or log out to or from voice hunt groups using HLog or DND softkeys, or standard or custom FACs, at line-Level as well as phone level. Whereas, SIP phones can log in or log out to or from voice hunt groups using only standard or custom FACs, only at Line-Level.

From Cisco Unified CME Release 11.6 onwards, SIP phones are also supported with agent status control, for voice hunt groups with HLog softkeys or FAC. Hence, SIP phones can logout or login to voice hunt group using HLog softkey, feature button, or FAC at phone level. If the phone is configured with a single line or multiple lines, and if these lines are members of a voice hunt group, then phone level logout or login results in logout or login of all lines on the phone.

To make HLog functionality work with the SIP or SCCP phones, you need to configure the command **hunt-group logout HLog** under telephony-service. Once user is logged out from the hunt group, phone displays a message stating that the user is logged out of hunt group. When the user is logged in to hunt group, the agent phone displays a message stating that the user is logged in to hunt group. For Unified CME 12.1 and earlier releases, if any directory number that is part of voice hunt group is shared across phones, then logout is not allowed at the phone level.

For Unified CME 12.2 and later releases, if any directory number that is part of voice hunt group is a shared-line, then logout is allowed for all lines at the phone level, except the shared-line. Shared-line status (always in logged-in state) in a voice hunt group cannot be toggled using agent status control functionality. While SCCP phones with a mixed shared-line only support line level logout of the phone lines (except the shared-line), SIP phones with a mixed shared-line support phone level logout of the phone lines (except the shared-line).

To enable FAC, you need to configure standard or custom FAC under telephony service configuration mode using the command **fac standard** or **fac custom**.

SIP and SCCP phone behavior is different for the following scenarios:

- If phone dn's are not members of a hunt group and phone is configured with an HLog feature button, then phone LED is off for SIP phones and on for SCCP phones.
- If a SIP phone is already in logged in state, any newly joining dn of that phone (in any voice hunt group) is automatically in logged in state.

- If a SIP phone is already in logged out state, any newly joining dn of that phone (in any voice hunt group) is automatically in logged out state.
- Irrespective of whether the SCCP phone is in logged out or logged in state, any dn of that phone joining any voice hunt group retains its previous state (logged out or logged in). For example, if dn 8002 is member of voice hunt group 1 in logged out state, then 8002 remains in logged out state on joining voice hunt group 2. If dn 8001 on the same phone (which was not part of any hunt group) joins any voice hunt group, it is in logged in state.

**Note** From Cisco Unified CME Release 11.6 onwards, line level logout or login using FAC \*4 is not supported for SIP phones (only supported on SCCP phones). SIP phones only support phone level logout or login using FAC \*5.

Use **hlog-block** command under **voice hunt-group** for Agent Status Control. If you enable this command under **voice hunt-group**, the logout or login functionality for voice hunt-group is disabled. For example, you can use **hlog-block** command in voice hunt-groups where logout or login functionality using HLog softkey (or by using FAC) needs to be restricted. By default, **hlog-block** command is disabled.

**Note** The Agent Status Control feature is different from the Dynamic Membership feature and the Automatic Agent Status Not-Ready feature. [Table 108: Comparison of Hunt Group Agent Availability Features](#), on page 1246 compares the features.

## Members Logout for Ephone Hunt Group

All members configured under an ephone-hunt are initialized with HLogin by default. The non-shared static members or agents in an ephone hunt group can be configured with the Hlogout initial state using the Members Logout feature. You can use the CLI command **members logout** configured under ephone-hunt configuration mode to enable the feature. From Cisco Unified CME Release 9.1, members logout is supported for ephone hunt groups.

Members logout cannot be used for shared DN's. Also, this feature is not supported if the CLI commands **list** and **hunt-group logout DND** are configured.

## Members Logout for Voice Hunt Group

All members configured in a voice hunt group are initialized with HLogin by default. The non-shared static members or agents in a voice hunt group can be configured with the Hlogout initial state using members logout functionality. You can use the CLI command **members logout** configured under voice hunt group configuration mode to enable the feature. From Cisco Unified CME Release 11.6, members logout is supported in voice hunt groups.

If any member of a hunt group in a SIP phone logs out using the CLI command **members logout**, all other DN's of that phone in any hunt group are also logged out. This is because SIP phones only support phone level logout. For SCCP phones, only the DN that is configured with the CLI command **members logout** is logged out from the hunt group. Other member DN's do not logout as SCCP phones support line level logout.

Members logout cannot be used for shared DN's. The feature is not supported if the CLI command **hunt-group logout DND** is configured. Also, you cannot configure the CLI command **members logout** if the command **list** is configured.

## Automatic Agent Status Not-Ready for Ephone Hunt Group

Before Cisco Unified CME 4.0, this feature was known as Automatic Hunt Group Logout. If the **auto logout** command was enabled for a hunt group, a phone was placed in DND mode when a line on the phone did not answer a call for that hunt group within the time limit specified in the **timeout** command.

In Cisco Unified CME 4.0 and later versions, the name and behavior of this feature has changed, although the Cisco IOS command remains the same. The **auto logout** command now specifies the number of unanswered hunt group calls after which the agent status of a directory number is automatically changed to not-ready. You can limit Automatic Agent Status Not-Ready to dynamic hunt group members (those who log in using a wildcard slot in the **list** command) or to static hunt group members (those who are explicitly named in the **list** command), or you can apply this behavior to all hunt group members.

A related command, **hunt-group logout**, specifies whether the phones that are automatically changed to the not-ready status should also be placed into DND mode. Phones in the not-ready status do not accept calls from hunt groups, but they do accept calls that directly dial their extensions. Phones in DND mode do not accept any calls. The default if the **hunt-group logout** command is not used is that the phones that are automatically placed in the not-ready status are also placed in DND mode.

Agents whose phones are automatically placed into the not-ready status do not relinquish their slots in the hunt group list.

**Note** The Automatic Agent Status Not-Ready feature is different from the Dynamic Membership feature and the Agent Status Control feature. [Table 108: Comparison of Hunt Group Agent Availability Features](#), on page 1246 compares the features.

## Automatic Agent Status Not-Ready for Voice Hunt Group

From Cisco Unified CME Release 11.6, Automatic Hunt Group Logout is supported on voice hunt groups. If the **auto logout** CLI command is enabled for a hunt group, it specifies the number of successive unanswered hunt group calls after which the agent status of a directory number is automatically changed to not-ready. The range for the number of unanswered rings configured under **auto logout** command is 1 to 20. If auto logout is not configured with any value, the default value of 1 is applied.

When the **auto logout** command is enabled under voice hunt group, the auto logout behavior applies to all hunt group members (including static and dynamic members).

A related command, **hunt-group logout**, specifies whether the phones are automatically changed to the not-ready status. Phones in the not-ready state do not accept calls from hunt groups, but they do accept calls that directly dial their extensions.

If **hunt group logout HLog** is configured, then the DN of that hunt group will go to logout state when the number of unanswered rings specified under **auto logout** command is exceeded. If **hunt group logout DND** is configured, then phone goes to DND mode and logs out the DND member when the number of unanswered rings specified under **auto logout** command is exceeded. If any hunt group members are logged out, they can use HLog Softkey, FAC, Feature Button, or DND softkey to login again.

Agents whose phones are automatically placed into the not-ready status do not relinquish their slots in the hunt group list. When an agent returns to ready status, the voice hunt group resumes sending calls to the agent's DN.

Consider a voice hunt group in sequential, peer, or longest idle configuration mode with call hunt in progress. Then, auto logout count is incremented for agents who do not answer the call. The auto logout count is not

incremented for agents who answer the call. In this scenario, the agent can be either an SCCP DN or a SIP DN.

Consider a voice hunt group in parallel configuration mode with call blast in progress to all logged in DN's in the hunt group. If call is answered by any of the agents, then the remaining agents in that hunt group will not have auto logout count incremented. However, if call is not answered by any of the agents, then the auto logout count will be incremented for all the logged in agents. Here, agent can be either a SCCP DN or SIP DN.

**Note** The Automatic Agent Status Not-Ready feature is different from the Dynamic Membership feature and the Agent Status Control feature. [Table 108: Comparison of Hunt Group Agent Availability Features](#), on page 1246 compares the features.

## All Agents Logged Out Display on SIP Phones

From Unified CME 12.2 release, **All agents logged out** status message is displayed on SIP phones. The feature is supported on Cisco 8800 Series IP Phones for Unified CME on Cisco 4000 Series Integrated Services Routers. For example, consider a voice hunt group with three directory numbers (DN) 4002, 4003, and 4004, configured in three different IP phones. When the last member of the voice hunt group is logged out, the message, **All agents logged out** displays at the line level for all the members in the hunt group. If one of the DNs in the voice hunt group with all members logged out has call forward all enabled as well, then the line level display on the phone toggles between the **All agents logged out** and the **Forwarded to directory number** messages. The duration of message display before toggling is 1.5 seconds. Localization is supported for the All Agents Logged Out Display on SIP Phones. For more information, see the figure.

**Figure 60: All Agents Logged Out Message on SIP Phones**

## Presentation of Calls for Ephone Hunt Group

For phones configured under ephone hunt group configuration mode, presentation of calls is supported using the CLI command, **present-call**. When the CLI command is configured, calls from the ephone hunt group are presented only if all lines are on hook or in idle state.

If you configure **idle-phone** as the sub-mode option of the CLI command **present-call**, calls from the ephone-hunt group are presented only if all lines are idle on the phone on which the hunt-group line appears. This option does not consider monitored lines that have been configured on the phone using the **button m** command.

If you configure **onhook-phone** as the sub-mode option of the CLI command **present-call**, calls from the ephone-hunt group are presented only if the phone on which the number appears is in onhook state. When this keyword is configured, calls in the ringing or hold state that are unrelated to the hunt group do not prevent the presentation of calls from the ephone-hunt group.

## Presentation of Calls for Voice Hunt Group

For phones configured under voice hunt group configuration mode, presentation of calls is supported using the CLI command **present-call**. The feature is supported from Cisco Unified CME Release 11.6 onwards. When the **present-call** CLI command is configured, calls from the voice hunt group are presented only if all lines are idle on the phone on which the hunt group line appears.

If the **present-call** CLI command is not configured, voice hunt group calls are presented without considering the status of other phone lines on the phone. Hence, voice hunt group presents calls to an ephone or voice register pool whenever the phone line (ephone-dn or voice register dn) that corresponds to a number in a voice hunt group list is available. Hence, when you configure the **present-call** CLI command, you get the additional control to ensure that hunt group calls do not possibly go unanswered.

## Night Service

The night-service feature allows you to provide coverage for unstaffed extensions during hours that you designate as “night-service” hours. During the night-service hours, calls to the designated extensions, known as night-service directory numbers or night-service lines, send a special “burst” ring (for SCCP phones and SIP phones) to night-service phones that have been specified to receive this special ring. Phone users at the night-service phones can then use the call-pickup feature to answer the incoming calls from the night-service directory numbers.

For example, the night-service feature can allow an employee working after hours to intercept and answer calls that are presented to an unattended receptionist’s phone. This feature is useful for sites at which all incoming public switched telephone network (PSTN) calls have to be transferred by a receptionist. This is because all the Direct Inward Dialing (DID) calls are not published to PSTN for Cisco Unified CME system. When a call arrives at the unattended receptionist’s phone during hours that are specified as night service, a ring burst notifies a specified set of phones of the incoming call. A phone user at any of the night-service phones can intercept the call using the call-pickup feature. Night-service call notification is sent every 12 seconds until the call is either answered or aborted.

A user can enter a night-service code to manually toggle night-service treatment off and on from any phone that has a line assigned to night service. Before Cisco CME 3.3, using the night-service code turns night service on or off only for directory numbers on the phone at which the code is entered. In Cisco CME 3.3 and later versions, using the night-service code at any phone with a night-service directory number turns night service on or off for all phones with night-service directory numbers. From Unified CME 11.5 onwards, night service feature is supported on SIP phones along with SCCP phones.

Mixed deployment of SIP and SCCP phones is supported from Cisco Unified CME Release 11.6. Any combination of SIP and SCCP phones are supported across incoming call, unstaffed DN, and agent phones. For DN in which night service is enabled, notifications are sent to both SIP and SCCP phones that are designated as night service agents in a mixed deployment.

[Figure 61: Night Service for SCCP Phones, on page 1256](#) illustrates night service for SCCP phones.

Figure 61: Night Service for SCCP Phones

- ① Extension 1000 has been designated as a night-service extension (ephone-dn). When extension 1000 receives an incoming call during a night-service period, phone 5 rings and notification is made to the night-service phones.
- ② Phones 14 and 15 have been designated as night-service phones. When phone 5 starts ringing, phones 14 and 15 ring once and display 'Night Service 1000.' The incoming call on extension 1000 can be answered from phone 14 or phone 15 using call pickup.

## Overlaid Ephone-dns

Overlaid ephone-dns are directory numbers that share the same button on a phone. Overlaid ephone-dns can be used to receive incoming calls and place outgoing calls. Up to 25 ephone-dns can be assigned to a single phone button. They can have the same extension number or different numbers. The same ephone-dns can appear on more than one phone and more than one phone can have the same set of overlaid ephone-dns.

The order in which overlaid ephone-dns are used by incoming calls can be determined by the call hunt commands, **preference** and **huntstop**. For example, ephone-dn 1 to ephone-dn 4 have the same extension number, 1001. Three phones are configured with the **button 1o1,2,3,4** command. A call to 1001 will ring on the ephone-dn with the highest preference and display the caller ID on all phones that are on hook. If another incoming call to 1001 is placed while the first call is active (and the first ephone-dn with the highest preference is configured with the **no huntstop** command), the second call will roll over to the ephone-dn with the next-highest preference, and so forth. For more information, see [Call Hunt, on page 1226](#).

If the ephone-dns in an ephone-dn overlay use different numbers, incoming calls go to the ephone-dn with the highest preference. If no preferences are configured, the **dial-peer hunt** command setting is used to determine which ephone-dns are used for incoming calls. The default setting for the **dial-peer hunt** command is to randomly select an ephone-dn that matches the called number.

**Note** To continue or to stop the search for ephone-dns, you must use, respectively, the **no huntstop** and **huntstop** commands under the individual ephone-dns. The huntstop setting is applied only to the dial peers affected by the **ephone-dn** command in telephony-service mode. Dial peers configured in global configuration mode comply with the global configuration huntstop setting.

Figure 63: Overlaid Ephone-dn (Simple Case), on page 1258 shows an overlay set with two directory numbers and one number that is shared on two phones. Ephone-dn 17 has a default preference value of 0, so it will receive the first call to extension 1001. The phone user at phone 9 answers the call, and a second incoming call to extension 1001 can be answered on phone 10 using directory number 18.

Figure 63: Overlaid Ephone-dn (Simple Case)

When a call is answered on an ephone-dn, that ephone-dn is no longer available to other phones that share the ephone-dn in overlay mode. For example, if extension 1001 is answered by phone 1, caller ID for extension 1001 displays on phone 1 and is removed from the screens of phone 2 and phone 3. All actions pertaining to the call to extension 1001 (ephone-dn 17) are displayed on phone 1 only. If phone 1 puts extension 1001 on hold, the other phones will not be able to pick up the on-hold call using a simple shared-line pickup. In addition, none of the other four phones will be able to make outgoing calls from the ephone-dn while it is in use. When phone users press button 1, they will be connected to the next available ephone-dn listed in the **button** command. For example, if phone 1 and phone 2 are using ephone-dn 1 and ephone-dn 2, respectively, phone 3 must pick up ephone-dn 3 for an outgoing call.

If there are more phones than ephone-dns associated with an ephone-dn overlay set, it is possible for some phones to find that all the ephone-dns within their overlay set are in use by other phones. For example, if five phones have a line button configured with the **button 1o1, 2, 3** command, there may be times when all three of the ephone-dns in the overlay set are in use. When that occurs, the other two phones will not be able to use an ephone-dn in the overlay set. When all ephone-dns in an overlay set are in use, phones with this overlay set will display the remote-line-in-use icon (a picture of a phone with a flashing X through it) for the corresponding line button. When at least one ephone-dn becomes available within the overlay set (that is, an ephone-dn is either idle or ringing), the phone display reverts to showing the status of the available ephone-dn (idle or ringing).

## Shared- Line Overlays

Dual-line ephone-dns can also use overlays. The configuration parameters are the same as for single-line ephone-dns, except that the **huntstop channel** command must be used to keep calls from hunting to the ephone-dn's second channel.

The primary ephone-dn in a shared-line overlay set should be unique to the phone to guarantee that the phone has a line available for outgoing calls, and to ensure that the phone user can obtain dial-tone even when there are no idle lines available in the rest of the shared-line overlay set. Use a unique ephone-dn to provide for a unique calling party identity on outbound calls made by the phone so that the called user can see which specific phone is calling.

The following example shows the configuration for a simple shared-line overlay set. The primary ephone-dn that is configured for each phone is unique while the remaining ephone-dns 10, 11, and 12 are shared in the overlay set on both phones.

```
ephone 1
 mac-address 1111.1111.1111
 button 101,10,11,12
!
ephone 2
 mac-address 2222.2222.2222
 button 102,10,11,12
```

A more complex directory number configuration mixes overlaid directory numbers with shared directory numbers and plain dual-line directory numbers on the same phones. [Figure 64: Overlaid Ephone-dn \(Complex Case\), on page 1260](#) illustrates the following example of a manager with two assistants. On the manager's phone the same number, 2001, appears on button 1 and button 2. The two line appearances of extension 2001 use two single-line directory numbers, so the manager can have two active calls on this number simultaneously, one on each button. The directory numbers are set up so that button 1 will ring first, and if a second call comes in, button 2 will ring. Each assistant has a personal directory number and also shares the manager's directory numbers. Assistant 1 has all three directory numbers in an overlay set on one button, whereas assistant 2 has one button for the private line and a second button with both of the manager's lines in an overlay set. A sequence of calls might be as follows.

1. An incoming call is answered by the manager on extension 2001 on button 1 (directory number 20).
2. A second call rings on 2001 and rolls over to the second button on the manager's phone (directory number 21). It also rings on both assistants' phones, where it is also directory number 21, a shared directory number.
3. Assistant 2 answers the call. This is a shared overlay line (one directory number, 21, is shared among three phones, and on two of them this directory number is part of an overlay set). Because it is shared with button 2 on the manager's phone, the manager can see when assistant 2 answers the call.
4. Assistant 1 makes an outgoing call on directory number 22. The button is available because of the additional directory numbers in the overlay set on the assistant 1 phone.

At this point, the manager is in conversation on directory number 20, assistant 1 is in conversation on directory number 22, and assistant 2 is in conversation on directory number 21.

Figure 64: Overlaid Ephone-dn (Complex Case)

For configuration information, see [Configure Overlaid Ephone-dns on SCCP Phones, on page 1312](#).

## Call Waiting for Overlaid Ephone-dns

Call waiting allows phone users to know that another person is calling them while they are talking on the phone. Phone users hear a call-waiting tone indicating that another party is trying to reach them. Calls to IP phones with soft keys can be answered with the Answer soft key. Calls to analog phones are answered using hookflash. When phone users answer a call-waiting call, their original call is automatically put on hold. If phone users ignore a call-waiting call, the caller is forwarded if call-forward no-answer has been configured.

In Cisco CME 3.2.1 and later versions, call waiting is available for overlaid ephone-dns. The difference in configuration between overlaid ephone-dns with call waiting and overlaid ephone-dns without call waiting is that overlaid ephone-dns with call waiting use the `c` keyword in the button command and overlaid ephone-dns without call waiting use the `o` keyword. For configuration information, see [Configure Overlaid Ephone-dns on SCCP Phones, on page 1312](#).

The behavior of overlaid ephone-dns with call waiting and overlaid ephone-dns without call waiting is the same, except for the following:

- Calls to numbers included in overlaid ephone-dns with call waiting will cause inactive phones to ring and active phones connected to other parties to generate auditory call-waiting notification. The default sound is beeping, but you can configure an ephone-dn to use a ringing sound. (See [Configure Call-Waiting Indicator Tone on SCCP Phone, on page 1270](#).) Visual call-waiting notification includes the blinking of handset indicator lights and the display of caller IDs.

For example, if three of four phones are engaged in calls to numbers from the same overlaid ephone-dn with call-waiting and another call comes in, the one inactive phone will ring, and the three active phones will issue auditory and visual call-waiting notification.

- In Cisco Unified CME 4.0 and later versions, up to six waiting calls can be displayed on Cisco Unified IP Phone 7940G, 7941G, 7941G-GE, 7960G, 7961G, 7961G-GE, 7970G, and 7971G-GE. For all other phones and earlier Cisco Unified CME versions, two calls to numbers in an overlaid ephone-dn set can be announced. Subsequent calls must wait in line until one of the two original calls has ended. The callers who are waiting in the line will hear a ringback tone.

For example, a Cisco Unified IP Phone 7910 (maximum two call-waiting calls) has a button configured with a set of overlaid ephone-dns with call waiting (**button 1c1,2,3,4**). A call to ephone-dn 1 is answered. A call to ephone-dn 2 generates call-waiting notification. Calls to ephone-dn 3 and ephone-dn 4 will wait in line and remain invisible to the phone user until one of the two original calls ends. When the call to ephone-dn 1 ends, the phone user can then talk to the person who called ephone-dn 2. The call to ephone-dn 3 issues call-waiting notification while the call to ephone-dn 4 waits in line. (The Cisco Unified IP Phone 7960 supports six calls waiting.) Phones configured for call waiting do not generate call-waiting notification when they are transferring calls or hosting conference calls.

Note that if an overlaid ephone-dn has call-forward-no-answer configured, calls to the ephone-dn that are unanswered before the no-answer timeout expires are forwarded to the configured destination. If call-forward-no-answer is not configured, incoming calls receive ringback tones until the calls are answered.

More than one phone can use the same set of overlaid ephone-dns. In this case, the call-waiting behavior is slightly different. The following example demonstrates call waiting for overlaid ephone-dns that are shared on two phones:

```
ephone 1
button 1c1,2,3,4
!
ephone 2
button 1c1,2,3,4
```

1. A call to ephone-dn 1 rings on ephone 1 and on ephone 2. Ephone 1 answers, and the call is no longer visible to ephone 2.
2. A call to ephone-dn 2 issues a call-waiting notification to ephone 1 and rings on ephone 2, which answers. The second call is no longer visible to ephone 1.
3. A call to ephone-dn 3 issues a call-waiting notification to ephone 1 and ephone 2. Ephone 1 puts the call to ephone-dn 1 on hold and answers the call to ephone-dn 3. The call to ephone-dn 3 is no longer visible to ephone 2.
4. A call to ephone-dn 4 issues a call-waiting notification on ephone 2. The call is not visible on ephone 1 because it has met the two-call maximum by handling the calls to ephone-dn 1 and ephone-dn 3. (Note that the call maximum is six for those phones that are able to handle six call-waiting calls, as previously described.)

#### Note

Ephone-dns accept call interruptions, such as call waiting, by default. For call waiting to work, the default must be active. For more information, see [Configure Call-Waiting Indicator Tone on SCCP Phone, on page 1270](#).

## Extend Calls for Overlaid Ephone-dns to Other Buttons on the Same Phone

Phones with overlaid ephone-dns can use the **button** command with the **x** keyword to dedicate one or more additional buttons to receive overflow calls. If an overlay button is busy, an incoming call to any of the other ephone-dns in the overlay set rings on the first available overflow button on each phone that is configured to receive the overflow. This feature works only for overlaid ephone-dns that are configured with the **button** command and the **o** keyword; it is not supported with overlaid ephone-dns that are configured using the **button** command and the **c** keyword or other types of ephone-dns that are not overlaid.

Using the **button** command with the **c** keyword results in multiple calls on one button (the button is overlaid with multiple ephone-dns that have call waiting), whereas using the **button** command with the **o** keyword and the **x** keyword results in one call per button and calls on multiple buttons.

For example, an ephone has an overlay button with ten numbers assigned to it using the **button** command and the **o** keyword. The next two buttons on the phone are configured using the **button** command and the **x** keyword. These buttons are reserved to receive additional calls to the overlaid extensions on the first button when the first button is in use.

```
ephone 276
 button 1024,25,26,27,28,29,30,31,32,33 2x1 3x1
```

For configuration information, see [Configure Overlaid Ephone-dns on SCCP Phones, on page 1312](#).

# Configure Call Coverage Features

## Configure Call Hunt on SCCP Phones

To configure a group of directory numbers to provide call coverage for a single called number, perform the following steps for each directory number in the group.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn dn-tag [dual-line]**
4. **number number [secondary number] [no-reg [both | primary]]**
5. **preference preference-order [secondary secondary-order]**
6. **no huntstop** or **huntstop**
7. **huntstop channel**
8. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action | Purpose                                                                              |
|--------|-------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>     | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b>   | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>Router&gt; enable</code>                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>ephone-dn dn-tag [dual-line]</b><br><b>Example:</b><br><code>Router(config)# ephone-dn 20 dual-line</code>                                                    | Enters ephone-dn configuration mode for the purpose of configuring a directory number.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 4</b> | <b>number number [secondary number] [no-reg [both   primary]]</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# number 101</code>                        | Associates a telephone or extension number with the directory number. <ul style="list-style-type: none"> <li>Assign the same number to several primary or secondary ephone-dns to create a group of virtual dial peers through which the incoming called number must search.</li> </ul>                                                                                                                                                                                                                               |
| <b>Step 5</b> | <b>preference preference-order [secondary secondary-order]</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# preference 2</code>                         | Sets the preference value for the ephone-dn. <ul style="list-style-type: none"> <li>Default: 0.</li> <li>Increment the preference order for subsequent ephone-dns with the same number. That is, the first directory number is preference <b>0</b> by default and you must specify <b>1</b> for the second ephone-dn with the same number, <b>2</b> for the next, and so on.</li> <li><b>secondary secondary-order</b>—(Optional) Preference value for the secondary number of an ephone-dn. Default is 9.</li> </ul> |
| <b>Step 6</b> | <b>no huntstop or huntstop</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# no huntstop</code><br>or<br><code>Router(config-ephone-dn)# huntstop</code> | Explicitly enables call hunting behavior for a directory number. <ul style="list-style-type: none"> <li>Configure <b>no huntstop</b> for all ephone-dns, <i>except</i> the final ephone-dn, within a set of ephone-dns with the same number.</li> <li>Configure the <b>huntstop</b> command for the final ephone-dn within a set of ephone-dns with the same number.</li> </ul>                                                                                                                                       |
| <b>Step 7</b> | <b>huntstop channel</b><br><b>Example:</b><br><code>Router(config-ephone-dn)# huntstop channel</code>                                                            | (Optional) Enables channel huntstop, which keeps a call from hunting to the next channel of a directory number if the first channel is busy or does not answer. <ul style="list-style-type: none"> <li>Required for dual-line ephone-dns that are used for call hunting.</li> </ul>                                                                                                                                                                                                                                   |
| <b>Step 8</b> | <b>end</b>                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|  | Command or Action                                 | Purpose |
|--|---------------------------------------------------|---------|
|  | <b>Example:</b><br>Router(config-ephone-dn) # end |         |

### What to do next

If you want to collect statistics for hunt groups, see [Cisco Unified CME B-ACD and Tcl Call-Handling Applications](#).

## Verify Call Hunt Configuration on SCCP Phones

To verify the configuration for call hunt, perform the following steps.

### SUMMARY STEPS

1. **show running-config**
2. **show telephony-service ephone-dn**
3. **show telephony-service all** or **show telephony-service dial-peer**

### DETAILED STEPS

#### Procedure

#### Step 1 **show running-config**

This command displays your configuration. Preference and huntstop information is listed in the ephone-dn portion of the output.

```
Router# show running-config
```

```
ephone-dn 2 dual-line
number 126
description FrontDesk
name Receptionist
preference 1
call-forward busy 500
huntstop channel
no huntstop
```

#### Step 2 **show telephony-service ephone-dn**

This command displays ephone-dn preference and huntstop configuration information.

#### Step 3 **show telephony-service all** or **show telephony-service dial-peer**

These commands display preference and huntstop configurations for ephone-dn dial peers.

```

Router# show telephony-service dial-peer

!
dial-peer voice 20026 pots
destination-pattern 5002
huntstop
call-forward noan 5001 timeout 45
port 50/0/2

```

## Configure Call Hunt on SIP Phones

To configure the call hunting feature and prevent hunt-on-busy from redirecting a call from a busy phone into a dial peer that has been setup with a catch-all default destination, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn** *dn-tag*
4. **number** *number*
5. **preference** *preference-order*
6. **huntstop**
7. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                | Purpose                                                                                                                         |
|---------------|--------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                       | Enters global configuration mode.                                                                                               |
| <b>Step 3</b> | <b>voice register dn</b> <i>dn-tag</i><br><b>Example:</b><br>Router(config)# voice register dn 1 | Enters voice register dn configuration mode to define a directory number for a SIP phone, intercom line, voice port, or an MWI. |
| <b>Step 4</b> | <b>number</b> <i>number</i>                                                                      | Associates a phone number with the directory number.                                                                            |

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br><code>Router(config-register-dn)# number 5001</code>                                               | <ul style="list-style-type: none"> <li>Assign the same number to several directory numbers to create a group of virtual dial peers through which the incoming called number must search.</li> </ul>                                                                                   |
| <b>Step 5</b> | <b>preference</b> <i>preference-order</i><br><b>Example:</b><br><code>Router(config-register-dn)# preference 4</code> | <p>Creates the preference order for matching the VoIP dial peers created for the number associated with this directory number to establish the hunt strategy for incoming calls.</p> <ul style="list-style-type: none"> <li>Default is 0, which is the highest preference.</li> </ul> |
| <b>Step 6</b> | <b>huntstop</b><br><b>Example:</b><br><code>Router(config-register-dn)# huntstop</code>                               | Disables call-hunting behavior for an extension on a SIP phone.                                                                                                                                                                                                                       |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-register-dn)# end</code>                                         | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                             |

### What to do next

If you want to collect statistics for hunt groups, see [Cisco Unified CME B-ACD and Tcl Call-Handling Applications](#).

## Enable Call Pickup

To enable Call Pickup features on SCCP or SIP phones, perform the following steps.

### Restriction

- SIP phones that do not support the Pickup and Gpickup soft keys must use feature access codes (FACs) to access these features.
- Different directory numbers with the same extension number must have the same Pickup configuration.
- A directory number can be assigned to only one pickup group.
- Pickup group numbers can vary in length, but must have unique leading digits. For example, if you configure group number 17, you cannot also configure group number 177. Otherwise a pickup in group 17 is always triggered before the user can enter the final 7 for 177.
- Calls from H.323 trunks are not supported on SIP phones.

### Before you begin

It is mandatory to configure the CLI command **call-park system application** under telephony-service to enable or disable Call Pickup functionality using call pickup feature on SIP phones.

- SIP phones require Cisco Unified CME 7.1 or a later version.

- The Pickup and GPickUp soft keys display by default on supported SCCP and SIP phones. If previously disabled, you must enable these soft keys with the **softkeys idle** command.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **call-park system application**
5. **service directed-pickup [gpickup]**
6. **fac {standard | custom pickup {direct | group | local} custom-fac}**
7. **exit**
8. **ephone-dn dn-tag [dual-line | octo-line] or voice register dn dn-tag**
9. **pickup-group group-number**
10. **pickup-call any-group**
11. **end**

## DETAILED STEPS

### Procedure

## Configure Call-Waiting Indicator Tone on SCCP Phone

To specify the type of audible call-waiting indicator on a SCCP phone, perform the following steps. The default is for directory numbers to accept call interruptions, such as call waiting, and to issue a beep tone. Instead of the standard call waiting beep, you can enable a ring tone for call-waiting.

### Restriction

- The call-waiting ring option is not supported if the ephone-dn is configured with the **no call-waiting beep accept** command.
- If you configure a button to have a silent ring, you will not hear a call-waiting beep or call-waiting ring regardless of whether the ephone-dn associated with the button is configured to generate a call-waiting beep or call-waiting ring. To configure a button for silent ring, see [Assign Directory Numbers to SCCP Phones, on page 270](#).
- The call-waiting beep volume cannot be adjusted through Cisco Unified CME for the Cisco Unified IP Phone 7902G, Cisco Unified IP Phone 7905G, Cisco Unified IP Phone 7912G, Cisco ATA-186, and Cisco ATA-188.
- The call-waiting ring option is not supported on the Cisco Unified IP Phone 7902G, Cisco Unified IP Phone 7905G, or Cisco Unified IP Phone 7912G.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn dn-tag [dual-line]**
4. **call-waiting beep [accept | generate]**
5. **call-waiting ring**
6. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                          | Purpose                                                                                                               |
|---------------|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                     |

|               | Command or Action                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>ephone-dn dn-tag [dual-line]</b><br><b>Example:</b><br>Router(config)# ephone-dn 20 dual-line                         | Enters ephone-dn configuration mode, creates an ephone-dn, and optionally assigns it dual-line status.                                                                                                                                                                                                      |
| <b>Step 4</b> | <b>call-waiting beep [accept   generate]</b><br><b>Example:</b><br>Router(config-ephone-dn)# no call-waiting beep accept | Enables an ephone-dn to generate or accept call-waiting beeps. <ul style="list-style-type: none"> <li>• Default is directory number both accepts and generates call-waiting beep.</li> <li>• The beep is heard only if the other ephone-dn is configured to accept call-waiting beeps (default).</li> </ul> |
| <b>Step 5</b> | <b>call-waiting ring</b><br><b>Example:</b><br>Router(config-ephone-dn)# call-waiting ring                               | (Optional) Enables an ephone-dn to use a ring indicator for call-waiting notification. <ul style="list-style-type: none"> <li>• To use this command, do not disable call-waiting beep by using the <b>no call-waiting beep accept</b> command.</li> </ul>                                                   |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone-dn)# end                                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                            |

## Verify Call-Waiting Indicator Tone on SCCP Phone

### Procedure

- Step 1** Use the **show running-config** command to verify your configuration. Call-waiting settings are listed in the ephone-dn portion of the output. If the **no call-waiting beep generate** and the **no call-waiting beep accept** commands are configured, the **show running-config** command output will display the **no call-waiting beep** command.

#### Example:

```
Router# show running-config
!
ephone-dn 3 dual-line
number 126
name Accounting
preference 2 secondary 9
huntstop
huntstop channel
call-waiting beep
!
```

**Step 2** Use the **show telephony-service ephone-dn** command to display call-waiting configuration information.

**Example:**

```
Router# show telephony-service ephone-dn
```

```
ephone-dn 1 dual-line
 number 126 secondary 1261
 preference 0 secondary 9
 no huntstop
 huntstop channel
 call-forward busy 500 secondary
 call-forward noan 500 timeout 10
 call-waiting beep
```

## Configure Cancel Call Waiting on SCCP Phone

To enable a phone user to cancel call waiting by using the CWOFF soft key or a FAC, perform the following steps.

**Restriction**

- Call Waiting must be disabled by pressing the CWOFF soft key or using the FAC before placing a call; it cannot be activated or deactivated during a call.
- The CWOFF soft key is not available when initiating Call Transfer.

**Before you begin**

For information about standard and custom FACs, see [Feature Access Codes, on page 751](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. **softkeys seized** { [ **CallBack** ] [ **Cfwdall** ] [ **CWOFF** ] [ **Endcall** ] [ **Gpickup** ] [ **HLog** ] [ **MeetMe** ] [ **Pickup** ] [ **Redial** ] }
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **exit**
9. **telephony-service**
10. **fac** { **standard** | **custom ccw** *custom-fac* }
11. **end**

|                | Command or Action                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 10</b> | <b>fac</b> { <b>standard</b>   <b>custom ccw</b> <i>custom-fac</i> }<br><b>Example:</b><br>Router(config-telephony)# fac custom ccw **8 | Enables standard FACs or creates a custom FAC or alias. <ul style="list-style-type: none"> <li>• <b>standard</b>—Enables standard FACs for all phones. Standard FAC for cancel call waiting is *1.</li> <li>• <b>custom</b>—Creates a custom FAC for a FAC type.</li> <li>• <i>custom-fac</i>—User-defined code to be dialed using the keypad on an IP or analog phone. Custom FAC can be up to 256 characters long and contain numbers 0 to 9 and * and #.</li> </ul> |
| <b>Step 11</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                                                                          | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Example

The following example shows a configuration where the order of the CWOFF soft key is modified for the seized call state in ephone template 5 and assigned to ephone 12. A custom FAC for cancel call waiting is set to \*\*8.

```
telephony-service
max-ephones 100
max-dn 240
voicemail 8900
max-conferences 8 gain -6
transfer-system full-consult
fac custom cancel call waiting **8
!
!
ephone-template 5
softkeys seized CWOFF Cfwdall Endcall Redial
!
!
ephone 12
ephone-template 5
mac-address 000F.9054.31BD
type 7960
button 1:10 2:7
```

# Enable Call Waiting on SIP Phones

To enable call waiting on an individual SIP phone, perform the following steps.

## Before you begin

- Cisco Unified CME 3.4 or a later version.
- **mode cme** command must be configured in Cisco Unified CME.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **call-waiting**
5. **exit**
6. **voice register global**
7. **hold-alert**
8. **end**

|---------------|---------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                    | Enters global configuration mode.                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>voice register pool</b> <i>pool-tag</i><br><b>Example:</b><br>Router(config)# <b>voice register pool 3</b> | Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone in Cisco Unified CME.                                                                                                                               |
| <b>Step 4</b> | <b>call-waiting</b><br><b>Example:</b><br>Router(config-register-pool)# call-waiting                          | Configures call waiting on the SIP phone being configured.<br><b>Note</b><br>This step is included to illustrate how to enable the command if it was previously disabled.<br><ul style="list-style-type: none"> <li>• Default: Enabled.</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b>                                                                                | Exits voice register pool configuration mode.                                                                                                                                                                                                      |

|               | Command or Action                                                                                     | Purpose                                                                                                              |
|---------------|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
|               | <code>Router(config-register-pool)# exit</code>                                                       |                                                                                                                      |
| <b>Step 6</b> | <b>voice register global</b><br><b>Example:</b><br><code>Router(config)# voice register global</code> | Enters voice register global configuration mode to set parameters for all supported SIP phones in Cisco Unified CME. |
| <b>Step 7</b> | <b>hold-alert</b><br><b>Example:</b><br><code>Router(config-register-global)# hold-alert</code>       | Sets an audible alert notification when a call is on hold on a SIP phone. Default is disabled.                       |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-register-global)# end</code>                     | Exits to privileged EXEC mode.                                                                                       |

## Configure Ephone-Hunt Groups on SCCP Phones

To define a hunt group and optional agent availability parameters, perform the following steps.

### Restriction

- The HLog soft key is available only on display phones. It is not available on Cisco Unified IP Phones 7902, 7905, and 7912; Cisco IP Communicator; and Cisco VG224.
- Shared ephone-dns cannot use the Agent Status Control or Automatic Agent Not-Ready feature.
- If directory numbers that are members of a hunt group are configured for called-name display, the following restrictions apply:
  - The primary or secondary pilot number must be defined using at least one wildcard character.
  - The phone numbers in the **list** command cannot contain wildcard characters.
- If Call Forward All or Call Forward Busy is configured for a hunt group member (directory number), the hunt group ignores it.

### Before you begin

Directory numbers included in a hunt group must be configured in Cisco Unified CME. For configuration information, see [Create Directory Numbers for SCCP Phones, on page 264](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-hunt** *hunt-tag* { **longest-idle** | **peer** | **sequential** }
4. **pilot number** [**secondary number**]
5. **list number** [, *number...*]
6. **final** *final-number*

7. **hops** *number*
8. **timeout** *seconds* [, *seconds...*]
9. **max-timeout** *seconds*
10. **preference** *preference-order* [**secondary** *secondary-order*]
11. **no-reg** [**both** | **pilot**]
12. **fwd-final** {**orig-phone** | **final**}
13. **forward** *local-calls*
14. **secondary start** [**current** | **next** | *list-position*]
15. **present-call** {**idle-phone** | **onhook-phone**}
16. **from-ring**
17. **description** *text-string*
18. **display-logout** *text-string*
19. **exit**
20. **telephony-service**
21. **max-redirect** *number*
22. **hunt-group logout** {**DND** | **HLog**}
23. **exit**
24. **ephone-dn** *dn-tag*
25. **ephone-hunt login**
26. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>ephone-hunt</b> <i>hunt-tag</i> { <b>longest-idle</b>   <b>peer</b>   <b>sequential</b> }<br><b>Example:</b><br>Router(config)# ephone-hunt 23 peer | Enters ephone-hunt configuration mode to define an ephone hunt group. <ul style="list-style-type: none"> <li>• <i>hunt-tag</i>—Unique sequence number that identifies this hunt group during configuration tasks.<br/>Range: 1 to 100.<br/><br/>Cisco CME 3.3 and earlier—Range: 1 to 10</li> <li>• <b>longest-idle</b>—Calls go to the ephone-dn that has been idle the longest for the number of hops specified when the ephone hunt group was defined. The longest-idle</li> </ul> |

|               | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                                 | <p>is determined from the last time that a phone registered, reregistered, or went on-hook.</p> <ul style="list-style-type: none"> <li>• <b>peer</b>—First ephone-dn to ring is the number to the right of the ephone-dn that was the last to ring when the pilot number was last called. Ringing proceeds in a circular manner, left to right, for the number of hops specified when the ephone hunt group was defined.</li> <li>• <b>sequential</b>—Ephone-dns ring in the left-to-right order in which they are listed when the hunt group is defined.</li> </ul>                                                                                           |
| <b>Step 4</b> | <p><b>pilot</b> <i>number</i> [<b>secondary</b> <i>number</i>]</p> <p><b>Example:</b></p> <pre>Router(config-ephone-hunt)# pilot 5601</pre>     | <p>Defines the pilot number, which is the number that callers dial to reach the hunt group.</p> <ul style="list-style-type: none"> <li>• <i>number</i>—E.164 number up to 27 characters. The dialplan pattern can be applied to the pilot number.</li> <li>• <b>secondary</b>—(Optional) Defines an additional pilot number for the ephone hunt group.</li> </ul>                                                                                                                                                                                                                                                                                              |
| <b>Step 5</b> | <p><b>list</b> <i>number</i> [, <i>number</i>...]</p> <p><b>Example:</b></p> <pre>Router(config-ephone-hunt)# list 5001, 5002, 5017, 5028</pre> | <p>Defines the list of numbers (from 2 and 20) to which the ephone hunt group redirects the incoming calls.</p> <ul style="list-style-type: none"> <li>• <i>number</i>—E.164 number up to 27 characters. Primary or secondary number assigned to an ephone-dn.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 6</b> | <p><b>final</b> <i>final-number</i></p> <p><b>Example:</b></p> <pre>Router(config-ephone-hunt)# final 6000</pre>                                | <p>Defines the last number in the ephone hunt group, after which the call is no longer redirected. Can be an ephone-dn primary or secondary number, a voice-mail pilot number, a pilot number of another hunt group, or an FXS number.</p> <p><b>Note</b></p> <p>When a final number is defined as a pilot number of another hunt group, the pilot number of the first hunt group cannot be configured as a final number in any other hunt group.</p> <p><b>Note</b></p> <p>This command is not used for ephone hunt groups that are part of a Cisco Unified CME B-ACD service. The final destination for those groups is determined by the B-ACD service.</p> |
| <b>Step 7</b> | <p><b>hops</b> <i>number</i></p> <p><b>Example:</b></p> <pre>Router(config-ephone-hunt)# hops 7</pre>                                           | <p>(Optional; peer and longest-idle hunt groups only) Sets the number of hops before a call proceeds to the final number.</p> <ul style="list-style-type: none"> <li>• <i>number</i>—Number of hops before the call proceeds to the final ephone-dn. Range is 2 to 20, but the value must be less than or equal to the number of extensions that are specified in the <b>list</b> command. Default</li> </ul>                                                                                                                                                                                                                                                  |

| <b>Step 23</b> | <b>exit</b><br><b>Example:</b><br>Router(config-telephony)# exit                           | Exits telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                          |
| <b>Step 24</b> | <b>ephone-dn dn-tag</b><br><b>Example:</b><br>Router(config)# ephone-dn 29                 | (Optional) Enters ephone-dn configuration mode. <ul style="list-style-type: none"> <li>• <i>dn-tag</i>—Tag number for the ephone-dn to be authorized to join and leave ephone hunt groups.</li> </ul>                                                                                                                                                                |
| <b>Step 25</b> | <b>ephone-hunt login</b><br><b>Example:</b><br>Router(config-ephone-dn)# ephone-hunt login | (Optional) Enables this ephone-dn to join and leave ephone hunt groups (dynamic membership).                                                                                                                                                                                                                                                                         |
| <b>Step 26</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone-dn)# end                             | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                     |

## Verify Ephone Hunt Groups Configuration

### Procedure

- Step 1** Use the **show running-config** command to verify your configuration. Ephone hunt group parameters are listed in the ephone-hunt portion of the output.

**Example:**

```
Router# show running-config
ephone-hunt 1 longest-idle
pilot 500
list 502, 503, *
max-timeout 30
timeout 10, 10, 10
hops 2
```

```
from-ring
fwd-final orig-phone
!
!
ephone-hunt 2 sequential
pilot 600
list 621, *, 623
final 5255348
max-timeout 10
timeout 20, 20, 20
fwd-final orig-phone
!
!
ephone-hunt 77 longest-idle
from-ring
pilot 100
list 101, *, 102
!
```

**Step 2**

To verify the configuration of ephone hunt group dynamic membership, use the **show running-config** command. Look at the ephone-hunt portion of the output to ensure at least one wildcard slot is configured. Look at the ephone-dn section to see whether particular ephone-dns are authorized to join ephone hunt groups. Look at the telephony-service section to see whether FACs are enabled.

**Example:**

```
Router# show running-config
ephone-hunt 1 longest-idle
pilot 500
list 502, 503, *
max-timeout 30
timeout 10, 10, 10
hops 2
from-ring
fwd-final orig-phone
!
!
```

```

ephone-dn 2 dual-line

number 126

preference 1

call-forward busy 500

ephone-hunt login

!

telephony-service

fac custom alias 5 *5 to *35000

fac custom ephone-hunt cancel #5

```

**Step 3** Use the **show ephone-hunt** command for detailed information about hunt groups, including dial-peer tag numbers, hunt-group agent status, and on-hook time stamps. This command also displays the dial-peer tag numbers of all ephone-dns that have joined dynamically and are members of the group at the time that the command is run.

**Example:**

Router# **show ephone-hunt**

```

## Configure Voice-Hunt Groups

To redirect calls for a specific number (pilot number) to a defined group of directory numbers on Cisco Unified SCCP and SIP IP phones, perform the following steps.

---

### Restriction

- Before Cisco Unified CME 4.3, forwarding or transferring to a voice hunt group is not supported.
  - In Cisco Unified CME 4.3 and later versions, Call Forwarding is supported to a parallel hunt-group (blast hunt group) only.
  - SIP-to-H.323 calls are not supported.
  - If Call Forward All or Call Forward Busy is configured for a hunt group member (directory number), the hunt group ignores it.
  - Caller ID update is not supported for supplementary services.
  - Voice hunt groups are subject to the max-redirect restriction.
  - A pilot dial peer cannot be used for a voice hunt group and an ephone hunt group at the same time.
  - Voice hunt groups do not support the expansion of pilot numbers using the **dialplan-pattern** command. To enable external phones to dial the pilot number, you must configure a secondary pilot number using a fully qualified E.164 number.
  - If call-waiting is enabled (the default), parallel hunt groups support multiple calls up to the limit of call-waiting calls supported by the particular SIP phone model. If call waiting is disabled, parallel hunt groups support only one call at a time in the ringing state. Phones that fail to connect must return to the on-hook state before they can receive other calls.
  - A phone number associated with an FXO port is not supported in parallel hunt groups.
  - If the directory number (member of a voice hunt group) is a shared line, agent status control or HLog is not supported.
  - From Unified CME release 11.6 onwards, line level logout or login is not supported for SIP phones.
  - DND FAC is not supported with SIP phones on Unified CME.
  - Consider an SCCP DN that is part of both voice hunt group and ephone hunt group. If voice hunt group is configured with members logout or auto logout, then the SCCP DN will logout only from voice hunt group. If ephone hunt group is configured with members logout or auto logout, then the SCCP DN will logout from both voice hunt group and ephone hunt group.
  - For Unified CME 12.1 and prior releases, mixed shared lines and SIP shared lines are not supported with voice hunt groups.
  - For parallel voice hunt group, the maximum number of call blasts that can be supported is limited to 32. This includes the shared-line as well as normal directory numbers.
  - Unified CME supports chaining (nesting) of a voice hunt group with another voice hunt group. The chaining of voice hunt groups is established by configuring the final number of the first voice hunt group as the pilot number of the second voice hunt group.
  - Unified CME supports the chaining (nesting) of a maximum of two voice hunt groups. The configuration ensures that there is no looping of calls placed to a voice hunt group.
-

**Before you begin**

- Cisco Unified CME 3.4 or a later version for SIP phones.
- Cisco Unified CME 4.3 or a later version is required to include a SCCP phone, FXS analog phone, DS0-group, PRI-group, or SIP trunk in a voice hunt-group.
- Cisco Unified CME 4.3 or a later version is required for call transfer to a voice hunt-group.
- Directory numbers included in a hunt group must be configured in Cisco Unified CME. For configuration information, see [Configure Phones to Make Basic Call, on page 327](#).
- Cisco Unified CME 11.6 or later is required to support HLog softkey, feature button, and agent status control.
- Cisco Unified CME 11.6 or later is required to configure **present-call**, **auto logout**, and **members logout** under voice hunt group configuration mode.
- Unified CME 12.2 or later is required to configure mixed shared lines and SIP shared lines with voice hunt groups.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voicehunt-group** *hunt-tag* [**longest-idle** | **parallel** | **peer** | **sequential**]
4. **pilot** *number* [**secondary** *number*]
5. **list** *number*
6. **final** *number*
7. **preference** *preference-order* [**secondary** *secondary-order*]
8. **hops** *number*
9. **timeout** *seconds*
10. **present-call** **idle-phone**
11. **members** **logout**
12. **auto logout** *number-of-calls*
13. **exit**
14. **telephony-service**
15. **hunt-group** **logout** { **DND** **HLog** }
16. **exit**
17. **voice** **register** *dn tag*
18. **voice-hunt-groups** **login**
19. **end**

**DETAILED STEPS****Procedure**

|        | Command or Action | Purpose                       |
|--------|-------------------|-------------------------------|
| Step 1 | enable            | Enables privileged EXEC mode. |

|               | Command or Action                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                                     | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                               | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 3</b> | <b>voicehunt-group</b> <i>hunt-tag</i> [ <b>longest-idle</b>   <b>parallel</b>   <b>peer</b>   <b>sequential</b> ]<br><b>Example:</b><br><pre>Router(config)# voice hunt-group 1 longest-idle</pre> | <p>Enters voice hunt-group configuration mode to define a hunt group.</p> <ul style="list-style-type: none"> <li>• <i>hunt-tag</i>—Unique sequence number of the hunt group to be configured. Range is 1 to 100.</li> <li>• <b>longest idle</b>—Hunt group in which calls go to the directory number that has been idle for the longest time.</li> <li>• <b>sequential</b>—Hunt group in which directory numbers ring in the order in which they are listed, left to right.</li> <li>• <b>parallel</b>—Hunt group in which all directory numbers ring simultaneously.</li> <li>• <b>peer</b>—Hunt group in which the call placed to a directory number rings for the next directory number in line.</li> <li>• To change the hunt-group type, remove the existing hunt group first by using the <b>no</b> form of the command; then, recreate the group.</li> </ul> |
| <b>Step 4</b> | <b>pilot number</b> [ <b>secondary number</b> ]<br><b>Example:</b><br><pre>Router(config-voice-hunt-group)# pilot number 8100</pre>                                                                 | <p>Defines the telephone number that callers dial to reach a voice hunt group.</p> <ul style="list-style-type: none"> <li>• <i>number</i>—String of up to 16 characters that represents an E.164 telephone number.</li> <li>• Number string may contain alphabetic characters when the number is to be dialed only by the Cisco Unified CME router, as with an intercom number, and not from telephone keypads.</li> <li>• <b>secondary number</b>—(Optional) Keyword and argument combination defines the number that follows as an additional pilot number for the voice hunt group.</li> <li>• Secondary numbers can contain wild cards. A wildcard is a period (.), which matches any entered digit.</li> </ul>                                                                                                                                                 |

|        | Command or Action                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p><b>list number</b></p> <p><b>Example:</b></p> <pre>Router(config-voice-hunt-group)# list 8000, 8010, 8020, 8030</pre>                                     | <p>Creates a list of extensions that are members of a voice hunt group. To remove a list from a router configuration, use the <b>no</b> form of this command.</p> <ul style="list-style-type: none"> <li>• <b>number</b>—List of extensions to be added as members to the voice hunt group. Separate the extensions with commas.</li> <li>• Add or delete all extensions in a hunt-group list at one time. You cannot add or delete a single number in an existing list.</li> <li>• There must be from 2 to 10 extensions in the hunt-group list, and each number must be a primary or secondary number.</li> <li>• Any number in the list cannot be a pilot number of a parallel hunt group.</li> </ul>                                                                                                                                                                                                                                                                                                                                     |
| Step 6 | <p><b>final number</b></p> <p><b>Example:</b></p> <pre>Router(config-voice-hunt-group)# final 8888</pre>                                                     | <p>Defines the last extension in a voice hunt group.</p> <ul style="list-style-type: none"> <li>• If a final number in one hunt group is configured as a pilot number of another hunt group, the pilot number of the first hunt group cannot be configured as a final number in any other hunt group.</li> <li>• This command is not used for voice hunt groups that are part of a Cisco Unified CME B-ACD service. The final destination for those groups is determined by the B-ACD service.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 7 | <p><b>preference preference-order</b> [<b>secondary secondary-order</b>]</p> <p><b>Example:</b></p> <pre>Router(config-voice-hunt-group)# preference 6</pre> | <p>Sets the preference order for the directory number associated with a voice hunt-group pilot number.</p> <p><b>Note</b></p> <p>We recommend that the parallel hunt-group pilot number be unique in the system. Parallel hunt groups may not work if there are more than one partial or exact dial-peer match. For example, if the pilot number is “8000” and there is another dial peer that matches “8...”. If multiple matches cannot be avoided, give parallel hunt groups the highest priority to run by assigning a lower preference to the other dial peers. Note that 8 is the lowest preference value. By default, dial peers created by parallel hunt groups have a preference of 0.</p> <ul style="list-style-type: none"> <li>• <b>preference-order</b>—Range is 0 to 8, where 0 is the highest preference and 8 is the lowest preference. Default is 0.</li> <li>• <b>secondary secondary-order</b>—(Optional) Keyword and argument combination is used to set the preference order for the secondary pilot number.</li> </ul> |

|                | Command or Action                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                            | Range is 1 to 8, where 0 is the highest preference and 8 is the lowest preference. Default is 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 8</b>  | <b>hops number</b><br><b>Example:</b><br><code>Router(config-voice-hunt-group)# hops 2</code>                              | For configuring a peer or longest-idle voice hunt group only. Defines the number of times that a call can hop to the next number in a peer or longest-idle voice hunt group before the call proceeds to the final number. <ul style="list-style-type: none"> <li>• <i>number</i>—Number of hops. Range is 2 to 10, and the value must be less than or equal to the number of extensions specified by the <b>list</b> command.</li> <li>• Default is the same number as there are destinations defined under the <b>list</b> command.</li> </ul> |
| <b>Step 9</b>  | <b>timeout seconds</b><br><b>Example:</b><br><code>Router(config-voice-hunt-group)# timeout 100</code>                     | Defines the number of seconds after which a call that is not answered is redirected to the next directory number in a voice hunt-group list. <ul style="list-style-type: none"> <li>• Default: 180 seconds.</li> </ul>                                                                                                                                                                                                                                                                                                                          |
| <b>Step 10</b> | <b>present-call idle-phone</b><br><b>Example:</b><br><code>Router(config-voice-hunt-group)# present-call idle-phone</code> | Specifies that voice hunt-group calls are presented only if all lines are idle on the phone on which the hunt-group line appears.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 11</b> | <b>members logout</b><br><b>Example:</b><br><code>Router(config-voice-hunt-group)# members logout</code>                   | Configures a Cisco Unified CME system for all non-shared static members or agents in a voice hunt group with the Hlogout initial state.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 12</b> | <b>auto logout number-of-calls</b><br><b>Example:</b><br><code>Router(config-voice-hunt-group)# auto logout 2</code>       | Enables the automatic change of a voice hunt group agent's voice register dn or ephone-dn to not-ready status after a specified number of successive hunt-group calls are not answered.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 13</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-voice-hunt-group)# exit</code>                                       | Exits voice-hunt-group configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 14</b> | <b>telephony-service</b><br><b>Example:</b><br><code>Router(config)# telephony-service</code>                              | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 15</b> | <b>hunt-group logout {DND HLog }</b><br><b>Example:</b><br><code>Router(config-telephony)# hunt-group logout Hlog</code>   | (Optional) Specifies HLog softkey functions. Agent not-ready status can be activated by an agent using the HLog softkey or a FAC.                                                                                                                                                                                                                                                                                                                                                                                                               |

|                | Command or Action                                                                                        | Purpose                                                                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 16</b> | <b>exit</b><br><b>Example:</b><br>Router(config-telephony)# exit                                         | Exits telephony-service configuration mode.                                                                                                                                                                      |
| <b>Step 17</b> | <b>voice register dn tag</b><br><b>Example:</b><br>Router(config)# voice register dn 29                  | (Optional) Enters voice register dn configuration mode.<br><ul style="list-style-type: none"> <li>• <i>tag</i>—Tag number for voice register dn to be authorized to join and leave voice hunt groups.</li> </ul> |
| <b>Step 18</b> | <b>voice-hunt-groups login</b><br><b>Example:</b><br>Router(config-register-dn)# voice-hunt-groups login | (Optional) Enables this voice register dn to join and leave voice hunt groups (dynamic membership).                                                                                                              |
| <b>Step 19</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-dn)# end                                         | Exits to privileged EXEC mode.                                                                                                                                                                                   |

## Verify Voice Hunt Groups Configuration

### Procedure

- Step 1** Use the **show running-config** command to verify your configuration. Voice hunt group parameters are listed in the voice-hunt portion of the output.

**Example:**

```
Router# show running-config
```

```
voice-hunt 1 longest-idle
pilot 500
list 502, 503, *
max-timeout 30
timeout 10, 10, 10
hops 2
from-ring
fwd-final orig-phone
!
!
voice-hunt 2 sequential
pilot 600
list 621, *, 623
final 5255348
max-timeout 10
timeout 20, 20, 20
fwd-final orig-phone
!
!
voice-hunt 77 longest-idle
from-ring
pilot 100
```

```
list 101, *, 102
!
```

**Step 2** To verify the configuration of voice hunt group dynamic membership, use the **show running-config** command. Look at the voice-hunt portion of the output to ensure at least one wildcard slot is configured. Look at the voice-dn section to see whether particular ephone-dns are authorized to join voice hunt groups. Look at the telephony-service section to see whether FACs are enabled.

**Example:**

```
Router# show running-config
```

```
voice-hunt 1 longest-idle
pilot 500
list 502, 503, *
max-timeout 30
timeout 10, 10, 10
hops 2
from-ring
fwd-final orig-phone
!
!
voice-dn 2 dual-line
number 126
preference 1
call-forward busy 500
ephone-hunt login
!
telephony-service
fac custom alias 5 *5 to *35000
fac custom ephone-hunt cancel #5
```

**Step 3** Use the **show ephone-hunt** command for detailed information about hunt groups, including dial-peer tag numbers, hunt-group agent status, and on-hook time stamps. This command also displays the dial-peer tag numbers of all ephone-dns that have joined dynamically and are members of the group at the time that the command is run.

**Example:**

```
Router# show ephone-hunt
```

```

## Enable Audible Tone for Successful Login and Logout of a Hunt Group on SCCP Phone

The user can enable playing of audible tone on an SCCP phone to confirm a successful join or unjoin and login or logout from a hunt group (applies to both ephone and voice hunt group). From Cisco Unified CME 10.5 onwards, distinct audible tone will be played for the following scenarios:

1. To join and unjoin a hunt group via FAC
2. To log in and log out from hunt group via Hlog/DND, or FAC

The audible tone will be played for ephone hunt group and voice hunt group for SCCP Phones.

### Restriction

- Supports all 79xx phones except for 7926 wireless phones.

### Before you begin

- Cisco Unified CME 10.5 or a later version
- Ephone or voice hunt group should be configured
- Ephone should be static or dynamic member of hunt group.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag* or **ephone-template** *template-tag*
4. **audible tone**
5. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action                                      | Purpose                                                                                                                   |
|--------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Step 4</b> | <b>audible tone</b><br><br><b>Example:</b><br>Router(config-ephone)# audible tone                                         | Enables playing of audible tone on an SCCP phone to confirm a successful login or logout.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-ephone)# end                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Example

The following example shows that audible tone is configured in voice register pool configuration mode:

```
!
Router(config)# ephone 1
Router(config-ephone)# device-security-mode none
Router(config-ephone)# mac-address 64D8.14A5.C87A
Router(config-ephone)# type 7965
Router(config-ephone)# button 1:3
Router(config-ephone)# audible-tone!
```

## Enable the Collection of Call Statistics for Voice Hunt-Groups

To enable the collection of call statistics for voice hunt groups, perform the following steps.

### Restriction

Hold and resume statistics are not updated for remote SCCP voice hunt group agents.

**Before you begin**

Cisco Unified CME 9.0 or a later version.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice hunt-group** *hunt-tag* { **longest-idle** | **parallel** | **peer** | **sequential** }
4. **statistics collect**
5. **end**

**DETAILED STEPS****Procedure**

#### Procedure

|        | Command or Action                                                                                                                  | Purpose                                                                                                                                                                                                             |
|--------|------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                             | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                           |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                     | Enters global configuration mode.                                                                                                                                                                                   |
| Step 3 | <b>voice hunt-group</b> <i>hunt-tag</i> { <b>parallel</b> }<br><br><b>Example:</b><br>Router(config)# voice hunt-group 20 parallel | Creates a hunt group for phones in a Cisco Unified CME system.<br><br><ul style="list-style-type: none"> <li>• <i>hunt-tag</i>—Unique sequence number that identifies the hunt group. Range is 1 to 100.</li> </ul> |

|               | Command or Action                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                                                               | <ul style="list-style-type: none"> <li>• <b>parallel</b>—Hunt group in which calls simultaneously ring multiple phones.</li> </ul>                                                                                                                                                                                                                         |
| <b>Step 4</b> | <b>final number</b><br><b>Example:</b><br><pre>Router(config-voice-hunt-group)# final 4000</pre>                                                                              | Defines the last extension in a voice hunt group. <ul style="list-style-type: none"> <li>• <b>number</b>—Telephone or extension number. Can be an E.164 number, voice-mail number, pilot number of another hunt group, or FXS caller-ID number.</li> </ul>                                                                                                 |
| <b>Step 5</b> | <b>list number [, number...]</b><br><b>Example:</b><br><pre>Router(config-voice-hunt-group)# list 3001, 3002, 3003</pre>                                                      | Defines a list of extensions that are members of a voice hunt group. <ul style="list-style-type: none"> <li>• <b>number</b>—Extension or E.164 number assigned to a phone in Cisco Unified CME. List must contain 2 to 32 numbers.</li> </ul>                                                                                                              |
| <b>Step 6</b> | <b>timeout seconds</b><br><b>Example:</b><br><pre>Router(config-voice-hunt-group)# timeout 20</pre>                                                                           | Defines the number of seconds after which a call that is not answered is redirected to the next number in a voice hunt-group list. <ul style="list-style-type: none"> <li>• <b>seconds</b>—Number of seconds. Range is 3 to 60000. Default is 180.</li> </ul>                                                                                              |
| <b>Step 7</b> | <b>pilot number [secondary number]</b><br><b>Example:</b><br><pre>Router(config-voice-hunt-group)# pilot 4045550110 secondary 3125550120</pre>                                | Defines the number that callers dial to reach a Cisco Unified CME voice hunt group. <ul style="list-style-type: none"> <li>• <b>number</b>—String of up to 32 characters that represents an extension or E.164 telephone number.</li> <li>• <b>secondary number</b>—(Optional) Defines an additional pilot number for the voice hunt group.</li> </ul>     |
| <b>Step 8</b> | <b>name “primary pilot name” [secondary “secondary pilot name”]</b><br><b>Example:</b><br><pre>Router(config-voice-hunt-group)# name Hospital secondary “Health Center”</pre> | Associates a name with the called voice hunt group. <ul style="list-style-type: none"> <li>• <b>“primary pilot name”</b>—Name for the primary pilot number.</li> <li>• <b>secondary “secondary pilot name”</b>—(Optional) Name for the secondary pilot number.</li> </ul> <p><b>Note</b><br/>Use quotes (") when input strings have spaces in between.</p> |

## Prevent Local Call Forwarding to Final Agent in Voice Hunt-Groups

### Before you begin

Cisco Unified CME 9.5 or a later version.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice hunt-group** *hunt-tag* {**parallel** | **sequential**}
4. [**no**] **forward local-calls to-final**

## DETAILED STEPS

## Procedure

|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                  | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>voice hunt-group</b> <i>hunt-tag</i> { <b>parallel</b>   <b>sequential</b> }<br><b>Example:</b><br>Router(config)# voice hunt-group 1 sequential | Creates a hunt group for phones in a Cisco Unified CME system.<br><ul style="list-style-type: none"> <li>• <i>hunt-tag</i>—Unique sequence number that identifies the hunt group. Range is 1 to 100.</li> <li>• <b>parallel</b>—Hunt group in which calls simultaneously ring multiple phones.</li> <li>• <b>sequential</b>—Hunt group in which extensions ring in the order in which they are listed, left to right, when the hunt group was defined.</li> </ul> |
| <b>Step 4</b> | [ <b>no</b> ] <b>forward local-calls to-final</b><br><b>Example:</b><br>Router(config-voice-hunt-group)# no forward local-calls to-final            | Prevents local calls from being forwarded to the final destination number.                                                                                                                                                                                                                                                                                                                                                                                        |

## Configure Night Service on SCCP Phones

This procedure defines night-service hours, an optional night-service code, the ephone-dns that trigger the notification process, and the ephones that will receive notification.

## Restriction

- Night service notification is not supported on analog endpoints connected to FXS ports on a Cisco Integrated Services Router (ISR) or Cisco VG224 Analog Phone Gateway.
- In Cisco Unified CME 4.0 and later versions, silent ringing, configured on the phone by using the **s** keyword with the **button** command, is suppressed when used with the night service feature. Silent ringing is overridden and the phone audibly rings during designated night-service periods.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **night-service day** *day start-time stop-time*
5. **night-service date** *month date start-time stop-time*
6. **night-service everyday** *start-time stop-time*
7. **night-service weekday** *start-time stop-time*
8. **night-service weekend** *start-time stop-time*
9. **night-service code** *digit-string*
10. **timeouts night-service-bell** *seconds*
11. **exit**
12. **ephone-dn** *dn-tag*
13. **night-service bell**
14. **exit**
15. **ephone** *phone-tag*
16. **night-service bell**
17. **end**

## Configure Night Service on SIP Phones

This procedure defines night-service hours, an optional night-service code, the voice register DNs that trigger the notification process, and the SIP phones (voice register pools) that receive notification. The CLI commands related to night-service in telephony-service are used to make night service feature work on SIP phones.

### Restriction

- When **service directed-pickup gpickup** is configured under telephony service, gpickup softkey has to be used on SCCP phones to pick up the ringing call on night-service extensions.

### Before you begin

- It is mandatory to configure the CLI command **service directed-pickup gpickup** under telephony-service to pick up calls from SIP phones for night service.
- It is mandatory to configure the CLI command **call-park system application** under telephony-service to enable or disable Night Service functionality using night service code on SIP phones.
- It is mandatory to configure source IP address, port, and max dn under telephony-service configuration to make night service feature work for SIP phones.

### SUMMARY STEPS

- enable**
- configure terminal**
- telephony-service**
- night-service day** *day start-time stop-time*
- night-service date** *month date start-time stop-time*
- night-service everyday** *start-time stop-time*
- night-service weekday** *start-time stop-time*
- night-service weekend** *start-time stop-time*
- fac standard**
- night-service code** *digit-string*

11. **call-park system application**
12. **service directed-pickup gpickup**
13. **timeouts night-service-bell** *seconds*
14. **exit**
15. **voice register dn** *dn-tag*
16. **night-service bell**
17. **exit**
18. **voice register pool** *pool -tag* | **voice register template** *template-tag*
19. **night-service bell**
20. **voice register pool** *pool-tag*
21. **template** *template-tag*
22. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                         | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 3</b> | <b>telephony-service</b><br><br><b>Example:</b><br>Router(config)# telephony-service                                                           | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 4</b> | <b>night-service day</b> <i>day start-time stop-time</i><br><br><b>Example:</b><br>Router(config-telephony)# night-service day mon 19:00 07:00 | Defines a recurring time period associated with a day of the week during which night service is active.<br><br>• <i>day</i> —Day of the week abbreviation. The following are valid day abbreviations: <b>sun</b> , <b>mon</b> , <b>tue</b> , <b>wed</b> , <b>thu</b> , <b>fri</b> , <b>sat</b> .<br><br>• <i>start-time stop-time</i> —Beginning and ending times for night service, in an HH:MM format using a 24-hour clock. If the stop time is a smaller value than the start time, the stop time occurs the day following the start time. For example, “mon 19:00 07:00” means “from Monday at 7 p.m. until Tuesday at 7 a.m.” |
| <b>Step 5</b> | <b>night-service date</b> <i>month date start-time stop-time</i><br><br><b>Example:</b>                                                        | Defines a recurring time period associated with a month and date during which night service is active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|               | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <pre>Router(config-telephony)# night-service date jan 1 00:00 00:00</pre>                                                                              | <ul style="list-style-type: none"> <li>• <i>month</i>—Month abbreviation. The following are valid month abbreviations: <b>jan, feb, mar, apr, may, jun, jul, aug, sep, oct, nov, dec</b>.</li> <li>• <i>date</i>—Date of the month. Range is 1 to 31.</li> <li>• <i>start-time stop-time</i>—Beginning and ending times for night service, in an HH:MM format using a 24-hour clock. The stop time must be greater than the start time. The value 24:00 is not valid. If 00:00 is entered as a stop time, it is changed to 23:59. If 00:00 is entered for both start time and stop time, calls are blocked for the entire 24-hour period on the specified date.</li> </ul>           |
| <b>Step 6</b> | <p><b>night-service everyday start-time stop-time</b></p> <p><b>Example:</b></p> <pre>Router(config-telephony)# night-service everyday 1200 1300</pre> | <p>Defines a recurring night-service time period to be effective everyday.</p> <ul style="list-style-type: none"> <li>• <i>start-time stop-time</i>—Beginning and ending times for night service, in an HH:MM format using a 24-hour clock. If the stop time is a smaller value than the start time, the stop time occurs the day following the start time. For example, “19:00 07:00” means “from 7 p.m. to 7 a.m. the next morning.” The value 24:00 is not valid. If 00:00 is entered as a stop time, it is changed to 23:59. If 00:00 is entered for both start time and stop time, the night service feature will be activated for the entire 24-hour period.</li> </ul>        |
| <b>Step 7</b> | <p><b>night-service weekday start-time stop-time</b></p> <p><b>Example:</b></p> <pre>Router(config-telephony)# night-service weekday 1700 0700</pre>   | <p>Defines a recurring night-service time period to be effective on all weekdays.</p> <ul style="list-style-type: none"> <li>• <i>start-time stop-time</i>—Beginning and ending times for night service, in an HH:MM format using a 24-hour clock. If the stop time is a smaller value than the start time, the stop time occurs the day following the start time. For example, “19:00 07:00” means “from 7 p.m. to 7 a.m. the next morning.” The value 24:00 is not valid. If 00:00 is entered as a stop time, it is changed to 23:59. If 00:00 is entered for both start time and stop time, the night service feature will be activated for the entire 24-hour period.</li> </ul> |
| <b>Step 8</b> | <p><b>night-service weekend start-time stop-time</b></p> <p><b>Example:</b></p> <pre>Router(config-telephony)# night-service weekend 00:00 00:00</pre> | <p>Defines a recurring night-service time period to be effective on all weekend days (Saturday and Sunday).</p> <ul style="list-style-type: none"> <li>• <i>start-time stop-time</i>—Beginning and ending times for night service, in an HH:MM format using a 24-hour clock. If the stop time is a smaller value than the start time, the stop time occurs the day following the start time. For example, “19:00 07:00” means</li> </ul>                                                                                                                                                                                                                                             |

|                | Command or Action                                                                                                                | Purpose                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                  | “from 7 p.m. to 7 a.m. the next morning.” The value 24:00 is not valid. If 00:00 is entered as a stop time, it is changed to 23:59. If 00:00 is entered for both start time and stop time, the night service feature will be activated for the entire 24-hour period.                    |
| <b>Step 9</b>  | <b>fac standard</b><br><b>Example:</b><br>Router(config-telephony)# fac standard                                                 | (Optional) Enables predefined standard feature access codes (FACs) to be enabled. For the CLI command <b>night-service code</b> to work, it is mandatory to configure <b>fac standard</b> under <b>telephony-service</b> configuration mode.                                             |
| <b>Step 10</b> | <b>night-service code</b> <i>digit-string</i><br><b>Example:</b><br>Router(config-telephony)# night-service code *6483           | Designates a code that can be dialed from any night-service line (voice register dn) to toggle night service on and off for all lines assigned to night service in the system.<br><br>• <i>digit-string</i> —String of up to 16 keypad digits. The code must begin with an asterisk (*). |
| <b>Step 11</b> | <b>call-park system application</b><br><b>Example:</b><br>Router(config-telephony)# call-park system application                 | Enables or disables Night Service functionality using night service code on SIP phones.                                                                                                                                                                                                  |
| <b>Step 12</b> | <b>service directed-pickup gpickup</b><br><b>Example:</b><br>Router(config-telephony)# service directed-pickup gpickup           | Enables Directed Call Pickup and modifies the function of the GPickUp and PickUp soft keys.                                                                                                                                                                                              |
| <b>Step 13</b> | <b>timeouts night-service-bell</b> <i>seconds</i><br><b>Example:</b><br>Router(config-telephony)# timeouts night-service-bell 15 | Defines the frequency of the night-service notification.<br><br>• <i>seconds</i> —Range: 4 to 30. Default: 12.                                                                                                                                                                           |
| <b>Step 14</b> | <b>exit</b><br><b>Example:</b><br>Router(config-telephony)# exit                                                                 | Exits telephony-service configuration mode.                                                                                                                                                                                                                                              |
| <b>Step 15</b> | <b>voice register dn</b> <i>dn-tag</i><br><b>Example:</b><br>Router(config)# voice register dn 10                                | Enters voice register dn configuration mode to define a voice register dn to receive night-service treatment.                                                                                                                                                                            |
| <b>Step 16</b> | <b>night-service bell</b><br><b>Example:</b><br>Router(config-register-dn)# night-service bell                                   | Marks this voice register dn for night-service treatment.                                                                                                                                                                                                                                |
| <b>Step 17</b> | <b>exit</b><br><b>Example:</b>                                                                                                   | Exits voice register dn configuration mode.                                                                                                                                                                                                                                              |

|                | Command or Action                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                              |

|                | <code>Router(config-register-dn)# exit</code>                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                      |
| <b>Step 18</b> | <b>voice register pool <i>pool -tag</i>   voice register template <i>template-tag</i></b><br><br><b>Example:</b><br><code>Router(config)# voice register pool 10</code><br><code>Router(config)# voice register template 1</code> | Enters pool configuration mode (or template configuration mode).<br><br><ul style="list-style-type: none"> <li><i>pool-tag</i>—The unique sequence number of the phone that will be notified when an incoming call is received by a night-service voice-dn during a night-service period.</li> </ul> |
| <b>Step 19</b> | <b>night-service bell</b><br><br><b>Example:</b><br><code>Router(config-register-pool)# night-service bell</code><br><code>Router(config-register-template)# night-service bell</code>                                            | Marks this phone to receive night-service bell notification when incoming calls are received on voice register dns marked for night service during the night-service time period.                                                                                                                    |
| <b>Step 20</b> | <b>voice register pool <i>pool-tag</i></b><br><br><b>Example:</b><br><code>Router(config)# voice register pool 10</code>                                                                                                          | Enters pool configuration mode. This step is valid only when the night service configuration is under voice register template.                                                                                                                                                                       |
| <b>Step 21</b> | <b>template <i>template-tag</i></b><br><br><b>Example:</b><br><code>Router(config-register-pool)# template 1</code>                                                                                                               | Includes the template with night-service bell configured to provide night service treatment for this pool. This step is valid only when the night service configuration is under voice register template.                                                                                            |
| <b>Step 22</b> | <b>end</b><br><br><b>Example:</b><br><code>Router(config-register-temp)# end</code>                                                                                                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                     |

## Verify Night Service Configuration on SCCP Phones

### Procedure

- Step 1** Use the **show running-config** command to verify the night-service parameters, which are listed in the telephony-service portion of the output, or use the **show telephony-service** command to display the same parameters.

**Example:**

```
Router# show running-config
```

```
telephony-service
fxo hook-flash
load 7910 P00403020214
load 7960-7940 P00303020214
max-ephones 48
```

```

max-dn 288
ip source-address 10.50.50.1 port 2000
application segway0
caller-id block code *321
create cnf-files version-stamp 7960 Mar 07 2003 11:19:18
voicemail 79000
max-conferences 8
call-forward pattern
moh minuet.wav
date-format yy-mm-dd
transfer-system full-consult
transfer-pattern

```

- Step 2** Use the **show running-config** command to verify that the correct ephone-dns and ephones are configured with the **night-service bell** command. You can also use the **show telephony-service ephone-dn** and **show telephony-service ephone** commands to display these parameters.

**Example:**

```
Router# show running-config
```

```
ephone-dn 24 dual-line
 number 2548
 description FrontDesk
 night-service bell

ephone 1
 mac-address 110F.80C0.FE0B

 button 7m20 8m21 9m22 10m23
 button 11m24 12m25 13m26
 night-service bell
```

## Verify Night Service Configuration on SIP Phones

### Procedure

- Step 1** Use the **show running-config | section telephony-service** command to verify the night-service parameters that are listed in the telephony-service portion of the output. Use the **show telephony-service** command to display the same parameters.

**Example:**

```
Router# show running-config | section telephony-service
```

```
telephony-service
 max-ephones 50
 max-dn 50
 ip source-address 10.50.50.1 port 2000
```

```

service phone sshAccess 0
service phone webAccess 0
service directed-pickup gpickup
time-zone 39
max-conferences 8 gain -6
call-park system application
hunt-group report url suffix 0 to 100
hunt-group report every 1 hours
hunt-group logout HLog
transfer-system full-consult
night-service weekday 13:17 14:17
night-service day Sun 00:05 23:59
night-service day Sat 00:05 23:59
night-service code *6483
Router# show telephony-service

```

```

max-ephones 50
max-dn 50
ip source-address 10.50.50.1 port 2000
service phone sshAccess 0
service phone webAccess 0
time-zone 39
max-conferences 8 gain -6
call-park system application
hunt-group report url suffix 0 to 100
hunt-group report every 1 hours
hunt-group logout HLog
transfer-system full-consult
night-service time is activated
night-service weekday 13:17 14:17
night-service day Sun 00:05 23:59
night-service day Sat 00:05 23:59

```

**Step 2** Use the **show voice register dn** and **show voice register pool** command to verify that the correct voice register dns and phones are configured with the **night-service bell** command.

**Example:**

```
Router# show voice register dn 1
```

```

Dn Tag 1
Config:
Number is 8001
Preference is 0
Huntstop is disabled
Auto answer is disabled
Pickup group is 5
Night Service Bell is enabled

```

```
Router# show voice register pool 5
```

```

Pool Tag 5
Config:
Mac address is B000.B4BE.F32C
Type is 8851
Number list 1 : DN 5
Proxy Ip address is 0.0.0.0
DTMF Relay is disabled
Call Waiting is enabled
DnD is disabled
Video is disabled
Camera is disabled

```

Night Service Bell is enabled  
 Busy trigger per button value is 2

## Configure Overlaid Ephone-dns on SCCP Phones

To create ephone-dns, then assign multiple ephone-dns to a single phone button by using the **o** or **c** keyword with the **button** command, perform the following steps.

### Restriction

- Call waiting is disabled when you configure ephone-dn overlays using the **o** keyword with the **button** command. To enable call waiting, you must configure ephone-dn overlays using the **c** keyword with the **button** command.
- Rollover of overlay calls to another phone button by using the **x** keyword with the **button** command only works to expand coverage if the overlay button is configured with the **o** keyword in the **button** command. Overlay buttons with call waiting that use the **c** keyword in the **button** command are not eligible for overlay rollover.
- In Cisco Unified CME 4.0(3), the Cisco Unified IP Phone 7931G cannot support overlays that contain ephone-dn configured for dual-line mode.
- The primary ephone-dn on each phone in a shared-line overlay set should be an ephone-dn that is unique to the phone to guarantee that the phone will have a line available for outgoing calls, and to ensure that the phone user can obtain dial-tone even when there are no idle lines available in the rest of the shared-line overlay set. Use a unique ephone-dn in this manner to provide for a unique calling party identity on outbound calls made by the phone so that the called user can see which specific phone is calling.
- Octo-line directory numbers are not supported in button overlay sets.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *phone-tag* [**dual-line**]
4. **number** *number*
5. **preference** *preference-order*
6. **no huntstop** or **huntstop**
7. **huntstop** *channel*
8. **call-forward** *noan*
9. **call-forward** *busy*
10. **exit**
11. **ephone** *phone-tag*
12. **mac-address** *mac-address*
13. **button** *button-number* { **o** | **c** } *dn-tag, dn-tag* [, *dn-tag...*] *button-number* { **x** } *overlay-button-number*
14. **end**

## DETAILED STEPS

## Procedure

|                |                                                                 | <ul style="list-style-type: none"> <li>• <i>dn-tag</i>—Unique identifier previously defined with the <b>ephone-dn</b> command for the ephone-dn to be added to this overlay set.</li> <li>• <i>overlay-button-number</i>—Number of the overlay button that should overflow to this button. Note that the button must have been defined using the <b>o</b> keyword and not the <b>c</b> keyword.</li> </ul> <p><b>Note</b><br/>For other keywords, see the <b>button</b> command in the <a href="#">Cisco Unified Communications Manager Express Command Reference</a>.</p> |
| <b>Step 14</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-ephone)# end | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Verify Overlaid Ephone-dns Configuration on SCCP Phone

### Procedure

**Step 1** Use the **show running-config** command or the **show telephony-service ephone** command to view button assignments.

```
Router# show running-config
```

```
ephone 5
description Cashier1
mac-address 0117.FBC6.1985
type 7960
button 1o4,5,6,200,201,202,203,204,205,206 2x1 3x1
```

**Step 2** Use the **show ephone overlay** command to display the configuration and current status of registered overlay ephone-dns.

**Step 3** Use the **show dialplan number** command to display all the number resolutions of a particular phone number, which allows you to detect whether calls are going to unexpected destinations. This command is useful for troubleshooting cases in which you dial a number but the expected phone does not ring.

# Enable Out-Of-Dialog REFER

## Restriction

- The call waiting, conferencing, hold, and transfer call features are not supported while the Refer-Target is ringing.
- In a SIP to SIP scenario, no ringback is heard by the Referee when Refer-Target is ringing.

## Before you begin

- Cisco Unified CME 4.1 or a later version.
- The application that initiates OOD-R, such as a click-to-dial application, and its directory server must be installed and configured.
- For information on the SIP REFER and NOTIFY methods used between the directory server and Cisco Unified CME, see [RFC 3515](#), The Session Initiation Protocol (SIP) Refer Method.
- For information on the message flow Cisco Unified CME uses when initiating a session between the Referee and Refer-Target, see [RFC 3725](#), Best Current Practices for Third Party Call Control (3pcc).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **sip-ua**
4. **refer-ood enable** [*request-limit*]
5. **exit**
6. **voice register global**
7. **authenticate ood-refer**
8. **authenticate credential** *tag location*
9. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                          | Purpose                                                                                                               |
|---------------|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                     |

|               | Command or Action                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>sip-ua</b><br><b>Example:</b><br><code>Router(config)# sip-ua</code>                                                                                         | Enters SIP user-agent configuration mode to configure the user agent.                                                                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <b>refer-ood enable</b> [ <i>request-limit</i> ]<br><b>Example:</b><br><code>Router(config-sip-ua)# refer-ood enable 300</code>                                 | Enables OOD-R processing. <ul style="list-style-type: none"> <li>• <i>request-limit</i>—Maximum number of concurrent incoming OOD-R requests that the router can process. Range: 1 to 500. Default: 500.</li> </ul>                                                                                                                                                                                |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-sip-ua)# exit</code>                                                                                      | Exits SIP user-agent configuration mode.                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 6</b> | <b>voice register global</b><br><b>Example:</b><br><code>Router(config)# voice register global</code>                                                           | Enters voice register global configuration mode to set global parameters for all supported SIP phones in a Cisco Unified CME or Cisco Unified SRST environment.                                                                                                                                                                                                                                    |
| <b>Step 7</b> | <b>authenticate ood-refer</b><br><b>Example:</b><br><code>Router(config-register-global)# authenticate ood-refer</code>                                         | (Optional) Enables authentication of incoming OOD-R requests using RFC 2617-based digest authentication.                                                                                                                                                                                                                                                                                           |
| <b>Step 8</b> | <b>authenticate credential</b> <i>tag location</i><br><b>Example:</b><br><code>Router(config-register-global)# authenticate credential 1 flash:cred1.csv</code> | (Optional) Specifies the credential file to use for authenticating incoming OOD-R requests. <ul style="list-style-type: none"> <li>• <i>tag</i>—Number that identifies the credential file to use for OOD-R authentication. Range: 1 to 5.</li> <li>• <i>location</i>—Name and location of the credential file in URL format. Valid storage locations are TFTP, HTTP, and flash memory.</li> </ul> |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-register-global)# end</code>                                                                               | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                     |

### What to do next

- If you are configuring Cisco Unified CME for the first time on this router, you are ready to configure system-level parameters. See [Configure System-Level Parameters, on page 172](#).
- If you modified network parameters for an already configured Cisco Unified CME router, you are ready to generate the configuration file to save the modifications. See [Generate Configuration Files for Phones, on page 400](#).

# Verify OOD-R Configuration

## SUMMARY STEPS

1. **show running-config**
2. **show sip-ua status refer-ood**

## DETAILED STEPS

### Procedure

---

#### Step 1 **show running-config**

This command verifies your configuration.

##### Example:

```
Router# show running-config
!
voice register global
mode cme
source-address 10.1.1.2 port 5060
load 7971 SIP70.8-0-1-11S
load 7970 SIP70.8-0-1-11S
load 7961GE SIP41.8-0-1-0DEV
load 7961 SIP41.8-0-1-0DEV
authenticate ood-refer
authenticate credential 1 tftp://172.18.207.15/labtest/cred1.csv
create profile sync 0004550081249644
.
.
.
sip-ua
refer-ood enable
```

#### Step 2 **show sip-ua status refer-ood**

This command displays OOD-R configuration settings.

##### Example:

```
Router# show sip-ua status refer-ood

Maximum allow incoming out-of-dialog refer 500
Current existing incoming out-of-dialog refer dialogs: 1
outgoing out-of-dialog refer dialogs: 0
```

---

## Troubleshooting OOD-R

### Procedure

- 
- Step 1** Use the **debug ccsip messages** command to display the SIP messages exchanged between the SIP UA client and the router.
- Step 2** Use the **debug voip application oodrefer** command to display debugging messages for the OOD-R feature.
- 

## Configuration Examples for Call Coverage Features

### Call Hunt: Examples

#### Example for Setting Ephone-dn Dial-Peer Preference

The following example sets a preference number of 2 for the primary number of ephone-dn 3:

```
ephone-dn 3
 number 3001
 preference 2
```

#### Example for Disabling Huntstop

The following example shows an instance in which huntstop is not desired and is explicitly disabled. In this example, ephone 4 is configured with two lines, each with the same extension number 5001. This is done to allow the second line to provide call waiting notification for extension number 5001 when the first line is in use. Setting **no huntstop** on the first line (ephone-dn 1) allows incoming calls to hunt to the second line (ephone-dn 2) on the same phone when the ephone-dn 1 line is busy.

Ephone-dn 2 has call forwarding set to extension 6000, which corresponds to a locally attached answering machine connected to a foreign exchange station (FXS) voice port. The plain old telephone service (POTS) dial peer for extension 6000 also has the dial-peer huntstop attribute explicitly set to prevent further hunting.

```
ephone-dn 1
 number 5001
 no huntstop
 preference 1
 call-forward noan 6000

ephone-dn 2
 number 5001
 preference 2
 call-forward busy 6000
 call-forward noan 6000

ephone 4
 button 1:1 2:2
 mac-address 0030.94c3.8724
 dial-peer voice 6000 pots
```

```
destination-pattern 6000
huntstop port 1/0/0
description answering-machine
```

## Example for Channel Huntstop

The following is an example that uses the **huntstop channel** command. It shows a dual-line ephone-dn configuration in which calls do not hunt to the second channel of any ephone-dn, but they do hunt through each ephone-dn's channel 1 in this order: ephone-dn 10, ephone-dn 11, ephone-dn 12.

```
ephone-dn 10 dual-line
 number 1001
 no huntstop
 huntstop channel

ephone-dn 11 dual-line
 number 1001
 no huntstop
 huntstop channel
 preference 1

ephone-dn 12 dual-line
 number 1001
 no huntstop
 huntstop channel
 preference 2
```

## Example for SIP Call Hunt

The following example shows a typical configuration in which huntstop is required. The **huntstop** command is enabled and prevents calls to extension 5001 from being rerouted to the on-net H.323 dial peer for 5... when extension 5001 is busy (three periods are used as wild cards).

```
voice register dn 1
 number 5001
 huntstop

voice register pool 4
 number 1 dn 1
 id-mac 0030.94c3.8724

dial-peer voice 5000 voip
 destination-pattern 5...
 session target ipv4:192.168.17.225
```

```
session protocol sipv2
```

## Example for Call Pickup

The following example assigns the line that has an ephone-dn tag of 55 to pickup group 2345:

```
ephone-dn 55
number 2555
pickup-group 2345
```

The following example globally disables directed call pickup and changes the action of the PickUp soft key to perform local group call pickup rather than directed call pickup:

```
telephony-service
no service directed-pickup
```

## Example for Call-Waiting Beep

In the following example, ephone-dn 10 neither accepts nor generates a beep, ephone-dn 11 does not accept a beep, and ephone-dn 12 does not generate a beep:

```
ephone-dn 10
no call-waiting beep
number 4410

ephone-dn 11
no call-waiting beep accept
number 4411

ephone-dn 12
no call-waiting beep generate
number 4412
```

## Example for Call-Waiting Ring

The following example specifies that a short ring will indicate a call is waiting for extension 5533:

```
ephone-dn 20
number 5533
call-waiting ring
```

## Examples for Hunt Group

### Example for Sequential Ephone-Hunt Group

The following example defines a sequential ephone hunt group with the pilot number 5600 and the final number 6000, with three numbers in the list of phones that answer for the pilot number:

```
ephone-hunt 2 sequential
```

```

pilot 5600
list 5621, *, 5623
final 6000
max-timeout 10
timeout 20, 20, 20
fwd-final orig-phone

```

## Example for Peer Ephone-Hunt Group

The following example defines peer ephone hunt group 10 with a pilot number 450, a final number 500, and four numbers in the list. After a call is redirected four times (makes four hops), it is redirected to the final number.

```

ephone-hunt 10 peer
pilot 450
list 451, 452, 453, 477
final 500
max-timeout 10
timeout 3, 3, 3, 3

```

## Example for Longest-idle Ephone-Hunt Group

The following example defines longest-idle ephone hunt group 1 with a pilot number 7501 and 11 numbers in the list. After a call is redirected five times, it is redirected to the final number.

```

ephone-hunt 1 longest-idle
pilot 7501
list 7001, 7002, 7023, 7028, 7045, 7062, 7067, 7072, 7079, 7085, 7099
final 8000
preference 1
hops 5
timeout 20
no-reg

```

## Example for Longest-idle Ephone-Hunt Group Using From-Ring Option

The following example defines longest-idle ephone hunt group 1 with a pilot number 7501, a final number 8000, and 11 numbers in the list. Because the **from-ring** command is used, on-hook time stamps will be recorded when calls ring extensions and when calls are answered. After a call is redirected six times (makes six hops), it is redirected to the final number, 8000. The **max-redirect** command is used to increase the number of redirects that are allowed because the number of hops (six) is larger than the default number of redirects that are allowed in the system (five).

```

ephone-hunt 1 longest-idle
pilot 7501
list 7001, 7002, 7023, 7028, 7045, 7062, 7067, 7072, 7079, 7085, 7099
final 8000
from-ring

```

```
preference 1
hops 6
timeout 20

telephony-service
max-redirect 8
```

## Example for Sequential Hunt Group

In the following parallel hunt-group example, when callers dial extension 1000, extension 1001, 1002, 1003, and 1004 ring simultaneously. The first extension to answer is connected. If none of the extensions answers within 60 seconds, the call is forwarded to extension 2000, which is the number for voice mail.

```
voice hunt-group 4 parallel
final 2000
list 1001,1002,1003,1004
timeout 60
pilot 1000
preference 1 secondary 9
!
!
ephone-dn 1 octo-line
number 1001
!
ephone-dn 2
number 1002
!
ephone-dn 3 dual-line
number 1003
!
ephone-dn 4
number 1004
!
!
ephone 1
max-calls-per-button 4
mac-address 02EA.EAEA.0001
button 1:1
!
!
ephone 2
mac-address 001C.821C.ED23
```

```

button 1:2
!
!
ephone 3
mac-address 002D.264E.54FA
button 1:3
!
!
ephone 4
mac-address 0030.94C3.053E
button 1:4

```

## Example for Preventing Local Call Forwarding in Parallel Voice Hunt-Groups

The following example shows how to prevent the forwarding of local calls to the final destination in parallel voice hunt-group 1:

```

Router# configure terminal
Router(config)# voice hunt-group 1 parallel
Router(config-voice-hunt-group)# no forward local-calls to-final

```

## Example for Associating a Name with a Called Voice Hunt-Group

When incoming call A reaches voice hunt group B and lands on final C, extension C does not show the name of the forwarder because the voice hunt group is not configured to display the name. To display the name of the forwarder and the final number, two separate names are required for the primary and secondary pilot numbers.

### ephone-hunt

The following is a sample output of the **show run** command when the primary and secondary pilot names are configured in ephone-hunt configuration mode:

```

ephone-hunt 10 sequential
pilot 1010 secondary 1020
list 2004, 2005
final 2006
timeout 8, 8
name "EHUNT PRIMARY" secondary "EHUNT SECONDARY"

ephone-hunt 11 peer
pilot 1012 secondary 1022
list 2004, 2005
final 2006
timeout 8, 8
name EHUNT1 secondary EHUNT1-SEC

```

The following is a sample output of the **show ephone-hunt** command when the primary and secondary pilot names are configured in ephone-hunt configuration mode:

```

show ephone-hunt 10
Group 10
type: sequential
pilot number: 1010, peer-tag 20010
pilot name: EHUNT PRIMARY

```

```
secondary number: 1020, peer-tag 20011
secondary name: EHUNT SECONDARY
```

### voice hunt-group

The following example shows how the primary and secondary pilot names are configured in voice hunt-group configuration mode:

```
voice hunt-group 24 parallel
final 097
list 885,886,124,154
timeout 20
pilot 021 secondary 621
name SALES secondary SALES-SECONDARY
```

The following is a sample output of the **show voice hunt-group** command when the primary and secondary pilot names are configured in voice hunt-group configuration mode:

```
show voice hunt-group 1
Group 1
type: parallel
pilot number: 1000, peer-tag 2147483647
secondary number: 2000, peer-tag 2147483646
pilot name: SALES
secondary name: SALES-SECONDARY
list of numbers:
 Member Used-by State Login/Logout
 =====
 2004 2004 up login
 2005 2005 down -
preference: 0
preference (sec): 0
timeout: 180
final_number:
stat collect: no
phone-display: no
```

## Example for Specifying a Description for a Voice Hunt-Group

The following example shows how to specify a description for voice hunt-group 12 using the **description** command and presents the description in the output of the **do show run** command:

```
Router(config)# voice hunt-group 12 parallel
Router (config-voice-hunt-group)# description ?
 LINE description for this hunt group
Router (config-voice-hunt-group)# description specific huntgroup description

Router (config-voice-hunt-group)# do show run | sec voice hunt-group
voice hunt-group 12 parallel
 timeout 0
description specific huntgroup description
```

## Example for Logout Display

In the following example, the description is set to "Marketing Hunt Group." This information will be shown in the configuration output and also on the display of IP phones that are receiving calls from this hunt group. The display-logout message is set to "Night Service," which will be displayed on IP phones that are members of the hunt group when all the members are logged out.

```

ephone-hunt 17 sequential
pilot 3000
list 3011, 3021, 3031
timeout 10
final 7600
description Marketing Hunt Group
display-logout Night Service

```

## Example for Displaying Total Logged-In Time and Total Logged-Out Time for Each Hunt-Group Agent

The following example displays the duration (in sec) since a specific agent logged into and logged out of ephone hunt group 1 from 4:00 a.m. to 5:00 a.m. (0400 to 0500):

```

show ephone-hunt 1 statistics

**Note** The per agent statistics are displayed for both static and dynamic agents.

---

## Example for Dynamic Membership To Ephone-Hunt

The following example creates four ephone-dns and a hunt group that includes the first ephone-dn and two wildcard slots. The last three ephone-dns are enabled for group hunt dynamic membership. Each of them can join and leave the hunt group whenever one of the wildcard slots is available. Standard FACs have been enabled, and the agents use standard FACs to join (\*3) and leave (#3) the hunt group. You can also use the **fac** command to create custom FACs for these actions if you prefer.

```

ephone-dn 22
 number 4566

ephone-dn 24
 number 4568
 ephone-hunt login

ephone-dn 25
 number 4569
 ephone-hunt login

ephone-dn 26

```

```

number 4570

ephone-hunt login

ephone-hunt 1 peer
list 4566,*,*
timeout 10
final 7777

telephony-service
fac standard

```

## Example for Dynamic Membership To Voice Hunt-Group

The following example creates one voice register dn and one voice hunt group which includes two wildcard slots. The voice register dn is enabled for group hunt dynamic membership. The DN can join and unjoin the hunt group whenever one of the wildcard slots is available. Standard FACs have been enabled, and the agents use standard FACs to join (\*3) and unjoin (#3) the hunt group. You can also use the **fac** command to create custom FACs for these actions if you prefer.

```

Voice register dn 1
Number 1001
Voice-hunt-groups login

Voice hunt-group 1 parallel
Pilot number 100
List 1001, 1002, 1003, *, *

```

The following example creates three lines (3 voice register dns and 1 ephone dn) in phones with mixed shared line DNs. Using the three wildcard entries configured, the DNs can join and unjoin the hunt groups. Here, standard FACs have been enabled, and the agents use standard FACs to join (\*3) and unjoin (#4) the hunt group.

```

ephone-dn 1 dual-line
number 1001
shared-line sip
ephone 1
device-security-mode none
mac-address 1111.4444.3301
type 7970

dtmf-relay rtp-nte
username cisco1 password cisco
codec g711ulaw
no vad

```

## Example for Agent Status Control using SCCP Phones

The following example sets up a peer ephone hunt group. It also establishes the appearance and order of soft keys for phones that are configured with ephone-template 7. These phones will have the HLog key available when they are idle, when they have seized a line, or when they are connected to a call. Phones without softkeys can use the standard HLog codes to toggle ready and not-ready status.

```

ephone-hunt 10 peer

pilot 450

list 451, 452, 453, 477

final 500

timeout 45

telephony-service

hunt-group logout HLog

fac standard

ephone-template 7

softkeys connected Endcall Hold Transfer HLog

softkeys idle Newcall Redial Pickup Cfwdall HLog

softkeys seized Endcall Redial Pickup Cfwdall HLog

```

## Example for Agent Status Control using SIP Phones

The following example sets up a peer voice hunt group. It also establishes the appearance and order of soft keys for phones that are configured with voice register template 7. These phones will have the HLog key available when idle, when there is a ringIn, or when connected to a call. Phones without softkeys can use the standard HLog codes to toggle ready and not-ready status.

```

voice hunt-group 10 peer
 pilot 450
 list 451, 452, 453, 477
 final 500
 timeout 45

telephony-service
 hunt-group logout HLog
 fac standard

voice register template 7
 softkeys connected Endcall Hold Transfer HLog
 softkeys idle Newcall Redial Pickup Cfdall HLog
 softkeys ringIn Answer DND iDivert HLog

```

## Example for Automatic Agent Not-Ready for Ephone Hunt Group

The following example enables automatic status change to not-ready after one unanswered hunt group call (the default) for both dynamic and static hunt group members (the default). It also specifies that the phones which are automatically put into the not-ready status should only be blocked from further hunt-group calls and that they should be able to receive calls that directly dial their extensions.

```

ephone-hunt 3 peer
 pilot 4200
 list 1001, 1002, 1003
 timeout 10
 auto logout
 final 4500

telephony-service
 hunt-group logout HLog

```

The following example enables automatic status change to not-ready after two unanswered hunt group calls for any ephone-dn that dynamically logs in to the hunt group using the wildcard slot in the hunt group list. Phones that are automatically placed in the not-ready status when they do not answer two hunt-group calls are also placed into DND status (they will also not accept directly dialed calls).

```

ephone-hunt 3 peer
 pilot 4200
 list 1001, 1002, *
 timeout 10
 auto logout 2 dynamic
 final 4500

telephony-service
 hunt-group logout DND

```

## Example for Automatic Agent Not-Ready for Voice Hunt Group

In the following example, voice hunt-group 1 is configured to permit automatic logout. If hunt group calls that are presented to 1001, 1002, 1003, and 1004 are unanswered (that is, if they ring longer than 40 seconds each), voice register pool 1, voice register pool 2, ephone 1, and ephone 2 are automatically logged out. All unanswered calls are sent to DN 5000.

```

Router(config)# voice register dn 1
Router(config-register-dn)# number 1001
Router(config)# voice register dn 2
Router(config-register-dn)# number 1002

Router(config)# ephone-dn 1

## Example for Night Service on SCCP Phones

The following example provides night service before 8 a.m. and after 5 p.m. Monday through Friday, before 8 a.m. and after 1 p.m. on Saturday, and all day Sunday. Extension 1000 is designated as a night-service extension. Incoming calls to extension 1000 during the night-service period ring on extension 1000 and provide night-service notification to phones that are designated as night-service phones. In this example, the night-service phones are ephone 14 and ephone 15. The night-service notification consists of a single ring on the phone and a display of “Night Service 1000.” A night-service toggle code has been configured, \*6483 (\*NITE), by which a phone user can activate or deactivate night-service conditions during the hours of night service.

```
telephony-service
 night-service day mon 17:00 08:00
 night-service day tue 17:00 08:00
 night-service day wed 17:00 08:00
 night-service day thu 17:00 08:00
 night-service day fri 17:00 08:00
 night-service day sat 13:00 12:00
 night-service day sun 12:00 08:00
 night-service code *6483

## Example for Night Service on SIP Phones

The following example provides night service everyday before 10:00 am and after 7:00 pm. Incoming calls to extension 3000 during the night-service period ring on extension 3000 and provide night-service notification to phones that are designated as night-service phones. In this example, the night-service phones are pool 2 and pool 3. The night-service notification consists of a single ring on the phone and a display of “Night Service 3000.” A night-service toggle code has been configured, \*8765 (\*NITE), by which a phone user can activate or deactivate night-service conditions during the hours of night service.

```
telephony-service
night-service everyday 19:00 10:00
night-service code *8765

```

## Examples for Overlaid Ephone-dns

### Example for Overlaid Ephone-dn

The following example creates three lines (ephone-dns) that are shared across three IP phones to handle three simultaneous calls to the same telephone number. Three instances of a shared line with the extension number 1001 are overlaid onto a single button on each of three phones. A typical call flow is as follows. The first call goes to ephone 1 (highest preference) and rings button 1 on all three phones (huntstop is off). The call is answered on ephone 1. A second call to extension 1001 hunts onto ephone-dn 2 and rings on the two remaining ephones, 11 and 12. The second call is answered by ephone 12. A third simultaneous call to extension 1001 hunts onto ephone-dn 3 and rings on ephone 11, where it is answered. Note that the no huntstop command is

used to allow hunting for the first two ephone-dns, and the **huntstop** command is used on the final ephone-dn to stop call-hunting behavior. The **preference** command is used to create different selection preferences for each ephone-dn.

```
ephone-dn 1
 number 1001
 no huntstop
 preference 0

ephone-dn 2
 number 1001
 no huntstop
 preference 1

ephone-dn 3
 number 1001
 huntstop
 preference 2

ephone 10
 button 101,2,3
 ephone 11
 button 101,2,3

ephone 12
 button 101,2,3
```

### Example for Overlaid Dual-Line Ephone-dn

The following example shows how to overlay dual-line ephone-dns. In addition to using the **huntstop** and **preference** commands, you must use the **huntstop channel** command to prevent calls from hunting to the second channel of an ephone-dn. This example overlays five ephone-dns on button 1 on five different ephones. This allows five separate calls to the same number to be connected simultaneously, while occupying only one button on each phone.

```
ephone-dn 10 dual-line
 number 1001
 no huntstop
 huntstop channel
 preference 0

ephone-dn 11 dual-line
 number 1001
 no huntstop
 huntstop channel
 preference 1

ephone-dn 12 dual-line
 number 1001
 no huntstop
 huntstop channel
 preference 2
```

## Example for Shared-line Overlaid Ephone-dns

```

ephone-dn 13 dual-line
 number 1001
 preference 3
 no huntstop
 huntstop channel

ephone-dn 14 dual-line

 button 1010,11,12,13,14

ephone 36
 mac 0111.9c87.3586
 button 1010,11,12,13,14

ephone 37
 mac 01a4.8222.3911
 button 1010,11,12,13,14

```

## Example for Shared-line Overlaid Ephone-dns

The following is an example of a unique ephone-dn as the primary dn in a simple shared-line overlay configuration. The **no huntstop** command is configured for all the ephone-dns except ephone-dn 12, the last one in the overlay set. Because the ephone-dns are dual-line dns, the **huntstop-channel** command is also configured to ensure that the second channel remains free for outgoing calls and for conferencing.

```

ephone-dn 1 dual-line
 number 101
 huntstop-channel

```

```

!
ephone-dn 2 dual-line
 number 102
 huntstop-channel
!
ephone-dn 10 dual-line

 no huntstop
 huntstop-channel
!
ephone-dn 12 dual-line
 number 201
 huntstop-channel
!
!The following ephone configuration includes (unique) ephone-dn 1 as the primary line in a
 shared-line overlay
ephone 1
 mac-address 1111.1111.1111
 button 1o1,10,11,12
!
!The next ephone configuration includes (unique) ephone-dn 2 as the primary line in another
 shared-line overlay
!
ephone 2
 mac-address 2222.2222.2222
 button 1o2,10,11,12

```

### Example for Overlaid Ephone-dn with Call Waiting

In following example, button 1 on ephone 1 though ephone 3 uses the same set of overlaid ephone-dns with call waiting that share the number 1111. The button also accept calls to each ephone's unique (nonshared) ephone-dn number. Note that if ephone-dn 10 and ephone-dn 11 are busy, the call will go to ephone-dn 12. If ephone-dn 12 is busy, the call will go to voice mail.

```

ephone-dn 1 dual-line
 number 1001

ephone-dn 2 dual-line
 number 1001

```

**Example for Overlaid Ephone-dns with Rollover Buttons**

```

ephone-dn 3 dual-line
 number 1001

ephone-dn 10 dual-line
 number 1111
 no huntstop

ephone-dn 11 dual-line
 number 1111
 preference 1
 no huntstop
 huntstop channel
 call-forward noan 7000 timeout 30

ephone-dn 12 dual-line
 number 1111
 preference 2
 huntstop channel
 call-forward noan 7000 timeout 30
 call-forward busy 7000

ephone 1
 button 1c1,10,11,12

ephone 2
 button 1c2,10,11,12

ephone 3
 button 1c3,10,11,12

```

**Example for Overlaid Ephone-dns with Rollover Buttons**

The following example configures a “3x3” shared-line setup for three ephones and nine shared lines (ephone-dns 20 to 28). Each ephone has a unique ephone-dn for each of its three buttons (ephone-dns 11 to 13 on ephone 1, ephone-dns 14 to 16 on ephone 2, and ephone-dns 17 to 19 on ephone 3). The rest of the ephone-dns are shared among the three phones. Three phones with three buttons each can take nine calls. The overflow buttons provide the ability for an incoming call to ring on the first available button on each phone.

```

ephone-dn 11
 number 2011

```

```
ephone-dn 12
 number 2012

ephone-dn 13
 number 2013

ephone-dn 14
 number 2014
.
.
.
ephone-dn 28
 number 2028

ephone 2
 button 1014,15,16,20,21,22,23,24,25,26,27,28 2x1 3x1

ephone 3
 button 1017,18,19,20,21,22,23,24,25,26,27,28 2x1 3x1
```

### Example for Called-Name Display for Voice Hunt Group

The Called-Name Display feature supports the display of the name associated with a called number for incoming calls to IP phones configured on Unified CME. For an example of Called-Name Display for Voice Hunt Group calls, see [Example for Called-Name Display for Voice Hunt Group, on page 670](#).

### Example for Called Directory Name Display for Overlaid Ephone-dns

The following example demonstrates the display of a directory name for a called ephone-dn that is part of an overlaid ephone-dn set. For configuration information, see [Directory Services, on page 657](#).

This configuration of overlaid ephone-dns uses wildcards in the secondary numbers for the ephone-dns. Wildcards allow you to control the display according to the number that was dialed. The example is for a medical answering service with three IP phones that accept calls for nine doctors on one button. When a call to 5550101 rings on button 1 on phone 1 to phone 3, “doctor1” is displayed on all three phones.

```
telephony-service
 service dnis dir-lookup
 directory entry 1 5550101 name doctor1
 directory entry 2 5550102 name doctor2
 directory entry 3 5550103 name doctor3
 directory entry 4 5550110 name doctor4
```

## Example for Called Directory Name Display for Overlaid Ephone-dns

```

directory entry 5 5550111 name doctor5
directory entry 6 5550112 name doctor6
directory entry 7 5550120 name doctor7
directory entry 8 5550121 name doctor8
directory entry 9 5550122 name doctor9

ephone-dn 1
 number 5500 secondary 555000.
ephone-dn 2
 number 5501 secondary 555001.
ephone-dn 3
 number 5502 secondary 555002.

ephone 1
 button 101,2,3
 mac-address 1111.1111.1111
ephone 2
 button 101,2,3
 mac-address 2222.2222.2222
ephone 3
 button 101,2,3
 mac-address 3333.3333.3333

```

The following example shows a hunt-group configuration for a medical answering service with two phones and four doctors. Each phone has two buttons, and each button is assigned two doctors' numbers. When a patient calls 5550341, Cisco Unified CME matches the hunt-group pilot secondary number (555.....), rings button 1 on one of the two phones, and displays "doctor1." For more information about hunt-group behavior, see [Hunt Groups, on page 1231](#). Note that wildcards are used only in secondary numbers and cannot be used with primary numbers.

```

telephony-service
 service dnis dir-lookup
 max-redirect 20

 directory entry 1 5550341 name doctor1
 directory entry 2 5550772 name doctor1
 directory entry 3 5550263 name doctor3
 directory entry 4 5550150 name doctor4

ephone-dn 1
 number 1001
ephone-dn 2
 number 1002
ephone-dn 3
 number 1003
ephone-dn 4
 number 104

```

```
ephone 1
 button 1o1,2
 button 2o3,4
 mac-address 1111.1111.1111
ephone 2
 button 1o1,2
 button 2o3,4
 mac-address 2222.2222.2222
ephone-hunt 1 peer
 pilot 5100 secondary 555....
 list 1001, 1002, 1003, 1004
 final number 5556000
 hops 5
 preference 1
 timeout 20
 no-reg
```

### Example for Called Ephone-dn Name Display for Overlaid Ephone-dns

The following example demonstrates the display of the name assigned to the called ephone-dn using the **name** command. For information about configuring this feature, see [Directory Services, on page 657](#).

In this example, three phones have button 1 assigned to pick up three shared 800 numbers for three different catalogs.

The default display for the phones is the number of the first ephone-dn listed in the overlay set (18005550100). A call is made to the first ephone-dn (18005550100), and the caller ID (for example, 4085550123) is visible on all phones. The user for phone 1 answers the call. The caller ID (4085550123) remains visible on phone 1, and the displays on phone 2 and phone 3 return to the default display (18005550100). A call to the second ephone-dn (18005550101) is made. The default display on phone 2 and phone 3 is replaced with the called ephone-dn's name (catalog1) and number (18005550101).

```
telephony-service
 service dnis overlay
ephone-dn 1
 number 18005550100
ephone-dn 2
 name catalog1
 number 18005550101
ephone-dn 3
 name catalog2
 number 18005550102
ephone-dn 4
 name catalog3
 number 18005550103
```

## Example for OOD-R

```
ephone 1
 button 101,2,3,4
ephone 2
 button 101,2,3,4
ephone 3
 button 101,2,3,4
```

## Example for OOD-R

```

## Where to Go Next

### Dial-Peer Call Hunt and Hunt Groups

Dial peers other than ephone-dn dial peers can be directly configured as hunt groups or rotary groups, in which multiple dial peers can match incoming calls. (These are not the same as Cisco Unified CME ephone hunt groups.) For more information, see the “Hunt Groups” section of the [Dial Peers Features and Configuration](#) chapter of [Dial Peer Configuration on Voice Gateway Routers](#).

### Called-Name Display

This feature allows you to specify that the name of the called party, rather than the number, should be displayed for incoming calls. This feature is very helpful for agents answering calls for multiple ephone-dns that appear on a single line button in an ephone-dn overlay set. For more information, see [Directory Services, on page 657](#).

### Soft Key Control

If the **hunt-group logout** command is used with the **HLog** keyword, the HLog soft key appears on phones during the idle, connected, and seized call states. The HLog soft key is used to toggle an agent from the ready to not-ready status or from the not-ready to ready status. To move or remove the HLog soft key on one or more phones, create and apply an ephone template that contains the appropriate **softkeys** commands.

From Unified CME Release 11.6 onwards, HLog keyword is supported with the **hunt-group logout** command configured under telephony service. On SIP phone, HLog softkey appears on phone for idle, ringIn, and connected state.

For more information, see [Customize Softkeys, on page 919](#).

### Feature Access Codes (FACs)

Dynamic membership allows agents at authorized ephones to join or leave a hunt group using a feature access code (FAC) after standard or custom FACs are enabled.

In Cisco Unified CME 4.0 and later versions, you can activate call pickup using a feature access code (FAC) instead of a soft key when standard or custom FACs have been enabled for your system. The following are the standard FACs for call pickup:

- Pickup group—Dial the FAC and a pickup group number to pick up a ringing call in a different pickup group than yours. Standard FAC is \*\*4.
- Pickup local—Dial the FAC to pick up a ringing call in your pickup group. Standard FAC is \*\*3.
- Pickup direct—Dial the FAC and the extension number to pick up a ringing call at any extension. Standard FAC is \*\*5.

For more information about FACs, see [Feature Access Codes, on page 751](#).

### Controlling Use of the Pickup Soft Keys

To block the functioning of the group pickup (GPickUp) or local pickup (Pickup) soft key without removing the key display, create and apply an ephone template that contains the **features blocked** command. For more information, see [Configure Call Blocking, on page 1052](#).

To remove the group pickup (GPickUp) or local pickup (Pickup) soft key from one or more phones, create and apply an ephone template that contains the appropriate **softkeys** command. For more information, see [Customize Softkeys, on page 919](#).

### Ephone-dn Templates

The **ephone-hunt login** command authorizes an ephone-dn to dynamically join and leave an ephone hunt group. It can be included in an ephone-dn template that is applied to one or more individual ephone-dns. For more information, see [Templates, on page 1423](#).

### Ephone Hunt Group Statistics Reports

Several different types of statistics can help you track whether your current ephone hunt groups are meeting your call coverage needs. These statistics can be displayed on-screen or written to files.

For more information, see the [Cisco Unified CME Basic Automatic Call Distribution and Auto-Attendant Service](#) chapter in [Cisco Unified CME B-ACD and Tcl Call-Handling Applications](#).

### Voice Hunt Group Statistics Reports

The **hunt-group statistics write-all** command writes all the ephone and voice hunt group statistics to a file.

The **hunt-group statistics write-v2** command writes all the ephone and voice hunt group statistics to a file, along with total logged in and logged out time for agents.

The **statistics collect** command enables the collection of call statistics for a voice hunt group.

The **show telephony-service all** command displays the total number of ephone and voice hunt groups that have statistics collection turned on.

The **show voice hunt-group statistics** command displays call statistics from voice hunt groups.

For more information, see [Cisco Unified Communications Manager Express Command Reference](#).

### Do Not Disturb

The Do Not Disturb (DND) feature can be used as an alternative to the HLog function for preventing incoming calls from ringing on a phone. The difference is that HLog prevents only hunt group calls from ringing, while DND prevents all calls from ringing. For more information, see [Do Not Disturb, on page 677](#).

### Automatic Call Forwarding During Night-Service

To have an ephone-dn forward all its calls automatically during night-service hours, use the **call-forward night-service** command. For more information, see [Enable Call Forwarding for a Directory Number, on page 1167](#).

### Ephone Templates

The **night-service bell** command specifies that a phone will receive night-service notification when calls are received at ephone-dns configured as night-service ephone-dns. This command can be included in an ephone template that is applied to one or more individual ephones.

For more information, see [Templates, on page 1423](#).

## Feature Information for Call Coverage Features

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 109: Feature Information for Call Coverage**

| Feature Name | Cisco Unified CME version | Modification                                                                                                                             |
|--------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Call Hunt    | 3.4                       | Added support for configuring call hunt features on SIP IP phones connected directly to Cisco Unified CME.                               |
|              | 3.0                       | <ul style="list-style-type: none"> <li>• Preference for secondary numbers was introduced.</li> <li>• Huntstop was introduced.</li> </ul> |
|              | 1.0                       | <ul style="list-style-type: none"> <li>• Ephone-dn dial-peer preference was introduced.</li> <li>• Huntstop was introduced.</li> </ul>   |

| Feature Name             | Cisco Unified CME version | Modification                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call Pickup              | 7.1                       | Added Call Pickup support for SIP phones.                                                                                                                                                                                                                                                                                                                                           |
|                          | 4.0                       | <ul style="list-style-type: none"> <li>• The ability to globally disable directed call pickup was introduced.</li> <li>• Feature access codes for call pickup were introduced.</li> <li>• The ability to block call pickup on individual phones was introduced.</li> </ul>                                                                                                          |
|                          | 3.2                       | The ability to remove or rearrange soft keys on individual phones was introduced.                                                                                                                                                                                                                                                                                                   |
|                          | 3.0                       | Call pickup groups were introduced.                                                                                                                                                                                                                                                                                                                                                 |
| Call Waiting             | 8.0                       | Added Cancel Call Waiting feature.                                                                                                                                                                                                                                                                                                                                                  |
|                          | 3.4                       | Added support for configuring call waiting for SIP phones directly connected to Cisco Unified CME.                                                                                                                                                                                                                                                                                  |
| Callback Busy Subscriber | 3.0                       | Callback busy subscriber was introduced.                                                                                                                                                                                                                                                                                                                                            |
| Hunt Groups              | 12.2                      | Introduced support for Shared Lines and Mixed Shared Lines (SIP and SCCP phones) on Parallel, Sequential, Peer, and Longest Idle Voice Hunt Groups.                                                                                                                                                                                                                                 |
|                          | 7.0/4.3                   | <p>Added support for the following:</p> <ul style="list-style-type: none"> <li>• SCCP phones in Voice Hunt-Groups</li> <li>• Call Forwarding to a Parallel Voice Hunt-Group (Blast Hunt Group)</li> <li>• Call Transfer to a Voice Hunt-Group</li> <li>• Member of Voice Hunt-Group can be a SCCP phone, FXS analog phone, DS0-group, PRI-group, SIP phone, or SIP trunk</li> </ul> |

| Feature Name | Cisco Unified CME version | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                           | <p>Added support for the following on IP phones running SCCP:</p> <ul style="list-style-type: none"> <li>• Maximum number of hunt groups in a system was increased from 20 to 100 and maximum number of agents in a hunt group was increased from 10 to 20.</li> <li>• Maximum number of hops automatically adjusts to the number of agents.</li> <li>• A description can be added to phone displays and configuration output to provide hunt group information associated with ringing and answered calls.</li> <li>• A configurable message can be displayed on agent phones when all agents are in the not-ready status to advise the destination to which calls are being forwarded or other useful information.</li> <li>• No-answer timeouts can be set individually for each ephone-dn in the list and a cumulative no-answer timeout can be set for all ephone-dns.</li> <li>• Automatic logout trigger criterion was changed from exceeding the specified timeout to exceeding the specified number of calls. The name of this feature was changed from automatic logout to automatic agent status not-ready.</li> <li>• Dynamic hunt group membership is introduced. Agents can join and leave hunt groups whenever a wildcard slot is available.</li> <li>• Agent status control using an HLog soft key or feature</li> </ul> |

| Feature Name | Cisco Unified CME version | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                           | <p>access code (FAC) is introduced. Agents can put their lines into not-ready state to temporarily block hunt group calls without relinquishing their slots in group.</p> <ul style="list-style-type: none"> <li>• Calls can be blocked from agent phones that are not idle or on hook.</li> <li>• Calls that are not answered by the hunt group can be returned to the party who transferred them into the huntgroup.</li> <li>• Calls parked by hunt group agents can be returned to a different entry point.</li> <li>• (Sequential hunt groups only) Local calls to a hunt group can be restricted so that they will not be forwarded past the initial agent that is rung.</li> <li>• (Longest-idle hunt groups only) A new command, the <b>from-ring</b> command, specifies that on-hook time stamps should be updated when a call rings an agent and when a call is answered by an agent.</li> </ul> |
|              | 3.4                       | Added support for configuring hunt groups for SIP phones directly connected to Cisco Unified CME.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|              | 3.2.1                     | <ul style="list-style-type: none"> <li>• Maximum number of hunt groups in a system was increased to 20.</li> <li>• Automatic logout capability was introduced.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|              | 3.2                       | Longest-idle hunt groups were introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|              | 3.1                       | Secondary pilot numbers were introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Feature Name  | Cisco Unified CME version | Modification                                                                                                                                                                                                                                                                                        |
|---------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | 3.0                       | Peer and sequential ephone hunt groups were introduced.                                                                                                                                                                                                                                             |
| Night Service | 11.6                      | Night service support for mixed deployment of SIP and SCCP phone was introduced.                                                                                                                                                                                                                    |
|               | 11.5                      | Night service support for SIP phone was introduced.                                                                                                                                                                                                                                                 |
|               | 4.0                       | The <b>night-service everyday</b> , <b>night-service weekday</b> , and <b>night-service weekend</b> commands were introduced.                                                                                                                                                                       |
|               | 3.3                       | The behavior of the night-service code was changed. Previously, using the night-service code at a phone either enabled or disabled night service for the ephone-dns on that phone. Now, using the night-service code at a phone enables or disables night service for all night-service ephone-dns. |
|               | 3.0                       | Night service was introduced.                                                                                                                                                                                                                                                                       |

| Feature Name                                 | Cisco Unified CME version | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Overlaid Ephone-dns                          | 4.0                       | <ul style="list-style-type: none"> <li>The number of ephone-dns that can be overlaid on a single button using the <b>button</b> command and the o or c keyword was increased from 10 to 25.</li> <li>The ability to extend calls for overlaid ephone-dns to other buttons (rollover buttons) on the same phone was introduced. Rollover buttons are created by using the x keyword with the <b>button</b> command.</li> <li>The number of waiting calls that can be displayed for overlaid ephone-dns that have call waiting configured has been increased to six for the following phone types: Cisco Unified IP Phone 7940G, 7941G, 7941G-GE, 7960G, 7961G, 7961G-GE, 7970G, and 7971G-GE.</li> </ul> |
|                                              | 3.2.1                     | Call waiting for overlaid ephone-dns was introduced and the c keyword was added to the <b>button</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                              | 3.0                       | Overlaid ephone-dns were introduced and the o keyword was added to the <b>button</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| All Agents Logged Out Message for VHG Phones | 12.2                      | Introduced support for all agents logged out display message for Cisco IP Phone 8800 Series on Cisco 4000 Series Integrated Services Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Agent Status Control                         | 12.2                      | Agent Status Control enhancements was supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Feature Name                                                                        | Cisco Unified CME version | Modification                                                                                                                                                                      |
|-------------------------------------------------------------------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Voice Hunt Group Enhancements                                                       | 11.6                      | Hlog Softkey support for SIP Phones was introduced.                                                                                                                               |
|                                                                                     | 9.0                       | Allows all ephone and voice hunt group call statistics to be written to a file using the <b>hunt-group statistics write-all</b> command.                                          |
| Preventing Local-Call Forwarding to Final Agent in Voice Hunt Groups                | 9.5                       | The <b>no forward local-calls</b> command was introduced in ephone-hunt group to prevent a local call from being forwarded to the next agent.                                     |
| Enhancement of Support for Hunt Group                                               | 9.5                       | Hunt group agent statistics of Cisco Unified SCCP IP phones is enhanced to include Total logged in time and Total logged out.                                                     |
| Total Logged in and Logged out Time Statistics for agent                            | 9.5                       | Allows all ephone hunt call statistics to be written to a file along with total logged in and logged out time for agents using the <b>hunt-group statistics write-v2</b> command. |
| Enhancement of Support for Total Logged in and Logged out Time Statistics for Agent | 11.5                      | Allows all voice hunt call statistics to be written to a file along with total logged in and logged out time for agents using the <b>hunt-group statistics write-v2</b> command.  |
| Out-of-Dialog Refer                                                                 | 4.1                       | Out-of-Dialog REFER support was added.                                                                                                                                            |

## CHAPTER 45

# Caller ID Blocking

---

- [Restrictions for Caller ID Blocking, on page 1353](#)
- [Information About Caller ID Blocking, on page 1353](#)
- [Configure Caller ID Blocking, on page 1354](#)
- [Configuration Examples for Caller ID Blocking, on page 1357](#)
- [Feature Information for Caller ID Blocking, on page 1358](#)

## Restrictions for Caller ID Blocking

Caller ID blocking on outbound calls does not apply to PSTN calls through foreign exchange office (FXO) ports. Caller ID features on FXO-connected subscriber lines are under the control of the PSTN service provider, who may require you to subscribe to their caller ID blocking service.

## Information About Caller ID Blocking

### Caller ID Blocking on Outbound Calls

Phone users can block caller-ID displays on calls from a particular ephone-dn, or you can selectively choose to block the name or number on outbound calls from a particular dial peer.

The display of caller ID information for outgoing calls from a particular ephone-dn can be blocked on a per-call basis, allowing users to maintain their privacy when necessary. The system administrator defines a code for caller ID blocking in Cisco Unified CME. Users then dial the code before making any call on which they do not want their number displayed on the called-party phone. The caller ID is sent, but its presentation parameter is set to “restricted” so that the caller ID is not displayed.

Blocking CLID displays for local calls from a particular extension tells the far-end gateway device to block display of calling-party information for the calls received from this ephone-dn.

Alternatively, you can allow the local display of CLID information and independently block the CLID name or number on outbound VoIP calls. This configuration has the benefit of allowing caller-ID display for local calls while preventing caller-ID display for external calls going over VoIP. This feature can be used for PSTN calls that go out over ISDN.

# Configure Caller ID Blocking

## Block Caller ID For All Outbound Calls on SCCP Phones

To block the CLID name or number on outbound VoIP calls from a particular dial peer, perform the following steps.

### Restriction

- Caller ID continues to be displayed for local calls. To block caller ID display on all outbound calls from a particular directory number, use the **caller-id block** command. See [Block Caller ID From a Directory Number on SCCP Phones, on page 1355](#) or [Verify Caller ID Blocking, on page 1356](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice tag [pots | voip]**
4. **clid strip**
5. **clid strip name**
6. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                     | Purpose                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                    | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                            | Enters global configuration mode.                                                                                                                                                             |
| <b>Step 3</b> | <b>dial-peer voice tag [pots   voip]</b><br><b>Example:</b><br>Router(config)# dial-peer voice 3 voip | Enters dial-peer configuration mode.<br><b>Note</b><br>You can configure caller-ID blocking on POTS dial peers if the POTS interface is ISDN. This feature is not available on FXO/CAS lines. |
| <b>Step 4</b> | <b>clid strip</b><br><b>Example:</b><br>Router(config-dial-peer)# clid strip                          | (Optional) Removes the calling-party number from the CLID information being sent with VoIP calls.                                                                                             |

|               | Command or Action                                                                      | Purpose                                                                                         |
|---------------|----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>clid strip name</b><br><b>Example:</b><br>Router(config-dial-peer)# clid strip name | (Optional) Removes the calling-party name from the CLID information being sent with VoIP calls. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-dial-peer)# end                         | Returns to privileged EXEC mode.                                                                |

## Block Caller ID From a Directory Number on SCCP Phones

To define a code that phone users can dial to block caller ID display on selected outbound calls from a particular directory number or to block caller ID display on all calls from a directory number, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **caller-id block code** *code-string*
5. **exit**
6. **ephone-dn** *dn-tag*
7. **caller-id block**
8. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                | Purpose                                                                                                               |
|---------------|----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal       | Enters global configuration mode.                                                                                     |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service | Enters telephony-service configuration mode.                                                                          |

|               | Command or Action                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>caller-id block code</b> <i>code-string</i><br><b>Example:</b><br>Router(config-telephony)# caller-id block code *1234 | (Optional) Defines a code that users can enter before making calls on which the caller ID should not be displayed. <ul style="list-style-type: none"> <li><i>code-string</i>—Digit string of up to 16 characters. The first character must be an asterisk (*).</li> </ul>                                                                 |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-telephony)# exit                                                          | Exits telephony-service configuration mode.                                                                                                                                                                                                                                                                                               |
| <b>Step 6</b> | <b>ephone-dn</b> <i>dn-tag</i><br><b>Example:</b><br>Router(config)# ephone-dn 3                                          | Enters ephone-dn configuration mode.                                                                                                                                                                                                                                                                                                      |
| <b>Step 7</b> | <b>caller-id block</b><br><b>Example:</b><br>Router(config-ephone-dn)# caller-id block                                    | (Optional) Blocks display of caller-ID information for all outbound calls that originate from this directory number.<br><br>This command can also be configured in ephone-dn-template configuration mode and applied to one or more directory number. The ephone-dn configuration has priority over the ephone-dn-template configuration. |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-dial-peer)# end                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                          |

## Verify Caller ID Blocking

### Procedure

Use the **show running-config** command to display caller ID blocking parameters, which may appear in the telephony-service, ephone-dn, or dial-peer portions of the output.

#### Example:

```
Router# show running-config

dial-peer voice 450002 voip
 translation-profile outgoing 457-456
 destination-pattern 457
 session target ipv4:10.43.31.81
 dtmf-relay h245-alphanumeric
 codec g711ulaw
 no vad
 clid strip
!
telephony-service
 fxo hook-flash
```

```

load 7960-7940 P00305000600
load 7914 S00103020002
max-ephones 100
max-dn 500
ip source-address 10.115.34.131 port 2000
max-redirect 20
no service directed-pickup
timeouts ringing 10
system message XYZ Company
voicemail 7189
max-conferences 8 gain -6
moh music-on-hold.au
caller-id block code *1234
web admin system name cisco password cisco
dn-webedit
time-webedit
transfer-system full-consult
transfer-pattern 92.....
transfer-pattern 91.....
transfer-pattern 93.....

transfer-pattern 95.....
transfer-pattern 96.....
transfer-pattern 97.....
transfer-pattern 98.....
transfer-pattern .T
secondary-dialtone 9
after-hours block pattern 1 91900 7-24
after-hours block pattern 2 9976 7-24
!
create cnf-files version-stamp 7960 Jul 13 2004 03:39:28
!
ephone-dn 2 dual-line
number 126
preference 1
call-forward busy 500
caller-id block

```

## Configuration Examples for Caller ID Blocking

### Example for Configuring Caller ID Blocking Code

The following example defines a code of \*1234 for phone users to enter to block caller ID on their outgoing calls:

```

telephony-service
caller-id block code *1234

```

### Example for Configuring Caller ID Blocking for Outbound Calls from a Directory Number on SCCP Phones

The following example sets CLID blocking for the ephone-dn with tag 3.

```
ephone-dn 3
 number 2345
 caller-id block
```

The following example blocks the display of CLID name and number on VoIP calls but allows CLID display for local calls:

```
ephone-dn 3
 number 2345
 dial-peer voice 2 voip
 clid strip
 clid strip name
```

# Feature Information for Caller ID Blocking

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

Table 110: Feature Information for Caller ID Blocking

| Feature Name       | Cisco Unified CME Version | Feature Information                                   |
|--------------------|---------------------------|-------------------------------------------------------|
| Caller ID Blocking | 3.0                       | Caller ID blocking per local call was introduced.     |
|                    | 1.0                       | Caller ID blocking for outbound calls was introduced. |

## CHAPTER 46

# Conferencing

---

- [Information About Conferencing, on page 1359](#)
- [Types of Conference, on page 1359](#)

- [Configure Software Conferencing, on page 1372](#)
- [Configure Hardware Conferencing, on page 1377](#)
- [Verify Conferencing, on page 1392](#)
- [Configuration Examples for Conferencing, on page 1395](#)
- [Where to Go Next, on page 1421](#)
- [Feature Information for Conferencing, on page 1421](#)

## Information About Conferencing

Conferencing allows three or more parties to join a telephone conversation. Unified CME offers conferencing functionality for the Unified phones and endpoints that it supports. Unified CME supports conferencing across the SIP and SCCP protocols. Also, the platforms Cisco Integrated Services Router Generation 2 and Cisco 4000 Series Integrated Services Routers support conferencing in Unified CME.

---

**Note** Cisco Cloud Services Routers (CSR) do not support DSP resources. As DSP resources are mandatory to support hardware conferencing in Unified CME, you cannot host hardware conferences in a CSR router.

---

## Types of Conference

Based on the conferencing method, conferencing in Unified CME is of two types:

- [Hardware Conferencing](#)—Conferencing based on the Unified CME hardware and DSP resources. The types of hardware conferencing in Unified CME include:
  - Ad Hoc Hardware Conference
  - Meet Me Conference.

- Connected Conference
- **Software Conferencing**—Software Conferencing is a three party conference that is hosted on the phone or on Unified CME. The types of software conferencing in Unified CME include:
  - Ad Hoc Software or Built-in Bridge (BIB) Conference (Supported on Unified IP Phones such as Cisco IP Phone 7800 Series and 8800 Series).
  - Three-Party Software Conference (For Unified CME, the support is only on Cisco Integrated Services Router Generation 2. For Cisco 4000 Series Integrated Service Routers, support is only for Unified SRST.)

The following table provides details on the support for various conferencing types in Unified CME:

**Table 111: Types of Conference and Support in Unified CME**

| Conferencing Feature            | Hardware-based                                        |                                                           | Software-based (Built-in Bridge) |                                           | Max Participants                                                                                       |
|---------------------------------|-------------------------------------------------------|-----------------------------------------------------------|----------------------------------|-------------------------------------------|--------------------------------------------------------------------------------------------------------|
|                                 | SIP                                                   | SCCP                                                      | SIP                              | SCCP                                      |                                                                                                        |
| Ad Hoc                          | Yes                                                   | Yes                                                       | Yes                              | No (Except 8900 Series Unified IP Phones) | <ul style="list-style-type: none"> <li>• Ad Hoc (Hardware)—8</li> <li>• Ad Hoc (Software)—3</li> </ul> |
| Meet Me                         | Yes                                                   | Yes                                                       | No                               | No                                        | 32                                                                                                     |
| Connected                       | Yes (Only for 7800 and 8800 Series Unified IP Phones) | Yes (Supported as Select and Join functionality for SCCP) | No                               | No                                        | 8                                                                                                      |
| Three-party Software Conference | No                                                    | No                                                        | No                               | Yes                                       | 3                                                                                                      |

**Note** Three-party software conference is supported only on Cisco Integrated Services Router Generation 2 for Unified CME. Cisco 4000 Series Integrated Services Routers supports three-party software conference only for Unified SRST.

## Hardware Conference

In a hardware-based conference, the conference is established using the hardware resources of a Unified CME system. This includes the routers and the Digital Signal Processors (DSPs.) From Unified CME Release 11.7, Cisco 4000 Series Integrated Services Routers support hardware conferencing.

Hardware-based conferencing uses the DSP resources in a router to perform audio mixing. The DSP resources used for conferencing take care of transcoding, and not just audio mixing. The participants of the conference can be IP phones that are connected to Unified CME or external callers. The external callers are the participants who join the conference call over TDM or SIP trunks. You must configure the DSP resources in a DSP farm for conferencing. Also, the DSP resources that are required for conferencing varies based on the codec complexity. For more information, see [Configure the DSP Farm Profile, on page 1381](#).

The following are the hardware-based conferencing models that are supported in Unified CME:

- Ad Hoc Hardware Conference
- Meet Me Conference
- Connected Conference

For information on the basic configurations that are required to enable a hardware conference, see [Configure Hardware Conferencing, on page 1377](#).

## Ad Hoc Hardware Conference

Ad hoc conferences can be of two types:

- Hardware-based
- Software-based

---

**Note** For more information on Ad Hoc software conference, see [Ad Hoc Software Conferencing, on page 1367](#).

---

Ad Hoc conferences allow the conference host or participant to add new participants to the conference. Ad hoc conferences are created when one party calls another, then either party decides to add another party and turn the call into a conference. Hence, Ad Hoc conferencing is not predetermined, but a conference call that is created instantaneously. From Cisco Unified CME Release 11.7, Cisco 4000 Series Integrated Services Routers support Ad Hoc conferencing.

Hardware Ad Hoc Conference is a conference with minimum of three participants and a maximum of eight participants. Hardware-based Ad Hoc conference uses digital signal processors (DSPs) to allow more parties than software-based ad hoc conferences and provides extra features such as Join and Conference Participant List (ConfList). Unified CME manages the conference bridge by using the DSP resources available.

For an Ad Hoc hardware conference hosted on Unified CME:

- You need to configure **ephone-dn** as a placeholder directory number configuration for conference hosting.
- From Unified CME 11.7 onwards, conference participants (line or trunk) with different codecs can be added to the conference bridge without the need for configuring extra DSP resources for LTI-based transcoding. For more information, see [Local Transcoding Interface \(LTI\) Based Transcoding, on page 487](#).
- The conference bridge is established when minimum of three participants join the conference and becomes a point-to-point call when there are only two participants.
- Ad Hoc conference supports a mixed deployment of SIP and SCCP phones.
- An Ad Hoc conference supports ITSP or SIP trunk external party.

- Ad Hoc conference supports the ability to play join tone when a participant joins the conference, and leave tone when a participant drops from the conference.
- During a two-party transcoded call on Unified CME (Cisco 4000 Series Integrated Services Router), LTI-based transcoding is invoked. When the two-party call becomes an ad hoc conference, LTI-based transcoding is released, and SCCP-based DSP conference is invoked.
- The DSP inserted for conferencing takes care of both transcoding and mixing of the audio stream.
- For Unified CME 4.1 and earlier, support for ad hoc conferencing was limited to three participants—all participants on G.711 codec.
- You need to configure **max-participant** under **dspfarm** configuration mode to define the number of participants supported by an ad hoc conference.
- Hardware-based multi-party ad hoc conference bridges do not support video phones. In a scenario where the participants joins the conference with video enabled phones, the caller on that phone can connect to the conference as an audio only participant.
- When the participant puts the call on hold in a conference, the other parties in the conference remain connected. The Resume softkey is not displayed to the other active remote-in-use calls on the shared lines. Only, the participant who puts the call on hold can resume the call.
- The maximum number of conference parties you can support on a hardware conference call is limited to eight.
- You can setup an Ad Hoc hardware conference even if different codecs are configured on the conference parties.
- The transcoder is invoked when it is a point-to-point call and its released once the conference is setup. The conference bridge performs codec mixing.
- You need to configure **dspfarm** to support transcoding:

```
enable
configure terminal
dspfarm profile tag transcode universal
codec codec_type
maximum sessions <1-40>
associate application CUBE
no shutdown
end
```

Ad Hoc hardware conferences can be created in several ways. For example, you can configure the Ad Hoc conference in Unified CME, such that:

- Only the conference creator can add parties to the conference.
- Any participant can add new participants to the conference (default behavior for ad hoc conference).
- Conference drops when the creator hangs up.
- Conference drops when the last local party hangs up.
- The default behavior for termination of ad hoc conference is that the conference is not dropped provided three parties remain in the conference. It is regardless of whether the creator hangs up or not.

The maximum number of simultaneous conferences is specific to the type of Cisco Unified CME router, and each individual Cisco Unified IP phone can host a maximum of one conference at a time. You cannot create a new conference on a phone if you already have an existing conference on hold.

For information on configuration of Ad Hoc or Meet Me conferencing for SIP and SCCP phones, see [Configure Ad Hoc or Meet Me Hardware Conference, on page 1386](#)

## Meet Me Conference

Meet Me conferences consist of at least three parties dialing a Meet Me conference number. The number is predetermined by the system administrator. Hence, it is not necessary for participants to dial another party to add them into the conference. The conference host uses the **MeetMe** softkey on the phone and dials the designated conference number to initiate the conference. The other participants can join the conference only when the conference host has initiated the conference.

For example, the conference shown in [Figure 65: Simple Meet Me Conference Scenario, on page 1363](#) is created when the conference creator at extension 1215 presses the **MeetMe** softkey and hears a confirmation tone, then dials the Meet Me conference number 1500. Extension 1225 and extension 1235 join the Meet Me conference by dialing 1500. Extensions 1215, 1225, and 1235 are now parties in a Meet Me conference on extension 1500.

**Figure 65: Simple Meet Me Conference Scenario**

For a Meet Me Conference in Unified CME:

- Meet Me conference is supported only as a hardware-based conference.
- If you configure software-based conferencing, you cannot host Meet Me conferences.
- For a Meet Me conference configured for multiple ephone-dns with octo line configurations that use the same directory number, a maximum of 32 participants can join. The support for participants is based upon the configuration of DSP resources.
- You can configure the maximum number of conference parties to be lower than the actual maximum of 32 for Meet Me conferences. For more information, see [Configure the DSP Farm Profile, on page 1381](#).
- With octo-line ephone directory numbers, only one directory number is required for an eight-party Meet Me conference. Hence, you need four ephone octo-line directory numbers for 32 parties.
- The conference initiator presses **MeetMe** softkey before dialing the conference number. Other Meet Me conference parties (line or trunk) dials the conference number to join the conference.

- If only one party remains in the Meet Me conference, (For example, if one party has forgotten to hang up and other participants have left), the conference call is disconnected after five minutes to free system resources.
- If the creator is waiting for parties to join the conference (that is, only one party has joined the conference), the conference is not disconnected because significant resources are not being used.
- If only one party remains in the Meet Me conference, the conference call is disconnected after five minutes to free system resources.
- Maximum number of participants in a single conference with G.711 codec conference bridge is 32. For a single conference with G.729 codec conference bridge, the maximum number of participants is 16.
- If Music on Hold (MOH) is configured for a conference party that puts the call on hold, the MOH is not played to the other conference. This is because other parties are in an active call.

For information on configuration of Ad Hoc or Meet Me conferencing for SIP and SCCP phones, see [Configure Ad Hoc or Meet Me Hardware Conference, on page 1386](#)

## Meet-Me Conferencing in Cisco Unified CME 11.7 and Later Versions

From Cisco Unified CME Release 11.7, Meet-Me conferencing is supported on Cisco 4000 Series Integrated Services Router.

Configuration of multi party conference on Cisco 4000 Series Integrated Services Routers for Unified CME Release 11.7 and later is same as that of previous releases. Also, the configuration remains same across both SIP and SCCP phones. For more information, see [Configure Hardware Conferencing, on page 1377](#).

## Connected Conference

Connected Conference supports Unified CME to host a conference for phones in connected call state. In a connected call scenario for SIP phones, a line on the phone is in an active call. The other lines are in held state. Using the Connected conference feature, you can allow one of the calls on hold to join the active call.

**Note** For Connected Conference to work on phones, you must enable Ad Hoc hardware conferencing in Unified CME.

Only Cisco IP Phone 7800 Series and Cisco IP Phone 8800 Series support Connected Conference.

Only one held call can join the active call at a time for SIP phones. If the other lines on the SIP phone have to join the conference, they can join one at a time.

**Note** Connected Conference supports a maximum of eight participants.

From Cisco Unified CME Release 11.7 onwards, Connected Conference feature is supported on SIP phones as well. As part of this enhancement, Unified CME introduced a new softkey **Active calls** for SIP phones.

For the Connected Conference feature, the behavior is different across Cisco IP Phone 7800 Series and Cisco IP Phone 8800 Series. Cisco IP Phone 7800 Series uses the line key for Connected Conference feature. However, Cisco IP Phone 8800 Series uses **Active calls** softkey.

Following are the steps to invoke connected conferencing on Cisco IP Phone 8800 Series:

1. A call from Phone A (Cisco IP Phone 8800 Series) is answered by Phone B.
2. Phone A puts the call with Phone B on hold.
3. Phone A makes another call to Phone C, and the call is answered by Phone C.
4. Press the **Conference** hard button or softkey on Phone A.
5. Then, press the **Active calls** softkey on Phone A to select the option Phone B.
6. Repeat the above steps to add more parties into conference.

A connected conference between Cisco IP Phone 8800 Series Phone A, Phone B, and Phone C is established.

Following are the steps to invoke connected conferencing on Cisco IP Phone 7800 Series:

1. A call from Phone A (Cisco IP Phone 7800 Series) is answered by Phone B.
2. Phone A puts the call with Phone B on hold.
3. Phone A makes another call to Phone C, and the call is answered by Phone C.
4. Use the line key on Phone A to select the option Phone B.
5. Repeat the preceding steps to add more parties into conference.

A connected conference between Cisco IP Phone 7800 Series IP Phone A, Phone B, and Phone C is established.

**Note**

The phone firmware files that support Connected Conference on Cisco IP Phone 8800 Series is unavailable until the next Unified CME release. Hence, Connected Conference support for SIP phones is limited to Cisco IP Phone 7800 Series for Unified CME Release 11.7.

## cBarge Conference

cBarge enables multiple phone users who share a directory number to join an active call on the shared line by pressing a softkey. cBarge facilitates a conference by invoking hardware conference on Unified CME. When the conference initiator barges into a call, hardware conference is created on Unified CME. The conference is established between the barge initiator, the target party, and the other parties connected in the call.

To support cBarge:

- Enable hardware conference
- Disable Privacy

If hardware conference is disabled, cBarge softkey invokes barge. Barge uses the built-in conference bridge on the target phone (the phone that is barged). Hence, a barge conference supports only up to three parties. Configure cBarge if you must support more participants.

**Note**

Even if you have configured cBarge softkey, the softkey display on the phone is **Barge**.

The configurations for cBarge on the conference bridge of Unified CME are same as an Ad Hoc hardware conference, except:

- The configuration to enable cBarge softkey on phone in remote-in-use state.
- Configure **no privacy** under **voice register global**.

To configure softkey template to enable cBarge softkey on phone in remote-in-use:

```
enable
configure terminal
voice register template <template-tag>
 softkeys remote-in-use {[Barge] [Newcall] [cBarge]}
exit
```

To associate softkey template with the pool:

```
voice register pool <phone-tag>
 template <template-tag>
end
```

To disable **privacy** and enable **conference hardware** under **voice register global** configuration mode:

```
voice register global
 no privacy
 conference hardware
 create profile
 reset
end
```

For more information on Barge and cBarge, see [Barge and cBarge, on page 1035](#).

## Drop Mode Conference

A person who initiates a conference call and hangs up can either keep the remaining parties connected or disconnect them. Based on this configuration option, Unified CME supports Drop Mode Conference as an End of Conference option for Hardware Conferencing.

To configure the mode for terminating hardware conferences when parties drop out, use the **conference drop-mode** and **conference add-mode** command in **ephone** or **ephone-template** configuration mode for SCCP phones. Configure **conference drop-mode** and **conference add-mode** command in **voice register** configuration mode for SIP phones.

The behavior for the end of three-way conferences can be configured at a phone level. The options specify whether the last party that joined a conference can be dropped from the conference and whether the remaining two parties should be allowed to continue their connection after the conference initiator has left the conference.

- For information on configuration of Drop Mode and Add Mode for hardware conferencing, see [Configure Softkeys and End of Conference Options for Hardware Conferencing, on page 1388](#)
  - For more information on configuration of Add Mode and Drop Mode Conference for SCCP phones, see [conference add-mode](#) and [conference drop-mode](#).
  - For more information on configuration of Add Mode and Drop Mode Conference for SIP phones, see [conference add-mode \(voice register\)](#) [conference drop-mode \(voice register\)](#).

## Software Conference

Software conference can host a maximum of three participants. There are two types of software-based conferencing available in Unified CME:

- **Ad Hoc Software Conference**—Ad Hoc Software Conference or Built-in Bridge Conference is established using the phone or endpoint hardware that provides audio mixing. There is no dependency upon the Unified CME router hardware for Ad Hoc software conferencing.
- **Three-Party Software Conference**—In a three-party software conference, Unified CME router supports conferencing for phones that do not support BIB-based conferencing (SCCP phones). When BIB conference is enabled, three-party software conference is disabled. It is supported only on Cisco Integrated Services Router Generation 2 and only for SCCP phones. For information on how to configure a three-party software conference, see [Configure Three-Party Software Conference, on page 1372](#).

### Ad Hoc Software Conferencing

Ad Hoc software conference is also known as Built-in bridge (BIB) conferencing. Ad hoc software conferences do not depend on the Unified CME hardware to support conferencing. Press the conferencing softkey on the phone that hosts the conference bridge to enable the Ad Hoc software conference. In an Ad Hoc software conference, the phone that hosts the conference also performs audio mixing.

The conference that is shown in [Figure 66: AdHoc Software Conference Using the Conference Softkey, on page 1367](#) is created when extension 1215 dials extension 1225. The two parties decide to add a third party, extension 1235. Extensions 1215, 1225, and 1235 are now parties in an ad hoc conference. Extension 1215 is the conference initiator. Hence, audio mixing happens in 1215.

**Figure 66: AdHoc Software Conference Using the Conference Softkey**

For a software-based Ad Hoc conference:

- The number of participants is limited to three parties.
- You do not need Unified CME hardware or DSP resources for audio mixing.
- The phone that hosts the conference performs audio mixing.
- Transcoding is not supported in a software-based conference call. Hence, you cannot host a software conference for calls with different audio codecs.

Software conference is enabled using softkeys on the Unified IP phones. The softkey varies depending on the phone model used. **confm** and **conference** are some of the common softkeys for Software Conferencing in Unified IP Phones.

To configure a software conference, you have to disable hardware conferencing in Unified CME:

- Configure **no conference hardware** under **telephony service** for SCCP phones and no conference hardware under **voice register global** for SIP phones to disable hardware conference.
- Also, you must configure **create profile** under **voice register global** and **create cnf-files** under **telephony-service** configuration mode.

## Keep Conference

A person who initiates a conference call and hangs up can either keep the remaining parties connected or disconnect them. Based on this configuration option, Unified CME supports Keep Conference as an End of Conference option for Software Conferencing.

Keep Conference is an end of conference option in Software Conferencing. With Keep Conference option, Unified IP phones can be configured to keep the remaining conference parties connected when the conference initiator hangs up (places the handset back in the on-hook position). Conference originators can disconnect from their conference calls by pressing the **Confrn** (conference) soft key. When an initiator uses the **Confrn** key to disconnect from the conference call, the oldest call leg will be put on hold, leaving the initiator connected to the most recent call leg. The conference initiator can then navigate between the two parties by pressing either the Hold soft key or the line buttons to select the desired call.

The behavior for the end of three-way conferences can be configured at a phone level. The options specify whether the last party that joined a conference can be dropped from the conference and whether the remaining two parties should be allowed to continue their connection after the conference initiator has left the conference.

- For information on configuration of Keep Conference for SCCP phones, see [Configure Keep Conference for SCCP Phones, on page 1373](#).

For an example of Keep Conference for SCCP phones, see [Example for Keep Conference Configuration on SCCP Phones, on page 1395](#).

- For information on configuration of Keep Conference for SIP phones, see [Configure Keep Conference Option for SIP Phones, on page 1375](#).

For an example of Keep Conference for SIP phones, see [Example for Keep Conference Configuration on SIP Phones, on page 1396](#).

## Max Conference

You can set the maximum number of three-party software conferences that are supported simultaneously by the Unified CME router using Max Conference option. Configure the **max-conferences** command in **telephony-service** configuration mode to define maximum number of software conferences.

---

**Note** For Max Conference in Unified CME, the configuration is same for both SIP and SCCP phones.

---

For information on configuration of **max-conferences**, see [Configure Three-Party Software Conference, on page 1372](#).

For an example of Max conference, see [Example for Configuration of Max Conference and Gain Levels, on page 1395](#).

## Conference Gain Levels

You can adjust the gain level of an external call to provide more adequate volume. This functionality is applied to inbound audio packets so that conference participants can more clearly hear a remote PSTN or VoIP caller

joining their call. Note that this functionality cannot discriminate between a remote VoIP/foreign exchange office (FXO) source, which requires a volume gain, and a remote VoIP/IP phone, which does not require a volume gain and may therefore incur some sound distortions.

Conference gain levels are set using the variable *gain* configured under the CLI command **max-conference** under **telephony-service** configuration mode. The Conference Gain Level configuration is consistent across all the hardware conferencing options supported in Unified CME. For more information, see [Configure Three-Party Software Conference, on page 1372](#).

For an example of Max conference, see [Example for Configuration of Max Conference and Gain Levels, on page 1395](#).

## Design Considerations for Conferencing

The following are some of the characteristics of conferencing in Unified CME:

- The maximum number of conference participants that you can host in a conference is specific to the mode of conference. For more information, see [Types of Conference, on page 1359](#).
- Consider a scenario where the ad hoc hardware conference creator transfers the call or parks the call with another call. For Unified CME 11.7 and later releases, the conference bridge remains active, irrespective of whether you have enabled **drop-mode creator** CLI command or not.
- When you are configuring dial peers or ephone-dns (including park slots and conferencing extensions) on Cisco Integrated Services Router Voice Bundles, the following message may appear to warn you that memory is not available:

```
%DIALPEER_DB-3-ADDPEER_MEM_THRESHOLD: Addition of dial-peers limited by available memory
```

To configure more dial peers or ephone-dns, increase the DRAM in the system. Moderately complex configuration may exceed the default 256 MB of DRAM and require 512 MB of DRAM. Many factors contribute to memory usage, in addition to the number of dial peers and ephone-dns configured.

- **Secure Conferencing in Unified CME**—If Unified CME uses a conference DSP farm resource for Ad Hoc or Meet Me hardware conference, it can use a secure or nonsecure DSP farm resource. However, it is recommended that you pick a nonsecure DSP farm resource for Unified CME. This is because the conference itself cannot be secure in Unified CME. Also, you can avoid wastage of the session capacity of the more expensive secure DSP farm resource.

To avoid using valuable secure DSP farm resources, we recommend that you do not register a secure conference DSP farm profile to a Unified CME. Unified CME cannot use the DSP farm's secure capabilities.

- **LTI-based Transcoding**—From Unified CME 11.7 onwards, LTI-based transcoding is supported for hardware conferencing in Unified CME. With LTI-based transcoding, conference participants (line or trunk) with different codecs can be added to the conference bridge without configuring extra DSP resources. During a two-party transcoded call on Unified CME (Cisco 4000 Series Integrated Services Router), LTI-based transcoding is invoked. When the two-party call becomes an Ad Hoc conference, LTI-based transcoding is released and SCCP-based DSP conference is invoked. The DSP inserted for conferencing takes care of both transcoding and mixing the audio stream. For information about LTI-based conferencing and configuration, see [Local Transcoding Interface \(LTI\) Based Transcoding, on page 487](#) and [Configure LTI-based Transcoding, on page 515](#).

- **Conference Blocking (Conference Pattern Blocked)**—To prevent extensions in an **ephone** or a **voice register pool** from initiating conferences, configure the **conference-pattern blocked** command . For more information, see [Conference-Pattern Blocked, on page 1140](#) and [Configure Conference Blocking Options for Phones, on page 1142](#).
- **Conference Max Length**—When **conference max-length** command is configured, Unified CME allows the conferences only if the dialed digits are within the max-length limit. For more information on Conference Max-length and configuration, see [Conference Max-Length, on page 1139](#) and [Configure the Maximum Number of Digits for a Conference Call, on page 1141](#).
- **Octo-line Directory Numbers**—With octo-line directory numbers, only one directory number is required for an eight-party Meet Me or Ad Hoc conference. An octo-line directory number supports up to eight active calls, both incoming and outgoing, in a single phone button. It supports up to eight Select and Join instances. When a conference initiator is an octo-line directory number, Unified CME selects an idle channel from that directory number. Establish a new call to complete the conference. If an idle channel is not available in the same octo-line directory number, the conference terminates and a **No Line Available** message displays.

**Note** If an idle channel is not available in the same octo-line directory number, Unified CME does not pick an idle channel from another directory number. Also, you cannot select **hold** calls in the other channels of the directory number or for other directory numbers. It is supported only for single-line and dual-line directory numbers.

## Deploy the DSP Farm Resource with Unified CME

It is mandatory to have DSP farm resources to support hardware conferencing in Unified CME. For more information on configuration of DSP resources with Unified CME, see [Configure Transcoding Resources, on page 489](#).

You can deploy a DSP farm with Unified CME in two ways:

- Configure DSP Farm and Unified CME in the same router.  
For a sample configuration, see [Example of DSP Farm and Cisco Unified CME on the Same Router, on page 1396](#).
- Configure DSP Farm and Unified CME in different routers.  
For a sample configuration, see [Example of DSP Farm and Cisco Unified CME on Different Routers, on page 1406](#).

## Softkeys for Conference Functions

For the conferencing functions that you configure on Unified CME, you have corresponding softkeys on the phone. The following soft keys provide conferencing functions for conferencing enhancements on your phone:

- **ConfList**—Conference list. Lists all parties in a conference. For multi-party ad hoc conferences, this soft key is available for all parties in a conference. For meet-me conferences, this soft key is available for

the creator only. Press **Update** to update the list of parties in the conference. For instance, press **Update** to verify that a party has been removed from the conference. Press **Remove** softkey to remove the appropriate parties. The suboption **Remove** is available for the conference creator and phones that have **conference admin** configured.

- **Join**—Joins an established call to an adhoc conference. You must first press **Select** to choose each connected call that you want to join in a conference, then press **Join** to join the selected calls.
- **RmLstC**—Remove last caller. Removes the last party added to the conference. This soft key works for the creator only.
- **Select**—Selects a call or conference to join to a conference and selects a call to remove from a conference. The creator can remove other parties by pressing the **ConfList** soft key, then use the **Select** and **Remove** soft keys to remove the appropriate parties.
- **MeetMe**—Initiates a Meet Me conference. The creator presses this soft key before dialing the conference number. Other meet-me conference parties only dial the conference number to join the conference. This soft key must be configured before you can start a Meet Me conference.

In Cisco Unified CME 11.7 and later versions, the following softkeys are also supported.

- **Details** (Supported only on Cisco IP Phone 7800 Series)—Lists all the participants in a conference. For multi-party ad hoc conferences, this soft key is available for all parties in a conference. For meet-me conferences, this soft key is available for the creator only. Press **Update** to update the list of parties in the conference. Press **Remove** softkey to remove the appropriate parties. The suboption **Remove** is available to the conference creator and phones that have **conference admin** configured.
- **Show detail** (Supported only on Cisco IP Phone 8800 Series)—Lists all the participants in a conference. For multi-party ad hoc conferences, this soft key is available for all parties in a conference. For meet-me conferences, this soft key is available for the creator only. Press **Update** to update the list of parties in the conference. Press **Remove** softkey to remove the appropriate parties. The suboption **Remove** is available to the conference creator and phones that have **conference admin** configured.
- **Active calls** (Supported on Cisco IP Phone 8800 Series)—As part of the Connected Conference support on Unified CME 11.7 and later releases, a new softkey **Active calls** is introduced. The **Active calls** softkey is added to the SIP phones configured on Unified CME. **Active calls** softkey is used in Cisco IP Phone 8800 Series for Unified CME.

For more information on the configuration, see [Configure Hardware Conferencing, on page 1377](#).

## Restrictions for Conferencing

- Unified CME does not support secure conferencing. All conference calls are nonsecure. This is because Unified CME cannot use the secure conference DSP farm capability.
- For a phone registered to Unified CME, you can support only one conference. If an existing conference is put on hold, you cannot create another conference.
- For calls having different audio codecs, you cannot host a hardware conference call without transcoding (DSPs).
- For calls having different audio codecs, you cannot host a software conference in Unified CME. The calls do not merge into a conference.

- A Software (BIB) conference does not support more than three parties.
- Cisco Jabber is supported only by hardware conferencing in Unified CME.
- At a time, only one held call can be selected to join the Connected conference for SIP phones.
- Each individual Unified IP phone can host a maximum of one conference at a time. You cannot support a new conference in a phone if you have a conference on hold.
- For cBarge, the conference type is listed as **Ad Hoc Barge** instead of Ad Hoc.
- For cBarge, Caller ID on phones in the Barge conference is displayed as **Barge** instead of **Conference**.
- Configurations, limitations and attributes associated with Connected Conference on Unified CME is same as that for Ad Hoc hardware conference.

## Configure Software Conferencing

### Configure Three-Party Software Conference

You can configure software conferencing on Unified CME as follows. To globally modify the default configuration and change any of the following parameters for three-party software conferencing, perform the following steps.

- The configuration **no conference hardware** is required to enable software conferencing on Unified CME and BIB conferencing on phones.
- Maximum number of simultaneous three-party software conferences that are supported by a router is platform-dependent. The default value is half of the maximum number.
- Increase the sound volume of VoIP and public switched telephony network (PSTN) parties joining a conference call.
- For Max Conference and Gain level in Unified CME, the configuration is consistent across SIP and SCCP phones.

#### Restriction

- When a three-way software conference is established, a participant cannot use call transfer to join the remaining conference participants to a different number.
- Three-party software conferencing does not support meet-me conferences.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **max-conferences** *max-conference-number* [**gain -6** | **0** | **3** | **6**]
5. **end**

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)#                                                                                      | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 4</b> | <b>max-conferences</b> <i>max-conference-number</i> [ <b>gain</b> -6   0   3   6]<br><b>Example:</b><br>Router(config-telephony)# max-conferences 6 | Sets the maximum number of simultaneous three-party conferences that are supported by the router. <ul style="list-style-type: none"> <li>• <i>max-conference-number</i>—Maximum value is platform-dependent. Type ? for maximum value. Default is half of the maximum value.</li> <li>• <b>gain</b>—(Optional) Amount to increase the sound volume of VoIP and PSTN calls joining a conference call, in decibels. Valid values are <b>-6</b>, <b>0</b>, <b>3</b>, and <b>6</b>. The default is <b>-6</b>.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                                                                                      | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configure Keep Conference for SCCP Phones

- Keep Conference is supported only for BIB Conferencing.
- Keep Conference on SCCP is supported only for Cisco Integrated Services Router Generation 2.
- To configure optional end-of-conference options for three-party ad hoc conferencing on a Cisco Unified IP phone running Skinny Client Control Protocol (SCCP), perform the following steps for each phone to be configured.

### Before you begin

- Conferencing uses call transfer to connect the two remaining parties of a conference when a conference initiator leaves the conference. To use this feature, you must configure the **transfer-system** command. For configuration information, see [Configure Call Transfer and Forwarding, on page 1160](#).

- Drop-last feature of Keep Conference on analog phones connected to the Cisco Unified CME system through a Cisco VG 224 requires Cisco IOS Release 12.4(9)T or later release.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **keep-conference** [**drop-last**] [**endcall**] [**local-only**]
5. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Step 4</b> | <b>keep-conference</b> [ <b>drop-last</b> ] [ <b>endcall</b> ] [ <b>local-only</b> ]<br><br><b>Example:</b><br>Router(config-ephone)# keep-conference endcall | Allows conference initiators to exit from conference calls and to either end or maintain the conference for the remaining parties.<br><br>• <b>no keep-conference</b> —(Default; the <b>no</b> form of the command) The conference initiator can hang up or press the EndCall soft key to end the conference and disconnect all parties or press the Confrn soft key to drop only the last party that was connected to the conference.<br><br>• <b>keep-conference</b> —(No keywords used) The conference initiator can press the EndCall soft key to end the conference and disconnect all parties or hang up to leave the conference and keep the other two parties connected. The conference initiator can also use the Confrn soft key (IP phone) or hookflash (analog phone) to break up the conference but stay connected to both parties. |

|        | Command or Action                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        |                                                          | <ul style="list-style-type: none"> <li>• <b>drop-last</b>—The action of the Confrn soft key is changed; the conference initiator can press the Confrn soft key (IP phone) or hookflash (analog phone) to drop the last party.</li> <li>• <b>endcall</b>—The action of the EndCall soft key is changed; the conference initiator can hang up or press the EndCall soft key to leave the conference and keep the other two parties connected.</li> <li>• <b>local-only</b>—The conference initiator can hang up to end the conference and leave the other two parties connected only if one of the remaining parties is local to the Cisco Unified CME system (an internal extension).</li> </ul> |
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

#### What to do next

If you are finished modifying the configuration, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

## Configure Keep Conference Option for SIP Phones

To configure optional end-of-conference options for three-party ad hoc conferencing on a Cisco Unified IP phone running SIP, perform the following steps for each phone to be configured.

#### Before you begin

- To facilitate call transfer by using the Confrn soft key, conference, and transfer attended or transfer blind must be enabled. For configuration information, see [Configure Call Transfer and Forwarding, on page 1160](#).

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag* | OR **voice register template** *template-tag*
4. **keep-conference**
5. **voice register pool** *pool-tag*
6. **template** *template-tag*
7. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>voice register pool</b> <i>pool-tag</i>   OR <b>voice register template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# <b>voice register pool 3</b><br>OR<br>Router(config)# <b>voice register template 3</b> | Enters voice register pool or voice register template configuration mode to set phone-specific parameters for SIP phones. <ul style="list-style-type: none"> <li><i>pool-tag</i>—Unique sequence number of the SIP phone to be configured. Range is 1 to 100 or the upper limit as defined by <b>max-pool</b> command.</li> <li><i>template-tag</i>—Unique sequence number of the template to be applied to the SIP phone. Range is 1 to 10.</li> </ul>                                                                                                                                                                                                                                               |
| <b>Step 4</b> | <b>keep-conference</b><br><b>Example:</b><br>Router(config-register-pool)# <b>keep-conference</b><br>OR<br>Router(config-register-temp)# <b>keep-conference</b>                                                                 | Allows a Cisco Unified IP phone conference initiator to exit from conference calls and keeps the remaining parties connected. <p><b>Note</b><br/>This step is included to illustrate how to enable the command if it was previously disabled.</p> <ul style="list-style-type: none"> <li>Default is enabled.</li> <li>Remaining calls are transferred without consultation as enabled by the <b>transfer-attended</b> (voice register template) or <b>transfer-blind</b> (voice register template) commands.</li> </ul> <p><b>Note</b><br/><b>keep-conference</b> command is configured under voice register template only if you configure voice register template command in the previous step.</p> |
| <b>Step 5</b> | <b>voice register pool</b> <i>pool-tag</i><br><b>Example:</b><br>Router(config-register-temp)# <b>voice register pool 1</b>                                                                                                     | (Optional) Enters voice register pool configuration mode to set phone-specific parameters for SIP phones. <p><b>Note</b><br/>This step is required only if you configure voice register template.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|        | Command or Action                                                                                         | Purpose                                                                                                                                                                |
|--------|-----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-register-pool)# <b>template 1</b> | (Optional) Attaches the template tag configured to the voice register pool.<br><br><b>Note</b><br>This step is required only if you configure voice register template. |
| Step 7 | <b>end</b><br><b>Example:</b><br>Router(config-register-pool)# <b>end</b>                                 | Exits to privileged EXEC mode.                                                                                                                                         |

#### What to do next

- If you are finished modifying the configuration, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

## Configure Hardware Conferencing

#### Prerequisites

- The following configuration is applicable to all hardware conferencing types supported in Unified CME, including Meet Me and Ad Hoc conferencing.
- DSP resources are mandatory to support a hardware conference in Unified CME.

#### Restriction

- The maximum number of meet-me conference parties is 32 for one DSP using the G.711 codec and 16 for the G.729 codec.
- A participant cannot join more than one conference at the same time.
- Hardware-based multi-party ad hoc conferencing for more than three parties is not supported on phones that do not support soft keys.
- Hardware based Ad Hoc conferencing does not support the local-consult transfer method (**transfer-system local-consult** command).

## Enable DSP Farm Services for a Voice Card

To enable DSP farm services for a voice card to support hardware conferences, perform the following steps.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice-card** *slot*

4. **dsp services dspfarm**
5. **exit**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                             | Purpose                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><code>Router&gt; enable</code>                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Router# configure terminal</code>                       | Enters global configuration mode.                                                                                     |
| <b>Step 3</b> | <b>voice-card slot</b><br><b>Example:</b><br><code>Router(config)# voice-card 2</code>                        | Enters voice-card configuration mode and configure a voice card.                                                      |
| <b>Step 4</b> | <b>dsp services dspfarm</b><br><b>Example:</b><br><code>Router(config-voicecard)# dsp services dspfarm</code> | Enables digital-signal-processor (DSP) farm services for a particular voice network module.                           |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-voicecard)# exit</code>                                 | Exits voice-card configuration mode.                                                                                  |

## Configure Join and Leave Tones

The Join and Leave configuration is applicable for:

- both SIP and SCCP phones in Unified CME.
- all hardware conferencing types supported in Unified CME, including Ad Hoc and Meet Me.

To configure tones to be played when parties join and leave multi-party ad hoc conferences and meet-me conferences, perform the following steps for each tone to be configured.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice class custom-cptone** *cptone-name*
4. **dualtone conference**
5. **frequency** *frequency-1* [*frequency-2*]

6. **cadence** {*cycle-1-on-time cycle-1-off-time* [*cycle-2-on-time cycle-2-off-time*] [*cycle-3-on-time cycle-3-off-time*] [*cycle-4-on-time cycle-4-off-time*] | **continuous**}
7. **end**

|               | Command or Action                                                                                                                                                                                                                                                                                    | Purpose                                                                       |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                               | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.       |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                       | Enters global configuration mode.                                             |
| <b>Step 3</b> | <b>voice class custom-cptone</b> <i>cptone-name</i><br><br><b>Example:</b><br>Router(config)# voice class custom-cptone jointone                                                                                                                                                                     | Creates a voice class for defining custom call-progress tones to be detected. |
| <b>Step 4</b> | <b>dualtone conference</b><br><br><b>Example:</b><br>Router(cfg-cptone)# dualtone conference                                                                                                                                                                                                         | Configures conference join and leave tones.                                   |
| <b>Step 5</b> | <b>frequency</b> <i>frequency-1</i> [ <i>frequency-2</i> ]<br><br><b>Example:</b><br>Router(cfg-cp-dualtone)# frequency 600 900                                                                                                                                                                      | Defines the frequency components for a call-progress tone.                    |
| <b>Step 6</b> | <b>cadence</b> { <i>cycle-1-on-time cycle-1-off-time</i> [ <i>cycle-2-on-time cycle-2-off-time</i> ] [ <i>cycle-3-on-time cycle-3-off-time</i> ] [ <i>cycle-4-on-time cycle-4-off-time</i> ]   <b>continuous</b> }<br><br><b>Example:</b><br>Router(cfg-cp-dualtone)# cadence 300 150 300 100 300 50 | Defines the tone-on and tone-off durations for a call-progress tone.          |
| <b>Step 7</b> | <b>end</b><br><br><b>Example:</b><br>Router(cfg-cp-dualtone)# exit                                                                                                                                                                                                                                   | Exits configuration mode and enters privileged EXEC mode.                     |

## Configure SCCP Infrastructure for Conferencing in Unified CME

The SCCP Infrastructure configuration is applicable to:

- Both SIP and SCCP phones in Unified CME.

- All hardware conferencing types supported in Unified CME, including Ad Hoc and Meet Me.

To enable SCCP Infrastructure in Unified CME to support multi-party ad hoc and meet-me conferences, perform the following steps:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **sccp local interface-type interface-number [port port-number]**
4. **sccp ccm {ip-address | dns} identifier identifier-number [port port-number] [version version-number]**
5. **sccp ccm group group-number**
6. **bind interface interface-type interface-number**
7. **exit**
8. **sccp**
9. **exit**

|               | Command or Action                                                                                                                                                                                | Purpose                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                       | Enters global configuration mode.                                                                                                                                                    |
| <b>Step 3</b> | <b>sccp local interface-type interface-number [port port-number]</b><br><b>Example:</b><br>Router(config)# sccp local FastEthernet0/0                                                            | Selects the local interface that SCCP applications (transcoding and conferencing) use to register with Cisco Unified CME.                                                            |
| <b>Step 4</b> | <b>sccp ccm {ip-address   dns} identifier identifier-number [port port-number] [version version-number]</b><br><b>Example:</b><br>Router(config)# sccp ccm 10.4.158.3 identifier 100 version 4.0 | Enables the Cisco Unified CME router to register SCCP applications.<br><ul style="list-style-type: none"> <li>• <i>version-number</i>—Must be set to <b>4.0</b> or later.</li> </ul> |
| <b>Step 5</b> | <b>sccp ccm group group-number</b><br><b>Example:</b><br>Router(config)# sccp ccm group 123                                                                                                      | Creates a Cisco Unified CME group.                                                                                                                                                   |

|        | Command or Action                                                                                                                           | Purpose                                                                   |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Step 6 | <b>bind interface</b> <i>interface-type interface-number</i><br><b>Example:</b><br>Router(config-sccp-cm) # bind interface fastethernet 0/0 | Binds an interface to a Cisco Unified CME group.                          |
| Step 7 | <b>exit</b><br><b>Example:</b><br>Router(config-sccp-cm) # exit                                                                             | Exits SCCP Cisco Unified CME configuration mode.                          |
| Step 8 | <b>sccp</b><br><b>Example:</b><br>Router(config) # sccp                                                                                     | Enables SCCP and its related applications (transcoding and conferencing). |
| Step 9 | <b>exit</b><br><b>Example:</b><br>Router(config) # exit                                                                                     | Exits global configuration mode.                                          |

## Configure the DSP Farm Profile

The DSP Farm Profile is applicable to:

- Both SIP and SCCP phones in Unified CME.
- All hardware conferencing types supported in Unified CME, including Ad Hoc and Meet Me.

To configure the DSP farm profile for multi-party ad hoc and meet-me conferencing, perform the following steps.

**Note** The DSP farm can be on the same router as the Cisco Unified CME or on a different router.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dspfarm profile** *profile-identifier* **conference**
4. **codec** {*codec-type* | **pass-through**}
5. **conference-join custom-cptone** *cptone-name*
6. **conference-leave custom-cptone** *cptone-name*
7. **maximum conference-participants** *max-participants*
8. **maximum sessions** *number*
9. **associate application** **sccp**
10. **end**

### Procedure

|               | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                      | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                              | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>dspfarm profile <i>profile-identifier</i> conference</b><br><b>Example:</b><br>Router(config)# dspfarm profile 1 conference                          | Enters DSP farm profile configuration mode and defines a profile for DSP farm services.                                                                                                                                                                                                                                                                |
| <b>Step 4</b> | <b>codec {<i>codec-type</i>   pass-through}</b><br><b>Example:</b><br>Router(config-dspfarm-profile)# codec g711ulaw                                    | Specifies the codecs supported by a DSP farm profile.<br><b>Note</b><br>Repeat this step as necessary to specify all the supported codecs.                                                                                                                                                                                                             |
| <b>Step 5</b> | <b>conference-join custom-cptone <i>cptone-name</i></b><br><b>Example:</b><br>Router(config-dspfarm-profile)# conference-join custom-cptone jointone    | Associates a custom call-progress tone to indicate joining a conference with a DSP farm profile.<br><b>Note</b><br>The <i>cptone-name</i> argument in this step must be the same as the <i>cptone-argument</i> in the <b>voice class custom-cptone</b> command configured in <a href="#">Enable DSP Farm Services for a Voice Card, on page 1377</a> . |
| <b>Step 6</b> | <b>conference-leave custom-cptone <i>cptone-name</i></b><br><b>Example:</b><br>Router(config-dspfarm-profile)# conference-leave custom-cptone leavetone | Associates a custom call-progress tone to indicate leaving a conference with a DSP farm profile.<br><b>Note</b><br>The <i>cptone-name</i> argument in this step must be the same as the <i>cptone-argument</i> in the <b>voice class custom-cptone</b> command configured in <a href="#">Enable DSP Farm Services for a Voice Card, on page 1377</a> . |
| <b>Step 7</b> | <b>maximum conference-participants <i>max-participants</i></b><br><b>Example:</b><br>Router(config-dspfarm-profile)# maximum conference-participants 32 | (Optional) Configures the maximum number of conference parties allowed in each meet-me conference. The maximum is codec-dependent.                                                                                                                                                                                                                     |
| <b>Step 8</b> | <b>maximum sessions <i>number</i></b><br><b>Example:</b>                                                                                                | Specifies the maximum number of sessions that are supported by the profile.                                                                                                                                                                                                                                                                            |

|                | Command or Action                                                                                                                   | Purpose                                    |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
|                | <code>Router(config-dspfarm-profile)# maximum sessions 8</code>                                                                     |                                            |
| <b>Step 9</b>  | <b>associate application sccp</b><br><br><b>Example:</b><br><code>Router(config-dspfarm-profile)# associate application sccp</code> | Associates SCCP with the DSP farm profile. |
| <b>Step 10</b> | <b>end</b><br><br><b>Example:</b><br><code>Router(config-dspfarm-profile)# end</code>                                               | Exits to privileged EXEC mode.             |

## Associate Unified CME with a DSP Farm Profile

The steps to associate Unified CME with a DSP farm profile is applicable to:

- Both SIP and SCCP phones in Unified CME.
- All hardware conferencing types supported in Unified CME, including Ad Hoc and Meet Me.

To associate a DSP farm profile with a group of Cisco Unified CME routers that control DSP services, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **sccp ccm group** *group-number*
4. **associate ccm identifier-number** **priority** *priority-number*
5. **associate profile** *profile-identifier* **register** *device-name*
6. **end**

#### Procedure

|               | Command or Action                                                                           | Purpose                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br><code>Router&gt; enable</code>                      | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br><code>Router# configure terminal</code> | Enters global configuration mode.                                                                                         |

|               | Command or Action                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                       |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>sccp ccm group</b> <i>group-number</i><br><b>Example:</b><br>Router(config)# sccp ccm group 1                                                                           | Creates a Cisco Unified CME group.                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>associate ccm identifier-number priority</b> <i>priority-number</i><br><b>Example:</b><br>Router(config-sccp-ccm)# associate ccm 100 priority 1                         | Associates a Cisco Unified CME router with the group and establishes its priority within the group.                                                                                                                                                           |
| <b>Step 5</b> | <b>associate profile</b> <i>profile-identifier</i> <b>register</b> <i>device-name</i><br><b>Example:</b><br>Router(config-sccp-ccm)# associate profile 2 register confdspi | Associates a DSP farm profile with the Cisco Unified CME group. <ul style="list-style-type: none"> <li><i>device-name</i> is a maximum of 16 characters.</li> </ul> <b>Note</b><br>Repeat this step for every conferencing DSP farm and transcoding DSP farm. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-sccp-ccm)# end                                                                                                              | Exits to privileged EXEC mode.                                                                                                                                                                                                                                |

## Enable Hardware Conferencing

To allow hardware-based multi-party conferences with more than three parties, perform the following steps.

### Note

- You cannot configure Hardware and Software conference simultaneously in Unified CME. Configuring multi-party hardware conference in Unified CME disables three-party Ad Hoc software conferencing.
- This configuration is applicable to both SIP and SCCP phones in Unified CME.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **conference hardware**
5. **transfer-system full-consult**
6. **sdspfarm units** *number*
7. **sdspfarm tag** *number device-name*
8. **sdspfarm conference** **mute-on** *mute-on-digits* **mute-off** *mute-off-digits*
9. **end**

|        | Command or Action                                                   | Purpose                        |
|--------|---------------------------------------------------------------------|--------------------------------|
| Step 9 | <b>end</b><br><br><b>Example:</b><br>Router(config-telephony) # end | Exits to privileged EXEC mode. |

## Configure Ad Hoc or Meet Me Hardware Conference

The configuration steps are applicable to:

- Both SIP and SCCP phones in Unified CME.
- All hardware conferencing types supported in Unified CME.

To configure extension numbers for hardware conferencing based on the maximum number of conference participants you configure, perform the following steps. Ad Hoc conferences require four extensions per conference, regardless of how many extensions are actually used by the conference parties.

**Note** Ensure that you configure enough directory numbers to accommodate the anticipated number of conferences. The maximum number of parties in a multi-party ad hoc conference on an IP phone is eight; the maximum on an analog phone is three.

**Note** For Meet Me conference to be enabled, you need to press the **MeetMe** softkey on the phone as well.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn *dn-tag* octo-line**
4. **number *number* [secondary *number*] [no-reg [both | primary]]**
5. Enter one of the following commands:
  - **conference ad-hoc**
  - **conference meetme**
6. **preference *preference-order* [secondary *secondary-order*]**
7. **no huntstop [channel]**
8. **end**

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>ephone-dn dn-tag octo-line</b><br><b>Example:</b><br>Router(config)# ephone-dn 18 octo-line                                                                                                                                                                            | Enters ephone-dn configuration mode to configure an extension (ephone-dn) for a phone line. <ul style="list-style-type: none"> <li>• Each ephone-dn can carry eight parties if it is configured as an octo line.</li> <li>• Configure enough ephone-dns to accommodate the maximum number of conference participants to be supported.</li> <li>• For multi-party ad hoc conferencing, maximum number of directory numbers is 8, but you can configure a lower maximum.</li> <li>• For meet-me conferencing, maximum number of directory numbers is 32, but you can configure a lower maximum.</li> <li>• Minimum number of directory numbers required: 2.</li> </ul> |
| <b>Step 4</b> | <b>number number [secondary number] [no-reg [both   primary]]</b><br><b>Example:</b><br>Router(config-ephone-dn)# number 6789                                                                                                                                             | Associates a telephone or extension number with an ephone-dn in a Cisco Unified CME system. <ul style="list-style-type: none"> <li>• Each DN for a conference must have the same primary and secondary number.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 5</b> | Enter one of the following commands: <ul style="list-style-type: none"> <li>• <b>conference ad-hoc</b></li> <li>• <b>conference meetme</b></li> </ul> <b>Example:</b><br>Router(config-ephone-dn)# conference ad-hoc<br>or<br>Router(config-ephone-dn)# conference meetme | Configures a number as a placeholder for ad hoc conferencing to associate the call with the DSP farm.<br>or<br>(Optional) Associates meet-me conferencing with a directory number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 6</b> | <b>preference preference-order [secondary secondary-order]</b><br><b>Example:</b>                                                                                                                                                                                         | Sets dial-peer preference order for an extension (ephone-dn) associated with a Cisco Unified IP phone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|               | Command or Action                                                                                        | Purpose                                                                                                                                                                                                                             |
|---------------|----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>Router(config-ephone-dn) # preference 1</code>                                                     | <ul style="list-style-type: none"> <li>Remember to configure “preference x” with low value to last DN.</li> <li>The lower the value of the <i>preference-order</i> argument, the higher the preference of the extension.</li> </ul> |
| <b>Step 7</b> | <b>no huntstop [ channel ]</b><br><b>Example:</b><br><code>Router(config-ephone-dn) # no huntstop</code> | Continues call hunting behavior for an extension (ephone-dn) or an extension channel. <ul style="list-style-type: none"> <li>Remember to configure <b>no huntstop</b> for all DNs except the last one.</li> </ul>                   |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-ephone-dn) # end</code>                             | Exits to privileged EXEC mode.                                                                                                                                                                                                      |

## Configure Softkeys and End of Conference Options for Hardware Conferencing

To configure a template of conferencing features such as the add party mode, drop party mode, and soft keys for hardware-based multi-party ad hoc and meet-me conferences and apply the template to a phone, perform the following steps.

### Note

The following commands can also be configured in ephone configuration mode. Commands configured in ephone configuration mode have priority over commands in ephone-template configuration mode.

#### Restriction

- The ConfList (including the Remove, Update, and Exit soft keys within the ConfList function) and RmLstC soft keys do not work on a Cisco Unified IP Phone 7902, 7935, and 7936.
- The RmLstC, ConfList, Join, and Select functions and soft keys are not supported for software-based conferencing.

The steps to configure end of conference and softkeys for hardware conference is applicable:

- Only for SCCP phones in Unified CME.

#### Note

- For End of Conference option on SIP phones, you need to configure **conference add-mode** and **conference drop-mode** under **voice register** configuration mode. For more information, see [Cisco Unified Communications Manager Express Command Reference](#).
- For softkey configuration on SIP phones, you need to configure **softkeys** under **voice register template** configuration mode. For more information, see [Cisco Unified Communications Manager Express Command Reference](#).

- For Ad Hoc and Meet Me hardware conferencing.

#### Before you begin

- The RmLstC, ConfList, Join, and Select functions and soft keys are supported for hardware-based conferencing only and require the appropriate DSP farm configuration. For configuration information, see these tasks in this module:
  - [Enable DSP Farm Services for a Voice Card, on page 1377](#)
  - [Configure the DSP Farm Profile, on page 1381](#)
  - [Associate Unified CME with a DSP Farm Profile , on page 1383](#)

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. **conference add-mode** [**creator**]
5. **conference drop-mode** [ | **creator local** ]
6. **conference admin**
7. **softkeys connected** { [**Acct**] [**ConfList**] [**Confrn**] [**Endcall**] [**Flash**] [**HLog**] [**Hold**] [**Join**] [**LiveRcd**] [**Park**] [**RmLstC**] [**Select**] [**TrnsfVM**] [**Trnsfer**] }
8. **softkeys hold** { [**Join**] [**Newcall**] [**Resume**] [**Select**] }
9. **softkeys idle** { [**Cfwdall**] [**ConfList**] [**Dnd**] [**Gpickup**] [**HLog**] [**Join**] [**Login**] [**Newcall**] [**Pickup**] [**Redial**] [**RmLstC**] }

10. **softkeys seized** { [ **CallBack** ] [ **Cfdall** ] [ **Endcall** ] [ **Gpickup** ] [ **HLog** ] [ **MeetMe** ] [ **Pickup** ] [ **Redial** ] }
11. **exit**
12. **ephone** *phone-tag*
13. **ephone-template** *template-tag*
14. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                        | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 3</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# ephone-template 1                                        | Enter ephone-template configuration mode to create an ephone template to configure a set of phone features.                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <b>conference add-mode</b> [ <b>creator</b> ]<br><b>Example:</b><br>Router(config-ephone-template)# conference add-mode creator           | (Optional) Configures the mode for adding parties to conferences.<br><ul style="list-style-type: none"> <li>• <b>creator</b>—Only the creator can add parties to the conference.</li> </ul>                                                                                                                                                                              |
| <b>Step 5</b> | <b>conference drop-mode</b> [   <b>creator local</b> ]<br><b>Example:</b><br>Router(config-ephone-template)# conference drop-mode creator | (Optional) Configures the mode for dropping parties from multi-party ad hoc conferences.<br><ul style="list-style-type: none"> <li>• <b>creator</b>—The active conference terminates when the creator hangs up.</li> <li>• <b>local</b>—The active conference terminates when the last local party in the conference hangs up or drops out of the conference.</li> </ul> |
| <b>Step 6</b> | <b>conference admin</b><br><b>Example:</b><br>Router(config-ephone-template)# conference admin                                            | (Optional) Configures the ephone as the conference administrator. The administrator can:<br><ul style="list-style-type: none"> <li>• Dial in to any conference directly through the conference number</li> <li>• Use the ConfList soft key to list conference parties</li> <li>• Remove any party from any conference</li> </ul>                                         |

|                | Command or Action                                                                                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b>  | <p><b>softkeys connected</b> { [Acct] [ConfList] [Confrn] [Endcall] [Flash] [HLog] [Hold] [Join] [LiveRcd] [Park] [RmLstC] [Select] [TrnsfVM] [Trnsfer] }</p> <p><b>Example:</b></p> <pre>Router(config-ephone-template)# softkeys connected Hold Trnsfer Park Endcall Confrn ConfList Join Select RmLstC</pre> | <p>Configures an ephone template for softkey display during the connected call stage.</p> <ul style="list-style-type: none"> <li>The soft keys used for multi-party conferencing are <b>RmLstC</b>, <b>ConfList</b>, <b>Join</b>, and <b>Select</b>. These soft keys are supported for hard-ware based conferencing only and require the appropriate DSP farm configuration.</li> <li>The number and order of soft key keywords you enter in this command correspond to the number and order of soft keys on your phone.</li> </ul> |
| <b>Step 8</b>  | <p><b>softkeys hold</b> { [Join] [Newcall] [Resume] [Select] }</p> <p><b>Example:</b></p> <pre>Router(config-ephone-template)# softkeys hold Join Newcall Resume Select</pre>                                                                                                                                   | <p>Configures an ephone template to modify softkey display during the call-hold call stage.</p> <ul style="list-style-type: none"> <li>The soft keys used for multi-party conferencing are <b>Join</b> and <b>Select</b>. These soft keys are supported for hard-ware based conferencing only and require the appropriate DSP farm configuration.</li> <li>The number and order of softkey keywords you enter in this command correspond to the number and order of soft keys on your phone.</li> </ul>                             |
| <b>Step 9</b>  | <p><b>softkeys idle</b> { [Cfwdall] [ConfList] [Dnd] [Gpickup] [HLog] [Join] [Login] [Newcall] [Pickup] [Redial] [RmLstC] }</p> <p><b>Example:</b></p> <pre>Router(config-ephone-template)# softkeys idle ConfList Gpickup Join Login Newcall Pickup Redial RmLstC</pre>                                        | <p>Configures an ephone template for softkey display during the idle call stage.</p> <ul style="list-style-type: none"> <li>The soft keys used for multi-party conferencing are <b>RmLstC</b>, <b>ConfList</b>, and <b>Join</b>. These soft keys are supported for hard-ware based conferencing only and require the appropriate DSP farm configuration.</li> <li>The number and order of soft key keywords you enter in this command correspond to the number and order of soft keys on your phone.</li> </ul>                     |
| <b>Step 10</b> | <p><b>softkeys seized</b> { [CallBack] [Cfwdall] [Endcall] [Gpickup] [HLog] [MeetMe] [Pickup] [Redial] }</p> <p><b>Example:</b></p> <pre>Router(config-ephone-template)# softkeys seized Redial Endcall Cfwdall Pickup Gpickup Callback Meetme</pre>                                                            | <p>(Optional) Configures an ephone template for softkey display during the seized call stage.</p> <ul style="list-style-type: none"> <li>You must configure the <b>MeetMe</b> soft key in the seized state for the ephone to initiate a meet-me conference.</li> <li>The number and order of soft key keywords you enter in this command correspond to the number and order of soft keys on your phone.</li> </ul>                                                                                                                  |
| <b>Step 11</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config-ephone-template)# exit</pre>                                                                                                                                                                                                                       | <p>Exits ephone-template configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                | Command or Action                                                                                            | Purpose                                                                                                                                         |
|----------------|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 12</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br>Router(config)# ephone 1                                | Enters ephone configuration mode to create and configure an ephone.                                                                             |
| <b>Step 13</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-ephone)# ephone-dn-template 1 | Applies an ephone-dn template to an ephone-dn.<br><b>Note</b><br>The <i>template-tag</i> must be the same as the <i>template-tag</i> in Step 3. |
| <b>Step 14</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# exit                                                 | Exits to privileged EXEC mode.                                                                                                                  |

### What to do next

If you are finished modifying the configuration, you are ready to generate configuration files for the phones to be connected. See [Generate Configuration Files for SCCP Phones, on page 400](#).

## Verify Conferencing

### Procedure

Use the **show running-config** command to verify your configuration. Any non-default conferencing parameters are listed in the telephony-service portion of the output, and end-of-conference options are listed in the ephone portion.

#### Example:

```
Router# show running-config
!
ephone-dn 1 dual-line
ring feature secondary
number 126 secondary 1261
description Sales
name Smith
call-forward busy 500 secondary
call-forward noan 500 timeout 10
huntstop channel
no huntstop
no forward local-calls
!
ephone 1
mac-address 011F.92A0.C10B
type 7960 addon 1 7914
no dnd feature-ring
keep-conference
```

## Verify Hardware Conferencing

The CLI commands to troubleshoot hardware conferencing is applicable to:

- Both SIP and SCCP conference configurations in Unified CME.

### Ad Hoc Hardware Conference

You can configure the following show commands to verify Ad Hoc hardware conferencing:

- **show telephony-service conference hardware**
- **show dspfarm profile <profile number>**
- **show sccp**
- **show call active voice compact**
- **show call active voice brief**

The following is a sample output for **show telephony-service conference hardware** command.

```
Router#show telephony-service conference hardware
Conference Type Active Max Peak Host HostPhone Last
 cur(initial)
=====
A002 Ad-hoc 4 8 5 1111 sip1 1 (1) 5555 sccp2
```

The following is a sample output for **show dspfarm dsp active** command.

```
Router#show dspfarm dsp active
SLOT DSP VERSION STATUS CHNL USE TYPE RSC_ID BRIDGE_ID PKTS_TXED PKTS_RXED
0/1 1 44.1.0 UP 1 USED conf 1 498 3384 3329
0/1 1 44.1.0 UP 1 USED conf 1 499 3383 1739
0/1 1 44.1.0 UP 1 USED conf 1 500 3382 3384
0/1 1 44.1.0 UP 1 USED conf 1 503 2899 671
0/1 1 44.1.0 UP 1 USED conf 1 506 2525 1269
```

### Meet Me Conference

You can configure the following show commands to verify Ad Hoc hardware conferencing:

- **show sccp connection**
- **show ephone-dn conference**
- **show telephony-service conference hardware**
- **show dspfarm dsp active**
- **show call active voice compact**
- **Show voip rtp connections**

The following is a sample output for **show ephone-dn conference** command.

```
Router#show ephone-dn conference
type active inactive numbers
=====
```

```
Meetme 4 28 5555
DN tags: 9, 10, 11, 12
```

The following is a sample output for **show telephony-service conference hardware** command.

```
Router#sh telephony-service conference hardware
Conference Type Active Max Peak Host HostPhone Last
 Type Active Max Peak Host cur(initial)
=====
5555 Meetme 4 32 4 phone2 1002 2 (2) 1003 1003
```

The following is a sample output for **show dspfarm dsp active** command.

```
Router#show dspfarm dsp active
SLOT DSP VERSION STATUS CHNL USE TYPE RSC_ID BRIDGE_ID PKTS_TXED PKTS_RXED

0/1 4 44.2.0 UP 1 USED conf 1 8 8574 8599
0/1 4 44.2.0 UP 1 USED conf 1 10 8223 8250
0/1 4 44.2.0 UP 1 USED conf 1 12 7724 7639
0/1 4 44.2.0 UP 1 USED conf 1 14 7274 7299
```

Total number of DSPFARM DSP channel(s) 1

The following is a sample output for **show call active voice compact** command.

```
Router#show call active voice compact
<callID> A/O FAX T<sec> Codec type Peer Address IP R<ip>:<udp>
VRF
Total call-legs: 8
 68771 ANS T301 g711ulaw VOIP P1002 10.0.0.1:22018
 68772 ORG T302 g711ulaw TELE P5555
 68775 ANS T295 g711ulaw VOIP P1004 10.0.0.2:22462
 68776 ORG T296 g711ulaw TELE P5555
 68778 ANS T286 g711ulaw VOIP P1001 10.0.0.3:31890
 68779 ORG T287 g711ulaw TELE P5555
 68781 ANS T278 g711ulaw VOIP P1003 10.0.0.4:31202
 68782 ORG T279 g711ulaw TELE P5555
```

## Verify Keep Conference

The following is a sample output for **show voice register tftp-bind** command.

```
Router#sh voice register tftp-bind
tftp-server url flash:/its/SEPE0D173E54508.cnf.xml alias SEPE0D173E54508.cnf.xml
```

With **keep-conference** enabled in **voice register pool** or **voice register template**

```
Router#more flash:/its/SEPE0D173E54508.cnf.xml | sec cnf
<cnfJoinEnabled>true</cnfJoinEnabled>
```

With **keep-conference** disabled in both **voice register pool** and **voice register template**

```
Router#more flash:/its/SEPE0D173E54508.cnf.xml | sec cnf
<cnfJoinEnabled>>false</cnfJoinEnabled>
```

## Troubleshoot Conferencing

### Procedure

- 
- |               |                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Use the <b>debug ephone</b> commands to observe messages and states associated with an ephone. For more information, see <a href="#">Cisco Unified CME Command Reference</a> . |
| <b>Step 2</b> | Use the <b>debug ephone detail</b> command for SCCP calls in a software conference.                                                                                            |
| <b>Step 3</b> | Use the <b>debug ccsip all</b> command for SIP calls in a software conference.                                                                                                 |
| <b>Step 4</b> | Use the <b>debug ephone hw-conference</b> command for SIP and SCCP calls in a hardware conference.                                                                             |
- 

## Configuration Examples for Conferencing

### Example for Configuration of Max Conference and Gain Levels

The following example sets the maximum number of conferences for a Cisco Unified IP phone to 4 and configures a gain of 6 db for inbound audio packets from remote PSTN or VoIP calls joining a conference:

```
telephony-service
max-conferences 4 gain 6
```

### Example for Keep Conference Configuration on SCCP Phones

In the following example, extension 3555 initiates a three-way conference. After the conference is established, extension 3555 can press the Confn soft key to disconnect the last party that was connected and remain connected to the first party that was connected. If extension 3555 hangs up from the conference, the other two parties remain connected if one of them is local to the Cisco Unified CME system.

```
ephone-dn 35
number 3555

ephone 24
button 1:35
keep-conference drop-last local-only
```

In the following example, extension 3666 initiates a three-way conference. After the conference is established, extension 3666 can press the Confn soft key to disconnect the last party that was connected and remain connected to the first party that was connected. Also, extension 3666 can hang up or press the EndCall soft key to leave the conference and keep the other two parties connected.

```
ephone-dn 36
number 3666

ephone 25
button 1:36
```

```
keep-conference drop-last endcall
```

In the following example, extension 3777 initiates a three-way conference. After the conference is established, extension 3777 can press the Confn soft key to disconnect the last party that was connected and remain connected to the first party that was connected. Also, extension 3777 can hang up or press the EndCall soft key to leave the conference and keep the other two parties connected *only* if one of the two parties is local to the Cisco Unified CME system.

```
ephone-dn 38
 number 3777

ephone 27
 button 1:38
 keep-conference drop-last endcall local-only
```

In the following example, extension 3999 initiates a three-way conference. After the conference is established, extension 3999 can hang up or press the EndCall soft key to leave the conference and keep the other two parties connected *only* if one of the two parties is local to the Cisco Unified CME system. Extension 3999 can also use the Confn soft key to break up the conference but stay connected to both parties.

```
ephone-dn 39
 number 3999

ephone 29
 button 1:39
 keep-conference endcall local-only
```

## Example for Keep Conference Configuration on SIP Phones

In the following example, extension 3555 initiates a three-way conference on SIP phones using keep-conference configured under **voice register pool**.

```
voice register dn 35
 number 3555

voice register pool 24
 number 1 dn 35
 keep-conference
```

Following is a sample configuration for keep-conference under **voice register template**.

```
voice register template 24
 keep-conference

voice register pool 35
 template 24
```

## Example of DSP Farm and Cisco Unified CME on the Same Router

In this example, the DSP farm and Cisco Unified CME are on the same router as shown in [Figure 67: CME and the DSP Farm on the Same Router, on page 1397](#).

## Where to Go Next

### Controlling Use of the Conference Soft Key

To block the functioning of the conference (Confrn) soft key without removing the key display, create and apply an ephone template that contains the **features blocked** command. For more information, see [Templates, on page 1423](#).

To remove the conference (Confrn) soft key from one or more phones, create and apply an ephone template that contains the appropriate **softkeys** command. For more information, see [Customize Softkeys, on page 919](#).

## Feature Information for Conferencing

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

Table 112: Feature Information for Conferencing

| Feature Name                  | Cisco Unified CME Version | Feature Information                                                                                                                                                                                                                                                           |
|-------------------------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Meet-me Conference            | 11.7                      | Added support for hardware-based Meet-me Conference on Cisco 4000 Series Integrated Services Router.                                                                                                                                                                          |
|                               | 4.1                       | Added support for hardware-based meet-me conferences created by parties calling a designated conference number.                                                                                                                                                               |
| Multi-party Ad Hoc Conference | 11.7                      | Added support for hardware-based Multi-party Conference on Cisco 4000 Series Integrated Services Router.                                                                                                                                                                      |
|                               | 4.1                       | Added support for hardware-based Multi-party Conferencing Enhancements which uses DSPs to enhance ad hoc conferencing by allowing more parties than software-based ad hoc conferencing. Configuring multi-party ad hoc conferencing disables three-party ad hoc conferencing. |
| Three-Party Ad Hoc Conference | 11.7                      | Added support for three-party Ad Hoc conference on Cisco 4000 Series Integrated Services Router.                                                                                                                                                                              |
|                               | 4.0                       | <ul style="list-style-type: none"> <li>End-of-conference options were introduced.</li> <li>Phones connected in a three-way conference display “Conference.”</li> </ul>                                                                                                        |
|                               | 3.2.2                     | Conference gain control for external calls was introduced.                                                                                                                                                                                                                    |
|                               | 3.2                       | Conference initiator drop-off control was introduced.                                                                                                                                                                                                                         |
|                               | 2.0                       | Support for software-based conferencing was introduced.                                                                                                                                                                                                                       |

## CHAPTER 47

# Templates

---

- [Information About Templates, on page 1423](#)
- [Configure Templates, on page 1424](#)
- [Configuration Examples for Creating Templates, on page 1430](#)
- [Where to Go Next, on page 1431](#)
- [Feature Information for Creating Templates, on page 1431](#)

## Information About Templates

### Phone Templates

An ephone or voice-register template is a set of features that can be applied to one or more individual phones using a single command.

Ephone templates were introduced in Cisco CME 3.2 to manipulate softkey display and order on IP phones.

In Cisco Unified CME 4.0, ephone templates were significantly enhanced to include a number of additional phone features. Templates allow you to uniformly and easily implement the features you select for a set of phones. A maximum of 20 ephone templates can be created in a Cisco Unified CME system, although an ephone can have only one template applied to it at a time.

In Cisco Unified CME 4.3 and later versions, an ephone template cannot be applied to a particular phone unless its configuration file includes its Mac address. If you attempt to apply a template to a phone for which the MAC address is not configured, a message appears.

If you use an ephone template to apply a command to a phone and you also use the same command in ephone configuration mode for the same phone, the value set in ephone configuration mode has priority.

Voice-register templates were introduced in Cisco CME 3.4 to enable sets of features to be applied to individual SIP Phones that are connected directly in Cisco Unified CME. Typically, features to be enabled by using a voice-register template are not configurable in other configuration modes. A maximum 10 voice-register templates can be defined in Cisco Unified CME, although a phone can have only one template applied to it at a time.

Type ? in ephone-template or voice-register-template configuration mode to display a list of features that can be implemented by using templates.

For configuration information, see [Create an Ephone Template, on page 1424](#).

## Ephone-dn Templates

Ephone-dn templates allow you to apply a standard set of features to ephone-dns. A maximum of 15 ephone-dn templates can be created in a Cisco Unified CME system, although an ephone-dn can have only one template applied to it at a time.

If you use an ephone-dn template to apply a command to an ephone-dn and you also use the same command in ephone-dn configuration mode for the same ephone-dn, the value that you set in ephone-dn configuration mode has priority.

Type ? in ephone-dn-template configuration mode to display a list of features that can be implemented by using templates.

For configuration information, see [Create an Ephone-dn Template, on page 1426](#).

## Configure Templates

### Create an Ephone Template

To create an ephone template and apply it to a phone, perform the following steps.

#### Before you begin

- In Cisco Unified CME 4.3 and later versions, the configuration file for a particular phone must contain its MAC address before an ephone template can be applied to that phone. To explicitly configure a MAC address, use the **mac-address** command in ephone configuration mode. For configuration information, see [Configuring Phones to Make Basic Calls, on page 229](#).
- It is recommended to configure cnf-file per phone before adding ephone-template under ephone.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. *command*
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **restart**
9. **end**

#### DETAILED STEPS

##### Procedure

|        | Command or Action | Purpose                       |
|--------|-------------------|-------------------------------|
| Step 1 | <b>enable</b>     | Enables privileged EXEC mode. |

|               | Command or Action                                                                                          | Purpose                                                                                                                                                                                                                                                                   |
|---------------|------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Router# enable                                                                          | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                 | Enters global configuration mode.                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>ephone-template <i>template-tag</i></b><br><b>Example:</b><br>Router(config)# ephone-template 15        | Enters ephone-template configuration mode to create an ephone template. <ul style="list-style-type: none"> <li><i>template-tag</i>—Unique identifier for the ephone template that is being created. Range is 1 to 20.</li> </ul>                                          |
| <b>Step 4</b> | <i>command</i><br><b>Example:</b><br>Router(config-ephone-template)# features blocked<br>Park Transfer     | Applies the specified command to the ephone template that is being created. <ul style="list-style-type: none"> <li>Type ? for a list of commands that can be used in this step.</li> </ul> Repeat this step for each command that you want to add to the ephone template. |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-ephone-template)# exit                                     | Exits ephone-template configuration mode.                                                                                                                                                                                                                                 |
| <b>Step 6</b> | <b>ephone <i>phone-tag</i></b><br><b>Example:</b><br>Router(config)# ephone 36                             | Enters ephone configuration mode. <ul style="list-style-type: none"> <li><i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks.</li> </ul>                                                                                       |
| <b>Step 7</b> | <b>ephone-template <i>template-tag</i></b><br><b>Example:</b><br>Router(config-ephone)# ephone-template 15 | Applies an ephone template to the ephone that is being configured.                                                                                                                                                                                                        |
| <b>Step 8</b> | <b>restart</b><br><b>Example:</b><br>Router(config-ephone)# restart                                        | Performs a fast reboot of this ephone. Does not contact the DHCP or TFTP server for updated information. <p><b>Note</b><br/>Restart all ephones using the <b>restart all</b> command in telephony-service configuration mode.</p>                                         |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                                          |

# Create an Ephone-dn Template

To create an ephone-dn template and apply it to an ephone-dn, perform the following steps:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn-template** *template-tag*
4. *command*
5. **exit**
6. **ephone-dn** *dn-tag*
7. **ephone-dn-template** *template-tag*
8. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                        | Purpose                                                                                                                                                                                                                                                   |
|---------------|----------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                               | Enters global configuration mode.                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>ephone-dn-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# ephone-dn-template 3 | Enters ephone-dn-template configuration mode to create an ephone-dn template.<br><ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier for the ephone-dn template that is being created. Range is 1 to 20.</li> </ul>            |
| <b>Step 4</b> | <i>command</i><br><b>Example:</b><br>Router(config-ephone-dn-template)# call-forwarding busy 4000        | Applies the specified command to the ephone-dn template that is being created.<br><ul style="list-style-type: none"> <li>• Type ? for a list of commands that can be used in this step.</li> </ul> Repeat this step to add more commands to the template. |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-ephone-dn-template)# exit                                | Exits ephone-dn-template configuration mode.                                                                                                                                                                                                              |
| <b>Step 6</b> | <b>ephone-dn</b> <i>dn-tag</i><br><b>Example:</b>                                                        | Enters ephone-dn configuration mode.                                                                                                                                                                                                                      |

|               | Command or Action                                                                                                  | Purpose                                                                                                                                             |
|---------------|--------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router(config)# ephone-dn 23                                                                                       | <ul style="list-style-type: none"> <li>• <i>dn-tag</i>—Unique sequence number that identifies this ephone-dn during configuration tasks.</li> </ul> |
| <b>Step 7</b> | <b>ephone-dn-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-ephone-dn)# ephone-dn-template 3 | Applies an ephone-dn template to the ephone-dn that is being configured.                                                                            |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone-dn)# end                                                     | Returns to privileged EXEC mode.                                                                                                                    |

## Verify Templates on SCCP Phones

To view the configuration of a template, and verify to which phone or directory number a template is applied, perform the following steps.

### Procedure

#### Step 1 show telephony-service ephone

Use is command to display information about SCCP phones in Cisco Unified CME, including which template-tags are enabled in the configuration for a phone.

```
Router# show telephony-service ephone 1
ephone-dn-template 1
description Call Center Line 1
call-forward busy 500
call-forward noan 500 timeout 10
pickup-group 33!
!
```

#### Step 2 show telephony-service ephone-template

Use is command to display information about an ephone template in Cisco Unified CME, including a list of features enabled in the configuration.

#### Step 3 show telephony-service ephone-dn

Use is command to display information about directory numbers, including which template-tags are enabled in the configuration for a directory number.

```
Router# show telephony-service ephone-dn 4
!
ephone-dn 4 dual-line
number 136
description Desk4
ephone-dn template 1
ephone-hunt login
```

**Step 4**    **show telephony-service ephone-dn-template**

Use is command to display information about an ephone-dn template in Cisco Unified CME, including a list of features enabled in the configuration.

## Create and Apply Templates for SIP Phones

To create templates of common features and softkeys that can be applied to individual Cisco SIP Phones, follow the steps in this section.

**Before you begin**

- Cisco CME 3.4 or a later version.
- The **mode cme** command must be enabled in Cisco Unified CME.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice register template** *template-tag*
4. *command*
5. **exit**
6. **voice register pool** *pool-tag*
7. **template** *template-tag*
8. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                                                                  | Purpose                                                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                         | Enters global configuration mode.                                                                                                                                                                     |
| <b>Step 3</b> | <b>voice register template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# voice register template 1 | Enters voice register template configuration mode to define a template of common parameters for SIP phones in Cisco Unified CME. <ul style="list-style-type: none"> <li>• Range is 1 to 5.</li> </ul> |

|               | Command or Action                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>command</b><br><b>Example:</b><br><pre>Router(config-register-template)# anonymous block</pre>                        | <p>Applies the specified command to this template and enables the corresponding feature on any supported SIP phone that uses a template in which this command is configure.</p> <ul style="list-style-type: none"> <li>Type <b>?</b> to display list of commands that can be used in a voice register template.</li> </ul> <p>Repeat this step for each feature to be added to this voice register template.</p> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config-register-template)# exit</pre>                                      | Exits configuration mode to the next highest mode in the configuration mode hierarchy.                                                                                                                                                                                                                                                                                                                           |
| <b>Step 6</b> | <b>voice register pool <i>pool-tag</i></b><br><b>Example:</b><br><pre>Router(config)# voice register pool 3</pre>        | <p>Enters voice register pool configuration mode to set phone-specific parameters for SIP phones.</p> <ul style="list-style-type: none"> <li><i>pool-tag</i>—Unique sequence number of the Cisco SIP phone to be configured. Range is 1 to 100 or the upper limit as defined by <b>max-pool</b> command.</li> </ul>                                                                                              |
| <b>Step 7</b> | <b>template <i>template-tag</i></b><br><b>Example:</b><br><pre>Router(config-register-pool)# voice register pool 1</pre> | <p>Applies a template created with the <b>voice register template</b> command.</p> <ul style="list-style-type: none"> <li><i>template-tag</i>—Unique sequence number of the template to be applied to the SIP phone specified by the <b>voice register pool</b> command. Range is 1 to 5.</li> </ul>                                                                                                             |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-register-pool)# end</pre>                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                 |

### Examples

The following example shows templates 1 and 2 and how to do the following:

- Apply template 1 to SIP phones 1 to 3.
- Apply template 2 to SIP phone 4.
- Remove a previously created template 5 from SIP phone 5.

```
Router(config)# voice register template 1
Router(config-register-temp)# anonymous block
Router(config-register-temp)# caller-id block
Router(config-register-temp)# voicemail 5001 timeout 15

Router(config)# voice register template 2
Router(config-register-temp)# anonymous block
Router(config-register-temp)# caller-id block
```

```

Router(config-register-temp)# no conference
Router(config-register-temp)# no transfer-attended
Router(config-register-temp)# voicemail 5005 timeout 15

Router(config)# voice register pool 1
Router(config-register-pool)# template 1

Router(config)# voice register pool 2
Router(config-register-pool)# template 1

Router(config)# voice register pool 3
Router(config-register-pool)# template 1

Router(config)# voice register pool 4
Router(config-register-pool)# template 2

Router(config)# voice register pool 5
Router(config-register-pool)# no template 5

```

## Configuration Examples for Creating Templates

### Example to Block The Use of Park and Transfer Soft Keys Using Ephone Template

The following example creates an ephone template to block the use of Park and Transfer soft keys. It is applied to ephone 36 and extension 2333.

```

ephone-template 15
 features blocked Park Transfer

ephone-dn 2
 number 2333

ephone 36
 button 1:2
 ephone-template 15

```

### Example to Set Call Forwarding Using Ephone-dn Template

The following example creates ephone-dn template 3, which sets call forwarding on busy and no answer to forward calls to extension 4000 and sets the pickup group to 4. Ephone-dn template 3 is then applied to ephone-dn 23 and ephone-dn 33, which appear on ephones 13 and 14, respectively.

```

ephone-dn-template 3
 call-forwarding busy 4000
 call-forwarding noan 4000 timeout 30
 pickup group 4

ephone-dn 23
 number 2323
 ephone-dn-template 3

ephone-dn 33
 number 3333
 ephone-dn-template 3

```

```

ephone 13
 button 1:23

ephone 14
 button 1:33

```

## Where to Go Next

### Softkey Display

The display of soft keys during different call states is managed using ephone templates. For more information, see [Customize Softkeys, on page 919](#).

## Feature Information for Creating Templates

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 113: Feature Information for Templates**

| Feature Name                   | Cisco Unified CME Version | Feature Information                                                                                                                                                                          |
|--------------------------------|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ephone Templates               | 4.0                       | <ul style="list-style-type: none"> <li>The number of ephone templates that can be created was increased from 5 to 20.</li> <li>More commands can be included in ephone templates.</li> </ul> |
|                                | 3.2                       | Ephone templates were introduced to manage soft keys. The only commands that can be used in ephone templates are the <b>softkeys</b> commands.                                               |
| Ephone-dn Templates            | 4.0                       | Ephone-dn templates were introduced.                                                                                                                                                         |
| Phone Templates for SIP Phones | 4.1                       | The maximum number of templates that can be configured was increased from 5 to 10.                                                                                                           |
|                                | 3.4                       | Voice-register templates were introduced for SIP Phones directly connected to a Cisco Unified CME router.                                                                                    |

## CHAPTER 48

# Modify Cisco Unified IP Phone Options

This chapter describes the screen and button features available for Cisco Unified IP phones connected to Cisco Unified Communications Manager Express (Cisco Unified CME).

- [Information About Cisco Unified IP Phone Options, on page 1433](#)
- [Configure Cisco Unified IP Phone Options, on page 1442](#)
- [Configuration Examples for Cisco Unified IP Phone Options, on page 1480](#)
- [Feature Information for Cisco Unified IP Phone Options, on page 1485](#)

## Information About Cisco Unified IP Phone Options

### Clear Directory Entries

Cisco Unified CME 8.6 allows you to clear the display of call-history details such as missed, placed, and received call entries on your Cisco Unified SCCP IP phone's display screen. You can press the directory services button on most of the Cisco Unified IP phones or program a line button on 7931 phone to delete the display of phone number entries in the missed, placed, and received calls. The clear call directory feature is supported on Cisco Unified IP phones, 7960, 7961, 7970, 7971 and 8961.

To enable the clear directory entries feature, a call-history option is added to the **exclude** command. For more information on configuring phones to clear call-history details, see [Clear Call-History Details from a SCCP Phone, on page 1443](#).

### Enable Customized Background Images for Cisco Unified IP Phone 7970

The Cisco Unified IP Phone 7970 and 7971 support customized background images on the phone screen. To enable your Cisco Unified IP Phone 7970 or 7971 to display a customized background image, follow the procedure in the technical note at

[http://www.cisco.com/en/US/products/sw/voicesw/ps4625/products\\_tech\\_note09186a008062495a.shtml](http://www.cisco.com/en/US/products/sw/voicesw/ps4625/products_tech_note09186a008062495a.shtml).

Sample background images are available in the 7970-backgrounds.tar file at

<http://www.cisco.com/cgi-bin/tablebuild.pl/ip-iostsp>.

## Customized Button Layout

Cisco Unified CME 8.5 and later versions allow you to customize the display order of various button types on a phone using the button layout feature. The button layout feature allows you to customize the display of the following button types:

- Line buttons
- Speed Dial buttons
- BLF Speed Dial buttons
- Feature Buttons
- ServiceURL buttons

Cisco Unified CME 8.5 uses the **button layout** command to populate buttons in any desired order. All buttons displayed on the phone follow the button-layout configuration. In the **button layout** command, the physical button number on the phone is specified under the *button-string* parameter of the **button layout** command. Buttons that are not defined under the button layout configuration are displayed as blank lines. Before configuring button layout on phones, line buttons, feature buttons (including privacy button), and url buttons must be configured through **line button**, **feature button** and **url button** commands, respectively.

### Line Buttons

The button layout control feature allows you to populate buttons with corresponding physical line numbers or line number ranges. Line buttons that are not associated with a physical line are not displayed on the phone. You can customize any Cisco Unified SCCP IP phone button to function as a line button using the **button** command and specifying the position, button type, and directory number of the phone. For more information, see [Configure Button Layout on SCCP Phones, on page 1448](#).

For Cisco Unified SIP phones, the first physical button must be a line button with a valid directory number. You can customize the other buttons using the **button** command and specifying the relative position (position index), button type, and directory number of the button. For more information, see [Configure Button Layout on SIP Phones, on page 1450](#).

### Speed Dial Buttons

You can customize the display of Speed Dial buttons to appear before, after, or between line buttons using the **speed-dial** command and specifying the position of the button. The button layout feature allows you to populate the buttons with corresponding physical line numbers or line number ranges. Buttons that do not have a physical line associated with them are not displayed on the phone.

### BLF Speed Dial Buttons

The button layout feature allows you to display the BLF Speed-Dial buttons before, after or between the line buttons using the **blf-speed-dial** command with a specific position. Once the BLF speed-dial button is configured, the system populates the button with corresponding physical line number or range of line numbers. Buttons without a physical line association are not displayed on the phone.

### Feature Buttons

Currently, privacy button is the only button available and is presented at the end of all the above mentioned buttons. With PLK feature you can enable most phone features on phone's physical buttons (line keys). This button layout feature requests all presented buttons to be configured via **button**, **speed-dial**, **blf-speed-dial**, **feature-button**, or **url-button** commands. The privacy-button is overridden by feature-button if there is one. For more information on configuring feature buttons on a line key, see [Configure Feature Button on a Cisco](#)

[Unified SCCP Line Key, on page 1458](#) and [Configure Feature Button on a Cisco Unified SIP Phone Line Key, on page 1456](#).

**Note** If the button-layout feature is configured in both ephone-template and logout profile (extension mobility) mode, configuration in the latter takes precedence. Button-layout configuration under ephone mode takes precedence in phones that do not have extension mobility (EM).

**Note** Privacy button is counted as a feature button on phones that support privacy button and do not have any feature button configured through the **feature-button** command.

### URL Buttons

The button layout feature allows you to display the url button before, after, or even between the line buttons, speed dial buttons, BLF speed dial buttons, or feature buttons. For more information on configuring the URL button on a line key, see [Configure Service URL Button on a SCCP Phone Line Key, on page 1454](#) and [Configure Service URL Button on a SIP IP Phone Line Key, on page 1452](#).

## Customized Phone User Interface Services

In Cisco Unified CME 8.5 and later, you can customize the availability of individual service items such as Extension Mobility, My Phone Apps, and Single Number Reach (SNR) on a phone's user interface by assigning individual service item to a button using the Programmable Line Key (PLK) url-button configuration. For more information, see [Configure Service URL Button on a SCCP Phone Line Key, on page 1454](#).

You can limit the availability of an individual service item on a phone's user interface by disabling the configuration for services such as EM, My Phone Apps, and Local Directory and exclude the display of these services from the phone's user interface. You can use the exclude command under ephone-template mode to exclude the display of Extension Mobility (EM), My Phone Apps, and Local Directory. For more information, see [Block Local Services on Phone User Interface, on page 1460](#).

If a directory service is enabled through PLK configuration, the PLK configuration takes precedence over the exclusion of directory services under ephone or ephone template configuration modes. The service is available through the button directly regardless of the exclusion of services configured under ephone and ephone-template modes.

In Cisco Unified CME 8.5 and later versions, you use the **exclude** command in ephone or ephone-template configuration mode to exclude the availability of local services such as EM, My Phone Apps, and Local Directory from a Cisco Unified SCCP IP phone's user interface.

In Cisco Unified CME 9.0 and later versions, you use the **exclude** command in voice register pool or voice register template configuration mode to exclude any of these local services from a Cisco Unified SIP IP phone's user interface.

**Note** Before Cisco Unified CME 9.0, you must configure the Local Directory service with the internal URL address. In Cisco Unified CME 9.0 and later versions, the internal URL address is the default when no external URL address is configured.

## Fixed Line-Feature Buttons for Cisco Unified IP Phone 7931G

In Cisco Unified CME 4.0(2) and later versions, you can select from two fixed button-layout formats to assign functionality to certain line buttons on a Cisco Unified IP Phone 7931G to support key system phone behavior. If you do not select a button set, no fixed set of feature/line buttons are defined.

The line button layout for the Cisco Unified IP Phone 7931G is a bottom-up array. Button 1 is at the bottom right of the array and button 24 is at the top left of the array.

Button set 1 includes two predefined feature buttons: button 24 is Menu and button 23 is Headset.

Button set 2 includes four predefined feature buttons: button 24 is Menu; button 23 is Headset; button 22 is Directories; and button 21 is Messages.

For configuration, see [Select Button Layout for a Cisco Unified SCCP IP Phone 7931G, on page 1447](#).

## Header Bar Display

You can customize the content of an IP phone header bar, which is the top line of the IP phone display.

The IP phone header bar, or top line, of a Cisco Unified IP Phone normally replicates the text that appears next to the first line button. The header bar is shown in [Figure 69: Cisco Unified IP Phone Display, on page 1436](#). The header bar can, however, contain a user-definable message instead of the extension number. For example, the header bar can be used to display a name or the full E.164 number of the phone. If no description is specified, the header bar replicates the extension number that appears next to the first button on the phone.

**Figure 69: Cisco Unified IP Phone Display**

## Phone Labels

Phone labels are configurable text strings that can be displayed instead of extension numbers next to line buttons on a Cisco Unified IP phone. By default, the number that is associated to a directory number, and assigned to a phone, is displayed next to the applicable button. The label feature allows you to enter a meaningful text string for each directory number so that a phone user with multiple lines can select a line by label instead of by phone number, thus eliminating the need to consult in-house phone directories. For configuration information, see [Create Labels for Directory Numbers on SCCP Phones, on page 1464](#) or [Create Labels for Directory Numbers on a SIP Phone, on page 1465](#).

## Programmable Vendor Parameters for Phones

The vendorConfig section of the configuration file contains phone and display parameters that are read and implemented by a phone's firmware when that phone is booted. Only the parameters supported by the currently loaded firmware are available. The number and type of parameters may vary from one firmware version to the next.

The IP phone that downloads the configuration file will implement only those parameters that it can support and ignore configured parameters that it cannot implement. For example, a Cisco Unified IP Phone 7970G does not have a backlit display and cannot implement Backlight parameters regardless of whether they are configured. The following text shows the format of an entry in the configuration file:

```
<vendorConfig>
<parameter-name>parameter-value</parameter-name>
</vendorConfig>
```

For configuration information at the system level, see [Modify Vendor Parameters for All SCCP Phones, on page 1473](#).

For configuration information for individual phones, see [Modify Vendor Parameters for a Specific SCCP Phone, on page 1474](#).

## Push-to-Talk

This feature allows one-way Push-to-Talk (PTT) in Cisco Unified CME 7.0 and later versions without requiring an external server to support the functionality. PTT is supported in firmware version 1.0.4 and later versions on Cisco Unified Wireless IP Phone 7921 and 7925 with a thumb button.

In the following figure, button1/DN 1 is configured as the primary line for this phone. Button 6/ DN 10 is configured for PTT and is the line that is triggered by pushing the thumb button on this phone.

- Holding down on the thumb button causes the configured DN on the phone to go off-hook.
- The thumb button utilizes an intercom DN that targets a paging number (1050).
- The targeted paging group (DN 50) can be unicast or multicast or both.
- Users will hear a “zipzip” tone when call path is set up.
- All other keys on the phone are locked during this operation.
- Releasing the thumb button ends the call.

Figure 70: PTT Call Flow

For configuration information, see [Configure One-Way Push-to-Talk on Cisco Unified SCCP Wireless IP Phones](#), on page 1476.

## Support for Cisco Jabber

For Unified CME 12.5, Cisco Jabber was supported. In this version, the SIP softphone client supports VoIP over WLAN. Unified CME supports supplementary services such as Hold, Resume, Transfer, Call Park, and Call Pickup for the softphone SIP client.

**Note** Cisco Jabber versions supported on Unified CME are now End-of-Life. Hence, there is no active support for Cisco Jabber on Unified CME 14.1 or earlier releases.

## Feature Support for Cisco Jabber

The following features are supported for Cisco Jabber with Unified CME:

- Hold or Resume
- Transfer
- Shared Line
- Mixed Shared Line
- Call forward—All, Busy, No Answer, Unregistered
- Directed Call Park Pickup
- Single Number Reach (SNR)
- Voice Hunt Group (Sequential, Parallel)
- Hardware Conference
- Music On Hold
- Video

### Restrictions

The following features are not supported for Cisco Jabber with Unified CME:

- Barge
- cBarge
- Built-in Bridge (BIB) Conference
- Do Not Disturb
- KPML Dialing

## Cisco Jabber Client Support on CME

Cisco Jabber Client is a SIP-based soft client with integrated Instant Messaging and presence functionality, and uses the new Client Services Framework 2nd Generation (CSF2G) architecture.

CSF is a unified communications engine that is reused by multiple Cisco PC-based clients and mobile clients. The client is identified by a device ID name that can be configured under the voice register pool in Cisco Unified CME. You should configure the username and password under voice register pool to identify the user logging into Cisco Unified CME through Cisco Jabber client. The device discovery process uses HTTPS connection. Therefore, you should configure the secure HTTP on Cisco Unified CME.

A new phone type, Jabber-CSF-Client has been added to configure the Cisco Jabber client under voice register pool. This can be used to configure any CSF based Cisco Jabber client. In Unified CME 10.0, we used the type 'Jabber-Win' to configure Cisco Jabber client. In Unified CME 10.5, this type is deprecated and the new 'Jabber-CSF-Client' should be used to configure Cisco Jabber client as well.

Cisco Jabber CSF client can be provisioned in two modes: Full UC mode (with integrated IM and Presence services) and Phone only mode. The phone-only mode of Cisco Jabber CSF devices is also supported. This can be configured with the option 'phone-mode phone-only' under 'voice register global' or 'voice register pool' or 'voice register template' config.

If the Jabber client is installed in phone only mode then no extra configuration is required on CME. The normal Jabber configuration should be sufficient.

For more information on installing Jabber client in phone mode for Windows, see <https://www.cisco.com/c/en/us/support/unified-communications/jabber-windows/products-installation-guides-list.html>.

For more information on installing Jabber client in phone mode for Mac, see <https://www.cisco.com/c/en/us/support/unified-communications/jabber-mac/products-installation-guides-list.html>.

If the Jabber client is installed in Full UC mode and you want to enable the phone only mode from CME, then the 'phone-mode' configuration is required as mentioned in the configuration section.

[Table 114: Cisco Jabber Client Support Versions, on page 1440](#) lists the Cisco Jabber Client Support versions along with the corresponding CME and Jabber client versions:

For Unified CME Release 12.5 (On Cisco 4000 Series Integrated Services Router), Cisco Jabber CSF client (softphone mode) Version 12.1.0 for MAC (phone-only) and Windows (phone-only) was supported.

---

**Note**

Cisco Jabber client versions supported on Unified CME are now End-of-Life (EOL). Hence, there is no active support on Unified CME for Cisco Jabber clients.

---

Table 114: Cisco Jabber Client Support Versions

| Cisco CSF Device Type                                      | Unified CME Supported Version | Jabber Client Version |
|------------------------------------------------------------|-------------------------------|-----------------------|
| Cisco Jabber for MAC (phone-only) and Windows (phone-only) | 10.0                          | 9.1.0                 |
|                                                            | 10.5                          | 9.2.1                 |
|                                                            | 12.5                          | 12.1.0                |

**Restrictions**

- The Cisco Jabber CSF client supports only the softphone mode with Cisco Unified CME.
- Desk phone mode is not supported.
- The following Cisco Jabber CSF type of devices are not supported:
  - Cisco Jabber for iPhone (both full UC mode and phone-only mode)
  - Cisco Jabber for Android (both full UC mode and phone-only mode)
  - Cisco Jabber for iPad (both full UC mode and phone-only mode)

For configuration information, see [Configure Cisco Jabber for CSF Client in Unified CME, on page 1478](#).

For configuration examples, see [Example for Configuring Cisco Jabber CSF Client, on page 1481](#).

## System Message Display

The System Message Display feature allows you to specify a custom text or display message to appear in the lower part of the display window on display-capable IP phones. If you do not set a custom text or display message, the default message “Cisco Unified CME” is displayed.

When you specify a text message, the number of characters that can be displayed is not fixed because IP phones typically use a proportional (as opposed to fixed-width) font. There is room for approximately 30 alphanumeric characters.

The display message is refreshed with a new message after one of the following events occurs:

- Busy phone goes back on-hook.
- idle phone receives a keepalive message.
- Phone is restarted.

The file-display feature allows you to specify a file to display on display-capable IP phones when they are not in use. You can use this feature to provide the phone display with a system message that is refreshed at configurable intervals, similar to the way that the text message feature provides a message. The difference between the two is that the system text message feature displays a single line of text at the bottom of the phone display, whereas the system display message feature can use the entire display area and contain graphic images.

**Note**

- The **System Message** command is supported only for SCCP IP phones registered to CME. It is not supported for SIP IP phones in CME mode.

## URL Provisioning for Feature Buttons

URL provisioning for programmable feature buttons allows you to specify alternative XML files to access using the feature buttons on IP phones.

Certain phones, such as the Cisco Unified IP Phone 7940, 7940G, 7960, and 7960G, have programmable feature buttons that invoke noncall-related services. The four buttons—Services, Directories, Messages, and Information (the i button)—are linked to appropriate feature operations through URLs. The fifth button—Settings—is managed entirely by the phone.

The feature buttons are provisioned with specific URLs. The URLs link to XML web pages formatted with XML tags that the Cisco Unified IP phone understands and uses. When you press a feature button, the Cisco Unified IP phone uses the configured URL to access the appropriate XML web page for instructions. The web page sends instructions to the Cisco Unified IP phone to display information on the screen for users to navigate. Phone users can select options and enter information by using soft keys and the scroll button.

Operation of these feature buttons is determined by the capabilities of the Cisco Unified IP phone and the content of the specified URL.

In Cisco Unified CME 4.2 and later versions, up to eight URLs can be configured for the Services feature button by using an ephone template to apply the configuration to one or more supported SCCP phones. If you use an ephone template to configure services URLs for one or SCCP phones and you also configure a system-level services URL in telephony-service configuration mode, the value set in telephony-service configuration mode appears first in the list of services displayed when the phone user presses the Services feature button. Cisco Unified CME self-hosted services, such as Extension Mobility, always appears last in the list of options displayed for the Services feature button.

For configuration information, see [Provision URLs for Feature Buttons for SCCP Phones, on page 1469](#).

## My Phone Apps for Cisco Unified SIP IP Phones

Before Cisco Unified CME 9.0, the My Phone Apps features were only supported on Cisco Unified SCCP IP phones.

In Cisco Unified CME 9.0 and later versions, support is added for My Phone Apps feature on Cisco Unified SIP IP phones.

My Phone Apps is a user application that enables the following settings to be configured using the menu available with the phone's Services feature buttons:

- add, modify, or delete Speed Dial
- add, modify, or delete Fast Dial
- add, modify, or delete BLF Speed Dial
- change SNR DN
- perform after-hour login

- reset the phone

The My Phone Apps features are available on both Extension Mobility (EM) and non-EM phones. For EM phones, the user login service allows the user to temporarily access a physical phone other than their own and utilize their personal settings as if the phone is their own desk phone. Any change in settings follows the user to the next phone they access. For non-EM phones, any change in settings remains with the physical phone.

# Configure Cisco Unified IP Phone Options

## Enable Edit User Settings

### Before you begin

Cisco Unified CME 8.6 or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **service phone** *parameter-name parameter-value*
5. **voice register global**
6. **create profile**
7. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                    | Purpose                                                                                                         |
|---------------|--------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                               | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted</li></ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal       | Enters global configuration mode                                                                                |
| <b>Step 3</b> | <b>telephony-service</b><br><br><b>Example:</b><br>Router(config)# telephony-service | Enters telephony-service configuration mode.                                                                    |
| <b>Step 4</b> | <b>service phone</b> <i>parameter-name parameter-value</i><br><br><b>Example:</b>    | Enables the edit user settings.                                                                                 |

|               | Command or Action                                                                                      | Purpose                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|

## Clear Call-History Details from a SCCP Phone

To clear the display of Call History details such as Missed Calls, Placed Calls, and Received Calls, from a SCCP IP phone user interface, follow these steps:

### Before you begin

To enable phones to send an HTTP GET request, url directories must be the default (not configured) or configured as `http://<CME's ip address>/localdirectory`.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
  - **ephone** *phone-tag*
  - **ephone template** *template tag*
4. **exclude** [ **em** | **myphoneapp** | **directory** | **call-history** ]
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                      | Purpose                                                                                                            |
|---------------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <code>configure terminal</code>                                                                                                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | Enter one of the following commands:<br><ul style="list-style-type: none"> <li>• <b>ephone</b> <i>phone-tag</i></li> <li>• <b>ephone template</b> <i>template tag</i></li> </ul> <b>Example:</b><br>Router(config)# <code>ephone 10</code> | Enters ephone configuration mode.<br><ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number of the phone for which you want to exclude local services such as Extension Mobility, My Phone Apps, and Local Directory.</li> </ul>                                                                                                                                                                                                                                                                                                       |
| <b>Step 4</b> | <b>exclude</b> [ <b>em</b>   <b>myphoneapp</b>   <b>directory</b>   <b>call-history</b> ]<br><b>Example:</b><br>Router(config-ephone)# <code>exclude call-history</code>                                                                   | Excludes local services (EM, My Phone Apps, Local Directory, and Call History) from displaying on phone's user interface.<br><ul style="list-style-type: none"> <li>• <b>em</b>—Excludes Extension Mobility (EM) from the phone's user interface.</li> <li>• <b>myphoneapp</b>—Excludes My Phone App service from the phone's user interface.</li> <li>• <b>directory</b>—Excludes Local Directory service from the phone's user interface.</li> <li>• <b>call-history</b>—Excludes entries from Call History on the phone's user interface.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# <code>end</code>                                                                                                                                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Example

The following example shows call-history as excluded from ephone 10 and ephone-template 5:

```

!
telephony-service
max-ephones 40
max-dn 100
max-conferences 8 gain -6
transfer-system full-consult
!
!
ephone-template 5
exclude call-history
!
!
ephone 10
exclude call-history
device-security-mode none
!

```

## Troubleshooting Tips for Clearing Call-History Details from a SCCP Phone

The following is a list of troubleshooting tips for successful implementation of this feature:

- Make sure that the local directory XML tag is configured and provisioned correctly.
- Check the attribute for <directoryURL> tag in the xml file (it must be set up with http://<CME's ip address>/localdirectory) and the phone must be restarted with this XML cnf file.
- Make sure that the phone sends out an HTTP GET request.
- Make sure that the HTTP GET request in the Cisco Unified CME log with “deb ip http url” is enabled.
- Make sure that the Clear Directory Entries request is sent to the phone.
- Check the Missed Calls, Placed Calls, and Received Calls on your phone’s local directory.

## Configure Dial Rules for Cisco Softphone SIP Client

### Before you begin

Cisco Unified CME 8.6 or a later version.

Support for **idle url** is available only on Unified CME 12.0 and later versions.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register template** *template tag*
4. **url** { **AppDialRule** *string* | **DirLookupRule** *string* | **ldapServer** *string* | **idle url** | **service url** }
5. **voice register pool** *pool tag*
6. **end**

| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-pool)# end                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Examples

The following example shows dial rules configured under voice register template 2:

```
!
voice register template 2
url ldapServer ldap.abcd.com
url AppDialRule tftp://10.1.1.1/AppDialRules.xml
url DirLookupRule tftp://10.1.1.1/DirLookupRules.xml
!
```

The following is a sample of Application Dial Rule content:

```
Router#more flash:AppDialRules.xml
<?xml version="1.0" encoding="UTF-8"?><DialRules>
 <DialRule BeginsWith="+1" NumDigits="12" DigitsToRemove="1" PrefixWith="9"/>
 <DialRule BeginsWith="+1" NumDigits="12" DigitsToRemove="1" PrefixWith="9"/>
 <DialRule BeginsWith="919" NumDigits="10" DigitsToRemove="3" PrefixWith="9"/>
 <DialRule BeginsWith="1" NumDigits="11" DigitsToRemove="0" PrefixWith="9"/>
 <DialRule BeginsWith="" NumDigits="10" DigitsToRemove="0" PrefixWith="91"/>
 <DialRule BeginsWith="" NumDigits="7" DigitsToRemove="0" PrefixWith="9"/>
```

```

<DialRule BeginsWith="+" NumDigits="13" DigitsToRemove="1" PrefixWith="9011"/>
<DialRule BeginsWith="+" NumDigits="14" DigitsToRemove="1" PrefixWith="9011"/>
<DialRule BeginsWith="+" NumDigits="15" DigitsToRemove="1" PrefixWith="9011"/>

<DialRule BeginsWith="+" NumDigits="12" DigitsToRemove="1" PrefixWith="9011"/>
<DialRule BeginsWith="+" NumDigits="11" DigitsToRemove="1" PrefixWith="9011"/>
</DialRules>

```

## Select Button Layout for a Cisco Unified SCCP IP Phone 7931G

### Before you begin

Cisco Unified CME 4.0(2) or a later version.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. **button-layout** *phone-type* { **1** | **2** }
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **end**

### DETAILED STEPS

| Procedure     |                                                                                                                                           |                                                                                                                                                                                                                                              |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                                                      |

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                | Enters global configuration mode.                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# ephone-template 15                                       | Enters ephone-template configuration mode to create an ephone template.                                                                                                                                                                      |
| <b>Step 4</b> | <b>button-layout</b> <i>phone-type</i> { <b>1</b>   <b>2</b> }<br><b>Example:</b><br>Router(config-ephone-template)# button-layout 7931 2 | Specifies which fixed set of feature buttons appears on a Cisco Unified IP Phone 7931G that uses a template in which this is configured.<br>• <b>1</b> —Includes two predefined feature buttons: button 24 is Menu and button 23 is Headset. |

|               | Command or Action                                                                                                       | Purpose                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                         | <ul style="list-style-type: none"> <li>• 2—Includes four predefined feature buttons: button 24 is Menu; button 23 is Headset; button 22 is Directories; and button 21 is Messages.</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-ephone-template)# exit</code>                                     | Exits from this command mode to the next highest mode in the configuration mode hierarchy.                                                                                                    |
| <b>Step 6</b> | <b>ephone <i>phone-tag</i></b><br><b>Example:</b><br><code>Router(config)# ephone 1</code>                              | Enters ephone configuration mode.                                                                                                                                                             |
| <b>Step 7</b> | <b>ephone-template <i>template-tag</i></b><br><b>Example:</b><br><code>Router(config-ephone)# ephone-template 15</code> | Applies an ephone template to the ephone that is being configured.                                                                                                                            |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-ephone)# end</code>                                                | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                     |

### What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

## Configure Button Layout on SCCP Phones

### Before you begin

- Cisco Unified CME 8.5 or later versions.
- Button types such as, line, feature, url, speed-dial, and blf-speed-dial are configured using commands such as, **button**, **feature-button** or **privacy-button**, **url-button**, **speed-dial**, and **blf-speed-dial** respectively.
- First button must be configured as line button.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template *template tag***
4. **button-layout** [*button-string* | *button-type*]
5. **exit**
6. **ephone *phone-tag***
7. **ephone-template *template-tag***

## 8. end

| <b>Step 3</b> | <b>ephone-template</b> <i>template tag</i><br><b>Example:</b><br>Router(config)# ephone 10                                                                                                                                                                                                                                                                                                            | Enters ephone template configuration mode to create an ephone template.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 4</b> | <b>button-layout</b> [ <i>button-string</i>   <i>button-type</i> ]<br><b>Example:</b><br>Router(config-ephone-template)#button-layout 1 line<br>Router(config-ephone-template)#button-layout 2,5 speed-dial<br>Router(config-ephone-template)#button-layout 3,6 blfspeed-dial<br>Router(config-ephone-template)#button-layout 4,7,9 feature<br>Router(config-ephone-template)# button-layout 8,11 url | Assigns physical button numbers or ranges of numbers with button types.<br><ul style="list-style-type: none"> <li><i>button-string</i>—Specifies a coma separated list of physical button number or ranges of button numbers.</li> <li><i>button-type</i>—Specifies one of the following button types: Line, Speed-Dial, BLF-Speed-Dial, Feature, URL. Button number specifies the relative display order of the button within the button type (line button, speed-dial, blf-speed-dial, feature-button or url-button).</li> </ul> <p><b>Note</b><br/>To facilitate phone provisioning, the first line button should always be a line button.</p> <p><b>Note</b><br/>When no feature-buttons are configured, privacy button is counted as a feature button.</p> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-ephone-template)# exit                                                                                                                                                                                                                                                                                                                                | Exits from this command mode to the next highest mode in the configuration mode hierarchy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 6</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br>Router(config)# ephone 1                                                                                                                                                                                                                                                                                                                         | Enters ephone configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|               | Command or Action                                                                                          | Purpose                                                            |
|---------------|------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| <b>Step 7</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-ephone)# ephone-template 10 | Applies an ephone template to the ephone that is being configured. |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                | Exits configuration mode and enters privileged EXEC mode.          |

### Examples

```
Router# show telephony-service ephone-template
ephone-template 10
 button-layout 1 line
 button-layout 2,5 speed-dial
 button-layout 3,6 blf-speed-dial
 button-layout 4,7,9 feature
 button-layout 8,11 url
```

### What to do next

If you are done modifying parameters for SCCP phones in Cisco Unified CME, restart the phones.

## Configure Button Layout on SIP Phones

**Note** You can not change the button number in the line button or index command through button layout configuration because the button number specifies the relative display order of the button within the button type (line button, speed-dial, blf-speed-dial, feature button, or url button).

### Before you begin

- Cisco Unified CME 8.5 or later versions.
- Button types (line button, feature button, url-button, speed dial button, and blf speed dial button) must be configured before configuring button layout.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register template** *template-tag*
4. **button-layout** [*button-string*] [*button-type*]
5. **exit**
6. **voice register pool** *pool-tag*
7. **template** *template-tag*

## 8. end

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                                                                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>voice register template <i>template-tag</i></b><br><b>Example:</b><br>Router(config)# voice register template 5                                                                                                                                                                                                                                                                                                                | Enters voice register template configuration mode to create a SIP phone template. <ul style="list-style-type: none"> <li><i>template-tag</i>—Range: 1 to 10.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 4</b> | <b>button-layout [<i>button-string</i>] [<i>button-type</i>]</b><br><b>Example:</b><br><br>Router(config-register-template)#button-layout 1 line<br>Router(config-register-template)#button-layout 2, 5 speed-dial<br>Router(config-register-template)#button-layout 3, 6 blfspeed-dial<br>Router(config-register-template)#button-layout 4,7,9 feature-button<br>Router(config-register-template)# button-layout 8,11 url-button | Assigns physical button numbers or ranges of numbers with button types. <ul style="list-style-type: none"> <li><i>button-string</i>—Specifies a coma separated list of physical button number or ranges of button numbers.</li> <li><i>button-type</i>—Specifies one of the following button types: Line, Speed-Dial, BLF-Speed-Dial, Feature, URL.</li> </ul> <p><b>Note</b><br/>To facilitate phone provisioning, the first line button should always be a line button.</p> <p><b>Note</b><br/>Privacy-button is counted as a feature-button in this configuration if no feature-button is configured.</p> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-register-template)# exit                                                                                                                                                                                                                                                                                                                                                          | Exits voice register template configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 6</b> | <b>voice register pool <i>pool-tag</i></b><br><b>Example:</b><br>Router(config)# voice register pool 10                                                                                                                                                                                                                                                                                                                           | Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 7</b> | <b>template <i>template-tag</i></b><br><b>Example:</b>                                                                                                                                                                                                                                                                                                                                                                            | Applies a SIP phone template to the phone you are configuring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|               | Command or Action                                                      | Purpose                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router(config-register-pool)# template 5                               | <ul style="list-style-type: none"> <li>• <i>template-tag</i>— Template tag that was created with the voice register template command in <a href="#">Step 3, on page 1451</a>.</li> </ul> |
| <b>Step 8</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-register-pool)# end | Exits to privileged EXEC mode.                                                                                                                                                           |

### Examples

```

Router# show voice register template all
!
voice register dn 65
 number 3065
 name SIP-7965
 label SIP3065
!
voice register template 5
 button-layout 1 line
 button-layout 2,5 speed-dial
 button-layout 3,6 blf-speed-dial
 button-layout 4,7,9 feature-button
 button-layout 8,11 url-button
!
voice register template 2
 button-layout 1,5 line<
 button-layout 4 speed-dial
 button-layout 3,6 blf-speed-dial
 button-layout 7,9 feature-button
 button-layout 8,10-11 url-button
!

```

### What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

## Configure Service URL Button on a SIP IP Phone Line Key

### SUMMARY STEPS

1. enable
2. configure terminal
3. voice register template *template-tag*
4. url-button [*index number*] [*url location*] [*url name*]
5. exit
6. voice register pool *phone-tag*
7. template *template-tag*
8. end

## Procedure

|               | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>voice register template <i>template-tag</i></b><br><b>Example:</b><br>Router(config)# voice register template 5                                                  | Enters ephone-template configuration mode to create an ephone template. <ul style="list-style-type: none"> <li><i>template-tag</i>—Unique identifier for the ephone template that is being created. Range: 1 to 10.</li> </ul>                                                                |
| <b>Step 4</b> | <b>url-button [<i>index number</i>] [<i>url location</i>] [<i>url name</i>]</b><br><b>Example:</b><br>Router(config-register-temp)url-button 1 http://www.cisco.com | Configures a service url feature button on a line key. <ul style="list-style-type: none"> <li><i>Index number</i>—Unique index number. Range: 1 to 8.</li> <li><i>url location</i>—Location of the url.</li> <li><i>url name</i>—Service url with maximum length of 31 characters.</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-register-temp)# exit                                                                                                | Exits ephone-template configuration mode.                                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <b>voice register pool <i>phone-tag</i></b><br><b>Example:</b><br>Router(config)# voice register pool 12                                                            | Enters ephone configuration mode. <ul style="list-style-type: none"> <li><i>phone-tag</i>—Unique number that identifies this ephone during configuration tasks.</li> </ul>                                                                                                                    |
| <b>Step 7</b> | <b>template <i>template-tag</i></b><br><b>Example:</b><br>Router(config-register-pool)# template 5                                                                  | Applies the ephone template to the phone. <ul style="list-style-type: none"> <li><i>template-tag</i>—Unique identifier of the template that you created in <a href="#">Step 3, on page 1453</a>.</li> </ul>                                                                                   |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-pool)# end                                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                              |

## Examples

The following example shows url buttons configured in voice register template 1:

```
Router# show run
!
voice register template 1

url-button 1 http://9.10.10.254:80/localdirectory/query My_Dir
url-button 5 http://www.yahoo.com Yahoo

!
voice register pool 50
!
```

### What to do next

If you are done configuring the url buttons for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

# Configure Service URL Button on a SCCP Phone Line Key

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone template** *template-tag*
4. **url-button** *index type* | *url* [*name*]
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                  | Purpose                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                         | Enters global configuration mode.                                                                                                                                                                                                |
| <b>Step 3</b> | <b>ephone template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# ephone template 5 | Enters ephone-template configuration mode to create an ephone template. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier for the ephone template that is being created. |               | Command or Action                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>url-button</b> <i>index type</i>   <i>url [name]</i><br><b>Example:</b><br><pre> Router# (config-ephone-template) #url-button 1 myphoneapp Router (config-ephone-template) #url-button 2 em Router (config-ephone-template) #url-button 3 snr Router (config-ephone-template) #url-button 4 http://www.cisco.com </pre> | Configures a service url feature button on a line key. <ul style="list-style-type: none"> <li>• <i>Index</i>—Unique index number. Range: 1 to 8.</li> <li>• <i>type</i>—Type of service url button. Following types of url service buttons are available: <ul style="list-style-type: none"> <li>• myphoneapp: My phone application configured under phone user interface.</li> <li>• em: Extension Mobility</li> <li>• snr: Single Number Reach</li> </ul> </li> <li>• <i>url name</i>—Service url with maximum length of 31 characters.</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><pre> Router (config-ephone-template) # exit </pre>                                                                                                                                                                                                                                      | Exits ephone-template configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 6</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br><pre> Router (config) #ephone 36 </pre>                                                                                                                                                                                                                               | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 7</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br><pre> Router (config-ephone) # ephone-template 5 </pre>                                                                                                                                                                                                   | Applies an ephone template to the ephone that is being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><pre> Router (config-ephone) # end </pre>                                                                                                                                                                                                                                                 | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Examples

The following example shows three url buttons configured for line keys:

```

!
!
!
ephone-template 5
 url-button 1 em
 url-button 2 mphoneapp mphoneapp
 url-button 3 snr
!
ephone 36
 ephone-template 5

```

### What to do next

If you are done configuring the url buttons for phones in Cisco Unified CME, restart the phones.

# Configure Feature Button on a Cisco Unified SIP Phone Line Key

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register template** *template-tag*
4. **feature-button** [*index*] [*feature identifier*]
5. **exit**
6. **voice register pool** *phone-tag*
7. **template** *template-tag*
8. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                              | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>voice register template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# voice register template 5                                      | Enters ephone-template configuration mode to create an ephone template. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier for the ephone template that is being created. Range: 1 to 10.</li> </ul> <p><b>Note</b><br/> Feature button can be configured under <b>voice register pool</b> or <b>voice register template</b> configuration mode. If both configurations are applied to the <b>voice register pool</b>, the feature button configuration under <b>voice register pool</b> takes precedence.</p> |
| <b>Step 4</b> | <b>feature-button</b> [ <i>index</i> ] [ <i>feature identifier</i> ]<br><b>Example:</b><br>Router (config-voice-register-template) feature-button 1 DnD | Configures a feature button on line key. <ul style="list-style-type: none"> <li>• <i>index</i>—One of the 12 index numbers for a specific feature type.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                         |

|               | Command or Action                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Step 5</b> | <b>exit</b><br><br><b>Example:</b><br><pre>Router(config-register-temp)# exit</pre>                                                            | Exits ephone-template configuration mode.                                                                                                                                                                                                                                                                      |
| <b>Step 6</b> | <b>voice register pool <i>phone-tag</i></b><br><br><b>Example:</b><br><pre>Router(config)# voice register pool 12</pre>                        | Enters ephone configuration mode.<br><br><ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number that identifies this ephone during configuration tasks.</li> </ul>                                                                                                                            |
| <b>Step 7</b> | <b>template <i>template-tag</i></b><br><br><b>Example:</b><br><pre>Router(config-register-pool)# template 5</pre>                              | Applies the ephone template to the phone.<br><br><ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier of the template that you created in <a href="#">Step 3, on page 1456</a></li> </ul>                                                                                            |
| <b>Step 8</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-register-pool)# end</pre>                                                              | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                               |

## Examples

The following example shows three feature buttons configured for line keys:

```
voice register template 5
 feature-button 1 DnD
 feature-button 2 EndCall
 feature-button 3 Cfdall
!
!
voice register pool 12
 template 5
```

## What to do next

If you are done configuring the url buttons for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

# Configure Feature Button on a Cisco Unified SCCP Line Key

**Note**

- Answer, Select, cBarge, Join, and Resume features are not supported as PLKs.
- Feature buttons are only supported on Cisco Unified IP Phones 6911, 7941, 7942, 7945, 7961, 7962, 7965, 7970, 7971, and 7975 with SCCP v12 or later versions.
- Any features available through hard button are not be provisioned. Use the show ephone register detail command to verify why the features buttons are not provisioned.
- Not all feature buttons are supported on Cisco Unified IP Phone 6911 phone. Call Forward, Pickup, Group Pickup, and MeetMe are the only feature buttons supported on the Cisco Unified IP Phone 6911.
- The privacy-button is available on Cisco Unified IP phones running a SCCP v8 or later. Privacy-button is overridden by any other feature-button available.
- Locales are not supported on Cisco Unified IP Phone 7914.
- Locales are not supported for Cancel Call Waiting or Live Recording feature-buttons.
- The feature state for DnD, Hlog, Privacy, Login, and Night Service feature-buttons are indicated by an LED.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone template** *template-tag*
4. **feature-button** *index feature identifier*
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **end**

## DETAILED STEPS

**Procedure**

| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                         |

|               | Command or Action                                                                                                                | Purpose                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>ephone template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config)# ephone template 10                              | Enters ephone-template configuration mode to create an ephone template. <ul style="list-style-type: none"> <li>• <i>template-tag</i>—Unique identifier for the ephone template that is being created. Range: 1 to 10.</li> </ul> |
| <b>Step 4</b> | <b>feature-button</b> <i>index feature identifier</i><br><b>Example:</b><br>Router(config-ephone-template) feature-button 1 hold | Configures a feature button on line key <ul style="list-style-type: none"> <li>• <i>index</i>—index number, one from 25 for a specific feature type.</li> <li>• <i>feature identifier</i>—feature ID or stimulus ID.</li> </ul>  |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router(config-ephone-template)# exit                                                           | Exits ephone-template configuration mode.                                                                                                                                                                                        |
| <b>Step 6</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br>Router(config)# ephone 5                                                    | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique sequence number that identifies this ephone during configuration tasks.</li> </ul>                                            |
| <b>Step 7</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-ephone)# ephone-template 10                       | Applies an ephone template to the ephone that is being configured.                                                                                                                                                               |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                 |

### Examples

The following example shows feature buttons configured for line keys:

```

!
!
!
ephone-template 10
 feature-button 1 Park
 feature-button 2 MeetMe
 feature-button 3 CallBack
!
!
ephone-template 10

```

### What to do next

If you are done configuring the feature buttons for phones in Cisco Unified CME, restart the phones.

## Block Local Services on Phone User Interface

To block the display and availability of local services such as Local Directory, Extension Mobility (EM), and My Phone Apps on a SCCP IP phone's user interface, perform the following steps.

### Before you begin

Cisco Unified CME 8.5 or later versions.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag* or **ephone template** *template tag*
4. **exclude** [**em** | **myphoneapp** | **directory**]
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>ephone</b> <i>phone-tag</i> or <b>ephone template</b> <i>template tag</i><br><b>Example:</b><br>Router(config)# ephone 10         | Enters ephone configuration mode. <ul style="list-style-type: none"> <li>• <i>phone-tag</i>—Unique number of the phone for which you want to exclude local services such as Extension Mobility, My Phone Apps, and Local Directory.</li> </ul>                                                                                                                                                                                        |
| <b>Step 4</b> | <b>exclude</b> [ <b>em</b>   <b>myphoneapp</b>   <b>directory</b> ]<br><b>Example:</b><br>Router(config-ephone)#exclude directory em | Excludes local services (EM, My Phone Apps, and Local Directory) from displaying on phone's user interface. <ul style="list-style-type: none"> <li>• <b>em</b>—Excludes Extension Mobility (EM) from the phone's user interface.</li> <li>• <b>myphoneapp</b>—Excludes My Phone App service from the phone's user interface.</li> <li>• <b>directory</b>—Excludes Local Directory service from the phone's user interface.</li> </ul> |

|               | Command or Action                                               | Purpose                          |
|---------------|-----------------------------------------------------------------|----------------------------------|
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-ephone)# end | Returns to privileged EXEC mode. |

### Examples

The following example shows the Local Directory and Extension Mobility services excluded from the phone user interface:

```
ephone 10
exclude directory em
device-security-mode none
description sccp7961
mac-address 0007.0E57.7561
```

## Modify Header Bar Display on SCCP Phones

### Before you begin

Directory number to be modified is already configured. For configuration information, see [Create Directory Numbers for SCCP Phones, on page 264](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *dn-tag*
4. **description** *display-text*
5. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                              | Purpose                                                                                                                   |
|---------------|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                         |

|               | Command or Action                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>ephone-dn</b> <i>dn-tag</i><br><b>Example:</b><br><code>Router(config)# ephone-dn 55</code>                               | Enters ephone-dn configuration mode.                                                                                                                                                                                                                                                                       |
| <b>Step 4</b> | <b>description</b> <i>display-text</i><br><b>Example:</b><br><code>Router(config-ephone-dn)# description 408-555-0134</code> | Defines a description for the header bar of a display-capable IP phone on which this ephone-dn appears as the first line. <ul style="list-style-type: none"> <li>• <i>display-text</i>—Alphanumeric character string, up to 40 characters. String is truncated to 14 characters in the display.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-ephone)# end</code>                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                           |

**What to do next**

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

## Modify Header Bar Display Supported SIP Phones

**Restriction** This feature is supported only on Cisco Unified IP Phone 7940, 7940G, 7960, and 7960G.

**Before you begin**

Cisco CME 3.4 or a later version.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **description** *string*
5. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                | Purpose                                                                                                            |
|---------------|----------------------------------|--------------------------------------------------------------------------------------------------------------------|

| <b>Step 3</b> | <b>voice register pool <i>pool-tag</i></b><br><br><b>Example:</b><br>Router(config)# <b>voice register pool 3</b>    | Enters voice register pool configuration mode to set phone-specific parameters for a SIP phone in Cisco Unified CME.                                                                                                                                                             |
| <b>Step 4</b> | <b>description <i>string</i></b><br><br><b>Example:</b><br>Router(config-register-pool)# description<br>408-555-0100 | Defines a customized description that appears in the header bar of supported Cisco Unified IP phones <ul style="list-style-type: none"> <li>• Truncated to 14 characters in the display.</li> <li>• If string contains spaces, enclose the string in quotation marks.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-register-pool)# end                                               | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                        |

### What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

## Verify Header Bar Display

### Procedure

Use the **show running-config** command to verify your configuration. Descriptions for directory numbers are listed in the ephone-dn and voice-register dn portions of the output.

#### Example:

```
Router# show running-config

ephone-dn 1 dual-line
number 150 secondary 151
description 555-0150
call-forward busy 160
call-forward noan 160 timeout 10
huntstop channel
no huntstop
!
!
!
voice-register dn 1
```

```
number 1101
description 555-0101
```

---

## Troubleshooting Header Bar Display

### Procedure

---

#### **show telephony-service ephone**

Use this command to ensure that the ephone-dn to which you applied the description appears on the first button on the ephone. In the example below, ephone-dn 22 has the description in the phone display header bar.

Router# **show telephony-service ephone**

```
ephone-dn 22
 number 2149
 description 408-555-0149

ephone 34
 mac-address 0030.94C3.F96A
 button 1:22 2:23 3:24
 speed-dial 1 5004
 speed-dial 2 5001
```

---

## Create Labels for Directory Numbers on SCCP Phones

To create a label to display in place of the number next to a line button, perform the following steps.

### Before you begin

Directory number for which the label is to be created is already configured. For configuration information, see [Create Directory Numbers for SCCP Phones, on page 264](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn** *dn-tag*
4. **label** *label-string*
5. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|---------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>ephone-dn dn-tag</b><br><b>Example:</b><br>Router(config)# ephone-dn 1             | Enters ephone-dn configuration mode. <ul style="list-style-type: none"> <li>• <i>dn-tag</i>—Unique sequence number that identifies the ephone-dn to which the label is to be associated.</li> </ul>                                                                                                                                                                          |
| <b>Step 4</b> | <b>label label-string</b><br><b>Example:</b><br>Router(config-ephone-dn)# label user1 | Creates a custom label that is displayed on the phone next to the line button that is associated with this ephone-dn. The custom label replaces the default label, which is the number that was assigned to this ephone-dn. <ul style="list-style-type: none"> <li>• <i>label-string</i>—String of up to 30 alphanumeric characters that provides the label text.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                             |

## What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

## Create Labels for Directory Numbers on a SIP Phone

To create label to be displayed in place of a directory number for a SIP phone, intercom line, voice port, or a message-waiting indicator (MWI), perform the following steps for each label to be created.

|                    |                                                   |
|--------------------|---------------------------------------------------|
| <b>Restriction</b> | Only one label is permitted per directory number. |
|--------------------|---------------------------------------------------|

## Before you begin

- Cisco CME 3.4 or a later version.

- Directory number for which the label is to be created is already configured and must already have a number assigned by using the **number (voice register dn)** command. For configuration information, see [Create Directory Numbers for SIP Phones, on page 275](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn** *dn-tag*
4. **number** *number*
5. **label** *string*
6. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                 | Purpose                                                                                                                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                        | Enters global configuration mode.                                                                                                                          |
| <b>Step 3</b> | <b>voice register dn</b> <i>dn-tag</i><br><b>Example:</b><br>Router(config-register-global)# voice register dn 17 | Enters voice register dn configuration mode to define a directory number for a SIP phone, intercom line, voice port, or a message-waiting indicator (MWI). |
| <b>Step 4</b> | <b>number</b> <i>number</i><br><b>Example:</b><br>Router(config-register-dn)# number 7001                         | Defines a valid number for a directory number.                                                                                                             |
| <b>Step 5</b> | <b>label</b> <i>string</i><br><b>Example:</b><br>Router(config-register-dn)# label user01                         | Creates a text identifier, instead of a phone-number display, for a directory number that appears on a SIP phone console.                                  |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-dn)# end                                                  | Exits configuration mode and enters privileged EXEC mode.                                                                                                  |

What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

# Verify Labels

Procedure

Use the **show running-config** command to verify your configuration. Descriptions for directory numbers are listed in the ephone-dn and voice-register dn portions of the output.

```
Router# show running-config

ephone-dn 1 dual-line
number 150 secondary 151
label MyLine
call-forward busy 160
call-forward noan 160 timeout 10
huntstop channel
no huntstop
!
!
!
voice-register dn 1
number 1101
label MyLine
```

# Modify System Message Display on SCCP Phone Screen

SUMMARY STEPS

1. enable
2. configure terminal
3. telephony-service
4. system message *text-message*
5. url idle *url idle-timeout seconds*
6. end

DETAILED STEPS

Procedure

|        | Command or Action                                      | Purpose                                                                                                            |
|--------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|

|               | Command or Action                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                               | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                                                         | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 4</b> | <b>system message text-message</b><br><b>Example:</b><br>Router(config-telephony)# system message ABC Company                                            | Defines a text message to display when a phone is idle. <ul style="list-style-type: none"> <li>• <i>text-message</i>—Alphanumeric string to display. Display uses proportional-width font, so the number of characters that are displayed varies based on the width of the characters that are used. The maximum number of displayed characters is approximately 30.</li> </ul> |
| <b>Step 5</b> | <b>url idle url idle-timeout seconds</b><br><b>Example:</b><br>Router(config-telephony)# url idle http://www.abcwrecking.com/public/logo idle-timeout 35 | Defines the location of a file to display on phones that are not in use and specifies the interval between refreshes of the display, in seconds. <ul style="list-style-type: none"> <li>• <i>url</i>—Any URL that conforms to RFC 2396.</li> <li>• <i>seconds</i>—Time interval between display refreshes, in seconds. Range is 0 to 300.</li> </ul>                            |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                                                                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                |

### What to do next

After configuring the url idle command, you must reset phones. See [Use the reset Command on SCCP Phones, on page 410](#).

## Verify System Message Display

### Procedure

Use the **show running-config** command to verify your configuration. System message display is listed in the telephony-service portion of the output.

```
Router# show running-config

telephony-service

## Troubleshooting System Message Display

### Procedure

Ensure that the HTTP server is enabled.

## Provision URLs for Feature Buttons for SCCP Phones

To customize URLs for feature buttons in the Sep\*.conf.xml configuration file for SCCP phones, perform the following steps.

### Restriction

- Operation of these services is determined by the Cisco Unified IP phone capabilities and the content of the specified URL.
- Provisioning a URL to access help screens using the i or ? buttons on a phone is not supported.
- Provisioning the directory URL to select an external directory resource disables the Cisco Unified CME local directory service.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **url {directories | information | messages | services} url**
5. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                                                                     | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 4</b> | <b>url {directories   information   messages   services} url</b><br><b>Example:</b><br>Router(config-telephony)# url directories<br>http://10.4.212.4/localdirectory | Provisions URLs for the four programmable feature buttons (Directories, Information, Messages, and Services) on a supported Cisco Unified IP phone. <ul style="list-style-type: none"> <li>• To use a Cisco Unified Communications Manager directory as an external directory source, you must list the MAC addresses of the phones in Cisco Unified Communications Manager and reset the phones from Cisco Unified Communications Manager. You do not need to assign ephone-dns to the phones for the phones to register with Cisco Unified Communications Manager.</li> <li>• The <b>url services</b> command is also available in ephone-template configuration mode. If you use an ephone template to provision the Services feature button on one or more SCCP phones and you configure the <b>url services</b> command in telephony-service configuration mode, the value set in telephony-service configuration mode appears first in the list of options displayed when the phone user presses the Services feature button.</li> </ul> |

|        | Command or Action                                                               | Purpose                          |
|--------|---------------------------------------------------------------------------------|----------------------------------|
| Step 5 | <b>end</b><br><br><b>Example:</b><br><code>Router(config-telephony)# end</code> | Returns to privileged EXEC mode. |

### What to do next

If you want to create an ephone template to provision multiple URLs for the Services feature button on supported individual SCCP phones, see [Templates, on page 1423](#).

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

## Provision URLs for Feature Buttons on SIP Phones

To customize URLs for feature buttons in the SEPDEFAULT.cnf configuration profile for SIP IP phones, perform the following steps.

### Restriction

- Operation of these services is determined by the Cisco Unified IP phone capabilities and the content of the specified URL.
- Provisioning the directory URL to select an external directory resource disables the Cisco Unified CME local directory service.

### Before you begin

Cisco CME 3.4 or a later version.

Support for **idle url** is available only on Unified CME 12.0 and later versions.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **url {authentication | directory | service | idle} url**
5. **end**

**What to do next**

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Profiles for SIP Phones, on page 403](#).

## Troubleshooting URL Provisioning for Feature Buttons

### Procedure

---

Ensure the HTTP server is enabled and that there is communication between the Cisco Unified CME router and the server.

---

# Modify Vendor Parameters for All SCCP Phones

To configure programmable phone and display parameters in the vendorConfig section of the SepDefault.conf.xml configuration file for all phones, perform the following steps.

## Restriction

- Only the parameters supported by the currently loaded firmware are available.
- The number and type of parameters may vary from one firmware version to the next.
- Only those parameters that are supported by a Cisco Unified IP phone and firmware version are implemented. Parameters that are not supported are ignored.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **service phone** *parameter-name parameter-value*
5. **end**

## DETAILED STEPS

### Procedure

| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br><pre>Router(config-telephony)# end</pre>                       | Returns to privileged EXEC mode.                                                                                                                               |

### What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

## Modify Vendor Parameters for a Specific SCCP Phone

To configure parameters in the vendorConfig section of the Sep\*.conf.xml configuration file for an individual SCCP phone, perform the following steps.

### Restriction

- Cisco Unified CME 4.0 or a later version.
- System must be configured to for per-phone configuration files. For configuration information, see [Define Per-Phone Configuration Files and Alternate Location for SCCP Phones, on page 187](#).
- Only the parameters supported by the currently loaded firmware are available.
- The number and type of parameters may vary from one firmware version to the next.
- Only those parameters that are supported by a Cisco Unified IP phone and firmware version are implemented. Parameters that are not supported are ignored.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. **service phone** *parameter-name* *parameter-value*
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **end**

| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                                                                                                                                                                                                                                                                         | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

## Troubleshooting Vendor Parameter Configuration

### Procedure

- Step 1** Ensure that the templates have been properly applied to the phones.
- Step 2** Ensure that you use the **create cnf-files** command to regenerate configuration files and reset the phones after you apply the templates.
- Step 3** Use the **show telephony-service tftp-bindings** command to display the configuration files that are associated with individual phones

### Example:

Router# **show telephony-service tftp-binding**

```
tftp-server system:/its/SEPDEFAULT.cnf
tftp-server system:/its/SEPDEFAULT.cnf alias SEPDefault.cnf
tftp-server system:/its/XMLDefault.cnf.xml alias XMLDefault.cnf.xml
tftp-server system:/its/ATADefault.cnf.xml
tftp-server system:/its/XMLDefault7960.cnf.xml alias SEP00036B54BB15.cnf.xml
tftp-server system:/its/germany/7960-font.xml alias German_Germany/7960-font.xml
tftp-server system:/its/germany/7960-dictionary.xml alias German_Germany/7960-dictionary.xml
tftp-server system:/its/germany/7960-kate.xml alias German_Germany/7960-kate.xml
tftp-server system:/its/germany/SCCP-dictionary.xml alias German_Germany/SCCP-dictionary.xml
tftp-server system:/its/germany/7960-tones.xml alias Germany/7960-tones.xml
```

- Step 4** Use the **debug tftp events** command to verify that the phone is accessing the file when you reboot the phone.

## Configure One-Way Push-to-Talk on Cisco Unified SCCP Wireless IP Phones

To associate a phone button with the thumb button on a wireless phone for one-way Push-to-Talk (PTT) functionality in Cisco Unified CME, perform the following steps.

|                    |                                                                  |
|--------------------|------------------------------------------------------------------|
| <b>Restriction</b> | Supported on Cisco Unified Wireless IP Phone 7921 and 7925 only. |
|--------------------|------------------------------------------------------------------|

### Before you begin

- Cisco Unified CME 7.0 or a later version.
- Cisco phone firmware version 1.0.4 or a later version.
- System must be configured to for per-phone configuration files. For configuration information, see [Define Per-Phone Configuration Files and Alternate Location for SCCP Phones, on page 187](#).

- Phone button to be associated with the thumb button must be configured with an intercom DN that targets a paging number. For configuration information, see [Intercom Lines, on page 775](#).
- Paging group to be dialed by the intercom line must be configured. Targeted paging group can be unicast or multicast or both. For configuration information, see [Paging, on page 851](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-template** *template-tag*
4. **service phone thumbButton1 PTTH** *button\_number*
5. **exit**
6. **ephone** *phone-tag*
7. **ephone-template** *template-tag*
8. **end**

### Procedure

|               | Command or Action                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                 | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>ephone-template</b> <i>template-tag</i><br><b>Example:</b><br>Router (config)# ephone-template 12                                               | Enters ephone-template configuration mode to create an ephone template.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 4</b> | <b>service phone thumbButton1 PTTH</b> <i>button_number</i><br><b>Example:</b><br>Router(config-ephone-template)# service phone thumbButton1 PTTH6 | Specifies which button is to go off hook when user presses the thumb button.<br><ul style="list-style-type: none"> <li>• <i>button_number</i>—Button on phone that is configured with an intercom dn that targets a paging number. Range is 1 to 6.</li> <li>• There are no spaces in the <b>PTTH</b> and <i>button_number</i> keyword/argument combination.</li> <li>• This command can also be configured in telephony-service configuration mode. For individual phones, the template configuration for this command overrides the system-level configuration for this command.</li> </ul> |

|               | Command or Action                                                                                                       | Purpose                                                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><code>Router(config-ephone-template)# exit</code>                                     | Exits from this command mode to the next highest mode in the configuration mode hierarchy. |
| <b>Step 6</b> | <b>ephone <i>phone-tag</i></b><br><b>Example:</b><br><code>Router(config)# ephone 1</code>                              | Enters ephone configuration mode.                                                          |
| <b>Step 7</b> | <b>ephone-template <i>template-tag</i></b><br><b>Example:</b><br><code>Router(config-ephone)# ephone-template 12</code> | Applies an ephone template to the ephone that is being configured.                         |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-ephone)# end</code>                                                | Exits configuration mode and enters privileged EXEC mode.                                  |

## Configure Cisco Jabber for CSF Client in Unified CME

### Before you begin

Cisco Jabber versions supported on Unified CME are now End-of-Life (EOL). Hence, there is no active support on Unified CME for Cisco Jabber clients.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http secure-server**
4. **ip http secure-port *port number***
5. **voice register dn *dn-tag***
6. **number *number***
7. **voice register pool *phone-tag***
8. **id device-id-name *name***
9. **type *type***
10. **number *number***
11. **username *username* password *password***
12. **description *string***
13. **exit**
14. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                   | Enables the privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                           | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>ip http secure-server</b><br><br><b>Example:</b><br>Router(config)# ip http secure-server                             | Enables a secure HTTP (HTTPS) server. The HTTPS server uses the Secure Sockets Layer (SSL) Version 3 protocol.                                                                                                                                                                                                                                                                                   |
| <b>Step 4</b> | <b>ip http secure-port</b> <i>port number</i><br><br><b>Example:</b><br>Router(config)# ip http secure-port 8443         | Sets the HTTPS server port number for listening.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 5</b> | <b>voice register dn</b> <i>dn-tag</i><br><br><b>Example:</b><br>Router(config)# voice register dn 1                     | Creates directory numbers for the SIP IP phones that are directly connected to Cisco Unified CME                                                                                                                                                                                                                                                                                                 |
| <b>Step 6</b> | <b>number</b> <i>number</i><br><br><b>Example:</b><br>Router(config-register-dn)# number 991001                          | Defines the numbers for the SIP IP phones.                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 7</b> | <b>voice register pool</b> <i>phone-tag</i><br><br><b>Example:</b><br>Router# voice register pool 1                      | Sets the phone type for the SIP IP phones on a Cisco Unified CME system.                                                                                                                                                                                                                                                                                                                         |
| <b>Step 8</b> | <b>id device-id-name</b> <i>name</i><br><br><b>Example:</b><br>Router(config-register-pool)# id device-id-name JabberWIN | Specifies the device ID of a phone type.<br><br>For a list of supported device IDs, see <a href="#">Cisco Unified Communications Manager Express Command Reference</a> .<br><br>Assigns a name to a phone type.<br><br><ul style="list-style-type: none"> <li><i>name</i>—String that specifies the SIP soft client device ID name. Device ID name string can be up to 32 characters.</li> </ul> |
| <b>Step 9</b> | <b>type</b> <i>type</i><br><br><b>Example:</b><br>Router(config-register-pool)# type Jabber-CSF-Client                   | Defines the phone type.                                                                                                                                                                                                                                                                                                                                                                          |

|                | Command or Action                                                                                                                                        | Purpose                                                                                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 10</b> | <b>number</b> <i>number</i><br><b>Example:</b><br>Router(config-register-pool)# number 1                                                                 | Defines the numbers for the SIP IP phones.                                                                                                                                                                           |
| <b>Step 11</b> | <b>username</b> <i>username</i> <b>password</b> <i>password</i><br><b>Example:</b><br>Router(config-register-pool)# username jabber1<br>password jabber1 | Sets the username and password. <ul style="list-style-type: none"> <li>• <i>Username</i>— Specifies the username of the phone type.</li> <li>• <i>Password</i>— Specifies the password of the phone type.</li> </ul> |
| <b>Step 12</b> | <b>description</b> <i>string</i><br><b>Example:</b><br>Router(config-register-pool)# description<br>Jabber-CSF-Client                                    | Associates a description with the Cisco Jabber client. Enter a string of up to 64 characters. A maximum of 128 characters, including spaces.                                                                         |
| <b>Step 13</b> | <b>exit</b><br><b>Example:</b><br>Router(config-register-pool)# exit                                                                                     | Exits the voice register-pool configuration mode.                                                                                                                                                                    |
| <b>Step 14</b> | <b>end</b><br><b>Example:</b><br>Router(config)# end                                                                                                     | Exits the privileged EXEC configuration mode.                                                                                                                                                                        |

### What to do next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

## Configuration Examples for Cisco Unified IP Phone Options

### Example for Configuring Cisco Jabber

The following example shows phone type Cisco Jabber configured under voice register pool 10:

```

!
voice register dn 10
 number 1089
 call-forward b2bua busy 1500
 call-forward b2bua mailbox 1500
 call-forward b2bua noan 1500 timeout 20
 pickup-call any-group
 pickup-group 1
 name CME SIP iPhone
 label CME SIP iPhone
!
!
voice register pool 8

```

```
registration-timer max 720 min 660
park reservation-group 1
session-transport tcp
type CiscoMobile-iOS
number 1 dn 10
dtmf-relay rtp-nte
!
ephone-dn 61
number 1061
park-slot reservation-group 1 timeout 10 limit 2 recall retry 2 limit 2
!
```

## Example for Configuring Cisco Jabber CSF Client

The following example shows how to configure the Cisco Jabber CSF client installed in full UC mode:

```
!
voice register dn 1
number 991001
name Jabber-CSF-Client-1
label Jabber-CSF-Client-1
!
voice register pool 1
id device-id-name jabber_csf_1
type Jabber-CSF-Client
number 1 dn 1
username john password john123
codec g711ulaw
camera
video
!
ip http secure-server
ip http secure-port 8443
```

The following example shows how to configure the Cisco Jabber CSF client in phone-only mode from CME under voice register global:

```
voice register global
phone-mode phone-only
!
voice register pool 1
id device-id-name winJabber
number 1 dn 1
type Jabber-CSF-Client
username 1111022 password 1111022
!
```

The following example shows how to configure the Cisco Jabber CSF client in phone-only mode from CME under voice register pool:

```
voice register pool 1
id device-id-name winJabber
number 1 dn 1
type Jabber-CSF-Client
username 1111022 password 1111022
phone-mode phone-only
!
```

The following example shows how to configure the Cisco Jabber CSF client in phone-only mode from CME under voice register template:

```
voice register template 1
 phone-mode phone-only
!
voice register pool 2
 id device-id-name winJabber
 type Jabber-CSF-Client
 number 1 dn 2
 username 1111023 password 1111023
 template 1
!
```

For Cisco Jabber CSF client (version 12.1.0 and onwards) support, Unified CME 12.5 is configured as the DNS Server. The host machine of the Jabber client is configured to point to Unified CME that is configured as the DNS server. The following example shows how to configure Unified CME 12.5 as DNS Server to support the Cisco Jabber CSF client, Version 12.1.0 for Mac and Windows (Phone-only Mode):

```
enable
configure terminal
ip dns server
ip host _sip_tcp.cisco.com srv 0 1 5060 cme.cisco.com
ip host _sip_udp.cisco.com srv 0 1 5060 cme.cisco.com
ip host _sips_tcp.cisco.com srv 0 1 5060 cme.cisco.com
ip host _cisco-uds._tcp.cisco.com srv 0 1 8443 cme.cisco.com
ip host uds._tcp.cisco.com srv 0 1 8443 cme.cisco.com
ip host _collab-edge._tls.cisco.com srv 0 1 8443 cme.cisco.com
ip host cme.cisco.com 10.64.86.106 (Note: IP Address of Unified CME 12.5)
ip host _cisco-phone-http.tcp.cisco.com srv 0 1 8443 cme.cisco.com
```

## Example for Configuring Dial Rules for Cisco Softphone SIP Client

The following example shows dial rules configured under voice register template 2:

```
!
voice register template 2
 url ldapServer ldap.abcd.com
 url AppDialRule tftp://10.1.1.1/AppDialRules.xml
 url DirLookupRule tftp://10.1.1.1/DirLookupRules.xml
!
```

The following is a sample of Application Dial Rule content:

```
Router#more flash:AppDialRules.xml
<?xml version="1.0" encoding="UTF-8"?><DialRules>
 <DialRule BeginsWith="+1" NumDigits="12" DigitsToRemove="1" PrefixWith="9"/>
 <DialRule BeginsWith="+1" NumDigits="12" DigitsToRemove="1" PrefixWith="9"/>
 <DialRule BeginsWith="919" NumDigits="10" DigitsToRemove="3" PrefixWith="9"/>
 <DialRule BeginsWith="1" NumDigits="11" DigitsToRemove="0" PrefixWith="9"/>
 <DialRule BeginsWith="" NumDigits="10" DigitsToRemove="0" PrefixWith="91"/>
 <DialRule BeginsWith="" NumDigits="7" DigitsToRemove="0" PrefixWith="9"/>
 <DialRule BeginsWith="+" NumDigits="13" DigitsToRemove="1" PrefixWith="9011"/>
 <DialRule BeginsWith="+" NumDigits="14" DigitsToRemove="1" PrefixWith="9011"/>
 <DialRule BeginsWith="+" NumDigits="15" DigitsToRemove="1" PrefixWith="9011"/>

 <DialRule BeginsWith="+" NumDigits="12" DigitsToRemove="1" PrefixWith="9011"/>
 <DialRule BeginsWith="+" NumDigits="11" DigitsToRemove="1" PrefixWith="9011"/>
```

```
</DialRules>
```

## Example for Excluding Local Services from Cisco Unified SIP IP Phones

The following example shows how the **exclude** command is used to exclude from the Cisco Unified SIP IP phone's user interface the availability of two local services. These services are Local Directory and My Phone Apps.

```
Router(config)# voice register pool 80
Router(config-register-pool)# exclude directory
Router(config-register-pool)# exclude myphoneapps
```

## Example to Create Text Labels for Ephone-dns

The following example creates text labels for two ephone-dns:

```
ephone-dn 1
 number 2001
 label Sales
ephone-dn 2
 number 2002
 label Engineering
```

## Example for Phone Header Bar Display

The following example provides the full E.164 number for a phone line in the phone header bar:

```
ephone-dn 55
 number 2149
 description 408-555-0149
ephone-dn 56
 number 2150
ephone 12
 button 1:55 2:56
```

## Example for System Text Message Display

The following example specifies text that should display on IP phones when they are not in use:

```
telephony-service
 system message ABC Company
```

## Example for System File Display

The following example specifies that a file called logo.htm should be displayed on IP phones when they are not in use:

```
telephony-service
 url idle http://www.abcwrecking.com/public/logo.htm idle-timeout 35
```

## Example for URL Provisioning for Directories, Services, and Messages Buttons

The following example provisions the Directories, Services, and Messages buttons:

```
telephony-service
url directories http://10.4.212.4/localdirectory
url services http://10.4.212.4/CCMUser/123456/urltest.html
url messages http://10.4.212.4/Voicemail/MessageSummary.asp
```

## Example for Programmable VendorConfig Parameters

The following partial output shows a template in which programmable parameters for phone and display functionality have been configured by using the **service phone** command:

```
ephone-template 1
button-layout 7931 1
service phone daysDisplayNotActive 1,2,3,4,5,6,7
service phone backlightOnTime 07:30
service phone backlightOnDuration 10:00
service phone backlightIdleTimeout 00.01
```

In the following example, the PC port is disabled on phones 26 and 27. All other phones have the PC port enabled.

```
ephone-template 8
service phone pcPort 1
!
!
ephone 26
mac-address 1111.1111.1001
ephone-template 8
type 7960
button 1:26
!
!
ephone 27
mac-address 1111.2222.2002
ephone-template 8
type 7960
button 1:27
```

## Example for Push-to-Talk (PTT) on Cisco Unified Wireless IP Phones in Cisco Unified CME

The following partial output shows a template in which one-way PTT is configured by using the **service phone thumbButton1** command:

```
ephone-template 12
service phone thumbButton1 PTH6
!
!
ephone-dn 10
intercom 1050
```

```

ephone-dn 50
number 1050
paging
!
!

ephone 1
type 7921
button 1:1 6:10
!
!

ephone 2
button 1:2
paging-dn 50
ephone 3
button 1:3
paging-dn 50
ephone 4
button 1:1
paging-dn 50

```

## Feature Information for Cisco Unified IP Phone Options

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 115: Feature Information for Cisco Unified IP Phone Options**

| Feature Name                                  | Unified CME Version | Feature Information                                                                                                                                                |
|-----------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Support for Cisco Jabber                      | 12.5                | Added Support for Cisco Jabber CSF Client MAC and Windows (Phone-only), Version 12.1(0).                                                                           |
| Support for Cisco Jabber                      | 8.6                 | Added support for Cisco Jabber.                                                                                                                                    |
| My Phone Apps for Cisco Unified SIP IP Phones | 9.0                 | Adds support for My Phone Apps feature on Cisco Unified SIP IP phones.                                                                                             |
| Clear Directory Entries                       | 8.6                 | Provides ability to clear the display of call-history details such as missed, placed, and received call entries on a Cisco Unified SCCP IP phone's display screen. |

| Feature Name                   | Unified CME Version | Feature Information                                                                                                                                                          |
|--------------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fixed Line/Feature Buttons     | 4.0(2)              | Provides two preconfigured fixed sets of feature buttons for provisioning a Cisco Unified IP Phone 7931G.                                                                    |
| Header Bar Display             | 3.4                 | Added support for modifying header bar display on SIP phones.                                                                                                                |
|                                | 2.01                | Phone header bar display is introduced.                                                                                                                                      |
| Labels for Directory Numbers   | 3.4                 | Added support for label display on SIP phones.                                                                                                                               |
|                                | 3.0                 | Ephone-dn labels were introduced.                                                                                                                                            |
| Programmable Vendor Parameters | 4.0                 | Added support for configuring programmable phone and display functionality at a phone level for SCCP phones.                                                                 |
|                                | 3.4                 | Added support for configuring programmable phone and display functionality for SIP phones.                                                                                   |
|                                | 3.2.1               | Added support for programmable phone and display functionality in vendorConfig portion of configuration file. Implementation of configuration is firmware version dependent. |
| System Message Display         | 3.0                 | System message display on idle phones using text messages was introduced.                                                                                                    |
|                                | 2.1                 | System message display on idle phones using HTML files was introduced.                                                                                                       |

| Feature Name                         | Unified CME Version | Feature Information                                                                                                 |
|--------------------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------|
| URL Provisioning for Feature Buttons | 12.0                | Added support for Idle URL functionality on SIP phones.                                                             |
|                                      | 4.2                 | Added support for configuring an ephone template to provision multiple URLs for the Services feature button phones. |
|                                      | 3.4                 | Added support for provisioning customized URLs for programmable feature buttons on supported SIP phones.            |
|                                      | 2.0                 | Provisioning customized URLs for programmable feature buttons was introduced.                                       |

## CHAPTER 49

# Interoperability with Cisco Unified CCX

This chapter describes features in Cisco Unified Communications Manager Express (Cisco Unified CME) that provide support for interoperability between Cisco Unified CME and external feature services, such as Cisco Customer Response Solutions (CRS) with Cisco Unified Contact Center Express (Cisco Unified CCX).

- [Information About Interoperability with Cisco Unified CCX, on page 1489](#)
- [Configure Interoperability with Cisco Unified CCX, on page 1491](#)
- [Configuration Examples for Interoperability with Cisco Unified CCX, on page 1501](#)
- [Feature Information for Interoperability with Cisco Unified CCX, on page 1510](#)

## Information About Interoperability with Cisco Unified CCX

Unified CME 4.2 to Unified CME 8.5 Release versions support interoperability between Cisco Unified CME and Cisco Customer Response Solutions (CRS) with Cisco Unified Call Center Express (Cisco Unified CCX), including enhanced call processing, device and call monitoring, unattended call transfers to multiple call center agents and basic extension mobility, and IP IVR applications.

---

**Note** For Unified CME 8.6 and later releases, CRS with Unified CCX is not supported.

---

The Cisco Unified CCX application uses the CRS platform to provide a multimedia (voice, data, and web). Cisco IP IVR functionality is available with Cisco Unified CCX and includes prompt-and-collect and call treatment.

The following functions are provided in Unified CME Release 4.2 to 8.5 for interoperability with Unified CCX:

- Support of Cisco Unified CCX Cisco Agent Desktop for use with Cisco Unified CME
- Configuration query and update between Cisco Unified CCX and Cisco Unified CME
- SIP-based simple and supplementary call control services including:
  - Call routing between Cisco Unified CME and Cisco Unified CCX using SIP-based route point
  - First-party call control for SIP-based simple and supplementary calls
  - Call monitoring and device monitoring based on SIP presence and dialog event package

- Cisco Unified CCX session management of Cisco Unified CME
- Cisco Unified CCX device and call monitoring of agent lines and call activities in Cisco Unified CME

Provisioning and configuration information in Cisco Unified CCX is automatically provided to Cisco Unified CME. If the configuration from Cisco Unified CCX is deleted or must be modified, you can configure the same information in Cisco Unified CME by using Cisco IOS commands.

For first party call control, a route point for Cisco CRS is a peer device to Cisco Unified CME through a SIP trunk. An incoming call to Cisco Unified CME that is targeted to a call center phone is routed to Cisco Unified CCX through the route point. The call is placed in a queue and redirected to the most suitable agent by Cisco Unified CCX.

Supplementary services such as call hold, blind transfer, and semi-attended transfer are initiated by Cisco Unified CCX. Existing SIP-based simple and supplementary service call flow applies except for blind transfers. For blind transfers with Cisco Unified CCX as the transferrer, Cisco Unified CCX will stay in the active state until the transfer target answers. It drops out only after the transferred call is successfully answered. If the transfer target does not answer when ringing times out, the call is pulled back by Cisco Unified CCX and rerouted to another agent. This mechanism also applies when the transfer target is configured with call-forward all or forward no-answer. The forward configuration is ignored during blind transfer.

When a call moves between Cisco Unified CCX and Cisco Unified CME because of redirect, transfer, and conference, the SIP Call-ID continues to change. For call control purposes, Cisco Unified CME issues a unique Global Call ID (Gcid) for every outbound call leg. A Gcid remains the same for all legs of the same call in the system, and is valid for redirect, transfer, and conference events, including 3-party conferencing when a call center phone acts as a conference host.

Before Cisco IOS Release 12.4(11)XW6, if the call monitoring module in Cisco Unified CME 4.2 detected a call associated with a non default session application, such as B-ACD or a TCL script, the module was globally disabled. After the module was disabled, Cisco Unified CCX administration had to manually re-enable the call monitoring module after the session completes.

In Cisco IOS Release 12.4(11)XW6 and later releases, the call monitoring module in Cisco Unified CME does not monitor a call associated with a non default session application, such as B-ACD or a TCL script, including all calls merged into this call by way of consult transfer and conference. The module is not disabled and continues to monitor other calls.

[Table 116: Tasks to Configure Interoperability between Cisco CRS and Cisco Unified CME, on page 1490](#) contains a list of tasks required to enable operability between Cisco Unified CME and Cisco Unified CCX, presented in the order in which the tasks are to be completed. This section contains information about performing tasks in the first 2 steps in this table and procedures for completing step 3.

For configuration information, see [Configure Interoperability with Cisco Unified CCX, on page 1491](#).

**Table 116: Tasks to Configure Interoperability between Cisco CRS and Cisco Unified CME**

| Step | Task                                                                                                                                                                                                                                                                                     | Name of Document |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 1    | Verify that the appropriate Cisco Unified Communications Manager Express (Cisco Unified CME) version is installed on the router. For compatibility information, see <a href="#">Cisco Unified Contact Center Express (Cisco Unified CCX) Software and Hardware Compatibility Guide</a> . | —                |

| Step | Task                                                                                                                                                                                                                                                                  | Name of Document                                                                                                                                                                                                          |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2    | Configure the Cisco Unified CME router.<br><b>Tip</b><br>Note the XML user ID and password in Cisco Unified CME and router's IP address.                                                                                                                              | See "Prerequisites" section in <a href="#">Enable Interoperability with Cisco Unified CCX</a> , on page 1491.                                                                                                             |
| 3    | Configure Cisco Unified CME to enable interoperability with Cisco Unified CCX.                                                                                                                                                                                        | <a href="#">Configure Interoperability with Cisco Unified CCX</a> , on page 1491                                                                                                                                          |
| 4    | Install Cisco Unified Contact Center Express (Cisco Unified CCX) for Cisco Unified CME.                                                                                                                                                                               | See <i>Cisco Unified Contact Center Express Administration Guide</i> at <a href="#">Configuration Guides</a> .                                                                                                            |
| 5    | Perform the initial setup of Cisco CRS for Cisco Unified CME.<br><b>Tip</b><br>When setup launches, you are asked for the XML user ID and password, known as AXL user in Cisco CRS, that you created in Cisco Unified CME. You also must enter the router IP address. |                                                                                                                                                                                                                           |
| 6    | Configure Cisco Unified CME telephony subsystem to enable interoperability with Cisco Unified CCX.                                                                                                                                                                    | "Provisioning Unified CCX for Unified CME" chapter in the appropriate <i>Cisco CRS Administration Guide</i> or <i>Cisco Unified Contact Center Express Administration Guide</i> at <a href="#">Configuration Guides</a> . |
| 7    | Create users and assign the agent capability in Cisco CRS.                                                                                                                                                                                                            |                                                                                                                                                                                                                           |

# Configure Interoperability with Cisco Unified CCX

## Enable Interoperability with Cisco Unified CCX

To configure Cisco Unified CME to enable interoperability between Cisco Unified CME and Cisco Unified CCX, perform the following steps.

**Note** A single Cisco Unified CME can support multiple session managers.

**Restriction**

- Maximum number of *active* Cisco Unified CCX agents supported: 50.
- Multi-Party Ad Hoc and Meet-Me Conferencing are not supported.
- The following incoming calls are supported for deployment of the interoperability feature: SIP trunk calls from another Cisco Unified CME and all calls from a PSTN trunk. Other trunks, such H.323, are supported as usual in Cisco Unified CME, however, not for customer calls to Cisco Unified CCX.

**Before you begin**

- Cisco Unified CME version and Cisco IOS release that is compatible with your Cisco Unified CCX version. For compatibility information, see [Cisco Unified Contact Center Express \(Cisco Unified CCX\) Software and Hardware Compatibility Guide](#).
- XML API must be configured to create an AXL username for Cisco Unified CCX access. For configuration information, see [Configure the XML API, on page 1547](#).

**Note** During the initial setup of Cisco CRS for Cisco Unified CME, you need the AXL username and password that was configured using the **xml user** command in telephony-service configuration mode. You also need the router IP address that was configured using the **ip source-address** command in telephony-service configuration mode.

- Agent phones to be connected in Cisco Unified CME must be configured in Cisco Unified CME. When configuring a Cisco Unified CCX agent phone, use the **keep-conference endcall** command to enable conference initiators to exit from conference calls and end the conference for the remaining parties. For configuration information, see [Configure Hardware Conferencing, on page 1377](#).
- The Cisco Unified CME router must be configured to accept incoming presence requests. For configuration information, see [Configure Presence Service, on page 873](#).
- To support Desktop Monitoring and Recording, the **service phone SpanToPCPort 1** command must be configured in telephony-service configuration mode. For configuration information, see [Modify Vendor Parameters for All SCCP Phones, on page 1473](#).

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice call send-alert**
4. **voice service voip**
5. **callmonitor**
6. **gcid**
7. **allow-connections sip to sip**
8. **no supplementary-service sip moved-temporary**
9. **no supplementary-service sip refer**
10. **sip**
11. **registrar server [expires [max sec] [min sec]]**
12. **end**

**DETAILED STEPS****Procedure**

|        | Command or Action | Purpose                       |
|--------|-------------------|-------------------------------|
| Step 1 | enable            | Enables privileged EXEC mode. |

|                | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                    |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <b>Example:</b><br>Router> enable                                                                                                               | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                       |
| <b>Step 2</b>  | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                      | Enters global configuration mode.                                                                                                                                                          |
| <b>Step 3</b>  | <b>voice call send-alert</b><br><b>Example:</b><br>Router(config)# voice call send-alert                                                        | Enables the terminating gateway to send an alert message instead of a progress message after it receives a call setup message.                                                             |
| <b>Step 4</b>  | <b>voice service voip</b><br><b>Example:</b><br>Router(config)# voice service voip                                                              | Enters voice-service configuration mode and specifies voice-over-IP encapsulation.                                                                                                         |
| <b>Step 5</b>  | <b>callmonitor</b><br><b>Example:</b><br>Router(config-voi-serv)# callmonitor                                                                   | Enables call monitoring messaging functionality. <ul style="list-style-type: none"> <li>• Used by Cisco Unified CCX for processing and reporting.</li> </ul>                               |
| <b>Step 6</b>  | <b>gcid</b><br><b>Example:</b><br>Router(config-voi-serv)# gcid                                                                                 | Enables Global Call-ID (Gcid) for call control purposes. <ul style="list-style-type: none"> <li>• Used by Cisco Unified CCX for tracking call.</li> </ul>                                  |
| <b>Step 7</b>  | <b>allow-connections sip to sip</b><br><b>Example:</b><br>Router(config-voi-serv)# allow-connections sip to sip                                 | Allows connections between specific types of endpoints in a VoIP network.                                                                                                                  |
| <b>Step 8</b>  | <b>no supplementary-service sip moved-temporary</b><br><b>Example:</b><br>Router(config-voi-serv)# no supplementary-service sip moved-temporary | Prevents the router from sending a redirect response to the destination for call forwarding.                                                                                               |
| <b>Step 9</b>  | <b>no supplementary-service sip refer</b><br><b>Example:</b><br>Router(config-voi-serv)# no supplementary-service sip refer                     | Prevents the router from forwarding a REFER message to the destination for call transfers.                                                                                                 |
| <b>Step 10</b> | <b>sip</b><br><b>Example:</b><br>Router(config-voi-serv)# sip                                                                                   | Enters SIP configuration mode.                                                                                                                                                             |
| <b>Step 11</b> | <b>registrar server [expires [max sec] [min sec]]</b><br><b>Example:</b><br>Router(config-voi-sip)# registrar server expires max 600 min 60     | Enables SIP registrar functionality in Cisco Unified CME. <ul style="list-style-type: none"> <li>• <b>expires</b>—(Optional) Sets the active time for an incoming registration.</li> </ul> |

|                | Command or Action                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|--------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                    | <ul style="list-style-type: none"> <li>• <b>max sec</b>—(Optional) Maximum time for a registration to expire, in seconds. Range: 600 to 86400. Default: 3600. Recommended value: 600.</li> </ul> <p><b>Note</b><br/>Ensure that the registration expiration timeout is set to a value smaller than the TCP connection aging timeout to avoid disconnection from the TCP.</p> <ul style="list-style-type: none"> <li>• <b>min sec</b>—(Optional) Minimum time for a registration to expire, in seconds. Range: 60 to 3600. Default: 60.</li> </ul> |
| <b>Step 12</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-voi-serv) # end | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Identify Agent Directory Numbers in Cisco Unified CME for Session Manager on SCCP Phones

To specify which directory numbers, associated with phone lines on Cisco Unified CCX agent phones, can be managed by a session manager, perform the following steps.

### Restriction

- Only SCCP phones can be configured as agent phones in Cisco Unified CME. The Cisco VG224 Analog Phone Gateway and analog and SIP phones are supported as usual in Cisco Unified CME, however, not as Cisco Unified CCX agent phones.
- Cisco Unified IP Phone 7931 cannot be configured as an agent phone in Cisco Unified CME. Cisco Unified IP Phone 7931s are supported as usual in Cisco Unified CME, however, not as Cisco Unified CCX agent phones.
- Shared-line appearance is not supported on agent phones. A directory number cannot be associated with more than one physical agent phone at one time.
- Overlaid lines are not supported on agent phones. More than one directory number cannot be associated with a single line button on an agent phone.
- Monitored mode for a line button is not supported on agent phones. An agent phone cannot be monitored by another phone.
- Cisco Unified CCX does not support a call event that includes a different directory number; all call events must include the primary directory number. Call transfers between phones with single-line directory numbers will cause call monitoring to fail.

### Before you begin

- Up to eight session managers must be configured in Cisco Unified CME.

- Directory numbers associated with Cisco Unified CCX agent phones must be configured in Cisco Unified CME.
  - Cisco Unified CME 4.2: Directory numbers for agent phones must be configured as dual lines to allow an agent to make two call connections at the same time using one phone line button. Note that if the second line of the dual-line directory number is busy, a transfer event between phones in the solution will fail to complete.
  - Cisco Unified CME 4.3/7.0 and later versions: We recommend that directory numbers for agent phones be configured as octal lines to help to ensure that a free line with the same directory number is available for a transfer event.
  - For configuration information, see [Configure Phones to Make Basic Call, on page 327](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ephone-dn *dn-tag***
4. **allow watch**
5. **session-server *session-server-tag* [...*session-server-tag*]**
6. **end**

### Procedure

|               | Command or Action                                                                 | Purpose                                                                                                                                                                                                                                                                |
|---------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal        | Enters global configuration mode.                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>ephone-dn <i>dn-tag</i></b><br><b>Example:</b><br>Router(config)# ephone-dn 24 | Enters ephone-dn configuration mode. <ul style="list-style-type: none"> <li>• <i>dn-tag</i>—Unique ID of an already configured directory number. The tag number corresponds to a tag number created when this directory number was initially configured.</li> </ul>    |
| <b>Step 4</b> | <b>allow watch</b><br><b>Example:</b><br>Router(config-ephone-dn)# allow watch    | Allows the phone line associated with this directory number to be monitored by a watcher in a presence service. <ul style="list-style-type: none"> <li>• This command can also be configured in ephone-dn template configuration mode and applied to one or</li> </ul> |

|               | Command or Action                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                                            | more phones. The ephone-dn configuration has priority over the ephone-dn template configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 5</b> | <b>session-server</b> <i>session-server-tag</i> [,... <i>session-server-tag</i> ]<br><b>Example:</b><br>Router(config-ephone-dn)# session-server 1,2,3,4,6 | Specifies which session managers are to monitor the directory number being configured. <ul style="list-style-type: none"> <li><i>session-server-tag</i>—Unique ID session manager, configured in Cisco Unified CCX and automatically provided to Cisco Unified CME. Range: 1 to 8.</li> </ul> <p><b>Tip</b><br/>If you do not know the value for <i>session-server-tag</i>, we recommend using 1.</p> <ul style="list-style-type: none"> <li>Can configure up to eight session-server-tags; individual tags must be separated by commas (,).</li> <li>Each directory number can be managed by up to eight session managers. Each session manager can monitor more than one directory number.</li> </ul> |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone-dn)# end                                                                                             | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Verify Registrations and Subscriptions in Cisco Unified CME

Before using the system, verify registrations and subscriptions for Cisco Unified CCX endpoints.

### Procedure

- Step 1** Use the **show sip status registrar** command to verify whether session manager and Cisco CRS route points are registered.
- Step 2** Use the **show presence subscription summary** command to verify whether Cisco CRS route points and Cisco Unified CCX agent directory numbers are subscribed.

The following is sample output from the **show presence subscription summary** command. The first two rows show the status for two route points. The next two are for logged in agent phones.

Router# **show presence subscription summary**

```

Presence Active Subscription Records Summary: 15 subscription
Watcher Presentity SubID Expires SibID Status
=====
CRScontrol@10.4.171.81 8101@10.4.171.34 4 3600 0 idle
CRScontrol@10.4.171.81 8201@10.4.171.34 8 3600 0 idle

```

```
CRScontrol@10.4.171.81 4016@10.4.171.34 10 3600 0 idle
CRScontrol@10.4.171.81 4020@10.4.171.34 12 3599 0 idle
```

## Re-create a Session Manager in Cisco Unified CME

**Note** Provisioning and configuration information in Cisco Unified CCX is automatically provided to Cisco Unified CME. The following task is required only if the configuration from Cisco Unified CCX is deleted or must be modified.

To re-create a session manager in Cisco Unified CME for Cisco Unified CCX, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register session-server** *session-server-tag*
4. **register id** *name*
5. **keepalive** *seconds*
6. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                                                                   | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>voice register session-server</b> <i>session-server-tag</i><br><b>Example:</b><br>Router(config)# voice register session-server 1 | Enters voice register session-server configuration mode to enable and configure a session manager for an external feature server, such as the Cisco Unified CCX application on a Cisco CRS system.<br><ul style="list-style-type: none"> <li>• Range: 1 to 8.</li> <li>• A single Cisco Unified CME can support multiple session managers.</li> </ul> |

|               | Command or Action                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>register id</b> <i>name</i><br><b>Example:</b><br><code>Router(config-register-fs)# CRS1</code>           | (Optional) Required only if the configuration from Cisco Unified CCX is deleted or must be modified. <ul style="list-style-type: none"> <li>• <i>name</i>—String for identifying Cisco Unified CCX. Can contain 1 to 30 alphanumeric characters.</li> </ul>                                                                                                                                                         |
| <b>Step 5</b> | <b>keepalive</b> <i>seconds</i><br><b>Example:</b><br><code>Router(config-register-fs)# keepalive 300</code> | (Optional) Required only if the configuration from Cisco Unified CCX is deleted or must be modified. <ul style="list-style-type: none"> <li>• Keepalive duration for registration, in seconds, after which the registration expires unless Cisco Unified CCX reregisters before the registration expiry.</li> <li>• Range: 60 to 3600. Default: 300.</li> </ul> <b>Note</b><br>Default in Cisco Unified CCX is 120. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><code>Router(config-register-fs)# end</code>                                | Exits configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                           |

## Reconfigure a Cisco CRS Route Point as a SIP Endpoint

**Note** Provisioning and configuration information in Cisco Unified CCX is automatically provided to Cisco Unified CME. The following task is required only if the configuration from Cisco Unified CCX is deleted or must be modified.

To reconfigure a Cisco CRS route point as a SIP endpoint in Cisco Unified CME, perform the following steps.

**Restriction**

- Each Cisco CRS route point can be managed by only one session manager.
- Each session manager can manage more than one Cisco CRS route point.

### Before you begin

- Directory numbers associated with Cisco CRS route points must be configured in Cisco Unified CME. For configuration information for directory numbers associated with SIP endpoints, see [Configure Phones to Make Basic Call, on page 327](#).
- Directory numbers associated with Cisco CRS route points must be enabled to be watched. For configuration information, see [Configure Presence Service, on page 873](#).
- The **mode cme** command must be enabled in Cisco Unified CME.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register dn** *dn-tag*
4. **number** *number*
5. **session-server** *session-server-tag* [...*session-server-tag*]
6. **allow watch**
7. **refer target dial-peer**
8. **exit**
9. **voice register pool** *pool-tag*
10. **number tag dn** *dn-tag*
11. **session-server** *session-server-tag*
12. **codec** *codec-type*
13. **dtmf-relay sip-notify**
14. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router# enable                                                                                                  | Enables privileged EXEC mode.<br>• Enter your password if prompted.                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                          | Enters global configuration mode.                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>voice register dn</b> <i>dn-tag</i><br><b>Example:</b><br>Router(config-register-global)# voice register dn 1                                    | Enters voice register dn configuration mode to define a directory number for a SIP phone, intercom line, voice port, or a message-waiting indicator (MWI).                                                                                                      |
| <b>Step 4</b> | <b>number</b> <i>number</i><br><b>Example:</b><br>Router(config-register-dn)# number 2777                                                           | Defines a valid number for a directory number.                                                                                                                                                                                                                  |
| <b>Step 5</b> | <b>session-server</b> <i>session-server-tag</i> [... <i>session-server-tag</i> ]<br><b>Example:</b><br>Router(config-register-dn)# session-server 1 | Specifies which session managers are to monitor the directory number being configured.<br>• <i>session-server-tag</i> —Unique ID session manager, configured in Cisco Unified CCX and automatically provided to Cisco Unified CME. Range: 1 to 8.<br><b>Tip</b> |

|                | Command or Action                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                            | <p>If you do not know the value for <i>session-server-tag</i>, we recommend using 1.</p> <ul style="list-style-type: none"> <li>• Can configure up to eight session-server-tags; individual tags must be separated by commas (,).</li> <li>• Each directory number can be managed by up to eight session managers. Each session manager can monitor more than one directory number.</li> </ul> |
| <b>Step 6</b>  | <b>allow watch</b><br><b>Example:</b><br><code>Router(config-register-dn)# allow watch</code>                              | Allows the phone line associated with this directory number to be monitored by a watcher in a presence service.                                                                                                                                                                                                                                                                                |
| <b>Step 7</b>  | <b>refer target dial-peer</b><br><b>Example:</b><br><code>Router(config-register-dn)# refer target dial-peer</code>        | <p>Enables watcher to handle SIP REFER message from this directory number.</p> <ul style="list-style-type: none"> <li>• <b>target dial-peer</b>—Refer To portion of message is based on address from dial peer for this directory number.</li> </ul>                                                                                                                                           |
| <b>Step 8</b>  | <b>exit</b><br><b>Example:</b><br><code>Router(config-register-dn)# exit</code>                                            | Exits configuration mode to the next highest mode in the configuration mode hierarchy.                                                                                                                                                                                                                                                                                                         |
| <b>Step 9</b>  | <b>voice register pool pool-tag</b><br><b>Example:</b><br><code>Router(config)# voice register pool 3</code>               | <p>Enters voice register pool configuration mode to set device-specific parameters for a Cisco CRS route point.</p> <ul style="list-style-type: none"> <li>• A voice register pool in Cisco Unified CCX can contain up to 10 individual SIP endpoints. Subsequent pools are created for additional SIP endpoints.</li> </ul>                                                                   |
| <b>Step 10</b> | <b>number tag dn dn-tag</b><br><b>Example:</b><br><code>Router(config-register-pool)# number 1 dn 1</code>                 | Associates a directory number with the route point being configured.                                                                                                                                                                                                                                                                                                                           |
| <b>Step 11</b> | <b>session-server session-server-tag</b><br><b>Example:</b><br><code>Router(config-register-pool)# session-server 1</code> | <p>identifies session manager to be used to control the route point being configured.</p> <ul style="list-style-type: none"> <li>• <i>session-server-tag</i>—Unique number assigned to a session manager. Range: 1 to 8. The tag number corresponds to a tag number created by using the <b>voice register session-server</b> command.</li> </ul>                                              |
| <b>Step 12</b> | <b>codec codec-type</b><br><b>Example:</b><br><code>Router(config-register-pool)# codec g711ulaw</code>                    | <p>Specifies the codec for the dial peer dynamically created for the route point being configured.</p> <ul style="list-style-type: none"> <li>• <i>codec-type</i>—g711ulaw is required for Cisco Unified CCX.</li> </ul>                                                                                                                                                                       |

|                | Command or Action                                                                                                   | Purpose                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
| <b>Step 13</b> | <b>dtmf-relay sip-notify</b><br><b>Example:</b><br><pre>Router(config-register-pool)#   dtmf-relay sip-notify</pre> | Specifies DTMF Relay method to be used by the route point being configured. |
| <b>Step 14</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-register-pool)# end</pre>                                       | Exits configuration mode and enters privileged EXEC mode.                   |

## Configuration Examples for Interoperability with Cisco Unified CCX

The following output from the **show running-configuration** command shows the configuration on a Cisco Unified CME router that will interoperate with Cisco Unified CCX.

## Where to Go Next

If you are done modifying parameters for phones in Cisco Unified CME, generate a new configuration file and restart the phones. See [Generate Configuration Files for Phones, on page 400](#).

## Feature Information for Interoperability with Cisco Unified CCX

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

*Table 117: Feature Information for Interoperability Feature*

| Feature Name                            | Cisco Unified CME Version | Modification                                                                                                                                                                                                                                                                                                                                                       |

| Interoperability with Cisco Unified CCX | 4.2                       | Enables interoperability between Cisco Unified CME and Cisco Customer Response Solutions (CRS) 5.0 and later versions with Cisco Unified Contact Center Express (Cisco Unified CCX), including Cisco Unified IP IVR, enhanced call processing, device and call monitoring, unattended call transfers to multiple call center agents, and basic extension mobility. |

## CHAPTER 50

# SRST Fallback Mode

---

- [Prerequisites for SRST Fallback Mode, on page 1513](#)
- [Restrictions for SRST Fallback Mode, on page 1513](#)
- [Information About SRST Fallback Mode, on page 1514](#)
- [Configure SRST Fallback Mode, on page 1518](#)
- [Configuration Examples for SRST Fallback Mode, on page 1523](#)
- [Feature Information for SRST Fallback Mode, on page 1526](#)

## Prerequisites for SRST Fallback Mode

- The IP address of the Cisco Unified CME router must be registered as the SRST reference on the Cisco Unified Communications Manager device pool.
- Cisco Unified CME 4.0 or a later version must be installed on the Cisco Unified CME router that is configured in SRST mode.
- Following tasks must be completed:
  - [Generate Configuration Files for Phones, on page 400](#)
  - [Configure System-Level Parameters, on page 172](#). Note that the **max-dn** command must be explicitly configured with the **preference** keyword to support calls between PSTN and IP phones during SRST fallback mode.
  - [Configure Call Transfer and Forwarding, on page 1160](#)

## Restrictions for SRST Fallback Mode

- SRST Fallback Mode is applicable only for SCCP phones. SIP phones are not supported.
- The **call-manager-fallback** command, which is used to configure Cisco Unified SRST, cannot be used on a router that is configured for Cisco Unified CME.
- The **telephony-service setup** command and **auto assign** command must not be enabled on a Cisco Unified CME router configured for SRST fallback mode. If you used the **telephony-service setup** command before configuring the router for SRST fallback support, you must remove any unwanted ephone directory numbers created by the setup process.

- The number of phones that fall back to a Cisco Unified CME router in SRST mode cannot exceed the maximum number of phones that is supported by the router. To find the maximum number of phones for a particular router and Cisco Unified CME version, see the appropriate *Cisco CME Supported Firmware, Platforms, Memory, and Voice Products* document at [http://www.cisco.com/en/us/products/sw/voicesw/ps4625/products\\_device\\_support\\_tables\\_list.html](http://www.cisco.com/en/us/products/sw/voicesw/ps4625/products_device_support_tables_list.html).
- The ephone-dns and ephones that are created from fallback may have less information associated with them than appears in their original configuration on a Cisco Unified Communications Manager or on an active Cisco Unified CME system. This situation occurs because the Cisco Unified CME router in SRST mode is designed to learn only a limited amount of information from the fallback IP phones. For example, if an ephone-dn has in its configuration the command **number 4888 no-reg** (to keep that extension from registering under its E.164 address), after fallback the **no-reg** part of this command will be lost because this information cannot be learned from the IP phones.
- The order of the SRST fallback ephone-dns and ephones will be different from the order of the active Cisco Unified Communications Manager or Cisco Unified CME ephone-dns and ephones. For example, ephone 1 on an active Cisco Unified Communications Manager might be numbered ephone 5 on the Cisco Unified CME router in SRST mode, because the order of learned ephone-dns and ephones is determined by the sequence of the ephone fallback occurrence, which is random.

## Information About SRST Fallback Mode

### SRST Fallback Mode Using Cisco Unified CME

This feature enables routers to provide call-handling support for Cisco Unified IP phones if they lose connection to remote primary, secondary, or tertiary Cisco Unified Communications Manager installations or if the WAN connection is down. When Cisco Unified SRST functionality is provided by Cisco Unified CME, provisioning of phones is automatic and most Cisco Unified CME features are available to the phones during periods of fallback, including hunt-groups, call park and access to Cisco Unity voice messaging services using SCCP protocol. The benefit is that Cisco Unified Communications Manager users will gain access to more features during fallback without any additional licensing costs.

This feature offers a limited telephony feature set during fallback mode. Customers who require the following features should continue to use Cisco Unified SRST, because these features are not supported with SRST fallback support using Cisco Unified CME.

- More than 240 phones during fallback service
- Cisco VG 248 Analog Phone Gateway support
- Secure voice fallback during SRST fallback service
- Simple, one-time configuration for SRST fallback service

Cisco Unified Communications Manager supports Cisco Unified IP phones at remote sites attached to Cisco Integrated Services Routers across the WAN. This new feature combines the many features available in Cisco Unified CME with the ability to automatically detect IP phone configurations that is available in Cisco Unified SRST to provide seamless call handling when communication with the Cisco Unified Communications Manager is interrupted.

When the system automatically detects a failure, Cisco Unified SRST uses Simple Network Auto Provisioning (SNAP) technology to auto-configure a branch office router to provide call processing for the Cisco Unified IP

phones that are registered with the router. When the WAN link or connection to the primary Cisco Unified Communications Manager is restored, call handling returns to the primary Cisco Unified Communications Manager.

A limited number of phone features are automatically detected at the time that call processing falls back to Cisco Unified CME in SRST Fallback Mode, and an advantage of SRST fallback support using Cisco Unified CME is that you can choose to prebuild a Cisco Unified CME configuration that contains a number of extensions (ephone-dns) with additional features that you want them to have for some or all of your extensions. The configurations will contain ephone-dn configurations but will not identify which phones (which MAC addresses) will be associated with which ephone-dns (extension numbers).

By copying and pasting a prebuilt configuration onto Cisco Unified CME routers at several locations, you can use the same overall configuration for sites that are identically laid out. For example, if you have a number of retail stores, each with five to ten checkout registers, you can use the same overall configuration in each store. You might use a range of extensions from 1101 to 1110. Stores with fewer than ten registers will simply not use some of the ephone-dn entries you provide in the configuration. Stores with more extensions than you have prebuilt will use the auto-provisioning feature to populate their extra phones. The only configuration variations from store to store will be the specific MAC addresses of the individual phones, which are added to the configurations at the time of fallback.

When a phone registers for SRST service with a Cisco Unified CME router and the router discovers that the phone was configured with a specific extension number, the router searches for an existing prebuilt ephone-dn with that extension number and then assigns that ephone-dn number to the phone. If there is no prebuilt ephone-dn with that extension number, the Cisco Unified CME system automatically creates one. In this way, extensions without prebuilt configurations are automatically populated with extension numbers and features as the numbers and features are “learned” by the Cisco Unified CME router in SRST mode when the phone registers to the router after a WAN link fails.

The SRST fallback support using Cisco Unified CME feature is able to interrogate phones to learn their MAC addresses and the extension-to-ephone relationships associated with each phone. This information is used to dynamically create and execute the Cisco Unified CME **button** command for each phone and automatically provision each phone with the extensions and features you want it to have.

The following sequence describes how Cisco Unified CME provides SRST services for Cisco Unified Communications Manager phones when they lose connectivity with the Cisco Unified Communications Manager and fall back to the Cisco Unified CME router in SRST mode:

#### Before Fallback

1. Phones are configured as usual in Cisco Unified Communications Manager.
2. The IP address of the Cisco Unified CME router is registered as the SRST reference on the Cisco Unified Communications Manager device pool.
3. SRST mode is enabled on the Cisco Unified CME router.
4. (Optional) Ephone-dns and features are prebuilt on the Cisco Unified CME router.

#### During Fallback

1. Phones that are enabled for fallback register to the default Cisco Unified CME router that has SRST mode enabled. Each display-enabled IP phone displays the message that has been defined using the **system message** command under telephony-service configuration mode. By default, this message is “Cisco Unified CME.”

2. While the fallback phones are registering, the router in SRST mode initiates an interrogation of the phones in order to learn their phone and extension configurations. The following information is acquired or “learned” by the router:
  - MAC address
  - Number of lines or buttons
  - Ephone-dn-to-button relationship
  - Speed-dial numbers
3. The option defined with the **srst mode auto-provision** command determines whether Cisco Unified CME adds the learned phone and extension information to its running configuration. If the information is added, it appears in the output when you use the **show running-config** command and is saved to NVRAM when you use the **write** command.
  - Use the **srst mode auto-provision none** command to enable the Cisco Unified CME router to provide SRST fallback services for Cisco Unified Communications Manager.
  - If you use the **srst mode auto-provision dn** or **srst mode auto-provision all** commands, the Cisco Unified CME router includes the phone configuration it learns from Cisco Unified Communications Manager in its running configuration. If you then save the configuration, the fallback phones are treated as locally configured phones on the Cisco Unified CME-SRST router which could adversely impact the fallback behavior of those phones.
4. While in fallback mode, Cisco Unified IP phones periodically attempt to reestablish a connection with Cisco Unified Communications Manager every 120 seconds (default). To manually reestablish a connection to Cisco Unified Communications Manager you can reboot the Cisco Unified IP phone.
5. When a connection is reestablished with Cisco Unified Communications Manager, Cisco Unified IP phones automatically cancel their registration with the Cisco Unified CME router in SRST mode. However, if a WAN link is unstable, Cisco Unified IP phones can bounce between Cisco Unified Communications Manager and the Cisco Unified CME router in SRST mode.

An IP phone connected to the Cisco Unified CME-SRST router over a WAN reconnects itself to Cisco Unified Communications Manager as soon as it can establish a connection to Cisco Unified Communications Manager over the WAN link. However, if the WAN link is unstable, the IP phone switches back and forth between Cisco Unified CME-SRST and Cisco Unified Communications Manager, causing temporary loss of phone service (no dial tone). These reconnect attempts, known as WAN link flapping issues, continue until the IP phone successfully reconnects itself back to Cisco Unified Communications Manager.

WAN link disruptions can be classified into two types: infrequent random outages that occur on an otherwise stable WAN, and sporadic, frequent disruptions that last a few minutes.

To resolve WAN-link flapping issues between Cisco Unified Communications Manager and SRST, Cisco Unified Communications Manager provides an enterprise parameter and a setting in the Device Pool Configuration window called Connection Monitor Duration. (Depending on system requirements, the administrator decides which parameter to use.) The value of the parameter is delivered to the IP phone in the XML configuration file.

- Use the enterprise parameter to change the connection duration monitor value for all IP phones in the Cisco Unified Communications Manager cluster. The default for the enterprise parameter is 120 seconds.

- Use the Device Pool Configuration window to change the connection duration monitor value for all IP phones in a specific device pool.

A Cisco Unified IP phone will not reestablish a connection with the primary Cisco Unified Communications Manager at the central office if it is engaged in an active call.

### After the First Fallback

Additional features can be set up, such as ephone hunt groups, which can contain learned extensions and prebuilt extensions. The complete core set of Cisco Unified CME phone features is available to the IP phones and extensions, whether they are learned or configured.

Figure 51-1 shows a branch office with several Cisco Unified IP phones connected to a Cisco Unified CME router in SRST fallback mode. The router provides connections to both a WAN link and the PSTN. The Cisco Unified IP phones connect to their primary Cisco Unified Communications Manager at the central office via this WAN link. Cisco Unified CME provides SRST services for the phones when connectivity over the WAN link is interrupted.

**Figure 71: SRST Fallback Support using Cisco Unified CME**

## Prebuilding Cisco Unified CME Phone Configurations

Prebuilding Cisco Unified CME ephone-dns allows you to create a set of directory numbers with extension numbers and some features, which will provide service during fallback that is similar to the service that is provided during normal operation. You can prebuild all of your normal extensions, a limited set of your extensions, or none of your extensions. Directory numbers that are not prebuilt will be populated with extension numbers and features as they are “learned” by the Cisco Unified CME router in SRST mode at the time of fallback.

An ephone-dn is the IP equivalent of a normal phone line in most cases. It represents a potential call connection and is associated with a virtual voice port and virtual dial peer. An ephone-dn has one or more extension or telephone numbers associated with it, which allow call connections to be made. An ephone-dn can be single-line,

which allows one call connection to be made at a time, or dual-line, which allows two simultaneous call connections. Dual-line ephone-dns are useful for features such as call transfer or call waiting, in which one call is put on hold to connect to another. Single-line ephone-dns are required for certain features such as intercom, paging, and message-waiting indication (MWI). For more information, see [Cisco Unified CME Overview](#), on page 65.

If an ephone-dn is manually configured in Cisco Unified CME, incoming calls will always route to the manually configured ephone-dn in Cisco Unified CME rather than to Cisco Unified Communications Manager using the voip dial peer. To avoid incorrect routing, configure a higher preference for the voip dial peer than the preference for the prebuilt directory number. For configuration example, see [Example for Prebuilding DN](#)s, on page 1526.

## Auto provision Directory Numbers in SRST Fallback Mode

Cisco Unified CME 4.3 and later versions support octo-line directory numbers in SRST fallback mode. You can specify whether Cisco Unified CME in SRST fallback mode creates octo-line or dual-line directory numbers based on the phone type. For the Cisco Unified IP Phone 7902 or 7920, or an analog phone connected to the Cisco VG224 or Cisco ATA, the system creates a dual-line directory number; it creates an octo-line directory number for all other phone types. This applies only to the ephone-dns that are “learned” automatically from ephone configuration information, and not to ephone-dns that are manually configured in Cisco Unified CME.

## Configure SRST Fallback Mode

### Enable SRST Fallback Mode

#### Restriction

Do not enable the **telephony-service setup** command or **auto assign** command on a Cisco Unified CME router that you are configuring for SRST fallback mode. If you used the **telephony-service setup** command previously on the router, you must remove any unwanted ephone directory numbers created by the setup process.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **srst mode auto-provision {all | dn | none}**
5. **srst dn line-mode {dual | dual-octo | octo | single}**
6. **srst dn template *template-tag***
7. **srst ephone template *template-tag***
8. **srst ephone description *string***
9. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                              | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                                        | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 4</b> | <b>srst mode auto-provision {all   dn   none}</b><br><b>Example:</b><br>Router(config-telephony)# srst mode auto-provision none         | Enables SRST mode for a Cisco Unified CME router. <ul style="list-style-type: none"> <li>• <b>all</b>—Includes information for learned ephones and ephone-dns in the running configuration.</li> <li>• <b>dn</b>—Includes information for learned ephone-dns in the running configuration.</li> <li>• <b>none</b>—Does not include information for learned ephones or learned ephone-dns in the running configuration. Use this keyword when you want Cisco Unified CME to provide SRST fallback services for Cisco Unified Communications Manager.</li> </ul>                                                                                              |
| <b>Step 5</b> | <b>srst dn line-mode {dual   dual-octo   octo   single}</b><br><b>Example:</b><br>Router(config-telephony)# srst dn line-mode dual-octo | (Optional) Specifies the line mode for ephone-dns in SRST mode on a Cisco Unified CME router. <ul style="list-style-type: none"> <li>• <b>dual</b>—SRST fallback ephone-dns are dual-line ephone-dns.</li> <li>• <b>dual-octo</b>—SRST fallback ephone-dns are dual-line or octo-line, depending on the phone type. This keyword is supported in Cisco Unified CME 4.3 and later versions.</li> <li>• <b>octo</b>—SRST fallback ephone-dns are octo-line. This keyword is supported in Cisco Unified CME 4.3 and later versions.</li> <li>• <b>single</b>—SRST fallback ephone-dns are single-line ephone-dns. Default value.</li> </ul> <p><b>Note</b></p> |

|               | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                                         | This command is used only when ephone-dns are learned at the time of fallback. It is ignored when you prebuild ephone-dn configurations.                                                                                                                                                                                                                                                                                              |
| <b>Step 6</b> | <b>srst dn template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-telephony)# srst dn template 3                                          | (Optional) Specifies an ephone-dn template to be used in SRST mode on a Cisco Unified CME router. The template includes features that were specified when the template was created. See <a href="#">Example for Configuring Templates for Fallback Support: Example, on page 1525</a> . <ul style="list-style-type: none"> <li><i>template-tag</i>—identifying number of an existing ephone-dn template. Range is 1 to 15.</li> </ul> |
| <b>Step 7</b> | <b>srst ephone template</b> <i>template-tag</i><br><b>Example:</b><br>Router(config-telephony)# srst ephone template 5                                  | (Optional) Specifies an ephone template to be used in SRST mode on a Cisco Unified CME router. <ul style="list-style-type: none"> <li><i>template-tag</i>—identifying number of an existing ephone template. Range is 1 to 20.</li> </ul>                                                                                                                                                                                             |
| <b>Step 8</b> | <b>srst ephone description</b> <i>string</i><br><b>Example:</b><br>Router(config-telephony)# srst ephone description<br>Cisco Unified CME SRST Fallback | (Optional) Specifies a description to be associated with an ephone learned in SRST mode on a Cisco Unified CME router. <ul style="list-style-type: none"> <li><i>string</i>—Description to be associated with an ephone. Maximum string length is 100 characters.</li> </ul>                                                                                                                                                          |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                                                                                          | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                      |

## Verify SRST Fallback Mode

### Procedure

- Step 1** Use the **show telephony-service all** or the **show running-config** command to verify that SRST fallback mode has been set on this router.

**Example:**

```
telephony-service
 srst mode auto-provision all
 srst ephone template 5
 srst ephone description srst fallback auto-provision phone : Jul 07 2005 17:45:08
 srst dn template 8
 srst dn line-mode dual
 load 7960-7940 P00305000600
 max-ephones 30
 max-dn 60 preference 0
 ip source-address 10.1.68.78 port 2000
```

```
max-redirect 20
system message "SRST Mode: Cisco Unified CME"
keepalive 10
max-conferences 8 gain -6
moh welcome.au
create cnf-files version-stamp Jan 01 2002 00:00:00
```

**Step 2** Use the **show telephony-service ephone-dn** command during fallback to review ephone-dn configurations. Learned ephone-dns are noted by a line stating that they were learned during SRST fallback.

**Note**

Learned ephone-dns do not appear in the output for the **show running-config** command if the **none** keyword is used in the **srst mode auto-provision** command.

**Example:**

```
ephone-dn 1 dual-line
number 4008
name 4008
description 4008
preference 0 secondary 9
huntstop
no huntstop channel
call-waiting beep
ephone-dn-template 8
This DN is learned from srst fallback ephones
```

**Step 3** Use the **show telephony-service ephone** command during fallback to review ephone configurations. Learned ephones are noted by a line stating that they were learned during SRST fallback.

**Note**

Learned ephones do not appear in the output for the **show running-config** command if the **none** keyword is used in the **srst mode auto-provision** command.

**Example:**

```
ephone 1
mac-address 0112.80B3.9C16
button 1:1
multicast-moh
ephone-template 5
Always send media packets to this router: No
Preferred codec: g711ulaw
user-locale JP
network-locale US
Description: "YOUR Description" : Oct 11 2005 09:58:27
This is a srst fallback phone
```

---

## Prebuilding Cisco Unified CME Phone Configurations

You can optionally create a set of ephone-dns that are preconfigured with extension numbers and some features to provide service during fallback that is similar to the service that is provided during normal operation. Extensions that are not prebuilt are populated with extension numbers and features as they are “learned” by the Cisco Unified CME router in SRST mode at the time of fallback.

**Note** To avoid incorrect routing when you prebuild ephone-dns for Cisco Unified Communications Manager phones in Cisco Unified CME, use the **preference** command in ephone-dn and voip-dial-peer configuration mode to create a higher preference (0 being the highest) for the voip dial peer than the preference for the prebuilt directory number. For configuration example, see [Example for Prebuilding DNs, on page 1526](#).

See the following procedures to set up a few of the most common features to associate with phones in fallback mode:

- [Create Directory Numbers for SCCP Phones, on page 264](#)
- [Enable Call Park or Directed Call Park, on page 1076](#)
- [Create an Ephone Template, on page 1424](#)
- [Create an Ephone-dn Template, on page 1426](#)
- [Configure Ephone-Hunt Groups on SCCP Phones, on page 1276](#)

**Note** Note that the **dial-peer hunt** command must be configured for hunt-selection order of explicit preference to support hunt groups during SRST fallback mode.

## Modify Call Pickup for Fallback Support

An especially useful feature for fallback phones is modifying the behavior of the Pickup soft key in Cisco Unified CME to match that of the Pickup soft key in Cisco Unified Communications Manager. To modify the call pickup feature for fallback support, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **no service directed-pickup**
5. **create cnf-files**
6. **reset all**
7. **exit**

### DETAILED STEPS

| Procedure |                                   |                                                                                      |
|-----------|-----------------------------------|--------------------------------------------------------------------------------------|
|           | Command or Action                 | Purpose                                                                              |
| Step 1    | <b>enable</b>                     | Enables privileged EXEC mode.                                                        |
|           | <b>Example:</b><br>Router> enable |                                                                                      |
|           |                                   | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|-------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                      | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 4</b> | <b>no service directed-pickup</b><br><b>Example:</b><br>Router(telephony)# no service directed-pickup | (Optional) Disables directed call pickup and changes the behavior of the Pickup soft key so that a user pressing it invokes local group pickup rather than directed call pickup. This behavior is consistent with that of the Pickup soft key in Cisco Unified Communications Manager.<br><br><b>Note</b><br>For changes to the service-phone settings to be effective, the Sep*.conf.xml file must be updated with the <b>create cnf-files</b> command and the phone units must rebooted with the <b>reset</b> command. |
| <b>Step 5</b> | <b>create cnf-files</b><br><b>Example:</b><br>Router(telephony)# create cnf-files                     | Builds XML configuration files for Cisco Unified IP phones.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 6</b> | <b>reset all</b><br><b>Example:</b><br>Router(telephony)# reset all                                   | Resets all phones.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br>Router(telephony)# exit                                             | Exits dial-peer configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Configuration Examples for SRST Fallback Mode

### Example for Enabling SRST Mode

The following example enables SRST mode on the Cisco Unified CME router. It specifies that learned fallback ephone-dns should be created in dual-line mode and use ephone-dn template 3 for their configuration parameters. Learned ephones will use the parameters in ephone template 5 and a description will be associated with the phones.

```
telephony-service
max-ephones 30
max-dn 60 preference 0
srst mode auto-provision all
```

```

srst dn line-mode dual
srst dn template 3
srst ephone description srst fallback auto-provision phone
srst ephone template 5
.
.
.

```

The following excerpt from the **show running-config** command displays the configuration of ephone 1, which was learned during fallback; the description is stamped with the date and time that the **show running-config** command was used. The configuration of ephone 2, which was prebuilt rather than learned, is shown for comparison.

```

ephone 1
description srst fallback auto-provision phone : Jul 07 2005 17:45:08
ephone-template 5
mac-address 100A.7052.2AAE
button 1:1 2:2

ephone 2
mac-address 1002.CD64.A24A
type 7960
button 1:3

```

The following excerpt from the **show running-config** command displays the configuration of ephone-dn 1 through ephone-dn 3. All three ephones are learned ephone-dns that are configured in dual-line mode and use ephone-dn template 5, as specified in the telephony-service configuration mode commands.

```

ephone-dn 1 dual-line
number 7001
description 7001
name 7001
ephone-dn-template 5
This DN is learned from srst fallback ephones
!
!
ephone-dn 2 dual-line
number 4005
name 4005
ephone-dn-template 5
This DN is learned from srst fallback ephones
!
!
ephone-dn 3 dual-line
number 4002
label 4002
name 4002
ephone-dn-template 5
This DN is learned from srst fallback ephones

```

## Example for Provisioning Directory Numbers for Fallback Support

The following example sets up five ephone-dns and two call-park slots that are used for fallback phones.

```

ephone-dn 1
number 1101
name Register 1

ephone-dn 2
number 1102

```

```

name Register 2

ephone-dn 3
number 1103
name Register 3

ephone-dn 4
number 1104
name Register 4

ephone-dn 5
number 1105
name Register 5

ephone-dn 21
number 1121
name Park Slot 1
park-slot timeout 60 limit 3 recall alternate 1100

ephone-dn 22
number 1122
name Park Slot 2
park-slot timeout 60 limit 3 recall alternate 1100

```

## Example for Configuring Templates for Fallback Support: Example

The following example creates ephone-dn template 3 and ephone template 5 that will be used with the SRST fallback support using Cisco Unified CME feature. Ephone-dn template 3 adds the fallback phones to pickup group 24 and specifies call forwarding for busy and no-answer conditions to extension 1100. Ephone template 5 defines two fastdial numbers that will appear as menu entries displayed from the **Directories > Local Services > Personal Speed Dials** option on the fallback phones, and also specifies the softkey layouts for the fallback phones.

```

ephone-dn-template 3
pickup-group 24
call-forward busy 1100
call-forward noan 1100 timeout 45

ephone-template 5
fastdial 1 1101 name Front Register
fastdial 2 918005550111 Headquarters
softkeys idle Newcall Cfwdall Pickup
softkeys seized Endcall Cfwdall Pickup
softkeys alerting Endcall
softkeys connected Endcall Hold Park Transfer

```

## Example for Enabling Hunt Groups for Fallback Support

The following example configures the dial peers to hunt in the following order: (1) explicit preference, (2) longest match in phone number, and (3) random selection. The **dial-peer hunt** command must be configured for hunt-selection order of explicit preference to support hunt groups during SRST fallback mode.

```
dial-peer hunt 2
```

The following example creates a peer hunt group with the pilot number 1111.

```

ephone-hunt 3 peer
pilot 1111

```

```
list 1101, 1102, 1103
hops 3
timeout 25
final 1100
```

## Example for Modifying Call Pickup for Fallback Support

The following example changes the behavior of the Pickup soft key to be like the one in Cisco Unified Communications Manager.

```
telephony-service
no service directed-pickup
create cnf-files
```

## Example for Prebuilding DNs

In the following partial example, the **preference** command in ephone-dn and voip-dial-peer configuration mode is configured to create a voip dial peer with a higher preference (0) than the preference (1) of the manually-configured directory number (ephone-dn 1).

```
dial-peer voice 1002
voip destination-pattern 1019
.
.
.
preference 0 <<=====This dial peer has precedence and will match first.

ephone-dn 1
number 1019
preference 1 <<=====Configure lower preference for prebuilt DN.
```

## Feature Information for SRST Fallback Mode

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 118: Feature Information for SRST Fallback Mode**

| Feature Name                                  | Cisco Unified CME Version | Feature Information                                           |
|-----------------------------------------------|---------------------------|---------------------------------------------------------------|
| Octo-Line Directory Numbers                   | 4.3                       | Support for octo-line directory numbers was added.            |
| SRST Fallback Support Using Cisco Unified CME | 4.0                       | SRST fallback support using Cisco Unified CME was introduced. |

# CHAPTER 51

## VRF Support

Virtual Route Forwarding (VRF) divides a physical router into multiple logical routers, each having its own set of interfaces and routing and forwarding tables. VRF support in voice networks can be used to split Cisco Unified Communications Manager Express (Cisco Unified CME) into multiple virtual systems for SIP and SCCP endpoints and TAPI-based client applications and softphones on your PC.

- [Prerequisites for Configuring VRF Support, on page 1527](#)
- [Restrictions for Configuring VRF Support, on page 1529](#)
- [Information About VRF Support, on page 1530](#)
- [Configure VRF Support, on page 1531](#)
- [Configuration Examples for Configuring VRF Support, on page 1539](#)
- [Feature Information for VRF Support, on page 1546](#)

## Prerequisites for Configuring VRF Support

- For Multi-VRF support on SIP phones, Cisco Unified CME version has to be 10.5 and later.
- For Multi-VRF support on SCCP phones, Cisco Unified CME 7.0(1) or a later version must be configured on the Cisco router.
- VRF-Aware H.323 and SIP must be configured on the Cisco Unified CME router, including the following:
  - Up to five VRFs must be configured on the Cisco Unified CME router by using the **ip vrf** command. For configuration information, see [VRF-Aware H.323 and SIP for Voice Gateways](#).
  - One of the groups must be designated as a global voice VRF (SIP Trunk) by using the **voice vrf** command. For configuration information, see [VRF-Aware H.323 and SIP for Voice Gateways](#).

Example:

```
voice vrf voice-vrf
ip vrf data-vrf1
 rd 801:1
 route-target export 801:1
 route-target import 1000:1
!
ip vrf data-vrf2
 rd 802:1
 route-target export 802:1
 route-target import 1000:1
!
```

```

ip vrf voice-vrf
 rd 1000:1
 route-target export 1000:1
 route-target import 801:1
 route-target import 802:1
 !

```

- Interfaces on the router must be configured for the VRFs by using the **ip vrf forwarding** command.

---

**Note** Only global voice VRF is supported for SIP trunk.

---

Example:

```

interface GigabitEthernet0/0.301
 encapsulation dot1Q 301
 ip vrf forwarding data-vrf1
 ip address 10.1.10.1 255.255.255.0
 !
interface GigabitEthernet0/0.302
 encapsulation dot1Q 302
 ip vrf forwarding data-vrf1
 ip address 10.2.10.1 255.255.255.0
 !
interface GigabitEthernet0/0.303
 encapsulation dot1Q 303
 ip vrf forwarding voice-vrf
 ip address 10.3.10.1 255.255.255.0

```

- VRFs must be mapped to IP addresses using DHCP. For configuration information, see [DHCP Service, on page 130](#).

Example:

```

!<=== no ip dhcp command required only if "ip vrf forward" is specified under ip dhcp
no ip dhcp use vrf connected pool==>
!<=== Associate subnets with VRFs. Overlapping IP addresses are NOT supported.==>
ip dhcp pool vcme1
 network 10.1.10.0 255.255.255.0
 default-router 10.1.10.1
 option 150 ip 10.1.10.1
 class vcme1
 address range 10.1.10.10 10.1.10.250
 !
ip dhcp pool vcme2
 network 10.2.10.0 255.255.255.0
 default-router 10.2.10.1
 option 150 ip 10.2.10.1
 class vcme2
 address range 10.2.10.10 10.2.10.250

```

For more configuration examples, see [Example for Mapping IP Address Ranges to VRF Using DHCP, on page 1539](#).

- Dial peers for H323 and SIP trunks must be routed through the global voice VRF.

**Note**

Dial peers are global resources belonging to the voice VRF and shared with and accessible from any VRF. There is no need to configure a dial peer for each individual VRF.

## Restrictions for Configuring VRF Support

- Multi-VRF is not supported on Cisco 4000 Series Integrated Services Routers for Unified CME.
- For SIP phones in Cisco Unified CME: SIP proxy and registrar must be in the same VRF.
- IP-address overlap between VRFs is not supported.
- Cross-VRF video is not supported.
- The following call types are not supported for a voice VRF:
  - IP-to-IP gateway and gatekeeper configured on the same router.
  - IP-to-IP gateway with a VRF configured on one call leg and not on another call leg.
  - IP-to-IP gateway with one VRF configured for the H.323 call leg and a different VRF configured for the SIP call leg.
  - For H.323 calls, only TCP is supported. H.323 UDP signaling is not supported. SIP calls support both TCP and UDP signaling.
- The following features are not supported by on a VRF:
  - Call-fallback and RSVP features.
  - H.323 Annex E calls.
  - AAA and DNS components in voice-capable access routers. These routers communicate with AAA and DNS using the default routing table.
- If a global voice VRF is not configured, signaling and media packets are sent using the default routing table.
- Only the global voice VRF is supported for SIP trunk.
- Cisco Unity Express on the Cisco Unified CME router must belong to the global voice VRF.
- For Unified SIP CME, secondary source-address can't be configured under a VRF group. Hence, redundancy isn't supported under a VRF group.

**Note** Telnet is used to access Cisco Unity Express on the global voice VRF because the Service-Engine Service-Engine 1/0 session command is for non-VRF aware Cisco Unified CME only. To access the Cisco Unity Express module for defining voice-mail users on global voice VRF, telnet through the global voice VRF. For example: telnet 10.10.10.5 2066 /vrf vrf. For more information, see the “*Installing Cisco Unity Express Software*” chapter in the appropriate [Cisco Unity Express Administrator Guide for Cisco Unified CME](#).

## Information About VRF Support

### VRF-Aware Cisco Unified CME

VRF implementations enable you to consolidate voice communication into one logically-partitioned network to separate voice and data communication on a converged multimedia network.

#### VRF-Aware Cisco Unified CME for SCCP Phones

In Cisco Unified CME 7.0(1) and later versions, VRF in voice networks can be used to share a Cisco Unified CME among multiple closed-users groups with different requirements. The actual call processing rules can be applied by voice on a per VRF basis. A virtual Cisco Unified CME on each VRF is a collection of phones in VRF groups that register in Cisco Unified CME through the VRF. All SCCP and SIP phones connected to Cisco Unified CME register through the global voice VRF. TAPI-based client applications and softphones on a PC must register through a data VRF and can communicate with phones on the voice VRF.

VRF Support on Cisco Unified CME provides the following enhancements to the VRF-Aware H.323 and SIP for Voice Gateways feature:

- Line side support for up to 5 VRFs.
- Interworks with the global voice VRF on an H323 or SIP Trunk.
- Line side VRF can be a global voice VRF.
- VRFs are assigned on a per-phone level.
- Support for cross-VRF shared-lines.

For configuration information, see [Configure VRF Support, on page 1531](#).

#### Multi-VRF Support on Cisco Unified CME for SIP Phones

The Multi-VRF support on Cisco Unified CME for SIP Phones, provides the following enhancements:

- Up to five VRF groups can be configured on SIP line side under voice register global.
- Under voice register pool, we can configure a VRF group to which the phone is associated with.
- All SIP signaling and media traffic between CME and the phones would be routed on the specified VRF.

# Configure VRF Support

## Create VRF Groups for SCCP Phones

To configure up to five VRF groups for users and phones in Cisco Unified CME, perform the following steps for each group to be configured.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **telephony-service**
4. **group** *group-tag* [**vrf** *vrfname*]
5. **ip source-address** *ip-address* [**port** *port*]
6. **url** {**authentication** | **directories** | **idle** | **information** | **messages** | **proxy-server** | **services**} *url*
7. **service phone** *webAccess 0*
8. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                  | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                    | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <b>group</b> <i>group-tag</i> [ <b>vrf</b> <i>vrfname</i> ]<br><b>Example:</b><br>Router(config-telephony)# group 1 | Creates a VRF group for Cisco Unified CME users and phones.<br><ul style="list-style-type: none"> <li>• <i>group-tag</i>—Unique identifier for VRF group being configured. Range: 1 to 5.</li> <li>• (Optional) <b>vrf</b> <i>vrfname</i>—Name of previously configured VRF to which this group is associated.</li> </ul> |

|               | Command or Action                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                     |

| <b>Step 6</b> | <b>url</b> { <b>authentication</b>   <b>directories</b>   <b>idle</b>   <b>information</b>   <b>messages</b>   <b>proxy-server</b>   <b>services</b> } <i>url</i><br><br><b>Example:</b><br>Router(conf-tele-group)# url directories http://10.1.10.1/localdirectory | Provisions uniform resource locators (URLs) for Cisco Unified IP phones connected to Cisco Unified CME.                                                                                                     |
| <b>Step 7</b> | <b>service phone webAccess 0</b><br><br><b>Example:</b><br>Router(conf-tele-group)# service phone webAccess 0                                                                                                                                                        | Enables webAccess for IP phones. This is required for 9.x firmware, since the web server is disabled by default. 8.x firmware and lower had the web server enabled by default.                              |
| <b>Step 8</b> | <b>end</b><br><br><b>Example:</b><br>Router(conf-tele-group)# end                                                                                                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                            |

## Examples

The following partial output from the **show running-config** commands shows how to define three VRF groups for Cisco Unified CME. Group 1 is on the global voice VRF and the other two groups are on data VRFs.

```
telephony-service
sdspfarm conference mute-on # mute-off #
sdspfarm units 4
sdspfarm transcode sessions 10
sdspfarm tag 1 xcode101
sdspfarm tag 2 conf103
group 1
ip source-address 10.1.10.1 port 2000
url directories http://10.1.10.1/localdirectory
!
group 2 vrf data-vrf1
ip source-address 10.2.10.1 port 2000
!
group 3 vrf data-vrf2
ip source-address 10.3.10.1 port 2000
```

## Create VRF Groups for SIP Phones

In Cisco Unified CME 10.5 release the VRF support for SIP phones is added. Up to five VRF groups can be configured on SIP line side under voice register global. Under voice register pool, we can configure VRF group to which the phone is associated with. To configure VRF support, perform the following steps:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register global**
4. **group** *group-tag* [**vrf** *vrfname*]
5. **source-address** *ip-address*
6. **url** {**authentication** | **directory** | **service**} *url*
7. **exit**

#### Procedure

|               | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                        | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>voice register global</b><br><br><b>Example:</b><br>Router(config)# voice register global                                  | Enters voice register global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 4</b> | <b>group</b> <i>group-tag</i> [ <b>vrf</b> <i>vrfname</i> ]<br><br><b>Example:</b><br>Router(config-register-global)# group 1 | Creates a VRF group for Cisco Unified CME users and phones.<br><br>• <i>group-tag</i> —Unique identifier for VRF group being configured. Range: 1 to 5.<br><br>• (Optional) <b>vrf</b> <i>vrfname</i> —Name of previously configured VRF to which this group is associated.<br><br>• By default, this group is not associated with any VRF unless otherwise specified by using the <b>vrf</b> <i>vrfname</i> keyword and argument combination.<br><br>• Defines unique identifiers group between 1 to 5, which can then be applied on individual pools.<br><br><b>Note</b> |

|               | Command or Action                                                                                                                                              | Purpose                                                                                                                                                                                                                                 |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                                                | Use the shutdown command to temporarily shutdown the group without effecting the other groups. Use the no form of the command to enable the group. <ul style="list-style-type: none"> <li>• The default behavior is no shut.</li> </ul> |
| <b>Step 5</b> | <b>source-address</b> <i>ip-address</i><br><b>Example:</b><br>Router(config-voice-register-group)# source-address 10.1.10.1                                    | Associates VRF group with Cisco Unified CME. <ul style="list-style-type: none"> <li>• <i>ip address</i> through which Cisco Unified IP phones communicate with Cisco Unified CME.</li> </ul>                                            |
| <b>Step 6</b> | <b>url {authentication   directory   service} url</b><br><b>Example:</b><br>Router(config-voice-register-group)# url directory http://10.1.10.1/localdirectory | Provisions uniform resource locators (URLs) for Cisco Unified IP phones connected to Cisco Unified CME.                                                                                                                                 |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br>Router(config-voice-register-group)# exit                                                                                    | Exits to privileged EXEC mode.                                                                                                                                                                                                          |

### Examples

The following sample output displays how to configure SIP CME support for VRF by provisioning its source address under a group:

```
voice register global or
voice register dn
or
voice register pool
mode cme
max-dn 100
max-pool 100

group 1 vrf voice-vrf1
source-address 8.0.0.1
```

## Add Cisco Unified CME SCCP Phones to a VRF Group

To add an SCCP Cisco Unified IP phone, TAPI-based client, or softphone in Cisco Unified CME to a VRF group, perform the following steps for each phone to be added.

**Restriction**

- All SCCP phones in Cisco Unified CME must register through the global voice VRF and must be added to the VRF group on the global voice VRF only.
- Analog phones connected to FXS ports on a IOS gateway must register through the global voice VRF and must be added to the VRF group on the global voice VRF only.
- TAPI-based client applications and softphones on a PC must register through the data VRF and must be added to a VRF group on a data VRF only.
- VRF groups do not support identical IP addresses or shared lines.

**Before you begin**

- All ephone configurations to be included in a VRF group must be already configured in Cisco Unified CME. For configuration information, see [Configure Phones to Make Basic Call, on page 327](#).

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ephone** *phone-tag*
4. **description** *string*
5. **mac-address** [*mac-address*]
6. **group phone** *group-tag* [**tapi** *group-tag*]
7. **end**

**DETAILED STEPS****Procedure**

|               | Command or Action                                                              | Purpose                                                                                                               |
|---------------|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                             | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal     | Enters global configuration mode.                                                                                     |
| <b>Step 3</b> | <b>ephone</b> <i>phone-tag</i><br><b>Example:</b><br>Router(config)# ephone 11 | Enters ephone configuration mode for a Cisco Unified IP phone.                                                        |

|               | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>description</b> <i>string</i><br><b>Example:</b><br>Router(config-ephone)# description cme-2801 srst                         | (Optional) Includes descriptive text about the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 5</b> | <b>mac-address</b> [ <i>mac-address</i> ]<br><b>Example:</b><br>Router(config-ephone)# mac-address 0012.8055.d2EE               | Associates the MAC address of a Cisco Unified IP phone with an ephone configuration.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 6</b> | <b>group phone</b> <i>group-tag</i> [ <b>tapi</b> <i>group-tag</i> ]<br><b>Example:</b><br>Router(config-ephone)# group phone 1 | Adds a phone, TAPI-based client, or softphone to a VRF group. <ul style="list-style-type: none"> <li>• <i>group-tag</i>—Unique identifier for VRF group that was previously configured by using the <b>group</b> command in telephony-service configuration mode. Range: 1 to 5.</li> <li>• This command can also be configured in ephone-template configuration mode and applied to one or more phones. The ephone configuration has priority over the ephone-template configuration.</li> </ul> |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Router(config-ephone)# end                                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Examples

The following example shows how to add phones to VRF groups. Phones 1 and 3 are in VRF group 1 on the global voice VRF. Phone 1 TAPI client and softphone 3 are in group 1 on the data-vrf2. Phone 3 TAPI client and softphone 4 are in group 3 on data-vrf 2.

```
telephony-service
sdspfarm conference mute-on # mute-off #
sdspfarm units 4
sdspfarm transcode sessions 10
sdspfarm tag 1 xcode101
sdspfarm tag 2 conf103
group 1 vrf voice-vrf
ip source-address 10.1.10.1 port 2000
url directories http://10.1.10.1/localedirectory
!
group 2 vrf data-vrf1
ip source-address 10.2.10.1 port 2000
!
group 3 vrf data-vrf2
ip source-address 10.3.10.1 port 2000
!
.
ephone-template 1
group phone 1 tapi 2
ephone-template 2
```

```

group phone 2
...
ephone 1
ephone-template 1
ephone 2
ephone-template 2
ephone 3
group phone 1 tapi 3
ephone 4
group phone 3
ephone 201
group phone 1
type anl

```

## Add Cisco Unified CME SIP Phones to a VRF Group

To add an SIP Cisco Unified IP phone, or softphone in Cisco Unified CME to a VRF group, perform the following steps for each phone to be added.

### Before you begin

- All voice register pool configurations to be included in a VRF group must be already configured in Cisco Unified CME. For configuration information, see [Configure Phones to Make Basic Call, on page 327](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice register pool** *pool-tag*
4. **id mac** [*mac-address*]
5. **group** *group-tag*
6. **end**

### DETAILED STEPS

#### Procedure

|        | Command or Action                                                          | Purpose                                                                                                               |
|--------|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                     |

|               | Command or Action                                                                                              | Purpose                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>voice register pool</b> <i>pool-tag</i><br><b>Example:</b><br>Router(config-register-pool)# group           | Enters voice register pool configuration mode for a Cisco Unified IP phone.                                                                                                                                                                                                |
| <b>Step 4</b> | <b>id mac</b> [ <i>mac-address</i> ]<br><b>Example:</b><br>Router(config-register-pool)# id mac 0012.8055.d2EE | Associates the MAC address of a Cisco Unified IP phone with an voice register pool configuration.                                                                                                                                                                          |
| <b>Step 5</b> | <b>group</b> <i>group-tag</i><br><b>Example:</b><br>Router(config-register pool)# group 1                      | Adds a phone, or softphone to a VRF group. <ul style="list-style-type: none"> <li><i>group-tag</i>—Unique identifier for VRF group that was previously configured by using the <b>group</b> command in voice register global configuration mode. Range: 1 to 5.</li> </ul> |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-register-pool)# end                                             | Returns to privileged EXEC mode.                                                                                                                                                                                                                                           |

## Examples

The following example shows how to add SIP phones to VRF groups.

```
voice register global
 mode cme
 max-dn 100
 max-pool 100
 authenticate realm ccmsipline
 voicemail 24001
 phone-mode phone-only
 tftp-path flash:
 create profile sync 0000443960010126
 conference hardware
 group 1 vrf voice-vrfl
 source-address 8.0.0.1
 !
 group 2 vrf data-vrfl
 url authentication http://7.0.0.1/CCMCIP/authenticate.asp
 source-address 7.0.0.1
 !
 group 3 vrf data-vrfl
 source-address 10.104.45.142
 !
 group 4 vrf voice-vrfl
 source-address 9.42.29.101
 !
!
voice register pool 1
 id mac A40C.C395.7B5C
 session-transport tcp
 type 9971
 number 1 dn 1
 group 1
 template 1
```

```
dtmf-relay rtp-nte
username 14001 password 14001
codec g711ulaw
paging-dn 99
!
```

# Configuration Examples for Configuring VRF Support

## Example for Mapping IP Address Ranges to VRF Using DHCP

**Note** Duplicate IP addresses, with or without specifying a VRF, are not supported in Cisco Unified CME 7.0(1).

There are three ways to assign DHCP addresses: global address allocation; VRF pool; or individual host. With a global address allocation scheme, you must use the **no ip dhcp use vrf connected** command.

```
no ip dhcp use vrf connected
!
ip dhcp pool vcme1
network 209.165.201.10 255.255.255.224
option 150 ip 209.165.201.9
default-router 209.165.201.9
class vcme1
address range 209.165.201.1 209.165.201.30
!
```

The following example shows how to assign addresses from VRF pool vcme1.

```
ip dhcp use vrf connected
!
ip dhcp pool vcme1
vrf data-vrfl
network 209.165.201.10 255.255.255.224
option 150 ip 209.165.201.9
default-router 209.165.201.9
class vcme1
address range 209.165.201.1 209.165.201.30
!
```

The following example show how to assign an address by an individual host. You must replace the first two hexadecimal digits of a host MAC address with **01**.

```
ip dhcp pool phone3
host 209.165.201.15 255.255.255.224
client-identifier 0100.0ed7.4ce6.3d
default-router 209.165.201.11
option 150 ip 209.165.201.11
!
```

## Example for Configuring VRF-Aware Hardware Conferencing

### Hardware Conferencing with Internal DSP Farm

- The internal DSPFarm must be registered through a local loopback interface.
- The loopback allows Cisco Unified CME to access the media path in global routing table.

The boldface commands in the following configuration example show that the signaling and media paths are accessed through the global routing table and the loopback interface is in default routing table.

```
interface Loopback5
 ip address 12.5.10.1 255.255.255.255
 !
 sccp local Loopback5
 sccp ccm 12.5.10.1 identifier 2 version 4.1
 sccp
 !
 sccp ccm group 2
 bind interface Loopback5
 associate ccm 2 priority 1
 associate profile 103 register conf103
 associate profile 101 register xcode101
 !
 telephony-service
 sdspfarm conference mute-on # mute-off #
 sdspfarm units 4
 sdspfarm transcode sessions 10
 sdspfarm tag 1 xcode101
 sdspfarm tag 2 conf103
 group 1 vrf vrf1
 ip source-address 10.1.10.1 port 2000
 !
 group 2 vrf vrf2
 ip source-address 10.2.10.1 port 2000
 !
 group 3 vrf vrf3
 ip source-address 10.3.10.1 port 2000
 !
 group 4 vrf vrf4
 ip source-address 10.4.10.1 port 2000
 !
 group 5
 ip source-address 12.5.10.1 port 2000
 !
 conference hardware
 max-ephones 240
 max-dn 480
 voicemail 7710
 max-conferences 8 gain -6
```

### Hardware Conferencing with External DSP Farm

- Configure DSP farm as usual on a Cisco router.
- The external DSP farm must be registered to Cisco Unified CME through the interface or subinterface assigned to the global voice VRF. Make sure the connection path is coming in through the voice VRF.
- The router on which the external DSP farm is configured does not have to be VRF-aware.

For information about configuring DSP Farms, see [Configure Transcoding Resources, on page 489](#).

## Example for Configuring Cisco Unity Express on Global Voice VRF

```
voice vrf vrf2
 ip vrf data-vrf2
 rd 100:2
 route-target export 100:2
 route-target import 100:2
!
Interface loop back 0
 ip vrf forwarding data-vrf2
 Ip address 21.10.10.2
!<==The following config puts CUE in the voice vrf. Service-engine interface and
service-module must have an IP address.==>
!
interface Service-Engine1/0
 ip vrf forwarding voice-vrf3 ip address 21.10.10.5 255.255.255.0
 service-module ip address 21.10.10.6 255.255.255.0
 service-module ip default-gateway 21.10.10.2!
 ip route 21.10.10.6 255.255.255.255 Service-Engine1/0
...
line 66
 no activation-character
```

### Hardware Conferencing with Internal DSP Farm

- The internal DSPFarm must be registered through a local loopback interface.
- The loopback allows Cisco Unified CME to access the media path in global routing table.

The boldface commands in the following configuration example show that the signaling and media paths are accessed through the global routing table and the loopback interface is in default routing table.

```
interface Loopback5
 ip address 12.5.10.1 255.255.255.255
!
sccp local Loopback5
sccp ccm 12.5.10.1 identifier 2 version 4.1
sccp
!
sccp ccm group 2
 bind interface Loopback5
associate ccm 2 priority 1
associate profile 103 register conf103
associate profile 101 register xcode101
!
telephony-service
sdspfarm conference mute-on # mute-off #
sdspfarm units 4
sdspfarm transcode sessions 10
sdspfarm tag 1 xcode101
sdspfarm tag 2 conf103
group 1 vrf vrf1
 ip source-address 10.1.10.1 port 2000
!
group 2 vrf vrf2
 ip source-address 10.2.10.1 port 2000
!
```

```

group 3 vrf vrf3
 ip source-address 10.3.10.1 port 2000
!
group 4 vrf vrf4
 ip source-address 10.4.10.1 port 2000
!
 group 5
 ip source-address 12.5.10.1 port 2000
 !
 conference hardware
 max-ephones 240
 max-dn 480
 voicemail 7710
 max-conferences 8 gain -6

```

### Hardware Conferencing with External DSP Farm

- Configure DSP farm as usual on a Cisco router.
- The external DSP farm must be registered to Cisco Unified CME through the interface or subinterface assigned to the global voice VRF. Make sure the connection path is coming in through the voice VRF.
- The router on which the external DSP farm is configured does not have to be VRF-aware.

For information about configuring DSP Farms, see [Configure Transcoding Resources, on page 489](#).

## Example for Configuring Multi- VRF Support for Cisco Unified CME SIP Phones

The following sample output displays CME configuration which enables the user to accept registrations from multiple VRFs.

```

voice register global
 mode cme
 max-dn 100
 max-pool 100
 authenticate realm ccmsipline
 voicemail 24001

## Feature Information for VRF Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

**Table 119: Feature Information for Virtual Route Forwarding**

| Feature Name                     | Cisco Unified CME Version | Feature Information                                                                                                                                                                  |
|----------------------------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VRF Support in Cisco Unified CME | 7.0(1)                    | VRF supports Cisco Unified CME, conferencing, transcoding, and RSVP components. VRF also allows soft phones in data VRF resources to communicate with phones in a VRF voice gateway. |

## CHAPTER 52

# Configure the XML API

---

This chapter describes the eXtensible Markup Language (XML) Application Programming Interface (API) support available in Cisco Unified Communications Manager Express (Cisco Unified CME).

- [Information About XML API, on page 1547](#)
- [Configure XML API, on page 1586](#)
- [Configuration Examples for XML API, on page 1591](#)
- [Where to Go Next, on page 1591](#)
- [Feature Information for XML API, on page 1592](#)

## Information About XML API

### XML API Definition

An XML API provides an interface to Cisco Unified CME that allows an external network management system (NMS) to configure and monitor Cisco Unified CME operations.

### XML API Provision Using IXI

In previous versions of Cisco Unified CME, the XML interface provided configuration and monitoring functions using the HTTP port. The XML interface ran under the HTTP server process, simultaneously parsing incoming XML requests on demand and processing them.

In Cisco Unified CME 4.0 and later versions, the XML interface is provided through the Cisco IOS XML Infrastructure (IXI), in which the parser and transport layers are separated from the application. This modularity provides scalability and enables future XML support to be developed. In Cisco Unified CME 4.0 and later versions, all Cisco Unified CME features have XML support.

### XML API for Cisco Unified CME

The eXtensible Markup Language (XML) Application Programming Interface (API) is supported in Cisco Unified Communications Manager Express (Cisco Unified CME) 8.5 and later versions.

## Target Audience

This chapter assumes that you have knowledge of a high-level programming language, such as C++, Java, or an equivalent language. You must also have knowledge or experience in the following areas:

- TCP/IP Protocol
- Hypertext Transport Protocol
- Socket programming
- XML

In addition, users of this programming guide must have a firm grasp of XML Schema, which is used to define the AXL requests, responses, and errors. For more information on XML Schema, see [XML Schema Part 0: Primer Second Edition](#).

## Prerequisites

- For Cisco Unified CME: XML API must be configured in Cisco Unified CME. For configuration information, see [Configure the XML API, on page 1547](#) of the *Cisco Unified CME Administrator Guide*.

## Information on XML API for Cisco Unified CME

The XML API support in Cisco Unified CME provides a mechanism for inserting, retrieving, updating, and removing data from the Cisco router using XML.

Request methods are XML structures that are passed to the XML server in Cisco Unified CME and Cisco Unified SRST applications using HTTP POST. The XML server receives the XML structures and executes the request. If the request completes successfully, then the appropriate XML response is returned.

**Note** Querying for multiple entities in a single request can fail because of the XML buffer size limitation. Because of this limitation, the application must adjust its granularity to query one entity per request.

[Table 120: XML API Methods: Request and Response, on page 1548](#) lists the request and response methods for the XML API along with the purpose and parameters for each method.

**Table 120: XML API Methods: Request and Response**

| Description                        | Request      | Parameter      | Response           |
|------------------------------------|--------------|----------------|--------------------|
| System                             |              |                |                    |
| Execute configuration commands     | ISexecCLI    | <i>command</i> | ISexecCLIResult    |
| Save router configuration to nvram | ISsaveConfig | —              | ISsaveConfigResult |
| SCCP                               |              |                |                    |

| Description                                                    | Request                | Parameter                                                                                                                                                                   | Response             |
|----------------------------------------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| Get system status for Cisco Unified CME or Cisco Unified SRST. | ISgetGlobal            | —                                                                                                                                                                           | ISGlobal             |

## Examples for XML API Methods

This section contains examples for the following XML API methods:

### System

- [ISexecCLI](#)
- [ISSaveConfig](#)

### SCCP IP Phones

- [ISgetGlobal](#)
- [ISgetDevice](#)
- [ISgetDeviceTemplate](#)
- [ISgetExtension](#)
- [ISgetExtensionTemplate](#)
- [ISgetUser](#)
- [ISgetUserProfile](#)
- [ISgetUtilityDirectory](#)

### SIP IP Phones

- [ISgetVoiceRegGlobal](#)
- [ISgetSipDevice](#)
- [ISgetSipExtension](#)
- [ISgetSessionServer](#)
- [ISgetVoiceHuntGroup](#)
- [ISgetPresenceGlobal](#)

## ISexecCLI

Use ISexecCLI to execute a list of Cisco IOS commands on the Cisco router. The request must include the CLI parameter with the Cisco IOS command string for each command to be executed.

### Request

```
<SOAP-ENV:Envelope>
<SOAP-ENV:Body>
<axl>
<request xsi:type="ISexecCLI">
<ISexecCLI>
<CLI>ephone 4</CLI>
<CLI>mac-address 000D.BC80.EB51</CLI>
<CLI>type 7960</CLI>
<CLI>button 1:1</CLI>
</ISexecCLI>
</request>
</axl>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

### Response

The value of “0” for ISexecCLIResponse in the following example is the response when the request is completed successfully.

```
<SOAP-ENV:Envelope >
<SOAP-ENV:Body>
<axl >
<response xsi:type="ISexecCLIResponse" >
<ISexecCLIResponse>0</ISexecCLIResponse>
<ISexecCLIError></ISexecCLIError>
</response>
</axl>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

The following example shows the response when the request fails. The value of ISexecCLIResponse identifies which line number in the request failed. Any subsequent commands in the list of commands are not executed. All preceding commands in the list were executed.

```
<SOAP-ENV:Envelope >
<SOAP-ENV:Body>
<axl >
<response xsi:type="ISexecCLIResponse" >
```

```

<ISexecCLIResponse>4</ISexecCLIResponse>
<ISexecCLIError> invalid input dn parameter for button 1</ISexecCLIError>
</response>
</axl>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>

```

## ISSaveConfig

Use ISSaveConfig to save the running configuration on a router to the startup configuration on the same router.

### Request

```

<request>
<ISSaveConfig />
</request>

```

### Response

The following example shows that the ISSaveConfig request was successfully completed.

```

<response xsi:type=" ISSaveConfig">
<ISSaveConfigResult>success</ISSaveConfigResult>
</request>

```

The following example shows the response when the request fails.

```

<response xsi:type=" ISSaveConfig">
<ISSaveConfigResult>fail</ISSaveConfigResult>
</request>

```

The following example shows that response when the request is delayed, typically because there is another terminal session connected to Cisco Unified CME. The running configuration will be saved later by a background process after all other terminal sessions are disconnected.

```

<response xsi:type=" ISSaveConfig">
<ISSaveConfigResult>delay</ISSaveConfigResult>
</request>

```

## ISgetGlobal

Use ISgetGlobal to retrieve system configuration and status information for the Cisco Unified CME system.

### Request

```

<request xsi:type="ISgetGlobal">
<ISgetGlobal></ISgetGlobal>
</request>

```

### Response

```

<response>
<ISGlobal>
<ISAddress>10.4.188.90</ISAddress>
<ISMode>ITS</ISMode>
<ISVersion>7.2</ISVersion>
<ISDeviceRegistered>0</ISDeviceRegistered>
<ISPeakDeviceRegistered>1</ISPeakDeviceRegistered>
<ISPeakDeviceRegisteredTime>9470</ISPeakDeviceRegisteredTime>
<ISKeepAliveInterval>30</ISKeepAliveInterval>

```

```

## ISgetDevice

Use ISgetDevice to retrieve configuration and status information for IP phones.

Use any combination of the following parameters in the request message to specific one or more SCCP phones:

- ISDevID with the ephone tag number of SCCP phone to be queried.
- ISDevName with the MAC address of SCCP phone to be queried.
- ISKeyword with one of the following options:
  - all—All configured SCCP phones
  - allTag—Ephone tag numbers for all SCCP phones configured
  - available—Next available ephone tag number to be configured

### Request:

```

<request xsi:type="ISgetDevice">
<ISgetDevice>
<ISDevID>1</ISDevID>
<ISDevName>SEP0012DA8AC43D</ISDevName>
<ISDevName>allKeyphone</ISDevName>
</ISgetDevice>
</request>

```

## Response

```

<response>
<ISDevices>
<ISDevice>
<ISDevID>1</ISDevID>
<ISDevName>SEP0016C7C7AF9D</ISDevName>

## ISgetDeviceTemplate

Use ISgetDeviceTemplate to retrieve configuration and status information for IP phone templates.

Use any combination of the following parameters in the request message to specify one or more phone templates:

- ISDevTemplateID with phone template tag number to be queried.
- ISKeyword with one of the following options:
  - all—All configured phone templates
  - allTag—Phone template tag numbers for all configured phone templates
  - available—Next available phone template tag number to be configured

### Request

```

<request>
<ISgetDeviceTemplate>
<ISgetDevTemplateID>1</ISgetDevTemplateID>
<ISgetDeviceTemplate>
</request>

```

## ISgetUser

Use ISgetUser to retrieve information for a particular user in Cisco Unified CME. The request must include the ISuserID parameter with a user name that is configured in Cisco Unified CME. If the request contains a valid ISuserID, the response includes the user-name tag number (ISuserTag) and type for this user.

The value for ISuserType corresponds to how a username is configured in Cisco Unified CME, as follows:

- 0—INVALID\_CME\_USER
- 1—EPHONE\_USER
- 2—LOGOUT\_PROFILE\_USER
- 3—USER\_PROFILE\_USER

If the request contains an invalid ISuserID, the value for ISuserTag and ISuserType will both be “0.”

### Request

```

<request>
<ISgetUser>
<ISuserID>a</ISuserID>
</ISgetUser>
</request>

```

### Response

```

<response>
<ISuser>
<ISuserID>a</ISuserID>
<ISuserType>3</ISuserType>
<ISuserTag>1</ISuserTag>
</ISuser>
</response>

```

## ISgetUserProfile

Use the ISgetUserProfile to retrieve the status and configuration information for a specific user profile.

Use any combination of the following:

- ISUserProfileID with the user profile ID of a specific user.
- ISuserID with user ID of a specific user.

- ISKeyword with one of the following options:
  - all—Displays details of all configured user profiles.
  - allTag—Displays a list of all configured user profile IDs.
  - available—Next available user profile.

## Request

```
<request>

## ISgetUtilityDirectory

Use the ISgetUtilityDirectory to retrieve status and configuration information for directory information.

### Request

```

<request>
<ISgetUtilityDirectory>
</ISgetUtilityDirectory>
</request>

```

### Response

```

<response>
<ISUtilityDirectory>
<ISDirectoryEntry>
<ISDirectoryTag>1</ISDirectoryTag>
<ISDirectoryNumber>12345</ISDirectoryNumber>
<firstName>first</firstName>
<lastName>last</lastName>
</ISDirectoryEntry>
<ISDirectoryEntry>
<ISDirectoryTag>2</ISDirectoryTag>
<ISDirectoryNumber>67890</ISDirectoryNumber>
<firstName>first2</firstName>
<lastName>last 2</lastName>
</ISDirectoryEntry>
</ISUtilityDirectory>
</response>

```

## ISgetVoiceRegGlobal

Use the ISgetVoiceRegGlobal to retrieve status and configuration information of global parameters for SIP,

### Request

```

<request>

```

```
<ISgetVoiceRegGlobal>
</ISgetVoiceRegGlobal>
</request>
```

## Response

```
<response>
<ISSipGlobal>
<ISAddress>10.10.10.1</ISAddress>
<ISMode>cme</ISMode>
<ISVersion>7.1</ISVersion>
<ISAuthModes>
<ISAuthMode>ood_refer</ISAuthMode>
<ISAuthMode>presence</ISAuthMode>
</ISAuthModes>
<ISPortNumber>5060</ISPortNumber>
<ISMaxPool>10</ISMaxPool>
<ISMaxDN>100</ISMaxDN>
<ISMaxRedirect>5</ISMaxRedirect>
</ISSipGlobal>
</response>
```

## ISgetSipDevice

For SIP phones, use any combination of the following parameters in the request message to specify one or more SIP phones:

- ISPoolID with the voice register pool tag number of SIP phone to be queried.
- ISPoolName with the voice register pool name of the SIP phone to be queried.
- ISKeyword with one of the following options:
  - all—All configured SIP phones
  - allTag—Voice register pool tag numbers for all configured SIP phones
  - available—Next available phone tag number to be configured

## Request

```
<request>
<ISgetSipDevice>
<ISPoolID>1</ISPoolID>
</ISgetSipDevice>
</request>
```

## Response

```
<response>
<ISSipDevices>
<ISSipDevice>
<ISPoolID>1</ISPoolID>
<ISDevMac>0013.1978.3CA5</ISDevMac>
<ISSessionServerID>0</ISSessionServerID>
<ISDevAddr>
<Xipv4Address>0</Xipv4Address>
</ISDevAddr>
```

```

<ISDevCodec>g729r8</ISDevCodec>
</ISSipDevice>
</ISSipDevices>
</response>

```

## ISgetSipExtension

Use ISgetSipExtension to retrieve configuration and status information for extension numbers.

Use any combination of the following parameters in the request message to specify one or more extensions:

- ISVoiceRegDNID with the extension ID number to be queried.
- ISVoiceRegNumber with the extension number to be queried.
- ISKeyword with one of the following options:
  - all—Displays details of all configured extension numbers
  - allTag—Displays a list of all configured extension ID numbers
  - available—Next available extension ID number to be configured

### Request

```

<request>
 <ISgetSipExtension>
 <ISVoiceRegDNID>1</ISVoiceRegDNID>
 </ISgetSipExtension>
</request>

```

### Response

```

<response>
 <ISSipExtensions>
 <ISSipExtension>
 <ISVoiceRegDNID>1</ISVoiceRegDNID>
 <ISExtNumber>901</ISExtNumber>
 <ISSessionServerIDs>
 <ISSessionServerID>1</ISSessionServerID>
 <ISSessionServerID>2</ISSessionServerID>
 </ISSessionServerIDs>
 <ISAllowWatch>true</ISAllowWatch>
 <firstName>Henry</firstName>
 </ISSipExtension>
 </ISSipExtensions>
</response>

```

```

<lastName>Mann</lastName>
<ISSipDevList>
<ISPoolID>1</ISPoolID>
<ISPoolID>2</ISPoolID>
</ISSipDevList>
</ISSipExtension>
</ISSipExtensions>
</response>

```

## ISgetSessionServer

Use ISgetSessionServer to retrieve configuration information for session servers in Cisco Unified CME.

Use any combination of the following parameters in the request message to specify one or more session servers:

- ISSessionServerID with the session server tag number.
- ISSessionserverName with session server name.
- ISKeyword with one of the following keywords:
  - all—All configured session servers
  - allTag—Session server tag numbers for all configured session servers
  - available—Next available session server tag number to be configured

### Request

```

<request>
<ISgetSessionServer>
<ISSessionServerID>1</ISSessionServerID>
</ISgetSessionServer>
</request>

```

### Response

```

<response>
<ISSessionServers>
<ISSessionServer>
<ISSessionServerID>1</ISSessionServerID>
<ISSessionRegisterID>SS1</ISSessionRegisterID>
<ISSessionKeepAlives>60</ISSessionKeepAlives>
</ISSessionServer>
</ISSessionServers>
</response>

```

## ISgetVoiceHuntGroup

Use the ISgetVoiceHuntGroupID to retrieve status and configuration information for voice hunt groups.

Use any combination of the following parameters in the request message to specify one or more voice hunt groups:

- ISVoiceHuntGroupID with the voice hunt group ID number.
- ISKeyword with one of the following keywords:

- all—All configured voice hunt groups
- allTag—Voice hunt group ID numbers for all configured voice hunt groups
- available—Next available voice hunt group ID number to be configured

### Request

```
<request>
<ISgetVoiceHuntGroup>
<ISVoiceHuntGroupID>1</ISVoiceHuntGroupID>
</ISgetVoiceHuntGroup>
</request>
```

### Response

```
<response>
<ISVoiceHuntGroups>
<ISVoiceHuntGroup>
<ISVoiceHuntGroupID>1</ISVoiceHuntGroupID>
<ISVoiceHuntGroupType>longest-idle</ISVoiceHuntGroupType>
<ISVoiceHuntGroupPilotNumber>200</ISVoiceHuntGroupPilotNumber>
<ISVoiceHuntGroupPilotPeerTag>200</ISVoiceHuntGroupPilotPeerTag>
<ISVoiceHuntGroupPilotPreference>0</ISVoiceHuntGroupPilotPreference>
<ISVoiceHuntGroupSecPilotNumber />
<ISVoiceHuntGroupSecPilotPeerTag>-1</ISVoiceHuntGroupSecPilotPeerTag>
<ISVoiceHuntGroupSecPilotPreference>0</ISVoiceHuntGroupSecPilotPreference>
<ISVoiceHuntGroupListSize>2</ISVoiceHuntGroupListSize>
<ISVoiceHuntGroupListNums>
<ISVoiceHuntGroupListNum>201</ISVoiceHuntGroupListNum>
<ISVoiceHuntGroupListNum>202</ISVoiceHuntGroupListNum>
</ISVoiceHuntGroupListNums>
<ISVoiceHuntGroupFinalNum />
<ISVoiceHuntGroupTimeout>180</ISVoiceHuntGroupTimeout>
<ISVoiceHuntGroupHops>2</ISVoiceHuntGroupHops>
</ISVoiceHuntGroup>
</ISVoiceHuntGroups>
</response>
```

## ISgetPresenceGlobal

Use ISgetPresenceGlobal to retrieve configuration information and status for the presence engine in Cisco Unified CME.

### Request

```
<request>
<ISgetPresenceGlobal />
</request>
```

### Response

```
<response>
<ISPresenceGlobal>
<ISPresenceEnable>true</ISPresenceEnable>
<ISMode>cme</ISMode>
```

```
<ISAllowSub>true</ISAllowSub>
<ISAllowWatch>true</ISAllowWatch>
<ISMaxSubAllow>100</ISMaxSubAllow>
<ISSipUaPresenceStatus>false</ISSipUaPresenceStatus>
</ISPresenceGlobal>
</response>
```

## Configure XML API

**Note** The following Cisco IOS commands that were previously used with the XML interface are no longer valid: **log password**, **xmltest**, **xmlschema**, and **xmlthread**.

## Define XML Transport Parameters

To define the XML transport method and associated parameters, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **ixi transport http**
5. **response size** *fragment-size*
6. **request outstanding** *number*
7. **request timeout** *seconds*
8. **no shutdown**
9. **end**

### DETAILED STEPS

#### Procedure

|               | Command or Action                                                              | Purpose                                                                                                                   |
|---------------|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                         |
| <b>Step 3</b> | <b>ip http server</b><br><br><b>Example:</b><br>Router(config)# ip http server | Enables the Cisco web browser user interface on the local Cisco Unified CME router.                                       |

|               | Command or Action                                                                                                       | Purpose                                                                                                                                                                                                                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>ixi transport http</b><br><b>Example:</b><br><pre>Router(config)# ixi transport http</pre>                           | Specifies the XML transport method and enters XML-transport configuration mode. <ul style="list-style-type: none"> <li>• <b>http</b>—HTTP transport.</li> </ul>                                                                                                                |
| <b>Step 5</b> | <b>response size <i>fragment-size</i></b><br><b>Example:</b><br><pre>Router(conf-xml-trans)# response size 8</pre>      | Sets the response buffer size. <ul style="list-style-type: none"> <li>• <i>fragment-size</i>—Size of fragment in the response buffer, in kilobytes. Range is constrained by the transport type and platform. See the CLI help for the valid range of values.</li> </ul>        |
| <b>Step 6</b> | <b>request outstanding <i>number</i></b><br><b>Example:</b><br><pre>Router(conf-xml-trans)# request outstanding 2</pre> | Sets the maximum number of outstanding requests allowed for the transport type. <ul style="list-style-type: none"> <li>• <i>number</i>—Number of requests. Range is constrained by the transport type and platform. See the CLI help for the valid range of values.</li> </ul> |
| <b>Step 7</b> | <b>request timeout <i>seconds</i></b><br><b>Example:</b><br><pre>Router(conf-xml-trans)# request timeout 30</pre>       | Sets the number of seconds to wait, while processing a request, before timing out. <ul style="list-style-type: none"> <li>• <i>seconds</i>—Number of seconds. Range is 0 to 60.</li> </ul>                                                                                     |
| <b>Step 8</b> | <b>no shutdown</b><br><b>Example:</b><br><pre>Router(conf-xml-trans)# no shutdown</pre>                                 | Enables HTTP transport.                                                                                                                                                                                                                                                        |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-xml-app)# end</pre>                                                 | Returns to privileged EXEC mode.                                                                                                                                                                                                                                               |

## Define XML Application Parameters

To set a response timeout for communication with the XML application that overrides the setting in transport configuration mode, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ixi application cme**
4. **response timeout { -1 | *seconds* }**
5. **no shutdown**
6. **end**

## DETAILED STEPS

## Procedure

|               | Command or Action                                                                                        | Purpose                                                                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                               | Enters global configuration mode.                                                                                                                                                                                                                                                                                |
| <b>Step 3</b> | <b>ixi application cme</b><br><b>Example:</b><br>Router(config)# ixi application cme                     | Enters XML-application configuration mode for configuring Cisco IOS XML infrastructure parameters for the Cisco Unified CME application. <p><b>Note</b><br/>This command defines URL of Cisco Unified CME XML server as<br/>http://&lt;routerIPAddress&gt;/ios_xml_app/cme.</p>                                  |
| <b>Step 4</b> | <b>response timeout {-1   seconds}</b><br><b>Example:</b><br>Router(config-xml-app)# response timeout 30 | Sets a timeout for responding to the XML application and overwrites the IXI transport level timeout. <ul style="list-style-type: none"> <li>• <b>-1</b>—No application-specific timeout is specified. This is the default.</li> <li>• <b>seconds</b>—Length of timeout, in seconds. Range is 0 to 60.</li> </ul> |
| <b>Step 5</b> | <b>no shutdown</b><br><b>Example:</b><br>Router(conf-xml-app)# no shutdown                               | Enables XML communication with the application.                                                                                                                                                                                                                                                                  |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-xml-app)# end                                             | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                 |

## Define Authentication for XML Access

To authenticate users for XML access, perform the following steps:

## SUMMARY STEPS

1. enable
2. configure terminal
3. telephony-service

4. **xml user** *user-name* **password** *password* *privilege-level*
5. **end**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                           | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                   | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)# telephony-service                                                                                             | Enters telephony-service configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>xml user</b> <i>user-name</i> <b>password</b> <i>password</i> <i>privilege-level</i><br><b>Example:</b><br>Router(config-telephony)# xml user user23 password 3Rs92uzQ 15 | Defines an authorized user.<br><ul style="list-style-type: none"> <li>• <i>user-name</i>—Unique alphanumeric string that is authorized user name. Maximum length of string is 19 characters.</li> <li>• <i>password</i>—Alphanumeric string to use for access. Maximum length of string is 19 characters.</li> <li>• <i>privilege-level</i>—Level of access to Cisco IOS commands to be granted to this user. Only the commands with the same or a lower level can be executed via XML. Range is 0 (lowest) to 15 (highest).</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                                                                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Define XML Event Table Parameters

The XML event table is an internal buffer that stores captured and time-stamped events, such as phones registering and unregistering and extension status. One event equals one entry in the table. To set the maximum number of events or entries that can be stored in the XML event table and the length of time that events are retained before they are deleted from the table, perform the following steps.

### SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **telephony-service**
4. **log table max-size** *number*
5. **log table retain-timer** *minutes*
6. **end**
7. **show fb-its-log**
8. **clear telephony-service xml-event-log**

## DETAILED STEPS

### Procedure

|               | Command or Action                                                                                                      | Purpose                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                             | Enters global configuration mode.                                                                                                                                                                                |
| <b>Step 3</b> | <b>telephony-service</b><br><b>Example:</b><br>Router(config)#                                                         | Enters telephony-service configuration mode.                                                                                                                                                                     |
| <b>Step 4</b> | <b>log table max-size</b> <i>number</i><br><b>Example:</b><br>Router(config-telephony)# log table max-size 100         | Sets the number of entries in the XML event table. <ul style="list-style-type: none"> <li>• <i>number</i>—Number of entries. Range is 0 to 1000. Default is 150.</li> </ul>                                      |
| <b>Step 5</b> | <b>log table retain-timer</b> <i>minutes</i><br><b>Example:</b><br>Router(config-telephony)# log table retain-timer 30 | Sets the number of minutes to retain entries in the event table before they are deleted. <ul style="list-style-type: none"> <li>• <i>minutes</i>—Number of minutes. Range is 2 to 500. Default is 15.</li> </ul> |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Router(config-telephony)# end                                                         | Returns to privileged EXEC mode.                                                                                                                                                                                 |
| <b>Step 7</b> | <b>show fb-its-log</b><br><b>Example:</b><br>Router# show fb-its-log                                                   | Displays the event logs.                                                                                                                                                                                         |
| <b>Step 8</b> | <b>clear telephony-service xml-event-log</b><br><b>Example:</b><br>Router# clear telephony-service xml-event-log       | Clears XML event logs.                                                                                                                                                                                           |

## Troubleshooting the XML Interface

- Use the **debug cme-xml** command to view debug messages for the Cisco Unified CME XML interface.

## Configuration Examples for XML API

### Example for XML Transport Parameters

The following example selects HTTP as the XML transport method:

```
ip http server
ixi transport http
 response size 8
 request outstanding 2
 request timeout 30
 no shutdown
```

### Example for XML Application Parameters

The following example sets the application response timeout to 30 seconds.

```
ixi application cme
 response timeout 30
 no shutdown
```

### Example for XML Authentication

The following example selects HTTP as the XML transport method. It allows access for user23 with the password 3Rs92uzQ, and sets up access list 99 that accepts requests from the IP address 192.168.146.72.

```
ixi transport http
 ip http server
 !
 telephony-service
 xml user user23 password 3Rs92uzQ 15
```

### Example for XML Event Table

The following example sets the maximum number of entries in the XML event table to 100 and the number of minutes to retain entries at 30:

```
telephony-service
 log table max-size 100
 log table retain-timer 30
```

## Where to Go Next

For developer information on the XML API, see [XML Provisioning Guide for Cisco CME/SRST](#).

## Feature Information for XML API

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 121: Feature Information for XML API**

| Feature Name                         | Cisco Unified CME Version | Feature Information                                                                                                                |
|--------------------------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Call Blocking Based on Date and Time | 4.0                       | The XML API was modified and is now provided through the Cisco IOS XML infrastructure. It supports all Cisco Unified CME features. |
|                                      | 3.0                       | The XML API was introduced.                                                                                                        |
|                                      | 12.6                      | The <b>log password</b> , <b>xmltest</b> , <b>xmlschema</b> , and <b>xmlthread</b> commands were deprecated.                       |
