CHAPTER 13

Configuring Dial Backup and Remote Management

The Cisco 800 series access routers support dial-in (for remote management) and dial-out (for dial backup) capabilities. By allowing you to configure a backup modem line connection, the Cisco 800 series access routers provide protection against WAN downtime. Dial backup is inactive by default, and must be configured to be active.

Dial backup functions can be configured as follows:

- Through the auxiliary port on any Cisco 870 series router
- Through the ISDN S/T port on a Cisco 876 with an advanced enterprise (c870-adventerprisek9-mz) image

Remote management functions can be configured as follows:

- Through the auxiliary port on any Cisco 850 or Cisco 870 series router
- Through the ISDN S/T port on the Cisco 876 and Cisco 878 routers

Note

The console port and the auxiliary port in the Cisco IOS software configuration are on the same physical RJ-45 port; therefore, both ports cannot be activated simultaneously, and the command-line interface (CLI) must be used to enable the desired function.

This chapter contains the following topics:

- Dial Backup Feature Activation Methods
- Dial Backup Feature Limitations
- Configuring Dial Backup and Remote Management Through the Console or Auxiliary Port
- Configuring Dial Backup and Remote Management Through the ISDN S/T Port

Dial Backup Feature Activation Methods

Three methods are available to activate the dial backup feature:

- Backup Interfaces
- Floating Static Routes
- Dialer Watch
Backup Interfaces

When the router receives an indication that the primary line is down, a backup interface is brought up. You can configure the backup interface to go down once the primary connection has been restored for a specified period.

This is accomplished using dial-on-demand routing (DDR). When this is configured, a backup call is triggered by specified traffic.

Note

Even if the backup interface comes out of standby mode (is brought up), the router does not trigger the backup call unless it receives the specified traffic for that backup interface.

Configuring Backup Interfaces

Perform these steps to configure your router with a backup interface, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>interface type number</strong>&lt;br&gt;Example: Router(config)# interface atm 0&lt;br&gt;Router(config-if)#</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>backup interface interface-type interface-number</strong>&lt;br&gt;Example: Router(config-if)# backup interface bri 0&lt;br&gt;Router(config-if)#</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>exit</strong>&lt;br&gt;Example: Router(config-if)# exit&lt;br&gt;Router(config)#</td>
</tr>
</tbody>
</table>

Floating Static Routes

Floating static routes provide alternative routes for traffic. Floating static routes are not activated unless a DDR backup call has been triggered by specified traffic for a backup interface.

Floating static routes are independent of line protocol status. This is an important consideration for Frame Relay circuits because the line protocol may not go down if the data-link connection identifier (DLCI) is inactive. Floating static routes are also encapsulation independent.
### Configuring Floating Static Routes

Static and dynamic routes are the two components of floating static routes. Perform these steps to configure the static and dynamic routes on your router, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>ip route prefix mask {ip-address \ interface-type interface-number [ip-address]}</code></td>
<td>Assigns the primary static route.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# <code>ip route 0.0.0.0 0.0.0.0 22.0.0.2</code></td>
<td>Assigns the primary static route.</td>
</tr>
<tr>
<td></td>
<td>Router(config)#</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>ip route prefix mask {ip-address \ interface-type interface-number [ip-address]} [distance]</code></td>
<td>Assigns the lower routing administrative distance value for the backup interface route. 192.168.2.2 is the peer IP address of the backup interface.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# <code>ip route 0.0.0.0 0.0.0.0 192.168.2.2 150</code></td>
<td>Assigns the lower routing administrative distance value for the backup interface route. 192.168.2.2 is the peer IP address of the backup interface.</td>
</tr>
<tr>
<td></td>
<td>Router(config)#</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>router rip</code></td>
<td>Enables RIP routing.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# <code>router rip</code></td>
<td>Enables RIP routing.</td>
</tr>
<tr>
<td></td>
<td>Router(config)#</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>network ip-address</code></td>
<td>Defines the primary interface network. 22.0.0.0 is the network value of the primary interface.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# <code>network 22.0.0.0</code></td>
<td>Defines the primary interface network. 22.0.0.0 is the network value of the primary interface.</td>
</tr>
<tr>
<td></td>
<td>Router(config)#</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td><code>ip route prefix mask {ip-address \ interface-type interface-number [ip-address]} [distance]</code></td>
<td>Assigns the lower routing administrative distance value for the backup interface route. 192.168.2.2 is the peer IP address of the backup interface.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# <code>ip route 0.0.0.0 0.0.0.0 192.168.2.2 150</code></td>
<td>Assigns the lower routing administrative distance value for the backup interface route. 192.168.2.2 is the peer IP address of the backup interface.</td>
</tr>
<tr>
<td></td>
<td>Router(config)#</td>
<td></td>
</tr>
</tbody>
</table>
When dynamic routes are being used, the time it takes to activate a floating static route depends on the routing protocol convergence times.

## Dialer Watch

The dialer watch method only supports the Extended Interior Gateway Routing Protocol (EIGRP) link-state dynamic routing protocols.

### Configuring Dialer Watch

Perform these steps to configure a dialer watch on your router, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>interface type number</code></td>
<td>Enters configuration mode for the dial backup interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# <code>interface dialer 2</code></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>dialerwatch-group group-number</code></td>
<td>Specifies the group number for the watch list.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# <code>dialer watch-group 2</code></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>exit</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# <code>exit</code></td>
<td></td>
</tr>
<tr>
<td>Router(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>`ip route prefix mask {ip-address</td>
<td>interface-type interface-number [ip-address]}`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# <code>ip route 0.0.0.0 0.0.0.0 22.0.0.2</code></td>
<td></td>
</tr>
<tr>
<td>Router(config)#</td>
<td></td>
</tr>
</tbody>
</table>
Dial Backup Feature Limitations

The following limitations exist for the dial backup feature:

- Bridging is not supported over console or auxiliary port backup interfaces.
- For the Cisco 851 router, only dial-in capability is supported.
- Dial backup support on the Cisco 871 router is limited because the Ethernet WAN interface is always up, even when ISP connectivity is down on the other side of the modem connected to the Cisco 871 router. The router must be in a PPPoE environment with the dialer watch feature running. The IP addresses of the peer must be specified in the dialer watch and the static route commands to enable dial backup when the primary line goes down.

Table 13-1 summarizes dial backup support and limitations for the Cisco 800 series access routers.

### Table 13-1 Dial Backup Feature Support and Limitations Summary

<table>
<thead>
<tr>
<th>WAN Encapsulation Type</th>
<th>Dial Backup Possible?</th>
<th>Dial Backup Method</th>
<th>Limitations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco 851 or 871</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PPPoE</td>
<td>Yes</td>
<td>Dialer watch</td>
<td>Bridging is not supported across a slow interface, for example, an auxiliary port. The peer IP address of the ISP is needed to configure the <code>dialerwatch</code> command and the IP static route.</td>
</tr>
<tr>
<td>Normal IP in cable modem scenario</td>
<td>No</td>
<td>Dialer watch</td>
<td>The IP addresses of the peers are needed for dialer watch to work properly. If a lease time obtained by DHCP is not set short enough (1 or 2 minutes), dial backup will not be supported.</td>
</tr>
</tbody>
</table>
### Table 13-1  Dial Backup Feature Support and Limitations Summary (continued)

<table>
<thead>
<tr>
<th>WAN Encapsulation Type</th>
<th>Dial Backup Possible?</th>
<th>Dial Backup Method</th>
<th>Limitations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco 876, 877, or 878</td>
<td></td>
<td>Backup interfaces</td>
<td>Floating static route and dialer watch need a routing protocol to run in the router. The dialer watch method brings up the backup interface as soon as the primary link goes down. The backup interface is brought down as soon as the dialer timeout is reached and the primary interface is up. The router checks the primary interface only when the dialer timeout expires. The backup interface remains up until the dialer timeout is reached, even though the primary interface is up. For the dialer watch method, a routing protocol does not need to be running in the router, if the IP address of the peer is known.</td>
</tr>
</tbody>
</table>

### Configuration Example

The following three examples show sample configurations for the three dial backup methods.

**Example 13-1  Configuring Dial Backup Using Backup Interfaces**

```conf
! vpdn enable
!
vpdn-group 1
   accept-dialin
   protocol pppoe
!
! Specifies the ISDN switch type
isdn switch-type basic-net3
!
interface vlan 1
   ip address 192.168.1.1 255.255.255.0
   hold-queue 100 out
!
! ISDN interface to be used as a backup interface
interface BRI0
   no ip address
   encapsulation ppp
dialer pool-member 1
   isdn switch-type basic-net3
!
interface ATM0
   backup interface BRI0
   no ip address
   no atm ilmi-keepalive
   pvc 1/40
   encapsulation aal5snap
   pppoe-client dial-pool-number 2
```
Dial Backup Feature Limitations

```
dsl operating-mode auto
!
! Dial backup interface, associated with physical BRI0 interface.
! Dialer pool 1 associates it with BRI0’s dialer pool member 1.
interface Dialer0
  ip address negotiated
  encapsulation ppp
dialer pool 1
dialer idle-timeout 30
dialer string 384040
dialer-group 1
!
! Primary interface associated with physical ATM0’s interface.
! Dialer pool 2 associates it with ATM0’s dial-pool-number2.
interface Dialer2
  ip address negotiated
  ip mtu 1492
  encapsulation ppp
dialer pool 2
dialer-group 2
  no cdp enable
!
ip classless
!
! Primary and backup interface are given route metric
ip route 0.0.0.0 0.0.0.0 22.0.0.2
ip route 0.0.0.0 0.0.0.0 192.168.2.2 80
ip http server
!
! Specifies interesting traffic to trigger backup ISDN traffic.
dialer-list 1 protocol ip permit
```

Example 13-2  Configuring Dial Backup Using Floating Static Routes

```
vpdn enable
!
vpdn-group 1
  accept-dialin
  protocol pppoe
!
! Specifies the ISDN switch type.
isdn switch-type basic-net3
!
interface vlan 1
  ip address 192.168.1.1 255.255.255.0
  hold-queue 100 out
!
! ISDN interface to be used as a backup interface.
interface BRI0
  no ip address
  encapsulation ppp
  dialer pool-member 1
  isdn switch-type basic-net3
!
interface ATM0
  no ip address
  no atm ilmi-keepalive
  pvc 1/40
  encapsulation aal5snap
  pppoe-client dial-pool-number 2
```
### Dial Backup Feature Limitations

```
!
dsl operating-mode auto
!
! Dial backup interface, associated with physical BRI0 interface.
! Dialer pool 1 associates it with BRI0’s dialer pool member 1
interface Dialer0
   ip address negotiated
   encapsulation ppp
dialer pool 1
dialer idle-timeout 30
dialer string 384040
dialer-group 1
!
! Primary interface associated with physical ATM0’s interface.
! Dialer pool 2 associates it with ATM0’s dial-pool-number2.
interface Dialer2
   ip address negotiated
   ip mtu 1492
   encapsulation ppp
dialer pool 2
dialer-group 2
!
   ip classless
   no cdp enable
!
   Primary and backup interface are given route metric. (This example uses static routes,
   thus atm0 line protocol must be brought down for backup interface to function.)
ip route 0.0.0.0 0.0.0.0 22.0.0.2
ip route 0.0.0.0 0.0.0.0 192.168.2.2 150
ip http server
!
! Specifies interesting traffic to trigger backup ISDN traffic.
dialer-list 1 protocol ip permit
```

### Example 13-3 Configuring Dial Backup Using Dialer Watch

```
!
vpdn enable
!
vpdn-group 1
   accept-dialin
   protocol pppoe
!
! Specifies the ISDN switch type.
   isdn switch-type basic-net3
!
interface Ethernet0
   ip address 192.168.1.1 255.255.255.0
   hold-queue 100 out
!
! ISDN interface to be used as a backup interface.
interface BRI0
   no ip address
   encapsulation ppp
   dialer pool-member 1
   isdn switch-type basic-net3
!
interface ATM0
   no ip address
   no atm ilmi-keepalive
   pvc 1/40
   encapsulation aal5snap
   pppoe-client aal5snap
```

### Configuring Dial Backup and Remote Management Through the Console or Auxiliary Port

When customer premises equipment, such as a Cisco 850 or Cisco 870 series router is connected to an ISP, an IP address is dynamically assigned to the router, or the IP address may be assigned by the router peer through the centrally managed function. The dial backup feature can be added to provide a failover route in case the primary line fails. Cisco 850 and Cisco 870 routers can use the auxiliary port for dial backup and remote management.

---

**Note**

The cable modem environment is currently not supported.
Figure 13-1 shows the network configuration used for remote management access and for providing backup to the primary WAN line.

**Figure 13-1 Dial Backup and Remote Management Through the Auxiliary Port**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Cisco 850 or Cisco 870 series router</td>
<td>Main WAN link; primary connection to Internet service provider</td>
</tr>
<tr>
<td>2</td>
<td>Modem</td>
<td>Dial backup; serves as a failover link for Cisco 870 routers when primary line goes down</td>
</tr>
<tr>
<td>3</td>
<td>PC</td>
<td>Remote management; serves as dial-in access to allow changes or updates to Cisco IOS configurations</td>
</tr>
</tbody>
</table>

### Configuration Tasks

Perform these steps to configure dial backup and remote management for these routers, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip name-server server-address</code></td>
<td>Enters your ISP DNS IP address.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# ip name-server 192.168.28.12</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip dhcp pool name</code></td>
<td>Creates a DHCP address pool on the router and enters DHCP pool configuration mode. The <code>name</code> argument can be a string or an integer.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# ip dhcp pool 1</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-dhcp)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Tip</strong></td>
<td></td>
</tr>
<tr>
<td>You may add multiple server addresses if available.</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Dial Backup and Remote Management Through the Console or Auxiliary Port

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>exit</strong></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| Example: | Router(config-dhcp)# **exit**  
  Router(config)# | |
| **Step 4** | **chat-script** *script-name expect-send* | Configures a chat script used in dial-on-demand routing (DDR) to give commands to dial a modem and to log in to remote systems. The defined script is used to place a call over a modem. |
| Example: | Router(config)# **chat-script** Dialout ABORT ERROR ABORT BUSY "" ""AT" OR ""ATDT 5555102 T" TIMEOUT 45 CONNECT \c  
  Router(config)# | |
| **Step 5** | **interface** *type number* | Creates and enters configuration mode for the asynchronous interface.  
- Configure the asynchronous interface. For sample commands you can use in async interface configuration mode, see the “Configuration Example” section on page 13-13. |
| Example: | Router(config)# **interface** Async 1  
  Router(config-if)# | |
| **Step 6** | **exit** | Enters global configuration mode. |
| Example: | Router(config-if)# **exit**  
  Router(config)# | |
| **Step 7** | **interface** *type number* | Enters interface configuration mode. |
| Example: | Router(config)# **interface** Dialer 3  
  Router(config-if)# | |
| **Step 8** | **dialer watch-group** *group-number* | Specifies the group number for watch list. |
| Example: | Router(config-if)# **dialer watch-group** 1  
  Router(config-if)# | |
| **Step 9** | **exit** | Enters global configuration mode. |
| Example: | Router(config-if)# **exit**  
  Router(config)# | |
### Chapter 13      Configuring Dial Backup and Remote Management

#### Step 10
**Command**
```
ip nat inside source {list access-list-number} {interface type number | pool name} [overload]
```

**Purpose**
Enables dynamic translation of addresses on the inside interface.

**Example:**
```
Router(config)# ip nat inside source list 101 interface Dialer 3 overload
```

#### Step 11
**Command**
```
ip route prefix mask [ip-address | interface-type interface-number [ip-address]]
```

**Purpose**
Sets the IP route to point to the dialer interface as a default gateway.

**Example:**
```
Router(config)# ip route 0.0.0.0 0.0.0.0 22.0.0.2
```

#### Step 12
**Command**
```
access-list access-list-number {deny | permit} source [source-wildcard]
```

**Purpose**
Defines an extended access list that indicates which addresses need translation.

**Example:**
```
Router(config)# access-list 1 permit 192.168.0.0 0.0.255.255 any
```

#### Step 13
**Command**
```
dialerwatch-list group-number {ip ip-address address-mask | delay route-check initial seconds}
```

**Purpose**
Evaluates the status of the primary link, based on the existence of routes to the peer. 22.0.0.2 is the peer IP address of the ISP.

**Example:**
```
Router(config)# dialer watch-list 1 ip 22.0.0.2 255.255.255.255
```

#### Step 14
**Command**
```
line [aux | console | tty | vty] line-number [ending-line-number]
```

**Purpose**
Enters configuration mode for the line interface.

**Example:**
```
Router(config)# line console 0
```

#### Step 15
**Command**
```
modem enable
```

**Purpose**
Switches the port from console to auxiliary port function.

**Example:**
```
Router(config-line)# modem enable
```

#### Step 16
**Command**
```
exit
```

**Purpose**
Enters global configuration mode.

**Example:**
```
Router(config-line)# exit
```

---

**Command Purpose**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ip nat inside source {list access-list-number} {interface type number</td>
<td>pool name} [overload]</td>
</tr>
<tr>
<td>11</td>
<td>ip route prefix mask [ip-address</td>
<td>interface-type interface-number [ip-address]]</td>
</tr>
<tr>
<td>12</td>
<td>access-list access-list-number {deny</td>
<td>permit} source [source-wildcard]</td>
</tr>
<tr>
<td>13</td>
<td>dialerwatch-list group-number {ip ip-address address-mask</td>
<td>delay route-check initial seconds}</td>
</tr>
<tr>
<td>14</td>
<td>line [aux</td>
<td>console</td>
</tr>
<tr>
<td>15</td>
<td>modem enable</td>
<td>Switches the port from console to auxiliary port function.</td>
</tr>
<tr>
<td>16</td>
<td>exit</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
### Configuration Example

The following configuration example specifies an IP address for the ATM interface through PPP/IPCPIP address negotiation and dial backup over the console port.

```bash
! ip name-server 192.168.28.12
ip dhcp excluded-address 192.168.1.1
! ip dhcp pool 1
import all
network 192.168.1.0 255.255.255.0
default-router 192.168.1.1
!
! Need to use your own correct ISP phone number.
modemcap entry MY-USER_MODEM:MSC=&F1S0=1
chat-script Dialout ABORT ERROR ABORT BUSY " " "AT" OK "ATDT 5555102\T"
TIMEOUT 45 CONNECT \c
!
!
!
interface vlan 1
ip address 192.168.1.1 255.255.255.0
ip nat inside
ip tcp adjust-mss 1452
hold-queue 100 out
!
! Dial backup and remote management physical interface.
interface Async1
no ip address
encapsulation ppp
dialer in-band
dialer pool-member 3
async default routing
async dynamic routing
async mode dedicated
ppp authentication pap callin
!
```

### Step 17

**Command**

```
line [aux | console | tty | vty] line-number [ending-line-number]
```

**Purpose**

Enters configuration mode for the auxiliary interface.

**Example:**

```
Router(config)# line aux 0
Router(config)#
```

### Step 18

**Command**

```
flowcontrol [none | software [lock] [in | out] | hardware [in | out]]
```

**Purpose**

Enables hardware signal flow control.

**Example:**

```
Router(config)# flowcontrol hardware
Router(config)#
```
interface ATM0
  mtu 1492
  no ip address
  no atm ilmi-keepalive
  pvc 0/35
  pppoe-client dial-pool-number 1
  !
  dsl operating-mode auto
  !
  ! Primary WAN link.
  interface Dialer1
  ip address negotiated
  ip nat outside
  encapsulation ppp
dialer pool 1
  ppp authentication pap callin
  ppp pap sent-username account password 7 pass
  ppp ipcp dns request
  ppp ipcp wins request
  ppp ipcp mask request
  !
  ! Dialer backup logical interface.
  interface Dialer3
  ip address negotiated
  ip nat outside
  encapsulation ppp
  no ip route-cache
  no ip mroute-cache
dialer pool 3
dialer idle-timeout 60
  dialer string 5555102 modem-script Dialout
  dialer watch-group 1
  !
  ! Primary WAN link.
  peer default ip address 192.168.2.2
  no cdp enable
  !
  ! Need to use your own ISP account and password.
  ppp pap sent-username account password 7 pass
  ppp ipcp dns request
  ppp ipcp wins request
  ppp ipcp mask request
  !
  ! IP NAT over Dialer interface using route-map.
  ip nat inside source route-map main interface Dialer1 overload
  ip nat inside source route-map secondary interface Dialer3 overload
  ip classless
  !
  ! When primary link is up again, distance 50 will override 80 if dial backup
  ! has not timed out. Use multiple routes because peer IP addresses are alternated
  ! among them when the CPE is connected.
  ip route 0.0.0.0 0.0.0.0 64.161.31.254 50
  ip route 0.0.0.0 0.0.0.0 66.125.91.254 50
  ip route 0.0.0.0 0.0.0.0 64.174.91.254 50
  ip route 0.0.0.0 0.0.0.0 63.203.35.136 80
  ip route 0.0.0.0 0.0.0.0 63.203.35.137 80
  ip route 0.0.0.0 0.0.0.0 63.203.35.138 80
  ip route 0.0.0.0 0.0.0.0 63.203.35.139 80
  ip route 0.0.0.0 0.0.0.0 63.203.35.140 80
  ip route 0.0.0.0 0.0.0.0 63.203.35.141 80
  ip route 0.0.0.0 0.0.0.0 Dialer1 150
  no ip http server
  ip pim bidir-enable
  !
! PC IP address behind CPE.
access-list 101 permit ip 192.168.0.0 0.0.255.255 any
access-list 103 permit ip 192.168.0.0 0.0.255.255 any
!
! Watch multiple IP addresses because peers are alternated
! among them when the CPE is connected.

Configuring Dial Backup and Remote Management Through the ISDN S/T Port

Cisco 876 and Cisco 878 routers can use the ISDN S/T port for remote management. With an advanced enterprise (c870-adventerprisek9-mz) image, a Cisco 876 router can also use the ISDN S/T port for dial backup.

Figure 13-2 and Figure 13-3 show two typical network configurations used to provide remote management access and backup for the primary WAN line. In Figure 13-2, the dial backup link goes through a customer premises equipment (CPE) splitter, a digital subscriber line access multiplexer (DSLAM), and a central office (CO) splitter before connecting to the ISDN switch. In Figure 13-3, the dial backup link goes directly from the Cisco router to the ISDN switch.

**Configuration Tasks**

Perform the following tasks to configure dial backup and remote management through the ISDN S/T port of your router:

- Configure ISDN Settings
- Configure the Aggregator and ISDN Peer Router

**Configure ISDN Settings**

*Note*

Traffic of interest must be present to activate the backup ISDN line by means of the backup interface and floating static routes methods. Traffic of interest is not needed for the dialer watch to activate the backup ISDN line.
Perform these steps to configure your router ISDN interface for use as a backup interface, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> isdn switch-type switch-type</td>
<td>Specifies the ISDN switch type. The example specifies a switch type used in Australia, Europe, and the United Kingdom. For details on other switch types supported, see the Cisco IOS Dial Technologies Command Reference.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# isdn switch-type basic-net3</td>

Configure the Aggregator and ISDN Peer Router

The aggregator is typically a concentrator router where your Cisco router ATM PVC terminates. In the configuration example shown below, the aggregator is configured as a PPPoE server to correspond with the Cisco 876 router configuration example that is given in this chapter.

The ISDN peer router is any router that has an ISDN interface and can communicate through a public ISDN network to reach your Cisco router ISDN interface. The ISDN peer router provides Internet access for your Cisco router during the ATM network downtime.

```
! This portion of the example configures the aggregator.
vpdn enable
