 * Gives a

 * This may be useful in the
  following cases:
 * * There are two functions for which the compiler gives same name in JavaScript, you
  can
  * mark one with `@JsName(...)` to prevent the compiler from reporting error.
 * * You are writing a
  JavaScript library in Kotlin. The compiler produces mangled names
  * for functions with parameters, which is
  unnatural for usual JavaScript developer.
 * You can put `@JsName(...)` on functions you want to be available
  from JavaScript.
 * * For some reason you want to rename declaration, e.g. there's common term in JavaScript
  * for a concept provided by the declaration, which is uncommon in Kotlin.
 * Example:
 * ```
  kotlin
  * class Person(val name: String) {
  *     fun hello() {
  *         println("Hello $name!")
  *     }
  * }
  * @JsName("helloWithGreeting")
  * fun hello(greeting: String) {
  *     println("$greeting $name!")
  * }
  * }
  * ```
  * @property name the name which compiler uses both for declaration itself and for all
  references to the declaration.
  * It's required to denote a valid JavaScript identifier.

 * Denotes an `external` declaration that must be imported from native JavaScript library.
 * The compiler produces the code relevant for the target module system, for example, in case of CommonJS,
  it
  will import the declaration via the `require(...)` function.
 * The annotation can be used on top-level external
  declarations
  (classes, properties, functions) and files.
 * In case of file (which can't be `external`) the following rule applies: all
  the
  declarations in
  * the file must be `external`. By applying `@JsModule(...)` on a file you tell the compiler to
  import
  a JavaScript object
  * that contain all the declarations from the file.
 * Example:
 * ```
  kotlin
  * @JsModule("jquery")
  * external abstract class JQuery() {
  *     // some declarations here
  * }
  * @JsModule("jquery")
  * external fun JQuery(element: Element): JQuery
  * ```
  * @property import name
  of a module to import declaration from.
  * It is not interpreted by the Kotlin compiler, it's passed as is
  directly to the target module system.
  * @see JsNonModule
