

## Configuring Domain Parameters

The Fibre Channel domain (fcdomain) feature performs principal switch selection, domain ID distribution, FC ID allocation, and fabric reconfiguration functions as described in the FC-SW-2 standards. The domains are configured on a per VSAN basis. If you do not configure a domain ID, the local switch uses a random ID.

**Caution**

made by an administrator or individual who is completely familiar with switch operations.

**Tip**

When you change the configuration, be sure to save the running configuration. The next time you reboot the switch, the saved configuration is used. If you do not save the configuration, the previously saved startup configuration is used.

This chapter includes the following sections:

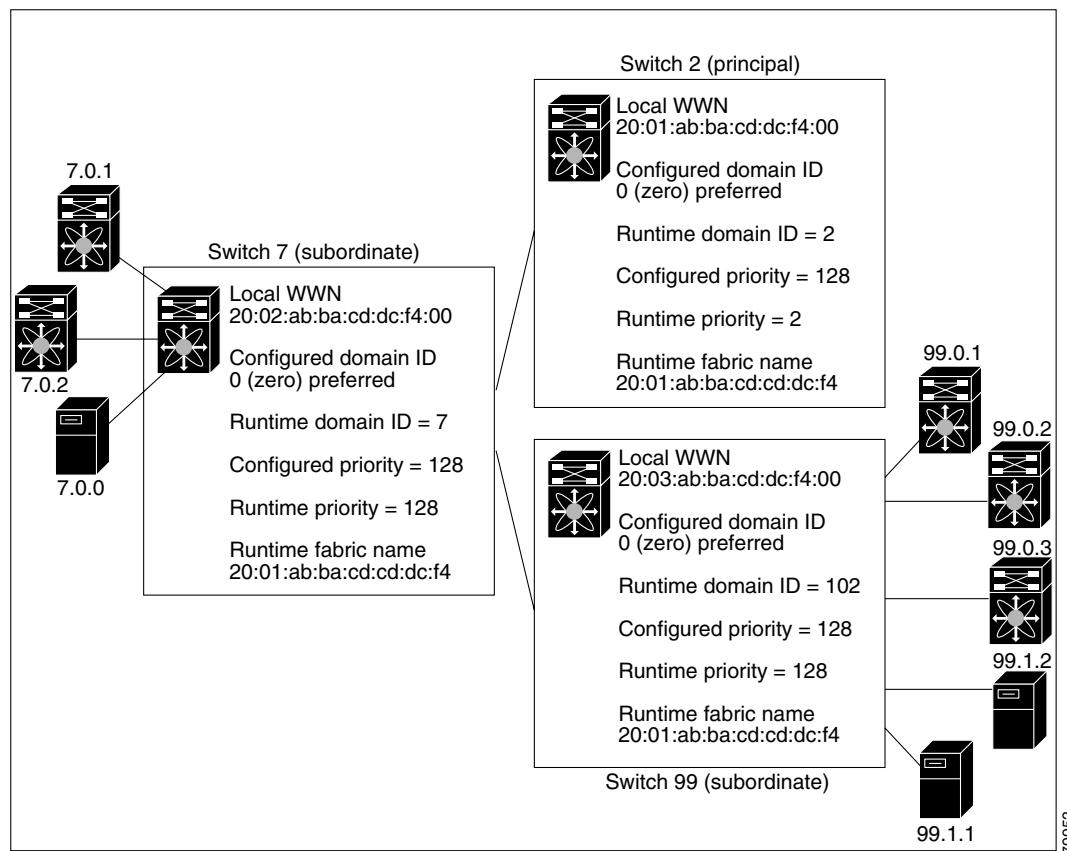

- [About fcdomain Phases, page 14-2](#)
  - [Domain Restart, page 14-3](#)
  - [Domain Configuration, page 14-4](#)
  - [Switch Priority, page 14-6](#)
  - [Allowed Domain ID Lists, page 14-6](#)
  - [Merged Stable Fabrics, page 14-7](#)
  - [Contiguous Domain Assignments, page 14-7](#)
  - [fcdomain Initiation, page 14-8](#)
  - [Fabric Name, page 14-8](#)
  - [Incoming RCFs, page 14-8](#)
  - [Persistent FC IDs, page 14-9](#)
  - [Persistent FC IDs Manual Configuration, page 14-10](#)
  - [Persistent FC ID Selective Purging, page 14-13](#)
  - [Displaying fcdomain Information, page 14-13](#)
  - [Default Settings, page 14-16](#)

# About fcdomain Phases

- Principal switch selection—This phase guarantees the selection of a unique principal switch across the fabric.
- Domain ID distribution—This phase guarantees each switch in the fabric obtains a unique domain ID.
- FC ID allocation—This phase guarantees a unique FC ID assignment to each device attached to the corresponding switch in the fabric.
- Fabric reconfiguration—This phase guarantees a resynchronization of all switches in the fabric to ensure they simultaneously restart a new principal switch selection phase.

See [Figure 14-1](#).

**Figure 14-1      Sample fcdomain Configuration**

**Note** Domain IDs and VSAN values used in all procedures are only provided as examples. Be sure to use IDs and values that apply to your configuration.

# Domain Restart

**Note**

the domain IDs are different, the runtime domain ID changes to take on the static domain ID after the next restart, either disruptive or non-disruptive.

**Tip**

If a VSAN is in interop mode, you cannot restart the fcdomain for that VSAN disruptively.

You can apply most of the configurations to their corresponding runtime values. Each of the following sections provide further details on how the fcdomain parameters are applied to the runtime values.

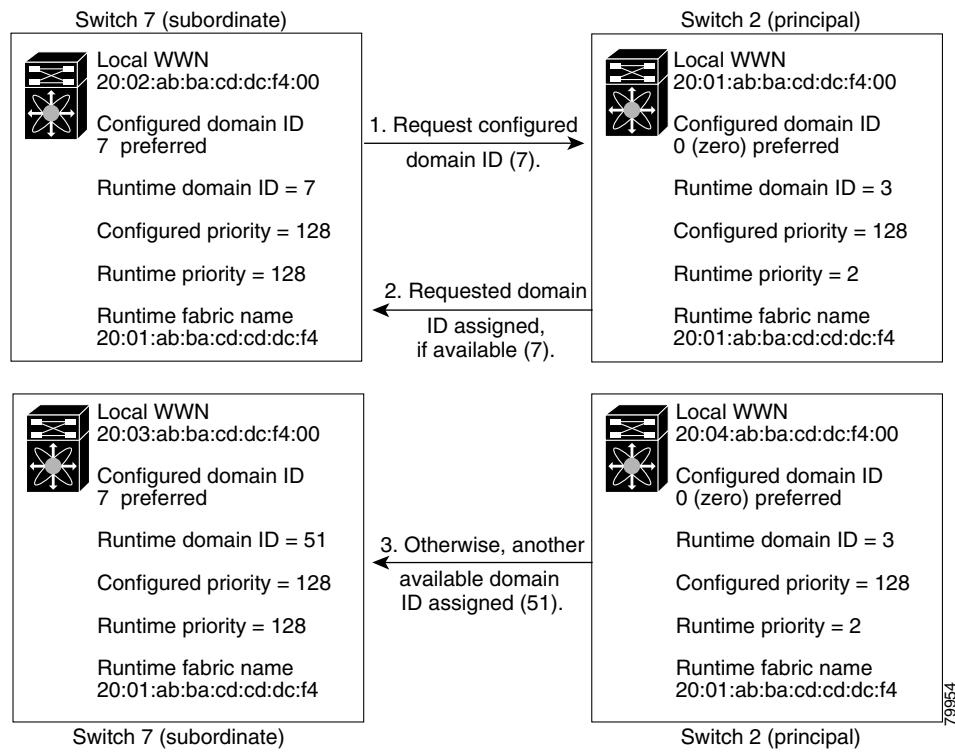

The **fcdomain restart** command applies your changes to the runtime settings. Use the **restart disruptive**

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>	switch# <b>config t</b> switch(config)#	
<b>Step 2</b>	switch(config)# <b>fcdomain restart vsan 1</b>	
	<b>fcdomain restart disruptive</b> <b>vsan 1</b>	

# Domain Configuration

- 1.
2. The principal switch assigns the requested domain ID if available. Otherwise, it assigns another available domain ID.

**Figure 14-2 Configuration Process Using the preferred Option**

If you change the configured domain ID, the change is only accepted if the new domain ID is included in all the allowed domain ID lists currently configured in the VSAN. Alternatively, you can also configure zero-preferred domain ID.

---

The 0 (zero) value can be configured only if you use the preferred option.

---

While the static option can be applied to runtime after a disruptive or nondisruptive restart, the preferred option is applied to runtime only after a disruptive restart (see the “[Domain Restart](#)” section on [page 14-3](#)).

---

When the FICON feature is enabled in a given VSAN, the domain ID for that VSAN remains in the static state. You can change the static ID value but you cannot change it to the preferred option.

---

---

You must issue the **fcdomain domain 3 preferred** command if you want to apply the configured domain changes to the runtime domain.

---

To specify a preferred or a static domain ID, follow these steps:

		Enters configuration mode.
	<b>fcdomain domain 3 preferred</b> <b>vsan 8</b>	
	<b>no fcdomain domain 3</b> <b>preferred vsan 8</b>	
<b>Step 3</b>	<b>fcdomain domain 2 static</b> <b>vsan 237</b>	
	<b>no fcdomain domain 18 static</b> <b>vsan 237</b>	

## Switch Priority

By default, the configured priority is 128. The valid range to set the priority is between 1 and 254. Priority 1 has the highest priority. Value 255 is accepted from other switches, but cannot be locally configured.

Any new switch cannot become the principal switch when it joins a stable fabric. During the principal switch selection phase, the switch with the highest priority becomes the principal switch. If two switches have the same configured priority, the switch with the lower WWN becomes the principal switch.

The priority configuration is applied to runtime when the fcdomain is restarted (see the “[Domain Restart](#)” section on page 14-3). This configuration is applicable to both disruptive and nondisruptive restarts.

To configure the priority for the principal switch, follow these steps:

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>		
<b>Step 2</b>	<b>fcdomain priority 25 vsan 99</b>	
	<b>no fcdomain priority 25 vsan 99</b>	

## Allowed Domain ID Lists

Tip

\_\_\_\_\_

\_\_\_\_\_

- 
- 
- 
- 

<b>config t</b>	
<b>fcdomain allowed 50-110 vsan 4</b>	
<b>no fcdomain allowed 50-110 vsan 5</b>	

## Merged Stable Fabrics

- 
- 

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>		
<b>Step 2</b>		
	<code>fcdomain auto-reconfigure 69</code>	

## Contiguous Domain Assignments

- 
- 

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>	<code>config t</code>	
<b>Step 2</b>	<code>fcdomain contiguous-allocation vsan 81-83</code>	<b>Note</b> <b>contiguous-allocation</b>

## fcdomain Initiation

## Fabric Name

- When the fcdomain feature is enabled, the runtime fabric name is the same as the principal switch's WWN.

The fabric name is applied to runtime through a disruptive restart when the fcdomain is configured as disabled (see the “Domain Restart” section on page 14-3).

To set the fabric name value for a disabled fcdomain, follow these steps:

<pre>fcdomain fabric-name 20:1:ac:16:5e:0:21:01 vsan 3</pre>	
<pre>no fcdomain fabric-name 20:1:ac:16:5e:0:21:01 vsan 3010</pre>	

## Incoming RCFs

*in use*

---

 If you connect to the switch from an AIX or HP-UX host, be sure to enable the persistent FC ID feature in the VSAN that connects these hosts.

---

---

 Persistent FC IDs are enabled by default. This change of default behavior from releases prior to Cisco MDS SAN-OS Release 2.0(1b) prevents FC IDs from being changed after a reboot. You can disable this option for each VSAN.

---

A persistent FC ID assigned to an F port can be moved across interfaces and can continue to maintain the same persistent FC ID.

---

 Persistent FC IDs with loop-attached devices (FL ports) need to remain connected to the same port in which they were configured.

---

---

---

## Enabling Persistent FC IDs

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>		
<b>Step 2</b>	FCID(s) persistent feature is enabled. switch(config)#
