Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

How to Configure Local Authentication and Authorization

Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the Catalyst 3850 switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Note

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

Beginning in privileged EXEC mode, follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:

SUMMARY STEPS

- 1. configure terminal
- 2. aaa new-model
- 3. aaa authentication login default local
- 4. aaa authorization exec local
- 5. aaa authorization network local
- **6. username** *name* [**privilege** *level*] {**password** *encryption-type password*}
- **7.** end

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 2	aaa new-model	Enables AAA.
	Example:	
	Switch(config)# aaa new-model	
Step 3	aaa authentication login default local	Sets the login authentication to use the local username database. The default keyword applies the local user database authentication to all
	Example:	ports.
	Switch(config)# aaa authentication login default local	
Step 4	aaa authorization exec local	Configures user AAA authorization, check the local database, and allow the user to run an EXEC shell.
	Example:	
	Switch(config)# aaa authorization exec local	
Step 5	aaa authorization network local	Configures user AAA authorization for all network-related service requests.
	Example:	
	Switch(config) # aaa authorization network local	

	Command or Action	Purpose
Step 6	<pre>username name [privilege level] {password encryption-type password}</pre>	Enters the local database, and establishes a username-based authentication system.
	Example: Switch(config) # username your_user_name privilege 1 password 7 secret567	 For name, specify the user ID as one word. Spaces and quotation marks are not allowed. (Optional) For level, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 0 gives user EXEC mode access. For encryption-type, enter 0 to specify that an unencrypted password follows. Enter 7 to specify that a hidden password follows. For password, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the username command.
Step 7	end	Returns to privileged EXEC mode.
	Example: Switch(config)# end
