Bidirectional Forwarding Detection MIB

Last Updated: April 18, 2012

The Bidirectional Forwarding Detection (BFD) MIB, Version 2 feature enables Simple Network Management Protocol (SNMP) agent support in Cisco IOS software for BFD management, as implemented in the Bidirectional Forwarding Detection Management Information Base (draft-ietf-bfd-mib-02.txt). The SNMP agent code operating with the BFD MIB enables a standardized, SNMP-based approach to be used in managing the BFD features in Cisco IOS software. The BFD MIB feature introduces the CISCO-IETF-BFD-MIB. The BFD MIB is also VPN-aware, which allows SNMP to differentiate incoming packets from different VPNs.

• Finding Feature Information, page 1
• Restrictions for the Bidirectional Forwarding Detection MIB, page 1
• Information About the Bidirectional Forwarding Detection MIB, page 2
• How to Configure the Bidirectional Forwarding Detection MIB, page 8
• Configuration Examples for the Bidirectional Forwarding Detection MIB, page 10
• Additional References, page 13
• Feature Information for the Bidirectional Forwarding Detection MIB, page 14

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for the Bidirectional Forwarding Detection MIB

The following restrictions apply to the BFD MIB for Cisco IOS releases:

• This MIB supports read-only (RO) permission for MIB objects, except for ciscoBfdSessNotificationsEnable, which has read-write access to enable or disable BFD traps via SNMP set commands.
• The BFD Session Mapping Table (ciscoBfdSessMapTable) maps the complex indexing of the BFD sessions to the flat BFDIndex used in the ciscoBfdSessionTable.
• BFD does not support 64-bit counters. The session performance table (ciscoBfdSessionPerfTable) collects BFD performance counts on a per session basis. This table augments the ciscoBfdSessionTable.
• The VRF-Aware functionality of BFD MIB is not supported with IPv6 addresses.

Information About the Bidirectional Forwarding Detection MIB

• BFD MIB Cisco Implementation, page 2
• Capabilities Supported by the BFD MIB, page 2
• Notification Generation Events, page 3
• Benefits of Bidirectional Forwarding Detection MIB, page 3
• Features and Technologies Related to BFD MIB, page 3
• Supported Objects in the BFD MIB, page 3
• VPN Aware BFD MIB, page 6

BFD MIB Cisco Implementation

The BFD MIB is based on the Internet Engineering Task Force (IETF) draft MIB entitled draft-ietf-bfd-mib-02.txt which includes objects describing features that support BFD.

Slight differences between the IETF draft MIB and the implementation of the BFD capabilities within Cisco IOS software require some minor translations between the BFD MIB and the internal data structures of Cisco IOS software. These translations are made by the SNMP agent code that is installed and operating on various hosts within the network. This SNMP agent code, running in the background as a low priority process, provides a management interface to Cisco IOS software.

The SNMP objects defined in the BFD MIB can be displayed by any standard SNMP utility. All BFD MIB objects are based on the IETF draft MIB; thus, no specific Cisco SNMP application is required to support the functions and operations pertaining to the BFD MIB.

Capabilities Supported by the BFD MIB

The following functionality is supported in the BFD MIB:

• The ability to generate and queue notification messages that signal changes in the operational status of BFD sessions.
• The ability to make the BFD MIB VPN aware.
• Extensions to existing SNMP commands that provide the ability to enable, disable, and configure notification messages for BFD sessions.
• The ability to specify the name or the IP address of a network management station (NMS) in the operating environment to which notification messages are to be sent.
• The ability to write notification configurations into nonvolatile memory.
Notification Generation Events

When BFD notifications are enabled with the `snmp-server enable traps bfd` command with the `session-up` and `session-down` keywords, notification messages relating to specific events within Cisco IOS software are generated and sent to a specified NMS in the network.

For example, a bfdSessUp notification is sent to an NMS when BFD is configured. Conversely, a bfdSessDown notification is generated and sent to an NMS when BFD is disabled.

Benefits of Bidirectional Forwarding Detection MIB

The BFD MIB provides the following benefits:

- Provides a standards-based SNMP interface for retrieving information about BFD.
- Forwards notification messages to a designated NMS for evaluation or action by network administrators.

Features and Technologies Related to BFD MIB

The BFD MIB feature is used in conjunction with the following features and technologies:

- Standards-based SNMP network management application
- BFD

Supported Objects in the BFD MIB

- BFD General Variables (scalars), page 3
- BFD Session Table, page 3
- BFD Session Performance Table, page 5
- BFD Session Mapping Table, page 6
- BFD Notifications, page 6

BFD General Variables (scalars)

The following parameters apply globally to the router’s BFD process:

- `ciscoBfdAdminStatus` is the global administrative status of BFD in this router. The value `enabled` denotes that the BFD Process is active on at least one interface; `disabled` means it is not enabled on any interface.
- `ciscoBfdVersionNumber` is the current default version number of the BFD protocol.
- `ciscoBfdSessNotificationsEnable` enables the emission of `ciscoBfdSessUp` and `ciscoBfdSessDown` notifications when set to true (1); otherwise, these notifications are not emitted.

BFD Session Table

The BFD Session Table specifies BFD session specific information and contains the following entries:

- `ciscoBfdSessTable` describes the BFD sessions.
- `ciscoBfdSessEntry` describes BFD session.
• `ciscoBfdSessIndex` contains an index used to represent a unique BFD session on this device. This is an Index and it does not show up in the MIB walk as an object.

• `ciscoBfdSessApplicationId` contains an index used to indicate a local application which owns or maintains this BFD session. This application ID provides a convenient way to segregate sessions by the applications that maintain them. The value corresponds to the `ClientID` in the output of the `showbfdclient` command.

• `ciscoBfdSessDiscriminator` specifies the local discriminator for this BFD session, used to uniquely identify it.

• `ciscoBfdSessRemoteDiscr` specifies the session discriminator chosen by the remote system for this BFD session.

• `ciscoBfdSessUdpPort` specifies the UDP Port for BFD. The default value is the well-known value for this port.

• `ciscoBfdSessState` specifies the perceived state of the BFD session. Valid values are `adminDown` (1), `down` (2), `init` (3), and `up` (4).

• `ciscoBfdSessRemoteHeardFlag` specifies status of BFD packet reception from the remote system. The flag is set to true (1) if the local system is actively receiving BFD packets from the remote system. The flag is set to false (0) if the local system has not received BFD packets recently (within the detection time) or if the local system is attempting to tear down the BFD session. This object is applicable only if the session is running at version 0. If the session is running version 1, that value will return false.

• `ciscoBfdSessDiag` displays a diagnostic code specifying the local system's reason for the last transition of the session from `up` (1) to some other state. This object is accessible only for notifications and will not display in the MIB walk for the `ciscoBfdSessTable`. The codes are:
  - BfdInterval—The delay in microseconds.
  - BfdDiag—A diagnostic code:
    - noDiagnostic(0)
    - controlDetectionTimeExpired(1)
    - echoFunctionFailed(2)
    - neighborSignaledSessionDown(3)
    - forwardingPlaneReset(4)
    - pathDown(5)
    - concatenatedPathDown(6)
    - administrativelyDown(7)
    - reverseConcatenatedPathDown(8)

• `ciscoBfdSessOperMode` specifies the current operating mode of the BFD session. The supported values are:
  - asyncModeWEchoFun (1),
  - asynchModeWOEchoFun (2).

• `ciscoBfdSessDemandModeDesiredFlag` indicates the local system's desire to use demand mode. It is set to true (1) if the local system wishes to use demand mode or false (0) if not. Demand Mode is not supported and therefore will always return a value of 0.

• `ciscoBfdSessEchoFuncModeDesiredFlag` indicates that the local system's desire to use echo mode. It is set to true (1) if the local system wishes to use Echo mode or false (0) if not.

• `ciscoBfdSessControlPlanIndepFlag` indicates if the local system's can function through a disruption of the control plane. It is set to true (1) if the local system BFD implementation is independent of the control plane. Otherwise, the value is set to false (0). This value will always return a value of 0.

• `ciscoBfdSessAddrType` specifies the IP address of the interface associated with this BFD session. Only values unknown (0), ipv4 (1) or ipv6 (2) are supported. A value of unknown (0) is allowed only when
the outgoing interface is of type point-to-point, or when the BFD session is not associated with a specific interface.

- ciscoBfdSessAddr specifies the IP address of the interface associated with this BFD session. The value is set to zero when BFD session is not associated with a specific interface.
- ciscoBfdSessDesiredMinTxInterval specifies the minimum interval, in microseconds, that the local system would like to use when transmitting BFD control packets.
- ciscoBfdSessReqMinRxInterval specifies the minimum interval, in microseconds, between received BFD control packets the local system can support.
- ciscoBfdSessReqMinEchoRxInterval specifies the minimum interval, in microseconds, between received BFD Echo packets that this system can support. If echo mode is disabled for the configured interface for the session, this object will return value of 0.
- ciscoBfdSessDetectMult specifies the detect time multiplier.
- ciscoBfdSessStorType indicates the storage type for this object. The storage type for this entry is a read-only implementation that is always volatile.
- ciscoBfdSessRowStatus This object is a read-only implementation that is always active.
- ciscoBfdSessAuthPresFlag indicates the local system’s desire to use Authentication. It is set to true (1) if the local system wishes the session to be authenticated or false (0) if not. Authentication is not supported and this object will always return a value of 0.
- ciscoBfdSessAuthenticationType specifies the authentication type used for this BFD session. This field is valid only when the authentication present bit is set. This object is not valid in BFD in Cisco IOS.

**BFD Session Performance Table**

ciscoBfdSessPerfTable specifies BFD session performance counters and augments the ciscoBfdSessionTable. This table contains the following entries:

- ciscoBfdSessPerfEntry includes an entry created by a BFD-enabled node for every BFD session. ciscoBfdCounterDiscontinuityTime is used to indicate potential discontinuity for all counter objects in this table.
- ciscoBfdSessPerfPktIn specifies the total number of BFD messages received for this BFD session.
- ciscoBfdSessPerfPktOut specifies the total number of BFD messages sent for this BFD session.
- ciscoBfdSessUpTime specifies the value of sysUpTime on the most recent occasion at which the session came up. If no such up event exists, the value is zero.
- ciscoBfdSessPerfLastSessDownTime specifies the value of sysUpTime on the most recent occasion at which the last time communication was lost with the neighbor. If no such down event exists, the value is zero.
- ciscoBfdSessPerfLastCommLostDiag specifies the BFD diag code for the last time communication was lost with the neighbor. This object is not supported.
- ciscoBfdSessPerfSessUpCount specifies the number of times this session has gone into the up state since the router last rebooted.
- ciscoBfdSessPerfDiskTime indicates the value of sysUpTime on the most recent occasion at which any one or more of the session counters suffered a discontinuity. The relevant counters are the specific instances associated with this BFD session of any Counter32 object contained in the BfdSessPerfTable. If no such discontinuities have occurred since the last re-initialization of the local management subsystem, then the value is zero. This object is not supported.
- ciscoBfdSessPerfPktInHC represents the total number of BFD messages received for this BFD session. It must be equal to the least significant 32 bits of ciscoBfdSessPerfPktIn if ciscoBfdSessPerfPktInHC is supported according to the rules spelled out in RFC2863.
• ciscoBfdSessPerfPktOutHC represents the total number of BFD messages transmitted for this BFD session. It must be equal to the least significant 32 bits of ciscoBfdSessPerfPktIn if ciscoBfdSessPerfPktOutHC is supported according to the rules spelled out in RFC2863.

BFD Session Mapping Table

The BFD Session Mapping Table maps the complex indexing of the BFD sessions to the flat BFDIndex used in the ciscoBfdSessionTable. If the value of the ciscoBfdSessAddr (an OID) has more than 111 sub-identifiers, then OIDs of column instances in this table have more than 128 sub-identifiers and cannot be accessed using SNMPv1, SNMPv2c, or SNMPv3. The BFD Session Mapping table contains the following entries:

- ciscoBfdSessMapEntry describes BFD session that is mapped to this index. If the value of the mplsInSegmentMapLabelPtrIndex (an OID) has more that 111 sub-identifiers, then OIDs of column instances in this table have more than 128 sub-identifiers and cannot be accessed using SNMPv1, SNMPv2c, or SNMPv3.
- ciscoBfdSessMapBfdIndex specifies the BfdIndex referred to by the indexes of this row. In essence, a mapping is provided between these indexes and the ciscoBfdSessTable. This is Index and does not show up in the MIB walk as an object.

See the MIB Walk for BFD MIB: Example in the configuration example section for an example of the mapping.

BFD Notifications

Notification contains the following entries. The range mode for this notification is not supported. Therefore, only a single notification is sent for one of the ciscoBfdSessTable entries representing this session.

- ciscoBfdSessUp generates a notification when the ciscoBfdSessState object for one or more entries in ciscoBfdSessTable is about to enter the up (4) state from some other state. The value of ciscoBfdSessDiag is set equal to noDiagnostic(0).
- ciscoBfdSessDown generates a notification when the ciscoBfdSessState object for one or more entries in ciscoBfdSessTable is about to enter the down (2) or adminDown (1) states from some other state. The values of ciscoBfdSessDiag returns the Diag code providing the reason for this new state (that is, pathDown (5) or administrativelyDown (7)).

VPN Aware BFD MIB

The VPN Aware BFD MIB feature enables the BFD MIB to get VPN context information. The feature adds support for different contexts for different MPLS VPNs. Users of the MIB can display BFD processes for a given MPLS VPN. The VPN Aware BFD MIB feature does not change the syntax of the BFD MIB. It changes the number and types of entries within the tables.

The BFD MIB can show information about only one context at a time. With Cisco IOS Release 12.2(33)SRE, you can specify a context using an SNMP security name.

For information about making the BFD MIB VPN-aware, see the SNMP Support over VPNs—Context-Based Access document.

- SNMP Contexts, page 7
- VPN Aware BFD MIB Sessions, page 7
- VPN Aware BFD MIB Notifications, page 7
**SNMP Contexts**

SNMP contexts provide VPN users with a secure way of accessing MIB data. When a VPN is associated with a context, that VPN’s specific MIB data exists in that context. Associating a VPN with a context enables service providers to manage networks with multiple VPNs. Creating and associating a context with a VPN enables a provider to prevent the users of one VPN from accessing information about users of other VPNs on the same networking device.

VPN-aware SNMP requires that SNMP manager and agent entities operating in a VPN environment agree on mapping between the SNMP security name and the VPN name. This mapping is created by you using different contexts for the SNMP data of different VPNs, which is accomplished through the configuration of the SNMP View-based Access Control Model MIB (SNMP-VACM-MIB). The SNMP-VACM-MIB is configured with views so that a user on a VPN with a security name is allowed access to the restricted object space within the context of only that VPN.

SNMP request messages undergo three phases of security and access control before a response message is sent back with the object values within a VPN context:

- The first security phase is authentication of the username. During this phase, the user is authorized for SNMP access.
- The second phase is access control. During this phase, the user is authorized for SNMP access to the group objects in the requested SNMP context.
- In the third phase, the user can access a particular instance of a table entry. With this third phase, complete retrieval can be based on the SNMP context name.

IP access lists can be configured and associated with SNMP community strings. This feature enables you to configure an association between VPN routing and forwarding (VRF) instances and SNMP community strings. When a VRF instance is associated with an SNMP community string, SNMP processes requests coming in for a particular community string only if they are received from the configured VRF. If the community string contained in the incoming packet does not have a VRF associated with it, it is processed only if it came in through a non-VRF interface.

**VPN Aware BFD MIB Sessions**

The VPN Aware BFD MIB feature supports an SNMP query to the BFD MIB for both global and VPN contexts. You can enter BFD queries on any VRF and on the core (global context). A query can differentiate between BFD sessions from different VPNs. BFD session information for a VPN stays in the context of that VPN. Therefore, the information from one VPN is not available to a user of a different VPN.

In an MPLS VPN, a service provider edge router (PE) might contain VRFs for several VPNs and a global routing table. To set up separate BFD processes for different VPNs on the same device, configure each VPN with a unique securityName, contextName, and View-based Access Control Model (VACM) view. The VPN securityName must be configured for the BFD MIB.

![Note]

To verify BFD session information for a specific VPN, use the show bfd neighbor **vrvpn-name** detail command.

**VPN Aware BFD MIB Notifications**

The VPN Aware BFD MIB feature supports BFD notifications for multiple VPN contexts for BFD. BFD notifications can be generated for the global context and for different VPNs. You can cause notifications be
sent to different NMS hosts for different BFD contexts. BFD notifications associated with a specific VRF are sent to the NMS designated for that VRF. BFD global notifications are sent to the NMS configured to receive global traps.

To enable BFD context notifications for the VPN Aware BFD MIB feature, use either the SNMP ciscoBfdSessNotificationEnable object (in the global BFD context only) or the following extended global configuration commands.

To enable BFD notifications for the global context, use the following commands on a provider edge (PE) router:

```bash
Router(config)# snmp-server host host-address traps community
Router(config)# snmp-server enable traps bfd
```

To enable BFD notifications for a VPN context, use the following commands:

```bash
Router(config)# snmp-server host
    host-address vrf vrf-name
    version {v1 | v2c | v3} community community-string
    udp-port upd-port bfd
Router(config)# snmp-server enable traps bfd
```

### How to Configure the Bidirectional Forwarding Detection MIB

- Enabling the SNMP Agent for BFD MIB Notifications, page 8
- Verifying the Status of the SNMP Agent, page 10

### Enabling the SNMP Agent for BFD MIB Notifications

The SNMP agent for the BFD MIB is disabled by default. To enable the SNMP agent for BFD MIB notifications, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `show running-config | includesnmp`
3. `configure terminal`
4. `snmp-server community string [view view-name] [ro | rw] [ipv6 nacl] [access-list-number]`
5. `snmp-server enable traps bfd [session-up] [session-down]`
6. `exit`
7. `write memory`
## Enabling the SNMP Agent for BFD MIB Notifications

### How to Configure the Bidirectional Forwarding Detection MIB

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router# enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> show running-config</td>
<td>includesnmp</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>`Router# show running-config</td>
<td>include snmp`</td>
</tr>
<tr>
<td><strong>Step 3</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> snmp-server community</td>
<td>string [viewview-name] [ro</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# snmp-server community comaccess ro 4</code></td>
<td><strong>• The example enables snmp with community string comaccess and read-only access.</strong></td>
</tr>
<tr>
<td><strong>Step 5</strong> snmp-server enable traps bfd</td>
<td>[session-up] [session-down]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# snmp-server enable traps bfd</code></td>
<td><strong>Note</strong> This command is optional. After SNMP is enabled, all MIBs are available for the user to query.</td>
</tr>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# exit</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> write memory</td>
<td>Writes the modified configuration to NVRAM, permanently saving the settings.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router# write memory</code></td>
<td></td>
</tr>
</tbody>
</table>
Verifying the Status of the SNMP Agent

To verify that the SNMP agent has been enabled on a host network device, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `show running-config | includesnmp`
3. `show bfd neighbors detail`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router# enable</code></td>
<td>Enter your password if prompted</td>
</tr>
<tr>
<td><strong>Step 2</strong> show running-config</td>
<td>includesnmp</td>
</tr>
<tr>
<td>Example:</td>
<td>Displays the running configuration on the target device and is used to</td>
</tr>
<tr>
<td>`Router# show running-config</td>
<td>include snmp</td>
</tr>
<tr>
<td><strong>Step 3</strong> show bfd neighbors detail</td>
<td>examine the output for displayed SNMP information.</td>
</tr>
<tr>
<td>Example:</td>
<td>Displays BFD protocol parameters and timers for each neighbor.</td>
</tr>
<tr>
<td><code>Router# show bfd neighbors detail</code></td>
<td></td>
</tr>
</tbody>
</table>

**Example**

The follows example displays the running configuration on the target device and its SNMP information.

```
Router# show running-config | include snmp
...
snmp-server community public rw
snmp-server community private ro
```

Any `snmp-server` statement that appears in the output and takes the form shown here verifies that SNMP has been enabled on that device.

---

**Configuration Examples for the Bidirectional Forwarding Detection MIB**

- **Enabling the SNMP Agent to Enable BFD Notifications** Example, page 11
Enabling the SNMP Agent to Enable BFD Notifications Example

The following example shows how to enable an SNMP agent on a host network device:

Router# configure terminal
Router(config)# snmp-server community privatero

The following example shows how to allow read-only access to all BFD MIB objects relating to members of access list 4 that specify the comaccess community string. No other SNMP agents will have access to any BFD MIB objects.

Router(config)# snmp-server community comaccess ro 4

The following example shows how to enable a router to send BFD-related SNMP notifications or informs to an SNMP host.

Router(config)# snmp-server enable traps bfd

Viewing BFD Sessions Example

The following example shows how to enable BFD notifications. The output of the `show bfd neighbors` command shows the BFD sessions and timers for each neighbor.

Router# show bfd neighbors

<table>
<thead>
<tr>
<th>NeighAddr</th>
<th>LD/RD</th>

MIB Walk for BFD MIB Example

This example shows sample output from a MIB walk of the BFD MIB:

ciscoBfdSessMapTable

ciscoBfdSessMapBfdIndex.1.7.1.4.10.1.0.1 - 65543
ciscoBfdSessMapBfdIndex.3.1.2.16.221.221.0.0.0.0.0.0.0.0.0.0.0.0.0.0.2 = 196609
ciscoBfdSessMapBfdIndex.4.6.1.4.40.4.0.1 = 262150

The MapTable index includes the following information about BFD sessions and clients:

Index example: 1.7.1.4.10.1.0.1
1 ± Client id
7 ± Local discriminator
1 ± IP address type (1 ± IPv4, 2- IPv6)
4 ± Length of next string (4 for IPv4 addresses or 16 for IPv6 addresses)
10.1.0.1 ± IP address of the BFD session

ciscoBfdSessTable

## Feature Information for the Bidirectional Forwarding Detection MIB

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

| Bidirectional Forwarding Detection MIB, Version 2 | 12.2(33)SRE | The Bidirectional Forwarding Detection MIB feature enables the SNMP agent support in Cisco IOS software for BFD management, as implemented in the CISCO-IETF-BFD-MIB. The following commands were introduced or modified:  
  • snmp-server enable traps bfd  
  • snmp-server host |
|                                            | 15.1(1)SG  |                              |
