 projectable nodes among <ng-content> occurrences in a given template.  
 \* It takes all the selectors from the entire  
 component's template and decides where  
 \* each projected node belongs (it re-distributes nodes among "buckets"  
 where each "bucket" is  
 \* backed by a selector).  
 \*  
 \*

This function requires CSS selectors to be provided in 2 forms: parsed (by a compiler) and text,  
 \* un-parsed  
 form.  
 \* The parsed form is needed for efficient matching of a node against a given CSS selector.  
 \* The un-  
 parsed, textual form is needed for support of the ngProjectAs attribute.  
 \* Having a CSS selector in 2 different  
 formats is not ideal, but alternatives have even more  
 \* drawbacks:  
 \* - having only a textual form would require  
 runtime parsing of CSS selectors;  
 \* - we can't have only a parsed as we can't re-construct textual form from it (as  
 entered by a  
 \* template author).  
 \* @param projectionSlots? A collection of projection slots. A projection  
 slot can be based  
 \* on a parsed CSS selectors or set to the wildcard selector ("\*") in order to match  
 \* all nodes which do not match any selector. If not specified, a single wildcard  
 \* selector projection slot will be  
 defined.

interchangeably as style or class styling.\n*\n* This file contains code to link styling instructions together so that
they can be replayed
in\n* priority order. The file exists because Ivy styling instruction execution order does not match\n* that of the
priority order. The purpose of this code is to create a linked list so that the\n* instructions can be traversed in
priority order when computing the styles.\n*\n* Assume we are dealing with the following code:\n* ```\n* @Component({\n*   template: \n*     <my-cmp [style]=" {color: '#001'} "\n*       [style.color]=" #002 "\n*
dir-style-color-1\n*       dir-style-color-2> \n*     })\n*   class ExampleComponent {\n*     static ngComp =
... {\n*       ... \n*       // Compiler ensures that `styleProp` is after `styleMap`\n*       styleMap({color: '#001'});\n*
styleProp('color', '#002');\n*       ... \n*     }}\n*   @Directive({\n*     selector: '[dir-style-color-1]',\n*   })\n*   class Style1Directive {\n*     @HostBinding('style') style = {color: '#005'};\n*     @HostBinding('style.color') color =
'#006';\n*     static ngDir
= ... {\n*       ... \n*       // Compiler ensures that `styleProp` is after `styleMap`\n*       styleMap({color: '#005'});\n*
styleProp('color', '#006');\n*       ... \n*     }}\n*   @Directive({\n*     selector: '[dir-style-color-2]',\n*   })\n*   class Style2Directive {\n*     @HostBinding('style') style = {color: '#007'};\n*     @HostBinding('style.color') color =
'#008';\n*     static ngDir = ... {\n*       ... \n*       // Compiler ensures that `styleProp` is after `styleMap`\n*
styleMap({color: '#007'});\n*       styleProp('color', '#008');\n*       ... \n*     }}\n*   @Directive({\n*     selector:
`my-cmp`,\n*   })\n*   class MyComponent {\n*     @HostBinding('style') style = {color: '#003'};\n*
@HostBinding('style.color') color = '#004';\n*     static ngComp = ... {\n*       ... \n*       // Compiler ensures that
`styleProp` is after `styleMap`\n*       styleMap({color: '#003'});\n*       styleProp('color', '#004');\n*       ... \n*
}}\n*   }\n*   * ```\n*   * The Order of instruction execution is:\n*   * NOTE: the comment binding location is for illustrative
purposes only.\n*   * ```\n*   * // Template: (ExampleComponent)\n*   *   styleMap({color: '#001'}); // Binding index:
10\n*   *   styleProp('color', '#002'); // Binding index: 12\n*   * // MyComponent\n*   *   styleMap({color: '#003'}); //
Binding index: 20\n*   *   styleProp('color', '#004'); // Binding index: 22\n*   * // Style1Directive\n*   *
styleMap({color: '#005'}); // Binding index: 24\n*   *   styleProp('color', '#006'); // Binding index: 26\n*   * //
Style2Directive\n*   *   styleMap({color: '#007'}); // Binding index: 28\n*   *   styleProp('color', '#008'); // Binding
index: 30\n*   * ```\n*   * The correct priority order of concatenation is:\n*   * ```\n*   * // MyComponent\n*   *
styleMap({color: '#003'}); // Binding index: 20\n*   *   styleProp('color', '#004'); // Binding index: 22\n*   * //
Style1Directive\n*   *   styleMap({color: '#005'});\n*   * // Binding index: 24\n*   *   styleProp('color', '#006'); // Binding index: 26\n*   * // Style2Directive\n*   *
styleMap({color: '#007'}); // Binding index: 28\n*   *   styleProp('color', '#008'); // Binding index: 30\n*   * //
Template: (ExampleComponent)\n*   *   styleMap({color: '#001'}); // Binding index: 10\n*   *   styleProp('color',

```

'#002'); // Binding index: 12\n \* ``\n \*\n \* What color should be rendered?\n \*\n \* Once the items are correctly sorted in the list, the answer is simply the last item in the\n \* concatenation list which is '#002'.\n \*\n \* To do so we keep a linked list of all of the bindings which pertain to this element.\n \* Notice that the bindings are inserted in the order of execution, but the `TVView.data` allows\n \* us to traverse them in the order of priority.\n \*\n \*

```
|Idx|TVView.data|LView` | Notes\n * |---|-----|-----\n * |...| | \n * |10|`null` |`{color: '#001'}|`styleMap('color', {color: '#001'})\n * |11|`30|12` |... | \n * |12|`color` |`'#002` |`styleProp('color', '#002')\n * |13|`10|0` |... | \n * |20|`null` |`{color: '#003'}|`styleMap('color', {color: '#003'})\n * |21|`0|22` |... | \n * |22|`color` |`'#004` |`styleProp('color', '#004')\n * |23|`20|24` |... | \n * |24|`null` |`{color: '#005'}|`styleMap('color', {color: '#005'})\n * |25|`22|26` |... | \n * |26|`color` |`'#006` |`styleProp('color', '#006')\n * |27|`24|28` |... | \n * |28|`null` |`{color: '#007'}|`styleMap('color', {color: '#007'})\n * |29|`26|30` |... | \n * |30|`color` |`'#008` |`styleProp('color', '#008')\n * |31|`28|10` |... | \n *\n * The above data structure allows us to re-concatenate the styling
```

no matter which data binding\n \* changes.\n \*\n \* NOTE: in addition to keeping track of next/previous index the `TVView.data` also stores prev/next\n \* duplicate bit. The duplicate bit if true says there either is a binding with the same name or\n \* there is a map (which may contain the name). This information is useful in knowing if other\n \* styles with higher priority need to be searched for overwrites.\n \*\n \* NOTE: See `should support example in 'tnode\_linked\_list.ts' documentation` in\n \* `tnode\_linked\_list\_spec.ts` for working example.\n \*/

    Retrieve the `TStylingKey` for the template styling instruction.\n    *\n    * This is needed since `hostBinding` styling
    instructions are inserted after the template\n    *\n    * instruction.
  
```

While the template instruction needs to update the residual in `TNode` the `hostBinding` instructions need to update the `TStylingKey` of the template instruction because the template instruction is downstream from the `hostBindings` instructions.

```

    @param tData `TData` where the linked list is stored.
    @param tNode `TNode` for which the styling is being computed.
    @param isClassBased `true` if `class` (`false` if `style`)
    @return `TStylingKey` if found or `undefined` if not found.
    \nfunction getTemplateHeadTStylingKey(tData:
    TData, tNode: TNode, isClassBased: boolean): TStylingKey|\n    undefined {\n    const bindings = isClassBased ?
    tNode.classBindings : tNode.styleBindings;\n    if (getTStylingRangeNext(bindings) === 0) {\n    // There does not
    seem to be a styling instruction in the `template`.\n    return undefined;\n    }\n    return
    tData[getTStylingRangePrev(bindings)] as TStylingKey;\n    }\n    /**
    Update the `TStylingKey` of the first
    template instruction
  
```

```

    in `TNode`.\n    *\n    * Logically `hostBindings` styling instructions are of lower priority than that of the template.\n    *\n    * However, they execute after the template styling instructions. This means that they get inserted\n    *\n    * in front of the
    template styling instructions.\n    *\n    * If we have a template styling instruction and a new `hostBindings` styling
    instruction is\n    *\n    * executed it means that it may need to steal static fields from the template instruction. This\n    *\n    * method allows us to update the first template instruction `TStylingKey` with a new value.\n    *\n    * Assume:\n    *\n    * <div my-dir style=\`color: red\` [style.color]=\`tmplExp\`></div>\n    *\n    * @Directive({\n    *   host: {\n    *     'style':
    *     'width: 100px',\n    *     '[style.color]': 'dirExp',\n    *   }\n    * })\n    * class MyDir {\n    *   when
    *   '[style.color]=\`tmplExp\`' executes it creates this data structure.\n    *   [\n    *     'color', 'color', 'red', 'width',
    *     '100px'],\n    *   }\n    * }\n    *\n    * The reason for this is that the template
    instruction does not know if there are styling\n    *\n    * instructions and must assume that there are none and must collect
    all of the static styling.\n    *\n    * (both `color` and `width`)\n    *\n    * When `[style.color]: 'dirExp',` executes we need to
    insert a new data into the linked list.\n    *\n    * [\n    *   'color', 'width', '100px'], // newly inserted\n    *   [\n    *     'color', 'color',
    *     'red', 'width', '100px'], // this is wrong\n    *   ]\n    *\n    * Notice that the template statics is now wrong as it incorrectly
    contains `width` so we need to\n    *\n    * update it like so:\n    *\n    * [\n    *   'color', 'width', '100px'],\n    *   [\n    *     'color', 'color',
    *     'red'], // UPDATE\n    *   ]\n    *\n    * @param tData `TData` where the linked list is stored.

The output of this is `KeyValueArray` (which is an array\n * where even indexes contain keys and odd indexes contain values for those keys).\n *\n * The advantage of converting to `KeyValueArray` is that we can perform diff in an input\n * independent way.
```

\* (ie we can compare `foo bar` to `[bar, baz]` and determine a set of changes which need to be applied)

The fact that `KeyValueArray` is sorted is very important because it allows us to compute the difference in linear fashion without the need to allocate any additional data.

For example if we kept this as a `Map` we would have to iterate over previous `Map` to determine which values need to be deleted, over the new `Map` to determine additions, and we would have to keep additional `Map` to keep track of duplicates or items which have not yet been visited.

@param keyValueArraySet (See `keyValueArraySet` in `util/array\_utils`) Gets passed in as a function so that `style` can be processed. This is done for tree shaking purposes.

@param stringParser The parser is passed in so that it will be tree shakable. See `styleStringParser` and `classStringParser`

@param value The value to parse/convert to `KeyValueArray`

^next export function toStylingKeyValueArray(keyValueArraySet: (keyValueArray: KeyValueArray<any>, key: string, value: any) => void, stringParser: (styleKeyValueArray: KeyValueArray<any>, text: string) => void, value: string|string[]|{[key: string]: any}|SafeValue|null|undefined): KeyValueArray<any> {

if (value == null || value === undefined || value === "") return EMPTY\_ARRAY as any;

const styleKeyValueArray: KeyValueArray<any> = [] as any;

const unwrappedValue = unwrapSafeValue(value) as string | string[] | {[key: string]: any};

if (Array.isArray(unwrappedValue)) {

for (let i = 0; i < unwrappedValue.length; i++) {

keyValueArraySet(styleKeyValueArray, unwrappedValue[i], true);

}

} else if (typeof unwrappedValue === 'object') {

for (const key in unwrappedValue) {

if (unwrappedValue.hasOwnProperty(key)) {

keyValueArraySet(styleKeyValueArray, key, unwrappedValue[key]);

}

}

} else if (typeof unwrappedValue === 'string') {

stringParser(styleKeyValueArray, unwrappedValue);

} else {

ngDevMode && throwError('Unsupported styling type ' + typeof unwrappedValue + ': ' + unwrappedValue);

}

return styleKeyValueArray;

}

Set a `value` for a `key`.

See: `keyValueArraySet` for details

@param keyValueArray KeyValueArray to add to.

@param key Style key to add.

@param value The value to set.

^next export function styleKeyValueArraySet(keyValueArray: KeyValueArray<any>, key: string, value: any) {

keyValueArraySet(keyValueArray, key, unwrapSafeValue(value));

}

Update map based styling.

Map based styling could be anything which contains more than one binding. For example `string`, or object literal. Dealing with all of these types would complicate the logic so instead this function expects that the complex input is first converted into normalized `KeyValueArray`. The advantage of normalization is that we get the values sorted, which makes it very cheap to compute deltas between the previous and current value.

@param tView Associated `TView.data` contains the linked list of binding priorities.

@param tNode `TNode` where the binding is located.

@param lView `LView` contains the values associated with other styling binding at this `TNode`.

@param renderer Renderer to use if any updates.

@param oldKeyValueArray Previous value represented as `KeyValueArray`

@param newKeyValueArray Current value represented as `KeyValueArray`

@param isClassBased `true` if `class` (`false` if `style`)

@param bindingIndex Binding index of the binding.

 * if (opcode & I18nCreateOpCode.APPEND_EAGERLY !== I18nCreateOpCode.APPEND_EAGERLY) {\n *
parentNode.appendChild(node);\n * }\n * }\n * ```\n *
 * export
interface I18nCreateOpCodes extends Array<number|string>, I18nDebug {\n * __brand__:
'I18nCreateOpCodes';\n * }\n *\n * /**\n * * See `I18nCreateOpCodes`\n * */\n * export enum I18nCreateOpCode {\n * /**\n * *
Number of bits to shift index so that it can be combined with the `APPEND_EAGERLY` and\n * `COMMENT`.\n * */\n *
 * SHIFT = 2,\n * /**\n * * Should the node be appended to parent immediately after creation.\n * */\n *
 * APPEND_EAGERLY = 0b01,\n * /**\n * * If set the node should be comment (rather than a text) node.\n * */\n *
 * COMMENT = 0b10,\n * }\n *\n * /**\n * * Stores DOM operations which need to be applied to update DOM render tree
due to changes in\n * expressions.\n * */\n * The basic idea is that `i18nExp` OpCodes capture expression changes and
update a change\n * mask bit. (Bit 1 for expression 1, bit 2 for expression 2 etc..., bit 32 for expression 32 and\n *
higher.) The OpCodes then compare its own change mask against the expression change mask to\n * determine if
the OpCodes should execute.\n *
 * NOTE: 32nd bit is special as it says 32nd or higher. This way if we have more than 32 bindings\n * the code
still works, but with lower efficiency. (it is unlikely that a translation would have\n * more than 32 bindings.)\n *
 * These OpCodes can be used by both the i18n block as well as ICU sub-block.\n *
 * ## Example\n *
 * Assume\n * ```\n * if (rf & RenderFlags.Update) {\n * i18nExp(ctx.exp1); // If changed set mask bit 1\n *
i18nExp(ctx.exp2); // If changed set mask bit 2\n * i18nExp(ctx.exp3); // If changed set mask bit 3\n *
i18nExp(ctx.exp4); // If changed set mask bit 4\n * i18nApply(0); // Apply all changes by executing the
OpCodes.\n * }\n * ```\n *
 * We can assume that each call to `i18nExp` sets an internal `changeMask` bit depending

```

```

on the index of `i18nExp`.

  * Keep track of which input bindings in `i18nExp` have changed.
  * This is used to efficiently update expressions in i18n only when the corresponding input has changed.
  * 1) Each bit represents which of the `i18nExp` has changed.
  * 2) There are 32 bits allowed in JS.
  * 3) Bit 32 is special as it is shared for all changes past 32. (In other words if you have more than 32 `i18nExp` then all changes past 32nd `i18nExp` will be mapped to same bit. This means that we may end up changing more than we need to. But i18n expressions with 32 bindings is rare so in practice it should not be an issue.)
  * Keeps track of which bit needs to be updated in `changeMask`
  * This value gets incremented on every call to `i18nExp`
  * let changeMaskCounter = 0;
  * Keep track of which input bindings in `i18nExp` have changed.

Use of this source code is governed by an MIT-style license that can be found in the LICENSE file at <https://angular.io/license>

This file re-exports all symbols contained in this directory.

Why is this file not `index.ts`? There seems to be an inconsistent path resolution of an `index.ts` file when only the parent directory is referenced. This could be due to the node module resolution configuration differing from rollup and/or typescript.

With commit <https://github.com/angular/angular/commit/d5e3f2c64bd13ce83e7c70788b7fc514ca4a9918> the `instructions.ts` file was moved to `instructions/instructions.ts` and an `index.ts` file was used to re-export everything. Having had file names that were importing from `instructions` directly (not the from the sub file or the `index.ts` file) caused strange CI issues. `index.ts` had to be renamed to `all.ts` for this to work. Jira Issue = FW-1184

```

Resolves the providers which are defined in the `DirectiveDef`.

When inserting the tokens and the factories in their respective arrays, we can assume that this method is called first for the component (if any), and then for other directives on the same node.

As a consequence, the providers are always processed in that order:

- 1) The view providers of the component
- 2) The providers of the component
- 3) The providers of the other directives

This matches the structure of the injectables arrays of a view (for each node). So the tokens and the factories can be pushed at the end of the arrays, except in one case for multi providers.

```

@param def the directive definition
@param providers: Array of `providers`
@param viewProviders: Array of `viewProviders`
^
export function providersResolver<T>(
  def: DirectiveDef<T>,
  providers: Provider[],
  viewProviders: Provider[]): void {
  const tView = getTView();
  if (tView.firstCreatePass) {
    const isComponent = isComponentDef(def);
    // The list of view providers is processed first, and the flags
    // are updated
    resolveProvider(viewProviders, tView.data, tView.blueprint, isComponent, true);
    // Then, the list of providers is processed, and the flags are updated
    resolveProvider(providers, tView.data, tView.blueprint, isComponent, false);
  }
}

```

Resolves a provider and publishes it to the DI system.

```

function
resolveProvider(
  provider: Provider,
  tInjectables: TData,
  tInjectablesBlueprint: NodeInjectorFactory[],
  isComponent: boolean,
  isViewProvider: boolean): void {

```

**\* Retrieves the component instance associated with a given DOM element.**

**@usageNotes** Given the following DOM structure:

```

`html`
<app-root>
  <div>
    <child-comp>
  </div>
</app-root>

```

Calling `getComponent` on `<child-comp>` will return the instance of `ChildComponent` associated with this DOM element. Calling the function on `<app-root>` will return the `MyApp` instance.

**@param** element DOM element from which the component should be retrieved.

**@returns** Component instance associated with the element or `null` if there is no component associated with it.

```

@publicApi
@globalApi ng
export function getComponent<T>(element: Element): T|null {
  ngDevMode && assertDomElement(element);
  const context = getLContext(element);
  if (context === null)
    return null;
  if (context.component === undefined) {
    const IView = context.IView;
    if (IView === null)
      return null;
    context.component = getComponentAtNodeIndex(context.nodeIndex, IView);
  }
  return context.component as unknown as T;
}

```

**\* If inside an embedded view (e.g. `\*ngIf` or `\*ngFor`), retrieves the context of the embedded view that the element is part of. Otherwise retrieves the instance of the component whose view owns the element (in this case, the result is the same as calling `getOwningComponent`).**

**@param** element Element for which to get the surrounding component instance.

**@returns** Instance of the component that is around the element or null if the element isn't inside any component.

```

@publicApi
@globalApi ng
export function getContext<T extends {}>(element: Element): T|null {
  assertDomElement(element);
  const context = getLContext(element)!;
  const IView = context ? context.IView : null;
  return IView === null ? null : IView[CONTEXT] as T;
}

```

**\* Retrieves the component instance whose view contains the DOM element.**

**For example,** if `<child-comp>` is used in the template of `<app-comp>` (i.e. a `ViewChild` of `<app-comp>`), calling `getOwningComponent` on `<child-comp>` would return `<app-comp>`.

**@param** elementOrDir DOM element, component or directive instance for which to retrieve the root components.

**@returns** Component instance whose view owns the DOM element or null if the element is not part of a component view.

```

@publicApi
@globalApi ng
export function getOwningComponent<T>(elementOrDir: Element|{}): T|null {
  const context = getLContext(elementOrDir)!;
  let IView = context ? context.IView : null;
  if (IView === null)
    return null;
  let parent: LView|null;
  while (IView[TVIEW].type === TViewType.Embedded && (parent = getLViewParent(IView!)))
    IView = parent;
  return IView[FLAGS] & LViewFlags.IsRoot ? null : IView[CONTEXT] as unknown as T;
}

```

**\* Retrieves all root components associated with a DOM element, directive or component instance.**

**Root components** are those which have been bootstrapped by Angular.

**@param** elementOrDir DOM element, component or directive instance for which to retrieve the root components.

**@returns** Root components associated with the target object.

```

@publicApi
@globalApi ng
export function getRootComponents(elementOrDir: Element|{}): {}[] {
  const IView = readPatchedLView<{}>(elementOrDir);
  return IView !== null ? [getLViewParent(IView)] : [];
}

```

**\* Retrieves an `Injector` associated with an element, component or directive instance.**

**@param** elementOrDir DOM element, component or directive instance for which to retrieve the injector.

**@returns** Injector associated with the element, component or directive instance.

```

@publicApi\n * @globalApi ng\n *^\nexport function getInjector(elementOrDir: Element|{}): Injector {\n const
context = getLContext(elementOrDir)!;\n

**@returns** Updated or cached value

```

export function pureFunction2Internal(
  IView:
  LView, bindingRoot: number, slotOffset: number, pureFn: (v1: any, v2: any) => any,
  exp1: any, exp2: any,
  thisArg?: any): any {
  const bindingIndex = bindingRoot + slotOffset;
  return bindingUpdated2(IView,
  bindingIndex, exp1, exp2) ?
  updateBinding(
  IView, bindingIndex + 2,
  thisArg ?
  pureFn.call(thisArg, exp1, exp2) : pureFn(exp1, exp2)) :
  getPureFunctionReturnValue(IView, bindingIndex +
  2);
}

```

If the value of any provided exp has changed, calls the pure function to return an updated value. Or

if no values have changed, returns cached value.

**@param IView LView** in which the function is being executed.

**@param bindingRoot** Binding root index.

**@param slotOffset** the offset from binding root to the reserved slot

**@param pureFn**

**@param exp1**

**@param exp2**

**@param exp3**

**@param thisArg** Optional calling context of pureFn

**@returns** Updated or cached value

```

export function pureFunction3Internal(
  IView: LView, bindingRoot: number, slotOffset: number,
  pureFn: (v1: any, v2: any,
  v3: any) => any, exp1: any, exp2: any, exp3: any,
  thisArg?: any): any {
  const bindingIndex = bindingRoot +
  slotOffset;
  return bindingUpdated3(IView, bindingIndex, exp1, exp2, exp3) ?
  updateBinding(
  IView,
  bindingIndex + 3,
  thisArg ? pureFn.call(thisArg, exp1, exp2, exp3) : pureFn(exp1, exp2, exp3)) :
  getPureFunctionReturnValue(IView, bindingIndex + 3);
}

```

If the value of any provided exp has changed, calls the

pure function to return an updated value. Or if no values have changed, returns cached value.

**@param IView LView** in which the function is being executed.

**@param bindingRoot** Binding root index.

**@param slotOffset** the offset from binding root to the reserved slot

**@param pureFn**

**@param exp1**

**@param exp2**

**@param exp3**

**@param exp4**

**@param thisArg** Optional calling context of pureFn

**@returns** Updated or cached value

```

export function pureFunction4Internal(
  IView: LView, bindingRoot: number,
  slotOffset: number,
  pureFn: (v1: any, v2: any, v3: any, v4: any) => any, exp1: any, exp2: any, exp3: any, exp4:
  any,
  thisArg?: any): any {
  const bindingIndex = bindingRoot + slotOffset;
  return bindingUpdated4(IView,
  bindingIndex, exp1, exp2, exp3, exp4) ?
  updateBinding(
  IView, bindingIndex + 4,
  thisArg ?
  pureFn.call(thisArg, exp1, exp2, exp3, exp4) : pureFn(exp1, exp2, exp3, exp4)) :
  getPureFunctionReturnValue(IView,
  bindingIndex + 4);
}

```

pureFunction instruction that can support any number of bindings.

If the value of any provided exp has changed, calls the pure function to return an updated value. Or if no values have changed, returns cached value.

**@param IView LView** in which the function is being executed.

**@param**

```

/**
 * An unmodifiable list of items that Angular keeps up to date when the
state of the application changes.
 * The type of object
that { @link ViewChildren }, { @link ContentChildren }, and { @link QueryList }
 * provide.
 * Implements an
iterable interface, therefore it can be used in both ES6 javascript `for (var i of items)` loops as well as in Angular
templates with `*ngFor`="let i of myList".
 * Changes can be observed by subscribing to the changes
`Observable`.
 * NOTE: In the future this class will implement an `Observable` interface.
 *
 * @usageNotes
 * ### Example
 * ```typescript
 * @Component({ ... })
 * class Container {
 *   @ViewChildren(Item) items: QueryList<Item>;
 * }
 *
 * @publicApi
 * ^\nexport class QueryList<T>
implements Iterable<T> {

```

prevent a template with `// e.g. ctx: {}` from being assigned to `ComponentTemplate<any>` as TypeScript won't infer `U = any` in that scenario. By including `T` this incompatibility is resolved.

```

<U extends T>(rf:
RenderFlags, ctx: T|U): void;

```

**Definition of what a view queries function should look like.**

```

export type ViewQueriesFunction<T> = <U extends T>(rf: RenderFlags, ctx: U) => void;

```

**Definition of what a content queries function should look like.**

```

export type ContentQueriesFunction<T>
= <U extends T>(rf: RenderFlags, ctx: U, directiveIndex: number) => void;

```

**Flags passed into template functions to determine which blocks (i.e. creation, update) should be executed.** Typically, a template runs both the creation block and the update block on initialization and subsequent runs only execute the update block. However, dynamically created views require that the creation block be executed separately from the update block (for backwards compat).

```

export const enum RenderFlags {
  /* Whether to run the creation block (e.g. create elements and directives)
  Create = 0b01,
  /* Whether to run the update block (e.g. refresh bindings)
  Update = 0b10
}

```

event-bound output properties.

- When an output property emits an event, an event handler attached to that event in the template is invoked.
- The `outputs` property defines a set of `DirectiveProperty` to `bindingProperty` configuration.
- `DirectiveProperty` specifies the component property that emits events.
- `bindingProperty` specifies the DOM property the event handler is attached to.

```

@usageNotes
```typescript
@Component({
  selector: 'child-dir',
  outputs: [
    'bankNameChange'
  ]
  template: `<input (input)="bankNameChange.emit($event.target.value)"
/>`)
class ChildDir {
  bankNameChange: EventEmitter<string> = new EventEmitter<string>();
}
@Component({
  selector: 'main',
  template: `
{{ bankName }} <child-dir
(bankNameChange)="onBankNameChange($event)"></child-dir>`
})
class MainComponent {
  bankName: string;
  onBankNameChange(bankName: string) {
    this.bankName = bankName;
  }
}
```

```

`outputs?: string[];` Configures the `[injector](guide/glossary#injector)` of this directive or component with a `[token](guide/glossary#di-token)` that maps to a `[provider](guide/glossary#provider)` of a dependency.

`providers?: Provider[];` Defines the name that can be used in the template to assign this directive to a variable.

```

@Directive({
  selector: 'child-dir',
  exportAs:
'child'
})
class ChildDir {
}
@Component({
  selector: 'main',
  template:
`<child-dir #c="child"></child-dir>`
})
class MainComponent {
}
```

```

`exportAs?: string;` Configures the queries that will be injected into the directive.

Content queries are set before the `ngAfterContentInit` callback is called.

View queries are set before the `ngAfterViewInit` callback is called.

`@usageNotes` The following example shows how queries are defined and when their results are available in lifecycle hooks:

```

@Component({
  selector: 'someDir',
  queries: {
    contentChildren: new ContentChildren(ChildDirective),
    viewChildren: new
ViewChildren(ChildDirective)
  },
  template: '<child-directive></child-directive>'
})
class
SomeDir {
  contentChildren: QueryList<ChildDirective>;
  viewChildren: QueryList<ChildDirective>;
  ngAfterContentInit() {
    // contentChildren is set
  }
  ngAfterViewInit() {
    // viewChildren is set
  }
}
```

```

`@Annotation` `queries?: {[key: string]: any};` Maps class properties to host element bindings for properties, attributes, and events, using a set of key-value pairs.

Angular automatically checks host property bindings during change detection.

If a binding changes, Angular updates the directive's host element.

When the key is a property of the host element, the property value is propagated to the specified DOM property.

When the key is a static attribute in the DOM, the attribute value is propagated to the specified property in the host element.

For event handling:

- The key is the DOM event that the directive listens to.

To listen to global events,

- add the target to the event name.
- The target can be `window`, `document` or `body`.
- The value is the statement to execute when the event occurs. If the statement evaluates to `false`, then `preventDefault` is applied on the DOM event. A handler method can refer to the `$event` local variable.

`host?: {[key: string]: string};` When present, this directive/component is ignored by the AOT compiler. It remains in distributed code, and the JIT compiler attempts to compile it at run time, in the browser.

To ensure the correct behavior, the app must import `@angular/compiler`.

```

jit?: true;
```

```

Angular directives marked as `standalone` do not need to be declared in an `NgModule`. Such directives don't depend on any "intermediate context" of an `NgModule` (ex. configured providers).

More information about standalone components, directives, and pipes can be found in [this guide](#) (`guide/standalone-components`).

```

@developerPreview
standalone?: boolean;
}
```

```

Type of the Directive metadata.

```

@publicApi
export const Directive: DirectiveDecorator = makeDecorator(
  'Directive',
  (dir: Directive = {}) => dir,
  undefined,
  undefined,
  (type: Type<any>, meta: Directive) => compileDirective(type, meta));
```

```

Component decorator interface

```

@publicApi
export interface ComponentDecorator {
}
```

```

Decorator that marks a class as an Angular component and provides configuration metadata that determines how the component should be processed, instantiated, and used at runtime.

Components are the most

basic UI building block of an Angular app.

- An Angular app contains a tree of Angular components.
- Angular components are a subset of directives, always associated with a template.
- Unlike other directives, only one component can be instantiated for a given element in a template.
- A component must belong to an NgModule in order for it to be available to another component or application. To make it a member of an NgModule, list it in the `declarations` field of the `NgModule` metadata.
- Note that, in addition to these options for configuring a directive, you can control a component's runtime behavior by implementing life-cycle hooks. For more information, see the [Lifecycle Hooks](guide/lifecycle-hooks) guide.
- @usageNotes
- ### Setting component inputs
- The following example creates a component with two data-bound properties, specified by the `inputs` value.
- <code-example path="core/ts/metadata/directives.ts" region="component-input"></code-example>
- ### Setting component outputs
- The following example shows two event emitters that emit on an interval. One emits an output every second, while the other emits every five seconds.
- {@example core/ts/metadata/directives.ts region='component-output-interval'}
- ### Injecting a class with a view provider
- The following simple example injects a class into a component using the view provider specified in component metadata:
- ts
- class Greeter {
 greet(name:string) {
 return 'Hello ' + name + '!';
 }
}
@Directive({
 selector: 'needs-greeter'
})
class NeedsGreeter {
 greeter:Greeter;

 constructor(greeter:Greeter) {
 this.greeter = greeter;
 }
}
@Component({
 selector: 'greet',
 viewProviders: [
 Greeter
 ],
 template: `<needs-greeter></needs-greeter>`
})
class HelloWorld {
}
- ### Preserving whitespace
- Removing whitespace can greatly reduce AOT-generated code size and speed up view creation.
- As of Angular 6, the default for `preserveWhitespaces` is false (whitespace is removed).
- To change the default setting for all components in your application, set the `preserveWhitespaces` option of the AOT compiler.
- By default, the AOT compiler removes whitespace characters as follows:

  - Trims all whitespaces at the beginning and the end of a template.
  - Removes whitespace-only text nodes. For example, `html <button>Action 1</button> <button>Action 2</button>` becomes `html <button>Action 1</button><button>Action 2</button>`
  - Replaces a series of whitespace characters in text nodes with a single space. For example, `<span>\n some text\n</span>` becomes `<span> some text </span>`
  - Does NOT alter text nodes inside HTML tags such as `<pre>` or `<textarea>`, where whitespace characters are significant.

- Note that these transformations can influence DOM nodes layout, although impact should be minimal.
- You can override the default behavior to preserve whitespace characters in certain fragments of a template. For example, you can exclude an entire DOM sub-tree by using the `ngPreserveWhitespaces` attribute:
- html
- <div ngPreserveWhitespaces>
 whitespaces are preserved here
 <span> and here </span>
</div>
- You can force a single space to be preserved in a text node by using `&nbsp;`, which is replaced with a space character by Angular's template compiler:
- html
- <a>Spaces</a>&nbsp;<a>between</a>&nbsp;<a>links.</a>
- <!-- compiled to be equivalent to: <a>Spaces</a> <a>between</a> <a>links.</a> -->
- Note that sequences of `&nbsp;` are still collapsed to just one space character when the `preserveWhitespaces` option is set to `false`.
- html
- <a>before</a>&nbsp;&nbsp;&nbsp;<a>after</a>
- <!-- compiled to be equivalent to: <a>before</a> <a>after</a> -->
- To preserve sequences of whitespace characters, use the `ngPreserveWhitespaces` attribute.

interface NgModule {\n /**\n * The set of injectable objects that are available in the injector\n */\n * of this
module.\n */\n * @see [Dependency Injection guide](guide/dependency-injection)\n */\n * @see [NgModule
guide](guide/providers)\n */\n * @usageNotes\n */\n * Dependencies whose providers are listed here become
available for injection\n */\n * into any component, directive, pipe or service that is a child of this injector.\n */\n * The
NgModule used for bootstrapping uses the root injector, and can provide dependencies\n */\n * to any part of the app.\n\n
*\n * A lazy-loaded module has its own injector, typically a child of the app root injector.\n\n
*\n * Lazy-loaded services are scoped to the lazy-loaded module's injector.\n */\n * If a lazy-loaded module also provides
the `UserService`, any component created\n */\n * within that module's context (such as by router navigation) gets the
local instance\n */\n * of the service, not the instance in the root injector.\n */\n * Components in external modules
continue to receive the instance provided by their injectors.\n *\n * ### Example\n *\n * The following
example defines a class that is injected in\n */\n * the HelloWorld NgModule:\n *\n * ```\n */\n * class Greeter {\n */\n *
greet(name:string) {\n */\n *     return 'Hello ' + name + '!';\n */\n * } \n */\n * }\n *\n * @NgModule({\n */\n * providers:
[\n */\n * Greeter\n */\n * ]\n */\n * })\n */\n * class HelloWorld {\n */\n * greeter:Greeter;\n */\n * }\n */\n *
constructor(greeter:Greeter) {\n */\n *     this.greeter = greeter;\n */\n * } \n */\n * }\n */\n * ```\n */\n * /\n */\n * providers?:
Provider[];\n\n /**\n * The set of components, directives, and pipes ([declarables](guide/glossary#declarable))\n\n
*\n * that belong to this module.\n *\n * @usageNotes\n */\n * The set of selectors that are available to a template
include those declared here, and\n */\n * those that are exported from imported NgModules.\n *\n * Declarables must
belong to exactly one module.\n */\n * The compiler emits an error if you try to declare the same class in more than one
module.\n */\n * Be careful not to declare a class that is imported from another module.\n *\n * ### Example\n *\n\n
*\n * The following example allows the CommonModule to use the `NgFor`\n */\n * directive.\n *\n * ```javascript\n */\n *
@NgModule({\n */\n * declarations: [NgFor]\n */\n * })\n */\n * class CommonModule {\n */\n * }\n */\n * ```\n */\n * /\n */\n *
declarations?: Array<Type<any>|any[]>;\n\n /**\n * The set of NgModules whose exported
[declarables](guide/glossary#declarable)\n\n
*\n * are available to templates in this module.\n *\n * @usageNotes\n\n
*\n * A template can use exported declarables from any\n\n
*\n * imported module, including those from modules that are imported indirectly\n */\n * and re-exported.\n */\n * For
example, `ModuleA` imports `ModuleB`, and also exports\n */\n * it, which makes the declarables from `ModuleB`
available\n */\n * wherever `ModuleA` is imported.\n *\n * ### Example\n *\n\n
*\n * The following example allows
MainModule to use anything exported by\n */\n * `CommonModule`:\n *\n * ```javascript\n */\n * @NgModule({\n */\n *
imports: [CommonModule]\n */\n * })\n */\n * class MainModule {\n */\n * }\n */\n * ```\n */\n * /\n */\n * imports?:
Array<Type<any>|ModuleWithProviders<{}>|any[]>;\n\n /**\n * The set of components, directives, and pipes
declared in this\n */\n * NgModule that can be used in the template of any component that is part of an\n */\n * NgModule
that imports this NgModule. Exported declarations are the module's public API.\n *\n * A declarable belongs to
one and only one NgModule.\n *\n * A module can list another module among its exports, in which case all of that
module's\n */\n * public declaration are exported.\n *\n * @usageNotes\n */\n * Declarations are private by
default.\n */\n * If this ModuleA does not export UserComponent, then only the components within this\n */\n * ModuleA
can use UserComponent.\n *\n * ModuleA can import ModuleB and also export it, making exports from
ModuleB\n */\n * available to an NgModule that imports ModuleA.\n *\n * ### Example\n *\n\n
*\n * The following
example exports the `NgFor` directive from CommonModule.\n *\n * ```javascript\n */\n * @NgModule({\n */\n *
exports: [NgFor]\n */\n * })\n */\n * class CommonModule {\n */\n * }\n */\n * ```\n */\n * /\n */\n * exports?:

```

LICENSE file at <https://angular.io/license>

This file exists to support compilation of @angular/core in Ivy mode.

When the Angular compiler processes a compilation unit, it normally writes imports to @angular/core. When compiling the core package itself this strategy isn't usable. Instead, the compiler writes imports to this file.

Only a subset of such imports are supported - core is not allowed to declare components or pipes.

A check in ngts's `R3SymbolsImportRewriter` validates this condition. The rewriter is only used when compiling @angular/core and is responsible for translating an external name (prefixed with `__`) to the internal symbol name as exported below.

The below symbols are used for @Injectable and @NgModule compilation.

```

export {inject} from './di/injector_compatibility';
export {defineInjectable, defineInjector, InjectableDeclaration} from './di/interface/defs';
export {NgModuleDef} from './metadata/ng_module_def';
export {defineNgModule} from './render3/definition';
export {FactoryDeclaration, InjectorDeclaration, NgModuleDeclaration} from './render3/interfaces/public_definitions';
export {setClassMetadata} from './render3/metadata';
export {NgModuleFactory} from './render3/ng_module_ref';
export {noSideEffects as noSideEffects} from './util/closure';

```

The existence of this constant (in this particular file) informs the Angular compiler that the current program is actually @angular/core, which needs to be compiled specially.

```

export const ITS_JUST_ANGULAR = true;

```

Copyright Google LLC All Rights Reserved.

Use of this source code is governed by an MIT-style license that can be found in the LICENSE file at <https://angular.io/license>

```

import {Observable} from 'rxjs';
import {Inject, Injectable, InjectionToken, Optional} from './di';
import {isObservable, isPromise} from './util/lang';
import {noop} from './util/noop';

```

A [DI token](guide/glossary#di-token "DI token definition") that you can use to provide one or more initialization functions.

The provided functions are injected at application startup and executed during app initialization. If any of these functions returns a Promise or an Observable, initialization does not complete until the Promise is resolved or the Observable is completed.

You can, for example, create a factory function that loads language data or an external configuration, and provide that function to the `APP_INITIALIZER` token.

The function is executed during the application bootstrap process, and the needed data is available on startup.

See `ApplicationInitStatus` and `usageNotes`.

The following example illustrates how to configure a multi-provider using `APP_INITIALIZER` token and a function returning a promise.

```

function initializeApp(): Promise<any> {
  return new Promise((resolve, reject) => {
    // Do some asynchronous stuff
    resolve();
  });
}

@NgModule({
  imports: [BrowserModule],
  declarations: [AppComponent],
  bootstrap: [AppComponent],
  providers: [
    {
      provide: APP_INITIALIZER,
      useFactory: () => initializeApp,
      multi: true
    }
  ]
})
export class AppModule {
}

```

It's also possible to configure a multi-provider using `APP_INITIALIZER` token and a function returning an observable, see an example below.

Note: the `HttpClient` in this example is used for demo purposes to illustrate how the factory function can work with other providers available through DI.

```

function initializeAppFactory(httpClient: HttpClient): () => Observable<any> {
  return () => httpClient.get("https://someUrl.com/api/user").pipe(
    tap(user => { ... })
  );
}

@NgModule({
  imports: [BrowserModule, HttpClientModule],
  declarations: [AppComponent],
  bootstrap: [AppComponent],
  providers: [
    {
      provide: APP_INITIALIZER,
      useFactory: initializeAppFactory,
      deps: [HttpClient],
      multi: true
    }
  ]
})
export class AppModule {
}

```

@publicApi

```

export
const APP_INITIALIZER = new InjectionToken<ReadonlyArray<() => Observable<unknown>| Promise<unknown>| void>>(
  'Application Initializer'
);

```

A class that reflects the state of running `APP_INITIALIZER` functions.

```

@publicApi
@Injectable({providedIn: 'root'})
export class ApplicationInitStatus {
  private resolve = noop;
  private reject = noop;
  private initialized = false;
  public readonly donePromise: Promise<any>;
  public readonly done = false;

  constructor(
    @Inject(APP_INITIALIZER) @Optional() private readonly appInits:
      ReadonlyArray<() => Observable<unknown>| Promise<unknown>| void>
  ) {
    this.donePromise = new Promise((res, rej) => {
      this.resolve = res;
      this.reject = rej;
    });
  }

getGlobalLocale(),\n});\n\n/**\n * Provide this token to set the default currency code your application uses for\n *
CurrencyPipe when there is no currency code passed into it. This is only used by\n * CurrencyPipe and has no
relation to locale currency. Defaults to USD if not configured.\n *\n * See the [i18n guide](guide/i18n-common-
locale-id) for more information.\n *\n * <div class="alert is-helpful">\n *\n * **Deprecation notice:**\n *\n * The
default currency code is currently always `USD` but this is deprecated from v9.\n *\n * **In v10 the default
currency code will be taken from the current locale.**\n *\n * If you need the previous behavior then set it by
creating a `DEFAULT_CURRENCY_CODE` provider in\n * your application `NgModule`:\n *\n * ```ts\n *
{provide: DEFAULT_CURRENCY_CODE, useValue: 'USD'}\n * ```\n *\n * </div>\n *\n * @usageNotes\n *
### Example\n *\n * ```typescript\n * import { platformBrowserDynamic } from '@angular/platform-browser-
dynamic';\n * import { AppModule } from './app/app.module';\n *\n *
platformBrowserDynamic().bootstrapModule(AppModule, {\n *   providers: [{provide:
DEFAULT_CURRENCY_CODE, useValue: 'EUR'}]\n * });\n *\n * ```\n *\n * @publicApi\n *^\nexport const
DEFAULT_CURRENCY_CODE = new InjectionToken<string>('DefaultCurrencyCode', {\n  providedIn: 'root',\n  factory: () =>
USD_CURRENCY_CODE,\n});\n\n/**\n * Use this token at bootstrap to provide the content of your
translation file (`xtb`,\n * `xlf` or `xlf2`) when you want to translate your application in another language.\n *\n *
See the [i18n guide](guide/i18n-common-merge) for more information.\n *\n * @usageNotes\n * ### Example\n *\n *
```typescript\n * import { TRANSLATIONS } from '@angular/core';\n * import { platformBrowserDynamic }
from '@angular/platform-browser-dynamic';\n * import { AppModule } from './app/app.module';\n *\n * //
content of your translation file\n * const translations = '...';\n *\n *
platformBrowserDynamic().bootstrapModule(AppModule, {\n *   providers: [{provide: TRANSLATIONS,
useValue: translations }]\n * });\n *\n * ```\n *\n * @publicApi\n *^\nexport const TRANSLATIONS = new
InjectionToken<string>('Translations');\n\n/**\n * Provide this token at bootstrap to set the format of your { @link
TRANSLATIONS}: `xtb`,\n * `xlf` or `xlf2`.\n *\n * See the [i18n guide](guide/i18n-common-merge) for more
information.\n *\n * @usageNotes\n * ### Example\n *\n * ```typescript\n * import { TRANSLATIONS_FORMAT
} from '@angular/core';\n * import { platformBrowserDynamic } from '@angular/platform-browser-dynamic';\n *
import { AppModule } from './app/app.module';\n *\n * platformBrowserDynamic().bootstrapModule(AppModule,

```

```

{\n * providers: [{provide: TRANSLATIONS_FORMAT, useValue: 'xlf' }]\n * });\n * ``\n *\n * @publicApi\n *^\nexport const TRANSLATIONS_FORMAT = new InjectionToken<string>('TranslationsFormat');\n *\n *\n * Use this enum at bootstrap as an option of `bootstrapModule` to define the strategy\n * that the compiler should use in case of missing translations:\n * - Error: throw if you have missing translations.\n * - Warning (default): show a warning in the console and/or shell.\n * - Ignore: do nothing.\n *\n * See the [i18n guide](guide/i18n-common-merge#report-missing-translations) for more information.\n *\n * @usageNotes\n * ### Example\n * ``typescript\n * import { MissingTranslationStrategy } from '@angular/core';\n * import { platformBrowserDynamic } from '@angular/platform-browser-dynamic';\n * import { AppModule } from './app/app.module';\n *\n * platformBrowserDynamic().bootstrapModule(AppModule, {\n *   missingTranslation: MissingTranslationStrategy.Error\n * });\n * ``\n *\n * @publicApi\n *^\nexport enum MissingTranslationStrategy {\n *   Error = 0,\n *   Warning = 1,\n *   Ignore = 2,\n *}\n *"/**\n * @license\n * Copyright Google LLC All Rights Reserved.\n *\n * Use of this source code is governed by an MIT-style license that can be\n * found in the LICENSE file at https://angular.io/license\n */\nimport {Injectable} from './di/injectable';\nimport {InjectionToken} from './di/injection_token';\nimport {StaticProvider} from './di/interface/provider';\nimport {MissingTranslationStrategy} from './i18n/tokens';\nimport {Type} from './interface/type';\nimport {ViewEncapsulation} from './metadata/view';\nimport {ComponentFactory as ComponentFactoryR3} from './render3/component_ref';\nimport {getComponentDef, getNgModuleDef} from './render3/definition';\nimport {NgModuleFactory as NgModuleFactoryR3} from './render3/ng_module_ref';\nimport {maybeUnwrapFn} from './render3/util/misc_utils';\nimport {ComponentFactory} from './component_factory';\nimport {NgModuleFactory} from './ng_module_factory';\n\n/**\n * Combination of NgModuleFactory and ComponentFactories.\n *\n * @publicApi\n *\n * @deprecated\n * Ivy JIT mode doesn't require accessing this symbol.\n * See [JIT API changes due to ViewEngine deprecation](guide/deprecations#jit-api-changes) for\n * additional context.\n */\nexport class ModuleWithComponentFactories<T> {\n *   constructor(\n *     public ngModuleFactory: NgModuleFactory<T>,\n *     public componentFactories: ComponentFactory<any>[])\n *   }\n *}\n\n/**\n * Low-level service for running the angular compiler during runtime\n * to create {@link ComponentFactory}s, which\n * can later be used to create and render a Component instance.\n *\n * Each `@NgModule` provides an own `Compiler` to its injector,\n * that will use the directives/pipes of the ng module for compilation\n * of components.\n *\n * @publicApi\n *\n * @deprecated\n * Ivy JIT mode doesn't require accessing this symbol.\n * See [JIT API changes due to ViewEngine deprecation](guide/deprecations#jit-api-changes) for\n * additional context.\n */\n@Injectable({providedIn: 'root'})\nexport class Compiler {\n *\n * Compiles the given NgModule and all of its components. ```

within the Angular zone and returns value returned by the function. Running functions via `run` allows you to reenter Angular zone from a task that was executed outside of the Angular zone (typically started via `@link #runOutsideAngular`). Any future tasks or microtasks scheduled from within this function will continue executing from within the Angular zone. If a synchronous error happens it will be rethrown and not reported via `onError`.

```
run<T>(fn: (...args: any[]) => T, applyThis?: any, applyArgs?: any[]): T {
  return (this as any as NgZonePrivate)._inner.run(fn, applyThis, applyArgs);
}
```

Executes the `fn` function synchronously within the Angular zone as a task and returns value returned by the function. Running functions via `run` allows you to reenter Angular zone from a task that was executed outside of the Angular zone (typically started via `@link #runOutsideAngular`).

Any future tasks or microtasks scheduled from within this function will continue executing from within the Angular zone. If a synchronous error happens it will be rethrown and not reported via `onError`.

```
runTask<T>(fn: (...args: any[]) => T, applyThis?: any, applyArgs?: any[], name?: string): T {
  const zone = (this as any as NgZonePrivate)._inner;
  const task = zone.scheduleEventTask('NgZoneEvent: ' + name, fn, EMPTY_PAYLOAD, noop, noop);
  try {
    return zone.runTask(task, applyThis, applyArgs);
  } finally {
    zone.cancelTask(task);
  }
}
```

Same as `run`, except that synchronous errors are caught and forwarded via `onError` and not rethrown.

```
runGuarded<T>(fn: (...args: any[]) => T, applyThis?: any, applyArgs?: any[]): T {
  return (this as any as NgZonePrivate)._inner.runGuarded(fn, applyThis, applyArgs);
}
```

Executes the `fn` function synchronously in Angular's parent zone and returns value returned by the function. Running functions via `@link #runOutsideAngular` allows you to escape Angular's zone and do work that doesn't trigger Angular change-detection or is subject to Angular's error handling. Any future tasks or microtasks scheduled from within this function will continue executing from outside of the Angular zone. Use `@link #run` to reenter the Angular zone and do work that updates the application model.

```
runOutsideAngular<T>(fn: (...args: any[]) => T): T {
  return (this as any as NgZonePrivate)._outer.run(fn);
}
```

```
const EMPTY_PAYLOAD = {};
```

```
interface NgZonePrivate extends NgZone {
  _outer: Zone;
  _inner: Zone;
  _nesting: number;
  _hasPendingMicrotasks: boolean;
  hasPendingMacrotasks: boolean;
  hasPendingMicrotasks: boolean;
  lastRequestAnimationFrameId: number;
}
```

A flag to indicate if `NgZone` is currently inside `checkStable`

and to prevent re-entry. The flag is needed because it is possible to invoke the change detection from within change detection leading to incorrect behavior. For detail, please refer here, <https://github.com/angular/angular/pull/40540>

```
isCheckStableRunning: boolean;
isStable: boolean;
```

Optionally specify coalescing event change detections or not. Consider the following case.

```
<div (click)="doSomething()">
  <button (click)="doSomethingElse()"></button>
</div>
```

When button is clicked, because of the event bubbling, both event handlers will be called and 2 change detections will be triggered. We can coalesce such kind of events to trigger change detection only once. By default, this option will be false. So the events will not be coalesced and the change detection will be triggered multiple times. And if this option be set to true, the change

detection will be triggered async by scheduling it in an animation frame. So in the case above, the change detection will only be triggered once.

```
shouldCoalesceEventChangeDetection: boolean;
```

Optionally specify if `NgZone#run()` method invocations should be coalesced into a single change detection. Consider the following case.

```
for (let i = 0; i < 10; i++) {
  ngZone.run(() => {
    // do something
  });
}
```

This case triggers the change detection multiple times. With `ngZoneRunCoalescing` options, all change detections in an event loops trigger only once. In addition, the change detection executes in `requestAnimationFrame`.

```
shouldCoalesceRunChangeDetection: boolean;
```

```
nativeRequestAnimationFrame: (callback: FrameRequestCallback) => number;
// Cache a "fake" top eventTask so you don't need to schedule a new task every time you run a `checkStable`.
fakeTopEventTask: Task;
```

```
function checkStable(zone: NgZonePrivate) {
  // TODO: @JiaLiPassion, should check zone.isCheckStableRunning to prevent re-entry. The case is:
  // @Component({...})
  // export class
```

```

AppComponent {\n // constructor(private ngZone: NgZone) {\n // this.ngZone.onStable.subscribe() => {\n //
this.ngZone.run(() => console.log('stable'));;\n // }};\n // }\n //\n // The onStable subscriber run another function
inside ngZone\n // which causes `checkStable()` re-entry.\n // But this fix causes some issues in g3, so this fix will
be\n // launched in another PR.\n // if (zone._nesting == 0 && !zone.hasPendingMicrotasks && !zone.isStable) {\n
try {\n zone._nesting++;\n zone.onMicrotaskEmpty.emit(null);\n } finally {\n zone._nesting--;\n if

collects all views that are to be checked for changes.\n * Use the methods to add and remove views from the tree,
initiate change-detection,\n * and explicitly mark views as _dirty_, meaning that they have changed and need to be
re-rendered.\n *\n * @see [Using change detection hooks](guide/lifecycle-hooks#using-change-detection-hooks)\n
*\n * @see [Defining custom change detection](guide/lifecycle-hooks#defining-custom-change-detection)\n *\n *
@usageNotes\n *\n * The following examples demonstrate how to modify default change-detection behavior\n * to
perform explicit detection when needed.\n *\n * ### Use `markForCheck()` with `CheckOnce` strategy\n *\n * The
following example sets the `OnPush` change-detection strategy for a component\n * (`CheckOnce`, rather than the
default `CheckAlways`), then forces a second check\n * after an interval. See [live
demo](https://plnkr.co/edit/GC512b?p=preview).\n *\n * <code-example path="core/ts/change_detect/change-
detection.ts"\n * region="mark-for-check"></code-example>\n *\n * ### Detach change detector to limit how
often check occurs\n *\n * The following example defines a component with a large list of read-only data\n * that is
expected to change constantly, many times per second.\n * To improve performance, we want
to check and update the list\n * less often than the changes actually occur. To do that, we detach\n * the
component's change detector and perform an explicit local check every five seconds.\n *\n * <code-example
path="core/ts/change_detect/change-detection.ts"\n * region="detach"></code-example>\n *\n * ### Reattaching
a detached component\n *\n * The following example creates a component displaying live data.\n * The component
detaches its change detector from the main change detector tree\n * when the `live` property is set to false, and
reattaches it when the property\n * becomes true.\n *\n * <code-example path="core/ts/change_detect/change-
detection.ts"\n * region="reattach"></code-example>\n *\n * @publicApi\n *\nexport abstract class

to be applied

- \* @param previousIndex The `IterableChangeRecord#previousIndex` of the `record` refers to the original `Iterable` location, where as `previousIndex` refers to the transient location of the item, after applying the operations up to this point.
- \* @param currentIndex The `IterableChangeRecord#currentIndex` of the `record` refers to the original `Iterable` location, where as `currentIndex` refers to the transient location of the item, after applying the operations up to this point.

```

*^/n forEachOperation(\n fn:\n (record: IterableChangeRecord<V>, previousIndex: number|null,\n currentIndex: number|null) => void): void;\n /**\n * Iterate over changes in the order of original `Iterable` showing where the original items have moved.\n *^/n forEachPreviousItem(fn: (record: IterableChangeRecord<V>) => void): void;\n\n /** Iterate over all added items. *^/n forEachAddedItem(fn: (record: IterableChangeRecord<V>) => void): void;\n\n /** Iterate over all moved items. *^/n forEachMovedItem(fn: (record: IterableChangeRecord<V>) => void): void;\n\n /** Iterate over all removed items. *^/n forEachRemovedItem(fn: (record: IterableChangeRecord<V>) => void): void;\n\n /**\n * Iterate over all items which had their identity (as computed by the `TrackByFunction`) changed.\n *^/n forEachIdentityChange(fn: (record: IterableChangeRecord<V>) => void): void;\n}\n\n/**\n * Record representing the item change information.\n *\n * @publicApi\n *^/nexport interface IterableChangeRecord<V> {\n /** Current index of the item in `Iterable` or null if removed. *^/n readonly currentIndex: number|null;\n /** Previous index of the item in `Iterable` or null if added. *^/n readonly previousIndex: number|null;\n\n /** The item. *^/n readonly item: V;\n\n /** Track by identity as computed by the `TrackByFunction`. *^/n readonly trackById: any;\n}\n\n/**\n * A function optionally passed into the `NgForOf` directive to customize how `NgForOf` uniquely identifies items in an iterable.\n *\n * `NgForOf` needs to uniquely identify items in the iterable to correctly perform DOM updates when items in the iterable are reordered, new items are added, or existing items are removed.\n *\n * In all of these scenarios it is usually desirable to only update the DOM elements associated with the items affected by the change. This behavior is important to:\n *\n * - preserve any DOM-specific UI state (like cursor position, focus, text selection) when the iterable is modified\n * - enable animation of item addition, removal, and iterable reordering\n * - preserve the value of the <select> element when nested <option> elements are dynamically populated using `NgForOf` and the bound iterable is updated\n *\n * A common use for custom `trackBy` functions is when the model that `NgForOf` iterates over contains a property with a unique identifier. For example, given a model:\n *\n * ``ts\n * class User {\n * id: number;\n * name: string;\n * ...}\n *\n * a custom `trackBy` function could look like the following:\n *\n * ``ts\n * function userTrackBy(index, user) {\n * return user.id;\n * }\n *\n * A custom `trackBy` function must have several properties:\n *\n * - be [idempotent](https://en.wikipedia.org/wiki/Idempotence) (be without side effects, and always return the same value for a given input)\n * - return unique value for all unique inputs\n * - be fast\n *\n * @see [NgForOf#ngForTrackBy](api/common/NgForOf#ngForTrackBy)\n *\n * @publicApi\n *^/nexport interface TrackByFunction<T> {\n // Note: the type parameter `U` enables more accurate template type checking in case a trackBy function is declared using a base type of the iterated type. The `U` type gives TypeScript additional freedom to infer a narrower type for the `item` parameter type, instead of imposing the trackBy's declared item type as the inferred type for `T`. See https://github.com/angular/angular/issues/40125\n\n /**\n * @param index The index of the item within the iterable.\n * @param item The item in the iterable.\n *^/n <U extends T>(index: number, item: T&U): any;\n}\n\n/**\n * Provides a factory for {@link IterableDiffer}.\n *\n * @publicApi\n *^/nexport interface IterableDifferFactory {\n supports(objects: any): boolean;\n create<V>(trackByFn?: TrackByFunction<V>): IterableDiffer<V>;\n}\n\nexport function defaultIterableDiffersFactory() {\n return new IterableDiffers([new DefaultIterableDifferFactory()]);\n}\n\n/**\n * A repository of different iterable diffing strategies used by NgFor, NgClass, and others.\n *\n * @publicApi\n *^/nexport class IterableDiffers {\n /** @nocollapse *^/n static prov = /** @pureOrBreakMyCode */ defineInjectable(\n {token: IterableDiffers, providedIn: 'root', factory: defaultIterableDiffersFactory});\n\n /**\n * @deprecated

from './definition';\nimport { assertComponentDef } from './errors';\n\n/**\n
  * Creates a `ComponentRef` instance based on provided component type and a set of options.\n * \n *
  @usageNotes\n * \n * The example below demonstrates how the `createComponent` function can be used\n * to
  create an instance of a ComponentRef dynamically and attach it to an ApplicationRef,\n * so that it gets included
  into change detection cycles.\n * \n * Note: the example uses standalone components, but the function can also be
  used for\n * non-standalone components (declared in an NgModule) as well.\n * \n * ```\ntypescript\n *

```

```

@Component({\n * standalone: true,\n * template: `Hello {{ name }}!\n * `})\n * class HelloComponent {\n *
name = 'Angular';\n * }\n * \n * @Component({\n * standalone: true,\n * template: `<div id="hello-component-
host"></div>\n * `})\n * class RootComponent {\n * \n * // Bootstrap an application.\n * const applicationRef =
await bootstrapApplication(RootComponent);\n * \n * // Locate a DOM node that would be used as a host.\n * const
host
= document.getElementById('hello-component-host');\n * \n * // Get an `EnvironmentInjector` instance from the
`ApplicationRef`.\n * const environmentInjector = applicationRef.injector;\n * \n * // We can now create a
`ComponentRef` instance.\n * const componentRef = createComponent(HelloComponent, {host,
environmentInjector});\n * \n * // Last step is to register the newly created ref using the `ApplicationRef` instance\n
* // to include the component view into change detection cycles.\n *
applicationRef.attachView(componentRef.hostView);\n * ``\n * \n * @param component Component class
reference.\n * @param options Set of options to use:\n * * `environmentInjector`: An `EnvironmentInjector`
instance to be used for the component, see\n * additional info about it at https://angular.io/guide/standalone-
components#environment-injectors.\n * * `hostElement` (optional): A DOM node that should act as a host node for
the component. If not\n * provided, Angular creates one based on the tag name
used in the component selector (and falls\n * back to using `div` if selector doesn't have tag name info).\n * *
`elementInjector` (optional): An `ElementInjector` instance, see additional info about it at\n *
https://angular.io/guide/hierarchical-dependency-injection#elementinjector.\n * * `projectableNodes` (optional): A
list of DOM nodes that should be projected through\n *
[<ng-content>](api/core/ng-content) of the
new component instance.\n * @returns ComponentRef instance that represents a given Component.\n * \n *
@publicApi\n * \n * export function createComponent<C>(component: Type<C>, options: {\n * environmentInjector:
EnvironmentInjector,\n * hostElement?: Element,\n * elementInjector?: Injector,\n * projectableNodes?: Node[][],\n * }):
ComponentRef<C> {\n * \n * ngDevMode && assertComponentDef(component);\n * const componentDef =
getComponentDef(component)!;\n * const elementInjector = options.elementInjector || getNullInjector();\n * const
factory = new ComponentFactory<C>(componentDef);\n *
return factory.create(\n * elementInjector, options.projectableNodes, options.hostElement,
options.environmentInjector);\n * }\n * \n * \n * An interface that describes the subset of component metadata\n * that
can be retrieved using the `reflectComponentType` function.\n * \n * \n * @publicApi\n * \n * export interface
ComponentMirror<C> {\n * \n * /**\n * * The component's HTML selector.\n * * \n * get selector(): string;\n * \n * /**\n * * The
type of component the factory will create.\n * * \n * get type(): Type<C>;\n * \n * /**\n * * The inputs of the component.\n * * \n *
get inputs(): ReadonlyArray<{readonly propName: string, readonly templateName: string}>;\n * \n * /**\n * * The
outputs of the component.\n * * \n * get outputs(): ReadonlyArray<{readonly propName: string, readonly
templateName: string}>;\n * \n * /**\n * * Selector for all <ng-content> elements in the component.\n * * \n *
get ngContentSelectors(): ReadonlyArray<string>;\n * \n * /**\n * * Whether this component is marked as standalone.\n *
* \n * get isStandalone(): boolean;\n * }\n * \n * \n * Creates an object that allows to retrieve component metadata.\n * \n * \n * @usageNotes\n * \n * The example below
demonstrates how to use the function and how the fields\n * of the returned object map to the component
metadata.\n * \n * \n * typescript\n * @Component({\n * standalone: true,\n * selector: 'foo-component',\n *
template: `\n * <ng-content></ng-content>\n * <ng-content select="content-selector-a"></ng-content>\n *
`,\n * })\n * class FooComponent {\n * \n * @Input('inputName') inputPropName: string;\n * \n * @Output('outputName')
outputPropName = new EventEmitter<void>;\n * }\n * \n * const mirror =
reflectComponentType(FooComponent);\n * expect(mirror.type).toBe(FooComponent);\n *
expect(mirror.selector).toBe('foo-component');\n * expect(mirror.isStandalone).toBe(true);\n *
expect(mirror.inputs).toEqual([{\n * propName: 'inputName',\n * templateName: 'inputPropName'}]);\n *
expect(mirror.outputs).toEqual([{\n * propName: 'outputName',\n * templateName: 'outputPropName'}]);\n *
expect(mirror.ngContentSelectors).toEqual([\n * '*', // first `<ng-content>` in a template, the selector
defaults to `*\n * 'content-selector-a' // second `<ng-content>` in a template\n * ]);\n * ``\n * \n * \n * @param
component Component class reference.\n * @returns An object that allows to retrieve component metadata.\n * \n *

```

```

the purposes of DI is declared, but not yet defined. It is also used when the `token` which we use when
creating a query is not yet defined.
@usageNotes
### Example
{
  @example
  core/di/ts/forward_ref/forward_ref_spec.ts
  region='forward_ref'
}
@publicApi
export function
forwardRef(forwardRefFn: ForwardRefFn): Type<any> {
  (<any>forwardRefFn).__forward_ref__ =
  forwardRef;
  (<any>forwardRefFn).toString = function() {
    return stringify(this);
  };
  return
  (<Type<any>><any>forwardRefFn);
}
Lazily retrieves the reference value from a forwardRef.
Acts as the identity function when given a non-forward-ref
value.
@usageNotes
### Example
{
  @example
  core/di/ts/forward_ref/forward_ref_spec.ts
  region='resolve_forward_ref'
}
@see `forwardRef`
@publicApi
export function
resolveForwardRef<T>(type: T): T {
  return isForwardRef(type) ? type() : type;
}
Checks whether a
function is wrapped by a `forwardRef`.
export function isForwardRef(fn: any): fn is() => any {
  return typeof
  fn === 'function' && fn.hasOwnProperty('__forward_ref__') &&
  fn.__forward_ref__ ===
  forwardRef;
}
}
}

import {ERROR_DETAILS_PAGE_BASE_URL} from
'./error_details_base_url';
The list of error codes used in runtime code of the `core` package.
Reserved
error code range: 100-999.
Note: the minus sign denotes the fact that a particular code has a detailed guide
on angular.io. This extra annotation is needed to avoid introducing a separate set to store
error codes which
have guides, which might leak into runtime code.
Full list of available error guides can be found at
https://angular.io/errors

Class that represents
a runtime error.
Formats and outputs the error message in a consistent way.
Example:
throw
new RuntimeError(
  RuntimeErrorCode.INJECTOR_ALREADY_DESTROYED,
  ngDevMode &&
  'Injector has already been destroyed.');
```

message as a string in development mode (when the `ngDevMode` is defined). In production mode (after tree-shaking pass), the `message` argument becomes `false`, thus we account for it in the typings and the runtime logic.

```

export class RuntimeError<T extends number = RuntimeErrorCode>
  extends Error {
    constructor(public code: T, message: null|false|string) {
      super(formatRuntimeError<T>(code, message));
    }
  }
  /**
   * Called to format a runtime error.
   * See additional info on the `message` argument
   * type in the `RuntimeError` class description.
   */
  export function formatRuntimeError<T extends number =
  RuntimeErrorCode>(code: T, message: null|false|string): string {
    // Error code might be a negative number,
    // which is a special marker that instructs the logic to
    // generate a link to the error details page on angular.io
    const fullCode = `NG0${Math.abs(code)}`;
    let errorMessage = `${fullCode}${message ? ': ' + message.trim() : ''}`;
    if (ngDevMode && code < 0) {
      const addPeriodSeparator = !errorMessage.match(/[,;!?$/);
      const separator = addPeriodSeparator ? '! : ' : '';
      errorMessage = `${errorMessage}${separator}`;
    }
    Find more at ${ERROR_DETAILS_PAGE_BASE_URL}/${fullCode};
    return errorMessage;
  }
  /**

   */
  Used for stringifying render output in Ivy.
  Important! This function is very performance-sensitive and we should be extra careful
  not to introduce megamorphic reads in it.
  Check `core/test/render3/perf/render_stringify` for benchmarks and
  alternate implementations.
  export function stringify(value: any): string {
    if (typeof value === 'string')
      return value;
    if (value == null) return '';
    // Use `String` so that it invokes the `toString` method of the value.
    // Note that this appears to be faster than calling `value.toString` (see `render_stringify` benchmark).
    return String(value);
  }
  /**
   * Used to stringify a value so that it can be displayed in an error message.
   * Important! This function contains a megamorphic read and should only be used for error messages.
   */

import { Type } from '../interface/type';
import { getClosureSafeProperty } from
 '../util/property';
import { ClassProvider, ConstructorProvider, ExistingProvider, FactoryProvider,
StaticClassProvider, ValueProvider } from './provider';
Information about how a type or
`InjectionToken` interfaces with the DI system.
At a minimum, this includes a `factory` which defines how
to create the given type `T`, possibly
requesting injection of other types if necessary.
Optionally, a
`providedIn` parameter

specifies that the given type belongs to a particular `Injector`, `NgModule`, or a special scope (e.g. `root`). A value of `null` indicates that the injectable does not belong to any scope. The ViewEngine compiler emits code with this type for injectables. This code is deployed to npm, and should be treated as public api.

`InjectableDeclaration<T>` Specifies that the given type belongs to a particular injector: `InjectorType` such as `NgModule`, `root` the root injector, `any` all injectors, `null`, does not belong to any injector. Must be explicitly listed in the `injectorProviders` providedIn: `InjectorType<any>|root|platform|any|environment|null`

The token to which this definition belongs. Note that this may not be the same as the type that the `factory` will create.

token: unknown;

`Factory method to execute to create an instance of the injectable.`

`factory: (t?: Type<any>) => T;`

In a case of no explicit injector, a location where the instance of the injectable is stored.

value: T|undefined;

Information about the providers to be included in an `Injector` as well as how the given type which carries the information should be created by the DI system.

An `InjectorDef` can import other types which have `InjectorDefs`, forming a deep nested structure of providers with a defined priority (identically to how `NgModule`'s also have an import/dependency structure).

NOTE: This is a private type and should not be exported.

`InjectorDef<T>` Narrow down the type here once decorators properly change the return type of the class they are decorating (to add the `prov` property for example).

providers:

```
(Type<any>|ValueProvider|ExistingProvider|FactoryProvider|ConstructorProvider|
  StaticClassProvider|ClassProvider|any[]); imports:
```

`InjectorType<any>|InjectorTypeWithProviders<any>[];` A `Type` which has a `prov`: `InjectableDeclaration` static field.

`InjectableType`'s contain their own Dependency Injection metadata and are usable in an `InjectorDef`-based `StaticInjector`.

`InjectableType<T>` extends `Type<T>` Opaque type whose structure is highly version dependent. Do not rely on any properties.

`prov: unknown;` A type which has an `InjectorDef` static field.

`InjectorTypes` can be used to configure a `StaticInjector`.

This is an opaque type whose structure is highly version dependent. Do not rely on any properties.

`InjectorType<T>` extends `Type<T>` `fac?: unknown;` `inj: unknown;` Describes the `InjectorDef` equivalent

of a `ModuleWithProviders`, an `InjectorType` with an associated array of providers.

Objects of this type can be listed in the imports section of an `InjectorDef`.

NOTE: This is a private type and should not be exported.

`InjectorTypeWithProviders<T>` `ngModule: InjectorType<T>; providers?:`

```
(Type<any>|ValueProvider|ExistingProvider|FactoryProvider|ConstructorProvider|
  StaticClassProvider|ClassProvider|any[]);
```

Construct an injectable definition which defines how a token will be constructed by the DI system, and in which injectors (if any) it will be available.

This should be assigned to a static `prov` field on a type, which will then be an `InjectableType`.

Options:

- `providedIn` determines which injectors will include the injectable, by either associating it with an `NgModule` or other `InjectorType`, or by specifying that this injectable should be provided in the `root` injector, which will be the application-level injector in most apps.
- `factory` gives the zero argument function which will create an instance of the injectable. The factory can call `inject` to access the `Injector` and request injection of dependencies.

This instruction has been emitted by ViewEngine for some time and is deployed to npm.

`defineInjectable<T>(opts: { token: unknown, providedIn?: Type<any>|root|platform|any|environment|null, factory: () => T, inj: unknown } | { token: opts.token, providedIn: opts.providedIn as any || null, factory: opts.factory, value: undefined, } as InjectableDeclaration<T>);`

@deprecated in v8, delete after v10. This API should be used only by generated code, and that code should now use `defineInjectable` instead.

`defineInjectable = defineInjectable;` Construct

The strategy that the default change detector uses to detect changes. When set, takes effect the next time change detection is triggered.

@see { @link ChangeDetectorRef#usage-notes Change detection usage }

@publicApi
export enum ChangeDetectionStrategy {
  /** Use the `CheckOnce` strategy, meaning that automatic change detection is deactivated until reactivated by setting the strategy to `Default` (`CheckAlways`). Change detection can still be explicitly invoked. This strategy applies to all child directives and cannot be overridden.
    OnPush = 0,
  /** Use the default `CheckAlways` strategy, in which change detection is automatic until explicitly deactivated.
    Default = 1,
}

Defines the possible states of the default change detector.

@see `ChangeDetectorRef`
export enum ChangeDetectorStatus {
  /** A state in which, after calling `detectChanges()`, the change detector state becomes `Checked`, and must be explicitly invoked or reactivated.
    CheckOnce,
  /** A state in which change detection is skipped until the change detector mode becomes `CheckOnce`.
    Checked,
  /** A state in which change detection continues automatically until explicitly deactivated.
    CheckAlways,
  /** A state in which a change detector sub tree is not a part of the main tree and should be skipped.
    Detached,
  /** Indicates that the change detector encountered an error checking a binding or calling a directive lifecycle method and is now in an inconsistent state. Change detectors in this state do not detect changes.
    Errored,
  /** Indicates that the change detector has been destroyed.
    Destroyed,
}

Reports whether a given strategy is currently the default for change detection.

@param changeDetectionStrategy The strategy to check.
@returns True if the given strategy is the current default, false otherwise.

@see `ChangeDetectorStatus`
@see `ChangeDetectorRef`
export function isDefaultChangeDetectionStrategy(changeDetectionStrategy: ChangeDetectionStrategy): boolean {
  return changeDetectionStrategy == null || changeDetectionStrategy === ChangeDetectionStrategy.Default;
}

Defines the CSS styles encapsulation policies for the { @link Component } decorator's `encapsulation` option. See { @link Component#encapsulation encapsulation }.

@usageNotes
### Example
{ @example core/ts/metadata/encapsulation.ts region='longform' }

@publicApi
export enum ViewEncapsulation {
  // TODO: consider making `ViewEncapsulation` a `const enum` instead. See // https://github.com/angular/angular/issues/44119 for additional information.
  /** Emulates a native Shadow DOM encapsulation behavior by adding a specific attribute to the component's host element and applying the same attribute to all the CSS selectors provided via { @link Component#styles styles } or { @link Component#styleUrls styleUrls }. This is the default option.
    Emulated = 0,
  // Historically the 1 value was for `Native` encapsulation which has been removed as of v11.
  /** Doesn't provide any sort of CSS style encapsulation, meaning that all the styles provided via { @link Component#styles styles } or { @link Component#styleUrls styleUrls } are applicable to any HTML element of the application regardless of their host Component.
    None = 2,
  /** Uses the browser's native Shadow DOM API to encapsulate CSS styles, meaning that it creates a ShadowRoot for the component's host element which is then used to encapsulate all the Component's styling.
    ShadowDom = 3,
}

 * there should be no need to refer to `HEADER_OFFSET`

```

anywhere else.  
`export const HEADER_OFFSET = 22;`  
 This interface replaces the real LView interface if it is an arg or a return value of a public instruction. This ensures we don't need to expose the actual interface, which should be kept private.  
`export interface OpaqueViewState { __brand__: 'Brand for OpaqueViewState that nothing will match'; }`  
 LView stores all of the information needed to process the instructions as they are invoked from the template. Each embedded view and component view has its own LView. When processing a particular view, we set the viewData to that LView. When that view is done processing, the viewData is set back to whatever the original viewData was before (the parent LView).  
 Keeping separate state for each view facilitates view insertion / deletion, so we don't have to edit the data array based on which views are present.  
`export interface LView<T = unknown> extends Array<any>`

```
{
  /** Human readable representation of the LView.
   * NOTE: This property only exists if ngDevMode is set to true and it is not present in production. Its presence is purely to help debug issue in development, and should not be relied on in production application.
   * debug?: LViewDebug;
   * The node into which this LView is inserted.
   * [HOST]: RElement|null;
   * The static data for this view. We need a reference to this so we can easily walk up the node tree in DI and get the TView.data array associated with a node (where the directive defs are stored).
   * readonly[TVIEW]: TView;
   * Flags for this view. See LViewFlags for more info.
   * [FLAGS]: LViewFlags;
   * This may store an {@link LView} or {@link LContainer}.
   * LView - The parent view. This is needed when we exit the view and must restore the previous LView. Without this, the render method would have to keep a stack of views as it is recursively rendering templates.
   * LContainer - The current view is part of a container, and is an embedded view.
   * [PARENT]: LView|LContainer|null;
   * The next sibling LView or LContainer.
   * Allows us to propagate between sibling view states that aren't in the same container. Embedded views already have a node.next, but it is only set for views in the same container. We need a way to link component views and views across containers as well.
   * [NEXT]: LView|LContainer|null;
   * Queries active for this view - nodes from a view are reported to those queries.
   * [QUERIES]: LQueries|null;
   * Store the TNode of the location where the current LView is inserted into.
   * Given:
   * <div>
   * <ng-template><span></span></ng-template>
   * </div>
   * We end up with two TView's - parent TView which contains
   * <div><!-- anchor --></div>
   * - child TView which contains <span></span>
   * Typically the child is inserted into the declaration location of the parent, but it can be inserted anywhere. Because it can be inserted anywhere it is not possible to store the insertion information in the TView and instead we must store it in the LView[T_HOST].
   * So to determine where is our insertion parent we would execute:
   * const parentLView = LView[PARENT];
   * const parentTNode = LView[T_HOST];
   * const insertionParent = parentLView[parentTNode.index];
   * If null, this is the root view of an application (root component is in this view) and it has no parents.
   * [T_HOST]: TNode|null;
   * When a view is destroyed, listeners need to be released and outputs need to be unsubscribed. This context array stores both listener functions wrapped with their context and output subscription instances for a particular view.
   * These change per LView instance, so they cannot be stored on TView. Instead, TView.cleanup saves an index to the necessary context in this array.
   * After LView is created it is possible to attach additional instance specific functions at the end of the LView[CLEANUP] because we know that no more T level cleanup functions will be added here.
   * [CLEANUP]: any[]|null;
   * - For dynamic views, this is the context with which to render the template (e.g. NgForContext), or {} if not defined explicitly.
   * - For root view of the root component it's a reference to the component instance itself.
   * - For components, the context is a reference to the component instance itself.
   * - For inline views, the context is null.
   * [CONTEXT]: T;
   * An optional Module Injector to be used as fall back after Element Injectors are consulted.
   * readonly[INJECTOR]: Injector|null;
   * Factory to be used for creating Renderer.
   * [RENDERER_FACTORY]: RendererFactory;
   * Renderer to be used for this view.
   * [RENDERER]: Renderer;
   * An optional custom sanitizer.
   * [SANITIZER]:
```

Sanitizer

- \* Reference to the first LView or LContainer beneath this LView in the hierarchy.
- \* Necessary to store this so views can traverse through their nested views to remove listeners and call onDestroy callbacks.

[CHILD\_HEAD]: LView/LContainer

- \* The last LView or LContainer beneath this LView in the hierarchy.
- \* The tail allows us to quickly add a new state to the end of the view list without having to propagate starting from the first child.

[CHILD\_TAIL]:

LView/LContainer

- \* View where this view's template was declared.
- \* The template for a dynamically created view may be declared in a different view than it is inserted.

We already track the "insertion view" (view where the template was inserted) in LView[PARENT], but we also need access to the "declaration view" (view where the template was declared). Otherwise, we wouldn't be able to call the view's template function with the proper contexts. Context should be inherited from the declaration view tree, not the insertion view tree.

Example (AppComponent template):

```
<ng-template #foo></ng-template> <-- declared here --> <some-comp [tpl]="foo"></some-comp> <-- inserted inside this component -->
```

The <ng-template> above is declared in the AppComponent template, but it will be passed into SomeComp and inserted there. In this case, the declaration view would be the AppComponent, but the insertion view would be SomeComp. When we are removing views, we would want to traverse through the insertion view to clean up listeners. When we are calling the template function during change detection, we need the declaration view to get inherited context.

[DECLARATION\_VIEW]: LView

- \* Points to the declaration component view, used to track transplanted LView's.
- \* See: DECLARATION\_VIEW which points to the actual LView where it was declared, whereas DECLARATION\_COMPONENT\_VIEW points to the component which may not be same as DECLARATION\_VIEW.
- \* Example:

```
<#VIEW #myComp> <div *ngIf="true"> <ng-template #myTpl>...</ng-template> </div> </#VIEW>
```

In the above case DECLARATION\_VIEW for myTpl points to the LView of ngIf whereas DECLARATION\_COMPONENT\_VIEW points to LView of the myComp which owns the template.

The reason for this is that all embedded views are always check-always whereas the component view can be check-always or on-push. When we have a transplanted view it is important to

- \* determine if we have transplanted a view from check-always declaration to on-push insertion point. In such a case the transplanted view needs to be added to the LContainer in the declared LView and CD during the declared view CD (in addition to the CD at the insertion point.) (Any transplanted views which are intra Component are of no interest because the CD strategy of declaration and insertion will always be the same, because it is the same component.)
- \* Queries already track moved views in LView[DECLARATION\_LCONTAINER] and LContainer[MOVED\_VIEWS]. However the queries also track LView's which moved within the same component LView. Transplanted views are a subset of moved views, and we use DECLARATION\_COMPONENT\_VIEW to differentiate them. As in this example:

Example showing intra component LView movement:

```
<#VIEW #myComp> <div *ngIf="condition; then thenBlock else elseBlock"></div>
```

- \* <ng-template #thenBlock>Content to render when condition is true.</ng-template> <ng-template #elseBlock>Content to render when condition is false.</ng-template>
- \* </#VIEW>
- \* The thenBlock and elseBlock is moved but not transplanted.
- \* Example showing inter component LView movement (transplanted view):

```
<#VIEW #myComp> <ng-template #myTpl>...</ng-template> <insertion-component [template]="myTpl"></insertion-component>
```

In the above example myTpl is passed into a different component. If insertion-component instantiates myTpl and insertion-component is on-push then the LContainer needs to be marked as containing transplanted views and those views need to be CD as part of the declaration CD.

When change detection runs, it iterates over [MOVED\_VIEWS] and CDs any child LView's where the DECLARATION\_COMPONENT\_VIEW

of the current component and the child LView does not match (it has been transplanted across components.)

Note: [DECLARATION\_COMPONENT\_VIEW] points to itself if the LView is a

component view (the simplest / most common case). see also: -  
<https://hackmd.io/@mhevery/rJUJsvv9H> write up of the problem -

``LContainer[HAS_TRANSPLANTED_VIEWS]`` which marks which ``LContainer`` has transplanted views.

Optional injector assigned to embedded views that takes precedence over the element and module injectors.  
``^` readonly[EMBEDDED_VIEW_INJECTOR]: Injector|null;``

Flags associated with an `LView` (saved in `LView[FLAGS]``)  
``^`export const enum LViewFlags {``  
The state of the init phase on the first 2 bits  
`InitPhaseStateIncrementer = 0b000000000001,``  
`InitPhaseStateMask = 0b000000000011,``  
Whether or not the view is in creationMode.  
This must be stored in the view rather than using ``data`` as a marker so that we can properly support embedded views. Otherwise, when exiting a child view back into the parent view, ``data`` will be defined and ``creationMode`` will be improperly reported as false.  
`CreationMode = 0b00000000100,``  
Whether or not this `LView` instance is on its first processing pass.  
An `LView` instance is considered to be on its "first pass" until it has completed one creation mode run and one update mode run. At this time, the flag is turned off.  
`FirstLViewPass = 0b00000001000,``  
Whether this view has default change detection strategy (checks always) or onPush  
`CheckAlways = 0b00000010000,``  
Whether or not this view is currently dirty (needing check)  
`Dirty = 0b00000100000,``  
Whether or not this view is currently attached to change detection tree.  
`Attached = 0b000001000000,``  
Whether or not this view is destroyed.  
`Destroyed = 0b000010000000,``  
Whether or not this view is the root view  
`IsRoot = 0b000100000000,``  
Whether this moved `LView` needs to be refreshed at the insertion location because the declaration was dirty.  
`RefreshTransplantedView = 0b001000000000,``  
Indicates that the view or any of its ancestors have an embedded view injector.  
`HasEmbeddedViewInjector = 0b001000000000,``  
Index of the current init phase on last 21 bits  
`IndexWithinInitPhaseIncrementer = 0b0100000000000,``  
`IndexWithinInitPhaseShift = 11,``  
`IndexWithinInitPhaseReset = 0b0011111111111,``

Possible states of the init phase:  
- 00: OnInit hooks to be run.  
- 01: AfterContentInit hooks to be run  
- 10: AfterViewInit hooks to be run  
- 11: All init hooks have been run  
``^`export const enum InitPhaseState {``  
`OnInitHooksToBeRun = 0b00,``  
`AfterContentInitHooksToBeRun = 0b01,``  
`AfterViewInitHooksToBeRun = 0b10,``  
`InitPhaseCompleted = 0b11,``

More flags associated with an `LView` (saved in `LView[PREORDER_HOOK_FLAGS]``)  
``^`export const enum PreOrderHookFlags {``  
The index of the next pre-order hook to be called in the hooks array, on the first 16 bits  
`IndexOfTheNextPreOrderHookMaskMask = 0b0111111111111111,``  
The number of init hooks that have already been called, on the last 16 bits  
`NumberOfInitHooksCalledIncrementer = 0b0100000000000000,``  
`NumberOfInitHooksCalledShift = 16,``  
`NumberOfInitHooksCalledMask = 0b11111111111111110000000000000000,``  
Stores a set of `OpCodes` to process ``HostBindingsFunction``

associated with a current view.  
 In order to invoke `HostBindingsFunction` we need:  
 1. `elementIdx`: Index to the element associated with the `HostBindingsFunction`.  
 2. `directiveIdx`: Index to the directive associated with the `HostBindingsFunction`. (This will become the context for the `HostBindingsFunction` invocation.)  
 3. `bindingRootIdx`: Location where the bindings for the `HostBindingsFunction` start. Internally `HostBindingsFunction` binding indexes start from `0` so we need to add `bindingRootIdx` to it.  
 4. `HostBindingOpCodes`: A host binding function to execute.  
 The above information needs to be encoded into the `HostBindingOpCodes` in an efficient manner.  
 1. `elementIdx` is encoded into the `HostBindingOpCodes` as `~elementIdx` (so a negative number);  
 2. `directiveIdx`  
 3. `bindingRootIdx`  
 4. `HostBindingOpCodes` is passed in as is.  
 The `HostBindingOpCodes` array contains:  
 \* - negative number to select the element index.  
 \* - followed by 1 or more of:  
 \* - a number to select the directive index  
 \* - a number to select the bindingRoot index  
 \* - and a function to invoke.  
 ##  
 Example  

```
const hostBindingOpCodes = [~30, // Select element 30
  40, 45,
  MyDir.dir.hostBindings // Invoke host bindings on MyDir on element 30;
  //
  directiveIdx = 40; bindingRootIdx = 45;
  50, 55, OtherDir.dir.hostBindings // Invoke host bindings on
  OtherDir on element 30;
  // directiveIdx = 50; bindingRootIdx = 55;
]

```

 ## Pseudocode  

```
const hostBindingOpCodes = tView.hostBindingOpCodes;
if (hostBindingOpCodes === null) return;
for (let i = 0; i < hostBindingOpCodes.length; i++) {
  const opCode = hostBindingOpCodes[i] as number;
  if (opCode < 0) {
    // Negative numbers are element indexes.
    setSelectedIndex(~opCode);
  } else {
    // Positive numbers are NumberTuple which store bindingRootIndex and directiveIndex.
    const directiveIdx = opCode;
    const bindingRootIdx = hostBindingOpCodes[++i] as number;
    const hostBindingFn = hostBindingOpCodes[++i] as HostBindingsFunction<any>;
    setBindingRootForHostBindings(bindingRootIdx, directiveIdx);
    const context = IView[directiveIdx];
    hostBindingFn(RenderFlags.Update, context);
  }
}

```

 ##  

```
export interface HostBindingOpCodes extends Array<number|HostBindingsFunction<any>> {
  __brand__: 'HostBindingOpCodes';
  debug?: string[];
}

```

Explicitly marks `TView` as a specific type in `ngDevMode`  
 It is useful to know conceptually what time of `TView` we are dealing with when debugging an application (even if the runtime does not need it.) For this reason we store this information in the `ngDevMode` `TView`  
 and then use it for better debugging experience.  

```
export const enum TViewType {
  Root
}

```

 `TView` is the used to bootstrap components into. It is used in conjunction with `LView` which takes an existing DOM node not owned by Angular and wraps it in `TView`/`LView` so that other components can be loaded into it.  
 Root = 0,  
 `TView` associated with a Component. This would be the `TView` directly associated with the component view (as opposed an `Embedded` `TView` which would be a child of `Component` `TView`)  
 Component = 1,  
 `TView` associated with a template. Such as `ngIf`, `` etc... A `Component` can have zero or more `Embedded` `TView`'s.  
 Embedded = 2,  
 Converts `TViewType` into human readable text.  
 Make sure this matches with `TViewType`  

```
export const TViewTypeAsString = [0 'Root', // 0 'Component', // 1 'Embedded', // 2] as const;

```

The static data for an LView (shared between all templates of a given type).  
 Stored on the `ComponentDef.tView`.  

```
export interface TView {
  type: TViewType;
  // This is a blueprint used to generate LView instances for this TView. Copying this blueprint is faster than creating a new LView from scratch.
  blueprint: LView;
  // The template function used to refresh the view of dynamically created views and components. Will be null for inline views.
  template: ComponentTemplate<{}>|null;
  // A function containing query-related instructions.
  viewQuery: ViewQueriesFunction<{}>|null;
  // A TNode representing the declaration location of this TView (not part of this TView).
  declTNode: TNode|null;
  // FIXME(misko): Why does TView not have declarationTView property?
  // Whether or not this

```

template has been processed in creation mode. `*^/n firstCreatePass: boolean;`  
`/**^/n * Whether or not this template has been processed in update mode (e.g. change detected)^/n *^/n * `firstUpdatePass` is used by styling to set up `TData` to contain metadata about the styling^/n * instructions. (Mainly to build up a linked list of styling priority order.)^/n *^/n * Typically this function gets cleared after first execution. If exception is thrown then this^/n * flag can remain turned un until there is first successful (no exception) pass. This means that^/n * individual styling instructions keep track of if they have already been added to the linked^/n * list to prevent double adding.^/n *^/n firstUpdatePass: boolean;`  
`/**^/n * Static data equivalent of LView.data[]. Contains TNodes, PipeDefInternal or TTI18n.^/n data: TData;`

hooks requires complex logic as we need to deal with 2 constraints.

1. Init hooks (ngOnInit, ngAfterContentInit, ngAfterViewInit) must all be executed once and only once, across many change detection cycles. This must be true even if some hooks throw, or if some recursively trigger a change detection cycle. To solve that, it is required to track the state of the execution of these init hooks. This is done by storing and maintaining flags in the view: the `{ @link InitPhaseState }`, and the index within that phase. They can be seen as a cursor in the following structure: `[[onInit1, onInit2], [afterContentInit1], [afterViewInit1, afterViewInit2, afterViewInit3]]`. They are stored as flags in `LView[FLAGS]`.
2. Pre-order hooks can be executed in batches, because of the select instruction. To be able to pause and resume their execution, we also need some state about the hook's array that is being processed:
  - the index of the next hook to be executed
  - the number of init hooks already found in the processed part of the array
 They are stored as flags in `LView[PREORDER_HOOK_FLAGS]`.

Executes pre-order check hooks ( `OnChanges`, `DoChanges`) given a view where all the init hooks were executed once. This is a light version of `executeInitAndCheckPreOrderHooks` where we can skip read / write of the init-hooks related flags.

@param `IView` The `LView` where hooks are defined

@param `hooks` Hooks to be run

@param `nodeIndex` 3 cases depending on the value:

- undefined: all hooks from the array should be executed (post-order case)
- null: execute hooks only from the saved index until the end of the array (pre-order case, when flushing the remaining hooks)
- number: execute hooks only from the saved index until that node index exclusive (pre-order case, when executing `select(number)`)

^nextport function `executeCheckHooks(IView: LView, hooks: HookData, nodeIndex?: number|null)`

```
{
  \n callHooks(IView, hooks, InitPhaseState.InitPhaseCompleted, nodeIndex);
}
```

Executes post-order init and check hooks (one of `AfterContentInit`, `AfterContentChecked`, `AfterViewInit`, `AfterViewChecked`) given a view where there are pending init hooks to be executed.

@param `IView` The `LView` where hooks are defined

@param `hooks` Hooks to be run

@param `initPhase` A phase for which hooks should be run

@param `nodeIndex` 3 cases depending on the value:

- undefined: all hooks from the array should be executed (post-order case)
- null: execute hooks only from the saved index until the end of the array (pre-order case, when flushing the remaining hooks)
- number: execute hooks only from the saved index until that node index exclusive (pre-order case, when executing `select(number)`)

^nextport function `executeInitAndCheckHooks(IView: LView, hooks: HookData, initPhase: InitPhaseState, nodeIndex?: number|null)`

```

  \n const nodeIndexLimit =
```

NO\_PARENT\_INJECTOR: RelativeInjectorLocation = -1 as any;

Each injector is saved in 9 contiguous slots in `LView` and 9 contiguous slots in `TView.data`. This allows us to store information about the current node's tokens (which can be shared in `TView`) as well as the tokens of its ancestor nodes (which cannot be shared, so they live in `LView`). Each of these slots (aside from the last slot) contains a bloom filter. This bloom filter determines whether a directive is available on the associated node or not. This prevents us from searching the directives array at this level unless it's probable the directive is in it. See: [https://en.wikipedia.org/wiki/Bloom\\_filter](https://en.wikipedia.org/wiki/Bloom_filter) for more about bloom filters. Because all injectors have been flattened into `LView` and `TViewData`, they cannot be typed using interfaces as they were previously. The start index of each `LInjector` and `TInjector` will differ based on where it is flattened into the main array, so it's not possible to know the indices ahead of

time and save their types here. The interfaces are still included here for documentation purposes. export interface LInjector extends Array<any> {\n \* // Cumulative bloom for directive IDs 0-31 (IDs are % BLOOM\_SIZE)\n \* [0]: number;\n \* // Cumulative bloom for directive IDs 32-63\n \* [1]: number;\n \* // Cumulative bloom for directive IDs 64-95\n \* [2]: number;\n \* // Cumulative bloom for directive IDs 96-127\n \* [3]: number;\n \* // Cumulative bloom for directive IDs 128-159\n \* [4]: number;\n \* // Cumulative bloom for directive IDs 160 - 191\n \* [5]: number;\n \* // Cumulative bloom for directive IDs 192 - 223\n \* [6]: number;\n \* // Cumulative bloom for directive IDs 224 - 255\n \* [7]: number;\n \* // We need to store a reference to the injector's parent so DI can keep looking up\n \* // the injector tree until it finds the dependency it's looking for.\n \* [PARENT\_INJECTOR]: number;\n

\* }\n \* export interface TInjector extends Array<any> {\n \* // Shared node bloom for directive IDs 0-31 (IDs are % BLOOM\_SIZE)\n \* [0]: number;\n \* // Shared node bloom for directive IDs 32-63\n \* [1]: number;\n \* // Shared node bloom for directive IDs 64-95\n \* [2]: number;\n \* // Shared node bloom for directive IDs 96-127\n \* [3]: number;\n \* // Shared node bloom for directive IDs 128-159\n \* [4]: number;\n \* // Shared node bloom for directive IDs 160 - 191\n \* [5]: number;\n \* // Shared node bloom for directive IDs 192 - 223\n \* [6]: number;\n \* // Shared node bloom for directive IDs 224 - 255\n \* [7]: number;\n \* // Necessary to find directive indices for a particular node.\n \* [TNODE]:

TElementNode|TElementContainerNode|TContainerNode;\n \* }\n \* Factory for creating instances of injectors in the NodeInjector.\n \* This factory is complicated by the fact that it can resolve

`multi` factories as well.\n \* NOTE: Some of the fields are optional which means that this class has two hidden classes.\n \* - One without `multi` support (most common)\n \* - One with `multi` values, (rare).\n \* Since VMs can cache up to 4 inline hidden classes this is OK.\n \* - Single factory: Only `resolving` and `factory` is defined.\n \* - `providers` factory: `componentProviders` is a number and `index = -1`.\n \* - `viewProviders` factory: `componentProviders` is a number and `index` points to `providers`.

export class NodeInjectorFactory {\n \* // The inject implementation to be activated when using the factory.\n \* injectImpl: null|(<T>(token: ProviderToken<T>, flags?: InjectFlags) => T);\n \* // Marker set to true during factory invocation to see if we get into recursive loop.\n \* Recursive loop causes an error to be displayed.\n \* resolving = false;\n \* Marks that the token can see other Tokens declared in `viewProviders`

on the same node.\n \* canSeeViewProviders: boolean;\n \* An array of factories to use in case of `multi` provider.\n \* multi?: Array<() => any>;\n \* Number of `multi`-providers which belong to the component.\n \* This is needed because when multiple components and directives declare the `multi` provider they have to be concatenated in the correct order.\n \* Example:\n \* If we have a component and directive active on a single element as declared here\n \* component:\n \* providers: [ {provide: String, useValue: 'component', multi: true} ],\n \* viewProviders: [ {provide: String, useValue: 'componentView', multi: true} ],\n \* directive:\n \* providers: [ {provide: String, useValue: 'directive', multi: true} ],\n \* Then the expected results are:\n \* providers: ['component', 'directive']\n \* viewProviders: ['component', 'componentView', 'directive']\n

\* The way to think about it is that the `viewProviders` have been inserted after the component but before the directives, which is why we need to know how many `multi`s have been declared by the component.\n

componentProviders?: number;\n\n /\*\*\n \* Current index of the Factory in the `data`. Needed for `viewProviders` and `providers` merging.\n \* See `providerFactory`. \n \*/\n index?: number;\n\n /\*\*\n \* Because the same `multi` provider can be declared in `providers` and `viewProviders` it is\n \* possible for `viewProviders` to shadow the `providers`. For this reason we store the\n \* `provideFactory` of the `providers` so that `providers` can be extended with `viewProviders`.\n \* \n \* Example:\n \* \n \* Given:\n \* ```\n \* providers: [ {provide: String, useValue: 'all', multi: true} ],\n \* viewProviders: [ {provide: String, useValue: 'viewOnly', multi: true} ],\n \* ```\n \* \n \* We have to return `[all]` in case of content injection, but `[all, 'viewOnly']` in case\n \* of view injection. We further have to make sure that the shared instances (in our case\n \* `all`) are the exact same instance in both the content as well as the view injection. (We\n \* have to make sure that we don't double instantiate.) For this reason the `viewProviders`\n \* `Factory` has a pointer to the shadowed `providers` factory so that it can instantiate the\n \* `providers` (`[all]`) and then extend it with `viewProviders` (`[all] + ['viewOnly']`).\n \*/\n providerFactory?: NodeInjectorFactory|null;\n\n constructor(\n /\*\*\n \* Factory to invoke in order to create a new instance.\n \*/\n public factory:\n (this: NodeInjectorFactory, \_: undefined,\n /\*\*\n \* array where injectables tokens are stored. This is used in\n \* case of an error reporting to produce friendlier errors.\n \*/\n tData: TData,\n /\*\*\n \* array where existing instances of injectables are stored. This is used in case\n \* of multi shadow is needed. See `multi` field documentation.\n \*/\n IView: LView,\n /\*\*\n \* The TNode of the same element injector.\n \*/\n tNode: TDirectiveHostNode) => any,\n /\*\*\n \* Set to `true` if the token is declared in `viewProviders` (or if it is component).\n \*/\n isViewProvider: boolean,\n injectImplementation: null|(<T>(token: ProviderToken<T>, flags?: InjectFlags) => T)) {\n ngDevMode && assertDefined(factory, 'Factory not specified');\n ngDevMode && assertEqual(typeof factory, 'function', 'Expected factory function.);\n this.canSeeViewProviders = isViewProvider;\n this.injectImpl = injectImplementation;\n }\n}\n\nexport function isFactory(obj: any): obj is NodeInjectorFactory {\n return obj instanceof NodeInjectorFactory;\n}\n\n// Note: This hack is necessary so we don't erroneously get a circular dependency\n// failure based on types.\nexport const unusedValueExportToPlacateAjd = 1;\n"/\*\*\n \* @license\n \* Copyright Google LLC All Rights Reserved.\n \*/\n \* Use of this source code is governed by an MIT-style license that can be\n \* found in the LICENSE file at https://angular.io/license\n \*/\nimport {KeyValueArray} from '../util/array\_utils';\nimport {TStylingRange} from '../interfaces/styling';\nimport {Ticu} from './i18n';\nimport {CssSelector} from './projection';\nimport {RNode} from './renderer\_dom';\nimport {LView, TView} from './view';\n\n/\*\*\n \* TNodeType corresponds to the {@link TNode} `type` property.\n \* \n \* NOTE: type IDs are such that we use each bit to denote a type. This is done so that we can easily\n \* check if the `TNode` is of more than one type.\n \* \n \* if (tNode.type === TNodeType.Text || tNode.type === TNodeType.Element)\n \* can be written as:\n \* if (tNode.type & (TNodeType.Text | TNodeType.Element))\n \* \n \* However any given `TNode` can only be of one type.\n \*/\nexport const enum TNodeType {\n /\*\*\n \* The TNode contains information about a DOM element aka {@link RText}.\n \*/\n Text = 0b1,\n\n /\*\*\n \* The TNode contains information about a DOM element aka {@link RElement}.\n \*/\n Element = 0b10,\n\n /\*\*\n \* The TNode contains information about an {@link LContainer} for embedded views.\n \*/\n Container = 0b100,\n\n /\*\*\n \* The TNode contains information about an <ng-container> element {@link RNode}.\n \*/\n ElementContainer = 0b1000,\n\n /\*\*\n \* The TNode contains information about an <ng-content> projection.\n \*/\n Projection = 0b10000,\n\n /\*\*\n \* The TNode contains information about an ICU comment used in `i18n`.\n \*/\n Icu = 0b100000,\n\n /\*\*\n \* Special node type representing a placeholder for future `TNode` at this location.\n \* \n \* I18n translation blocks are created before the element nodes which they contain. (I18n blocks\n \* can span over many elements.) Because i18n `TNode`s (representing text) are created first they\n \* often may need to point to element `TNode`s which are not yet created. In such a case we create\n \* a `Placeholder` `TNode`. This allows the i18n to structurally link the `TNode`s together\n \* without knowing any information about the future nodes which will be at that location.\n \* \n \* On `firstCreatePass` When element instruction executes it will try to create

```

a `TNode` at that location. Seeing a `Placeholder` `TNode` already there tells the system that it should reuse
existing `TNode` (rather than create a new one) and just update the missing information.
Placeholder =
0b1000000, // Combined Types These should never be used for `TNode.type` only as a useful way to check
// if `TNode.type` is one of several choices. // See: https://github.com/microsoft/TypeScript/issues/35875 why we
can't refer to existing enum. AnyRNode = 0b11, // Text | Element,

* Corresponds to the TNode.flags
property.
* `TNode.flags`
* `TNode.flags`
* Bit #1 - This bit is set if the node is a host for any directive
(including a component)
* `isDirectiveHost`
isDirectiveHost = 0x1,
* Bit #2 - This bit is set if the node is a host for a component.
* `isDirectiveHost`
* Setting this bit implies that the
`isDirectiveHost` bit is set as well.
* `isComponentHost`
isComponentHost = 0x2,
* Bit #3 - This bit is set if the node has
been projected
* `isProjected`
isProjected = 0x4,
* Bit #4 - This bit is set if any directive on this node has content
queries
* `hasContentQuery`
hasContentQuery = 0x8,
* Bit #5 - This bit is set if the node has any `class` inputs
* `hasClassInput`
hasClassInput = 0x10,
* Bit #6 - This bit is set if the node has any `style` inputs
* `hasStyleInput`
hasStyleInput =
0x20,
* Bit #7 This bit is set if the node has been detached by i18n
* `isDetached`
isDetached = 0x40,
* Bit
#8 - This bit is set if the node has directives with host bindings.
* `isDetached`
* This flags allows us to guard host-binding
logic and invoke it only on nodes
* that actually have directives with host bindings.
* `hasHostBindings`
hasHostBindings =
0x80,
* Corresponds to the TNode.providerIndexes
property.
* `TNode.providerIndexes`
* `TNode.providerIndexes`
* The index of the first provider on this node is
encoded on the least significant bits.
* `ProvidersStartIndexMask`
ProvidersStartIndexMask =
0b00000000000000111111111111111111,
* The count of view providers from the component on this
node is
* encoded on the 20 most significant bits.
* `CptViewProvidersCountShifter`
CptViewProvidersCountShifter = 0b00000000000010000000000000000000,
* A set of marker values
to be used in the attributes arrays. These markers indicate that some
* items are not regular attributes and the
processing should be adapted accordingly.
* `AttributeMarker`
* `AttributeMarker`
* An implicit
marker which indicates that the value in the array are of `attributeKey`,
* `attributeValue` format.
* `AttributeMarker`
* NOTE: This is implicit as it is the type when no marker is present in array. We indicate that
* it should not be
present at runtime by the negative number.
* `ImplicitAttributes`
ImplicitAttributes = -1,
* Marker indicates that the following 3 values in the attributes array are:
* namespaceUri, attributeName, attributeValue
* in that order.
* `NamespaceURI`
NamespaceURI = 0,
* Signals class declaration.
* Each value following `Classes` designates a class name to include on the
element.
* ## Example:
* Given:
* <div class="foo bar baz">...</div>
* the
generated code is:
* var _c1 = [AttributeMarker.Classes, 'foo', 'bar', 'baz'];
* Classes =
1,
* Signals style declaration.
* Each pair of values following `Styles` designates a style name
and value to include on the
* element.
* ## Example:
* Given:
* <div
style="width:100px; height:200px; color:red">...</div>
* the generated code is:
* var
_c1 = [AttributeMarker.Styles, 'width', '100px', 'height',
'200px', 'color', 'red'];
* Styles = 2,
* Signals that the following attribute names were
extracted from input or output bindings.
* For example, given the following HTML:
* <div
moo="car" [foo]="exp" (bar)="doSth()">
* the generated code is:
* var _c1 =
['moo', 'car', AttributeMarker.Bindings, 'foo', 'bar'];
* Bindings = 3,
* Signals that the
following attribute names were hoisted from an inline-template declaration.
* For example, given the

```

following HTML:

```

<div *ngFor="let value of values; trackBy:trackBy" dirA [dirB]="value">

```

the generated code for the `template()` instruction would include:

```

['dirA', '',
AttributeMarker.Bindings, 'dirB', AttributeMarker.Template, 'ngFor', 'ngForOf',
'ngForTrackBy', 'let-value']

```

while the generated code for the `element()` instruction inside the template function would include:

```

['dirA', '',
AttributeMarker.Bindings, 'dirB']
Template = 4,
Signals that the following attribute is `ngProjectAs` and its value is a parsed `CssSelector`.
For example, given the following HTML:
<h1 attr="value" ngProjectAs="[title]">
the generated code for the `element()` instruction would include:
['attr', 'value', AttributeMarker.ProjectAs, ['title', '']]
ProjectAs = 5,
Signals that the following attribute will be translated by runtime i18n.
For example, given the following HTML:
<div moo="car" foo="value" i18n-foo [bar]="binding" i18n-bar>
the generated code is:
var _c1 = ['moo', 'car', AttributeMarker.I18n, 'foo', 'bar'];
I18n = 6,
}

```

A combination of:

- Attribute names and values.
- Special markers acting as flags to alter attributes processing.
- Parsed `ngProjectAs` selectors.

export type TAttributes = (string|AttributeMarker|CssSelector)[];

Constants that are associated with a view. Includes:

- Attribute arrays.
- Local definition arrays.
- Translated messages (i18n).

export type TConstants = (TAttributes|string)[];

Factory function that returns an array of consts. Consts can be represented as a function in case any additional statements are required to define consts in the list. An example is i18n where additional i18n calls are generated, which should be executed when consts are requested for the first time.

export type TConstantsFactory = () => TConstants;

TConstants type that describes how the `consts` field is generated on `ComponentDef`: it can be either an array or a factory function that returns that array.

export type TConstantsOrFactory = TConstants|TConstantsFactory;

Binding data (flyweight) for a particular node that is shared between all templates of a specific type.

If a property is:

- `PropertyAliases`: that property's data was generated and this is it
- `Null`: that property's data was already generated and nothing was found.
- `Undefined`: that property's data has not yet been generated

see: [https://en.wikipedia.org/wiki/Flyweight\\_pattern](https://en.wikipedia.org/wiki/Flyweight_pattern) for more on the Flyweight pattern

export interface TNode {

/\*\* The type of the TNode. See TNodeType. \*/

type: TNodeType;

/\*\* Index of the TNode in TView.data and corresponding native element in LView. This is necessary to get from any TNode to its corresponding native element when traversing the node tree. If index is -1, this is a dynamically created container node or embedded view node. \*/

index: number;

/\*\* Insert before existing DOM node index. When DOM nodes are being inserted, normally they are being appended as they are created. Under i18n case, the translated text nodes are created ahead of time as part of the `i18nStart` instruction which means that this `TNode` can't just be appended and instead needs to be inserted using `insertBeforeIndex` semantics. Additionally sometimes it is necessary to insert new text nodes as a child of this `TNode`. In such a case the value stores an array of text nodes to insert. Example: `<div i18n> Hello <span>World</span>!` In the above example the `i18nStart` instruction can create `Hello`, `World` and `!` text nodes. It can also insert `Hello` and `!` text node as a child of `<div>`, but it can't insert `World` because the `<span>` node has not yet been created. In such a case the `<span>` `TNode` will have an array which will direct the `<span>` to not only insert itself in front of `!` but also to insert the `World` (created by `i18nStart`) into `<span>` itself.

Pseudo code:

```

if (insertBeforeIndex === null) {
  // append as normal
} else if (Array.isArray(insertBeforeIndex)) {
  // First insert current `TNode` at correct location
  const currentNode = IView[this.index];
  parentNode.insertBefore(currentNode, IView[this.insertBeforeIndex[0]]);
  // Now append all of the children
  for(let i=1; i<this.insertBeforeIndex; i++) {
    currentNode.appendChild(IView[this.insertBeforeIndex[i]]);
  }
} else {
  parentNode.insertBefore(IView[this.index], IView[this.insertBeforeIndex])
}

```

Append as normal using `parentNode.appendChild`number``: Append using

```

parentNode.insertBefore(IView[this.index], IView[this.insertBeforeIndex])`
`
` * Initialization *
` * Because `i18nStart` executes before nodes are created, on `TView.firstCreatePass`
it is not possible for `i18nStart` to set the `insertBeforeIndex` value as the corresponding `TNode`
has not yet been created. For this reason the `i18nStart` creates a `TNodeType.Placeholder`
`TNode` at that location. See `TNodeType.Placeholder` for more information.
`
` insertBeforeIndex: InsertBeforeIndex;
`
` * The index of the closest injector in this node's LView.
` * If the index === -1, there is no injector on this node or any ancestor node in this view.
` * If the index !== -1, it is the index of this node's injector OR the index of a parent
injector in the same view. We pass the parent injector index down the node tree of a view so
it's possible to find the parent injector without walking a potentially deep node tree.
` * Injector indices are not set across view boundaries because there could
be multiple component hosts.
` * If tNode.injectorIndex === tNode.parent.injectorIndex, then the index belongs to a parent
injector.
`
` injectorIndex: number;
`
` * Stores starting index of the directives.
`
` * NOTE: The first directive is always component (if present).
`
` directiveStart: number;
`
` * Stores final exclusive index of the directives.
`
` * The area right behind the `directiveStart`-`directiveEnd` range is used to allocate the
`HostBindingFunction` `vars` (or null if no bindings.) Therefore `directiveEnd` is used to set
`LFrame.bindingRootIndex` before `HostBindingFunction` is executed.
`
` directiveEnd: number;
`
` * Stores the last directive which had a styling instruction.
`
` * Initial value of this is `-1` which means that no `hostBindings` styling instruction has
executed. As `hostBindings` instructions execute they set the value to the index of the
`DirectiveDef` which contained the last `hostBindings` styling instruction.
`
` * Valid values are:
` * - `-1` No `hostBindings` instruction has executed.
` * - `directiveStart <= directiveStylingLast < directiveEnd`: Points to the
`DirectiveDef` of the last styling instruction which executed in the `hostBindings`.
`
` * This data is needed so that styling instructions know which static styling data needs to be
collected from the `DirectiveDef.hostAttrs`. A styling instruction needs to collect all data
since last styling instruction.
`
` directiveStylingLast: number;
`
` * Stores indexes of property bindings. This field is only set in the ngDevMode and holds
indexes of property bindings so TestBed can get bound property metadata for a given node.
`
` propertyBindings: number[]|null;
`
` * Stores if Node isComponent, isProjected, hasContentQuery, hasClassInput and hasStyleInput
etc.
`
` flags: TNodeFlags;
`
` * This number stores two values using its bits:
` * - the index of the first provider on that node (first 16 bits)
` * - the count of view providers from the component on this node (last 16 bits)
`
` // TODO(misko): break this into actual vars.
` providerIndexes: TNodeProviderIndexes;
`
` * The value name associated with this node.
`
` if type:
` * `TNodeType.Text`: text value
` * `TNodeType.Element`: tag name
` * `TNodeType.ICUContainer`: `Ticu` value;
`
` * Attributes associated with an element. We need to store attributes to support various
use-cases (attribute injection, content projection with selectors, directives matching).
Attributes are stored statically because reading them from the DOM would be way too slow for
content projection and queries.
`
` * Since attrs will always be calculated first, they will never need to be marked undefined by
other instructions.
`
` * For regular attributes a name of an attribute and its value alternate in the array.
e.g. ['role', 'checkbox']
`
` * This array can contain flags that will indicate "special attributes" (attributes with namespaces,
attributes extracted from bindings and outputs).
`
` attrs: TAttributes|null;
`
` * Same as `TNode.attrs` but contains merged data across all directive host bindings.
`
` * We need to keep `attrs` as unmerged so that it can be used for attribute selectors.
`
` * We merge attrs here so that it can be used in a performant way for initial rendering.
`
` * The `attrs` are merged in first pass in following order:
` * - Component's `hostAttrs`
` * - Directives' `hostAttrs`
` * - Template `TNode.attrs` associated with the current `TNode`.
`
` mergedAttrs: TAttributes|null;
`
` * A set of local names under which a given element is exported in a template and visible to queries.
An entry in this array can be created for different reasons:
`
` * - an element itself is referenced, ex.: `<div #foo>`
` * - a component is referenced, ex.: `<my-cmpt #foo>`
`
` * - a directive is referenced, ex.: `<my-cmpt #foo="directiveExportAs">`.
`
` * A given element

```

might have different local names and those names can be associated with a directive. We store local names at even indexes while odd indexes are reserved for directive index in a view (or -1 if there is no associated directive).

Some examples:

```

<div #foo> => ["foo", -1]
<my-cmpt #foo> => ["foo", myCmptIdx, directiveIdx]
<div #foo #bar="directiveExportAs"> => ["foo", -1, "bar", directiveIdx]

```

localNames: (string|number)[]|null;

Information about input properties that need to be set once from attribute data.

initialInputs: InitialInputData|null|undefined;

Input data for all directives on this node. null means that there are no directives with inputs on this node.

inputs: PropertyAliases|null;

Output data for all directives on this node. null means that there are no directives with outputs on this node.

outputs: PropertyAliases|null;

The TView or TViews attached to this node.

If this TNode corresponds to an LContainer with inline views, the container will need to store separate static data for each of its view blocks (TView[]). Otherwise, nodes in inline views with the same index as nodes in their parent views will overwrite each other, as they are in the same template.

Each index in this array corresponds to the static data for a certain view. So if you had V(0) and V(1) in a container, you might have:

```

[
  { tagName: 'div', attrs: ... }, null, // V(0) TView
  [{ tagName: 'button', attrs ... }, null] // V(1) TView
]

```

If this TNode corresponds to an LContainer with a template (e.g. structural directive), the template's TView will be stored here.

If this TNode corresponds to an element, tViews will be null.

tViews: TView|TView[]|null;

The next sibling node. Necessary so we can propagate through the root nodes of a view to insert them or remove them from the DOM.

next: TNode|null;

The next projected sibling. Since in Angular content projection works on the node-by-node basis the act of projecting nodes might change nodes relationship at the insertion point (target view). At the same time we need to keep initial relationship between nodes as expressed in content view.

projectionNext: TNode|null;

First child of the current node.

For component nodes, the child will always be a ContentChild (in same view).

For embedded view nodes, the child will be in their child view.

child: TNode|null;

Parent node (in the same view only).

We need a reference to a node's parent so we can append the node to its parent's native element at the appropriate time.

If the parent would be in a different view (e.g. component host), this property will be null.

It's important that we don't try to cross component boundaries when retrieving the parent because the parent will change (e.g. index, attrs) depending on where the component was used (and thus shouldn't be stored on TNode). In these cases, we retrieve the parent through LView.node instead (which will be instance-specific).

If this is an inline view node (V), the parent will be its container.

parent: TElementNode|TContainerNode|null;

List of projected TNodes for a given component host element OR index into the said nodes.

For easier discussion assume this example:

```

<parent>'s view definition:
<child id="c1">content1</child>
<child id="c2"><span>content2</span></child>
<child>'s view definition:
<ng-content id="cont1"></ng-content>

```

If Array.isArray(projection) then TNode is a host element.

projection stores the content nodes which are to be projected.

The nodes represent categories defined by the selector: For example: <ng-content select="abc"/> would represent the heads for <ng-content/> and <ng-content select="abc"/> respectively.

The nodes we store in projection are heads only, we used .next to get their siblings.

The nodes .next is sorted/rewritten as part of the projection setup.

projection size is equal to the number of projections <ng-content>. The size of c1 will be 1 because <child> has only one <ng-content>.

we store projection with the host (c1, c2) rather than the <ng-content> (cont1) because the same component (<child>) can be used in multiple locations (c1, c2) and as a result have different set of nodes to project.

without projection it would be difficult to efficiently traverse nodes to be projected.

If typeof projection == 'number' then TNode is a <ng-content> element.

projection is an index of the host's projectionNodes.

This would return the first head node to project.

```

`getHost(currentTNode).projection[currentTNode.projection]`.
 * - When projecting nodes the parent node
retrieved may be a `` node, in which case
 * the process is recursive in nature.
 * If
`projection` is of type `RNode[]` then we have a collection of native nodes passed as
 * projectable nodes during
dynamic component creation.
 * /
projection: (TNode|RNode[])|number|null;
 /**
 * A collection of all `style` static values for an element (including from host).
 * This field will be
populated if and when:
 * - There are one or more initial `style`s on an element (e.g. `

`)
 * - There are one or more initial `style`s on a directive/component host
 * (e.g.
`@Directive({host: {style: "width:200px;"} })`)
 * /
styles: string|null;
 /**
 * A collection of all
`style` static values for an element excluding host sources.
 * Populated when there are one or more initial
`style`s on an element
 * (e.g. `

`)
 * Must be stored separately from `tNode.styles`
to facilitate setting directive
 * inputs that shadow the `style` property. If we used `tNode.styles` as is for
shadowed inputs,
 * we would feed host styles back into directives as `inputs`. If we used `tNode.attrs`, we
 * would have to concatenate the attributes on every template pass. Instead,
we process once on
 * first create pass and store here.
 * /
stylesWithoutHost: string|null;
 /**
 * A
`KeyValueArray` version of residual `styles`.
 * When there are styling instructions than each instruction
stores the static styling
 * which is of lower priority than itself. This means that there may be a higher priority
 * styling than the instruction.
 * Imagine:
 * ``
 * 

*
 * @Directive({
 *   host: {
 *     style: 'color: lowest;',
 *     [styles.color]: 'exp' // styleProp('color', ctx.exp);
 *   }
 * })
 * ``
 * In the above case:
 * - `color: lowest` is stored with `styleProp('color', ctx.exp);`
instruction
 * - `color: highest` is the residual and is stored here.
 * - `undefined`: not initialized.
 * -
`null`: initialized but `styles` is `null`
 * - `KeyValueArray`: parsed version of `styles`.
 * /
residualStyles:
KeyValueArray<any>|undefined|null;
 /**
 * A collection of all class static values for an element (including from host).
 * This field will be
populated if and when:
 * - There are one or more initial classes on an element (e.g. `

{defineInjectable} from './interface/defs';\n\n\n/**\n * Creates a token that can be used in a DI Provider.\n *\n * Use
an `InjectionToken` whenever the type you are injecting is not reified (does not have a\n * runtime representation)
such as when injecting an interface, callable type, array or\n * parameterized type.\n *\n * `InjectionToken` is
parameterized on `T` which is the type of object which will be returned by\n * the `Injector`. This provides an
additional level of type safety.\n *\n * ``\n * interface MyInterface {...}\n * const myInterface = injector.get(new
InjectionToken<MyInterface>('SomeToken'));\n * // myInterface is inferred to be MyInterface.\n * ``\n *\n * When
creating an `InjectionToken`, you can optionally specify a factory function which returns\n * (possibly by creating) a
default value of the parameterized type `T`. This sets up the\n * `InjectionToken`
using this factory as a provider as if it was defined explicitly in the\n * application's root injector. If the factory
function, which takes zero arguments, needs to inject\n * dependencies, it can do so using the `inject` function.\n
*\n * As you can see in the Tree-shakable InjectionToken example below.\n *\n * Additionally, if a `factory` is specified
you can also specify the `providedIn` option, which\n * overrides the above behavior and marks the token as

```

```

belonging to a particular `@NgModule`. As mentioned above, `root` is the default value for `providedIn`.

only query direct children of the element.

- `read` - Used to read a different token from the queried element.
- `static` - True to resolve query results before change detection runs, false to resolve after change detection. Defaults to false.

The following selectors are supported:

- Any class with the `@Component` or `@Directive` decorator
- A template reference variable as a string (e.g. `query`<my-component #cmp></my-component>`` with `@ViewChild('cmp')`)
- Any provider defined in the child component tree of the current component (e.g. `@ViewChild(SomeService) someService: SomeService``)
- Any provider defined through a string token (e.g. `@ViewChild('someToken') someTokenVal: any``)
- A `TemplateRef` (e.g. `query`<ng-template></ng-template>`` with `@ViewChild(TemplateRef) template;``)

The following values are supported by `read`:

- Any class with the `@Component` or `@Directive` decorator
- Any provider defined on the injector of the component that is matched by the `selector` of this query
- Any provider defined through a string token (e.g. `{provide: 'token', useValue: 'val'}``)
- `TemplateRef`, `ElementRef`, and `ViewContainerRef`
- `@usageNotes`

```

@see `ViewChildren`.
@publicApi
^/next interface ViewChildrenDecorator
{
  /**
   * @description
   * Property decorator that configures a view query.
   * Use to get the
   * `QueryList` of elements or directives from the view DOM.
   * Any time a child element is added, removed, or
   * moved, the query list will be updated,
   * and the changes observable of the query list will emit a new value.
   * View queries are set before the `ngAfterViewInit` callback is called.
   * **Metadata Properties**
   * **selector** - The directive type or the name used for querying.
   * **read** - Used to read a different
   * token from the queried elements.
   * **emitDistinctChangesOnly** - The `QueryList#changes` observable will
   * emit new values only
   * if the QueryList result has changed. When `false` the `changes` observable might emit
   * even
   * if the QueryList has not changed.
   * ** Note: ** This config option is **deprecated**, it will be
   * permanently set to `true` and
   * removed in future versions of Angular.
   * The following selectors are supported.
   * Any class with the `@Component` or `@Directive`
   * decorator
   * A template reference variable as a string (e.g. query`<my-component #cmp></my-component>`
   * with @ViewChildren('cmp'))
   * Any provider defined in the child component tree of the
   * current component (e.g. @ViewChildren(SomeService) someService!: SomeService`)
   * Any provider
   * defined through a string token (e.g. @ViewChildren('someToken') someTokenVal!: any`)
   * A
   * TemplateRef (e.g. query`<ng-template></ng-template>` with @ViewChildren(TemplateRef)
   * template;`)
   * In addition, multiple string selectors can be separated with a comma (e.g.
   * @ViewChildren('cmp1,cmp2'))
   * The following values are supported by read:
   * Any class with
   * the @Component or @Directive decorator
   * Any provider defined on the injector of the component that is
   * matched by the selector of
   * this query
   * Any provider defined through a string token (e.g. {provide: 'token', useValue: 'val'}`)
   * TemplateRef, ElementRef, and ViewContainerRef
   * @usageNotes
   * {@example
   * core/di/ts/viewChildren/view_children_howto.ts region='HowTo'}
   * ### Another example
   * {@example core/di/ts/viewChildren/view_children_example.ts region='Component'}
   * @Annotation
   * ^ (selector: ProviderToken<unknown>|Function|string,
   * opts?: {read?: any, emitDistinctChangesOnly?:
```

```

 * @description
 * Represents a type that a Component or other object is instances of.
 * An
example of a `Type` is `MyCustomComponent` class, which in JavaScript is represented by the
`MyCustomComponent` constructor function.
 * @publicApi
 * @next export const Type = Function;
 * next export
function isType(v: any): v is Type<any> {
return typeof v === 'function';
}
 * @description
 * Represents an abstract class
`T`, if applied to a concrete class it would stop being
 * instantiable.
 * @publicApi
 * @next export interface
AbstractType<T> extends Function {
prototype: T;
}
 * next export interface Type<T> extends Function {
new(...args: any[]): T;
}
 * next export type Mutable<T extends {[x: string]: any}, K extends string> = {
[P in K]:
T[P];
};
 * Returns a writable type version of type.
 * USAGE:
 * Given:
 * `` interface Person
{readonly name: string}
 * ``
 * We would like to get a read/write version of `Person`.
 * const
WritablePerson = Writable<Person>;
 * ``
 * The result is that you can do:
 * const
readonlyPerson: Person = {name: 'Marry'};
 * readonlyPerson.name = 'John'; // TypeError
 * (readonlyPerson as
WritablePerson).name = 'John'; // OK
 * // Error: Correctly detects that `Person` did not have `age` property.
 * (readonlyPerson as WritablePerson).age = 30;
 * ``
 * @next export type Writable<T> = {
-readonly[K
in keyof T]: T[K];
};

```

array where even positions contain keys and odd positions contain values.

`KeyValueArray` provides a very efficient way of iterating over its contents. For small sets (~10) the cost of binary searching an `KeyValueArray` has about the same performance characteristics that of a `Map` with significantly better memory footprint.

If used as a `Map` the keys are stored in alphabetical order so that they can be binary searched for retrieval.

See: `keyValueArraySet`, `keyValueArrayGet`, `keyValueArrayIndexOf`, `keyValueArrayDelete`.

```

export interface KeyValueArray<VALUE> extends Array<VALUE|string> {
  __brand__: 'array-map';
  Set a `value` for a `key`.
  @param keyValueArray to modify.
  @param key The key to locate or create.
  @param value The value to set for a `key`.
  @returns index (always even) of where the value was set.
}

  let index = keyValueArrayIndexOf(keyValueArray, key);
  if (index >= 0) // if we found it set it.
    keyValueArray[index | 1] = value;
  else index = ~index;
  arrayInsert2(keyValueArray, index, key, value);
  return index;
}

Retrieve a `value` for a `key` (on `undefined` if not found).
@param keyValueArray to search.
@param key The key to locate.
@return The `value` stored at the `key` location or `undefined` if not found.

export function
keyValueArrayGet<V>(keyValueArray:
  KeyValueArray<V>, key: string): V|undefined {
  const index = keyValueArrayIndexOf(keyValueArray, key);
  if (index >= 0) // if we found it retrieve it.
    return keyValueArray[index | 1] as V;
  return
  undefined;
}

Retrieve a `key` index value in the array or `-1` if not found.
@param
keyValueArray to search.
@param key The key to locate.
@returns index of where the key is (or should have been.)
- positive (even) index if key found.
- negative index if key not found.
(`~index` (even) to get the index where it should have
  been inserted.)

export function
keyValueArrayIndexOf<V>(keyValueArray: KeyValueArray<V>, key: string): number {
  return
  _arrayIndexOfSorted(keyValueArray as string[], key, 1);
}

Delete a `key` (and `value`) from the `KeyValueArray`.
@param keyValueArray to modify.
@param key The key to locate or delete (if exist).
@returns index of where the key was
(or should have been.)
- positive (even) index if key found and deleted.
- negative index if key not found.
(`~index` (even) to get the index where it should have
  been.)

export function
keyValueArrayDelete<V>(keyValueArray: KeyValueArray<V>, key: string): number {
  const index =
  keyValueArrayIndexOf(keyValueArray, key);
  if (index >= 0) // if we found it remove it.
    arraySplice(keyValueArray, index, 2);
  return index;
}

INTERNAL: Get an index of an `value`
in a sorted `array` by grouping search by `shift`.
NOTE:
- This uses binary search algorithm for fast
  removals.
@param array A sorted array to binary search.
@param value The value to look for.
@param shift grouping shift.
- `0` means look at every location
- `1` means only look at every other
(even) location (the odd locations are to be ignored as
  they are values.)
@returns index of the value.
- positive index
if value found.
- negative index if value not found.
(`~index` to get the value where it should have been
  inserted)

function _arrayIndexOfSorted(array: string[], value: string, shift: number): number {
  ngDevMode
  && assertEqual(Array.isArray(array), true, 'Expecting an array');
  let start = 0;
  let end = array.length >> shift;
  while (end !== start) {
    const middle = start + ((end - start) >> 1); // find the middle.
    const current =
    array[middle << shift];
    if (value === current) {
      return (middle << shift);
    } else if (current > value) {
      end = middle;
    } else {
      start = middle + 1; // We already searched middle so make it non-inclusive by
      adding 1
    }
  }
  return ~(end << shift);
}

is successful, `null` otherwise.\n * @throws if called outside of a supported context.\n *\n */\n * @usageNotes\n * In
practice the `inject()` calls are allowed in a constructor, a constructor parameter and a\n * field initializer:\n *\n
```\ntypescript\n * @Injectable({providedIn: 'root'})\n * export class Car {\n * radio: Radio|undefined;\n * // OK:
field initializer\n * spareTyre = inject(Tyre);\n *\n * constructor() {\n * // OK: constructor body\n *
this.radio = inject(Radio);\n * }\n * }\n *```\n *\n * It is also legal to call `inject` from a provider's factory:\n *\n
```\ntypescript\n * providers: [\n * {provide: Car, useFactory:\n * () => {\n * // OK: a class factory\n * const engine = inject(Engine);\n * return new Car(engine);\n * }}\n *
]\n *```\n *\n * Calls to the `inject()` function outside of the class creation context will result in error. Most\n *
notably, calls to `inject()` are disallowed after a class instance was created, in methods\n * (including lifecycle

```

example shows a class constructor that specifies a `new()` custom provider of a dependency using the parameter decorator. When `@Inject()` is not present, the injector uses the type annotation of the parameter as the provider.

```

<code-example path="core/di/ts/metadata_spec.ts" region="InjectWithoutDecorator">
@see ["Dependency Injection Guide"](guide/dependency-injection)
(token: any): any;
new(token: any): Inject;
Type of the Inject metadata.
@publicApi
export interface Inject {
  A [DI token](guide/glossary#di-token) that maps to the dependency to be injected.
  token: any;
}
Inject decorator and metadata.
@Annotation
@publicApi
export const Inject: InjectDecorator = attachInjectFlag(
  // Disable tslint because `DecoratorFlags` is a const enum which gets inlined.
  // tslint:disable-next-line: no-toplevel-property-access
  makeParamDecorator('Inject', (token: any) => ({ token })),
  DecoratorFlags.Inject);
Type of the Optional decorator / constructor function.
@publicApi
export interface OptionalDecorator {
  Parameter decorator to be used on constructor parameters, which marks the parameter as being an optional dependency.
  The DI framework provides `null` if the dependency is not found.
  Can be used together with other parameter decorators that modify how dependency injection operates.
}
@usageNotes
The following code allows the possibility of a `null` result:
<code-example path="core/di/ts/metadata_spec.ts" region="Optional">
@see ["Dependency Injection Guide"](guide/dependency-injection)
(): any;
new(): Optional;
Type of the Optional metadata.
@publicApi
export interface Optional {
}
Optional decorator and metadata.
@Annotation
@publicApi
export const Optional: OptionalDecorator =
  // Disable tslint because `InternalInjectFlags` is a const enum which gets inlined.
  // tslint:disable-next-line: no-toplevel-property-access
  attachInjectFlag(makeParamDecorator('Optional'), InternalInjectFlags.Optional);
Type of the Self decorator / constructor function.
@publicApi
export interface SelfDecorator {
  Parameter decorator to be used on constructor parameters, which tells the DI framework to start dependency resolution from the local injector.
  Resolution works upward through the injector hierarchy, so the children of this class must configure their own providers or be prepared for a `null` result.
}
@usageNotes
In the following example, the dependency can be resolved by the local injector when instantiating the class itself, but not when instantiating a child.
<code-example path="core/di/ts/metadata_spec.ts" region="Self">
@see `SkipSelf`
@see `Optional`
(): any;
new(): Self;
Type of the Self metadata.

```

their own Containers at the View roots.

- Projection: implies that we have to insert/remove/destroy the nodes of the projection. The complication is that the nodes we are projecting can themselves have Containers or other Projections. As you can see this is a very recursive problem. Yes recursion is not most efficient but the code is complicated enough that trying to implemented with recursion becomes unmaintainable.

```

@param tView The `TView` which needs to be inserted, detached, destroyed
@param IView The LView which needs to be inserted, detached, destroyed.
@param renderer Renderer to use
@param action action to perform (insert, detach, destroy)

*/\n\n\n *\n * Most of the use of `document` in Angular is from within the DI system so it is possible to simply\n *\n
inject the `DOCUMENT` token and are done.\n *\n * Ivy is special because it does not rely upon the DI and must
get hold of the document some other\n * way.\n *\n * The solution is to define `getDocument()` and
`setDocument()` top-level functions for ivy.\n *\n * Wherever ivy needs the global document, it calls `getDocument()`
instead.\n *\n * When running ivy outside of a browser environment, it is necessary to call `setDocument()` to\n *\n
tell ivy what the global `document`
is.\n *\n * Angular does this for us in each of the standard platforms (`Browser`, `Server`, and `WebWorker`)\n *\n
calling `setDocument()` when providing the `DOCUMENT` token.\n *\n\nlet DOCUMENT: Document|undefined =
undefined;\n\n/**\n * Tell ivy what the `document` is for this platform.\n *\n * It is only necessary to call this if the
current platform is not a browser.\n *\n * @param document The object representing the global `document` in this
environment.\n */\nexport function setDocument(document: Document|undefined): void {\n DOCUMENT =
document;\n}\n\n/**\n * Access the object that represents the `document` for this platform.\n *\n * Ivy calls this
whenever it needs to access the `document` object.\n *\n * For example to create the renderer or to do sanitization.\n
*/\nexport function getDocument(): Document {\n if (DOCUMENT !== undefined) {\n return DOCUMENT;\n }\n
else if (typeof document !== 'undefined') {\n return document;\n }\n // No "document" can be found.

```

```

This should only happen if we are running ivy outside Angular and
// the current platform is not a browser. Since
this is not a supported scenario at the moment
// this should not happen in Angular apps.
// Once we support
running ivy outside of Angular we will need to publish `setDocument()` as a
// public API. Meanwhile we just
return `undefined` and let the application fail.
return undefined!;

 * A source of
 * providers for the `importProvidersFrom` function.
 */
@developerPreview
 @publicApi
export type
 ImportProvidersSource =
 Type<unknown> | ModuleWithProviders<unknown> | Array<ImportProvidersSource>;
"/**
 * Collects providers
 * from all NgModules and standalone components, including transitively imported
 * ones.
 * Providers
 * extracted
 * via `importProvidersFrom` are only usable in an application injector or
 * another environment injector (such as a
 * route injector). They should not be used in component
 * providers.
 * More information about standalone
 * components can be found in [this
 * guide](guide/standalone-components).
 */
@usageNotes
 * The results of
 * the `importProvidersFrom` call can be used in the `bootstrapApplication` call:
 * ```typescript
 * await
 * bootstrapApplication(RootComponent, {
 *   providers: [
 *     importProvidersFrom(NgModuleOne,
 * NgModuleTwo)
 *   ]
 * });
 * ```
 * You can also use the `importProvidersFrom` results in the `providers`
 * field of a route, when a
 * standalone component is used:
 * ```typescript
 * export const ROUTES: Route[] =
 * [
 *   {
 *     path: 'foo',
 *     providers: [
 *       importProvidersFrom(NgModuleOne, NgModuleTwo)
 *     ],
 *     component: YourStandaloneComponent
 *   ]
 * ];
 * ```
 * @returns Collected providers
 * from the specified list of types.
 */

```

provided in one of the following injectors:

- 'root': The application-level injector in most apps.
- 'platform': A special singleton platform injector shared by all applications on the page.
- 'any': Provides a unique instance in each lazy loaded module while all eagerly loaded modules share one instance.

```
Type<any>|'root'|'platform'|'any'|null;
```

**Injectable decorator and metadata.**

```
@Annotation
@publicApi
export const Injectable:
InjectableDecorator = makeDecorator(
  'Injectable', undefined, undefined, undefined,
  (type: Type<any>,
  meta: Injectable) => compileInjectable(type as any, meta));
```

**License:** Copyright Google LLC All Rights Reserved. Use of this source code is governed by an MIT-style license that can be found in the LICENSE file at <https://angular.io/license>

```
import {flatten} from './util/array_utils';
import {EMPTY_ARRAY} from './util/empty';
import {stringify} from './util/stringify';
import {Injector} from './injector';
import {StaticProvider} from './interface/provider';
import {importProvidersFrom} from './provider_collection';
import {getNullInjector, R3Injector} from './r3_injector';
import {InjectorScope} from './scope';
```

Create a new `Injector` which is configured using a `defType` of `InjectorType<any>`.

```
@publicApi
export function createInjector(
  defType: /* InjectorType<any> */ any, parent: Injector|null = null,
  additionalProviders: StaticProvider[]|null = null, name?: string): Injector {
  const injector =
  createInjectorWithoutInjectorInstances(defType, parent, additionalProviders, name);
  injector.resolveInjectorInitializers();
  return injector;
}
```

Creates a new injector without eagerly resolving its injector types. Can be used in places where resolving the injector types immediately can lead to an infinite loop. The injector types should be resolved at a later point by calling `_resolveInjectorDefTypes`.

```
export function createInjectorWithoutInjectorInstances(
  defType: /* InjectorType<any> */ any, parent:
  Injector|null = null,
  additionalProviders: StaticProvider[]|null = null, name?: string,
  scopes = new Set<InjectorScope>(): R3Injector {
  const providers = [
    additionalProviders || EMPTY_ARRAY,
    importProvidersFrom(defType),
  ];
  name = name || (typeof defType === 'object' ? stringify(defType));
  return new
  R3Injector(providers, parent || getNullInjector(), name || null, scopes);
}
```

```
import {createInjector} from './create_injector';
import {THROW_IF_NOT_FOUND, inject} from './injector_compatibility';
import {InjectorMarkers} from './injector_marker';
import {INJECTOR} from './injector_token';
import {defineInjectable} from './interface/defs';
import {InjectFlags} from './interface/injector';
import {StaticProvider} from './interface/provider';
import {NullInjector} from './null_injector';
import {ProviderToken} from './provider_token';
```

Concrete injectors implement this interface. Injectors are configured with `providers` ([guide/glossary#provider](#)) that associate dependencies of various types with `injection tokens` ([guide/glossary#di-token](#)).

**Usage:** See `StaticProvider` and `usageNotes`.

The following example creates a service injector instance.

```
region='ConstructorProvider'
### Usage example
region='Injector'
Injector returns itself when given Injector as a token:
region='injectInjector'
```

```
@publicApi
export abstract class Injector {
  static THROW_IF_NOT_FOUND = THROW_IF_NOT_FOUND;
  static NULL: Injector = (/* @__PURE__ */ new
  NullInjector());
  Retrieves an instance from the injector based on the provided token.
  @returns The instance from the injector if defined, otherwise the notFoundValue.
  @throws When the notFoundValue is undefined or
  Injector.THROW_IF_NOT_FOUND.
  abstract get<T>(token: ProviderToken<T>, notFoundValue?: T,
  flags?: InjectFlags): T;
  @deprecated from v4.0.0 use ProviderToken<T>
  @suppress {duplicate}
  abstract get(token: any, notFoundValue?: any): any;
  @deprecated from v5 use the new signature
  Injector.create(options)
  static create(providers: StaticProvider[], parent?: Injector): Injector;
```

Creates a new injector instance that provides one or more dependencies, according to a given type or types of `StaticProvider`.

**@param options** An object with the following properties:

- providers**: An array of providers of the [StaticProvider type](api/core/StaticProvider).
- parent**: (optional) A parent injector.
- name**: (optional) A developer-defined identifying name for the new injector.

**@returns** The new injector instance.

```

static create(options: { providers: StaticProvider[],
parent?: Injector, name?: string }): Injector;

static create(options: StaticProvider[] | { providers:
StaticProvider[], parent?: Injector, name?: string },
parent?: Injector): Injector {
  if (Array.isArray(options))
    return createInjector({ name: "" }, parent, options, "");
  else {
    const name = options.name ?? "";
    return createInjector({ name }, options.parent, options.providers, name);
  }
}

/** @nocollapse */
static prov = /** @pureOrBreakMyCode */ defineInjectable({
  token: Injector,
  providedIn: 'any',
  factory: () =>
inject(INJECTOR),
});

/** @internal */
/** @nocollapse */
static __NG_ELEMENT_ID__ =
InjectorMarkers.Injector;

 Threshold for the dynamic version\nconst UNDEFINED = {};\n\n/**\n * A ReflectiveDependency injection
 container used for instantiating objects and resolving\n * dependencies.\n * An `Injector` is a replacement for a
 `new` operator, which can automatically resolve the\n * constructor dependencies.\n * In typical use, application
 code asks for the dependencies in the constructor and they are\n * resolved by the `Injector`.\n * @usageNotes\n
 * ### Example\n * The following example creates an `Injector` configured to create `Engine` and `Car`.\n *
 ```typescript\n * @Injectable()\n * class Engine {\n * }\n * @Injectable()\n * class Car {\n *   constructor(public
 engine:Engine) {}\n * }\n * var injector = ReflectiveInjector.resolveAndCreate([Car, Engine]);\n * var car =
 injector.get(Car);\n * expect(car instanceof Car).toBe(true);\n * expect(car.engine instanceof Engine).toBe(true);\n
 * ```\n * Notice, we don't use the `new` operator because we explicitly want
 to have the `Injector`\n * resolve all of the object's dependencies automatically.\n * TODO: delete in v14.\n *
 @deprecated from v5 - slow and brings in a lot of code, Use `Injector.create` instead.\n * @publicApi\n *
 abstract class ReflectiveInjector implements Injector {\n /**\n * Turns an array of provider definitions into an
 array of resolved providers.\n * A resolution is a process of flattening multiple nested arrays and converting
 individual\n * providers into an array of `ResolvedReflectiveProvider`s.\n * @usageNotes\n * ###
 Example\n *
 ```typescript\n * @Injectable()\n * class Engine {\n * }\n * @Injectable()\n * class
 Car {\n *   constructor(public engine:Engine) {}\n * }\n * var providers = ReflectiveInjector.resolve([Car,
 [[Engine]]]);\n * expect(providers.length).toEqual(2);\n * expect(providers[0] instanceof
 ResolvedReflectiveProvider).toBe(true);\n * expect(providers[0].key.displayName).toBe("Car");\n
 * expect(providers[0].dependencies.length).toEqual(1);\n * expect(providers[0].factory).toBeDefined();\n *
 expect(providers[1].key.displayName).toBe("Engine");\n * });\n *
 ```\n *

removed) of the value stored in the `TData` which is\n * needed to re-concatenate the styling.\n *\n * - `string`:
Stores the property name. Used with `styleProp`/`classProp` instruction.\n * - `null`: Represents map, so there is no
name. Used with `styleMap`/`classMap`.\n * - `false`: Represents an ignore case. This happens when
`styleProp`/`classProp` instruction\n * is combined with directive which shadows its input `@Input('class')`. That
way the binding\n * should not participate in the styling resolution.\n */\nexport type TStylingKeyPrimitive =
string|null|false;\n\n/**\n * Store the static values for the styling binding.\n *\n * The `TStylingStatic` is just
`KeyValueArray` where key `\"\"` (stored at location 0) contains the\n * `TStylingKey` (stored at location 1). In
other words this wraps the `TStylingKey` such that the\n * `\"\"` contains the wrapped
value.\n *\n * When instructions are resolving styling they may need to look forward or backwards in the linked\n *
list to resolve the value. For this reason we have to make sure that the linked list also contains\n * the static values.
However the list only has space for one item per styling instruction. For this\n * reason we store the static values
here as part of the `TStylingKey`. This means that the\n * resolution function when looking for a value needs to first
look at the binding value, and then\n * at `TStylingKey` (if it exists).\n *\n * Imagine we have:\n *\n * <div
class=\"TEMPLATE\" my-dir>\n *\n * @Directive({\n *\n * host: {\n *\n * class: 'DIR',\n *\n * [class.dynamic]: 'exp' //
classProp('dynamic', ctx.exp);\n *\n * })\n *\n * })\n *\n * In the above case the linked list will contain one item:\n
*\n * <TStylingStatic>[\n *\n * 'dynamic', // This is the wrapped
value of `TStylingKey`\n *\n * 'DIR': true, // This is the default static value of directive binding.\n *\n * ];\n *
tData[10 + 1] = 0; // We don't have prev/next.\n *\n * IView[10] = undefined; // assume `ctx.exp` is
`undefined`\n *\n * IView[10 + 1] = undefined; // Just normalized `IView[10]`\n *\n * So when the function is
resolving styling value, it first needs to look into the linked list\n * (there is none) and then into the static
`TStylingStatic` too see if there is a default value for\n * `dynamic` (there is not). Therefore it is safe to remove it.\n
*\n * If setting `true` case:\n *\n * IView[10] = true; // assume `ctx.exp` is `true`\n *\n * IView[10 + 1] = true; //
Just normalized `IView[10]`\n *\n * So when the function is resolving styling value, it first needs to look into the
linked list\n * (there is none) and then into `TNode.residualClass` (TNode.residualStyle) which contains\n *\n *
tNode.residualClass = [\n *\n * 'TEMPLATE': true,\n
*\n * ];\n *\n * This means that it is safe to add class.\n */\nexport interface TStylingStatic extends
KeyValueArray<any> {\n\n/**\n * This is a branded number which contains previous and next index.\n *\n * When we
come across styling instructions we need to store the `TStylingKey` in the correct\n * order so that we can
re-concatenate the styling value in the desired priority.\n *\n * The insertion can happen either at the:\n * - end of
template as in the case of coming across additional styling instruction in the template\n * - in front of the template
in the case of coming across additional instruction in the\n * `hostBindings`.\n *\n * We use `TStylingRange` to store
the previous and next index into the `TData` where the template\n * bindings can be found.\n *\n * - bit 0 is used to
mark that the previous index has a duplicate for current value.\n * - bit 1 is used to mark that the next index has a
duplicate for the current value.\n * - bits 2-16 are used to encode
the next/tail of the template.\n * - bits 17-32 are used to encode the previous/head of template.\n *\n * NODE:
*duplicate* false implies that it is statically known that this binding will not collide\n * with other bindings and

```

therefore there is no need to check other bindings. For example the `<div [style.color]=\"exp\" [style.width]=\"exp\">` will never collide and will have their bits set accordingly. Previous duplicate means that we may need to check previous if the current binding is `null`. Next duplicate means that we may need to check next bindings if the current binding is not `null`. `0` has special significance and represents `null` as in no additional pointer. `^` next export interface `TStylingRange` { `__brand__`: 'TStylingRange'; `__next__`: `TStylingRange`; `__prev__`: `TStylingRange`; `__mask__`: `number`; `__shift__`: `number`; } `enum StylingRange` { `PREV_SHIFT`: `number`; `PREV_MASK`: `number`; `NEXT_SHIFT`: `number`; `NEXT_MASK`: `number`; `UNSIGNED_MASK`: `number`; `PREV_DUPLICATE`: `number`; `NEXT_DUPLICATE`: `number`; }

```

Needed due to tsickle downleveling where multiple `implements` with classes creates multiple @extends in Closure annotations, which is illegal. This workaround fixes the multiple @extends by making the annotation @implements instead

```

ChangeDetectorRef, private dataProvider: DataProvider) {\n *   ref.detach();\n
  *   setInterval(() => {\n *     this.ref.detectChanges();\n *     }, 5000);\n *   }\n * }\n *\n *
@Component({\n *   selector: 'app',\n *   providers: [DataProvider],\n *   template: `<giant-list><giant-
list>\n *   `,\n *   })\n * class App {\n * }\n *
Re-attaches a view to the change detection tree.\n * This can be
used to re-attach views that were previously detached from the tree\n * using { @link ChangeDetectorRef#detach
detach}. Views are attached to the tree by default.\n * <!-- TODO: Add a link to a chapter on
detach/reattach/local digest -->\n * @usageNotes\n * ### Example\n * The following example creates
a component displaying `live` data. The component will detach\n * its change detector from the main change
detector tree when the component's live property\n * is set to false.\n *
typescript\n
  * class DataProvider {\n *   data = 1;\n *   constructor() {\n *     setInterval(() => {\n *       this.data =
this.data * 2;\n *     }, 500);\n *   }\n * }\n *
@Component({\n *   selector: 'live-data',\n *   inputs:
['live'],\n *   template: 'Data: {{dataProvider.data}}'\n * })\n * class LiveData {\n *   constructor(private ref:
ChangeDetectorRef, private dataProvider: DataProvider) {\n *     set live(value) {\n *       if (value) {\n *
this.ref.reattach();\n *     } else {\n *       this.ref.detach();\n *     }\n *   }\n * }\n *
@Component({\n *   selector: 'app-root',\n *   providers: [DataProvider],\n *   template: `<div>
Live Update: <input
type="checkbox" [(ngModel)]="live">\n *   <live-data [live]="live"></live-data>\n *   `,\n *   })\n * class
AppComponent {\n *   live = true;\n * }\n *
Reattach(): void {\n *   this._IView[FLAGS] |=
LViewFlags.Attached;\n
  }\n *
Checks the view and its children.\n * This can also be used in combination with { @link
ChangeDetectorRef#detach detach} to implement\n * local change detection checks.\n * <!-- TODO: Add a
link to a chapter on detach/reattach/local digest -->\n * <!-- TODO: Add a live demo once ref.detectChanges is
merged into master -->\n * @usageNotes\n * ### Example\n * The following example defines a
component with a large list of readonly data.\n * Imagine, the data changes constantly, many times per second. For
performance reasons,\n * we want to check and update the list every five seconds.\n * We can do that by
detaching the component's change detector and doing a local change detection\n * check every five seconds.\n *
See { @link ChangeDetectorRef#detach detach} for more information.\n *
detectChanges(): void {\n *   detectChangesInternal(this._IView[TVIEW], this._IView, this.context as unknown as {});
}\n *
Checks the change detector and its children, and throws if any changes are detected.\n * This
is used in development mode to verify that running change detection doesn't\n * introduce other changes.\n *
checkNoChanges(): void {\n *   if (ngDevMode) {\n *     checkNoChangesInternal(this._IView[TVIEW], this._IView,
this.context as unknown as {});\n *   }\n * }\n *
