

# File System Commands on Cisco IOS XR Software

This chapter describes the Cisco IOS XR software commands used to manage file systems.

The commands in this chapter should not be used to access or modify any Cisco IOS XR software or configuration files. Use only the documented commands for installing and configuring the router. Modifying, deleting, or moving configuration or software package files using the manual commands described in this chapter is not required and can result in router downtime, loss of service, and a corrupted database.

# cd

To change the present working directory, use the **cd** command in EXEC mode.

cd [filesystem:]

# **Syntax Description**

filesystem:	(Optional) Location of the new present working directory. Include the file
	system alias for the filesystem argument, followed by a colon, and,
	optionally, the name of a directory.

Defaults

The default file directory is disk0:/usr.

#### **Command Modes**

**EXEC** 

### **Command History**

Releases	Modifications	
Release 2.0	This command was introduced on the Cisco CRS-1.	
Release 3.0	No modification.	
Release 3.2	This command was first supported on the Cisco XR 12000 Series Router.	
Release 3.3.0	No modification.	
Release 3.4.0	No modification.	
Release 3.5.0	No modification.	
Release 3.6.0	No modification.	
Release 3.7.0	No modification.	

### **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

The present working directory is the directory used when EXEC commands that have an optional *filesystem* argument are entered without that argument. Use the **cd** command to define the present working directory. For example, when the **dir** command is entered without specifying the *filesystem* argument, the files in the present working directory are displayed.

Use the **pwd** command to display the present working directory.

Use the **show filesystem** command to display the available storage devices.

Enter the cd command without an argument to return the present working directory to disk0:/usr.

# Task ID

Task ID	Operations
filesystem	read

# **Examples**

The following example shows how to change the present working directory to the root directory on the hard disk. In this example, the **pwd** command confirms that the present working directory has changed to the root directory on the hard disk.

```
RP/0/RP0/CPU0:router# cd harddisk:
RP/0/RP0/CPU0:router# pwd
```

harddisk:

The following example shows how to change the present working directory to the default file directory by specifying the **cd** command without a location. In this example, the **pwd** command confirms that the present working directory has changed to the default file directory.

```
RP/0/RP0/CPU0:router# cd
RP/0/RP0/CPU0:router# pwd
```

disk0:/usr

Command	Description	
dir	Displays the contents of a file system.	
pwd	Displays the current working directory of the <b>cd</b> command.	
show filesystem	Displays the layout and contents of a file system.	

# cfs check

To perform a check of the Configuration File System (CFS), use the **cfs check** command in EXEC or administration EXEC mode.

#### cfs check

**Syntax Description** 

This command has no arguments or keywords.

Defaults

No default behavior or values

**Command Modes** 

**EXEC** 

Administration EXEC

### **Command History**

Release	Modification	
Release 2.0	This command was introduced on the Cisco CRS-1.	
Release 3.0	No modification.	
Release 3.2	This command was first supported on the Cisco XR 12000 Series Router.	
Release 3.3.0	No modification.	
Release 3.4.0	No modification.	
Release 3.5.0	No modification.	
Release 3.6.0	No modification.	
Release 3.7.0	No modification.	

# **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

Use the **cfs check** command to check the sanity of the configuration file system and attempt to recover from internal inconsistencies; one or more rollback points may be lost depending on the severity of the state of the file system.

While this command runs, redundancy of the designated secure domain router system controller (DSDRSC) is disabled.

#### Task ID

Task ID	Operations
root-lr	read, write

# **Examples**

The following example shows how to perform a CFS check:

RP/0/RP0/CPU0:router# cfs check

Creating any missing directories in Configuration File system...OK Initializing Configuration Version Manager...OK
Syncing commit database with running configuration...OK
Re-initializing cache files...OK
Updating Commit Database. Please wait...[OK]

# clear-classic-config

To clear or truncate the Cisco IOS software running configuration stored in NVRAM, use the **clear-classic-config** command in EXEC mode.

#### clear-classic-config

**Syntax Description** 

This command has no arguments or keywords.

Defaults

No default behavior or values

**Command Modes** 

**EXEC** 

#### **Command History**

Release	Modification	
Release 3.2	This command was introduced on the Cisco XR 12000 Series Router.	
Release 3.3.0	No modification.	
Release 3.4.0	No modification.	
Release 3.5.0	No modification.	
Release 3.6.0	No modification.	
Release 3.7.0	No modification.	

### **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

Use the **clear-classic-config** command to clear space on the NVRAM, if the Cisco IOS software configuration is no longer needed or to boot the Cisco IOS software with no configuration.

#### Task ID

Task ID	Operations
config-services	execute

### **Examples**

The following example shows how to clear the Cisco IOS software running configuration stored in NVRAM:

RP/0/0/CPU0:router# clear-classic-config

# copy

To copy a file from a source (such as a network server) to a destination (such as a flash disk), use the **copy** command in EXEC or administration EXEC mode.

copy source {location node-id destination {location node-id | location all} | running-config
 [atomic]}

Syntax Description	source	Filename including the directory path or network location of the file. The possible sources are:
		• directory-path—Directory path of the file from which the file is copied.
		• access-list {ipv4   ipv6}—Copies an access list (EXEC mode only).
		• bootflash:—Copies from the bootflash: file system.
		• <b>compactflash:</b> —Copes from the compactflash: file system (Cisco XR 12000 Series Router only).
		• <b>compactflasha:</b> —Copes from the compactflasha: file system partition (Cisco XR 12000 Series Router only).
		• <b>disk0</b> :—Copies from disk0: file system.
		• <b>disk0a</b> :—Copies from disk0a: file system partition.
		• <b>disk1</b> :—Copies from disk1: file system.
		• <b>disk1a</b> :—Copies from disk1a: file system partition.
		• <b>flash:</b> —Copies from the flash: file system. The <b>flash:</b> keyword is an alias for bootflash:.
		• <b>ftp:</b> —Copies from an FTP network server. The syntax is <b>ftp:</b> [[[//username [:password]@] location]/directory]/filename.
		• harddisk:—Copies from the hard disk drive file system (if present).
		• harddiska:—Copies from the hard disk partition a.
		• harddiskb:—Copies from the hard disk partition b.
		• <b>nvram:</b> —Copies from the NVRAM file system.
		• <b>prefix-list</b> { <b>ipv4</b>   <b>ipv6</b> }—Copies from a prefix list (EXEC mode only).
		• <b>rcp:</b> —Copies from a remote copy protocol (rcp) network server. The syntax is <b>rcp:</b> [[[//username@]location]/directory]/filename.
		• running-config—Copies from the current system configuration.
		• <b>tftp:</b> —Copies from a TFTP network server. The syntax is <b>tftp:</b> [[//location]/directory]/filename.
		• xml-schema—Copies the XML schema files as a tar ball file (.tar.gz) [EXEC mode only].
	destination	Filename including the directory path or network location of the file.
	location node-id	Specifies a node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.
	location all	Copies to all nodes.

running-config	Applies the source configuration file to the running configuration of the system.	
atomic	(Optional) Applies the changes to the running configuration only if there are no errors	

#### Defaults

No default behavior or values

#### **Command Modes**

**EXEC** 

Administration EXEC

#### **Command History**

Releases	Modifications	
Release 2.0	This command was introduced on the Cisco CRS-1.	
Release 3.0	No modification.	
Release 3.2	This command was first supported on the Cisco XR 12000 Series Router. The command was made available in administration EXEC mode.	
	Support was added to copy to a designated node or to all nodes. Hardware partition support was added.	
Release 3.3.0	No modification.	
Release 3.4.0	No modification.	
Release 3.5.0	Support was added to copy XML schema files.	
Release 3.6.0	The following file systems were added: disk0a:, disk1a:, and compactflasha:.	
Release 3.7.0	No modification.	

#### **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

Source and destination can each be a configuration file, a text file, or a file system. Enter source and destination URL information, usernames, and passwords and issue the **copy** command. The networking device prompts for any missing information.

The exact format of the *source* and *destination* arguments vary according to the file or directory location. Enter the device or network location for the file system type.

Filenames can include the following characters:

! # \$ % & ' + 0 1 2 3 4 5 6 7 8 9 ; @ A B C D E F G H I J K L M N O P Q R S T U V W X Y Z [ ] ^ \_ a b c d e f g h i j k l m n o p q r s t u v w x y z { } ~

The following characters can be used with the stated limitations:

- needs backslash before this character
- cannot be the first character
- cannot be the last character
- = cannot be the filename without other characters

The following characters cannot be used in filenames:

"()\*,/:
$$<>?$$
\|

The maximum length allowed by the Cisco CRS-1 router for a filename is 254 characters including the path. If a filename longer than 254 characters is specified, the filename is truncated to 254 characters.

To copy a file from a source on the router to a destination on the router, specify a source **location** *node-id* and a destination **location** *node-id*. To copy the file to all nodes, use the keywords **location all**.

In the alias syntax for the **ftp:**, **rcp:**, and **tftp:** keywords, the location is either an IP address or a hostname. The filename is specified relative to the directory used for file transfers.

When no alias is specified, the networking device looks for a file in the current directory. To view the current directory, enter the **pwd** command.

During processing of the **copy** command, you might see the "C" character. For all files being copied, "C" indicates that the copy process is taking place. The entire copying process might take several minutes and differs from protocol to protocol and from network to network.

Table 28 describes the network protocols supported by Cisco IOS XR software.

Table 28 Network Protocols Supported by Cisco IOS XR Software

Prefix	Name	Description
tftp:	Trivial File Transfer Protocol	TFTP is a simplified version of FTP that allows files to be transferred from one computer to another over a network, usually without the use of client authentication (for example, username and password).
ftp:	File Transfer Protocol	FTP is an application protocol, part of the TCP/IP protocol stack, and is used for transferring files between network nodes. FTP requires a username and password.
rcp:	Remote Copy Protocol	The rcp protocol allows users to copy files to and from a file system residing on a remote host or server on the network. The rcp protocol uses TCP to ensure the reliable delivery of data. The rcp protocol downloads require a username.

Additional usage guidelines are in the following sections:

- Invalid Combinations of Source and Destination, page 305
- Using TFTP, page 306
- Using FTP, page 306
- Using rcp, page 306

#### **Invalid Combinations of Source and Destination**

Some combinations of source and destination are invalid. Specifically, you cannot copy the following:

- From a running configuration to a running configuration
- From a network device to a network device (for example, **copy ftp: rcp:**)

#### **Using TFTP**

TFTP is a simplified version of FTP that allows files to be transferred from one computer to another over a network, usually without the use of client authentication (for example, username and password).

The syntax is as follows:

**copy tftp:**//hostname | ipaddress/directory-path/pie-name target-device [**location** node-id | **location all**]

#### Example:

RP/0/RP0/CPU0:router# copy tftp://1.1.1/images/crs\_software.pie disk1:

Some Cisco IOS XR software images may be larger than 32 MB, and the TFTP services provided by some vendors may not support a file this large. If you do not have access to a TFTP server that supports files larger than 32 MB, download the software image using FTP or rcp as described in the following sections.

#### **Using FTP**

FTP servers require a username and password for each client request. Cisco IOS XR software sends the first valid username in the following list:

1. The username and password specified in the **copy** command, if a username is specified.

The syntax is as follows:

**copy ftp:**//username:password@hostname or ipaddress/directory-path/pie-name target-device [location node-id | location all]

#### Example:

RP/0/RP0/CPU0:router# copy ftp://john:secret@10.1.1/images/crs\_software.pie disk1:

- **2.** An "anonymous" username and password. The anonymous password is "root@ip address," where "ip address" is the IP address of the local networking device.
- **3.** A password "username@iosname.domain" formed by the networking device. The variable "username" is the username associated with the current session, "iosname" is the configured hostname, and "domain" is the domain of the networking device.

The username and password must be associated with an account on the FTP server. If you are writing to the network server, the FTP server must be properly configured to accept the FTP write request from the user on the networking device.

If the network server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the network server. For example, if the system image resides in the home directory of a user on the network server, specify the name of that user as the remote username.

Refer to the documentation for your FTP server for more details.

#### Usina rcp

The rcp protocol requires a username upon each request. When you copy a configuration file or image between the networking device and an rcp server, the Cisco IOS XR software sends the first valid username in the following list:

- 1. The remote username specified in the **copy** command, if one is specified.
- 2. The username set by the **rcp client username** command, if the command is configured.

#### **3.** The networking device hostname.

For the rcp copy request to process successfully, an account must be defined on the network server for the remote username. If the network administrator of the destination server did not establish an account for the remote username, this command does not run successfully. If the network server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the network server. For example, if the system image resides in the home directory of a user on the network server, specify the name of that user as the remote username.

If you are writing to the network server, the rcp server must be properly configured to accept the rcp write request from the user on the networking device. For UNIX systems, add an entry to the .rhosts file for the remote user on the rcp server. Suppose the networking device contains the following configuration lines:

```
hostname Rtr1
ip rcp remote-username User0
```

If the IP address of the networking device translates to company.com, then the .rhosts file for User0 on the rcp server should contain the following line:

```
company.com Rtr1
```

See the documentation for your rcp server for more details.

If you are using a personal computer as a file server, the computer must support remote shell (rsh) protocol.

Table 29 shows the syntax and example for the **copy** command when used with FTP, rcp, and TFTP network servers.

Table 29 Syntax and Examples of the copy Command

Туре	Syntax and Example			
FTP	copy ftp://username:password@{hostname   ipaddress}/directory-path/pie-name target-device [location node-id   location all]			
	Example:			
	RP/0/RP0/CPU0:router# copy ftp://john:secret@10.1.1.1/images/comp-crs-full.pie disk1:			
rcp	copy rcp://username@{hostname   ipaddress}/directory-path/pie-name target-device [location node-id   location all]			
	Example:			
	RP/0/RP0/CPU0:router# copy rcp://john@10.1.1.1/images/comp-crs-full.pie disk1:			
TFTP	copy tftp://{hostname   ipaddress}/directory-path/pie-name target-device [location node-id   location all]			
	Example:			
	RP/0/RP0/CPU0:router# copy tftp://10.1.1.1/images/comp-crs-full.pie disk1:			

#### Using xml-schema

Use the **xml-schema** keyword to obtain the most up-to-date XML schemas (.xsd files) from the router. This is useful to prevent the use of outdated schemas in the event that router software updates include schema updates. The tar ball file includes all active schema files. It does not include schemas that are activated by specific Package Installation Envelopes (PIEs), if those PIEs are not installed and activated on the router.

#### **Copying to the Running Configuration**

When you use the **copy** command to copy a configuration file to the **running-config** destination, the configuration in the file is applied to the running configuration of the system. This is a configuration operation. By default, the copy is carried out in a best-effort manner. This means that if some configuration lines from the file cannot be applied, the remaining configuration is still integrated into the system. In this case, a partial configuration is committed. When the **atomic** option is used, partial configurations are not committed. This means that even if one error occurs in the parsing or committing phase, no changes are made to the system. To view any errors when applying the configuration, use the **show configuration failed** command.

Task	

Task ID	Operations
filesystem	execute

#### **Examples**

The following example shows how to copy a file from a FTP server to disk1:

RP/0/RP0/CPU0:router# copy ftp://john:secret@10.1.1.1/images/comp-crs-full.pie disk1:

Command	Description
cd	Changes the default directory or file system.
dir	Displays the contents of a file system.
show configuration failed (config)	Displays information about a configuration that failed during the last commit.

# delete

To delete files, use the **delete** command in EXEC or administration EXEC mode.

**delete** [/noprompt] [/ena] [filesystem:] filename {location node-id | location all}

### **Syntax Description**

/noprompt	(Optional) Causes no prompt for confirmation before deleting the specified files.	
/ena	(Optional) Deletes all files from and below the current working directory.	
filesystem:	(Optional) Location of the file to be deleted. Include the file system alias for the <i>filesystem</i> argument, followed by a colon, and, optionally, the name of a directory.	
filename	Filename of the file to be deleted.	
<b>location</b> node-id Deletes a file from a designated node. The node-id argum expressed in the rack/slot/module notation.		
location all	on all Deletes a file from all nodes.	

#### Defaults

A filename must be specified. If a filename is entered without a file system or directory path, the present working directory is used.

### **Command Modes**

**EXEC** 

Administration EXEC

# **Command History**

Release	Modification				
Release 2.0	This command was introduced on the Cisco CRS-1.				
Release 3.0	No modification.				
Release 3.2 This command was first supported on the Cisco XR 12000 Se The command was made available in administration EXEC m					
	Support was added to delete files from a node or from all nodes.				
Release 3.3.0	No modification.				
Release 3.4.0	No modification.				
Release 3.5.0	No modification.				
Release 3.6.0	The following file systems were added: disk0a:, disk1a:, and compactflasha:.				
Release 3.7.0	No modification.				

# **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

When a file is deleted, it is removed from the system and cannot be restored (undeleted).

Use the dir command to display the list of files on a storage device.

# Task ID

Task ID	Operations
filesystem	execute

# Examples

The following example shows how to delete a file:

RP/0/RP0/CPU0:router# delete rbtest

Delete disk1:/rbtest[confirm]y

Command	Description				Description		
cd	Changes the default directory or file system.						
dir	Displays the contents of a file system.						
squeeze	Permanently deletes flash files by squeezing a flash file system.						
undelete	Recovers a file marked "deleted" on a flash file system.						

# dir

To display a list of files on a file system or in a specific directory, use the **dir** command in EXEC or administration EXEC mode.

dir [/all | /ena | /recurse] [filesystem:] [filename] {location node-id | location all}

# **Syntax Description**

/all	(Optional) Lists deleted files, undeleted files, and files with errors.			
/ena	(Optional) Recognizes subdirectories.			
/recurse	(Optional) Recursively lists subdirectories.			
filesystem:	(Optional) Name of the directory containing the files to be displayed. Include the file system alias for the <i>filesystem</i> argument, followed by a colon, and, optionally, the name of a directory.			
filename	(Optional) Name of the files to display. The files can be of any type. You can use wildcards in the filename. A wildcard character (*) matches all patterns. Strings following a wildcard are ignored.			
location node-id	Displays a lists of files from a directory on the designated node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.			
location all	Displays a lists of files from a directory on all nodes.			

# Defaults

When the **dir** command is entered without keywords or arguments, the contents of the present working directory are displayed.

# **Command Modes**

#### **EXEC**

Administration EXEC

# **Command History**

Releases	Modifications				
Release 2.0	This command was introduced on the Cisco CRS-1.				
Release 3.0	No modification.				
Release 3.2	This command was first supported on the Cisco XR 12000 Series Router. The command was made available in administration EXEC mode.				
	Support was added to display a list of files from a directory on a node or from all nodes.				
Release 3.3.0	No modification.				
Release 3.4.0	No modification.				
Release 3.5.0	No modification.				
Release 3.6.0	The following file systems were added: <b>disk0a:</b> , <b>disk1a:</b> , and <b>compactflasha:</b> .				
Release 3.7.0	No modification.				

# **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

If you enter the **dir** command without specifying a directory, the contents of the present working directory are displayed. The **all** keyword displays all files, including deleted files. The size associated with the directory name is the total size for all files in that directory.

# Task ID

Task ID	Operations
filesystem	execute

### **Examples**

The following example shows how to display the contents of a directory:

RP/0/RP0/CPU0:router# dir harddisk:/log

Directory of harddisk:/log

5527	drwx	4096	Thu Aug	28	11:21:48 2003	boot_28_Aug_2003_11_21_49
5533	drwx	4096	Thu Aug	28	11:38:54 2003	boot_28_Aug_2003_11_38_54
5538	drwx	4096	Fri Sep	5	13:28:54 2003	boot_05_Sep_2003_13_28_54
5543	drwx	4096	Mon Sep	8	08:55:52 2003	boot_08_Sep_2003_06_59_08
More						

Command	Description
cd	Changes the default directory or file system.
pwd	Displays the current working directory of the <b>cd</b> command.
show filesystem	Displays the layout and contents of a file system.

# erase nvram:

To erase the NVRAM file system, use the **erase nvram:** command in EXEC mode.

erase nvram: [format]

### **Syntax Description**

format (0	Optional)	Formats the	entire NVRAM.
-----------	-----------	-------------	---------------

Defaults

No default behavior or values

**Command Modes** 

**EXEC** 

# **Command History**

Release	Modification
Release 2.0	This command was introduced on the Cisco CRS-1.
Release 3.0	No modification.
Release 3.2	This command was first supported on the Cisco XR 12000 Series Router.
Release 3.3.0	No modification.
Release 3.4.0	No modification.
Release 3.5.0	No modification.
Release 3.6.0	No modification.
Release 3.7.0	No modification.

# **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

Using the **erase nvram:** command permanently removes the files.

# Task ID

Task ID	Operations
filesystem	execute

### **Examples**

The following example shows how to erase the NVRAM file system:

RP/0/RP0/CPU0:router# erase nvram:

Erase operation will destroy IOS/ENA files in "nvram:":. Continue? [confirm] $\mathbf{y}$ 

erase nvram:

Command	Description
delete	Deletes a file from a flash memory device.

# erase nvram-raw:

To format the NVRAM raw data partition with a '0' value, use the **erase nvram-raw:** command in EXEC or administration EXEC mode.

erase nvram-raw: [location {node-id | all}]

### **Syntax Description**

location {node-id   all}	(Optional) Specifies the node where the file system is located. The
	node-id argument is expressed in the rack/slot/module notation. Use
	the all keyword to indicate all nodes.

#### Defaults

No default behavior or values

#### **Command Modes**

**EXEC** 

Administration EXEC

### **Command History**

Release	Modification
Release 3.6.0	This command was introduced on the Cisco CRS-1 and Cisco XR 12000 Series Router.
Release 3.7.0	No modification.

# **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

The NVRAM is divided into two partitions. The first partition, consisting of 1 megabyte (MB), is used by the existing NVRAM file-system partition. The second partition, consisting of 1 MB, is a raw data partition and is used by the Kernel Dumper to store reboot historical logs, critical crash information, syslog, and Kernel Dumper traces. The **erase nvram-raw:** command formats the raw data partition of the NVRAM.

#### Task ID

Task ID	Operations
filesystem	execute

# **Examples**

The following example shows how to erase the raw data partition of the NVRAM file system:

RP/0/RP0/CPU0:router# erase nvram-raw:

erase nvram-raw:

Command	Description
delete	Deletes a file from a flash memory device.

# **format**

To format a file system, use the **format** command in EXEC or administration EXEC mode.

**format** filesystem: [partition] [monlib-filename] [location node-id | all] [spare spare-number] [force] [recover]

# **Syntax Description**

filesystem:	Name of the file system to format, followed by a colon. Possible values are bootflash:, disk0:, disk0a:, disk1:, disk1a:, harddisk:, harddiskb:, compactflash:, and compactflasha:.
partition	(Optional) Creates a partition on a hard disk. This option is not available when the <b>bootflash:</b> keyword is entered for the <i>filesystem</i> : argument.
monlib-filename	(Optional) Name of the ROM monitor library (monlib) file to use for formatting the file system. The default monlib file is the one bundled with the system software.
	<b>Note</b> The monlib is used by ROMMON for accessing the file system on the media.
location node-id	(Optional) Specifies the node where the file system is located. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.
all	(Optional) Specifies all nodes where the file system is located.
spare spare-number	(Optional) Reserves spare sectors as specified by the <i>spare-number</i> argument when formatting flash memory. Valid values are from 0 to 16.
force	(Optional) Forces a monlib update, without verifying the monlib version on the device.
recover	(Optional) Recovers any sector read errors on a flash disk.

# Defaults

The default monlib file is the one included with the Cisco IOS XR software. *spare-number*: 0

# **Command Modes**

# **EXEC**

Administration EXEC

# **Command History**

Release	Modification
Release 2.0	This command was introduced on the Cisco CRS-1.
Release 3.0	No modification.
Release 3.2	This command was first supported on the Cisco XR 12000 Series Router. The command was made available in administration EXEC mode.
	Support was added to create a hard disk partition.
Release 3.3.0	No modification.
Release 3.4.0	No modification.

Release	Modification
Release 3.5.0	No modification.
Release 3.6.0	The following file systems were added: disk0a:, disk1a:, and compactflasha:.
Release 3.7.0	No modification.

# **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

Before you can use a new flash memory card, you must format it.

Formatting a storage device deletes all data on that device.

The file systems that are available on the router and the formatting options available for file systems differ according to platform.

Use the online help (?) function to display the file systems available to be formatted on the router and the formatting options available for a file system.

As of Cisco IOS XR Release 3.6.0, disk0: and disk1: can be partitioned into two partitions each: disk0: and disk0a:, disk1: and disk1a:. The harddisk: can be partitioned into three partitions: harddisk:, harddiska:, and harddiskb:. The primary partitions are used to store critical data. The secondary partitions are used to store noncritical data.

If you partition disk0:, disk1: or the compactflash:, the size of the partitions are as indicated in Table 30:

Table 30 Size of Disk Partitions in Relation to Size of Disk

Size of Disk	Primary Partition Percentage	Secondary Partition Percentage
less than 900 MB	Partitioning not supported	Partitioning not supported
900 MB to 1.5 GB	80%	20%
1.5 GB to 3 GB	60%	40%
more than 3 GB	50%	50%

The size of the three hard disk partitions are as follows:

- Primary partition (harddisk:)—30%
- Secondary partition (harddiska:)—60%
- Third partition (harddiskb:)—10%

# Task ID

Task ID	Operations
root-lr (EXEC)	execute
root-system (administration EXEC)	execute

# **Examples**

The following example shows how to format disk1:

RP/0/RP0/CPU0:router# format disk1:

The following example shows how to format disk1 with instructions to recover any sectors on the device that have read errors:

RP/0/RP0/CPU0:router# format disk1: recover

This format operation will try to recover sectors with read error This operation may take a while. Continue? [confirm] Format will destroy all data on "disk1:". Continue? [confirm]

When the console returns to the EXEC prompt, the new flash disk has been formatted and is ready for use.

Command	Description	
fsck	Checks a file system for a damage and repairs any problems.	

# fsck

To check a file system for damage, use the **fsck** command in EXEC or administration EXEC mode.

**fsck** filesystem: [location node-id]

# **Syntax Description**

filesystem:	Name of the file system to check, followed by a colon. Possible values are <b>disk0</b> :, <b>disk0a</b> :, <b>disk1a</b> :, <b>harddisk</b> :, <b>harddiska</b> :, <b>harddiskb</b> :, and <b>compactflash</b> :, <b>compactflasha</b> :.
location node-id	(Optional) Specifies the node where the file system is located. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.

Defaults

No default behavior or values

#### **Command Modes**

**EXEC** 

Administration EXEC

# **Command History**

Release	Modification
Release 2.0	This command was introduced on the Cisco CRS-1.
Release 3.0	No modification.
Release 3.2	This command was first supported on the Cisco XR 12000 Series Router.
	Support was added to check the hard-disk A file system for damage and repair any problems.
Release 3.3.0	No modification.
Release 3.4.0	No modification.
Release 3.5.0	No modification.
Release 3.6.0	The following file systems were added: <b>disk0a:</b> , <b>disk1a:</b> , and <b>compactflasha:</b> .
	The command checks the file system, but does not repair the file system.
Release 3.7.0	No modification.

# **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

# Task ID

Task ID	Operations	
filesystem	execute	

# **Examples**

The following example shows how to check the file system on flash disk0: for damage:

RP/0/RP0/CPU0:router# fsck disk0:

Phase 1 - Read and compare FATs Phase 2 - Check cluster chains Phase 3 - Check directories Phase 4 - Check for lost files

 $157280\ \text{kb}$  used,  $843344\ \text{kb}$  free,  $2541\ \text{files},\ 190\ \text{directories}$  Filesystem is clean.

Command	Description		
show filesystem	Displays the layout and contents of a file system.		

# mkdir

To create a new directory on a file system, use the **mkdir** command in EXEC or administration EXEC mode.

mkdir filesystem: [location node-id | location all]

### **Syntax Description**

filesystem:	File system on which to create a new directory.		
location node-id	(Optional) Creates a new directory on a file system on the designated node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.		
location all	(Optional) Creates a new directory on a file system on all RP and DRP nodes.		

**Defaults** 

No default behavior or values

### **Command Modes**

**EXEC** 

Administration EXEC

# **Command History**

Releases	Modifications			
Release 2.0	This command was introduced on the Cisco CRS-1.			
Release 3.0 No modification.				
Release 3.2	This command was first supported on the Cisco XR 12000 Series Router. The command was made available in administration EXEC mode.			
	Support was added to create a new directory on a file system on a designated node or on all nodes.			
Release 3.3.0	No modification.			
Release 3.4.0	No modification.			
Release 3.5.0	No modification.			
Release 3.6.0	The following file systems were added: disk0a:, disk1a:, and compactflasha:.			
Release 3.7.0	No modification.			

# **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

After you issue the **mkdir** command, Cisco IOS XR software prompts you to specify the name of the directory to be created. When specifying the name of the new directory, include the directory path where you want the new directory to reside. If you do not specify a directory path, the new directory is created in the /usr directory of the file system specified for the *filesystem*: argument.

#### Task ID

Task ID	Operations
filesystem	execute

### **Examples**

The following example shows how to create a directory named newdir. The **dir** command is used to verify that the directory has been added.

RP/0/RP0/CPU0:router# mkdir harddisk:

Create directory filename []?newdir Created dir harddisk:/newdir RP/0/RP0/CPU0:router# dir harddisk:

Directory of harddisk:

11193	drwx	4096	Fri	Feb	13	06:45:05	2004	newdir
37146	drwx	4096	Sun	Dec	14	15:30:48	2003	malloc_dump

39929724928 bytes total (39883231232 bytes free)

Command	Description		
dir	Displays the contents of a file system.		
rmdir	Removes an existing directory in a flash file system.		

# pwd

To display the present working directory, use the **pwd** command in EXEC mode.

pwd

**Syntax Description** 

This command has no arguments or keywords.

Defaults

No default behavior or values

**Command Modes** 

**EXEC** 

# **Command History**

Releases	Modifications
Release 2.0	This command was introduced on the Cisco CRS-1.
Release 3.0	No modification.
Release 3.2	This command was first supported on the Cisco XR 12000 Series Router.
Release 3.3.0	No modification.
Release 3.4.0	No modification.
Release 3.5.0	No modification.
Release 3.6.0	No modification.
Release 3.7.0	No modification.

# **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

Use the **pwd** command to show what directory or file system is specified as the default by the **cd** command.

#### Task ID

Task ID	Operations
filesystem	read

# **Examples**

The following example shows how to display the present working directory:

RP/0/RP0/CPU0:router# pwd

disk0:/usr

Command	Description
cd	Changes the default directory or file system.
dir	Displays the contents of a file system.

# rmdir

To remove an existing directory, use the **rmdir** command in EXEC or administration EXEC mode.

**rmdir** *filesystem*: {location *node-id* | location all}

### **Syntax Description**

filesystem	Name of the file system from which to delete a directory, followed by a colon.
location node-id	Removes a directory from the designated node.
location all	Removes a directory from all nodes.

#### **Defaults**

No default behavior or values

### **Command Modes**

Releases	Modifications			
Release 2.0	This command was introduced on the Cisco CRS-1.			
Release 3.0	No modification.			
Release 3.2	This command was first supported on the Cisco XR 12000 Series Router. The command was made available in administration EXEC mode.			
	Support was added to remove a directory from a node or from all nodes.			
Release 3.3.0	No modification.			
Release 3.4.0	No modification.			
Release 3.5.0	No modification.			
Release 3.6.0	The following file systems were added: disk0a:, disk1a:, and compactflasha:.			
Release 3.7.0	No modification.			

### **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

Use the **rmdir** command to remove directories (for example, to free up disk space) from a file system. After you issue the **rmdir** command, the Cisco IOS XR software prompts you to specify the name of the directory to be deleted.

When a directory contains files, you must remove the files before deleting the directory. Use the **delete** command to remove files.

#### Task ID

Task ID	Operations
filesystem	execute

# **Examples**

The following example shows how to delete a subdirectory from the hard disk. The **dir** command is used to verify that the directory has been deleted.

RP/0/RP0/CPU0:router# rmdir harddisk:

Remove directory filename []?newdir Delete harddisk:/newdir[confirm]y RP/0/RP0/CPU0:router# dir harddisk:

Directory of harddisk:

37146	drwx	4096	Sun Dec	: 14	15:30:48	2003	malloc_dump

39929724928 bytes total (39883235328 bytes free)

Command	Description
delete	Deletes a file from a flash memory device.
dir	Displays the contents of a file system.
mkdir	Creates a new directory on a flash file system.

# show filesystem

To display the layout and contents of file systems, use the **show filesystem** command in EXEC or administration EXEC mode.

show filesystem filesystem: [firmware | stats | verbose level] [location node-id | location all]

### **Syntax Description**

filesystem:	Name of the file system for which to display information, followed by a colon. Possible values are: disk0:, disk1:, harddisk:, compactflash:.
firmware	(Optional) Displays the firmware level.
stats	(Optional) Displays device statistics.
verbose level	(Optional) Changes the device driver verbose level.
location node-id	(Optional) Displays the layout and contents of file systems on the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
location all	(Optional) Displays the layout and contents of file systems on all nodes.

#### **Defaults**

The file system for the active RP is displayed.

Use the **show filesystem** command to learn the alias names (prefixes) of the file systems supported by your networking device.

#### Task ID

Task ID	Operations
basic-services	read

#### **Examples**

The following is sample output from the **show filesystem** command:

```
RP/0/RP0/CPU0:router# show filesystem
```

File Systems:

```
Free(b)
   Size(b)
                        Type Flags Prefixes
                     network rw qsm/dev/fs/tftp: tftp:
                              rw qsm/dev/fs/rcp: rcp:
                     network
                       network
                                rw qsm/dev/fs/ftp: ftp:
39929724928 39852978176 harddisk
                                rw harddisk:
1024606208 863584256 flash-disk
                                rw disk0:
   2092032
           2059264 nvram rw nvram:
  62390272 62381260
                        flash rw bootflash:
```

The following is sample output from the **show filesystem** command using the optional **location** keyword and *node-id* argument:

```
Size(b)
          Free(b)
                        Type Flags Prefixes
                     network rw qsm/dev/fs/tftp: tftp:
                     network rw qsm/dev/fs/rcp: rcp:
                      network rw qsm/dev/fs/ftp: ftp:
39929724928 39883235328
                    harddisk
                                rw harddisk:
   2092032 2019328
                       nvram
                                rw nvram:
1024606208 847888384 flash-disk
                                rw disk0:
                    flash
                                rw bootflash:
  62390272 62153616
```

Table 31 describes the significant fields shown in the display.

Table 31 show filesystem Field Descriptions

Field	Description
Size(b)	Amount of memory in the file system (in bytes).
Free(b)	Amount of free memory in the file system (in bytes).
Туре	Type of file system.
Flags	Permissions for file system.
Prefixes	Alias for the file system.

# show media

To display the current state of the disk storage media, use the **show media** command in EXEC or administration EXEC mode.

show media [location node-id | location all]

# **Syntax Description**

location node-id	(Optional) Displays the disk storage media on the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
location all	(Optional) Displays the disk storage media on all nodes.

#### Defaults

The disk storage media for the active RP is displayed.

#### **Command Modes**

**EXEC** 

Administration EXEC

#### **Command History**

Release	Modification
Release 3.6.0	This command was introduced on the Cisco CRS-1 and Cisco XR 12000 Series Router.
Release 3.7.0	No modification.

### **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

Use the **show media** command to view the status of the storage media on your system.

### Task ID

Task ID	Operations
filesystem	read

### **Examples**

The following sample output disk displays the disk storage media for the active RP:

RP/0/RP0/CPU0:router# show media

Media Information for 0/RP0/CPU0.

Table 32 describes the significant fields shown in the display.

Table 32 show media Field Descriptions

Field	Description
Mountpoint	File system name.
FsType	File system type.
State	State of the storage media.
DrvrPid	Process ID of the media driver.

Table 32 show media Field Descriptions (continued)

Field	Description	
Mirror	Indicates if disk mirroring is enabled or not.	
Flags	Where disk mirroring is enabled, indicates whether the partition has been repaired, formatted, or the driver has been restarted.	

Command	Description
mirror	Configures disk mirroring on a node.
mirror pause	Temporarily pauses disk mirroring on a node.

# squeeze

To permanently erase files tagged as "deleted" or "error" on a flash file system, use the **squeeze** command in EXEC mode.

**squeeze** *filesystem*:

### **Syntax Description**

filesystem:	Name of the file system,	followed by a colon.

**Defaults** 

No default behavior or values

#### **Command Modes**

**EXEC** 

### **Command History**

Release	Modification
Release 3.2	This command was introduced on the Cisco XR 12000 Series Router.
Release 3.3.0	No modification.
Release 3.4.0	No modification.
Release 3.5.0	No modification.
Release 3.6.0	No modification.
Release 3.7.0	No modification.

### **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

When flash memory is full, you might need to rearrange the files so that the space used by the files marked "deleted" can be reclaimed. (This "squeeze" process is required for linear flash memory cards to make sectors contiguous; the free memory must be in a "block" to be usable.)

When you enter the **squeeze** command, the router copies all valid files to the beginning of flash memory and erases all files marked "deleted." After the squeeze process is completed, you can write to the reclaimed flash memory space.

After performing the squeeze process you cannot recover deleted files using the undelete command.

In addition to removing deleted files, the **squeeze** command removes any files that the system has marked as "error." An error file is created when a file write fails (for example, the device is full). To remove error files, you must use the **squeeze** command.

Rewriting flash memory space during the squeeze operation may take several minutes.

# Task ID

Task ID	Operations
basic-services	execute

# Examples

The following example shows how to permanently erase files tagged as "deleted" or "error" on the bootflash file system:

RP/0/0/CPU0:router# squeeze bootflash:

All deleted files will be removed. Continue? [confirm]  ${f y}$  Squeeze operation may take a while. Continue? [confirm]  ${f y}$ 

Squeeze under progress 30 Squeeze of bootflash: complete

Command	Description
delete	Deletes a file from a flash memory device.
dir	Displays the contents of a file system.
undelete	Recovers a file marked "deleted" on a flash file system.

# undelete

To recover a file marked "deleted" on a flash file system, use the **undelete** command in EXEC mode.

undelete index filesystem:

# **Syntax Description**

index	Number that indexes the file in the <b>dir</b> command output.
filesystem:	File system containing the file to undelete, followed by a colon.

#### Defaults

The default file system is the one specified by the **cd** command.

#### **Command Modes**

**EXEC** 

#### **Command History**

Release	Modification
Release 3.2	This command was introduced on the Cisco XR 12000 Series Router.
Release 3.3.0	No modification.
Release 3.4.0	No modification.
Release 3.5.0	No modification.
Release 3.6.0	No modification.
Release 3.7.0	No modification.

#### **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

For flash file systems, when you delete a file, Cisco IOS XR software simply marks the file as deleted, but it does not erase the file. The **undelete** command allows you to recover a deleted file on a specified flash memory device. You must undelete a file by its index, because you could have multiple deleted files with the same name. For example, the "deleted" list could contain multiple configuration files with the name router-config. You undelete by index to indicate which of the many router-config files from the list to undelete. Use the **dir** command to learn the index number of the file you want to undelete.

You cannot undelete a file if a valid (undeleted) file with the same name exists. Instead, you first delete the existing file and then undelete the file you want. For example, if you had an undeleted version of the router-config file and you wanted to use a previous, deleted version instead, you could not simply undelete the previous version by index. You would first delete the existing router-config file and then undelete the previous router-config file by index. You can delete and undelete a file up to 15 times.

On flash file systems, if you try to recover the configuration file pointed to by the CONFIG\_FILE environment variable, the system prompts you to confirm recovery of the file. This prompt reminds you that the CONFIG\_FILE environment variable points to an undeleted file. To permanently delete all files marked "deleted" on a flash memory device, use the **squeeze** command.

# Task ID

Task ID	Operations
filesystem	execute

# Examples

The following example recovers the deleted file whose index number is 1 on the bootflash file system: RP/0/0/CPU0:router# undelete 1 bootflash:

Command	Description
cd	Changes the default directory or file system.
delete	Deletes a file from a flash memory device.
dir	Displays the contents of a file system.
pwd	Displays the current working directory of the <b>cd</b> command.
squeeze	Permanently deletes flash files by squeezing a flash file system.

# unmount

To render a media device safe to be removed, use the **unmount** command in EXEC or administration EXEC mode.

unmount filesystem: [location node-id] [undo]

# **Syntax Description**

filesystem:	File system to unmount, followed by a colon. Possible values are disk0:, disk1:, harddisk:, and compactflash:.
location node-id	(Optional) Specifies a node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.
undo	Remounts the device if it is not removed and reinserted.

#### **Defaults**

No default behavior or values

### **Command Modes**

#### **EXEC**

Administration EXEC

### **Command History**

Release	Modification
Release 3.6.0	This command was introduced on the Cisco CRS-1 and Cisco XR 12000 Series Router.
Release 3.7.0	No modification.

# **Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of the *Cisco IOS XR System Security Configuration Guide*.

Use the **unmount** command before removing the media device. The command unmounts all partitions and ensures that no further access is made to the device. Use the **undo** option to remount the device if it is not removed and reinserted.

#### Task ID

Task ID	Operations
root-lr (EXEC)	execute
root-system (administration EXEC)	execute

# **Examples**

The following example unmounts the disk0: file system so that it can be safely removed:

RP/0/0/CPU0:router# unmount disk0:

Command	Description
cd	Changes the default directory or file system.
delete	Deletes a file from a flash memory device.
dir	Displays the contents of a file system.
pwd	Displays the current setting of the <b>cd</b> command.
squeeze	Permanently deletes flash files by squeezing a flash file system.
