Monitoring System Processes and Logs

This chapter provides details on monitoring the health of the switch. It includes the following sections:

Displaying System Processes

Use the **show processes** command to obtain general information about all processes (see Examples 25-1 to 25-6).

Example 25-1   Displays System Processes

```
switch# show processes
PID    State  PC        Start_cnt    TTY   Process
-----  -----  --------  -----------  ----  -------------
  868     S   2ae4f33e            1    -   snmpd
  869     S   2acee33e            1    -   rscn
  870     S   2ac36c24            1    -   qos
  871     S   2ac44c24            1    -   port-channel
  872     S   2ac7a33e            1    -   ntp
    -    ER          -            1    -   mdog
    -    NR          -            0    -   vbuilder
```

Where:

- PID = process ID.

- State = process state

    - D = uninterruptible sleep (usually IO)

    - R = runnable (on run queue)

    - S = sleeping

    - T = traced or stopped

    - Z = defunct ("zombie") process

- NR = not-running

- ER = should be running but currently not-running

- PC = current program counter in hex format

- Start_cnt = how many times a process has been started (or restarted).

- TTY = terminal that controls the process. A "-" usually means a daemon not running on any particular TTY.

- Process = name of the process.

Example 25-2   Displays CPU Utilization Information

```
switch# show processes cpu
PID    Runtime(ms)  Invoked   uSecs  1Sec   Process
-----  -----------  --------  -----  -----  -----------
  842         3807    137001     27    0.0  sysmgr
 1112         1220     67974     17    0.0  syslogd
 1269          220     13568     16    0.0  fcfwd
 1276         2901     15419    188    0.0  zone
 1277          738     21010     35    0.0  xbar_client
 1278         1159      6789    170    0.0  wwn
 1279          515     67617      7    0.0  vsan
```

Where:

- Runtime(ms) = CPU time the process has used, expressed in milliseconds

- Invoked = number of times the process has been invoked.

- uSecs = microseconds of CPU time in average for each process invocation.
- 1Sec = CPU utilization in percentage for the last one second.

Example 25-3   Displays Process Log Information

```
switch# show processes log
Process          PID    Normal-exit Stack-trace Core    Log-create-time
---------------- ------ ----------- ----------- ------- ---------------
fspf             1339             N           Y       N Jan  5 04:25
lcm              1559             N           Y       N Jan  2 04:49
rib              1741             N           Y       N Jan  1 06:05
```

Where:

- Normal-exit = whether or not the process exited normally.
- Stack-trace = whether or not there is a stack trace in the log.
- Core = whether or not there exists a core file.
- Log-create-time = when the log file got generated.

Example 25-4   Displays Detail Log Information About a Process

```
switch# show processes log pid 1339
Service: fspf
Description: FSPF Routing Protocol Application

Started at Sat Jan  5 03:23:44 1980 (545631 us)
Stopped at Sat Jan  5 04:25:57 1980 (819598 us)
Uptime: 1 hours 2 minutes 2 seconds

Start type: SRV_OPTION_RESTART_STATELESS (23)
Death reason: SYSMGR_DEATH_REASON_FAILURE_SIGNAL (2)
Exit code: signal 9 (no core)
CWD: /var/sysmgr/work

Virtual Memory:

    CODE      08048000 - 0809A100
    DATA      0809B100 - 0809B65C
    BRK       0809D988 - 080CD000
    STACK     7FFFFD20
    TOTAL     23764 KB

Register Set:

    EBX 00000005         ECX 7FFFF8CC         EDX 00000000

```

Example 25-5   Displays All Process Log Details

```
switch# show processes log details
=========================================================
Service: snmpd
Description: SNMP Agent

Started at Wed Jan  9 00:14:55 1980 (597263 us)
Stopped at Fri Jan 11 10:08:36 1980 (649860 us)
Uptime: 2 days 9 hours 53 minutes 53 seconds

Start type: SRV_OPTION_RESTART_STATEFUL (24)
Death reason: SYSMGR_DEATH_REASON_FAILURE_SIGNAL (2)
Exit code: signal 6 (core dumped)
CWD: /var/sysmgr/work

Virtual Memory:

    CODE      08048000 - 0804C4A0
    DATA      0804D4A0 - 0804D770

    STACK     7FFFFCE0
    TOTAL     26656 KB
..........
```

Example 25-6   Displays Memory Information About Processes

```
switch# show processes memory
PID    MemAlloc  StackBase/Ptr      Process
-----  --------  -----------------  ----------------
 1277    120632  7ffffcd0/7fffefe4  xbar_client
 1278     56800  7ffffce0/7ffffb5c  wwn
 1279   1210220  7ffffce0/7ffffbac  vsan
 1293    386144  7ffffcf0/7fffebd4  span
 1294   1396892  7ffffce0/7fffdff4  snmpd
 1295    214528  7ffffcf0/7ffff904  rscn
 1296     42064  7ffffce0/7ffffb5c  qos
```

Where:

• MemAlloc = total memory allocated by the process.

• StackBase/Ptr = process stack base and current stack pointer in hex format

Displaying System Status

Use the **show system** command to display system-related status information (to .

Example 25-7   Displays Default Switch Port States

```
switch# show system default switchport
System default port state is down
System default trunk mode is on
```

Example 25-8   Displays Error Information for a Specified ID

```
switch# show system error-id 0x401D0019
Error Facility: module
Error Description: Failed to stop Linecard Async Notifciation.
```

Example 25-9   Displays the System Reset Information

```
switch# Show system reset-reason
1) No time
    Reason: Watchdog Timeout
    Service:
    Version: 1.0(0.253e)

2) At 125982 usecs after Tue Jan  1 06:45:55 1980
    Reason: Reset Requested CLI command reload
    Service:
    Version: 1.0(0.253e)
```

Example 25-10 Displays System Uptime

```
switch# show system uptime
Start Time: Sun Oct 13 18:09:23 2030
Up Time:    0 days, 9 hours, 46 minutes, 26 seconds
```

Configuring Core and Log Files

You can save cores (from the active supervisor module, the standby supervisor module, or any switching module) to an external flash (slot 0) or to a an TFTP server in one of two ways:

- On demand—to copy a single file based on the provided process ID.
- Periodically—to copy core files periodically as configured by the user.

To copy the core and log files on demand, follow this step:

	Command	Purpose
Step 1	switch# **copy core:7407 slot0:coreSample**	Copies the core file with the process ID 7407 as coreSample in slot 0.
	switch# **copy core://5/1524 tftp:/1.1.1.1/abcd**	Copies cores (if any) of a process with pid 1524 generated on slot 5 to tftp server.
	switch# **no terminal session-timeout 0**	Reverts the switch to its factory default.

- If the core file for the specified process ID is not available, you will see the following response:

```
switch# copy core:133 slot0:foo
No core file found with pid 133
```

- If two core files exist with same process ID, only one file will be copied:

```
switch# copy core:7407 slot0:foo1
2 core files found with pid 7407
Only "/isan/tmp/logs/calc_server_log.7407.tar.gz" will be copied to the destination.
```

To copy the core and log files periodically, follow these steps:

	Command	Purpose
Step 1	switch# **config t**	Enters configuration mode.
Step 2	switch(config)# **system cores slot0:coreSample**	Copies the core files coreSample to slot 0.
	switch(config)# **no system cores**	Disable the core files copying feature.

A new scheme overwrites any previously-issued scheme. For example, if you issue a new system core command, the cores are periodically saved to the new location or file.

Tip Be sure to create any required directory before issuing this command. If the directory specified by this command does not exist, the switch software logs a syslog message each time a copy cores is attempted.)

Clearing the Core Directory

Use the **clear cores** command to clean out the core directory. The software keeps the last few cores per service and per slot and clears all other cores present on the active supervisor module.

```
switch# clear cores
switch#
```

Displaying Cores Status

Use the **show system cores** command to display the currently configured scheme for copying cores. See Examples 25-11 to 25-13.

Example 25-11 Displays the status of System Cores

```
switch# show system cores
Transfer of cores is enabled
```

Example 25-12 Displays All Cores Available for Upload from the Active Supervisor Module

```
switch# show cores
Module-num Process-name PID Core-create-time
---------- ------------ --- ----------------
5          fspf         1524   Jan 9 03:11
6          fcc          919    Jan 9 03:09
8          acltcam      285    Jan 9 03:09
8          fib          283    Jan 9 03:08
```

Where:

`module-num` shows the slot number on which the core was generated. In this example, the `fspf core` was generated on the active supervisor module (slot 5), `fcc` was generated on the standby supervisor module (slot 6), and `acltcam` and `fib` were generated on the switching module (slot 8).

Example 25-13 Displays Logs on the Local System

```
switch# show processes log
Process PID    Normal-exitStack-traceCore Log-create-time
--------------- ------ ----------- ----------- ------- ---------------
fspf    1524   N         Y         Y  Jan 9 03:11
```

Configuring HA Policy

You can disable the HA policy supervisor reset feature (enabled by default) for debugging and troubleshooting purposes.

To configure HA policies, follow this step:

	Command	Purpose
Step 1	switch# **system no hap-reset**	Disables supervisor reset HA policy.
	switch# **system hap-reset**	Enables Supervisor Reset HA policy whenever a critical service runs out of HA policies (default) and reverts it to factory default.

Configuring Heartbeat Checks

The software monitors every service to verify if heartbeats are sent at regular intervals. If not, the software restarts that service. This feature helps locate situations when a service is stuck in an infinite loop.

You can disable the heartbeat checking feature (enabled by default) for debugging and troubleshooting purposes like attaching a GDB to a specified process.

To configure heartbeat checks, follow this step:

	Command	Purpose
Step 1	switch# **system no heartbeat**	Disables heartbeat checks.
	switch# **system heartbeat**	Enables heartbeat checks (default) and reverts it to factory default.

Configuring Watchdog Checks

If a watchdog is not logged at every 8 seconds by the software, the supervisor module reboots the switch.

You can disable the watchdog checking feature (enabled by default) for debugging and troubleshooting purposes like attaching a GDB or a kernel GDB (KGDB) to a specified process.

To configure watchdog checks, follow this step:

	Command	Purpose
Step 1	switch# **system no watchdog**	Disables watchdog checks.
	switch# **system watchdog**	Enables watchdog checks (default) and reverts it to factory default.

Configuring Upgrade Resets

This feature, when enabled (default), enables supervisor module resets when an upgrade has failed. If for some reason the upgrade fails, the software reboots the switch since the file system may be in an unstable state.

You can disable the upgrade-reset feature (enabled by default) for debugging and troubleshooting purposes.

To configure supervisor upgrade resets, follow this step:

	Command	Purpose
Step 1	switch# **system no upgrade-reset**	Disables the upgrade reset feature.
	switch# **system upgrade-reset**	Enables the upgrade reset feature (default) and reverts it to factory default.
