starting with [initial] value and applying [operation] from left to right
 to current accumulator value and each
element with its index in the original array.
 Returns the
specified [initial] value if the array is empty.
 @param
[operation] function that takes the index of an element, current accumulator value
 and the element
itself, and calculates the next accumulator value.
public inline fun <R> FloatArray.foldIndexed(initial: R,
operation: (index: Int, acc: R, Float) -> R): R {
    var index = 0
    var accumulator = initial
    for (element in
this) accumulator = operation(index++, accumulator, element)
    return accumulator
}
 Accumulates
value starting with [initial] value and applying [operation] from left to right
 to current accumulator value and
each element with its index in the original array.
 Returns the
specified [initial] value if the array is empty.
 @param
[operation] function that takes the index of an element, current accumulator value
 and the
element itself, and calculates the next accumulator value.
public inline fun <R>
DoubleArray.foldIndexed(initial: R, operation: (index: Int, acc: R, Double) -> R): R {
    var index = 0
    var
accumulator = initial
    for (element in this) accumulator = operation(index++, accumulator, element)
    return
accumulator
}
 Accumulates value starting with [initial] value and applying [operation] from left to
right
 to current accumulator value and each element with its index in the original array.
 Returns the
specified [initial] value if the array is empty.
 @param [operation] function that takes the index of an
element, current accumulator value
 and the element itself, and calculates the next accumulator value.
public inline fun <R> BooleanArray.foldIndexed(initial: R, operation: (index: Int, acc: R, Boolean) -> R): R {
    var
index = 0
    var accumulator = initial
    for (element in this) accumulator = operation(index++, accumulator,
element)
    return accumulator
}
 Accumulates value starting with [initial] value and applying
[operation] from left to right
 to current accumulator value and each element with its index in the original array.

Returns an [IntRange] of the valid indices for this collection.
@sample
samples.collections.Collections.Collections.indicesOfCollection
public val Collection<*>.indices: IntRange
get() = 0..size - 1
Returns the index of the last item in the list or -1 if the list is empty.
@sample
samples.collections.Collections.Collections.lastIndexOfList
public val <T> List<T>.lastIndex: Int
get() = this.size - 1
Returns `true` if the collection is not empty.
@sample
samples.collections.Collections.Collections.collectionIsNotEmpty
public inline fun <T> Collection<T>.isNotEmpty(): Boolean = !isEmpty()
Returns `true` if this nullable collection is either null or empty.
@sample
samples.collections.Collections.Collections.collectionOrNullOrNullEmpty
public inline fun <T> Collection<T>?.isNullOrEmpty(): Boolean {
    contract {
        returns(false) implies (this@isNullOrEmpty != null)
    }
    return this == null || this.isEmpty()
}
Returns this Collection if it's not `null` and the empty list otherwise.
@sample
samples.collections.Collections.Collections.collectionOrNullEmpty
public inline fun <T> Collection<T>?.orEmpty(): Collection<T> = this ?: emptyList()
Returns this List if it's not `null` and the empty list otherwise.
@sample
samples.collections.Collections.Collections.listOrNullEmpty
public inline fun <T> List<T>?.orEmpty(): List<T> = this ?: emptyList()
Returns this collection if it's not empty or the result of calling [defaultValue] function if the collection is empty.
@sample
samples.collections.Collections.Collections.collectionIfEmpty
public inline fun <C, R> C.ifEmpty(defaultValue: () -> R): R where C : Collection<*>, C : R =
    if (isEmpty()) defaultValue() else this
Checks if all elements in the specified collection are contained in this collection.
Allows to overcome type-safety restriction of `containsAll` that requires to pass a collection of type `Collection<E>`.
@sample
samples.collections.Collections.Collections.collectionContainsAll
public inline fun <@kotlin.internal.OnlyInputTypes T> Collection<T>.containsAll(elements: Collection<T>): Boolean = this.containsAll(elements)
Returns a new list with the elements of this list randomly shuffled using the specified [random] instance as the source of randomness.
@sample
samples.collections.Collections.Collections.collectionShuffled
public fun <T> Iterable<T>.shuffled(random: Random): List<T> = toMutableList().apply { shuffle(random) }
optimizeReadOnlyList() = when (size) {
    0 -> emptyList()
    1 -> listOf(this[0])
    else -> this
}
Searches this list or its range for the provided [element] using the binary search algorithm.
The list is expected to be sorted into ascending order according to the Comparable natural ordering of its elements, otherwise the result is undefined.
If the list contains multiple elements equal to the specified [element], there is no guarantee which one will be found.
`null` value is considered to be less than any non-null value.
@return the index of the element, if it is contained in the list within the specified range; otherwise, the inverted insertion point `(-insertion point - 1)`.
The insertion point is defined as the index at which the element should be inserted, so that the list (or the specified subrange of list) still remains sorted.
@sample
samples.collections.Collections.Collections.binarySearchOnComparable
@sample
samples.collections.Collections.Collections.binarySearchWithBoundaries
public fun <T : Comparable<T>> List<T>.binarySearch(element: T?, fromIndex: Int = 0, toIndex: Int = size): Int {
    rangeCheck(size, fromIndex, toIndex)
    var low = fromIndex
    var high = toIndex - 1
    while (low <= high) {
        val mid = (low + high).ushr(1) // safe from overflows
        val midVal = get(mid)
        val cmp = compareValues(midVal, element)
        if (cmp < 0) low = mid + 1
        else if (cmp > 0) high = mid - 1
        else return mid // key found
    }
    return -(low + 1) // key not found
}
Searches this list or its range for the provided [element] using the binary search algorithm.
The list is expected to be sorted into ascending order according to the specified [comparator], otherwise the result is undefined.
If the list contains

```

multiple elements equal to the specified [element], there is no guarantee which one will be found.

`null` value is considered to be less than any non-null value.

@return the index of the element, if it is contained in the list within the specified range; otherwise, the inverted insertion point `(-insertion point - 1)`.

The insertion point is defined as the index at which the element should be inserted, so that the list (or the specified subrange of list) still remains sorted according to the specified [comparator].

@sample

```

samples.collections.Collections.Lists.binarySearchWithComparator
public fun <T>
List<T>.binarySearch(element: T, comparator: Comparator<in T>, fromIndex: Int = 0, toIndex: Int = size): Int {
    rangeCheck(size, fromIndex, toIndex)
    var low = fromIndex
    var high = toIndex - 1
    while (low <= high) {
        val mid = (low + high).ushr(1) // safe from overflows
        val midVal = get(mid)
        val cmp = comparator.compare(midVal, element)
        if (cmp < 0) low = mid + 1
        else if (cmp > 0) high = mid - 1
        else return mid // key found
    }
    return -(low + 1) // key not found
}

```

Searches this list or its range for an element having the key returned by the specified [selector] function equal to the provided [key] value using the binary search algorithm. The list is expected to be sorted into ascending order according to the Comparable natural ordering of keys of its elements. otherwise the result is undefined.

If the list contains multiple elements with the specified [key], there is no guarantee which one will be found.

`null` value is considered to be less than any non-null value.

@return the index of the element with the specified [key], if it is contained in the list within the specified range; otherwise, the inverted insertion point `(-insertion point - 1)`.

The insertion point is defined as the index at which the element should be inserted, so that the list (or the specified subrange of list) still remains sorted.

@sample

```

samples.collections.Collections.Lists.binarySearchByKey
public inline fun <T, K : Comparable<K>>
List<T>.binarySearchBy(
    key: K?,
    fromIndex: Int = 0,
    toIndex: Int = size,
    crossinline selector: (T) -> K?): Int =
    binarySearch(fromIndex, toIndex) { compareValues(selector(it), key) }

```

do not introduce this overload --- too rare

```

public fun <T, K> List<T>.binarySearchBy(key: K, comparator: Comparator<K>,
    fromIndex: Int = 0, toIndex: Int = size(), selector: (T) -> K): Int =
    binarySearch(fromIndex, toIndex) {
        comparator.compare(selector(it), key)
    }

```

Searches this list or its range for an element for which the given [comparison] function returns zero using the binary search algorithm. The list is expected to be sorted so that the signs of the [comparison] function's return values ascend on the list elements, i.e. negative values come before zero and zeroes come before positive values. Otherwise, the result is undefined.

If the list contains multiple elements for which [comparison] returns zero, there is no guarantee which one will be found.

@param comparison function that returns zero when called on the list element being searched. On the elements coming before the target element, the function must return negative values; on the elements coming after the target element, the function must return positive values.

@return the index of the found element, if it is contained in the list within the specified range; otherwise, the inverted insertion point `(-insertion point - 1)`.

The insertion point is defined as the index at which the element should be inserted, so that the list (or the specified subrange of list) still remains sorted.

@sample

```

samples.collections.Collections.Lists.binarySearchWithComparisonFunction
public fun <T>
List<T>.binarySearch(fromIndex: Int = 0, toIndex: Int = size, comparison: (T) -> Int): Int {
    rangeCheck(size, fromIndex, toIndex)
    var low = fromIndex
    var high = toIndex - 1
    while (low <= high) {
        val mid = (low + high).ushr(1) // safe from overflows
        val midVal = get(mid)
        val cmp = comparison(midVal)
        if (cmp < 0) low = mid + 1
        else if (cmp > 0) high = mid - 1
        else return mid // key found
    }
    return -(low + 1) // key not found
}

```

Checks that `from` and `to` are in the range of `[0..size]` and throws an appropriate exception, if they aren't.

```

private fun rangeCheck(size: Int, fromIndex: Int, toIndex: Int) {
    when {
        fromIndex > toIndex -> throw
        IllegalArgumentException("fromIndex ($fromIndex) is greater than toIndex ($toIndex).")
        fromIndex < 0 -> throw
        IndexOutOfBoundsException("fromIndex ($fromIndex) is less than zero.")
        toIndex > size -> throw
        IndexOutOfBoundsException("toIndex ($toIndex) is greater than size ($size).")
    }
}

```

 return count  
 }  
 Returns the number of elements in this collection.  
 @kotlin.internal.InlineOnly  
 public inline fun <T> Collection<T>.count(): Int {  
 return size  
 }  
 Returns the number of elements matching the given [predicate].  
 public fun <T> Iterable<T>.count(predicate: (T) -> Boolean): Int {  
 if (this is Collection && isEmpty()) return 0  
 var count = 0  
 for (element in this) if (predicate(element)) checkCountOverflow(++count)  
 return count  
 }  
 Accumulates value starting with [initial] value and applying [operation] from left to right  
 to current accumulator value and each element.  
 Returns the specified [initial] value if the collection is empty.  
 @param [operation] function that takes current accumulator value and an element, and calculates the next accumulator value.  
 public inline fun <T, R> Iterable<T>.fold(initial: R, operation: (acc: R, T) -> R): R {  
 var accumulator = initial  
 for (element in this) accumulator = operation(accumulator, element)  
 return accumulator  
 }  
 Accumulates value starting with [initial] value and applying [operation] from left to right  
 to current accumulator value and each element with its index in the original collection.  
 Returns the specified [initial] value if the collection is empty.  
 @param [operation] function that takes the index of an element, current accumulator value  
 and the element itself, and calculates the next accumulator value.  
 public inline fun <T, R> Iterable<T>.foldIndexed(initial: R, operation: (index: Int, acc: R, T) -> R): R {

```

Returns a [Map] where keys are elements from the given sequence and values are produced by the [valueSelector] function applied to each element.

If any two elements are equal, the last one gets added to the map.

The returned map preserves the entry iteration order of the original sequence.

The operation is `_terminal_`.

```

@sample samples.collections.Collections.Transformations.associateWith
*
@SinceKotlin("1.3")
public inline fun <K, V> Sequence<K>.associateWith(valueSelector: (K) -> V):
Map<K, V> {
    val result = LinkedHashMap<K, V>()
    return associateWithTo(result,
valueSelector)
}

```

Populates and returns the [destination] mutable map with key-value pairs for each element of the given sequence, where key is the element itself and value is provided by the [valueSelector] function applied to that key.

If any two elements are equal, the last one overwrites the former value in the map.

The operation is `_terminal_`.

```

@sample
samples.collections.Collections.Transformations.associateWithTo
*
@SinceKotlin("1.3")
public inline fun
<K, V, M : MutableMap<in K, in V>> Sequence<K>.associateWithTo(destination: M, valueSelector: (K) -> V): M
{
    for (element in this) {
        destination.put(element, valueSelector(element))
    }
    return
destination
}

```

Appends all elements to the given [destination] collection.

The operation is `_terminal_`.

```

public fun <T, C : MutableCollection<in T>> Sequence<T>.toCollection(destination: C): C {
    for (item in this) {
        destination.add(item)
    }
    return destination
}

```

Returns a new [HashSet] of all elements.

The operation is `_terminal_`.

```

public fun <T> Sequence<T>.toHashSet(): HashSet<T> {
    return toCollection(HashSet<T>())
}

```

Returns a [List] containing all elements.

The operation is `_terminal_`.

```

public fun <T> Sequence<T>.toList(): List<T> {
    return
this.toMutableList().optimizeReadOnlyList()
}

```

Returns a new [MutableList] filled with all elements of this sequence.

The operation is `_terminal_`.

```

public fun <T> Sequence<T>.toMutableList():
MutableList<T> {
    return toCollection(ArrayList<T>())
}

```

Returns a [Set] of all elements.

The returned set preserves the element iteration order of the original sequence.

The operation is `_terminal_`.

```

public fun <T> Sequence<T>.toSet(): Set<T> {
    return
toCollection(LinkedHashSet<T>()).optimizeReadOnlySet()
}

```

Returns a single sequence of all elements from results of [transform] function being invoked on each element of original sequence.

The operation is `_intermediate_` and `_stateless_`.

```

```

the original sequence into an [IndexedValue] containing the index of that element and the element itself.

The operation is `_intermediate_ and _stateless_`.

```
public fun <T> Sequence<T>.withIndex():
Sequence<IndexedValue<T>> {
    return IndexingSequence(this)
}
```

Returns a sequence containing only distinct elements from the given sequence. Among equal elements of the given sequence, only the first one will be present in the resulting sequence. The elements in the resulting sequence are in the same order as they were in the source sequence.

The operation is `_intermediate_ and _stateful_`.

```
@sample
samples.collections.Collections.Transformations.distinctAndDistinctBy
public fun <T>
Sequence<T>.distinct(): Sequence<T> {
    return this.distinctBy { it }
}
```

Returns a sequence containing only elements from the given sequence having distinct keys returned by the given [selector] function. Among elements of the given sequence with equal keys, only the first one will be present in the resulting sequence. The elements in the resulting sequence are in the same order as they were in the source sequence.

The operation is `_intermediate_ and _stateful_`.

```
@sample
samples.collections.Collections.Transformations.distinctAndDistinctBy
public fun <T, K>
Sequence<T>.distinctBy(selector: (T) -> K): Sequence<T> {
    return DistinctSequence(this, selector)
}
```

Returns a new [MutableSet] containing all distinct elements from the given sequence. The returned set preserves the element iteration order of the original sequence.

The operation is `_terminal_`.

```
public fun
<T> Sequence<T>.toMutableSet(): MutableSet<T> {
    val set = LinkedHashSet<T>()
    for (item in this)
        set.add(item)
    return set
}
```

Returns `true` if all elements match the given [predicate].

The operation is `_terminal_`.

```
@sample
samples.collections.Collections.Aggregates.all
public inline fun
<T> Sequence<T>.all(predicate: (T) -> Boolean): Boolean {
    for (element in this) if (!predicate(element)) return
false
    return true
}
```

Returns `true` if sequence has at least one element.

The operation is `_terminal_`.

```
@sample
samples.collections.Collections.Aggregates.any
public fun <T>
Sequence<T>.any(): Boolean {
    return iterator().hasNext()
}
```

Returns `true` if at least one element matches the given [predicate].

The operation is `_terminal_`.

```
@sample
samples.collections.Collections.Aggregates.anyWithPredicate
public inline fun <T>
Sequence<T>.any(predicate: (T) -> Boolean): Boolean {
    for (element in this) if (predicate(element)) return
true
    return false
}
```

Returns the number of elements in this sequence.

The operation is `_terminal_`.

```
public fun <T> Sequence<T>.count(): Int {
    var count = 0
    for (element in this)
        checkCountOverflow(++count)
    return count
}
```

Returns the number of elements matching the given [predicate].

The operation is `_terminal_`.

```
public inline fun <T> Sequence<T>.count(predicate: (T) ->
Boolean): Int {
    var count = 0
    for (element in this) if (predicate(element)) checkCountOverflow(++count)
    return count
}
```

Accumulates value starting with [initial] value and applying [operation] from left to right to current accumulator value and each element. Returns the specified [initial] value if the sequence is empty.

@param [operation] function that takes current accumulator value and an element, and calculates the next accumulator value.

The operation is `_terminal_`.

```
public inline fun <T, R>
Sequence<T>.fold(initial: R, operation: (acc: R, T) -> R): R {
    var accumulator = initial
    for (element in this)
        accumulator = operation(accumulator, element)
    return accumulator
}
```

Accumulates value starting with [initial] value and applying [operation] from left to right to current accumulator value and each element with its index in the original sequence. Returns the specified [initial] value if the sequence is empty.

@param [operation] function that takes the index of an element, current accumulator value and the element itself, and calculates the next accumulator value.

The operation is `_terminal_`.

```
public inline fun <T, R>
Sequence<T>.foldIndexed(initial: R, operation: (index: Int, acc: R, T) -> R): R {
    var index = 0
    var accumulator = initial
    for (element in this)
        accumulator = operation(checkIndexOverflow(index++), accumulator,
element)
    return accumulator
}
```

Performs the given [action] on each element.

The operation is `_terminal_`.

```
public inline fun <T> Sequence<T>.forEach(action: (T) -> Unit): Unit {
    for (element in this)
        action(element)
}
```

Performs the given [action] on each element, providing sequential index with the element.

@param [action] function that takes the index of an element and the element itself and performs the action on the element.

The operation is `_terminal_`.

```
public inline fun <T>
```

```

Sequence<T>.forEachIndexed(action: (index: Int, T) -> Unit): Unit {
    var index = 0
    for (item in this)
        action(checkIndexOverflow(index++), item)
}

```

between successive calls to `iterator` may affect the result.

`Sequence` is `_intermediate_` and `_stateless_`.

```

public operator fun <T> Sequence<T>.plus(elements: Sequence<T>): Sequence<T> {
    return sequenceOf(this, elements).flatten()
}

```

Returns a sequence containing all elements of the original sequence and then the given `[element]`.

The operation is `_intermediate_` and `_stateless_`.

```

@kotlin.internal.InlineOnly
public inline fun <T> Sequence<T>.plusElement(element: T): Sequence<T> {
    return plus(element)
}

```

Returns a sequence of snapshots of the window of the given `[size]` sliding along this sequence with the given `[step]`, where each snapshot is a list. Several last lists may have fewer elements than the given `[size]`. Both `[size]` and `[step]` must be positive and can be greater than the number of elements in this sequence.

`@param size` the number of elements to take in each window

`@param step` the number of elements to move the window forward by on an each step, by default 1

`@param partialWindows` controls whether or not to keep partial windows in the end if any, by default ``false`` which means partial windows won't be preserved

`@sample samples.collections.Sequences.Transformations.takeWindows`

```

@SinceKotlin("1.2")
public fun <T> Sequence<T>.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false): Sequence<List<T>> {
    return windowedSequence(size, step, partialWindows, reuseBuffer = false)
}

```

Returns a sequence of results of applying the given `[transform]` function to an each list representing a view over the window of the given `[size]` sliding along this sequence with the given `[step]`.

Note that the list passed to the `[transform]` function is ephemeral and is valid only inside that function. You should not store it or allow it to escape in some way, unless you made a snapshot of it.

Several last lists may have fewer elements than the given `[size]`. Both `[size]` and `[step]` must be positive and can be greater than the number of elements in this sequence.

`@param size` the number of elements to take in each window

`@param step` the number of elements to move the window forward by on an each step, by default 1

`@param partialWindows` controls whether or not to keep partial windows in the end if any, by default ``false`` which means partial windows won't be preserved

`@sample samples.collections.Sequences.Transformations.averageWindows`

```

@SinceKotlin("1.2")
public fun <T, R> Sequence<T>.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false, transform: (List<T>) -> R): Sequence<R> {
    return windowedSequence(size, step, partialWindows, reuseBuffer = true).map(transform)
}

```

Returns a sequence of values built from the elements of ``this`` sequence and the `[other]` sequence with the same index. The resulting sequence ends as soon as the shortest input sequence ends.

The operation is `_intermediate_` and `_stateless_`.

`@sample samples.collections.Sequences.Transformations.zip`

```

public infix fun <T, R> Sequence<T>.zip(other: Sequence<R>): Sequence<Pair<T, R>> {
    return MergingSequence(this, other) { t1, t2 -> t1 to t2 }
}

```

Returns a sequence of values built from the elements of ``this`` sequence and the `[other]` sequence with the same index using the provided `[transform]` function applied to each pair of elements. The resulting sequence ends as soon as the shortest input sequence ends.

The operation is `_intermediate_` and `_stateless_`.

`@sample samples.collections.Sequences.Transformations.zipWithTransform`

```

public fun <T, R, V> Sequence<T>.zip(other: Sequence<R>, transform: (a: T, b: R) -> V): Sequence<V> {
    return MergingSequence(this, other, transform)
}

```

Returns a sequence of pairs of each two adjacent elements in this sequence. The returned sequence is empty if this sequence contains less than two elements.

The operation is `_intermediate_` and `_stateless_`.

`@sample samples.collections.Collections.Transformations.zipWithNext`

```

@SinceKotlin("1.2")
public fun <T> Sequence<T>.zipWithNext(): Sequence<Pair<T, T>> {
    return zipWithNext { a, b -> a to b }
}

```

Returns a sequence containing the results of applying the given `[transform]` function to an each pair of two adjacent elements in this sequence. The returned sequence is empty if this sequence contains less than two elements.

The operation is `_intermediate_` and `_stateless_`.

`@sample samples.collections.Collections.Transformations.zipWithNextToFindDeltas`

```

@SinceKotlin("1.2")
public fun <T, R> Sequence<T>.zipWithNext(transform: (a: T, b: T) -> R): Sequence<R> {
    return sequence result@ {
        val iterator = iterator()
        if (!iterator.hasNext()) return@result
        var current = iterator.next()
        while (iterator.hasNext()) {
            val next = iterator.next()
            yield(transform(current, next))
        }
    }
}

```

```

}

// public fun String.replace(oldChar: Char, newChar: Char, ignoreCase: Boolean): String // JVM- and JS-specific
// public fun String.replace(oldValue: String, newValue: String, ignoreCase: Boolean): String // JVM- and JS-specific

Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the given [replacement].

The [replacement] can consist of any combination of literal text and $-substitutions. To treat the replacement string literally escape it with the [kotlin.text.Regex.Companion.escapeReplacement] method.

@kotlin.internal.InlineOnly
public inline fun CharSequence.replace(regex: Regex, replacement: String): String = regex.replace(this, replacement)

Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the result of the given function [transform] that takes [MatchResult] and returns a string to be used as a replacement for that match.

@kotlin.internal.InlineOnly
public inline fun CharSequence.replace(regex: Regex, noinline transform: (MatchResult) -> CharSequence): String = regex.replace(this, transform)

Replaces the first occurrence of the given regular expression [regex] in this char sequence with specified [replacement] expression.

@param replacement A replacement expression that can include substitutions. See [Regex.replaceFirst] for details.

@kotlin.internal.InlineOnly
public inline fun CharSequence.replaceFirst(regex: Regex, replacement: String): String = regex.replaceFirst(this, replacement)

Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty.

@param transform function that takes the first character and returns the result of the transform applied to the character.

@sample samples.text.Strings.replaceFirstChar

@SinceKotlin("1.5")
@WasExperimental(ExperimentalStdlibApi::class)
@OptIn(kotlin.experimental.ExperimentalTypeInference::class)
@OverloadResolutionByLambdaReturnType
@JvmName("replaceFirstCharWithChar")
@kotlin.internal.InlineOnly
public inline fun String.replaceFirstChar(transform: (Char) -> Char): String {
    return if (isEmpty()) transform(this[0]) + substring(1) else this
}

Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty.

@param transform function that takes the first character and returns the result of the transform applied to the character.

@sample samples.text.Strings.replaceFirstChar

@SinceKotlin("1.5")
@WasExperimental(ExperimentalStdlibApi::class)
@OptIn(kotlin.experimental.ExperimentalTypeInference::class)
@OverloadResolutionByLambdaReturnType
@JvmName("replaceFirstCharWithCharSequence")
@kotlin.internal.InlineOnly
public inline fun String.replaceFirstChar(transform: (Char) -> CharSequence): String {
    return if (isEmpty()) transform(this[0]).toString() + substring(1) else this
}

Returns `true` if this char sequence matches the given regular expression.

@kotlin.internal.InlineOnly
public inline infix fun CharSequence.matches(regex: Regex): Boolean = regex.matches(this)

Implementation of [regionMatches] for CharSequences.

Invoked when it's already known that arguments are not Strings, so that no additional type checks are performed.

internal fun CharSequence.regionMatchesImpl(thisOffset: Int, other: CharSequence, otherOffset: Int, length: Int, ignoreCase: Boolean): Boolean {
    if ((otherOffset < 0) || (thisOffset < 0) || (thisOffset > this.length - length) || (otherOffset > other.length - length)) {
        return false
    }
    for (index in 0 until length) {
        if (!this[thisOffset + index].equals(other[otherOffset + index], ignoreCase)) {
            return false
        }
    }
    return true
}

```

```

Returns `true` if this char sequence starts with the specified character.
public fun CharSequence.startsWith(char: Char, ignoreCase: Boolean = false): Boolean {
    return this.length > 0 && this[0].equals(char, ignoreCase)
}

Returns `true` if this char sequence ends with the specified character.
public fun CharSequence.endsWith(char: Char, ignoreCase: Boolean = false): Boolean {
    return this.length > 0 && this[lastIndex].equals(char, ignoreCase)
}

Returns `true` if this char sequence starts with the specified prefix.
public fun CharSequence.startsWith(prefix: CharSequence, ignoreCase: Boolean = false): Boolean {
    if (!ignoreCase && this is String && prefix is String)
        return this.startsWith(prefix)
    else
        return regionMatchesImpl(0, prefix, 0, prefix.length, ignoreCase)
}

Returns `true` if a substring of this char sequence starting at the specified offset [startIndex] starts with the specified prefix.
public fun CharSequence.startsWith(prefix: CharSequence, startIndex: Int, ignoreCase: Boolean = false): Boolean {
    if (!ignoreCase && this is String && prefix is String)
        return this.startsWith(prefix, startIndex)
    else
        return regionMatchesImpl(startIndex, prefix, 0, prefix.length, ignoreCase)
}

Returns `true` if this char sequence ends with the specified suffix.
public fun CharSequence.endsWith(suffix: CharSequence, ignoreCase: Boolean = false): Boolean {
    if (!ignoreCase && this is String && suffix is String)
        return this.endsWith(suffix)
    else
        return regionMatchesImpl(length - suffix.length, suffix, 0, suffix.length, ignoreCase)
}

Returns the longest string `prefix` such that this char sequence and [other] char sequence both start with this prefix, taking care not to split surrogate pairs. If this and [other] have no common prefix, returns the empty string.
@param ignoreCase `true` to ignore character case when matching a character. By default `false`.
@sample samples.text.Strings.commonPrefixWith
public fun CharSequence.commonPrefixWith(other: CharSequence, ignoreCase: Boolean = false): String {
    val shortestLength = minOf(this.length, other.length)
    var i = 0
    while (i < shortestLength && this[i].equals(other[i], ignoreCase = ignoreCase))
        i++
    if (this.hasSurrogatePairAt(i - 1) || other.hasSurrogatePairAt(i - 1))
        i--
    return subSequence(0, i).toString()
}

Returns the longest string `suffix` such that this char sequence and [other] char sequence both end with this suffix, taking care not to split surrogate pairs. If this and [other] have no common suffix, returns the empty string.
@param ignoreCase `true` to ignore character case when matching a character. By default `false`.
@sample samples.text.Strings.commonSuffixWith
public fun CharSequence.commonSuffixWith(other: CharSequence, ignoreCase: Boolean = false): String {
    val thisLength = this.length
    val otherLength = other.length
    val shortestLength = minOf(thisLength, otherLength)
    var i = 0
    while (i < shortestLength && this[thisLength - i - 1].equals(other[otherLength - i - 1], ignoreCase = ignoreCase))
        i++
    if (this.hasSurrogatePairAt(thisLength - i - 1) || other.hasSurrogatePairAt(otherLength - i - 1))
        i--
    return subSequence(thisLength - i, thisLength).toString()
}

Finds the index of the first occurrence of any of the specified [chars] in this char sequence, starting from the specified [startIndex] and optionally ignoring the case.
@param ignoreCase `true` to ignore character case when matching a character. By default `false`.
@return An index of the first occurrence of matched character from [chars] or -1 if none of [chars] are found.
public fun CharSequence.indexOfAny(chars: CharArray, startIndex: Int = 0, ignoreCase: Boolean = false): Int {
    if (!ignoreCase && chars.size == 1 && this is String)
        val char = chars.single()

samples.collections.Iterables.Operations.zipIterableWithTransform

*\/n@SinceKotlin("1.3")n@ExperimentalUnsignedTypesn@kotlin.internal.InlineOnlynpublic inline fun <V>
UByteArray.zip(other: UByteArray, transform: (a: UByte, b: UByte) -> V): List<V> {
    val size = minOf(size, other.size)
    val list = ArrayList<V>(size)
    for (i in 0 until size) {
        list.add(transform(this[i], other[i]))
    }
    return list
}

Returns a list of values built from the elements of `this` array and the [other] array with the same index
using the provided [transform] function applied to each pair of elements.
The returned list has length of the shortest array.

@sample
samples.collections.Iterables.Operations.zipIterableWithTransform

*\/n@SinceKotlin("1.3")n@ExperimentalUnsignedTypesn@kotlin.internal.InlineOnlynpublic inline fun <V>
UShortArray.zip(other: UShortArray, transform: (a: UShort, b: UShort) -> V): List<V> {
    val size = minOf(size, other.size)
    val list = ArrayList<V>(size)
    for (i in 0 until size) {
        list.add(transform(this[i], other[i]))
    }
    return list
}

Returns the sum of all elements in the array.

```

 * Contains the list of possible annotation's retentions.
 * Determines how an annotation is stored in binary output.
 * \npublic enum class AnnotationRetention {
 *     /**
 *     Annotation isn't stored in binary output
 *     \n SOURCE,
 *     /** Annotation is stored in binary output, but invisible
 *     for reflection
 *     \n BINARY,
 *     /** Annotation is stored in binary output and visible for reflection (default
 *     retention)
 *     \n RUNTIME
 * }
 * This meta-annotation indicates the kinds of code elements which are
 * possible targets of an annotation.
 * If the target meta-annotation is not present on an annotation declaration,
 * the annotation is applicable to the following elements: [CLASS], [PROPERTY], [FIELD],
 * [LOCAL_VARIABLE], [VALUE_PARAMETER], [CONSTRUCTOR], [FUNCTION], [PROPERTY_GETTER],
 * [PROPERTY_SETTER].
 * @property allowedTargets list of allowed annotation targets
 * \n@Target(AnnotationTarget.ANNOTATION_CLASS)\n@MustBeDocumented\npublic annotation class
 * Target(vararg val allowedTargets: AnnotationTarget)
 * This meta-annotation determines whether an
 * annotation is stored in binary output and visible for reflection. By default, both are true.
 * @property value
 * necessary annotation retention (RUNTIME, BINARY or SOURCE)
 * \n@Target(AnnotationTarget.ANNOTATION_CLASS)\npublic annotation class Retention(val value:
 * AnnotationRetention = AnnotationRetention.RUNTIME)
 * This meta-annotation determines that an
 * annotation is applicable twice or more on a single code element
 * \n@Target(AnnotationTarget.ANNOTATION_CLASS)\npublic annotation class Repeatable
 * This
 * meta-annotation determines that an annotation is a part of public API and therefore should be included in the
 * generated documentation for the element to which the annotation is applied.
 * \n@Target(AnnotationTarget.ANNOTATION_CLASS)\npublic annotation class MustBeDocumented
