package kotlin.coroutines.intrinsics
import kotlin.coroutines.*
import kotlin.internal.InlineOnly

```

Starts an unintercepted coroutine without a receiver and with result type [T] and executes it until its first suspension. Returns the result of the coroutine or throws its exception if it does not suspend or [COROUTINE\_SUSPENDED] if it suspends. In the latter case, the [completion] continuation is invoked when the coroutine completes with a result or an exception. The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

```

@SinceKotlin("1.3")@InlineOnly
public actual inline fun <T> (suspend () ->
T).startCoroutineUninterceptedOrReturn(
    completion: Continuation<T>): Any? =
this.asDynamic()(completion, false)

```

Starts an unintercepted coroutine with receiver type [R] and result type [T] and executes it until its first suspension. Returns the result of the coroutine or throws its exception if it does not suspend or [COROUTINE\_SUSPENDED] if it suspends. In the latter case, the [completion] continuation is invoked when the coroutine completes with a result or an exception. The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

```

@SinceKotlin("1.3")@InlineOnly
public actual inline fun <R, T> (suspend R.() ->
T).startCoroutineUninterceptedOrReturn(
    receiver: R,
    completion: Continuation<T>): Any? =
this.asDynamic()(receiver, completion, false)

```

```

@InlineOnly
internal actual inline fun <R, P, T> (suspend R.(P) -
> T).startCoroutineUninterceptedOrReturn(
    receiver: R,
    param: P,
    completion: Continuation<T>):
Any? = this.asDynamic()(receiver, param, completion, false)

```

Creates unintercepted coroutine without receiver and with result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor]. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or

PROPERTY)\ninternal annotation class library(public val name: String = "\\")\n\n@Target(CLASS)\ninternal annotation class marker\n\n/\*\*\n \* Gives a declaration (a function, a property or a class) specific name in JavaScript.\n \*\n \* This may be useful in the following cases:\n \*\n \* \* There are two functions for which the compiler gives same name in JavaScript, you can mark one with `@JsName(...)` to prevent the compiler from reporting error.\n \*\n \* \* You are writing a JavaScript library in Kotlin. The compiler produces mangled names for functions with parameters, which is unnatural for usual JavaScript developer.\n \*\n \* You can put `@JsName(...)` on functions you want to be available from JavaScript.\n \*\n \* \* For some reason you want to rename declaration, e.g. there's common term in JavaScript for a concept provided by the declaration, which is uncommon in Kotlin.\n \*\n \* Example:\n \*\n \* ``` kotlin\n \* class Person(val name: String) {\n \* fun hello() {\n \* println("Hello \$name!")\n \* }\n \* @JsName("helloWithGreeting")\n \* fun hello(greeting: String) {\n \* println("\$greeting \$name!")\n \* }\n \* }\n \* ```\n \*\n \* @property name the name which compiler uses both for declaration itself and for all references to the declaration.\n \*\n \* It's required to denote a valid JavaScript identifier.\n \*\n \* \n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, FUNCTION, PROPERTY, CONSTRUCTOR, PROPERTY\_GETTER, PROPERTY\_SETTER)\npublic actual annotation class JsName(actual val name: String)\n\n/\*\*\n \* Denotes an `external` declaration that must be imported from native JavaScript library.\n \*\n \* The compiler produces the code relevant for the target module system, for example, in case of CommonJS,\n \*\n \* it will import the declaration via the `require(...)` function.\n \*\n \* The annotation can be used on top-level external declarations (classes, properties, functions) and files.\n \*\n \* In case of file (which can't be `external`) the following rule applies: all the declarations in the file must be `external`. By applying `@JsModule(...)` on a file you tell the compiler to import a JavaScript object that contain all the declarations from the file.\n \*\n \* Example:\n \*\n \* ``` kotlin\n \* @JsModule("jquery")\n \* external abstract class JQuery() {\n \* // some declarations here\n \* }\n \* @JsModule("jquery")\n \* external fun JQuery(element: Element): JQuery\n \* ```\n \*\n \* @property import name of a module to import declaration from.\n \*\n \* It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module system.\n \*\n \* @see JsNonModule\n \*\n \* \n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, PROPERTY, FUNCTION, FILE)\npublic annotation class JsModule(val import: String)\n\n/\*\*\n \* Denotes an `external` declaration that can be used without module system.\n \*\n \* By default, an `external` declaration is available regardless your target module system.\n \*\n \* However, by applying [JsModule] annotation you can make a declaration unavailable to \*plain\* module system.\n \*\n \* Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available as an npm package.\n \*\n \* To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.\n \*\n \* For example:\n \*\n \* ``` kotlin\n \* @JsModule("jquery")\n \* @JsNonModule\n \* @JsName("\$")\n \* external abstract class JQuery() {\n \* // some declarations here\n \* }\n \*\n \* @JsModule("jquery")\n \* @JsNonModule\n \* @JsName("\$")\n \* external fun JQuery(element: Element): JQuery\n \* ```\n \*\n \* @see JsModule\n \*\n \* \n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, PROPERTY, FUNCTION, FILE)\npublic annotation class JsNonModule\n\n/\*\*\n \* Adds prefix to `external` declarations in a source file.\n \*\n \* JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects.\n \*\n \* The compiler turns references to `external` declarations either to plain unprefix names (in case of \*plain\* modules)\n \*\n \* or to plain imports.\n \*\n \* However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this.\n \*\n \* You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)` annotation.\n \*\n \* Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.\n \*\n \* Example:\n \*\n \* ```\n \* @file:JsQualifier("my.jsPackageName")\n \* package some.kotlinPackage\n \*\n \* external fun foo(x: Int)\n \*\n \* external fun bar(): String\n \* ```\n \*\n \* @property value the qualifier to add to the declarations in the generated code.\n \*\n \* It must be a sequence of valid JavaScript identifiers separated by the `.` character.\n \*\n \* Examples of valid qualifiers are: `foo`, `bar.Baz`, `\_\$0.f`.\n \*\n \* @see JsModule\n \*\n \* \n\n@Retention(AnnotationRetention.BINARY)\n@Target(AnnotationTarget.FILE)\npublic annotation class JsQualifier(val value: String)\n\n/\*\*\n \* Exports top-level declaration on JS platform.\n \*\n \* Compiled module exposes declarations that are marked with this annotation without name mangling.\n \*\n \* This annotation can be

applied to either files or top-level declarations.\n \* It is currently prohibited to export the following kinds of declarations:\n \* `expect` declarations\n \* inline functions with reified type parameters\n \* suspend functions\n \* secondary constructors without `@JsName`\n \* extension properties\n \* enum classes\n \* annotation classes\n \* Signatures of exported declarations must only contain \"exportable\" types:\n \* `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`\n \* `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`\n \* `Array<exportable-type>`\n \* Function types with exportable parameters and return types\n \* `external` or `@JsExport` classes and interfaces\n \* Nullable counterparts of types above\n \* Unit return type. Must not be nullable\n \* This annotation is experimental, meaning that restrictions mentioned above are subject to change.\n

 * Hash table based
implementation of the [MutableMap] interface, which additionally preserves the insertion order
of entries during
the iteration.
The insertion order is preserved by maintaining a doubly-linked list of all of its entries.
public actual open class LinkedHashMap<K, V> : HashMap<K, V>, MutableMap<K, V> {
 * The

```

```

entry we use includes next/prev pointers for a doubly-linked circular
 * list with a head node. This reduces the
special cases we have to deal with
 * in the list operations.
 * Note that we duplicate the key from the
underlying hash map so we can find
 * the eldest entry. The alternative would have been to modify HashMap so
more
 * of the code was directly usable here, but this would have added some
 * overhead to HashMap, or to
reimplement most of the HashMap code here with
 * small modifications. Paying a small storage cost only if
you use
 * LinkedHashMap and minimizing code size seemed like a better tradeoff
 *

kotlin.collections\n\n/**\n * Represents a source of elements with a [keyOf] function, which can be applied to each\n
element to get its key.\n *\n * A [Grouping] structure serves as an intermediate step in group-and-fold operations:\n
*\n * they group elements by their keys and then fold each group with some aggregating operation.\n *\n * It is created\n
by attaching `keySelector: (T) -> K` function to a source of elements.\n * To get an instance of [Grouping] use one\n
of `groupingBy` extension functions:\n * - [Iterable.groupingBy]\n * - [Sequence.groupingBy]\n * -\n
[Array.groupingBy]\n * - [CharSequence.groupingBy]\n *\n * For the list of group-and-fold operations available,\n
see the [extension functions](#extension-functions) for `Grouping`.\n *\n@SinceKotlin("1.1")\npublic interface\n
Grouping<T, out K> {\n    /** Returns an [Iterator] over the elements of the source of this grouping. *\n    fun\n
sourceIterator(): Iterator<T>\n    /** Extracts the key of an [element]. *\n    fun keyOf(element: T): K\n}\n\n/**\n *\n * Groups elements from the [Grouping] source by key and applies [operation] to the elements of each group\n
sequentially,\n * passing the previously accumulated value and the current element as arguments, and stores the\n
results in a new map.\n *\n * The key for each element is provided by the [Grouping.keyOf] function.\n *\n *\n
@param operation function is invoked on each element with the following parameters:\n * - `key`: the key of the\n
group this element belongs to;\n * - `accumulator`: the current value of the accumulator of the group, can be `null`\n
if it's the first `element` encountered in the group;\n * - `element`: the element from the source being aggregated;\n
*\n * - `first`: indicates whether it's the first `element` encountered in the group.\n *\n * @return a [Map] associating\n
the key of each group with the result of aggregation of the group elements.\n * @sample\n

correspond\n * to the rectangular coordinates `(x, y)` by computing the arc tangent of the value [y] / [x];\n * the
returned value is an angle in the range from `-PI` to `PI` radians.\n *^n * Special cases:\n * - `atan2(0.0, 0.0)` is
`0.0`\n * - `atan2(0.0, x)` is `0.0` for `x > 0` and `PI` for `x < 0`\n * - `atan2(-0.0, x)` is `-0.0` for `x > 0` and `-PI`

```

for  $x < 0$  `atan2(y, +Inf)` is `0.0` for  $0 < y < +Inf$  and `-0.0` for  $-Inf < y < 0$  `atan2(y, -Inf)` is `PI` for  $0 < y < +Inf$  and `-PI` for  $-Inf < y < 0$  `atan2(y, 0.0)` is `PI/2` for  $y > 0$  and `-PI/2` for  $y < 0$  `atan2(+Inf, x)` is `PI/2` for finite  $x$  `atan2(-Inf, x)` is `-PI/2` for finite  $x$  `atan2(NaN, x)` and `atan2(y, NaN)` is `NaN`

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun atan2(y: Float, x: Float): Float = nativeMath.atan2(y.toDouble(), x.toDouble()).toFloat()

```

Computes the hyperbolic sine of the value  $[x]$ .

Special cases:

- `sinh(NaN)` is `NaN`
- `sinh(+Inf)` is `+Inf`
- `sinh(-Inf)` is `-Inf`

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun sinh(x: Float): Float = nativeMath.sinh(x.toDouble()).toFloat()

```

Computes the hyperbolic cosine of the value  $[x]$ .

Special cases:

- `cosh(NaN)` is `NaN`
- `cosh(+Inf|-Inf)` is `+Inf`

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun cosh(x: Float): Float = nativeMath.cosh(x.toDouble()).toFloat()

```

Computes the hyperbolic tangent of the value  $[x]$ .

Special cases:

- `tanh(NaN)` is `NaN`
- `tanh(+Inf)` is `1.0`
- `tanh(-Inf)` is `-1.0`

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun tanh(x: Float): Float = nativeMath.tanh(x.toDouble()).toFloat()

```

Computes the inverse hyperbolic sine of the value  $[x]$ .

The returned value is  $y$  such that  $\sinh(y) == x$ .

Special cases:

- `asinh(NaN)` is `NaN`
- `asinh(+Inf)` is `+Inf`
- `asinh(-Inf)` is `-Inf`

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun asinh(x: Float): Float = nativeMath.asinh(x.toDouble()).toFloat()

```

Computes the inverse hyperbolic cosine of the value  $[x]$ .

The returned value is positive  $y$  such that  $\cosh(y) == x$ .

Special cases:

- `acosh(NaN)` is `NaN`
- `acosh(x)` is `NaN` when  $x < 1$
- `acosh(+Inf)` is `+Inf`

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun acosh(x: Float): Float = nativeMath.acosh(x.toDouble()).toFloat()

```

Computes the inverse hyperbolic tangent of the value  $[x]$ .

The returned value is  $y$  such that  $\tanh(y) == x$ .

Special cases:

- `atanh(NaN)` is `NaN`
- `atanh(x)` is `NaN` when  $x > 1$  or  $x < -1$
- `atanh(1.0)` is `+Inf`
- `atanh(-1.0)` is `-Inf`

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun atanh(x: Float): Float = nativeMath.atanh(x.toDouble()).toFloat()

```

Computes  $\sqrt{x^2 + y^2}$  without intermediate overflow or underflow.

Special cases:

- returns `+Inf` if any of arguments is infinite
- returns `NaN` if any of arguments is `NaN` and the other is not infinite

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun hypot(x: Float, y: Float): Float = nativeMath.hypot(x.toDouble(), y.toDouble()).toFloat()

```

Computes the positive square root of the value  $[x]$ .

Special cases:

- `sqrt(x)` is `NaN` when  $x < 0$  or  $x$  is `NaN`

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun sqrt(x: Float): Float = nativeMath.sqrt(x.toDouble()).toFloat()

```

Computes Euler's number  $e$  raised to the power of the value  $[x]$ .

Special cases:

- `exp(NaN)` is `NaN`
- `exp(+Inf)` is `+Inf`
- `exp(-Inf)` is `0.0`

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun exp(x: Float): Float = nativeMath.exp(x.toDouble()).toFloat()

```

Computes  $\exp(x) - 1$ .

This function can be implemented to produce more precise result for  $[x]$  near zero.

Special cases:

- `expm1(NaN)` is `NaN`
- `expm1(+Inf)` is `+Inf`
- `expm1(-Inf)` is `-1.0`

@see [exp] function.

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun expm1(x: Float): Float = nativeMath.expm1(x.toDouble()).toFloat()

```

Computes the logarithm of the value  $[x]$  to the given [base].

Special cases:

- `log(x, b)` is `NaN` if either  $x$  or  $b$  are `NaN`
- `log(x, b)` is `NaN` when  $x < 0$  or  $b <= 0$  or  $b == 1.0$
- `log(+Inf, +Inf)` is `NaN`
- `log(+Inf, b)` is `+Inf` for  $b > 1$  and `-Inf` for  $b < 1$
- `log(0.0, b)` is `-Inf` for  $b > 1$  and `+Inf` for  $b > 1$

See also logarithm functions for common fixed bases: [ln], [log10] and [log2].

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun log(x: Float, base: Float): Float = log(x.toDouble(), base.toDouble()).toFloat()

```

Computes the natural logarithm (base  $E$ ) of the value  $[x]$ .

Special cases:

- `ln(NaN)` is `NaN`
- `ln(x)` is `NaN` when  $x < 0$
- `ln(+Inf)` is `+Inf`
- `ln(0.0)` is `-Inf`

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun ln(x: Float): Float = nativeMath.log(x.toDouble()).toFloat()

```

Computes the common logarithm (base 10) of the value  $[x]$ .

@see [ln] function for special cases.

```

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun log10(x: Float): Float = nativeMath.log10(x.toDouble()).toFloat()

```

Computes the binary

logarithm (base 2) of the value [x].  
`@see [ln] function for special cases.`

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun log2(x: Float): Float =
nativeMath.log2(x.toDouble()).toFloat()

```

Computes  $\ln(a + 1)$ .  
This function can be implemented to produce more precise result for [x] near zero.  
Special cases:  
 $\ln(\text{NaN})$  is  $\text{NaN}$   
 $\ln(x)$  is  $\text{NaN}$  where  $x < -1.0$   
 $\ln(-1.0)$  is  $-\text{Inf}$   
 $\ln(+\text{Inf})$  is  $+\text{Inf}$   
`@see [ln] function`  
`@see [expm1] function`

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun ln1p(x: Float): Float =
nativeMath.log1p(x.toDouble()).toFloat()

```

Rounds the given value [x] to an integer towards positive infinity.  
`@return` the smallest Float value that is greater than or equal to the given value [x] and is a mathematical integer.  
Special cases:  
 $\text{ceil}(x)$  is  $x$  where  $x$  is  $\text{NaN}$  or  $+\text{Inf}$  or  $-\text{Inf}$  or already a mathematical integer.

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun ceil(x: Float): Float =
nativeMath.ceil(x.toDouble()).toFloat()

```

Rounds the given value [x] to an integer towards negative infinity.  
`@return` the largest Float value that is smaller than or equal to the given value [x] and is a mathematical integer.  
Special cases:  
 $\text{floor}(x)$  is  $x$  where  $x$  is  $\text{NaN}$  or  $+\text{Inf}$  or  $-\text{Inf}$  or already a mathematical integer.

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun floor(x: Float): Float =
nativeMath.floor(x.toDouble()).toFloat()

```

Rounds the given value [x] to an integer towards zero.  
`@return` the value [x] having its fractional part truncated.  
Special cases:  
 $\text{truncate}(x)$  is  $x$  where  $x$  is  $\text{NaN}$  or  $+\text{Inf}$  or  $-\text{Inf}$  or already a mathematical integer.

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun truncate(x: Float): Float =
truncate(x.toDouble()).toFloat()

```

Rounds the given value [x] towards the closest integer with ties rounded towards even integer.  
Special cases:  
 $\text{round}(x)$  is  $x$  where  $x$  is  $\text{NaN}$  or  $+\text{Inf}$  or  $-\text{Inf}$  or already a mathematical integer.

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun round(x: Float): Float =
round(x.toDouble()).toFloat()

```

Returns the absolute value of the given value [x].  
Special cases:  
 $\text{abs}(\text{NaN})$  is  $\text{NaN}$   
`@see` `absoluteValue` extension property for [Float]

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun abs(x: Float): Float =
nativeMath.abs(x.toDouble()).toFloat()

```

Returns the sign of the given value [x]:  
 $-1.0$  if the value is negative,  
zero if the value is zero,  
 $1.0$  if the value is positive  
Special case:  
 $\text{sign}(\text{NaN})$  is  $\text{NaN}$ 

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun sign(x: Float): Float =
nativeMath.sign(x.toDouble()).toFloat()

```

Returns the smaller of two values.  
If either value is  $\text{NaN}$ , then the result is  $\text{NaN}$ .

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun min(a: Float, b: Float): Float =
nativeMath.min(a, b)

```

Returns the greater of two values.  
If either value is  $\text{NaN}$ , then the result is  $\text{NaN}$ .

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun max(a: Float, b: Float): Float =
nativeMath.max(a, b)

```

extensions

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun Float.pow(x: Float): Float =
nativeMath.pow(this.toDouble(), x.toDouble()).toFloat()

```

Raises this value to the power [x].  
Special cases:  
 $b.\text{pow}(0.0)$  is  $1.0$   
 $b.\text{pow}(1.0) == b$   
 $b.\text{pow}(\text{NaN})$  is  $\text{NaN}$   
 $\text{NaN}.\text{pow}(x)$  is  $\text{NaN}$  for  $x \neq 0.0$   
 $b.\text{pow}(\text{Inf})$  is  $\text{NaN}$  for  $\text{abs}(b) == 1.0$   
 $b.\text{pow}(x)$  is  $\text{NaN}$  for  $b < 0$  and  $x$  is finite and not an integer

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun Float.pow(n: Int): Float =
nativeMath.pow(this.toDouble(), n.toDouble()).toFloat()

```

Raises this value to the integer power [n].  
See the other overload of [pow] for details.

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun Float.absoluteValue: Float get() =
nativeMath.abs(this.toDouble()).toFloat()

```

Returns the sign of this value:  
 $-1.0$  if the value is negative,  
zero if the value is zero,  
 $1.0$  if the value is positive  
Special case:  
 $\text{NaN}.\text{sign}$  is  $\text{NaN}$ 

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun Float.sign: Float get() =
nativeMath.sign(this.toDouble()).toFloat()

```

Returns this value with the sign bit same as of the [sign] value.  
If [sign] is  $\text{NaN}$  the sign of the result is undefined.

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun Float.withSign(sign: Float): Float =
this.toDouble().withSign(sign.toDouble()).toFloat()

```

Returns this value with the sign bit same as of the [sign] value.

```

*^@SinceKotlin("1.2")^@InlineOnly^public actual inline fun Float.withSign(sign: Int): Float =

```

```

}

```

\* Represents the results from a single capturing group within a [MatchResult] of [Regex].

```

@param value The value of captured group.
public actual data class MatchGroup(actual val value:
String)

```

\* Represents a compiled regular expression.

\* Provides functions to match strings in text with a pattern, replace the found occurrences and split text around matches.

\* For pattern syntax reference see [MDN RegExp]([https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global\\_Objects/RegExp#Special\\_characters\\_meaning\\_in\\_regular\\_expressions](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/RegExp#Special_characters_meaning_in_regular_expressions))

\* and

[[http://www.w3schools.com/jsref/jsref\\_obj\\_regexp.asp](http://www.w3schools.com/jsref/jsref_obj_regexp.asp)]([https://www.w3schools.com/jsref/jsref\\_obj\\_regexp.asp](https://www.w3schools.com/jsref/jsref_obj_regexp.asp)).

\* Note that `RegExp` objects under the hood are constructed with [the `u` flag]([https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global\\_Objects/RegExp/unicode](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/RegExp/unicode)) that enables Unicode-related features in regular expressions. This also makes the pattern syntax more strict, for example, prohibiting unnecessary escape sequences.

```

/**
 * Allows to infer generic type arguments of a function from the calls in the annotated function parameter of that function.
 * When this annotation is placed on a generic function parameter of a function, it enables to infer the type arguments of that generic function from the lambda body passed to that parameter.
 * The calls that affect inference are either members of the receiver type of an annotated function parameter or extensions for that type. The extensions must be themselves annotated with @BuilderInference.
 * Example: we declare
 * ```
 * fun <T> sequence(@BuilderInference block: suspend SequenceScope<T>().-> Unit): Sequence<T>
 * ```
 * and use it like
 * ```
 * val result = sequence {
 *   yield("result")
 * }
 * ```
 * Here the type argument of the resulting sequence is inferred to `String` from the argument of the [SequenceScope.yield] function, that is called inside the lambda passed to [sequence].
 * Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.

/**
 * Enables overload selection based on the type of the value returned from lambda argument.
 * When two or more function overloads have otherwise the same parameter lists that differ only in the return type of a functional parameter, this annotation enables overload selection by the type of the value returned from the lambda function passed to this functional parameter.
 * Example:
 * ```
 * @OverloadResolutionByLambdaReturnType
 * fun create(intProducer: () -> Int): Int
 * fun create(doubleProducer: () -> Double): Double
 * val newValue = create { 3.14 }
 * ```
 * The annotation being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned from the lambda function.
 * This annotation is also used to discriminate the annotated overloads in case if overload selection still cannot choose one of them even taking in account the result of lambda parameter analysis. In that case a warning is reported.
 * Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.

```

This annotation marks the experimental preview of the standard library API for measuring time and working with durations.

Note that this API is in a preview state and has a very high chance of being changed in the future. Do not use it if you develop a library since your library will become binary incompatible with the future versions of the standard library. Any usage of a declaration annotated with `@ExperimentalTime` must be accepted either by annotating that usage with the `[OptIn]` annotation, e.g. `@OptIn(ExperimentalTime::class)`, or by using the compiler argument `-opt-in=kotlin.time.ExperimentalTime`.

`@RequiresOptIn(level = RequiresOptIn.Level.ERROR)`

`@MustBeDocumented`

`@Retention(AnnotationRetention.BINARY)`

`@Target(Class::class, Annotation::class, Property::class, Field::class, LocalVariable::class, ValueParameter::class, Constructor::class, Function::class, PropertyGetter::class, PropertySetter::class, TypeAlias::class)`

Since Kotlin 1.3

public annotation class ExperimentalTime {

Copyright 2010-2020 JetBrains s.r.o. and Kotlin Programming Language contributors. Use of this source code is governed by the Apache 2.0 license that can be found in the license/LICENSE.txt file.

A source of time for measuring time intervals.

The only operation provided by the time source is `markNow`. It returns a `TimeMark`, which can be used to query the elapsed time later. @see `measureTime` @see `measureTimedValue`

Since Kotlin 1.3

@ExperimentalTime

public interface TimeSource {

Marks a point in time on this time source.

The returned `TimeMark` instance encapsulates the captured time point and allows querying the duration of time interval `[elapsed]` `TimeMark.elapsedNow` from that point.

public fun markNow(): TimeMark

The most precise time source available in the platform.

This time source returns its readings from a source of monotonic time when it is available in a target platform, and resorts to a non-monotonic time source otherwise.

public object Monotonic : TimeSource by MonotonicTimeSource {

override fun toString(): String = MonotonicTimeSource.toString()

public companion object {

Represents a time point notched on a particular `TimeSource`. Remains bound to the time source it was taken from and allows querying for the duration of time elapsed from that point (see the function `elapsedNow`).

Since Kotlin 1.3

@ExperimentalTime

public abstract class TimeMark {

Returns the amount of time passed from this mark measured with the time source from which this mark was taken.

Note that the value returned by this function can change on subsequent invocations.

public abstract fun elapsedNow(): Duration

Returns a time mark on the same time source that is ahead of this time mark by the specified `[duration]`.

The returned time mark is more `_late_` when the `[duration]` is positive, and more `_early_` when the `[duration]` is negative.

public open operator fun plus(duration: Duration): TimeMark = AdjustedTimeMark(this, duration)

Returns a time mark on the same time source that is behind this time mark by the specified `[duration]`.

The returned time mark is more `_early_` when the `[duration]` is positive, and more `_late_` when the `[duration]` is negative.

public open operator fun minus(duration: Duration): TimeMark = plus(-duration)

Returns true if this time mark has passed according to the time source from which this mark was taken.

Note that the value returned by this function can change on subsequent invocations.

If the time source is monotonic, it can change only from `false` to `true`, namely, when the time mark becomes behind the current point of the time source.

public fun hasPassedNow(): Boolean = !elapsedNow().isNegative()

Returns false if this time mark has not passed according to the time source from which this mark was taken.

Note that the value returned by this function can change on subsequent invocations.

If the time source is monotonic, it can change only from `true` to `false`, namely, when the time mark becomes behind the current point of the time source.

public fun hasNotPassedNow(): Boolean = elapsedNow().isNegative()

Since Kotlin 1.3

deep recursive function that keeps its stack on the\n heap,\n * which allows very deep recursive computations that do not use the actual call stack.\n * To initiate a call to\n this deep recursive function use its [invoke] function.\n * As a rule of thumb, it should be used if recursion goes\n deeper than a thousand calls.\n *\n * The [DeepRecursiveFunction] takes one parameter of type [T] and returns a\n result of type [R].\n * The [block] of code defines the body of a recursive function. In this block\n * [callRecursive][DeepRecursiveScope.callRecursive] function can be used to make a recursive call\n * to the\n declared function. Other instances of [DeepRecursiveFunction] can be called\n * in this scope with `callRecursive`\n extension, too.\n *\n * For example, take a look at the following recursive tree class and a deeply\n * recursive\n instance of this tree with 100K nodes:\n *\n * ```\n * class Tree(val left: Tree? = null, val right: Tree? = null)\n * val\n    deepTree = generateSequence(Tree()) { Tree(it) }.take(100_000).last()\n * ```\n *\n * A regular recursive function\n can be defined to compute a depth of a tree:\n *\n * ```\n * fun depth(t: Tree?): Int =\n    if (t == null) 0 else\n    max(depth(t.left), depth(t.right)) + 1\n * println(depth(deepTree)) // StackOverflowError\n * ```\n *\n * If this\n `depth` function is called for a `deepTree` it produces [StackOverflowError] because of deep recursion.\n *\n * However, the `depth` function can be rewritten using `DeepRecursiveFunction` in the following way, and then\n * it\n successfully computes [depth(deepTree)][DeepRecursiveFunction.invoke] expression:\n *\n * ```\n * val depth =\n    DeepRecursiveFunction<Tree?, Int> { t ->\n        if (t == null) 0 else max(callRecursive(t.left),\n callRecursive(t.right)) + 1\n    }\n * println(depth(deepTree)) // Ok\n * ```\n *\n * Deep recursive functions can also

```

mutually call each other using a heap for the stack via `callRecursive` [DeepRecursiveScope.callRecursive] extension. For example, the following pair of mutually recursive functions computes the number of tree nodes at even depth in the tree.

```

val mutualRecursion = object {
    val even: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->
        if (t == null) 0 else
        odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1
    }
    val odd: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->
        if (t == null) 0 else even.callRecursive(t.left) +
        even.callRecursive(t.right)
    }
}

```

the function parameter type. `@param [T]` the function parameter type. `@param [R]` the function result type. `@param block` the function body.

```

@SinceKotlin("1.4")
@ExperimentalStdlibApi
public class DeepRecursiveFunction<T, R> {
    internal val block: suspend DeepRecursiveScope<T, R>.(T) -> R
}

```

Initiates a call to this deep recursive function, forming a root of the call tree. This operator should not be used from inside of `DeepRecursiveScope` as it uses the call stack slot for initial recursive invocation. From inside of `DeepRecursiveScope` use `callRecursive` [DeepRecursiveScope.callRecursive].

```

@SinceKotlin("1.4")
@ExperimentalStdlibApi
public operator fun <T, R> DeepRecursiveFunction<T, R>.invoke(value: T): R =
    DeepRecursiveScopeImpl<T, R>(block, value).runCallLoop()

```

A scope class for `DeepRecursiveFunction` function declaration that defines `callRecursive` methods to recursively call this function or another `DeepRecursiveFunction` putting the call activation frame on the heap.

```

@RestrictsSuspension
@SinceKotlin("1.4")
@ExperimentalStdlibApi

 \*/

`public expect fun hypot(x: Double, y: Double): Double` \* Computes the positive square root of the value [x]. \* Special cases: `sqrt(x)` is `NaN` when `x < 0` or `x` is `NaN`

`public expect fun sqrt(x: Double): Double` \* Computes Euler's number `e` raised to the power of the value [x]. \* Special cases: `exp(NaN)` is `NaN` \* `exp(+Inf)` is `+Inf` \* `exp(-Inf)` is `0.0`

`public expect fun exp(x: Double): Double` \* Computes `exp(x) - 1`. \* This function can be implemented to produce more precise result for [x] near zero. \* Special cases: `expm1(NaN)` is `NaN` \* `expm1(+Inf)` is `+Inf` \* `expm1(-Inf)` is `-1.0` \* @see [exp] function.

`public expect fun expm1(x: Double): Double` \* Computes the logarithm of the value [x] to the given [base]. \* Special cases: `log(x, b)` is `NaN` if either `x` or `b` are `NaN` \* `log(x, b)` is `NaN` when `x < 0` or `b <= 0` or `b == 1.0` \* `log(+Inf, +Inf)` is `NaN` \* `log(+Inf, b)` is `+Inf` for `b > 1` and `-Inf` for `b < 1` \* `log(0.0, b)` is `-Inf` for `b > 1` and `+Inf` for `b < 1` \* See also logarithm functions for common fixed bases: [ln], [log10] and [log2].

`public expect fun log(x: Double, base: Double): Double` \* Computes the natural logarithm (base `E`) of the value [x]. \* Special cases: `ln(NaN)` is `NaN` \* `ln(x)` is `NaN` when `x < 0.0` \* `ln(+Inf)` is `+Inf` \* `ln(0.0)` is `-Inf`

`public expect fun ln(x: Double): Double` \* Computes the common logarithm (base 10) of the value [x]. \* @see [ln] function for special cases.

`public expect fun log10(x: Double): Double` \* Computes the binary logarithm (base 2) of the value [x]. \* @see [ln] function for special cases.

`public expect fun log2(x: Double): Double` \* Computes `ln(x + 1)`. \* This function can be implemented to produce more precise result for [x] near zero. \* Special cases: `ln1p(NaN)` is `NaN` \* `ln1p(x)` is `NaN` where `x < -1.0` \* `ln1p(-1.0)` is `-Inf` \* `ln1p(+Inf)` is `+Inf` \* @see [ln] function \* @see [expm1] function

`public expect fun ln1p(x: Double): Double` \* Rounds the given value [x] to an integer towards positive infinity. \* @return the smallest double value that is greater than or equal to the given value [x] and is a mathematical integer. \* Special cases: `ceil(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.

`public expect fun ceil(x: Double): Double` \* Rounds the given value [x] to an integer towards negative infinity. \* @return the largest double value that is smaller than or equal to the given value [x] and is a mathematical integer. \* Special cases: `floor(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.

`public expect fun floor(x: Double): Double` \* Rounds the given value [x] to an integer towards zero. \* @return the value [x] having its fractional part truncated. \* Special cases: `truncate(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.

`public expect fun truncate(x: Double): Double` \* Rounds the given value [x] towards the closest integer with ties rounded towards even integer. \* Special cases: `round(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.

`public expect fun round(x: Double): Double` \* Returns the absolute value of the given value [x]. \* Special cases: `abs(NaN)` is `NaN` \* @see absoluteValue extension property for [Double]

`public expect fun abs(x: Double): Double` \* Returns the sign of the given value [x]: `-1.0` if the value is negative, `0.0` if the value is zero, `1.0` if the value is positive \* Special case: `sign(NaN)` is `NaN`

`public expect fun sign(x: Double): Double` \* Returns the smaller of two values. \* If either value is `NaN`, then the result is `NaN`.

`public expect fun min(a: Double, b: Double): Double` \* Returns the greater of two values. \* If either value is `NaN`, then the result is `NaN`.

`public expect fun max(a: Double, b: Double): Double` // extensions

`Double.pow(x: Double): Double` \* Raises this value to the power [x]. \* Special cases: `b.pow(0.0)` is `1.0` \* `b.pow(1.0) == b` \* `b.pow(NaN)` is `NaN` \* `NaN.pow(x)` is `NaN` for `x != 0.0` \* `b.pow(Inf)` is `NaN` for `abs(b) == 1.0` \* `b.pow(x)` is `NaN` for `b < 0` and `x` is finite and not an integer

`Double.pow(x: Double): Double` \* Raises this value to the integer power [n]. \* See the other overload of [pow] for details.

`Double.pow(n: Int): Double`

Double\n/n/\*\*\n \* Returns the absolute value of this value.\n \*\n \* Special cases:\n \* - `NaN.absoluteValue` is `NaN`\n \*\n \* @see abs function\n \*/\n@SinceKotlin("1.2")\npublic expect val Double.absoluteValue: Double\n/n/n/\*\*\n \* Returns the sign of this value:\n \* -
