The file exists

because Ivy styling

instruction execution order does not match that of the priority order. The purpose of this code is to create a linked list so that the instructions can be traversed in priority order when computing the styles. Assume we are dealing with the following code:

```
@Component({\n *  template: \n *  <my-cmp [style]=\" \n *  {color: '#001'} \n *  [style.color]=\" #002 \n *  dir-style-color-1 \n *  dir-style-color-2> \n *  })\n *  class ExampleComponent {\n *  static ngComp = ... {\n *  ... \n *  // Compiler ensures that `styleProp` is after `styleMap`\n *  styleMap({color: '#001'});\n *  styleProp('color', '#002');\n *  ... \n *  }\n *  }\n *  @Directive({\n *  selector: `[dir-style-color-1]`,\n *  })\n *  class Style1Directive {\n *  @HostBinding('style') style = {color: '#005'};\n *  @HostBinding('style.color') color = '#006';\n *  static ngDir = ... {\n *  ... \n *  // Compiler ensures that
```

```
`styleProp` is after `styleMap`\n *  styleMap({color: '#005'});\n *  styleProp('color', '#006');\n *  ... \n *  }\n *  }\n *  @Directive({\n *  selector: `[dir-style-color-2]`,\n *  })\n *  class Style2Directive {\n *  @HostBinding('style') style = {color: '#007'};\n *  @HostBinding('style.color') color = '#008';\n *  static ngDir = ... {\n *  ... \n *  // Compiler ensures that `styleProp` is after `styleMap`\n *  styleMap({color: '#007'});\n *  styleProp('color', '#008');\n *  ... \n *  }\n *  }\n *  @Directive({\n *  selector: `my-cmp`,\n *  })\n *  class MyComponent {\n *  @HostBinding('style') style = {color: '#003'};\n *  @HostBinding('style.color') color = '#004';\n *  static ngComp = ... {\n *  ... \n *  // Compiler ensures that `styleProp` is after `styleMap`\n *  styleMap({color: '#003'});\n *  styleProp('color', '#004');\n *  ... \n *  }\n *  }\n *  }\n *  The Order of instruction execution is:
```

```
* NOTE: the comment binding location is for illustrative purposes only.\n * \n * \n * // Template: (ExampleComponent)\n * styleMap({color: '#001'}); // Binding index: 10\n * styleProp('color', '#002'); // Binding index: 12\n * // MyComponent\n * styleMap({color: '#003'}); // Binding index: 20\n * styleProp('color', '#004'); // Binding index: 22\n * // Style1Directive\n * styleMap({color: '#005'}); // Binding index: 24\n * styleProp('color', '#006'); // Binding index: 26\n * // Style2Directive\n * styleMap({color: '#007'}); // Binding index: 28\n * styleProp('color', '#008'); // Binding index: 30\n * \n * \n * The correct priority order of concatenation is:\n * \n * \n * // MyComponent\n * styleMap({color: '#003'}); // Binding index: 20\n * styleProp('color', '#004'); // Binding index: 22\n * // Style1Directive\n * styleMap({color: '#005'}); // Binding index: 24\n * styleProp('color', '#006');
```

```
// Binding index: 26\n * // Style2Directive\n * styleMap({color: '#007'}); // Binding index: 28\n * styleProp('color', '#008'); // Binding index: 30\n * // Template: (ExampleComponent)\n * styleMap({color: '#001'}); // Binding index: 10\n * styleProp('color', '#002'); // Binding index: 12\n * \n * \n * What color should be rendered?\n * \n * \n * Once the items are correctly sorted in the list, the answer is simply the last item in the concatenation list which is `#002`.\n * \n * \n * To do so we keep a linked list of all of the bindings which pertain to this element.\n * \n * Notice that the bindings are inserted in the order of execution, but the `TVView.data` allows us to traverse them in the order of priority.
```

```
* \n * |Idx|TVView.data|LView|Notes\n * |---|-----|-----|\n * ----|-----\n * |... | | |10| null | {color: '#001'}| `styleMap('color', {color: '#001'})`\n * |11| 30 | 12`\n * |... | |12| `color` | `#002` | `styleProp('color', '#002')`\n * |13| 10 | 0` |... | |...| | \n * |20| null | {color: '#003'}| `styleMap('color', {color: '#003'})`\n * |21| 0 | 22` |... | |...| \n * |22| `color` | `#004` | `styleProp('color', '#004')`\n * |23| 20 | 24` |... | |24| null | {color: '#005'}| `styleMap('color', {color: '#005'})`\n * |25| 22 | 26` |... | |26| `color` | `#006` | \n * `styleProp('color', '#006')`\n * |27| 24 | 28` |... | |28| null | {color: '#007'}| `styleMap('color', {color: '#007'})`\n * |29| 26 | 30` |... | |30| `color` | `#008` | `styleProp('color', '#008')`\n * |31| 28 | 10` |... | \n * \n * \n * The above data structure allows us to re-concatenate the styling no matter which data binding changes.\n * \n * NOTE:
```

in addition to keeping track of next/previous index the `TVView.data` also stores prev/next duplicate bit. The duplicate bit if true says there either is a binding with the same name or there is a map (which may contain the name). This information is useful in knowing if other styles with higher priority need to be searched for

```

/**
 * Update a style binding on an element with the provided value.
 * If the style value is falsy then it will be removed from the element
 * (or assigned a different value depending if there are any styles placed
 * on the element with `styleMap` or any static styles that are
 * present from when the element was created with `styling`).
 * Note that the styling element is updated
 */

```

as part of `stylingApply`.  
 @param prop A valid CSS property.  
 @param value New value to write ( `null` or an empty string to remove).  
 @param suffix

Optional suffix. Used with scalar values to add unit such as `px`.  
 Note that this will apply the provided style value to the host element if this function is called within a host binding function.

```

@codeGenApi
export function styleProp(
  prop: string, value: string|number|SafeValue|undefined|null, suffix?:
string|null): typeOf styleProp {
  checkStylingProperty(prop, value, suffix, false);
  return styleProp;
}

```

Update a class binding on an element with the provided value.  
 This instruction is meant to handle the `[class.foo]="exp"` case and, therefore, the class binding itself must already be allocated using `styling` within the creation block.

@param prop A valid CSS class (only one).  
 @param value A true/false value which will turn the class on or off.  
 Note that this will apply the provided class value to the host element if this function is called within a host binding function.

```

@codeGenApi
export function classProp(className: string, value: boolean|undefined|null): typeOf
classProp {
  checkStylingProperty(className, value, null, true);
  return classProp;
}

```

Update style bindings using an object literal on an element.  
 This instruction is meant to apply styling via the `[style]="exp"` template bindings.  
 When styles are applied to the element they will then be updated with respect to any styles/classes set via `styleProp`.  
 If any styles are set to falsy then they will be removed from the element.  
 Note that the styling instruction will not be applied until `stylingApply` is called.

@param styles A key/value style map of the styles that will be applied to the given element.  
 Any missing styles (that have already been applied to the element beforehand) will be removed (unset) from the element's styling.  
 Note that this will apply the provided styleMap value to the host element if this function is called within a host binding function.

```

@codeGenApi
export function styleMap(styles: {[styleName: string]: any}|string|undefined|null): void {
  checkStylingMap(styleKeyValueArraySet, styleStringParser, styles, false);
}

```

Parse text as style and add values to KeyValueArray.  
 This code is pulled out to a separate function so that it can be tree shaken away if it is not needed. It is only referenced from `styleMap`.

@param keyValueArray KeyValueArray to add parsed values to.  
 @param text text to parse.

```

export function styleStringParser(keyValueArray:
KeyValueArray<any>, text: string): void {
  for (let i = parseStyle(text); i >= 0; i = parseStyleNext(text, i)) {
    styleKeyValueArraySet(keyValueArray, getLastParsedKey(text),
    getLastParsedValue(text));
  }
}

```

Update class bindings using an object literal or class-string on an element.  
 This instruction is meant to apply styling via the `[class]="exp"` template bindings.  
 When classes are applied to the element they will then be updated with respect to any styles/classes set via `classProp`.  
 If any classes are set to falsy then they will be removed from the element.  
 Note that the styling instruction will not be applied until `stylingApply` is called.  
 Note that this will the provided classMap value to the host element if this function is called within a host binding function.

@param classes A key/value map or string of CSS classes that will be added to the given element.  
 Any missing classes (that have already been applied to the element beforehand) will be removed (unset) from the element's list of CSS classes.

```

@codeGenApi
export function classMap(classes: {[className: string]:
boolean|undefined|null}|string|undefined|null): void {
  checkStylingMap(keyValueArraySet,
classStringParser, classes, true);
}

```

Parse text as class and add values to KeyValueArray.  
 This code is pulled out to a separate function so that it can be tree shaken away if it is not needed. It is only referenced from `classMap`.

@param keyValueArray KeyValueArray to add parsed values to.  
 @param text text to parse.

```

export function classStringParser(keyValueArray:
KeyValueArray<any>, text: string): void {
  for (let i = parseClassName(text); i >= 0; i = parseClassNameNext(text, i)) {
    keyValueArraySet(keyValueArray, getLastParsedKey(text), true);
  }
}

```

Common code between `classProp` and `styleProp`.

@param prop property name.  
 @param value binding value.  
 @param suffix suffix for the property (e.g. `em` or `px`).

```

@codeGenApi
export function checkStylingProperty(
  prop: string, value: any|NO_CHANGE, suffix: string|undefined|null,
  isClassBased: boolean): void {
  const IVIEW =

```

```

    if (!isStylingValuePresent(value)) {
      // We should delete current value or restore to lower priority value.
      if (getTStylingRangePrevDuplicate(tRange)) {
        // We have a possible prev duplicate, let's retrieve it.
        value = findStylingValue(tData, null, IView, prop, bindingIndex, isClassBased);
      }
    }
    const rNode = getNativeByIndex(getSelectedIndex(), IView) as RELEMENT;
    applyStyling(renderer, isClassBased, rNode, prop, value);
  }
}

```

Search for styling value with higher priority which is overwriting current value, or a value of lower priority to which we should fall back if the value is `undefined`.

When value is being applied at a location, related values need to be consulted.

- If there is a higher priority binding, we should be using that one instead.

For example `

- If there is a lower priority binding and we are changing to `undefined`

For example `

NOTE: The styling stores two values.

1. The raw value which came from the application is stored at `index + 0` location. (This value is used for dirty checking).
2. The normalized value is stored at `index + 1`.

@param tData `TData` used for traversing the priority.

@param tNode `TNode` to use for resolving static styling. Also controls search direction.

- `TNode` search next and quit as soon as `isStylingValuePresent(value)` is true.

If no value found consult `tNode.residualStyle`/`tNode.residualClass` for default value.

- `null` search prev and go all the way to end. Return last value where `isStylingValuePresent(value)` is true.

@param IView `LView` used for retrieving the actual values.

@param prop Property which we are interested in.

@param index Starting index in the linked list of styling bindings where the search should start.

@param isClassBased `true` if `class` (`false` if `style`)

```

*function findStylingValue(tData: TData, tNode: TNode|null, IView: LView, prop: string, index: number, isClassBased: boolean): any {
  // `TNode` to use for resolving static styling. Also controls search direction.
  // - `TNode` search next and quit as soon as `isStylingValuePresent(value)` is true.
  // If no value found consult `tNode.residualStyle`/`tNode.residualClass` for default value.
  // - `null` search prev and go all the way to end. Return last value where `isStylingValuePresent(value)` is true.
  const isPrevDirection = tNode === null;
  let value: any = undefined;
  while (index > 0) {

```

```

I18nDebug {\n __brand__: 'I18nCreateOpCodes';\n}\n\n/**\n * See `I18nCreateOpCodes`\n */\nexport enum
I18nCreateOpCode {\n /**\n * Number of bits to shift index so that it can be combined with the
`APPEND_EAGERLY` and\n * `COMMENT`.\n */\n SHIFT = 2,\n /**\n * Should the node be appended to
parent immediately after creation.\n */\n APPEND_EAGERLY = 0b01,\n /**\n * If set the node should be
comment (rather than a text) node.\n */\n COMMENT = 0b10,\n}\n\n/**\n * Stores DOM operations which
need to be applied to update DOM render tree due to changes in\n * expressions.\n */\n * The basic idea is that
`i18nExp` OpCodes capture expression changes and update a change\n * mask bit. (Bit 1 for expression 1, bit 2 for
expression 2 etc..., bit 32 for expression 32 and\n * higher.) The OpCodes then compare its own change mask
against the expression change mask to\n * determine if the OpCodes should execute.\n */\n * NOTE: 32nd bit is
special as it says 32nd or higher.

```

```

This way if we have more than 32 bindings\n * the code still works, but with lower efficiency. (it is unlikely that a
translation would have\n * more than 32 bindings.)\n */\n * These OpCodes can be used by both the i18n block as
well as ICU sub-block.\n */\n * ## Example\n */\n * Assume\n * ```\n * if (rf & RenderFlags.Update) {\n *
i18nExp(ctx.exp1); // If changed set mask bit 1\n * i18nExp(ctx.exp2); // If changed set mask bit 2\n *
i18nExp(ctx.exp3); // If changed set mask bit 3\n * i18nExp(ctx.exp4); // If changed set mask bit 4\n *
i18nApply(0); // Apply all changes by executing the OpCodes.\n * }\n * ```\n * We can assume that each call
to `i18nExp` sets an internal `changeMask` bit depending on the\n * index of `i18nExp`.\n */\n * ### OpCodes\n *
```\n * <I18nUpdateOpCodes>[\n * // The following OpCodes represent: `<div i18n-
title="pre{ {exp1} }in{ {exp2} }post">\n * // If `changeMask & 0b11`\n * // has changed then execute update
OpCodes.\n * // has NOT changed then skip `8` values and start processing next OpCodes.\n * 0b11, 8,\n *
// Concatenate `newValue = 'pre'+IView[bindIndex-4]+'in'+IView[bindIndex-3]+'post';.\n * 'pre', -4, 'in', -3,
'post',\n * // Update attribute: `elementAttribute(1, 'title', sanitizerFn(newValue));`\n * 1 << SHIFT_REF | Attr,
'title', sanitizerFn,\n * // The following OpCodes represent: `<div i18n>Hello { {exp3} }!`\n * // If
`changeMask & 0b100`\n * // has changed then execute update OpCodes.\n * // has NOT changed then
skip `4` values and start processing next OpCodes.\n * 0b100, 4,\n * // Concatenate `newValue = 'Hello ' +

```

stores the currently selected case. This is needed to know how to clean up the current case when transitioning to the new case.

If the value stored is `null`: No current case selected.

`<0`: A flag which means that the ICU just switched and that `icuUpdate` must be executed regardless of the `mask`. (After the execution the flag is cleared)

`>=0` A currently selected case

index

currentCaseLViewIndex: number

A list of case values which the current ICU will try to match.

The last value is `other` cases: any[]

A set of OpCodes to apply in order to build up the DOM render tree for the ICU

create: IcuCreateOpCodes[]

A set of OpCodes to apply in order to destroy the DOM render tree for the ICU

remove: I18nRemoveOpCodes[]

A set of OpCodes to apply in order to update the DOM render tree for the ICU bindings

update: I18nUpdateOpCodes[]

Note: This hack is necessary so we don't erroneously get a circular dependency failure based on types.

```

Subject, Subscription } from 'rxjs';\n\n/**\n * Use in components with the `@Output` directive to emit custom\n
events\n * synchronously or asynchronously, and register handlers for those events\n * by subscribing to an\n
instance.\n * @usageNotes\n
*\n * Extends\n * [RxJS `Subject`](https://rxjs.dev/api/index/class/Subject)\n * for Angular by adding the `emit()`\n
method.\n * In the following example, a component defines two output properties\n * that create event emitters.\n
When the title is clicked, the emitter\n * emits an open or close event to toggle the current visibility state.\n
*\n
```html\n * @Component({\n *   selector: 'zippy',\n *   template: `\n *     <div class="zippy">\n *       <div\n
(click)="toggle()">Toggle</div>\n *       <div [hidden]="!visible">\n *         <ng-content></ng-content>\n *\n
</div>\n *     </div>` })\n * export class Zippy {\n *   visible: boolean = true;\n *   @Output() open:\n
EventEmitter<any> = new EventEmitter();\n *   @Output() close: EventEmitter<any> = new EventEmitter();\n *   toggle()\n
{\n *     this.visible = !this.visible;\n *     if (this.visible) {\n *       this.open.emit(null);\n *     } else {\n *\n
this.close.emit(null);\n *     }\n *   }\n * }\n * ```\n * Access the event\n
object with the `$event` argument passed to the output event\n * handler:\n * ```html\n * <zippy\n
(open)="onOpen($event)" (close)="onClose($event)"></zippy>\n * ```\n * @see [Observables in\n

matters in the following scenario:\n * Consider a component 'A' that extends component 'B', both declared in
module 'M'. During\n * the compilation of 'A' the definition of 'B' is requested to
capture the inheritance chain,\n * potentially triggering compilation of 'B'. If this nested compilation were to
trigger\n * `flushModuleScopingQueueAsMuchAsPossible` it may happen that module 'M' is still pending in the\n *

```

queue, resulting in 'A' and 'B' to be patched with the NgModule scope. As the compilation of 'A' is still in progress, this would introduce a circular dependency on its compilation. To avoid this issue, the module scope queue is only flushed for compilations at the depth 0, to ensure all compilations have finished.

```

compileDepth = 0;
Compile an Angular component according to its decorator metadata, and patch the
resulting component def (cmp) onto the component type.
Compilation may be asynchronous (due to the
need to resolve URLs for the component template or other resources, for example). In the event that compilation
is not immediate, `compileComponent` will enqueue resource resolution into a global queue
and will fail to return the `cmp` until the global queue has been resolved with a call to
`resolveComponentResources`.
export function compileComponent(type: Type<any>, metadata: Component):
void {
  // Initialize ngDevMode. This must be the first statement in compileComponent.
  // See the
  `initNgDevMode` docstring for more information.

configured\n * providers).\n *\n * More information about standalone components, directives, and pipes can be
found in [this\n * guide](guide/standalone-components).\n *\n * @developerPreview\n
*\n * standalone?: boolean;\n}\n\n/**\n
* Type of the Directive metadata.\n *\n * @publicApi\n */\nexport const
Directive: DirectiveDecorator = makeDecorator(\n * `Directive`, (dir: Directive = {}) => dir, undefined, undefined,\n
(type: Type<any>, meta: Directive) => compileDirective(type, meta));\n\n/**\n
* Component decorator interface\n
*\n * @publicApi\n */\nexport interface ComponentDecorator {\n * /\n *\n * Decorator that marks a class as an
Angular component and provides configuration\n * metadata that determines how the component should be
processed,\n * instantiated, and used at runtime.\n *\n * Components are the most basic UI building block of an
Angular app.\n * An Angular app contains a tree of Angular components.\n *\n * Angular components are a
subset of directives, always associated with a template.\n * Unlike other directives, only one component can be
instantiated for a given element in a\n * template.\n *\n * A component must belong
to an NgModule in order for it to be available\n * to another component or application. To make it a member of an
NgModule,\n * list it in the `declarations` field of the `NgModule` metadata.\n *\n * Note that, in addition to
these options for configuring a directive,\n * you can control a component's runtime behavior by implementing\n
* life-cycle hooks. For more information, see the\n * [Lifecycle Hooks](guide/lifecycle-hooks) guide.\n *\n *
@usageNotes\n *\n * ### Setting component inputs\n *\n * The following example creates a component with
two data-bound properties,\n * specified by the `inputs` value.\n *\n * <code-example
path=\"core/ts/metadata/directives.ts\" region=\"component-input\"></code-example>\n *\n * ### Setting
component outputs\n *\n * The following example shows two event emitters that emit on an interval. One\n *
emits an output every second, while the other emits every five seconds.\n *\n * {@example
core/ts/metadata/directives.ts
region=\"component-output-interval\"}\n *\n * ### Injecting a class with a view provider\n *\n * The following
simple example injects a class into a component\n * using the view provider specified in component metadata:\n
*\n * ```\n * class Greeter {\n *   greet(name:string) {\n *     return 'Hello ' + name + '!';\n *   }\n * }\n
*\n * @Directive({\n *   selector: 'needs-greeter'\n * })\n * class NeedsGreeter {\n *   greeter:Greeter;\n *\n
* constructor(greeter:Greeter) {\n *   this.greeter = greeter;\n * }\n * }\n *\n * @Component({\n *
selector: 'greet',\n * viewProviders: [\n *   Greeter\n * ],\n * template: `<needs-greeter></needs-
greeter>`\n * })\n * class HelloWorld {\n * }\n *}\n *```\n *\n * ### Preserving whitespace\n *\n *
Removing whitespace can greatly reduce AOT-generated code size and speed up view creation.\n * As of Angular
6, the default for `preserveWhitespaces`
is false (whitespace is removed).\n * To change the default setting for all components in your application, set\n
* the `preserveWhitespaces` option of the AOT compiler.\n *\n * By default, the AOT compiler removes

```

whitespace characters as follows:

- `trim`: Trims all whitespaces at the beginning and the end of a template.
- `removeWhitespace`: Removes whitespace-only text nodes. For example, `<button>Action 1</button><button>Action 2</button>` becomes `<button>Action 1</button><button>Action 2</button>`.
- `collapseWhitespace`: Replaces a series of whitespace characters in text nodes with a single space. For example, `<span>\n some text</span>` becomes `<span> some text </span>`.
- `preserveWhitespace`: Does NOT alter text nodes inside HTML tags such as `<pre>` or `<textarea>`, where whitespace characters are significant. Note that these transformations can influence DOM nodes layout, although impact should be minimal. You can override the default behavior to preserve whitespace characters in certain fragments of a template. For example, you can exclude an entire DOM sub-tree by using the `ngPreserveWhitespaces` attribute: `<div ngPreserveWhitespaces> whitespaces are preserved here <span> and here </span></div>`. You can force a single space to be preserved in a text node by using `&ngsp;`, which is replaced with a space character by Angular's template compiler: `<a>Spaces</a>&ngsp;<a>between</a>&ngsp;<a>links.</a>` `<!-- compiled to be equivalent to: <a>Spaces</a> <a>between</a> <a>links.</a> -->`
- `preserveAllWhitespaces`: Note that sequences of `&ngsp;` are still collapsed to just one space character when the `preserveWhitespaces` option is set to `false`. `<a>before</a>&ngsp;&ngsp;&ngsp;<a>after</a>` `<!-- compiled to be equivalent to: <a>before</a> <a>after</a> -->`
- `preserveAllWhitespaces`: To preserve sequences of whitespace characters, use the `ngPreserveWhitespaces` attribute.

**@Annotation** (obj: Component): TypeDecorator; See the `Component` decorator.

**new**(obj: Component): Component; Supplies configuration metadata for an Angular component.

**@publicApi** `export interface Component extends Directive {`

- `changeDetectionStrategy`: The change-detection strategy to use for this component. When a component is instantiated, Angular creates a change detector, which is responsible for propagating the component's bindings. The strategy is one of:
  - `ChangeDetectionStrategy#OnPush`: sets the strategy to `CheckOnce` (on demand).
  - `ChangeDetectionStrategy#Default`: sets the strategy to `CheckAlways`.
- `ChangeDetectionStrategy`: Defines the set of injectable objects that are visible to its view DOM children. See [example](#injecting-a-class-with-a-view-provider).
- `viewProviders`: Provider[]; The module ID of the module that contains the component. The component must be able to resolve relative URLs for templates and styles. SystemJS exposes the `__moduleName` variable within each module. In CommonJS, this can be set to `module.id`.
- `moduleId`: string; The relative path or absolute URL of a template file for an Angular component. If provided, do not supply an inline template using `template`.
- `templateUrl`: string; An inline template for an Angular component. If provided, do not supply a template file using `templateUrl`.
- `template`: string; One or more relative paths or absolute URLs for files containing CSS stylesheets to use in this component.
- `styleUrls`: string[]; One or more inline CSS stylesheets to use in this component.
- `styles`: string[]; One or more animation `trigger()` calls, containing `[state()](api/animations/state)` and `transition()` definitions. See the [Animations guide](/guide/animations) and animations API documentation.
- `animations`: any[]; An encapsulation policy for the component's styling. Possible values:
  - `ViewEncapsulation.Emulated`: Apply modified component styles in order to emulate a native Shadow DOM CSS encapsulation behavior.
  - `ViewEncapsulation.None`: Apply component styles globally without any sort of encapsulation.
  - `ViewEncapsulation.ShadowDom`: Use the browser's native Shadow DOM API to encapsulate styles. If not supplied, the value is taken from the `CompilerOptions` which defaults to `ViewEncapsulation.Emulated`.
- `linkComponentStyles`: { @link Component#styles styles } nor `{ @link Component#styleUrls styleUrls }`, the policy is automatically switched to `ViewEncapsulation.None`.
- `encapsulation`: ViewEncapsulation; Overrides the default interpolation start and end delimiters

```

undefined,\n      (type: Type<any>, meta: Pipe) => compilePipe(type, meta));\n\n    /**\n     * @publicApi\n     */\n    export
interface InputDecorator {\n\n      /**\n       * Decorator that marks a class field as an input property and supplies

```

configuration metadata. The input property is bound to a DOM property in the template. During change detection, Angular automatically updates the data property with the DOM property's value.

`@usageNotes` You can supply an optional name to use in templates when the component is instantiated, that maps to the name of the bound property. By default, the original name of the bound property is used for input binding.

The following example creates a component with two input properties, one of which is given a special binding name.

```

@Component({
  selector: 'bank-account',
  template: `
    Bank Name: {{bankName}}
    Account Id: {{id}}
  `})
class BankAccount {
  // This property is bound using its original name.
  @Input() bankName: string;
  // this property value is bound to a different property name
  // when this component is instantiated in a
  // template.
  @Input('account-id') id: string;
  // this property is not bound, and is not automatically
  // updated by Angular
  normalizedBankName: string;
}

@Component({
  selector: 'app',
  template: `
    <bank-account bankName="RBC" account-id="4747"></bank-account>
  `})
class App {}

```

`@see [Input and Output properties](guide/inputs-outputs)`

`(bindingPropertyName?: string): any;` `new(bindingPropertyName?: string): any;` Type of metadata for an `Input` property.

`@publicApi` `^` `export interface Input` `{}` `/**` The name of the DOM property to which the input property is bound. `bindingPropertyName?: string;` `*/`

`@Annotation` `@publicApi` `^` `export const Input: InputDecorator =` `makePropDecorator('Input', (bindingPropertyName?: string) => ({bindingPropertyName}));` `/**` Type of the Output decorator / constructor function. `@publicApi` `^` `export interface OutputDecorator` `{}` `/**` Decorator that marks a class field as an output property and supplies configuration metadata. The DOM property bound to the output property is automatically updated during change detection. `usageNotes` You can supply an optional name to use in templates when the component is instantiated, that maps to the name of the bound property. By default, the original name of the bound property is used for output binding. See `Input` decorator for an example of providing a binding name. `@see [Input and Output properties](guide/inputs-outputs)`

`(bindingPropertyName?: string): any;` `new(bindingPropertyName?: string): any;` Type of the Output metadata.

`@publicApi` `^` `export interface Output` `{}` `/**` The name of the DOM property to which the output property is bound. `bindingPropertyName?: string;` `*/`

`@Annotation` `@publicApi` `^` `export const Output: OutputDecorator =` `makePropDecorator('Output', (bindingPropertyName?: string) => ({bindingPropertyName}));` `/**` Type of the HostBinding decorator / constructor function. `@publicApi` `^` `export interface HostBindingDecorator` `{}` `/**` Decorator that marks a DOM property as a host-binding property and supplies configuration metadata. Angular automatically checks host property bindings during change detection, and if a binding changes it updates the host element of the directive. `usageNotes` The following example creates a directive that sets the `valid` and `invalid` properties on the DOM element that has an `ngModel` directive on it.

```

@Directive({selector: '[ngModel]'})
class NgModelStatus {
  constructor(public control: NgModel) {}
  @HostBinding('class.valid') get valid() {
    return this.control.valid;
  }
  @HostBinding('class.invalid') get invalid() {
    return this.control.invalid;
  }
}

@Component({
  selector: 'app',
  template: `<input [(ngModel)]="prop">`})
class App {
  prop;
}

```

`(hostPropertyName?: string): any;` `new(hostPropertyName?: string): any;` Type of the HostBinding metadata.

`@publicApi` `^` `export interface HostBinding` `{}` `/**` The DOM property that is bound to a data property. `hostPropertyName?: string;` `*/`

`@Annotation` `@publicApi` `^` `export const HostBinding: HostBindingDecorator =` `makePropDecorator('HostBinding', (hostPropertyName?: string) => ({hostPropertyName}));` `/**` Type of the HostListener decorator / constructor function. `@publicApi` `^` `export interface HostListenerDecorator` `{}` `/**` Decorator that declares a DOM event to listen for, and provides a handler method to run when that event occurs. Angular invokes the

supplied handler method when the host element emits the specified event, and updates the bound element with the result. If the handler method returns false, applies `preventDefault` on the bound element.

(eventName: string, args?: string[]): any; new(eventName: string, args?: string[]): any; Type of the HostListener metadata.

```

    @publicApi
    export interface HostListener {
      /** The DOM event to listen for. */
      eventName?: string;
      /** A set of arguments to pass to the handler method when the event occurs. */
      args?: string[];
    }
  }
  * Decorator that binds a DOM event to a host listener and supplies configuration metadata. Angular invokes the supplied handler method when the host element emits the specified event, and updates the bound element with the result. If the handler method returns false, applies `preventDefault` on the bound element.
  * @usageNotes
  * The following example declares a directive that attaches a click listener to a button and counts clicks.
  * @Directive({selector: 'button[counting]'})
  * class CountClicks {
  *   numberOfClicks = 0;
  *   @HostListener('click', ['$event.target'])
  *   onClick(btn) {
  *     console.log('button', btn, 'number of clicks:', this.numberOfClicks++);
  *   }
  * }
  * @Component({
  *   selector: 'app',
  *   template: '<button counting>Increment</button>',
  * })
  * class App {
  * }
  * The following example registers another DOM event handler that listens for `Enter` key-press events on the global `window`.
  * @Component({
  *   selector: 'app',
  *   template: '<h1>Hello, you have pressed enter {counter} number of times!</h1> Press enter key to increment the counter. <button (click)="resetCounter()">Reset Counter</button>',
  * })
  * class AppComponent {
  *   counter = 0;
  *   @HostListener('window:keydown.enter', ['$event'])
  *   handleKeyDown(event: KeyboardEvent) {
  *     this.counter++;
  *     resetCounter() {
  *       this.counter = 0;
  *     }
  *   }
  * }
  * The list of valid key names for `keydown` and `keyup` events can be found here: https://www.w3.org/TR/DOM-Level-3-Events-key/#named-key-attribute-values
  * Note that keys can also be combined, e.g. `@HostListener('keydown.shift.a')`. The global target names that can be used to prefix an event name are `document:`, `window:` and `body:`.
  * @Annotation
  * @publicApi
  * export const HostListener: HostListenerDecorator = makePropDecorator('HostListener', (eventName?: string, args?: string[]) => ({eventName, args}));

  *   metadata: NgModuleMetadata;
  * }
  * @publicApi
  * export interface NgModule {
  *   /** The set of injectable objects that are available in the injector of this module. */
  *   providers: Provider[];
  *   /** @see [Dependency Injection guide](guide/dependency-injection) */
  *   @see [NgModule guide](guide/providers)
  *   @usageNotes
  *   Dependencies whose providers are listed here become available for injection into any component, directive, pipe or service that is a child of this injector. The NgModule used for bootstrapping uses the root injector, and can provide dependencies to any part of the app. A lazy-loaded module has its own injector, typically a child of the app root injector. Lazy-loaded services are scoped to the lazy-loaded module's injector. If a lazy-loaded module also provides the `UserService`, any component created within that module's context (such as by router navigation) gets the local instance of the service, not the instance in the root injector. Components in external modules continue to receive the instance provided by their injectors.
  *   ### Example
  *   The following example defines a class that is injected in the HelloWorld NgModule.
  *   class Greeter {
  *     greet(name:string) {
  *       return 'Hello ' + name + '!';
  *     }
  *   }
  *   @NgModule({
  *     providers: [
  *       Greeter
  *     ]
  *   })
  *   class HelloWorld {
  *
  
```

```

greeter:Greeter;\n *\n * constructor(greeter:Greeter) {\n *   this.greeter = greeter;\n * }\n * }\n * ```\n
*\n providers?: Provider[];\n\n /**\n * The set of components, directives, and pipes
([declarables](guide/glossary#declarable))\n * that belong to this
module.\n *\n * @usageNotes\n *\n * The set of selectors that are available to a template include those
declared here, and\n * those that are exported from imported NgModules.\n *\n * Declarables must belong to
exactly one module.\n * The compiler emits an error if you try to declare the same class in more than one
module.\n * Be careful not to declare a class that is imported from another module.\n *\n * ### Example\n *\n * The following example allows the CommonModule to use the `NgFor`\n * directive.\n *\n * ```javascript\n * @NgModule({\n *   declarations: [NgFor]\n * })\n * class CommonModule {\n * }\n * ```\n *\n declarations?: Array<Type<any>|any[]>;\n\n /**\n * The set of NgModules whose exported
[declarables](guide/glossary#declarable)\n * are available to templates in this module.\n *\n * @usageNotes\n
*\n * A template can use exported declarables from any\n * imported module, including those from modules that
are imported indirectly\n * and re-exported.\n * For example, `ModuleA` imports `ModuleB`, and also exports\n
* it, which makes the declarables from `ModuleB` available\n * wherever `ModuleA` is imported.\n *\n * ###
Example\n *\n * The following example allows MainModule to use anything exported by\n *
`CommonModule`:\n *\n * ```javascript\n * @NgModule({\n *   imports: [CommonModule]\n * })\n * class
MainModule {\n * }\n * ```\n *\n *\n imports?: Array<Type<any>|ModuleWithProviders<{}>|any[]>;\n\n
/**\n * The set of components, directives, and pipes declared in this\n * NgModule that can be used in the
template of any component that is part of an\n * NgModule that imports this NgModule. Exported declarations are
the module's public API.\n *\n * A declarable belongs to one and only one NgModule.\n * A module can list
another module among its exports, in which case all of that module's\n * public declaration are exported.\n *\n
* @usageNotes\n *\n * Declarations are private by default.\n * If this ModuleA does not export
UserComponent, then only the components within this\n * ModuleA can use UserComponent.\n *\n * ModuleA
can import ModuleB and also export it, making exports from ModuleB\n * available to an NgModule that imports
ModuleA.\n *\n * ### Example\n *\n * The following example exports the `NgFor` directive from
CommonModule.\n *\n * ```javascript\n * @NgModule({\n *   exports: [NgFor]\n * })\n * class
CommonModule {\n * }\n * ```\n *\n *\n exports?: Array<Type<any>|any[]>;\n\n /**\n * The set of components
to compile when this NgModule is defined,\n * so that they can be dynamically loaded into the view.\n *\n * For
each component listed here, Angular creates a `ComponentFactory`\n * and stores it in the
`ComponentFactoryResolver`.\n *\n * Angular automatically adds components in the module's bootstrap\n * and
route definitions into the `entryComponents`
list. Use this\n * option to add components that are bootstrapped\n * using one of the imperative techniques, such
as `ViewContainerRef.createComponent()`.\n *\n * @see [Entry Components](guide/entry-components)\n *
@deprecated\n * Since 9.0.0. With Ivy, this property is no longer necessary.\n * (You may need to keep these if
building a library that will be consumed by a View Engine\n * application.)\n *\n entryComponents?:
Array<Type<any>|any[]>;\n\n /**\n * The set of components that are bootstrapped when\n * this module is
bootstrapped. The components listed here\n * are automatically added to `entryComponents`.\n *\n bootstrap?:
Array<Type<any>|any[]>;\n\n /**\n * The set of schemas that declare elements to be allowed in the NgModule.\n
*\n * Elements and properties that are neither Angular components nor directives\n * must be declared in a schema.\n
*\n *\n * Allowed value are `NO_ERRORS_SCHEMA` and `CUSTOM_ELEMENTS_SCHEMA`.\n *\n
* @security When using one of `NO_ERRORS_SCHEMA` or `CUSTOM_ELEMENTS_SCHEMA`\n * you
must ensure that allowed elements and properties securely escape inputs.\n *\n schemas?:
Array<SchemaMetadata|any[]>;\n\n /**\n * A name or path that uniquely identifies this NgModule in
`getNgModuleById`.\n *\n * If left `undefined`, the NgModule is not registered with `getNgModuleById`.\n *\n id?:
string;\n\n /**\n * When present, this module is ignored by the AOT compiler.\n * It remains in distributed code,
and the JIT compiler attempts to compile it\n * at run time, in the browser.\n * To ensure the correct behavior, the
app must import `@angular/compiler`.\n *\n jit?: true;\n\n\n /**\n * @Annotation\n * @publicApi\n *\n export
const NgModule: NgModuleDecorator = makeDecorator(\n * `NgModule`, (ngModule: NgModule) => ngModule,

*\n * @usageNotes\n * \n * { @a is-stable-examples }\n * ### isStable examples and caveats\n * \n * Note two

```

important points about `isStable`, demonstrated in the examples below:

- the application will never be stable if you start any kind of recurrent asynchronous task when the application starts (for example for a polling process, started with a `setInterval`, a `setTimeout` or using RxJS operators like `interval`);
- the `isStable` Observable runs outside of the Angular zone.

Let's imagine that you start a recurrent task (here incrementing a counter, using RxJS `interval`), and at the same time subscribe to `isStable`.

```

constructor(appRef: ApplicationRef) {
  appRef.isStable.pipe(
    filter(stable => stable)
  ).subscribe(() => console.log('App is stable now'));
  interval(1000).subscribe(counter => console.log(counter));
}

```

In this example, `isStable` will never emit `true`, and the trace `"App is stable now"` will never get logged.

If you want to execute something when the app is stable, you have to wait for the application to be stable before starting your polling process.

```

constructor(appRef: ApplicationRef) {
  appRef.isStable.pipe(
    first(stable => stable),
    tap(stable => console.log('App is stable now')),
    switchMap(() => interval(1000))
  ).subscribe(counter => console.log(counter));
}

```

In this example, the trace `"App is stable now"` will be logged and then the counter starts incrementing every second.

Note also that this Observable runs outside of the Angular zone, which means that the code in the subscription to this Observable will not trigger the change detection.

Let's imagine that instead of logging the counter value, you update a field of your component and display it in its template.

```

constructor(appRef: ApplicationRef) {
  appRef.isStable.pipe(
    first(stable => stable),
    switchMap(() => interval(1000))
  ).subscribe(counter => this.value = counter);
}

```

As the `isStable` Observable runs outside the zone, the `value` field will be updated properly, but the template will not be refreshed!

You'll have to manually trigger the change detection to update the template.

```

constructor(appRef: ApplicationRef, cd: ChangeDetectorRef) {
  appRef.isStable.pipe(
    first(stable => stable),
    switchMap(() => interval(1000))
  ).subscribe(counter => {
    this.value = counter;
    cd.detectChanges();
  });
}

```

Or make the subscription callback run inside the zone.

```

constructor(appRef: ApplicationRef, zone: NgZone) {
  appRef.isStable.pipe(
    first(stable => stable),
    switchMap(() => interval(1000))
  ).subscribe(counter => zone.run(() => this.value = counter));
}

```

}

```

in the `bootstrap` array of `NgModule`, but it requires us to know the component while writing the application code. Imagine a situation where we have to wait for an API call to decide about the component to bootstrap. We can use the `ngDoBootstrap` hook of the `NgModule` and call this method to dynamically bootstrap a component.

```

    { @example core/ts/platform/platform.ts region='componentSelector' }

```

Optionally, a component can be mounted onto a DOM element that does not match the selector of the bootstrapped component. In the following example, we are providing a CSS selector to match the target element.

```

    { @example core/ts/platform/platform.ts region='cssSelector' }

```

While in this example, we are providing reference to a DOM node.

```

    { @example core/ts/platform/platform.ts region='domNode' }

```

```

provides change detection functionality.\n * A change-detection tree collects all views that are to be checked for
changes.\n * Use the methods to add and remove views from the tree, initiate change-detection,\n * and explicitly
mark views as _dirty_, meaning that they have changed and need to be re-rendered.\n *\n * @see [Using change
detection hooks](guide/lifecycle-hooks#using-change-detection-hooks)\n * @see [Defining custom change
detection](guide/lifecycle-hooks#defining-custom-change-detection)\n *\n * @usageNotes\n *\n * The following
examples demonstrate how to modify default change-detection behavior\n * to perform explicit detection when
needed.\n *\n * ### Use markForCheck() with CheckOnce strategy\n *\n * The following example
sets the OnPush change-detection strategy for a component\n * (CheckOnce, rather than the default
CheckAlways), then forces a second check\n * after an interval. See [live
demo](https://plnkr.co/edit/GC512b?p=preview).\n *\n * <code-example path="core/ts/change_detect/change-
detection.ts"\n * region="mark-for-check"></code-example>\n *\n * ### Detach change detector to limit how
often check occurs\n *\n * The following example defines a component with a large list of read-only data\n * that is
expected to change constantly, many times per second.\n * To improve performance, we want to check and update
the list\n * less often than the changes actually occur. To do that, we detach\n * the component's change detector and
perform an explicit local check every five seconds.\n *\n * <code-example path="core/ts/change_detect/change-
detection.ts"\n * region="detach"></code-example>\n *\n * ### Reattaching a detached component\n *\n * The

```

following example creates a component displaying

```
live data.\n * The component detaches its change detector from the main change detector tree\n * when the `live`  
property is set to false, and reattaches it when the property\n * becomes true.\n *\n * <code-example  
path=\"core/ts/change_detect/change-detection.ts\" region=\"reattach\"></code-example>\n *\n * @publicApi\n *\n * \nexport abstract class ChangeDetectorRef {\n /**\n * When a view uses the {@link

/**
 * A function optionally passed into the `NgForOf` directive to customize how
 * `NgForOf` uniquely
 * identifies items in an iterable.
 * `NgForOf` needs to uniquely identify items in the
 * iterable to correctly perform DOM updates
 * when items in the iterable are reordered, new items are added, or
 * existing items are removed.
 * In all of these scenarios it is usually desirable to only update the

```

DOM elements associated with the items affected by the change. This behavior is important to preserve any DOM-specific UI state (like cursor position, focus, text selection) when the iterable is modified

- enable animation of item addition, removal, and iterable reordering
- preserve the value of the `<select>` element when nested `<option>` elements are dynamically populated using `NgForOf` and the bound iterable is updated

A common use for custom `trackBy` functions is when the model that `NgForOf` iterates over contains a property with a unique identifier. For example, given a model:

```
class User {
  id: number;
  name: string;
  ...
}
```

a custom `trackBy` function could look like the following:

```
function userTrackBy(index, user) {
  return user.id;
}
```

A custom `trackBy` function must have several properties:

- be [idempotent](https://en.wikipedia.org/wiki/Idempotence) (be without side effects, and always return the same value for a given input)
- return unique value for all unique inputs
- be fast

@see [NgForOf#ngForTrackBy](api/common/NgForOf#ngForTrackBy)

```
@publicApi
export interface TrackByFunction<T> {
  // Note: the type parameter `U` enables more accurate
  // template type checking in case a trackBy function is declared using a base type of the iterated type. The `U`
  // type gives TypeScript additional freedom to infer a narrower type for the `item` parameter type, instead of
  // imposing the trackBy's declared item type as the inferred type for `T`.
  // See https://github.com/angular/angular/issues/40125
  @param index The index of the item within the iterable.
  @param item The item in the iterable.
  <U extends T>(index: number, item: T&U):
  any;
}
```

```
export interface IterableDifferFactory {
  supports(objects: any): boolean;
  create<V>(trackByFn?: TrackByFunction<V>):
  IterableDiffer<V>;
}
```

```
export function defaultIterableDifferFactory() {
  return new IterableDifferers([new DefaultIterableDifferFactory()]);
}
```

A repository of different iterable diffing strategies used by `NgFor`, `NgClass`, and others.

    return new IterableDifferers(factories);
  }
  /** Takes an array of {@link IterableDifferFactory} and returns a provider used to extend the inherited {@link IterableDifferers} instance with the provided factories and return a new {@link IterableDifferers} instance.
  @usageNotes
  ### Example
  The following example shows how to extend an existing list of factories, which will only be applied to the injector for this component and its children. This step is all that's required to make a new {@link IterableDiffer} available.
  @Component({
    viewProviders: [
      IterableDifferers.extend([
        new ImmutableListDiffer()
      ])
    ]
  })
  static extend(factories: IterableDifferFactory[]):
  StaticProvider {
    return {
      provide: IterableDifferers,
      useFactory: (parent: IterableDifferers|null) => {
        // if parent is null, it means that we are in the root injector and we have
        // just overridden the default injection mechanism for IterableDifferers, in such a case just assume
        // defaultIterableDifferFactory.
        return IterableDifferers.create(factories, parent ||
        defaultIterableDifferFactory());
      },
      // Dependency technically isn't optional, but we can provide a better
      // error message this way.
      deps: [[IterableDifferers, new SkipSelf(), new Optional()]]
    };
  }
  find(iterable:
  any): IterableDifferFactory {
    const factory = this.factories.find(f => f.supports(iterable));
    if (factory != null) {
      return factory;
    } else {
      throw new RuntimeError(
        RuntimeErrorCode.NO_SUPPORTING_DIFFER_FACTORY,
        ngDevMode && `Cannot find a
        differ supporting object '${iterable}' of type '${
          getTypeNameForDebugging(iterable)}'`);
    }
  }
}
```

```
export function getTypeNameForDebugging(type: any): string {
  return type['name'] || typeof
  type;
}
```

```

'./di/r3_injector';\nimport { Type } from './interface/type';\nimport { ComponentRef } from
'./linker/component_factory';\nimport { ComponentFactory } from './component_ref';\nimport { GetComponentDef }
from './definition';\nimport { assertComponentDef } from './errors';\n\n/**\n * Creates a `ComponentRef` instance
based on provided component type and a set of options.\n * \n * @usageNotes\n * \n * The example below
demonstrates how the `createComponent` function can be used\n * to create an instance of a ComponentRef
dynamically and attach it to an ApplicationRef,\n * so that it gets included into change detection cycles.\n * \n *
Note: the example uses standalone
components, but the function can also be used for\n * non-standalone components (declared in an NgModule) as
well.\n * \n * ```typescript\n * @Component({\n *   standalone: true,\n *   template: `Hello {{ name }}`!\n * })\n *
class HelloComponent {\n *   name = 'Angular';\n * }\n * \n * @Component({\n *   standalone: true,\n *   template:
`<div id="hello-component-host"></div>\n * `)\n * class RootComponent {\n *   // Bootstrap an application.\n *
const applicationRef = await bootstrapApplication(RootComponent);\n *   // Locate a DOM node that would be
used as a host.\n *   const host = document.getElementById('hello-component-host');\n *   // Get an
`EnvironmentInjector` instance from the `ApplicationRef`.\n *   const environmentInjector =
applicationRef.injector;\n *   // We can now create a `ComponentRef` instance.\n *   const componentRef =
createComponent(HelloComponent, {host, environmentInjector});\n *   // Last step is to register the newly
created ref using the `ApplicationRef`
instance\n * // to include the component view into change detection cycles.\n *
applicationRef.attachView(componentRef.hostView);\n * ```\n * \n * @param component Component class
reference.\n * @param options Set of options to use:\n * * `environmentInjector`: An `EnvironmentInjector`
instance to be used for the component, see\n * additional info about it at https://angular.io/guide/standalone-
components#environment-injectors.\n * * `hostElement` (optional): A DOM node that should act as a host node for
the component. If not\n * provided, Angular creates one based on the tag name used in the component selector (and
falls\n * back to using `div` if selector doesn't have tag name info).\n * * `elementInjector` (optional): An
`ElementInjector` instance, see additional info about it at\n * https://angular.io/guide/hierarchical-dependency-
injection#elementinjector.\n * * `projectableNodes` (optional): A list of DOM nodes that should be projected
through\n *
[<ng-content>](api/core/ng-content) of the new component instance.\n * @returns ComponentRef instance that
represents a given Component.\n * \n * @publicApi\n */\nexport function createComponent<C>(component:

 * Wraps a test function in an asynchronous test zone. The test will automatically complete when all asynchronous calls within this zone are done. Can be used to wrap an {@link inject} call.  
 * Example:  
 * ```  
 * it('...', waitForAsync(inject([AClass], (object) => {  
 *   object.doSomething.then(() => {  
 *     expect(...);  
 *   }  
 * }));  
 * @publicApi  
 * ^nexport function waitForAsync(fn: Function): (done: any) => any {  
 *   const _Zone: any = typeof Zone !== 'undefined' ? Zone : null;  
 *   if (!_Zone) {  
 *     return function() {  
 *       return Promise.reject('Zone is needed for the waitForAsync() test helper but could not be found. ' +  
 *       'Please make sure that your environment includes zone.js');  
 *     };  
 *   }  
 *   const asyncTest = _Zone && _Zone[_Zone.__symbol__('asyncTest')];  
 *   if (typeof asyncTest === 'function') {  
 *     return asyncTest(fn);  
 *   }  
 *   return function() {  
 *     return Promise.reject('zone-testing.js is needed for the async() test helper but could not be found. ' +  
 *     'Please make sure that your environment includes zone.js/testing');  
 *   };  
 * }  
 * @deprecated use `waitForAsync`, (expected removal in v12)  
 * @see {@link waitForAsync}  
 * @publicApi  
 * ^nexport function async(fn: Function): (done: any) => any {

passage of time for the timers in the `fakeAsync` zone.\n *\n * The microtasks queue is drained at the very start of
this function and after any timer callback\n * has been executed.\n *\n * @param millis The number of milliseconds
to advance the
virtual timer.\n * @param tickOptions The options to pass to the `tick()` function.\n *\n * @usageNotes\n *\n * The
`tick()` option is a flag called `processNewMacroTasksSynchronously`,\n * which determines whether or not to
invoke new macroTasks.\n *\n * If you provide a `tickOptions` object, but do not specify a\n *
`processNewMacroTasksSynchronously` property (`tick(100, {})`),\n * then
`processNewMacroTasksSynchronously` defaults to true.\n *\n * If you omit the `tickOptions` parameter
(`tick(100)`), then\n * `tickOptions` defaults to `{processNewMacroTasksSynchronously: true}`.\n *\n * ###
Example\n *\n * { @example core/testing/ts/fake_async.ts region='basic'}\n *\n * The following example includes a
nested timeout (new macroTask), and\n * the `tickOptions` parameter is allowed to default. In this case,\n *
`processNewMacroTasksSynchronously` defaults to true, and the nested\n * function is executed on each tick.\n *\n
* ```\n * it ('test with nested setTimeout', fakeAsync()
=> {\n * let nestedTimeoutInvoked = false;\n * function funcWithNestedTimeout() {\n * setTimeout(() => {\n
* nestedTimeoutInvoked = true;\n * });\n * });\n * setTimeout(funcWithNestedTimeout);\n * tick();\n *
expect(nestedTimeoutInvoked).toBe(true);\n * });\n * ```\n *\n * In the following case,
`processNewMacroTasksSynchronously` is explicitly\n * set to false, so the nested timeout function is not
invoked.\n *\n * ```\n * it ('test with nested setTimeout', fakeAsync() => {\n * let nestedTimeoutInvoked = false;\n
* function funcWithNestedTimeout() {\n * setTimeout(() => {\n * nestedTimeoutInvoked = true;\n * });\n *
});\n * setTimeout(funcWithNestedTimeout);\n * tick(0, {processNewMacroTasksSynchronously: false});\n *
expect(nestedTimeoutInvoked).toBe(false);\n * });\n * ```\n *\n * @publicApi\n */\nexport function tick(\n

@throws if called outside of a supported context, or if the token is not found.  
@publicApi  
^/next export function inject<T>(token: ProviderToken<T>, options: InjectOptions & { optional?: false }): T;  
/\*\* @param token A token that represents a dependency that should be injected.  
@param options Control how injection is executed. Options correspond to injection strategies that can be specified with parameter decorators `@Host`, `@Self`, `@SkipSelf`, and `@Optional`.  
@returns the injected value if operation is successful, `null` if the token is not found and optional injection has been requested.  
@throws if called outside of a supported context, or if the token is not found and optional injection was not requested.  
@publicApi  
^/next export function inject<T>(token: ProviderToken<T>, options: InjectOptions): T|null;  
Injects a token from the currently active injector.  
`inject` is only supported during instantiation of a dependency by the DI system. It can be used during:  
- Construction (via the `constructor`) of a class being instantiated by the DI system, such as an `@Injectable` or `@Component`.  
- In the initializer for fields of such classes.  
- In the factory function specified for `useFactory` of a `Provider` or an `@Injectable`.  
- In the `factory` function specified for an `InjectionToken`.  
@param token A token that represents a dependency that should be injected.  
@param flags Optional flags that control how injection is executed.  
The flags correspond to injection strategies that can be specified

with\n \* parameter decorators `@Host`, `@Self`, `@SkipSelf`, and `@Optional`.\n \* @returns the injected value if operation is successful, `null` otherwise.\n \* @throws if called outside of a supported context.\n \*\n \* @usageNotes\n \* In practice the `inject()` calls are allowed in a constructor, a constructor parameter and a\n \* field initializer:\n \*\n \* ```typescript\n \* @Injectable({providedIn: 'root'})\n \* export class Car {\n \* radio: Radio;\n \* // OK: field initializer\n \* spareTyre = inject(Tyre);\n \* constructor() {\n \* // OK: constructor body\n \* this.radio = inject(Radio);\n \* }\n \* }\n \* ```\n \*\n \* It is also legal to call `inject` from a provider's factory:\n \*\n \* ```typescript\n \* providers: [\n \* {provide: Car, useFactory: () => {\n \* // OK: a class\n \* const engine = inject(Engine);\n \* return new Car(engine);\n \* }}\n \* ]\n \* ```\n \*\n \* Calls to the `inject()` function outside of the class creation context will result in error. Most\n \* notably, calls to `inject()` are disallowed after a class instance was created, in methods\n \* (including lifecycle hooks):\n \*\n \* ```typescript\n \* @Component({ ... })\n \* export class CarComponent {\n \* ngOnInit() {\n \* // ERROR: too late, the component instance was already created\n \* const engine = inject(Engine);\n \* engine.start();\n \* }\n \* }\n \* ```\n \*\n \* @publicApi\n \*\n \* @next\n \* export function inject<T>(\n \* token: ProviderToken<T>, flags: InjectFlags|InjectOptions = InjectFlags.Default): T|null {\n \* if (typeof flags !== 'number') {\n \* // While TypeScript doesn't accept it without a cast, bitwise OR with false-y values in\n \* // JavaScript is a no-op. We can use that for a very codesize-efficient conversion from\n \* // `InjectOptions` to `InjectFlags`.\n \* flags = (InternalInjectFlags.Default | // comment to force a line break in the formatter\n \* ((flags.optional && InternalInjectFlags.Optional) as number) |\n \* ((flags.host && InternalInjectFlags.Host) as number) |\n \* ((flags.self && InternalInjectFlags.Self) as number) |\n \* ((flags.skipSelf && InternalInjectFlags.SkipSelf) as number)) as InjectFlags;\n \* }\n \* return inject(token, flags);\n \* }\n \* export function injectArgs(types: (ProviderToken<any>|any[]|[]): any[] {\n \* const args: any[] = [];\n \* for (let i = 0; i < types.length; i++) {\n \* const arg = resolveForwardRef(types[i]);\n \* if (Array.isArray(arg)) {\n \* if (arg.length === 0) {\n \* throw new RuntimeError(\n \* RuntimeErrorCode.INVALID\_DIFFER\_INPUT,\n \* ngDevMode && 'Arguments array must have arguments.);\n \* }\n \* let type: Type<any>|undefined = undefined;\n \* let flags: InjectFlags = InjectFlags.Default;\n \* for (let j = 0; j < arg.length; j++) {\n \* const meta = arg[j];\n \* const flag = getInjectFlag(meta);\n \* if (typeof flag === 'number') {\n \* // Special case when we handle @Inject decorator.\n \* if (flag === DecoratorFlags.Inject) {\n \* type = meta.token;\n \* } else {\n \* flags |= flag;\n \* }\n \* } else {\n \* type = meta;\n \* }\n \* }\n \* args.push(inject(type!, flags));\n \* } else {\n \* args.push(inject(arg));\n \* }\n \* }\n \* return args;\n \* }\n \* }\n \* }\n \* }\n \*\n \* @next\n \* \* Attaches a given InjectFlag to a given decorator using monkey-patching.\n \* \* Since DI decorators can be used in providers `deps` array (when provider is configured using\n \* \* `useFactory`) without initialization (e.g. `Host`) and as an instance (e.g. `new Host()`), we\n \* \* attach the flag to make it available both as a static property and as a field on decorator\n \* \* instance.\n \* \* @param decorator Provided DI decorator.\n \* \* @param flag InjectFlag that should be applied.\n \* \* @next\n \* export function attachInjectFlag(decorator: any, flag: InternalInjectFlags|DecoratorFlags): any {\n \* decorator[DI\_DECORATOR\_FLAG] = flag;\n \* decorator.prototype[DI\_DECORATOR\_FLAG] = flag;\n \* return decorator;\n \* }\n \* }\n \* }\n \*\n \* @next\n \* \* Reads monkey-patched property that contains InjectFlag attached to a decorator.\n \* \* @param token Token that may contain monkey-patched DI flags property.\n \* \* @next\n \* export function getInjectFlag(token: any): number|undefined {\n \* return token[DI\_DECORATOR\_FLAG];\n \* }\n \* }\n \* }\n \*\n \* @next\n \* export function catchInjectorError(\n \* e: any, token: any, injectorErrorName: string, source: string|null): never {\n \* const tokenPath: any[] = e[NG\_TEMP\_TOKEN\_PATH];\n \* if (token[SOURCE]) {\n \* tokenPath.unshift(token[SOURCE]);\n \* }\n \* e.message = formatError(`\n \* '\n \* + e.message, tokenPath, injectorErrorName, source);\n \* e[NG\_TOKEN\_PATH] = tokenPath;\n \* e[NG\_TEMP\_TOKEN\_PATH] = null;\n \* throw e;\n \* }\n \* }\n \* }\n \*\n \* @next\n \* export function formatError(\n \* text: string, obj: any, injectorErrorName: string, source: string|null = null): string {\n \* text = text && text.charAt(0) === '\n \* && text.charAt(1) == NO\_NEW\_LINE ? text.slice(2) : text;\n \* let context = stringify(obj);\n \* if (Array.isArray(obj))

 * Size of LContainer's header.
Represents the index after which all views in the
 * container will be inserted. We need to keep a record of current
views so we know
 * which views are already

```

in the DOM (and don't need to be re-added) and so we can remove views from the DOM when they are no longer required.

```

export const CONTAINER_HEADER_OFFSET = 10;

```

The state associated with a container. This is an array so that its structure is closer to LView. This helps when traversing the view tree (which is a mix of containers and component views), so we can jump to viewOrContainer[NEXT] in the same way regardless of type.

```

export interface LContainer extends Array<any> {

```

The host element of this LContainer. The host could be an LView if this container is on a component node. In that case, the component LView is its HOST.

```

readonly [HOST]: RElement|RComment|LView;

```

This is a type field which allows us to differentiate `LContainer` from `StylingContext` in an efficient way. The value is always set to `true`.

```

[TYPE]: true;

```

Flag to signify that this `LContainer` may have transplanted views which need to be change detected. (see:

```

LView[DECLARATION_COMPONENT_VIEW])

```

This flag, once set, is never unset for the `LContainer`.

```

[HAS_TRANSPLANTED_VIEWS]: boolean;

```

Access to the parent view is necessary so we can propagate back up from inside a container to parent[NEXT].

```

[PARENT]: LView;

```

This allows us to jump from a container to a sibling container or component view with the same parent, so we can remove listeners efficiently.

```

[NEXT]: LView|LContainer|null;

```

The number of direct transplanted views which need a refresh or have descendants themselves that need a refresh but have not marked their ancestors as Dirty. This tells us that during change detection we should still descend to find those children to refresh, even if the parents are not `Dirty`/`CheckAlways`.

```

[TRANSPLANTED_VIEWS_TO_REFRESH]: number;

```

A collection of views created based on the underlying `` element but inserted into a different `LContainer`. We need to track views created from a given declaration point since queries collect matches from the embedded view declaration point and `_not_` the insertion point.

```

[MOVED_VIEWS]: LView[]|null;

```

Pointer to the `TNode` which represents the host of the container.

```

[T_HOST]: TNode;

```

The comment element that serves as an anchor for this LContainer.

```

readonly [NATIVE]: RComment;

```

TODO(misko): remove as this value can be gotten by unwrapping `[HOST]`.

```

[HOST]: ViewRef[]|null;

```

Array of `ViewRef`s used by any `ViewContainerRef`s that point to this container. This is lazily initialized by `ViewContainerRef` when the first view is inserted.

NOTE: This is stored as `any[]` because `render3` should really not be aware of `ViewRef` and doing so creates circular dependency.

```

[VIEW_REFS]:

```

```

unknown[]|null;

```

Note: This hack is necessary so we don't erroneously get a circular dependency failure based on types.

```

export const unusedValueExportToPlacateAjd = 1;

parents.\n   */\n  [T_HOST]: TNode|null;\n\n  /**\n   * When a view is destroyed, listeners need to be released and
outputs need to be\n   * unsubscribed. This context array stores both listener functions wrapped with\n   * their
context and output subscription instances for a particular view.\n   *\n   * These change per LView instance, so they
cannot be stored on TView. Instead,\n   * TView.cleanup saves an index to the necessary context in this array.\n   *\n   * After `LView` is created it is possible to attach additional instance specific functions at the\n   * end of the
`IView[CLEANUP]` because we know that no more `T` level cleanup functions will be\n   * added here.\n   */\n  [CLEANUP]: any[]|null;\n\n  /**\n   * - For dynamic views, this is
the context with which to render the template (e.g.\n   * `NgForContext`), or `{}` if not defined explicitly.\n   * -
For root view of the root component it's a reference to the component instance itself.\n   * - For components, the

```

context is a reference to the component instance itself. \* - For inline views, the context is null. \*  
[CONTEXT]: T; \*\* An optional Module Injector to be used as fall back after Element Injectors are consulted.  
\* readonly[INJECTOR]: Injector|null; \*\* Factory to be used for creating Renderer. \*  
[RENDERER\_FACTORY]: RendererFactory; \*\* Renderer to be used for this view. \* [RENDERER]:  
Renderer; \*\* An optional custom sanitizer. \* [SANITIZER]: Sanitizer|null; \*\* Reference to the  
first LView or LContainer beneath this LView in the hierarchy. \* Necessary to store this so views can  
traverse through their nested views to remove listeners and call onDestroy callbacks. \* [CHILD\_HEAD]:  
LView|LContainer|null; \*\* The last LView or LContainer beneath this LView in the hierarchy. \*  
The tail allows us to quickly add a new state to the end of the view list without having to propagate starting  
from the first child. \* [CHILD\_TAIL]: LView|LContainer|null; \*\* View where this view's template  
was declared. \* The template for a dynamically created view may be declared in a different view than  
it is inserted. We already track the "insertion view" (view where the template was inserted) in  
LView[PARENT], but we also need access to the "declaration view" (view where the template was declared).  
Otherwise, we wouldn't be able to call the view's template function with the proper contexts. Context should be  
inherited from the declaration view tree, not the insertion view tree. \* Example (AppComponent  
template):  
<ng-template #foo></ng-template> <-- declared here  
--> <some-comp [tpl]="foo"></some-comp> <-- inserted inside this component --> \* The <ng-  
template> above is declared in the AppComponent template, but it will be passed into SomeComp and inserted  
there. In this case, the declaration view would be the AppComponent, but the insertion view would be  
SomeComp. When we are removing views, we would want to traverse through the insertion view to clean up  
listeners. When we are calling the template function during change detection, we need the declaration view to  
get inherited context. \* [DECLARATION\_VIEW]: LView|null; \*\* Points to the declaration  
component view, used to track transplanted `LView`s. \* See: `DECLARATION\_VIEW` which points to the  
actual `LView` where it was declared, whereas `DECLARATION\_COMPONENT\_VIEW` points to the  
component which may not be same as `DECLARATION\_VIEW`. \* Example:  
<#VIEW #myComp> <div  
\*ngIf="true"> <ng-template #myTpl>...</ng-template> </div> </#VIEW> \* In the  
above case `DECLARATION\_VIEW` for `myTpl` points to the `LView` of `ngIf` whereas  
`DECLARATION\_COMPONENT\_VIEW` points to `LView` of the `myComp` which owns the template. \*  
The reason for this is that all embedded views are always check-always whereas the component view can be  
check-always or on-push. When we have a transplanted view it is important to determine if we have  
transplanted a view from check-always declaration to on-push insertion point. In such a case the transplanted  
view needs to be added to the `LContainer` in the declared `LView` and CD during the declared view CD (in  
addition to the CD at the insertion point.) (Any transplanted views which are intra Component are of no interest  
because the CD strategy of declaration and insertion will always be the same, because it is the same component.)  
\* Queries already track moved views in `LView[DECLARATION\_LCONTAINER]` and `LContainer[MOVED\_VIEWS]`. However the queries also track `LView`s which moved within the same component `LView`. Transplanted views are a subset of moved views, and we use  
`DECLARATION\_COMPONENT\_VIEW` to differentiate them. As in this example. \* Example showing  
intra component `LView` movement. \*  
<#VIEW #myComp> <div \*ngIf="condition; then  
thenBlock else elseBlock"></div> <ng-template #thenBlock>Content to render when condition is true.</ng-  
template> <ng-template #elseBlock>Content to render when condition is false.</ng-template> \*  
</#VIEW> \* The `thenBlock` and `elseBlock` is moved but not transplanted. \* Example  
showing inter component `LView` movement (transplanted view). \*  
<#VIEW #myComp> <ng-  
template #myTpl>...</ng-template> <insertion-component [template]="myTpl"></insertion-  
component>

```

* </#VIEW>\n * ``\n * In the above example `myTpl` is passed into a different component. If `insertion-
component`\n * instantiates `myTpl` and `insertion-component` is on-push then the `LContainer` needs to be\n
* marked as containing transplanted views and those views need to be CD as part of the\n * declaration CD.\n *\n
*\n * When change detection runs, it iterates over `[MOVED_VIEWS]` and CDs any child `LView`s where\n *
the `DECLARATION_COMPONENT_VIEW` of the current component and the child `LView` does not match\n
* (it has been transplanted across components.)\n *\n * Note: `[DECLARATION_COMPONENT_VIEW]` points
to itself if the LView is a component view (the\n * simplest / most common case).\n *\n * see also:\n * -

This cleanup array stores both listener data (in chunks of 4)\n \* and output data (in chunks of 2) for a particular view. Combining the arrays\n \* saves on memory (70 bytes per array) and on a few bytes of code size (for two\n \* separate for loops).\n \*\n \* If it's a native DOM listener or output subscription being stored:\n \* 1st index is: event name `name = tView.cleanup[i+0]`\n \* 2nd index is: index of native element or a function that retrieves global target (window,\n \* document or body) reference based on the native element:\n \* `typeof idxOrTargetGetter === 'function': global target getter function\n \* `typeof idxOrTargetGetter === 'number': index of native element`\n \* 3rd index is: index of listener function `listener = lView[CLEANUP][tView.cleanup[i+2]]`\n \* 4th index is: `useCaptureOrIdx = tView.cleanup[i+3]`\n \* `typeof useCaptureOrIdx === 'boolean': useCapture boolean\n \* `typeof useCaptureOrIdx === 'number': `useCaptureOrIdx >= 0`\n \* `removeListener = lView[CLEANUP][useCaptureOrIdx]`\n \* `useCaptureOrIdx < 0` `subscription = lView[CLEANUP][-useCaptureOrIdx]`\n \*\n \* If it's an output subscription or query list destroy hook:\n \* 1st index is: output unsubscribe function / query list destroy function\n \* 2nd index is: index of function context in lView.cleanupInstances[]\n \* `tView.cleanup[i+0].call(lView[CLEANUP][tView.cleanup[i+1]])`\n \*/\n\n cleanup: any[][]|null;\n\n /\*\*\n \* A list of element indices for child components that will need to be\n \* refreshed when the current view has finished its check. These indices have\n \* already been adjusted for the HEADER\_OFFSET.\n \*\n \* components: number[][]|null;\n\n /\*\*\n \* A collection of queries tracked in a given view.\n \*\n \* queries: TQueries|null;\n\n /\*\*\n \* An array of indices pointing to directives with content queries alongside with the\n \* corresponding query index. Each entry in this array is a tuple of:\n \* - index of the first content query index declared by a given directive;\n \* - index of a directive.\n \*\n \* We are storing those indexes so we can refresh content queries as part of a view refresh\n \* process.\n \*/\n\n contentQueries: number[][]|null;\n\n /\*\*\n \* Set of schemas that declare elements to be allowed inside the view.\n \*/\n\n schemas: SchemaMetadata[][]|null;\n\n /\*\*\n \* Array of constants for the view. Includes attribute arrays, local definition arrays etc.\n \* Used for directive matching, attribute bindings, local definitions and more.\n \*/\n\n consts: TConstants|null;\n\n /\*\*\n \* Indicates that there was an error before we managed to complete the first create pass of the\n \* view. This means that the view is likely corrupted and we should try to recover it.\n \*/\n\n incompleteFirstPass: boolean;\n\n /\*\*\n \* Single hook callback function.\n \*/\n\n export type HookFn = () => void;\n\n /\*\*\n \* Information necessary to call a hook. E.g. the callback that\n \* needs to be invoked and the index at which to find its context.\n \*/\n\n export type HookEntry = number|HookFn;\n\n /\*\*\n \* Array of hooks that should be executed for a view and their directive indices.\n \*\n \* For each node of the view, the following data is stored:\n \* 1) Node index (optional)\n \* 2) A series of number/function pairs where:\n \* - even indices are directive indices\n \* - odd indices are hook functions\n \*\n \* Special cases:\n \* - a negative directive index flags an init hook (ngOnInit, ngAfterContentInit, ngAfterViewInit)\n \*/\n\n export type HookData = HookEntry[];\n\n /\*\*\n \* Array of destroy hooks that should be executed for a view and their directive indices.\n \*\n \* The array is set up as a series of number/function or number/(number|function)[]:\n \* - Even indices represent the context with which hooks should be called.\n \* - Odd indices are the hook functions themselves. If a value at an odd index is an array,\n \* it represents the destroy hooks of a `multi` provider where:\n \* - Even indices represent the index of the provider for which we've registered a destroy hook,\n \* inside of the `multi` provider array.\n \* - Odd indices are the destroy hook functions.\n \*\n \* For example:\n \* lView: `[0, 1, 2, AService, 4, [BService, CService, DService]]`\n \* destroyHooks: `[3, AService.ngOnDestroy, 5, [0, BService.ngOnDestroy, 2, DService.ngOnDestroy]]`\n \*\n \* In the example above `AService` is a type provider

with an `ngOnDestroy``, whereas `BService``, `CService`` and `DService`` are part of a `multi`` provider where only `BService`` and `DService`` have an `ngOnDestroy`` hook.

```

export type DestroyHookData =
(HookEntry|HookData)[];
/**
 * Static data that corresponds to the instance-specific data array on an LView.
 * Each node's static data is stored in tData at the same index that it's stored
 * in the data array. Any nodes that do not have static data store a null value in tData to avoid a sparse array.
 * Each pipe's definition is stored here at the same index as its pipe instance in the data array.
 * Each host property's name is stored here at the same index as its value in the data array.
 * Each property binding name is stored here at the same index as its value in the data array.
 * If the binding is an interpolation, the static string values are stored parallel to the dynamic values.
 * Example: id="prefix {{ v0 }} a {{ v1 }} b {{ v2 }}"
 * LView | TView.data----- v0 value | 'a' v1 value | 'b' v2 value | id prefix suffix
 * Injector bloom filters are also stored here.
 */

`LView`` is a data structure used internally to keep track of views. The `LView`` is designed for efficiency and so at times it is difficult to read or write tests which assert on its values. For this reason when `ngDevMode`` is true we patch a `LView.debug`` property which points to `LViewDebug`` for easier debugging and test writing. It is the intent of `LViewDebug`` to be used in tests.

```

export interface LViewDebug<T = unknown> {
  /**
   * Flags associated with the LView unpacked into a more readable state.
   * See LViewFlags` for the flag meanings.
   */
  readonly flags: {
    initPhaseState: number,
    creationMode: boolean,
    firstViewPass: boolean,
    checkAlways: boolean,
    dirty: boolean,
    attached: boolean,
    destroyed: boolean,
    isRoot: boolean,
    indexWithinInitPhase: number,
  };
  /**
   * Associated TView
   */
  readonly tView: TView;
  /**
   * Parent view (or container)
   */
  readonly parent: LViewDebug|LContainerDebug|null;
  /**
   * Next sibling to the LView
   */
  readonly next: LViewDebug|LContainerDebug|null;
  /**
   * The context used for evaluation of the LView
   */
  readonly context: T;
  /**
   * Hierarchical tree of nodes
   */
  readonly nodes: DebugNode[];
  /**
   * Template structure (no instance data).
   * (Shows how TNodes are connected)
   */
  readonly template: string;
  /**
   * HTML representation of the LView
   */
  /**
   * This is only approximate to actual HTML as child LView`s are removed.
   */
  readonly html: string;
  /**
   * The host element to which this LView` is attached.
   */
  readonly hostHTML: string|null;
  /**
   * Child LView`s
   */
  /**
   * Sub range of LView` containing decls (DOM elements)
   */
  readonly decls: LViewDebugRange;
  /**
   * Sub range of LView` containing vars (bindings)
   */
  readonly vars: LViewDebugRange;
  /**
   * Sub range of LView` containing expando (used by DI)
   */
  readonly expando: LViewDebugRange;
}

```

`LContainer`` is a data structure used internally to keep track of child views. The `LContainer`` is designed for efficiency and so at times it is difficult to read or write tests which assert on its values. For this reason when `ngDevMode`` is true we patch a `LContainer.debug`` property which points to `LContainerDebug`` for easier debugging and test writing. It is the intent of `LContainerDebug`` to be used in tests.

```

export interface LContainerDebug {
  /**
   * Child LView`s
   */
  readonly views: LViewDebug[];
  /**
   * Parent
   */
  readonly parent: LViewDebug|null;
  /**
   * Moved views
   */
  readonly movedViews: LView[]|null;
  /**
   * Host
   */
  readonly host: RElement|RComment|LView;
  /**
   * Next
   */
  readonly next: LViewDebug|LContainerDebug|null;
  /**
   * Has transplanted views
   */
  readonly hasTransplantedViews: boolean;
}

```

`LView`` is subdivided to ranges where the actual data is stored. Some of these ranges such as `decls`` and `vars`` are known at compile time. Other such as `i18n`` and `expando`` are runtime only concepts.

```

export interface LViewDebugRange {
  /**
   * The starting index in LView` where the range begins. (Inclusive)
   */
  start: number;
  /**
   * The ending index in LView` where the range ends. (Exclusive)
   */
  end: number;
}

```

```

/**\n * The length of the range\n */\n length: number;\n\n /**\n * The merged content of the range. `t` contains
data from `TVIEW.data` and `l` contains `LVIEW`\n */\n content:

const inner = x().$implicit;
const outer = x().$implicit;

Store the element depth count. This is used to identify the root elements of the template so that we can then attach patch data to only those elements. We know that those are the only places where the patch data could change, this way we will save on number of places where the patching occurs.

Current namespace to be used when creating elements

The root index from which pure function instructions should calculate their binding indices. In component views, this is TView.bindingStartIndex. In a host binding context, this is the TView.expandoStartIndex + any dirs/hostVars before the given dir.

Current index of a View or Content Query which needs to be processed next. We iterate over the list of Queries and increment current query index at every step.

When host binding is executing this points to the directive index. TView.data[currentDirectiveIndex] is DirectiveDef LView[currentDirectiveIndex] is directive instance.

Are we currently in i18n block as denoted by elementStart and elementEnd. This information is needed because while we are in i18n block all elements must be pre-declared in the translation. (i.e. `Hello #2World/#2!` pre-declares element at `#2` location.) This allocates TNodeType.Placeholder element at location `2`. If translator removes `#2` from translation then the runtime must also ensure the element at `2` does not get inserted into the DOM. The translation does not carry information about deleted elements. Therefore the only way to know that an element is deleted is that it was not pre-declared in the translation. This flag works by ensuring that elements which are created without pre-declaration (TNodeType.Placeholder) are not inserted into the DOM render tree. (It does mean that the element still gets instantiated along with all of its behavior [directives])

All implicit instruction state is stored here. It is useful to have a single object where all of the state is stored as a mental model (rather it being spread across many different variables.)

PERF NOTE: Turns out that writing to a true global variable is slower than having an intermediate object with properties.

a relative

location of parent injector.\n \*\n \* The interfaces encodes number of parents `LView`s to traverse and index in the `LView`\n \* pointing to the parent injector.\n \*/\nexport interface RelativeInjectorLocation {\n \_\_brand\_\_:\n 'RelativeInjectorLocationFlags';\n}\n\nexport const enum RelativeInjectorLocationFlags {\n InjectorIndexMask = 0b1111111111111111,\n ViewOffsetShift = 16,\n NO\_PARENT = -1,\n}\n\nexport const NO\_PARENT\_INJECTOR: RelativeInjectorLocation = -1 as any;\n\n/\*\*\n \* Each injector is saved in 9 contiguous slots in `LView` and 9 contiguous slots in\n \* `TView.data`. This allows us to store information about the current node's tokens (which\n \* can be shared in `TView`) as well as the tokens of its ancestor nodes (which cannot be\n \* shared, so they live in `LView`).\n \*\n \* Each of these slots (aside from the last slot) contains a bloom filter. This bloom filter\n \* determines whether a directive is available on the associated node or not. This prevents us\n \* from searching

the directives array at this level unless it's probable the directive is in it.\n \*\n \* See:

[https://en.wikipedia.org/wiki/Bloom\\_filter](https://en.wikipedia.org/wiki/Bloom_filter) for more about bloom filters.\n \*\n \* Because all injectors have been flattened into `LView` and `TViewData`, they cannot typed\n \* using interfaces as they were previously. The start index of each `LInjector` and `TInjector`\n \* will differ based on where it is flattened into the main array, so it's not possible to know\n \* the indices ahead of time and save their types here. The interfaces are still included here\n \* for documentation purposes.\n \*\n \* export interface LInjector extends Array<any> {\n \*\n \* // Cumulative bloom for directive IDs 0-31 (IDs are % BLOOM\_SIZE)\n \* [0]: number;\n \*\n \* // Cumulative bloom for directive IDs 32-63\n \* [1]: number;\n \*\n \* // Cumulative bloom for directive IDs 64-95\n \* [2]: number;\n \*\n \* // Cumulative bloom for directive IDs 96-127\n \* [3]: number;\n \*\n \* // Cumulative bloom for directive IDs 128-159\n \* [4]: number;\n \*\n \* // Cumulative bloom for directive IDs 160 - 191\n \* [5]: number;\n \*\n \* // Cumulative bloom for directive IDs 192 - 223\n \* [6]: number;\n \*\n \* // Cumulative bloom for directive IDs 224 - 255\n \* [7]: number;\n \*\n \* // We need to store a reference to the injector's parent so DI can keep looking up\n \* // the injector tree until it finds the dependency it's looking for.\n \* [PARENT\_INJECTOR]: number;\n \* }\n \*\n \* export interface TInjector extends Array<any> {\n \*\n \* // Shared node bloom for directive IDs 0-31 (IDs are % BLOOM\_SIZE)\n \* [0]: number;\n \*\n \* // Shared node bloom for directive IDs 32-63\n \* [1]: number;\n \*\n \* // Shared node bloom for directive IDs 64-95\n \* [2]: number;\n \*\n \* // Shared node bloom for directive IDs 96-127\n \* [3]: number;\n \*\n \* // Shared node bloom for directive IDs 128-159\n \* [4]: number;\n \*\n \* // Shared node bloom for directive IDs 160 - 191\n \* [5]: number;\n \*\n \* // Shared node bloom for directive IDs 192 - 223\n \* [6]: number;\n \*\n \* // Shared node bloom for directive IDs 224 - 255\n \* [7]: number;\n \*\n \* // Necessary to find directive indices for a particular node.\n \* [TNODE]: TElementNode|TElementContainerNode|TContainerNode;\n \* }\n \*\n \* Factory for creating instances of injectors in the NodeInjector.\n \*\n \* This factory is complicated by the fact that it can resolve `multi` factories as well.\n \*\n \* NOTE: Some of the fields are optional which means that this class has two hidden classes.\n \* - One without `multi` support (most common)\n \* - One with `multi` values, (rare).\n \*\n \* Since VMs can cache up to 4 inline hidden classes this is OK.\n \*\n \* - Single factory: Only `resolving` and `factory` is defined.\n \* - `providers` factory: `componentProviders` is a number and `index = -1`.\n \* - `viewProviders` factory: `componentProviders` is a number and `index`

```
points to `providers`.\n */\nexport class NodeInjectorFactory {\n /**\n * The inject implementation to be activated when using the factory.\n */\n injectImpl: null|(<T>(token: ProviderToken<T>, flags?: InjectFlags) => T);\n\n /**\n * Marker set to true during factory invocation to see if we get into recursive loop.\n * Recursive loop causes an error to be displayed.\n */\n resolving = false;\n\n /**\n * Marks that the token can see other Tokens declared in `viewProviders` on the same node.\n */\n canSeeViewProviders: boolean;\n\n /**\n * An array of factories to use in case of `multi` provider.\n */\n multi?: Array<() => any>;\n\n /**\n * Number of `multi`-providers which belong to the component.\n *\n * This is needed because when multiple components and directives declare the `multi` provider\n * they have to be concatenated in the correct order.\n *\n * Example:\n *\n * If we have a component and directive active an a single element as declared
```

```

here\n * ```\n * component:\n * providers: [ {provide: String, useValue: 'component', multi: true} ],\n *
viewProviders: [ {provide: String, useValue: 'componentView', multi: true} ],\n * \n * directive:\n * providers: [
{provide: String, useValue: 'directive', multi: true} ],\n * ```\n * \n * Then the expected results are:\n * \n * ```\n
* providers: ['component', 'directive']\n * viewProviders: ['component', 'componentView', 'directive']\n * ```\n
*\n * The way to think about it is that the `viewProviders` have been inserted after the component\n * but before
the directives, which is why we need to know how many `multi`s have been declared by\n * the component.\n * \n
componentProviders?: number;\n\n /**\n * Current index of the Factory in the `data`. Needed for `viewProviders`
and `providers` merging.\n * See `providerFactory`. \n * \n index?: number;\n\n /**\n * Because the same
`multi` provider can be declared in `providers`
and `viewProviders` it is\n * possible for `viewProviders` to shadow the `providers`. For this reason we store the\n
* `provideFactory` of the `providers` so that `providers` can be extended with `viewProviders`. \n * \n
Example:\n * \n * Given:\n * ```\n * providers: [ {provide: String, useValue: 'all', multi: true} ],\n *
viewProviders: [ {provide: String, useValue: 'viewOnly', multi: true} ],\n * ```\n * \n * We have to return `[all]`
in case of content injection, but `[all, 'viewOnly']` in case\n * of view injection. We further have to make sure that
the shared instances (in our case\n * `all`) are the exact same instance in both the content as well as the view
injection. (We\n * have to make sure that we don't double instantiate.) For this reason the `viewProviders`\n *
`Factory` has a pointer to the shadowed `providers` factory so that it can instantiate the\n * `providers` (`[all]`) and
then extend it with `viewProviders` (`[all] + ['viewOnly']
= \n * `[all, 'viewOnly']`). \n * \n providerFactory?: NodeInjectorFactory|null;\n\n\n constructor(\n /**\n *

function that returns that array.\n *\n export type TConstantsOrFactory = TConstants|TConstantsFactory;\n\n /**\n *
Binding data (flyweight) for a particular node that is shared between all templates\n * of a specific type.\n *\n * If
a property is:\n * - PropertyAliases: that property's data was generated and this is it\n * - Null: that property's data
was already generated and nothing was found.\n * - Undefined: that property's data has not yet been generated\n
*\n * see: https://en.wikipedia.org/wiki/Flyweight_pattern for
more on the Flyweight pattern\n *\n export interface TNode {\n * /** The type of the TNode. See TNodeType. *\n
type: TNodeType;\n\n /**\n * Index of the TNode in TView.data and corresponding native element in LView.\n
*\n * This is necessary to get from any TNode to its corresponding native element when\n * traversing the node
tree.\n *\n * If index is -1, this is a dynamically created container node or embedded view node.\n *\n index:
number;\n\n /**\n * Insert before existing DOM node index.\n *\n * When DOM nodes are being inserted,
normally they are being appended as they are created.\n * Under i18n case, the translated text nodes are created
ahead of time as part of the\n * `i18nStart` instruction which means that this `TNode` can't just be appended and
instead\n * needs to be inserted using `insertBeforeIndex` semantics.\n *\n * Additionally sometimes it is
necessary to insert new text nodes as a child of this `TNode`. In\n * such a case the
value stores an array of text nodes to insert.\n *\n * Example:\n * ``\n * <div i18n>\n * Hello
<span>World</span>!</div>\n * ``\n *\n * In the above example the `i18nStart` instruction can create `Hello`,
`World` and `!` text\n * nodes. It can also insert `Hello` and `!` text node as a child of `<div>`, but it can't\n
* insert `World` because the `<span>` node has not yet been created. In such a case the\n * `<span>` `TNode` will
have an array which will direct the `<span>` to not only insert\n * itself in front of `!` but also to insert the `World`
(created by `i18nStart`) into\n * `<span>` itself.\n *\n * Pseudo code:\n * ``\n * if (insertBeforeIndex ===

```

be used for attribute selectors.

- \* We merge attrs here so that it can be used in a performant way for initial rendering.
- \* The `attrs` are merged in first pass in following order:
  - \* - Component's `hostAttrs`
  - \* - Directives' `hostAttrs`
  - \* - Template `TNode.attrs` associated with the current `TNode`.
- \* `mergedAttrs: TAttributes|null;`
- \* A set of local names under which a given element is exported in a template and visible to queries. An entry in this array can be created for different reasons:
  - \* - an element itself is referenced, ex.: `

`
  - \* - a component is referenced, ex.: ``
  - \* - a directive is referenced, ex.: ``
- \* A given element might have different local names and those names can be associated with a directive.
- \* We store local names at even indexes while odd indexes are reserved for directive index in a view (or `-1` if there is no associated directive).
- \* Some examples:
  - \* - `

` => `["foo", -1]`
  - \* - `` => `["foo", myCmptIdx]`
  - \* - `` => `["foo", myCmptIdx, "bar", directiveIdx]`
  - \* - `

` => `["foo", -1, "bar", directiveIdx]`
- \* `localNames: (string|number)[]|null;`
- \* Information about input properties that need to be set once from attribute data.
  - \* `initialInputs: InitialInputData|undefined;`
  - \* Input data for all directives on this node. `null` means that there are no directives with inputs on this node.
  - \* `inputs: PropertyAliases|null;`
  - \* Output data for all directives on this node. `null` means that there are no directives with outputs on this node.
  - \* `outputs: PropertyAliases|null;`
  - \* The TView or TViews attached to this node.
  - \* If this TNode corresponds to an LContainer with inline views, the container will need to store separate static data for each of its view blocks (TView[]). Otherwise, nodes in inline views with the same index as nodes in their parent views will overwrite each other, as they are in the same template.
  - \* Each index in this array corresponds to the static data for a certain view. So if you had V(0) and V(1) in a container, you might have:
    - \* `[{tagName: 'div', attrs: ...}, null], // V(0) TView`
    - \* `[{tagName: 'button', attrs: ...}, null] // V(1) TView`
  - \* If this TNode corresponds to an LContainer with a template (e.g. structural directive), the template's TView will be stored here.
  - \* If this TNode corresponds to an element, tViews will be null.
  - \* `tViews: TView|TView[]|null;`
  - \* The next sibling node. Necessary so we can propagate through the root nodes of a view to insert them or remove them from the DOM.
  - \* `next: TNode|null;`
  - \* The next projected sibling. Since in Angular content projection works on the node-by-node basis the act of projecting nodes might change nodes relationship at the insertion point (target view). At the same time we need to keep initial relationship between nodes as expressed in content view.
  - \* `projectionNext: TNode|null;`
  - \* First child of the current node.
    - \* For component nodes, the child will always be a ContentChild (in same view).
    - \* For embedded view nodes, the child will be in their child view.
    - \* `child: TNode|null;`
    - \* Parent node (in the same view only).
    - \* We need a reference to a node's parent so we can append the node to its parent's native element at the appropriate time.
    - \* If the parent would be in a different view (e.g. component host), this property will be null.
    - \* It's important that we don't try to cross component boundaries when retrieving the parent because the parent will change (e.g. index, attrs) depending on where the component was used (and thus shouldn't be stored on TNode). In these cases, we retrieve the parent through LView.node instead (which will be instance-specific).
    - \* If this is an inline view node (V), the parent will be its container.
    - \* `parent: TElementNode|TContainerNode|null;`
    - \* List of projected TNodes for a given component host element OR index into the said nodes.
    - \* For easier discussion assume this example:
      - \* ``'s view definition:
 

```
<child id="c1">content1</child>
<child id="c2"><span>content2</span></child>
```
      - \* ``'s view definition:
 

```
<ng-content id="cont1"></ng-content>
```
    - \* If `Array.isArray(projection)` then `TNode` is a host element.
      - \* `projection` stores the content nodes which are to be projected.
      - \* The nodes represent categories defined by the selector: For example:
 

```
<ng-content/><ng-content select="abc"/>
```
      - \* would represent the heads for `      - \* The nodes we store in `projection` are heads only, we used `next` to get their siblings.
      - \* The nodes `next`

is sorted/rewritten as part of the projection setup.

- \* - `projection` size is equal to the number of projections

`<ng-content>`. The size of `c1`` will be `1`` because `<child>` has only one `<ng-content>`.

- \* - we store `projection`` with the host (`c1``, `c2``) rather than the `<ng-content>` (`cont1``) because the same component (`<child>`) can be used in multiple locations (`c1``, `c2``) and `projection`` as a result have different set of nodes to project.
- \* - without `projection`` it would be difficult to efficiently traverse nodes to be projected.
- \* If `typeof projection == 'number'` then `TNode`` is a `<ng-content>` element:
  - \* - `projection`` is an index of the host's `projection`Nodes``
  - \* This would return the first head node to project:

```
getHost(currentTNode).projection[currentTNode.projection]
```
- \* - When projecting nodes the parent node retrieved may be a `<ng-content>` node, in which case the process is recursive in nature.
  - \* If `projection`` is of type `RNode[]`` then we have a collection of native nodes passed as `projectable nodes`` during dynamic component creation.

```
projection: (TNode|RNode[])[]|number|null;
```
  - \* A collection of all `static values`` for an element (including from host). This field will be populated if and when:
    - \* - There are one or more initial `style`s`` on an element (e.g. `<div style="width:200px;">`)
    - \* - There are one or more initial `style`s`` on a directive/component host (e.g. `@Directive({host: {style: "width:200px;" } })`)
  - \* A collection of all `style` static values`` for an element excluding host sources.
    - \* Populated when there are one or more initial `style`s`` on an element (e.g. `<div style="width:200px;">`)
    - \* Must be stored separately from `tNode.styles`` to facilitate setting directive inputs that shadow the `style`` property. If we used `tNode.styles`` as is for shadowed inputs, we would feed host styles back into directives as `"inputs"`. If we used `tNode.attrs``, we would have to concatenate the attributes on every template pass. Instead, we process once on first create pass and store here.
    - \* `stylesWithoutHost: string|null;`
    - \* A `KeyValueArray`` version of residual `styles``. When there are styling instructions than each instruction stores the static styling which is of lower priority than itself. This means that there may be a higher priority styling than the instruction.
      - \* Imagine: `<div style="color: highest;" my-dir>`
      - \* `@Directive({ host: { style: 'color: lowest;', '[styles.color]': 'exp // styleProp('color', ctx.exp); } })`
    - \* In the above case: `color: lowest`` is stored with `styleProp('color', ctx.exp);`` instruction
    - \* `color: highest`` is the residual and is stored here.
    - \* `undefined``: not initialized.
    - \* `null``: initialized but `styles`` is `null``
    - \* `KeyValueArray``: parsed version of `styles``
    - \* `residualStyles: KeyValueArray<any>|undefined|null;`
    - \* A collection of all class static values for an element (including from host). This field will be populated if and when:
      - \* - There are one or more initial classes on an element (e.g. `<div class="one two three">`)
      - \* - There are one or more initial classes on an directive/component host (e.g. `@Directive({host: {class: "SOME_CLASS" } })`)
    - \* A collection of all class static values for an element excluding host sources.
      - \* Populated when there are one or more initial classes on an element (e.g. `<div class="SOME_CLASS">`)
      - \* Must be stored separately from `tNode.classes`` to facilitate setting directive inputs that shadow the `class`` property. If we used `tNode.classes`` as is for shadowed inputs, we would feed host classes back into directives as `"inputs"`. If we used `tNode.attrs``, we would have to concatenate the attributes on every template pass. Instead, we process once on first create pass and store here.
      - \* `classesWithoutHost: string|null;`
      - \* A `KeyValueArray`` version of residual `classes``
      - \* Same as `TNode.residualStyles`` but for classes.
      - \* `undefined``: not initialized.
      - \* `null``: initialized but `classes`` is `null``
      - \* `KeyValueArray``: parsed version of `classes``
      - \* `residualClasses: KeyValueArray<any>|undefined|null;`
      - \* Stores the head/tail index of the class bindings.
        - \* - If no bindings, the head and tail will both be 0.
        - \* - If there are template bindings, stores the head/tail of the class bindings in the template.
        - \* - If no template bindings but there are host bindings, the head value will point to the last host binding for `"class"` (not the head of the linked list), tail will be 0.
      - \* See: `style_binding_list.ts`` for details.
      - \* This is used by `insertTStylingBinding`` to know where the

 * Expresses a single CSS Selector.
 * Beginning of array - First index: element name
 * - Subsequent odd indices: attr keys
 * - Subsequent even indices: attr values
 * After SelectorFlags.CLASS flag
 * - Class name values
 * SelectorFlags.NOT flag - Changes the mode to NOT
 * - Can be combined with other flags to set the element / attr / class mode
 * e.g. SelectorFlags.NOT | SelectorFlags.ELEMENT
 * Example:
 * Original: `div.foo.bar[attr1=val1][attr2]`
 * Parsed: ['div', 'attr1', 'val1', 'attr2', ' ', SelectorFlags.CLASS, 'foo', 'bar']
 * Original: `div[attr1]:not(.foo[attr2])`
 * Parsed: [
 * 'div', 'attr1', ' ',
 * SelectorFlags.NOT | SelectorFlags.ATTRIBUTE 'attr2', ' ',
 * SelectorFlags.CLASS, 'foo'
 * ]
 * See more examples in node_selector_matcher_spec.ts

ImportProvidersSource =\nType<unknown>|ModuleWithProviders<unknown>|Array<ImportProvidersSource>;\n\n\n/**\n * Collects providers

```

from all NgModules and standalone components, including transitively imported ones. Providers extracted via `importProvidersFrom` are only usable in an application injector or another environment injector (such as a route injector). They should not be used in component providers. More information about standalone components can be found in [this guide](guide/standalone-components). @usageNotes

The results of the `importProvidersFrom` call can be used in the `bootstrapApplication` call:

```

typescript
await bootstrapApplication(RootComponent, { providers: [ importProvidersFrom(NgModuleOne,
NgModuleTwo) ] });

```

You can also use the `importProvidersFrom` results in the `providers` field of a route, when a standalone component is used:

```

typescript
export const ROUTES: Route[] = [
  { path: 'foo', providers: [ importProvidersFrom(NgModuleOne, NgModuleTwo) ],
  component: YourStandaloneComponent } ];

```

@returns Collected providers from the specified list of types.

@publicApi @developerPreview

Creates and initializes a custom renderer that implements the `Renderer2` base class.
@publicApi
export abstract class RendererFactory2 {
  */
  Creates and initializes a custom renderer for a host DOM element.
  @param hostElement The element to render.
  @param type The base class to implement.
  @returns The new custom renderer instance.
  abstract createRenderer(hostElement: any, type: RenderType2|null): Renderer2;
  */
  A callback invoked when rendering has begun.
  abstract begin?(): void;
  */
  A callback invoked when rendering has completed.
  abstract end?(): void;
  */
  Use with animations test-only mode. Notifies the test when rendering has completed.
  @returns The asynchronous result of the developer-defined function.
  abstract whenRenderingDone?(): Promise<any>;
}
*/
Extend this base class to implement custom rendering. By default, Angular renders a template into DOM. You can use custom rendering to intercept rendering calls, or to render to something other than DOM.
Create your custom renderer using `RendererFactory2`.
Use a custom renderer to bypass Angular's templating and make custom UI changes that can't be expressed declaratively.
For example if you need to set a property or an attribute whose name is not statically known, use the `setProperty()` or `setAttribute()` method.
@publicApi
export abstract class Renderer2 {
  */
  Use to store arbitrary developer-defined data on a renderer instance, as an object containing key-value pairs.
  This is useful for renderers that delegate to other renderers.
  abstract get data(): {[key: string]: any};
  */
  Implement this callback to destroy the renderer or the host element.
  abstract destroy(): void;
  */
  Implement this callback to create an instance of the host element.
  @param name An identifying name for the new element, unique within the namespace.
  @param namespace The namespace for the new element.
  @returns The new element.
  abstract createElement(name: string, namespace?: string|null): any;
  */
  Implement this callback to add a comment to the DOM of the host element.
  @param value The comment text.
  @returns The modified element.
  abstract createComment(value: string): any;
  */
  Implement this callback to add text to the DOM of the host element.
  @param value The text string.
  @returns The modified element.
  abstract createText(value: string): any;
  */
  If null or undefined, the view engine won't call it. This is used as a performance optimization for production mode.
  // TODO(issue/24571): remove '!'.
  destroyNode!: ((node: any) => void)|null;
  */
  Appends a child to a given parent node in the host element DOM.
  @param parent The parent node.
  @param newChild The new child node.
  abstract appendChild(parent: any, newChild: any): void;
  */
  Implement this callback to insert a child node at a given position in a parent node in the host element DOM.

```

\* @param parent The parent node.\n \* @param newChild The new child nodes.\n \* @param refChild The existing child node before which `newChild` is inserted.\n \* @param isMove Optional argument which signifies if the current `insertBefore` is a result of a\n \* move. Animation uses this information to trigger move animations. In the past the Animation\n \* would always assume that any `insertBefore` is a move. This is not strictly true because\n \* with runtime i18n it is possible to invoke `insertBefore` as a result of i18n and it should\n \* not trigger an animation move.\n \*/\n abstract insertBefore(parent: any, newChild: any, refChild: any, isMove?: boolean): void;\n /\*\*\n \* Implement this callback to remove a child node from the host element's DOM.\n \* @param parent The parent node.\n \* @param oldChild The child node to remove.\n \* @param isHostElement Optionally signal to the renderer whether this element is a host element\n \* or not\n \*/\n abstract removeChild(parent: any, oldChild: any, isHostElement?: boolean): void;\n /\*\*\n \* Implement this callback to prepare an element to be bootstrapped\n \* as a root element, and return the element instance.\n \* @param selectorOrNode The DOM element.\n \* @param preserveContent Whether the contents of the root element\n \* should be preserved, or cleared upon bootstrap (default behavior).\n \* Use with `ViewEncapsulation.ShadowDom` to allow simple native\n \* content projection via `` elements.\n \*/\n @returns The root element.\n \*/\n abstract selectRootElement(selectorOrNode: string|any, preserveContent?: boolean): any;\n /\*\*\n \* Implement this callback to get the parent of a given node\n \* in the host element's DOM.\n \* @param node The child node to query.\n \* @returns The parent node, or null if there is no parent.\n \* For WebWorkers, always returns true.\n \* This is because the check is synchronous,\n \* and the caller can't rely on checking for null.\n \*/\n abstract parentNode(node: any): any;\n /\*\*\n \* Implement this callback to get the next sibling node of a given node\n \* in the host element's DOM.\n \* @returns The sibling node, or null if there is no sibling.\n \* For WebWorkers, always returns a value.\n \* This is because the check is synchronous,\n \* and the caller can't rely on checking for null.\n \*/\n abstract nextSibling(node: any): any;\n /\*\*\n \* Implement this callback to set an attribute value for an element in the DOM.\n \* @param el The element.\n \* @param name The attribute name.\n \* @param value The new value.\n \* @param namespace The namespace.\n \*/\n abstract setAttribute(el: any, name: string, value: string, namespace?: string|null): void;\n /\*\*\n \* Implement this callback to remove an attribute from an element in the DOM.\n \* @param el The element.\n \* @param name The attribute name.\n \* @param namespace The namespace.\n \*/\n abstract removeAttribute(el: any, name: string, namespace?: string|null): void;\n /\*\*\n \* Implement this callback to add a class to an element in the DOM.\n \* @param el The element.\n \* @param name The class name.\n \*/\n abstract addClass(el: any, name: string): void;\n /\*\*\n \* Implement this callback to remove a class from an element in the DOM.\n \* @param el The element.\n \* @param name The class name.\n \*/\n abstract removeClass(el: any, name: string): void;\n /\*\*\n \* Implement this callback to set a CSS style for an element in the DOM.\n \* @param el The element.\n \* @param style The name of the style.\n \* @param value The new value.\n \* @param flags Flags for style variations. No flags are set by default.\n \*/\n abstract setStyle(el: any, style: string, value: any, flags?: RendererStyleFlags2): void;\n /\*\*\n \* Implement this callback to remove the value from a CSS style for an element in the DOM.\n \* @param el The element.\n \* @param style The name of the style.\n \* @param flags Flags for style variations to remove, if set. ???\n \*/\n abstract removeStyle(el: any, style: string, flags?: RendererStyleFlags2): void;\n /\*\*\n \* Implement this callback to set the value of a property of an element in the DOM.\n \* @param el The element.\n \* @param name The property name.\n \* @param value The new value.\n \*/\n abstract setProperty(el: any, name: string, value: any): void;\n /\*\*\n \* Implement this callback to set the value of a node in the host element.\n \* @param node The node.\n \* @param value The new value.\n \*/\n abstract setValue(node: any, value: string): void;\n /\*\*\n \* Implement this callback to start an event listener.\n \* @param target The context in which to listen for events. Can be\n \* the entire window or document, the body of the document, or a specific\n \* DOM element.\n \* @param eventName The event to listen for.\n \* @param callback A handler function to invoke when the event occurs.\n \* @returns An "unlisten" function for disposing of this handler.\n \*/\n abstract listen(\n target: 'window'|'document'|'body'|any, eventName: string,\n callback: (event: any) => boolean | void): () => void;\n /\*\*\n \* @internal\n \* @nocollapse\n \*/\n static \_\_NG\_ELEMENT\_ID\_\_: () => Renderer2 = () =>

/**
 * A ReflectiveDependency injection container used for instantiating objects and
  resolving
  * dependencies.
  * An `Injector` is
  a replacement for a `new` operator, which can automatically resolve the
  * constructor dependencies.
  * In
  typical use, application code asks for the dependencies in the constructor and they are
  * resolved by the
  `Injector`.
  * @usageNotes
  * ### Example
  * The following example creates an `Injector` configured to
  create `Engine` and `Car`.
  * ```typescript
  * @Injectable()
  * class Engine {
  * }
  * @Injectable()
  * class Car {
  *   constructor(public engine: Engine) {}
  * }
  * var injector =
  ReflectiveInjector.resolveAndCreate([Car, Engine]);
  * var car = injector.get(Car);
  * expect(car instanceof
  Car).toBe(true);
  * expect(car.engine instanceof Engine).toBe(true);
  * ```
  * Notice, we don't use the `new`
  operator because we explicitly want to have the `Injector`
  * resolve all of the object's dependencies
  automatically.
  * TODO: delete in v14.
  * @deprecated from v5 - slow and brings in a lot of code, Use
  `Injector.create`
  instead.
  * @publicApi
  */
export abstract class ReflectiveInjector implements Injector {
  /**
  * Turns an
  array of provider definitions into an array of resolved providers.
  *
  * A resolution is a process of flattening
  multiple nested arrays and converting individual
  * providers into an array of `ResolvedReflectiveProvider`s.
  *
  * @usageNotes
  * ### Example
  * ```typescript
  * @Injectable()
  * class Engine {
  * }
  * @Injectable()
  * class Car {
  *   constructor(public engine: Engine) {}
  * }
  * var providers =
  ReflectiveInjector.resolve([Car, [[Engine]]]);
  * expect(providers.length).toEqual(2);
  * expect(providers[0] instanceof ResolvedReflectiveProvider).toBe(true);
  * expect(providers[0].key.displayName).toBe("Car");
  * expect(providers[0].dependencies.length).toEqual(1);
  * expect(providers[0].factory).toBeDefined();
  * expect(providers[1].key.displayName).toBe("Engine");
  */

```

```

    * });\n * ```\n * \n * \n static resolve(providers: Provider[]): ResolvedReflectiveProvider[] {\n return

of the value stored in the `TData` which is\n * needed to re-concatenate the styling.\n
*\n * - `string`: Stores the property name. Used with `styleProp`/^classProp` instruction.\n * - `null`: Represents
map, so there is no name. Used with `styleMap`/^classMap`. \n * - `false`: Represents an ignore case. This happens
when `styleProp`/^classProp` instruction\n * is combined with directive which shadows its input `@Input('class')`.
That way the binding\n * should not participate in the styling resolution.\n */\nexport type TStylingKeyPrimitive =
string|null|false;\n\n/**\n * Store the static values for the styling binding.\n *\n * The `TStylingStatic` is just
`KeyValueArray` where key `""` (stored at location 0) contains the\n * `TStylingKey` (stored at location 1). In
other words this wraps the `TStylingKey` such that the\n * `""` contains the wrapped value.\n *\n * When
instructions are resolving styling they may need to look forward or backwards in the linked\n * list to resolve the
value. For this reason we have to make sure that the linked list
also contains\n * the static values. However the list only has space for one item per styling instruction. For this\n
* reason we store the static values here as part of the `TStylingKey`. This means that the\n * resolution function when
looking for a value needs to first look at the binding value, and then\n * at `TStylingKey` (if it exists).\n *\n
* Imagine we have:\n *\n * <div class=""TEMPLATE" my-dir">\n *   @Directive({\n *     host: {\n *       class:
'DIR',\n *       [class.dynamic]: 'exp' // classProp('dynamic', ctx.exp);\n *     }\n *   })\n *\n * In the above case
the linked list will contain one item:\n *\n * // assume binding location: 10 for `classProp('dynamic',

```

```

ctx.exp);\n * tData[10] = <TStylingStatic>[\n *   ": 'dynamic', // This is the wrapped value of `TStylingKey`\n *
'DIR': true, // This is the default static value of directive binding.\n * ];\n * tData[10 + 1] = 0; // We don't have
prev/next.\n *\n * IView[10] = undefined;
    // assume `ctx.exp` is `undefined`\n * IView[10 + 1] = undefined; // Just normalized `IView[10]`\n * ```\n *\n *
So when the function is resolving styling value, it first needs to look into the linked list\n * (there is none) and than
into the static `TStylingStatic` too see if there is a default value for\n * `dynamic` (there is not). Therefore it is safe
to remove it.\n *\n * If setting `true` case:\n * ```\n * IView[10] = true; // assume `ctx.exp` is `true`\n *
IView[10 + 1] = true; // Just normalized `IView[10]`\n * ```\n *\n * So when the function is resolving styling value, it
first needs to look into the linked list\n * (there is none) and than into `TNode.residualClass` (TNode.residualStyle)
which contains\n * ```\n * tNode.residualClass = [\n *   'TEMPLATE': true,\n * ];\n * ```\n *\n * This means that
it is safe to add class.\n *\n * export interface TStylingStatic extends KeyValueArray<any> {} \n /**\n * This is a
branded number which contains previous and
next index.\n *\n * When we come across styling instructions we need to store the `TStylingKey` in the correct\n *
order so that we can re-concatenate the styling value in the desired priority.\n *\n * The insertion can happen either
at the:\n * - end of template as in the case of coming across additional styling instruction in the template\n * - in
front of the template in the case of coming across additional instruction in the\n * `hostBindings`.\n *\n * We use
`TStylingRange` to store the previous and next index into the `TData` where the template\n * bindings can be
found.\n *\n * - bit 0 is used to mark that the previous index has a duplicate for current value.\n * - bit 1 is used to
mark that the next index has a duplicate for the current value.\n * - bits 2-16 are used to encode the next/tail of the
template.\n * - bits 17-32 are used to encode the previous/head of template.\n *\n * NODE: *duplicate* false implies
that it is statically known that this binding will not collide\n
* with other bindings and therefore there is no need to check other bindings. For example the\n * bindings in `

Mapping between attributes names that don't correspond to their element property names.

\* Performance note: this function is written as a series of if checks (instead of, say, a property object lookup) for performance reasons - the series of `if` checks seems to be the fastest way of mapping property names. Do NOT change without benchmarking.

\* Note: this mapping has to be kept in sync with the equally named mapping in the template type-checking machinery of ngtscc.

```

  }
  onDestroy(callback: Function) { storeCleanupWithContext(this._IView[TVIEW], this._IView, null, callback); }
  /** Marks a view and all of its ancestors dirty. This can be used to ensure an {@link ChangeDetectionStrategy#OnPush OnPush} component is checked when it needs to be re-rendered but the two normal triggers haven't marked it dirty (i.e. inputs haven't changed and events haven't fired in the view).
  * <!-- TODO: Add a link to a chapter on OnPush components -->
  * @usageNotes
  * ### Example
  * ```typescript
  * @Component({
  *   selector: 'app-root',
  *   template: `Number of ticks: {{numberOfTicks}}`
  *   changeDetection: ChangeDetectionStrategy.OnPush,
  * })
  * class AppComponent {
  *   numberOfTicks = 0;
  *   constructor(private ref: ChangeDetectorRef) {
  *     setInterval(() => {
  *       this.numberOfTicks++;
  *       // the following is required, otherwise the view will not be updated
  *       this.ref.markForCheck();
  *     }, 1000);
  *   }
  *   markForCheck(): void {
  *     markViewDirty(this._cdRefInjectingView || this._IView);
  *   }
  * }
  *
  * Detaches the view from the change detection tree. Detached views will not be checked during change detection runs until they are re-attached, even if they are dirty. `detach` can be used in combination with {@link ChangeDetectorRef#detectChanges detectChanges} to implement local change detection checks.
  * <!-- TODO: Add a link to a chapter on detach/reattach/local digest -->
  * <!-- TODO: Add a live demo once ref.detectChanges is merged into master -->
  * @usageNotes
  * ### Example
  *
  * The following example defines a component with a large list of readonly data. Imagine the data changes constantly, many times per second. For performance reasons, we want to check and update the list every five seconds. We can do that by detaching the component's change detector and doing a local check every five seconds.
  * ```typescript
  * class DataProvider {
  *   // in a real application the returned data will be different every time
  *   get data() { return [1,2,3,4,5]; }
  * }
  * @Component({
  *   selector: 'giant-list',
  *   template: `<li *ngFor="let d of dataProvider.data">Data {{d}}</li>`,
  * })
  * class GiantList {
  *   constructor(private ref: ChangeDetectorRef, private dataProvider: DataProvider) {
  *     ref.detach();
  *     setInterval(() => {
  *       this.ref.detectChanges();
  *     }, 5000);
  *   }
  * }
  * @Component({
  *   selector: 'app',
  *   providers: [DataProvider],
  *   template: `<giant-list></giant-list>`,
  * })
  * class App {
  * }
  *
  * detach(): void {
  *   this._IView[FLAGS] &= ~LViewFlags.Attached;
  * }
  *
  * Re-attaches a view to the change detection tree. This can be used to re-attach views that were previously detached from the tree using {@link ChangeDetectorRef#detach detach}. Views are attached to the tree by default.
  * <!-- TODO: Add a link to a chapter on detach/reattach/local digest -->
  * @usageNotes
  * ### Example
  *
  * The following example creates a component displaying `live` data. The component will detach its change detector from the main change detector tree when the component's live property is set to false.
  * ```typescript
  * class DataProvider {
  *   data = 1;
  *   constructor() {
  *     setInterval(() => {
  *       this.data = this.data *

```

```

2;\n * }, 500);\n * }\n * }\n * \n
 * @Component({\n * selector: 'live-data',\n * inputs: ['live'],\n * template: 'Data: {{dataProvider.data}}'\n
 * })\n * class LiveData {\n * constructor(private ref: ChangeDetectorRef, private dataProvider: DataProvider)\n
 * {\n * \n * set live(value) {\n * if (value) {\n * this.ref.reattach();\n * } else {\n * \n
 * this.ref.detach();\n * }\n * }\n * }\n * }\n * @Component({\n * selector: 'app-root',\n * providers:\n
