BOOT	<p><b>set BOOT</b> <i>filesystem :/file-url</i> ...</p> <p>A semicolon-separated list of executable files to try to load and execute when automatically booting.</p>	<p><b>boot system</b> {<i>filesystem : /file-url ...</i>   <b>switch</b> {<i>number</i>   <b>all</b>}}</p> <p>Specifies the Cisco IOS image to load during the next boot cycle and the stack members on which the image is loaded. This command changes the setting of the BOOT environment variable.</p> <p>The package provisioning file, also referred to as the <i>packages.conf</i> file, is used by the system to determine which software packages to activate during boot up.</p> <ul style="list-style-type: none"> <li>• When booting in installed mode, the package provisioning file specified in the <b>boot</b> command is used to determine which packages to activate. For example <b>boot flash:packages.conf</b>.</li> <li>• When booting in bundle mode, the package provisioning file contained in the booted bundle is used to activate the packages included in the bundle. For example, <b>boot flash:image.bin</b>.</li> </ul>
MANUAL_BOOT	<p><b>set MANUAL_BOOT</b> <b>yes</b></p> <p>Decides whether the switch automatically or manually boots.</p> <p>Valid values are 1, yes, 0, and no. If it is set to no or 0, the boot loader attempts to automatically boot up the system. If it is set to anything else, you must manually boot up the switch from the boot loader mode.</p>	<p><b>boot manual</b></p> <p>Enables manually booting the switch during the next boot cycle and changes the setting of the MANUAL_BOOT environment variable.</p> <p>The next time you reboot the system, the switch is in boot loader mode. To boot up the system, use the <b>boot flash:</b> <i>filesystem :/file-url</i> boot loader command, and specify the name of the bootable image.</p>

Variable	Boot Loader Command	Cisco IOS Global Configuration Command
CONFIG_FILE	<b>set CONFIG_FILE flash:/<i>file-url</i></b> Changes the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.	<b>boot config-file flash:/<i>file-url</i></b> Specifies the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration. This command changes the CONFIG_FILE environment variable.
SWITCH_NUMBER	<b>set SWITCH_NUMBER <i>stack-member-number</i></b> Changes the member number of a stack member.	<b>switch <i>current-stack-member-number</i> renumber <i>new-stack-member-number</i></b> Changes the member number of a stack member.
SWITCH_PRIORITY	<b>set SWITCH_PRIORITY <i>stack-member-number</i></b> Changes the priority value of a stack member.	<b>switch <i>stack-member-number</i> priority <i>priority-number</i></b> Changes the priority value of a stack member.
BAUD	<b>set BAUD <i>baud-rate</i></b>	<b>line console 0 speed <i>speed-value</i></b> Configures the baud rate.
ENABLE_BREAK	<b>set ENABLE_BREAK yes/no</b>	<b>boot enable-break switch yes/no</b> Enables a break to the auto-boot cycle. You have 5 seconds to enter the <b>break</b> command.

## Scheduled Reload of the Software Image

You can schedule a reload of the software image to occur on the device at a later time (for example, late at night or during the weekend when the device is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all devices in the network).

You have these reload options:

- Reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 hours. You can specify the reason for the reload in a string up to 255 characters in length.
- Reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

The **reload** command halts the system. If the system is not set to manually boot up, it reboots itself.

If your device is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the device from entering the boot loader mode and then taking it from the remote user's control.

If you modify your configuration file, the device prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the CONFIG\_FILE environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

To cancel a previously scheduled reload, use the **reload cancel** privileged EXEC command.

## How to Perform Device Setup Configuration

Using DHCP to download a new image and a new configuration to a device requires that you configure at least two devices. One device acts as a DHCP and TFTP server and the second device (client) is configured to download either a new configuration file or a new configuration file and a new image file.

### Configuring DHCP Autoconfiguration (Only Configuration File)

This task describes how to configure DHCP autoconfiguration of the TFTP and DHCP settings on an existing device in the network so that it can support the autoconfiguration of a new device.

#### SUMMARY STEPS

1. **configure terminal**
2. **ip dhcp pool** *poolname*
3. **boot** *filename*
4. **network** *network-number mask prefix-length*
5. **default-router** *address*
6. **option 150** *address*
7. **exit**
8. **tftp-server flash:***filename.text*
9. **interface** *interface-id*
10. **no switchport**
11. **ip address** *address mask*
12. **end**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>ip dhcp pool</b> <i>poolname</i> <b>Example:</b>	Creates a name for the DHCP server address pool, and enters DHCP pool configuration mode.

	Command or Action	Purpose
	Device (config) # <code>ip dhcp pool pool</code>	
<b>Step 3</b>	<p><b>boot filename</b></p> <p><b>Example:</b></p> <pre>Device (dhcp-config) # boot config-boot.text</pre>	Specifies the name of the configuration file that is used as a boot image.
<b>Step 4</b>	<p><b>network network-number mask prefix-length</b></p> <p><b>Example:</b></p> <pre>Device (dhcp-config) # network 10.10.10.0 255.255.255.0</pre>	<p>Specifies the subnet network number and mask of the DHCP address pool.</p> <p><b>Note</b> The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).</p>
<b>Step 5</b>	<p><b>default-router address</b></p> <p><b>Example:</b></p> <pre>Device (dhcp-config) # default-router 10.10.10.1</pre>	Specifies the IP address of the default router for a DHCP client.
<b>Step 6</b>	<p><b>option 150 address</b></p> <p><b>Example:</b></p> <pre>Device (dhcp-config) # option 150 10.10.10.1</pre>	Specifies the IP address of the TFTP server.
<b>Step 7</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device (dhcp-config) # exit</pre>	Returns to global configuration mode.
<b>Step 8</b>	<p><b>tftp-server flash:filename.text</b></p> <p><b>Example:</b></p> <pre>Device (config) # tftp-server flash:config-boot.text</pre>	Specifies the configuration file on the TFTP server.
<b>Step 9</b>	<p><b>interface interface-id</b></p> <p><b>Example:</b></p> <pre>Device (config) # interface gigabitethernet1/0/4</pre>	Specifies the address of the client that will receive the configuration file.

	Command or Action	Purpose
Step 10	<b>no switchport</b> <b>Example:</b> Device(config-if) # <b>no switchport</b>	Puts the interface into Layer 3 mode.
Step 11	<b>ip address address mask</b> <b>Example:</b> Device(config-if) # <b>ip address 10.10.10.1</b> <b>255.255.255.0</b>	Specifies the IP address and mask for the interface.
Step 12	<b>end</b> <b>Example:</b> Device(config-if) # <b>end</b>	Returns to privileged EXEC mode.

## Configuring DHCP Auto-Image Update (Configuration File and Image)

This task describes DHCP autoconfiguration to configure TFTP and DHCP settings on an existing device to support the installation of a new switch.

#### Before you begin

You must first create a text file (for example, `autoinstall_dhcp`) that will be uploaded to the device. In the text file, put the name of the image that you want to download (forexample, `c3750e-ipservices-mz.122-44.3.SE.tar``c3750x-ipservices-mz.122-53.3.SE2.tar`). This image must be a tar and not a bin file.

#### SUMMARY STEPS

1. **configure terminal**
2. **ip dhcp pool** *poolname*
3. **boot** *filename*
4. **network** *network-number mask prefix-length*
5. **default-router** *address*
6. **option 150** *address*
7. **option 125** *hex*
8. **copy tftp flash** *filename.txt*
9. **copy tftp flash** *imagename.bin*
10. **exit**
11. **tftp-server flash:** *config.text*

12. **tftp-server flash:** *imagename.bin*
13. **tftp-server flash:** *filename.txt*
14. **interface** *interface-id*
15. **no switchport**
16. **ip address** *address mask*
17. **end**
18. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ip dhcp pool</b> <i>poolname</i> <b>Example:</b> Device(config)# <b>ip dhcp pool pool1</b>	Creates a name for the DHCP server address pool and enter DHCP pool configuration mode.
<b>Step 3</b>	<b>boot</b> <i>filename</i> <b>Example:</b> Device(dhcp-config)# <b>boot config-boot.text</b>	Specifies the name of the file that is used as a boot image.
<b>Step 4</b>	<b>network</b> <i>network-number mask prefix-length</i> <b>Example:</b> Device(dhcp-config)# <b>network 10.10.10.0 255.255.255.0</b>	Specifies the subnet network number and mask of the DHCP address pool.  <b>Note</b> The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).
<b>Step 5</b>	<b>default-router</b> <i>address</i> <b>Example:</b> Device(dhcp-config)# <b>default-router 10.10.10.1</b>	Specifies the IP address of the default router for a DHCP client.
<b>Step 6</b>	<b>option 150</b> <i>address</i> <b>Example:</b> Device(dhcp-config)# <b>option 150 10.10.10.1</b>	Specifies the IP address of the TFTP server.

	Command or Action	Purpose
Step 7	<b>option 125 hex</b> <b>Example:</b> <pre>Device(dhcp-config)# option 125 hex 0000.0009.0a05.08661.7574.6f69.6e73.7461.6c6c.5f64.686370</pre>	Specifies the path to the text file that describes the path to the image file.
Step 8	<b>copy tftp flash filename.txt</b> <b>Example:</b> <pre>Device(config)# copy tftp flash image.bin</pre>	Uploads the text file to the device.
Step 9	<b>copy tftp flash imagename.bin</b> <b>Example:</b> <pre>Device(config)# copy tftp flash image.bin</pre>	Uploads the tar file for the new image to the device.
Step 10	<b>exit</b> <b>Example:</b> <pre>Device(dhcp-config)# exit</pre>	Returns to global configuration mode.
Step 11	<b>tftp-server flash: config.txt</b> <b>Example:</b> <pre>Device(config)# tftp-server flash:config-boot.txt</pre>	Specifies the Cisco IOS configuration file on the TFTP server.
Step 12	<b>tftp-server flash: imagename.bin</b> <b>Example:</b> <pre>Device(config)# tftp-server flash:image.bin</pre>	Specifies the image name on the TFTP server.
Step 13	<b>tftp-server flash: filename.txt</b> <b>Example:</b> <pre>Device(config)# tftp-server flash:boot-config.txt</pre>	Specifies the text file that contains the name of the image file to download
Step 14	<b>interface interface-id</b> <b>Example:</b>	Specifies the address of the client that will receive the configuration file.

	Command or Action	Purpose
	Device(config)# <b>interface</b> gigabitEthernet1/0/4	
<b>Step 15</b>	<b>no switchport</b> <b>Example:</b> Device(config-if)# <b>no switchport</b>	Puts the interface into Layer 3 mode.
<b>Step 16</b>	<b>ip address</b> <i>address mask</i> <b>Example:</b> Device(config-if)# <b>ip address</b> 10.10.10.1 255.255.255.0	Specifies the IP address and mask for the interface.
<b>Step 17</b>	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 18</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device(config-if)# <b>end</b>	(Optional) Saves your entries in the configuration file.

## Configuring the Client to Download Files from DHCP Server

**Note** You should only configure and enable the Layer 3 interface. Do not assign an IP address or DHCP-based autoconfiguration with a saved configuration.

**SUMMARY STEPS**

1. **configure terminal**
2. **boot host dhcp**
3. **boot host retry timeout** *timeout-value*
4. **banner config-save** ^C *warning-message* ^C
5. **end**
6. **show boot**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>boot host dhcp</b> <b>Example:</b> Device(conf)# <code>boot host dhcp</code>	Enables autoconfiguration with a saved configuration.
<b>Step 3</b>	<b>boot host retry timeout <i>timeout-value</i></b> <b>Example:</b> Device(conf)# <code>boot host retry timeout 300</code>	(Optional) Sets the amount of time the system tries to download a configuration file. <b>Note</b> If you do not set a timeout, the system will try indefinitely to obtain an IP address from the DHCP server.
<b>Step 4</b>	<b>banner config-save ^C <i>warning-message</i> ^C</b> <b>Example:</b> Device(conf)# <code>banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause You to No longer Automatically Download Configuration Files at Reboot^C</code>	(Optional) Creates warning messages to be displayed when you try to save the configuration file to NVRAM.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show boot</b> <b>Example:</b> Device# <code>show boot</code>	Verifies the configuration.

## Manually Assigning IP Information to Multiple SVIs

This task describes how to manually assign IP information to multiple switched virtual interfaces (SVIs):

## SUMMARY STEPS

1. **configure terminal**
2. **interface vlan** *vlan-id*
3. **ip address** *ip-address subnet-mask*
4. **exit**
5. **ip default-gateway** *ip-address*
6. **end**
7. **show interfaces vlan** *vlan-id*
8. **show ip redirects**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface vlan</b> <i>vlan-id</i> <b>Example:</b> Device(config)# <b>interface vlan 99</b>	Enters interface configuration mode, and enters the VLAN to which the IP information is assigned. The range is 1 to 4094.
<b>Step 3</b>	<b>ip address</b> <i>ip-address subnet-mask</i> <b>Example:</b> Device(config-vlan)# <b>ip address 10.10.10.2 255.255.255.0</b>	Enters the IP address and subnet mask.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-vlan)# <b>exit</b>	Returns to global configuration mode.
<b>Step 5</b>	<b>ip default-gateway</b> <i>ip-address</i> <b>Example:</b> Device(config)# <b>ip default-gateway 10.10.10.1</b>	<p>Enters the IP address of the next-hop router interface that is directly connected to the device where a default gateway is being configured. The default gateway receives IP packets with unresolved destination IP addresses from the device.</p> <p>Once the default gateway is configured, the device has connectivity to the remote networks with which a host needs to communicate.</p> <p><b>Note</b> When your device is configured to route with IP, it does not need to have a default gateway set.</p>

	Command or Action	Purpose
		<b>Note</b> The device capwap relays on default-gateway configuration to support routed access point join the device.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show interfaces vlan <i>vlan-id</i></b> <b>Example:</b> Device# <b>show interfaces vlan 99</b>	Verifies the configured IP address.
<b>Step 8</b>	<b>show ip redirects</b> <b>Example:</b> Device# <b>show ip redirects</b>	Verifies the configured default gateway.

## Modifying the Device Startup Configuration

### Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the config.text file to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

#### Before you begin

Use a standalone device for this task.

#### SUMMARY STEPS

1. **configure terminal**
2. **boot flash:*/file-url***
3. **end**
4. **show boot**
5. **copy running-config startup-config**

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 2</b>	<b>boot flash:</b> <i>file-url</i> <b>Example:</b> Device(config)# <code>boot flash:config.text</code>	Specifies the configuration file to load during the next boot cycle. <i>file-url</i> —The path (directory) and the configuration filename. Filenames and directory names are case-sensitive.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 4</b>	<b>show boot</b> <b>Example:</b> Device# <code>show boot</code>	Verifies your entries. The <b>boot</b> global configuration command changes the setting of the CONFIG_FILE environment variable.
<b>Step 5</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Manually Booting the Switch

By default, the switch automatically boots up; however, you can configure it to manually boot up.

### Before you begin

Use a standalone switch for this task.

### SUMMARY STEPS

1. `configure terminal`
2. `boot manual`
3. `end`
4. `show boot`
5. `copy running-config startup-config`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	<b>boot manual</b> <b>Example:</b> Device(config)# <code>boot manual</code>	Enables the switch to manually boot up during the next boot cycle.
Step 3	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 4	<b>show boot</b> <b>Example:</b> Device# <code>show boot</code>	Verifies your entries. The <b>boot manual</b> global command changes the setting of the MANUAL_BOOT environment variable. The next time you reboot the system, the switch is in boot loader mode, shown by the <i>switch:</i> prompt. To boot up the system, use the <b>boot filesystem:/file-url</b> boot loader command. <ul style="list-style-type: none"> <li>• <i>filesystem:</i>—Uses flash: for the system board flash device.                device: <code>boot flash:</code></li> <li>• For <i>file-url</i>—Specifies the path (directory) and the name of the bootable image.</li> </ul> Filenames and directory names are case-sensitive.
Step 5	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Booting the Device in Installed Mode

## SUMMARY STEPS

1. `cp source_file_path destination_file_path`

2. **software expand file** *source\_file\_path*
3. **reload**
4. **boot flash:packages.conf**
5. **show version**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>cp</b> <i>source_file_path destination_file_path</i></p> <p><b>Example:</b></p> <pre>Device# copy tftp://10.0.0.6/cat3k_caa-universalk9.SSA.03.12.02.EXP.150-12.02.EXP.150-12.02.EXP.bin flash:</pre>	(Optional) Copies the bin file ( <i>image.bin</i> ) from the FTP or TFTP server to flash or USB flash.
<b>Step 2</b>	<p><b>software expand file</b> <i>source_file_path</i></p> <p><b>Example:</b></p> <p>Expanding the bin file from the TFTP server:</p> <pre>Switch# software expand file tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin to flash: Preparing expand operation ... [1]: Downloading file tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin to active switch 1 [1]: Finished downloading file tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37. EXP.bin to active switch 1 [1]: Copying software from active switch 1 to switch 2 [1]: Finished copying software to switch 2 [1 2]: Expanding bundle cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin [1 2]: Copying package files [1 2]: Package files copied [1 2]: Finished expanding bundle cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin   18 -rw-    74387812   Dec 7 2012 05:55:43 +00:00 cat3k_caa-base.SSA.03.09.37.EXP.pkg  19 -rw-    2738868   Dec 7 2012 05:55:44 +00:00 cat3k_caa-drivers.SSA.03.09.37.EXP.pkg  20 -rw-    32465772   Dec 7 2012 05:55:44 +00:00 cat3k_caa-infra.SSA.03.09.37.EXP.pkg  21 -rw-    30389036   Dec 7 2012 05:55:44 +00:00 cat3k_caa-iosd-universalk9.SSA.150-9.37.EXP.pkg  22 -rw-    18342624   Dec 7 2012 05:55:44 +00:00 cat3k_caa-platform.SSA.03.09.37.EXP.pkg  23 -rw-    63374028   Dec 7 2012 05:55:44 +00:00 cat3k_caa-wcm.SSA.10.0.10.14.pkg  17 -rw-         1239   Dec 7 2012 05:56:29 +00:00 packages.conf</pre>	<p>Expands the bin file stored in flash, FTP, TFTP, HTTP, or HTTPS server on the booted device.</p> <p><b>Note</b> Ensure that the <i>packages.conf</i> file is available in the expanded list.</p>
<b>Step 3</b>	<b>reload</b>	Reloads the device.

	Command or Action	Purpose
	<b>Example:</b> Device: <code>reload</code>	<b>Note</b> You can boot the device manually or automatically using the <code>packages.conf</code> file. If you are booting manually, you can proceed to Step 4. Otherwise, the device boots up automatically.
<b>Step 4</b>	<b>boot flash:packages.conf</b>  <b>Example:</b> switch: <code>boot flash:packages.conf</code>	Boots the device with the <code>packages.conf</code> file.
<b>Step 5</b>	<b>show version</b>  <b>Example:</b> switch# <code>show version</code>  <pre> Switch Ports Model          SW Version SW Image              Mode          ----- -----   1 6      WS-C3850-6DS-S  03.09.26.EXP ct3850-ipervicesk9  INSTALL           </pre>	Verifies that the device is in the <b>INSTALL</b> mode.

## Booting the Device in Bundle Mode

There are several methods by which you can boot the device—either by copying the bin file from the TFTP server and then boot the device, or by booting the device straight from flash or USB flash using the commands `boot flash:<image.bin>` or `boot usbflash0:<image.bin>`.

The following procedure explains how to boot the device from th TFTP server in the bundle mode.

### SUMMARY STEPS

1. `cp source_file_path destination_file_path`
2. `switch:BOOT=<source path of .bin file>`
3. `boot`
4. `show version`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<code>cp source_file_path destination_file_path</code>  <b>Example:</b> Device# <code>copy</code> <code>tftp://10.0.0.6/cat3k-csa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin</code> flash:	(Optional) Copies the bin file ( <code>image.bin</code> ) from the FTP or TFTP server to flash or USB flash.
<b>Step 2</b>	<code>switch:BOOT=&lt;source path of .bin file&gt;</code>  <b>Example:</b>	Sets the boot parameters.

	Command or Action	Purpose
	Device: switch: <code>boot http://10.0.0.2/cat3k_universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</code>	
<b>Step 3</b>	<b>boot</b>  <b>Example:</b> switch: <code>boot</code>	Boots the device.
<b>Step 4</b>	<b>show version</b>  <b>Example:</b> switch# <code>show version</code> Switch Ports Model SW Version SW Image Mode ----- 1 6 WS-C3850-6DS-S 03.09.40.EXP ct3850-ipservicesk9 BUNDLE	Verifies that the device is in the <b>BUNDLE</b> mode.

## Booting a Specific Software Image On a Switch Stack

By default, the switch attempts to automatically boot up the system using information in the **BOOT** environment variable. If this variable is not set, the switch attempts to load and execute the first executable image it can by performing a recursive, depth-first search throughout the flash file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory. However, you can specify a specific image to boot up.

### SUMMARY STEPS

1. `configure terminal`
2. `boot system switch {number | all}`
3. `end`
4. `show boot system`
5. `copy running-config startup-config`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b>  Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>boot system switch {number   all}</b>  <b>Example:</b>  Switch(config)# <code>boot system switch 2</code> flash: <code>cat3850-universalk9.SSA.03.08.83.EMD.150-8.83.EMD.bin</code>	(Optional) For switches in a stack, specifies the switch members on which the system image is loaded during the next boot cycle: <ul style="list-style-type: none"> <li>• Use <i>number</i> to specify a stack member. (Specify only one stack member.)</li> <li>• Use <b>all</b> to specify all stack members.</li> </ul>

	Command or Action	Purpose
		<p>If you enter on a Catalyst 3750-X stack master or member, you can only specify the switch image for other Catalyst 3750-X stack members.</p> <p>If you enter on a Catalyst 3750-E stack master or member, you can only specify the switch image for other Catalyst 3750-E stack members.</p> <p>If you want to specify the image for a Catalyst 3750 switch, enter this command on the Catalyst 3750 stack member.</p>
Step 3	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 4	<p><b>show boot system</b></p> <p><b>Example:</b></p> <pre>Device# show boot system</pre>	<p>Verifies your entries.</p> <p>The <b>boot system</b> global command changes the setting of the BOOT environment variable.</p> <p>During the next boot cycle, the switch attempts to automatically boot up the system using information in the BOOT environment variable.</p>
Step 5	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring a Scheduled Software Image Reload

This task describes how to configure your device to reload the software image at a later time.

### SUMMARY STEPS

1. **configure terminal**
2. **copy running-config startup-config**
3. **reload in [hh:]mm [text]**
4. **reload at hh: mm [month day | day month] [text]**
5. **reload cancel**
6. **show reload**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><b>configure terminal</b></p> <p><b>Example:</b></p>	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 2</b>	<b>copy running-config startup-config</b> <b>Example:</b> <code>copy running-config startup-config</code>	Saves your device configuration information to the startup configuration before you use the <b>reload</b> command.
<b>Step 3</b>	<b>reload in [hh:]mm [text]</b> <b>Example:</b>  Device(config)# <code>reload in 12</code>  System configuration has been modified. Save? [yes/no]: <code>y</code>	Schedules a reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 days. You can specify the reason for the reload in a string up to 255 characters in length.
<b>Step 4</b>	<b>reload at hh: mm [month day   day month] [text]</b> <b>Example:</b>  Device(config)# <code>reload at 14:00</code>	Specifies the time in hours and minutes for the reload to occur.  <b>Note</b> Use the <b>at</b> keyword only if the device system clock has been set (through Network Time Protocol (NTP), the hardware calendar, or manually). The time is relative to the configured time zone on the device. To schedule reloads across several devices to occur simultaneously, the time on each device must be synchronized with NTP.
<b>Step 5</b>	<b>reload cancel</b> <b>Example:</b>  Device(config)# <code>reload cancel</code>	Cancels a previously scheduled reload.
<b>Step 6</b>	<b>show reload</b> <b>Example:</b> <code>show reload</code>	Displays information about a previously scheduled reload or identifies if a reload has been scheduled on the device.

## Monitoring Device Setup Configuration

### Example: Verifying the Device Running Configuration

```
Device# show running-config
Building configuration...

Current configuration: 1363 bytes
!
```

```

# Configuration Examples for Performing Device Setup

## Example: Configuring a Device as a DHCP Server

```
Device# configure terminal
Device(config)# ip dhcp pool pool1
Device(dhcp-config)# network 10.10.10.0 255.255.255.0
Device(dhcp-config)# boot config-boot.text
Device(dhcp-config)# default-router 10.10.10.1
Device(dhcp-config)# option 150 10.10.10.1
Device(dhcp-config)# exit
Device(config)# tftp-server flash:config-boot.text
Device(config)# interface gigabitethernet1/0/4
Device(config-if)# no switchport
Device(config-if)# ip address 10.10.10.1 255.255.255.0
Device(config-if)# end
```

## Example: Configuring DHCP Auto-Image Update

**Related Topics**

[Configuring DHCP Auto-Image Update \(Configuration File and Image\)](#), on page 2079

## Example: Configuring a Device to Download Configurations from a DHCP Server

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with a saved configuration:

```
Device# configure terminal
Device(config)# boot host dhcp
Device(config)# boot host retry timeout 300
Device(config)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause
  You to No longer Automatically Download Configuration Files at Reboot^C
Device(config)# vlan 99
Device(config-vlan)# interface vlan 99
Device(config-if)# no shutdown
Device(config-if)# end
Device# show boot
BOOT path-list:
Config file:          flash:/config.text
Private Config file:  flash:/private-config.text
Enable Break:        no
Manual Boot:         no
HELPER path-list:
NVRAM/Config file
  buffer size:       32768
Timeout for Config
  Download:          300 seconds
Config Download
  via DHCP:          enabled (next boot: enabled)
Device#
```

**Related Topics**

## Examples: Scheduling Software Image Reload

This example shows how to reload the software on the device on the current day at 7:30 p.m.:

```
Device# reload at 19:30
Reload scheduled for 19:30:00 UTC Wed Jun 5 2013 (in 2 hours and 25 minutes)
Proceed with reload? [confirm]
```

This example shows how to reload the software on the device at a future time:

```

Device# reload at 02:00 jun 20
Reload scheduled for 02:00:00 UTC Thu Jun 20 2013 (in 344 hours and 53 minutes)
Proceed with reload? [confirm]

```

## Installing WCM Sub-Package

This document explains the process to install wireless control module (WCM) sub-package in Cisco Catalyst 3850 and 3650 Series Switches.

The WCM sub-package, which consists of WCM module and AP images, upgrades features, supports new APs, and fixes known issues. It eliminates the need for a full image upgrade and the resulting network downtime by upgrading only the WCM portion of the image. For example, if the WCM fails to allow a new AP to join the network due to image version mis-match, you can upgrade only the WCM portion of the image to add support for the new AP. When the WCM is upgraded, all the APs in the network are automatically upgraded to the newer image.

### Benefits

- Fixes WCM bugs
- Supports new APs
- Updates features available in WCM

### Prerequisites

- The controller must be booted in install mode.
- WCM sub-package should be available in any of the sources supported by installer. For example, flash or TFTP or USB.

## Restrictions

- WCM sub-package can only be installed on previous minor versions of the 16.1 image (for example, WCM package from 16.01.YY(cat3k\_caa-wcm.16.01.YY.SSA.pkg) can be installed on 16.01.01 to 16.01.YY super package (cat3k\_caa-universalk9.16.01.[01-to-YY].SSA.bin).
- You should reboot the switch after an upgrade.

## Installing WCM Sub-Package

**Step 1** Upgrade controller WCM package.

**request platform software package install switch all file flash: wcm\_sub\_package.pkg auto-copy**

**Step 2** (Optional) Download and install the AP image. This procedure reduces network downtime by pre-downloading and pre-programming APs with new image. Otherwise, when the controller reloads there will be a version mis-match between controller and APs and the APs will start to upgrade themselves using the new AP image, which may lead to longer downtime on the network.

**Note** After the download and install, wait for 30 seconds to ensure that the CLIs reach the AP.

- Push the new image to all connected APs.  
**ap image predownload**
- Monitor the progress of the download.  
**show ap image**
- Point the boot variable of all APs to the new image.  
**ap image swap**
- Reset the APs.  
**ap image reset**

**Step 3** Reload the controller. After the reload, the controller reloads with new WCM package and APs reloads with new AP image and they will start joining the upgraded controller.

**reload**

## Feature History and Information For Performing Device Setup Configuration

# Configuring Right-To-Use Licenses

- [Finding Feature Information, on page 2101](#)
- [Restrictions for Configuring RTU Licenses, on page 2101](#)
- [Information About Configuring RTU Licenses, on page 2102](#)
- [How to Configure RTU Licenses, on page 2105](#)
- [Monitoring and Maintaining RTU Licenses, on page 2110](#)
- [Configuration Examples for RTU Licensing, on page 2110](#)
- [Additional References for RTU Licensing, on page 2115](#)
- [Feature History and Information for RTU Licensing, on page 2116](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for Configuring RTU Licenses

The following are the restrictions for configuring and using RTU licenses.

- AP count licenses can be ordered and pre-activated on your switch.
- Imaged based licenses can be upgraded. AP count licenses can be deactivated and moved between switches and controllers.
- To activate a permanent license, you must reboot your switch after configuring the new image level. The AP-count license does not require a reboot to activate.
- An expired image based evaluation license can not be reactivated after reboot.
- Stack members of a switch stack must run the same license level.
- Licenses on mixed switch stacks are not supported.

- Your switch is pre-installed with the image that you ordered. If an image was not pre-ordered, then the switch is booted with a LAN base image by default.
- Adder AP-count licenses are installed in the factory.

**Related Topics**

[Examples: Activating RTU Image Based Licenses](#), on page 2110

## Information About Configuring RTU Licenses

### Right-To-Use Licensing

Right-to-use (RTU) licensing allows you to order and activate a specific license type and level, and then to manage license usage on your switch. The types of licenses available to order are:

- Permanent licenses—Purchased with a specific feature set with no expiration date.
- Evaluation licenses—Pre-installed on the switch and is valid for only a 90 day in-use period.

To activate a permanent or evaluation license, you are required to accept the End-User License Agreement (EULA).

A permanent license can be moved from one device to another. To activate a license, you must reboot your switch.

If you activate the evaluation license, it will expire in 90 days. An evaluation license is a manufacturing image on your switch and is not transferable to another switch. Once activated, this type of license cannot be deactivated until it expires. After your evaluation period expires, at the next reload your switch image will return to its default license.

**Related Topics**

[Activating an Imaged Based License](#), on page 2105

[Examples: Activating RTU Image Based Licenses](#), on page 2110

### Right-To-Use Image-Based Licenses

Right-to-use image licenses support a set of features based on a specific image-based license:

- LAN Base—Layer 2 features.
- IP Base—Layer 2 and Layer 3 features.
- IP Services—Layer 2, Layer 3, and IPv6 features. (Applicable only to switches and not controllers.)

### Right-To-Use License States

After you configure a specific license type and level, you can manage your licenses by monitoring the license state.

Table 171: RTU License States

License State	Description
Active, In Use	EULA was accepted and the license is in use after device reboot.
Active, Not In Use	EULA was accepted and the switch is ready to use when the license is enabled.
Not Activated	EULA was not accepted.

Guidelines to follow when monitoring your image based license state:

- A purchased permanent license is set to *Active, In Use* state only after a switch reboot.
- If more than one license was purchased, a reboot will activate the license with the highest feature set. For instance, the IP Services license is activated and not the LAN Base license.
- Remaining licenses purchased after switch reboot, stay in **Active, Not In Use** state.

**Note** For the AP count license, to change the state to Active, In Use, you must first make sure that the evaluation AP count license is deactivated.

## License Activation for Switch Stacks

Right-to-use licensing is supported on switch stacks. A switch is a set of up to nine stacking-capable switches connected through their StackWise-160 ports. You can connect only one switch type in a stack. One switch in the stack is identified as the active switch and the remaining switches are standby switches. The active switch is the switch that is activated with an RTU license and from its active console, the license level for the standby switches in the stack can be activated at the same time.

A new switch is allowed to join the switch stack if its license level matches. If there is a mismatch, then the active switch can reconfigure the license level and reboot it to allow it to join the stack.

## Mobility Controller Mode

AP-count licenses are used only when the switch is in Mobility Controller mode. The MC is the gatekeeper for tracking the AP-count licenses and allows an access point to join or not.

Management of AP-count licenses is performed by the in mobility controller mode configurable through the CLI.

### Related Topics

[Changing Mobility Mode](#), on page 2108

## Right-To-Use AP-Count Licensing

Right-to-use licensing (RTU) allows you to order and activate a specific license type, and then to manage license usage on your .

You can order your device with support for a specific number of adder access point count licenses, but the total number of licenses ordered should not exceed 25. You can also order your adder access point count licenses after receiving the device.

For example, if you have ordered 25 new adder licenses, you can add only those ordered adder licenses to the device. The licenses can be added in increments of 1, but the total number of licenses added for the device should not exceed 25.

You can configure your switch to manage the access point count licenses and view the number of access points currently in use from the CLI.

The following are two different types of access point licenses:

1. Permanent licenses for the access points
  - Adder access point count license—You can purchase the adder license to increase the device capacity at a later time. You can transfer the adder access point count license from one device to another.
2. Evaluation licenses for the access points
  - You can activate these licenses to evaluate more access points before purchasing the licenses.
  - The maximum number of access points that can be evaluated is 25.
  - The evaluation period for using the access point licenses is 90 days.
  - You can activate and deactivate the evaluation licenses from the CLI.

#### Related Topics

[Obtaining an Upgrade or Capacity Adder License](#), on page 2107

[Rehosting a License](#), on page 2108

## Right-to-Use AP-Count Evaluation Licenses

If you are considering upgrading to a license with a higher access point count, you can try an evaluation license before upgrading to a permanent version of the license. For example, if you are using a permanent license with a 50-access-point count and want to try an evaluation license with a 100-access-point count, you can try out the evaluation license for 90 days. For example, if you are using a permanent license with a 10 access-point count and want to try an evaluation license with a 15-access-point count, you can try out the evaluation license for 90 days.

When an evaluation license is activated, the permanent AP-count licenses are ignored. The maximum supported licenses of 1000 access points are available for 90 days. The maximum supported licenses of 25 access points are available for 90 days.

To prevent disruptions in operation, the device does not change licenses when an evaluation license expires. A warning expiry message is displayed daily starting five days prior to the expiry date. After 90 days, the evaluation license expires with a warning message. You must disable the evaluation license and then purchase the permanent license.

When the device reboots after the evaluation license expiry, the license defaults to a permanent license.

[Activating an AP-Count License](#), on page 2106

[Obtaining an Upgrade or Capacity Adder License](#), on page 2107

[Rehosting a License](#), on page 2108

## Right-To-Use Adder AP-Count Rehosting Licenses

Revoking a license from one device and installing it on another is called rehosting. You might want to rehost a license to change the purpose of a device. For example, if you want to move your Office Extend or indoor access points to a different device, you could transfer the adder ap-count license from one device to another.

To rehost a license, you must deactivate the adder ap-count license from one device and activate the same license on another device.

Evaluation licenses cannot be rehosted.

## How to Configure RTU Licenses

### Activating an Imaged Based License

#### SUMMARY STEPS

1. `license right-to-use activate{ipbase | ipservices | lanbase} {all | evaluation all} [slot slot-number] [acceptEULA]`
2. `reload [LINE | at | cancel | in | slot stack-member-number | standby-cpu]`
3. `show license right-to-use usage [slot slot-number]`

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><code>license right-to-use activate{ipbase   ipservices   lanbase} {all   evaluation all} [slot slot-number] [acceptEULA]</code></p> <p><b>Example:</b></p> <pre>Device# license right-to-use activate ipservices all acceptEULA</pre>	<p>Activates a type of image based license. Activation can happen on all switches and also include the EULA acceptance.</p> <p><b>Note</b> If you do not accept EULA, the modified configuration will not take effect after reload. The default license (or a license that was not deactivated) becomes active after reload.</p>
Step 2	<p><code>reload [LINE   at   cancel   in   slot stack-member-number   standby-cpu]</code></p> <p><b>Example:</b></p> <pre>Device# reload slot 1 Proceed with reload? [confirm] y</pre>	<p>Reloads a specific stack member to complete the activation process for the RTU adder AP-count license.</p> <p><b>Note</b> The reminder to accept a EULA is displayed after reload if it was not accepted earlier.</p>
Step 3	<p><code>show license right-to-use usage [slot slot-number]</code></p> <p><b>Example:</b></p>	<p>Displays detailed usage information.</p>

	Command or Action	Purpose
	<pre>Device# show license right-to-use usage  Slot# License Name      Type usage-duration(y:m:d) In-Use EULA</pre> <hr/> <pre> 1      ipservices      permanent    0 :10 :0       yes      yes  1      ipbase          permanent    0 :0 :0       no      no  1      ipbase          evaluation   0 :0 :0       no      no  1      lanbase         permanent    0 :0 :7       no      yes  1      apcount         evaluation   0 :0 :0       no      no  1      apcount         base         0 :0 :0       no      no  1      apcount         adder        0 :0 :0       no      no</pre> <pre>Switch#</pre>

## Obtaining an Upgrade or Capacity Adder License

You can use the capacity adder licenses to increase the number of access points supported by the device.

### SUMMARY STEPS

1. `license right-to-use {activate | deactivate} apcount {ap-number | evaluation } slot slot-num [ acceptEULA]`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<pre>license right-to-use {activate   deactivate} apcount {ap-number   evaluation } slot slot-num [ acceptEULA]</pre> <p><b>Example:</b></p> <pre>Device# license right to use activate apcount 5 slot 2 acceptEULA</pre>	Activates one or more adder AP-count licenses and immediately accepts the EULA.

## Rehosting a License

To rehost a license, you have to deactivate the license from one device and then activate the same license on another device.

**SUMMARY STEPS**

1. `license right-to-use deactivate apcount ap-number slot slot-num [ acceptEULA]`
2. `license right-to-use activate apcount ap-number slot slot-num [ acceptEULA]`

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<p><code>license right-to-use deactivate apcount ap-number slot slot-num [ acceptEULA]</code></p> <p><b>Example:</b></p> <pre>Device# license right to use deactivate apcount 1 slot 1 acceptEULA</pre>	Deactivates the license on one device.
<b>Step 2</b>	<p><code>license right-to-use activate apcount ap-number slot slot-num [ acceptEULA]</code></p> <p><b>Example:</b></p> <pre>Device# license right to use activate apcount 2 slot 2 acceptEULA</pre>	Activates the license on another device.

## Changing Mobility Mode

**SUMMARY STEPS**

1. `wireless mobility controller`
2. `write memory`
3. `reload [ LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`
4. `no wireless mobility controller`
5. `write memory`
6. `reload [ LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><b>wireless mobility controller</b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility controller % Mobility role changed to Mobility Controller. Please save config and reboot the whole stack.</pre>	Changes a switch in Mobility Agent mode to Mobility Controller mode.
Step 2	<p><b>write memory</b></p> <p><b>Example:</b></p> <pre>Device# write memory  Building configuration... Compressed configuration from 13870 bytes to 5390 bytes[OK] Device#</pre>	
Step 3	<p><b>reload [ <i>LINE</i>   at   cancel   in   slot <i>stack-member-number</i>   standby-cpu ]</b></p> <p><b>Example:</b></p> <pre>Device# reload slot 3 Proceed with reload? [confirm] y</pre>	
Step 4	<p><b>no wireless mobility controller</b></p> <p><b>Example:</b></p> <pre>Device(config)# no wireless mobility controller % Mobility role changed to Mobility Agent. Please save config and reboot the whole stack. Switch(config)#</pre>	Changes a switch in Mobility Controller mode to Mobility Agent mode.
Step 5	<p><b>write memory</b></p> <p><b>Example:</b></p> <pre>Device# write memory  Building configuration... Compressed configuration from 13870 bytes to 5390 bytes[OK] Device#</pre>	
Step 6	<p><b>reload [ <i>LINE</i>   at   cancel   in   slot <i>stack-member-number</i>   standby-cpu ]</b></p> <p><b>Example:</b></p> <pre>Device# reload slot 3 Proceed with reload? [confirm] y</pre>

## Monitoring and Maintaining RTU Licenses

Command	Purpose
<code>show license right-to-use default</code>	Displays the default license information.
<code>show license right-to-use detail</code>	Displays detailed information of all the licenses in the switch stack.
<code>show license right-to-use eula {adder   evaluation   permanent}</code>	Displays the end user license agreement.
<code>show license right-to-use mismatch</code>	Displays the license information that does not match.
<code>show license right-to-use slot slot-number</code>	Displays the license information for a specific slot in a switch stack.
<code>show license right-to-use summary</code>	Displays a summary of the license information on the entire switch stack.
<code>show license right-to-use usage [ slot slot-number ]</code>	Displays detailed information about usage for all licenses in the switch stack.
<code>show switch</code>	Displays detailed information of every member in a switch stack including the state of the license.

[Activating an AP-Count License](#), on page 2106

## Configuration Examples for RTU Licensing

### Examples: Activating RTU Image Based Licenses

This example shows how to activate an IP Services image license and accept the EULA for a specific slot:

```
Switch# license right-to-use activate ipservices slot 1 acceptEULA
% switch-1:stack-mgr:Reboot the switch to invoke the highest activated License level
```

This example shows how to activate a license for evaluation:

```
Switch# license right-to-use activate ipservices evaluation acceptEULA
```

```
% switch-1:stack-mgr:Reboot the switch to invoke the highest activated License level
```

### Related Topics

[Right-To-Use Licensing](#), on page 2102

[Monitoring and Maintaining RTU Licenses](#), on page 2110

## Examples: Displaying RTU Licensing Information

This example shows the consolidated RTU licensing information from the active switch on a switch stack. All of the members in the stack have the same license level. When the evaluation AP-count license is activated, the adder AP-count licenses are ignored. The maximum number of AP-count licenses are available when evaluation is enabled.

```
Switch# show license right-to-use summary
```

License Name	Type	Count	Period left
ipservices	permanent	10	Lifetime
apcount	evaluation	15	90

```
-----
License Level In Use: ipservices
License Level on Reboot: ipbase
Evaluation AP-Count: Enabled
Total AP Count Licenses: 25
AP Count Licenses In-use: 10
AP Count Licenses Remaining: 15
```

This example shows a summary of permanent and adder licenses. The evaluation AP-count license is disabled displaying the total number of activated adder AP-count licenses in the switch stack. AP-count licenses in-use mean that they are connected.

```
Switch# show license right-to-use summary
```

License Name	Type	Count	Period left
ipservices	permanent	N/A	Lifetime
apcount	base	0	
apcount	adder	25	Lifetime

```
-----
License Level In Use: ipservices
License Level on Reboot: ipservices eval
Evaluation AP-Count: Disabled
Total AP Count Licenses: 25
AP Count Licenses In-use: 10
AP Count Licenses Remaining: 15
```

This example shows the RTU default licenses. Default licenses are pre-installed and cannot be removed or transferred. If no license is activated the switch uses the default license, after a reboot.

```
Switch# show license right-to-use default
```

Slot#	License Name	Type	Count
1	ipservices	permanent	N/A
1	apcount	base	0
1	apcount	adder	10
Slot#	License Name	Type	Count
2	ipservices	permanent	N/A
2	apcount	base	0
2	apcount	adder	10
Slot#	License Name	Type	Count
3	ipservices	permanent	N/A
3	apcount	base	0
3	apcount	adder	10

This example shows the consolidated RTU licensing information of the controller. When the evaluation ap-count license is activated, the base and adder ap-count licenses are ignored. The maximum number of ap-count licenses are available when evaluation is enabled.

```
controller# show license right-to-use summary
```

License Name	Type	Count	Period left
apcount	evaluation	25	Expired

```
-----
Evaluation AP-Count: Enabled
Total AP Count Licenses: 25
AP Count Licenses In-use: 2
AP Count Licenses Remaining: 23
```

This example shows the RTU default licenses. Default licenses are pre-installed and cannot be removed or transferred. If no license is activated the controller uses the default license, after a reboot.

```
controller# show license right-to-use default
```

Slot#	License Name	Type	Count
1	apcount	base	10

## Example: Displaying RTU License Details

This example shows all the detailed information for the RTU licenses on slot 1:

```
Switch# show license right-to-use detail slot 1
```

```
Index 1: License Name: ipservices
         Period left: Lifetime
         License Type: permanent
         License State: Active, In use
         License Count: Non-Counted
         License Location: Slot 1
Index 2: License Name: ipservices
         Period left: 90
```

```

    License Type: evaluation
    License State: Not Activated
    License Count: Non-Counted
    License Location: Slot 1
Index 3: License Name: ipbase
    Period left: Lifetime
    License Type: permanent
    License State: Active, Not In use
    License Count: Non-Counted
    License Location: Slot 1
Index 4: License Name: ipbase
    Period left: 90
    License Type: evaluation
    License State: Not Activated
    License Count: Non-Counted
    License Location: Slot 1
    License Location: Standby Switch 1
Index 5: License Name: lanbase
    Period left: Lifetime
    License Type: permanent
    License State: Not Activated
    License Count: Non-Counted
    License Location: Slot 1
Index 6: License Name: apcount
    Period left: 90
    License Type: evaluation
    License State: Active, In use
    License Count: 50
    License Location: Slot 1
Index 7: License Name: apcount
    Period left: Lifetime
    License Type: base
    License State: Active, Not In use
    License Count: 0
    License Location: Slot 1
Index 8: License Name: apcount
    Period left: Lifetime
    License Type: adder
    License State: Active, Not In use
    License Count: 10
    License Location: Slot 1

Controller# show license right-to-use detail slot 1
Index 6: License Name: apcount
    Period left: Expired
    License Type: evaluation
    License State: Active, In use
    License Count: 1000
    License Location: Slot 1
Index 7: License Name: apcount
    Period left: Lifetime
    License Type: base
    License State: Active, Not In use
    License Count: 0
    License Location: Slot 1
Index 8: License Name: apcount
    Period left: Lifetime
    License Type: adder
    License State: Not Activated
    License Count: 0
    License Location: Slot 1
```

## Example: Displaying RTU License Mismatch

This example shows the license information of the switches in a stack and a mismatch state of a member switch. The member must match the active.

```
Switch# show switch
```

```
Switch/Stack Mac Address : 6400.f125.0c80
```

Switch#	Role	Mac Address	Priority	H/W Version	Current State
1	Standby	6400.f125.1b00	1	0	Ready
*2	Active	6400.f125.0c80	1	V01	Ready
3	Member	6400.f125.1780	1	0	Lic-Mismatch

**Note** To resolve the license mismatch, first check the RTU license summary:

```
Switch# show switch right-to-use summary
```

Then change the license level of the mismatched switched so that it is the same license level of the active switch. This example shows that the IP Base license was activated for the member switch to match the active switch.

```
Switch# license right-to-use activate ipbase slot 1 acceptEULA
```

## Example: Displaying RTU Licensing Usage

This example shows the detailed licensing usage on your switch stack. The IP Services license in Slot 1 is permanent and usage is one day. An AP-count license in Slot 2 is ready for evaluation. EULA was accepted and state shows in use, but after reboot the evaluation license will be deactivated.

```
Switch# show license right-to-use usage
```

Slot#	License Name	Type	usage-duration (y:m:d)	In-Use	EULA
1	ipservices	permanent	0 :0 :1	yes	yes
1	ipservices	evaluation	0 :0 :0	no	no
1	ipbase	permanent	0 :0 :0	no	yes
1	ipbase	evaluation	0 :0 :0	no	no
1	lanbase	permanent	0 :0 :0	no	no
1	apcount	evaluation	0 :0 :0	yes	yes
1	apcount	base	0 :0 :0	no	yes
1	apcount	adder	0 :0 :0	no	yes

Slot#	License Name	Type	usage-duration(y:m:d)	In-Use	EULA
2	ipservices	permanent	0 :0 :1	yes	no
2	ipservices	evaluation	0 :0 :0	no	yes
2	ipbase	permanent	0 :0 :0	no	yes
2	ipbase	evaluation	0 :0 :0	no	no
2	lanbase	permanent	0 :0 :0	no	no
2	apcount	evaluation	0 :0 :0	yes	yes
2	apcount	base	0 :0 :0	no	yes
2	apcount	adder	0 :0 :0	no	no

Slot#	License Name	Type	usage-duration(y:m:d)	In-Use	EULA
3	ipservices	permanent	0 :0 :1	yes	yes
3	ipservices	evaluation	0 :0 :0	no	no
3	ipbase	permanent	0 :0 :0	no	no
3	ipbase	evaluation	0 :0 :0	no	no
3	lanbase	permanent	0 :0 :0	no	no
3	apcount	evaluation	0 :0 :0	yes	yes
3	apcount	base	0 :0 :0	no	yes
3	apcount	adder	0 :0 :0	no	no

This example shows the detailed licensing usage on your controller.

Controller# **show license right-to-use usage**

Slot#	License Name	Type	usage-duration(y:m:d)	In-Use	EULA
1	apcount	evaluation	0 :3 :3	yes	yes
1	apcount	base	0 :0 :0	no	yes
1	apcount	adder	0 :0 :0	no	no

# Configuring Administrator Usernames and Passwords

---

- [Finding Feature Information, on page 2117](#)
- [Information About Configuring Administrator Usernames and Passwords, on page 2117](#)
- [Configuring Administrator Usernames and Passwords, on page 2118](#)
- [Examples: Administrator Usernames and Passwords Configuration, on page 2120](#)
- [Additional References for Administrator Usernames and Passwords, on page 2121](#)
- [Feature History and Information For Performing Administrator Usernames and Passwords Configuration, on page 2121](#)

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring Administrator Usernames and Passwords

You can configure administrator usernames and passwords to prevent unauthorized users from reconfiguring the device and viewing configuration information. This section provides instructions for initial configuration and for password recovery.

You can also set administrator usernames and passwords to manage and configure one or more access points that are associated with the device.

### Strong Passwords

You can set strong administrator passwords such as encrypted passwords with ASCII keys for the administrator user for managing access points.

Use the following guidelines while creating strong passwords:

- There should be at least three of the following categories—lowercase letters, uppercase letters, and digits, and special characters.

---

**Note** Special characters are not supported for username and password for GUI login.

---

- The new password should not be the same as that of the associated username and the username should not be reversed.
- The characters in the password should not be repeated more than three times consecutively.
- The password should not be **cisco**, **ocsic**, **admin**, **nimda**, or any variant obtained by changing the capitalization of letters therein, or by substituting "1" "|" or "!" for i, and/or substituting "0" for "o", and/or substituting "\$" for "s".
- The maximum number of characters accepted for the username and password is 32.

### Encrypted Passwords

You can set three types of keys for the password:

- Randomly generated key—This key is generated randomly and it is the most secure option. To export the configuration file from one system to another, the key should also be exported.
- Static key—The simplest option is to use a fixed (static) encryption key. By using a fixed key, no key management is required, but if the key is somehow discovered, the data can be decrypted by anyone with the knowledge of that key. This is not a secure option and it is called obfuscation in the CLI.
- User defined key—You can define the key by yourself. To export the configuration file from one system to another, both systems should have the same key configured.

# Configuring Administrator Usernames and Passwords

## SUMMARY STEPS

1. **configure terminal**
2. **wireless security strong-password**
3. **username admin-username password {0 unencrypted\_password | 7 hidden\_password | unencrypted\_text}**
4. **username admin-username secret {0 unencrypted\_secret\_text | 4 SHA256 encrypted\_secret\_text | 5 MD5 encrypted\_secret\_text | LINE}**
5. **ap mgmtuser username username password {0 unencrypted password | 8 AES encrypted password }secret {0 unencrypted password | 8 AES encrypted password }**
6. **ap dot1x username username password {0 unencrypted password | 8 AES encrypted password }**
7. **end**
8. **ap name apname mgmtuser username usernamepassword password secret secret\_text**
9. **ap name apname dot1x-user username password password**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>wireless security strong-password</b> <b>Example:</b> Device(config)# <b>wireless security strong-password</b>	Enables strong password policy for the administrator user.
Step 3	<b>username admin-username password {0 unencrypted_password   7 hidden_password   unencrypted_text}</b> <b>Example:</b> Device(config)# <b>username adminuser1 password 0 Qzsek239@</b>	Specifies a username and password for an administrator. The administrator can configure the device and view the configured information.
Step 4	<b>username admin-username secret {0 unencrypted_secret_text   4 SHA256 encrypted_secret_text   5 MD5 encrypted_secret_text   LINE}</b> <b>Example:</b> Device(config)# <b>username adminuser1 secret 0 Qzsek239@</b>	Specifies the secret for the administrator.
Step 5	<b>ap mgmtuser username username password {0 unencrypted_password   8 AES encrypted_password }secret {0 unencrypted_password   8 AES encrypted_password }</b> <b>Example:</b> Device(config)# <b>ap mgmtuser username cisco password 0 Qwci12@ secret 0 Qwci14@!</b>	Specifies administrator username and password for managing all of the access points configured to the device. You can also include the secret text to perform privileged access point management.  <b>Note</b> If your password is not strong enough to fulfill the strong password policy, then the password is rejected with a valid error message. For example, the following password is rejected because it is not a strong password.  Device# <b>ap mgmtuser username cisco password 0 abcd secret 0 1234</b>
Step 6	<b>ap dot1x username username password {0 unencrypted_password   8 AES encrypted_password }</b> <b>Example:</b> Device(config)# <b>ap dot1x username cisco password 0 Qwci12@</b>	Specifies the 802.1X username and password for managing all of the access points configured to the device.
Step 7	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

	Command or Action	Purpose
<b>Step 8</b>	<b>ap name apname mgmtuser username usernamepassword password secret secret _text</b>  <b>Example:</b> Device# <b>ap name APf0f7.55c7.7b23 mgmtuser username cisco password Qne35! secret Nzep592\$</b>	Configures the administrator username, password, and secret text for managing a specific access point that is configured to the device.
<b>Step 9</b>	<b>ap name apname dot1x-user username password password</b>  <b>Example:</b> Device# <b>ap name APf0f7.55c7.7b23 dot1x-user username cisco password Qne35!</b>	Configures the 802.1X username and password for a specific access point.

### Example

## Examples: Administrator Usernames and Passwords Configuration

This example shows how to configure administrator usernames and passwords with the strong password policy in configuration mode:

```
Device# configure terminal
Device(config)# wireless security strong-password
Device(config)# username adminuser1 password 0 QZsek239@
Device(config)# ap mgmtuser username cisco password 0 Qwci12@ secret 0 Qwci14@!
Device(config)# ap dot1x username cisco password 0 Qwci12@
Device# end
```

This example shows how to configure administrator usernames and passwords for an access point in global EXEC mode:

```
Device# wireless security strong-password
Device# ap name APf0f7.55c7.7b23 mgmtuser username cisco password Qwci12@ secret Qwci14@
Device# ap name APf0f7.55c7.7b23 dot1x-user username cisco password Qwci12@
Device# end
```

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions on Band Selection, 802.11 Bands, and Parameters

- Band-selection enabled WLANs do not support time-sensitive applications like voice and video because of roaming delays.
- Band selection can be used only with Cisco Aironet 1040, 1140, 1250, 1260, 1550, 2600, 3500, 3600, series access points.
- Band selection operates only on access points that are connected to a controller. A FlexConnect access point without a controller connection does not perform band selection after a reboot.
- The band-selection algorithm directs dual-band clients only from the 2.4-GHz radio to the 5-GHz radio of the same access point, and it only runs on an access point when both the 2.4-GHz and 5-GHz radios are up and running.

- You can enable both band selection and aggressive load balancing on the controller. They run independently and do not impact one another.
- It is not possible to enable or disable band selection and client load balancing globally through the controller GUI or CLI. You can, however, enable or disable band selection and client load balancing for a particular WLAN. Band selection and client load balancing are enabled globally by default.

## Information About Configuring Band Selection, 802.11 Bands, and Parameters

### Band Selection

Band selection enables client radios that are capable of dual-band (2.4- and 5-GHz) operation to move to a less congested 5-GHz access point. The 2.4-GHz band is often congested. Clients on this band typically experience interference from Bluetooth devices, microwave ovens, and cordless phones as well as co-channel interference from other access points because of the 802.11b/g limit of three nonoverlapping channels. To prevent these sources of interference and improve overall network performance, you can configure band selection on the device.

Band selection works by regulating probe responses to clients and it can be enabled on a per-WLAN basis. It makes 5-GHz channels more attractive to clients by delaying probe responses to clients on 2.4-GHz channels. In the access point, the band select table can be viewed by giving `show dot11 band-select` command. It can also be viewed from `show cont d0/d1 | begin Lru`.

---

**Note** The WMM default configuration will not be shown in **show running-config** output.

---

### Band Selection Algorithm

The band selection algorithm affects clients that use 2.4-GHz band. Initially, when a client sends a probe request to the access point, the corresponding client probe's Active and Count values (as seen from the band select table) become 1. The algorithm functions based on the following scenarios:

- Scenario - 1: Client RSSI (as seen from `show cont d0/d1 | begin RSSI`) is greater than both Mid-RSSI and Acceptable Client RSSI.
  - Dual band clients—No 2.4-GHz probe responses are seen at any time; 5-GHz probe responses are seen for all 5-GHz probe requests.
  - Single band (2.4-GHz) clients—2.4-GHz probe responses are seen only after the probe suppression cycle.
  - After the client's probe count reaches the configured probe cycle count, the algorithm waits for the Age Out Suppression time and then marks the client probe's Active value as 0. Then, the algorithm is restarted.
- Scenario - 2: Client RSSI (as seen from `show cont d0/d1 | begin RSSI`) lies between Mid-RSSI and Acceptable Client RSSI.

- All 2.4-GHz and 5-GHz probe requests are responded without any restrictions.
- This scenario is similar to the band select disabled.

---

**Note** The client RSSI value (seen as **sh cont d0 | begin RSSI**) is the average of the client packets received, and the Mid-RSSI feature is the instantaneous RSSI value of the probe packets. As a result, the client RSSI is seen as weaker than the configured Mid-RSSI value (7 dB delta). The 802.11b probes from the client are suppressed to push the client to associate with the 802.11a band.

---

## 802.11 Bands

You can configure the 802.11b/g/n (2.4-GHz) and 802.11a/n (5-GHz) bands for the controller to comply with the regulatory requirements in your country. By default, both 802.11b/g/n and 802.11a/n are enabled.

When a controller is configured to allow only 802.11g traffic, 802.11b client devices are able to successfully connect to an access point but cannot pass traffic. When you configure the controller for 802.11g traffic only, you must mark 11g rates as mandatory.

## 802.11n Parameter

This section provides instructions for managing 802.11n devices such as the Cisco Aironet 1140 and 3600 Series Access Points on your network. The 802.11n devices support the 2.4- and 5-GHz bands and offer high-throughput data rates.

The 802.11n high-throughput rates are available on all 802.11n access points for WLANs using WMM with no Layer 2 encryption or with WPA2/AES encryption enabled.

---

**Note** Some Cisco 802.11n APs may intermittently emit incorrect beacon frames, which can trigger false wIPS alarms. We recommend that you ignore these alarms. The issue is observed in the following Cisco 802.11n APs: 1140, 1250, 2600, 3500, and 3600.

---

## 802.11h Parameter

802.11h informs client devices about channel changes and can limit the transmit power of those client devices.

# How to Configure 802.11 Bands and Parameters

## Configuring Band Selection (CLI)

### SUMMARY STEPS

1. **configure terminal**

2. **wireless client band-select cycle-count** *cycle\_count*
3. **wireless client band-select cycle-threshold** *milliseconds*
4. **wireless client band-select expire suppression** *seconds*
5. **wireless client band-select expire dual-band** *seconds*
6. **wireless client band-select client-rssi** *client\_rssi*
7. **end**
8. **wlan** *wlan\_profile\_name wlan\_ID SSID\_network\_name* **band-select**
9. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless client band-select cycle-count</b> <i>cycle_count</i> <b>Example:</b> Device(config)# <b>wireless client band-select cycle-count 3</b>	Sets the probe cycle count for band select.  You can enter a value between 1 and 10 for the <i>cycle_count</i> parameter.
<b>Step 3</b>	<b>wireless client band-select cycle-threshold</b> <i>milliseconds</i> <b>Example:</b> Device(config)# <b>wireless client band-select cycle-threshold 5000</b>	Sets the time threshold for a new scanning cycle period.  You can enter a value for threshold between 1 and 1000 for the <i>milliseconds</i> parameter.
<b>Step 4</b>	<b>wireless client band-select expire suppression</b> <i>seconds</i> <b>Example:</b> Device(config)# <b>wireless client band-select expire suppression 100</b>	Sets the suppression expire to the band select.  You can enter a value for suppression between 10 to 200 for the <i>seconds</i> parameter.
<b>Step 5</b>	<b>wireless client band-select expire dual-band</b> <i>seconds</i> <b>Example:</b> Device(config)# <b>wireless client band-select expire dual-band 100</b>	Sets the dual band expire.  You can enter a value for dual band between 10 and 300 for the <i>seconds</i> parameter.
<b>Step 6</b>	<b>wireless client band-select client-rssi</b> <i>client_rssi</i> <b>Example:</b> Device(config)# <b>wireless client band-select client-rssi 40</b>	Sets the client RSSI threshold.  You can enter a value for minimum dBm of a client RSSI to respond to a probe between 20 and 90 for the <i>client_rssi</i> parameter.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 8</b>	<b>wlan</b> <i>wlan_profile_name wlan_ID SSID_network_name</i> <b>band-select</b>	Configures band selection on specific WLANs.

	Command or Action	Purpose
	<b>Example:</b> Device(config)# <b>wlan wlan1 25 ssid12</b>  Device(config-wlan)# <b>band-select</b>	You can enter a value between 1 and 512 for the <i>wlan_ID</i> parameter.  You can enter the up to 32 alphanumeric characters for <i>SSID_network_name</i> parameter.
<b>Step 9</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring the 802.11 Bands (CLI)

You can configure 802.11 bands and parameters.

### SUMMARY STEPS

1. **configure terminal**
2. **ap dot11 5ghz shutdown**
3. **ap dot11 24ghz shutdown**
4. **ap dot11 {5ghz | 24ghz} beaconperiod *time\_unit***
5. **ap dot11 {5ghz | 24ghz} fragmentation *threshold***
6. **ap dot11 {5ghz | 24ghz} dtpc**
7. **wireless client association limit *number interval milliseconds***
8. **ap dot11 {5ghz | 24ghz} rate *rate {disable | mandatory | supported}***
9. **no ap dot11 5ghz shutdown**
10. **no ap dot11 24ghz shutdown**
11. **ap dot11 24ghz dot11g**
12. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 5ghz shutdown</b>  <b>Example:</b> Device(config)# <b>ap dot11 5ghz shutdown</b>	Disables the 802.11a band.  <b>Note</b> You must disable the 802.11a band before configuring the 802.11a network parameters.
<b>Step 3</b>	<b>ap dot11 24ghz shutdown</b>  <b>Example:</b> Device(config)# <b>ap dot11 24ghz shutdown</b>	Disables the 802.11b band.  <b>Note</b> You must disable the 802.11b band before configuring the 802.11b network parameters.

	Command or Action	Purpose
<b>Step 4</b>	<b>ap dot11 {5ghz   24ghz} beaconperiod <i>time_unit</i></b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz beaconperiod 500</b>	Specifies the rate at which the SSID is broadcast by the access point.  The beacon interval is measured in time units (TUs). One TU is 1024 microseconds. You can configure the access point to send a beacon every 20 to 1000 milliseconds.
<b>Step 5</b>	<b>ap dot11 {5ghz   24ghz} fragmentation <i>threshold</i></b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz fragmentation 300</b>	Specifies the size at which packets are fragmented.  The threshold is a value between 256 and 2346 bytes (inclusive). Specify a low number for areas where communication is poor or where there is a great deal of radio interference.
<b>Step 6</b>	<b>ap dot11 {5ghz   24ghz} dtpc</b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz dtpc</b> Device(config)# <b>no ap dot11 24ghz dtpc</b>	Enables access points to advertise their channels and transmit the power levels in beacons, and probe responses.  The default value is enabled. Client devices using dynamic transmit power control (DTPC) receive the channel and power level information from the access points and adjust their settings automatically. For example, a client device used primarily in Japan could rely on DTPC to adjust its channel and power settings automatically when it travels to Italy and joins a network there.  <b>Note</b> On access points that run Cisco IOS software, this feature is called world mode.  The <b>no</b> form of the command disables the 802.11a or 802.11b DTPC setting.
<b>Step 7</b>	<b>wireless client association limit <i>number interval milliseconds</i></b> <b>Example:</b> Device(config)# <b>wireless client association limit 50 interval 1000</b>	Specifies the maximum allowed clients that can be configured.  You can configure a maximum number of association request on a single access point slot at a given interval. The range of association limit that you can configure is from one through 100.  The association request limit interval is measured between 100 to 10000 milliseconds.
<b>Step 8</b>	<b>ap dot11 {5ghz   24ghz} rate <i>rate {disable   mandatory   supported}</i></b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz rate 36 mandatory</b>	Specifies the rate at which data can be transmitted between the controller and the client. <ul style="list-style-type: none"> <li>• <i>disabled</i>—Defines that the clients specify the data rates used for communication.</li> <li>• <i>mandatory</i>—Defines that the clients support this data rate in order to associate to an access point on the controller.</li> <li>• <i>supported</i>—Any associated clients that support this data rate may communicate with the access point</li> </ul>

	Command or Action	Purpose
		<p>using that rate. However, the clients are not required to be able to use this rate in order to associate.</p> <ul style="list-style-type: none"> <li><i>rate</i>—Specifies the rate at which data is transmitted. For the 802.11a and 802.11b bands, the data is transmitted at the rate of 1, 2, 5.5, 6, 9, 11, 12, 18, 24, 36, 48, or 54 Mbps.</li> </ul>
Step 9	<p><b>no ap dot11 5ghz shutdown</b></p> <p><b>Example:</b></p> <pre>Device(config)# no ap dot11 5ghz shutdown</pre>	<p>Enables the 802.11a band.</p> <p><b>Note</b> The default value is enabled.</p>
Step 10	<p><b>no ap dot11 24ghz shutdown</b></p> <p><b>Example:</b></p> <pre>Device(config)# no ap dot11 24ghz shutdown</pre>	<p>Enables the 802.11b band.</p> <p><b>Note</b> The default value is enabled.</p>
Step 11	<p><b>ap dot11 24ghz dot11g</b></p> <p><b>Example:</b></p> <pre>Device(config)# ap dot11 24ghz dot11g</pre>	<p>Enables or disables 802.11g network support.</p> <p>The default value is enabled. You can use this command only if the 802.11b band is enabled. If you disable this feature, the 802.11b band is enabled without 802.11g support.</p>
Step 12	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>

## Configuring 802.11n Parameters (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **ap dot11 {5ghz | 24ghz} dot11n**
3. **ap dot11 {5ghz | 24ghz} dot11n mcs tx rtu**
4. **wlanwlan\_profile\_name wlan\_ID SSID\_network\_name wmm require**
5. **ap dot11 {5ghz | 24ghz} shutdown**
6. **{ap | no ap} dot11 {5ghz | 24 ghz} dot11n a-mpdu tx priority {all | 0-7}**
7. **no ap dot11 {5ghz | 24ghz} shutdown**
8. **ap dot11 {5ghz | 24ghz} dot11n guard-interval {any | long}**
9. **ap dot11 {5ghz | 24ghz} dot11n rifs rx**
10. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 {5ghz   24ghz} dot11n</b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz dot11n</b>	Enables 802.11n support on the network.  The <b>no</b> form of the command disables the 802.11n support on the network.
<b>Step 3</b>	<b>ap dot11 {5ghz   24ghz} dot11n mcs tx rtu</b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz dot11n mcs tx 20</b>	Specifies the modulation and coding scheme (MCS) rates at which data can be transmitted between the access point and the client. You can set a value from 0 through 23 for the <b>mcs tx</b> parameter.  The <b>no</b> form of the command disables the MCS rates that is configured.
<b>Step 4</b>	<b>wlan wlan_profile_name wlan_ID SSID_network_name wmm require</b> <b>Example:</b> Device(config)# <b>wlan wlan1 25 ssid12</b> Device(config-wlan)# <b>wmm require</b>	Enables WMM on the WLAN and uses the 802.11n data rates that you configured.  The <b>require</b> parameter requires client devices to use WMM. Devices that do not support WMM cannot join the WLAN.
<b>Step 5</b>	<b>ap dot11 {5ghz   24ghz} shutdown</b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz shutdown</b>	Disables the network.
<b>Step 6</b>	<b>{ap   no ap} dot11 {5ghz   24 ghz} dot11n a-mpdu tx priority {all   0-7}</b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz dot11n a-mpdu tx priority all</b>	Specifies the aggregation method used for 802.11n packets.  Aggregation is the process of grouping packet data frames together rather than transmitting them separately. Two aggregation methods are available: Aggregated MAC Protocol Data Unit (A-MPDU) and Aggregated MAC Service Data Unit (A-MSDU). Both A-MPDU and A-MSDU are performed in the software.  You can specify the aggregation method for various types of traffic from the access point to the clients.  The following table defines the priority levels (0-7) assigned per traffic type.  <b>Table 172: Traffic Type Priority Levels</b>

User Priority	Traffic Type
0	Best effort
1	Background

	Command or Action	Purpose												
		<table border="1" data-bbox="914 281 1503 617"> <tr> <td data-bbox="914 281 1062 331">2</td> <td data-bbox="1062 281 1503 331">Spare</td> </tr> <tr> <td data-bbox="914 331 1062 382">3</td> <td data-bbox="1062 331 1503 382">Excellent effort</td> </tr> <tr> <td data-bbox="914 382 1062 432">4</td> <td data-bbox="1062 382 1503 432">Controlled load</td> </tr> <tr> <td data-bbox="914 432 1062 483">5</td> <td data-bbox="1062 432 1503 483">Video, less than 100-ms latency and jitter</td> </tr> <tr> <td data-bbox="914 483 1062 533">6</td> <td data-bbox="1062 483 1503 533">Voice, less than 100-ms latency and jitter</td> </tr> <tr> <td data-bbox="914 533 1062 617">7</td> <td data-bbox="1062 533 1503 617">Network control</td> </tr> </table> <p data-bbox="914 636 1523 789">You can configure each priority level independently, or you can use the all parameter to configure all of the priority levels at once. You can configure priority levels so that the traffic uses either A-MPDU transmission or A-MSDU transmission.</p> <ul data-bbox="948 810 1523 1016" style="list-style-type: none"> <li>• When you use the <b>ap</b> command along with the other options, the traffic associated with that priority level uses A-MPDU transmission.</li> <li>• When you use the <b>no ap</b> command along with the other options, the traffic associated with that priority level uses A-MSDU transmission.</li> </ul> <p data-bbox="964 1037 1523 1190">Configure the priority levels to match the aggregation method used by the clients. By default, A-MPDU is enabled for priority level 0, 4 and 5 and the rest are disabled. By default, A-MPDU is enabled for all priorities except 6 and 7.</p>	2	Spare	3	Excellent effort	4	Controlled load	5	Video, less than 100-ms latency and jitter	6	Voice, less than 100-ms latency and jitter	7	Network control
2	Spare													
3	Excellent effort													
4	Controlled load													
5	Video, less than 100-ms latency and jitter													
6	Voice, less than 100-ms latency and jitter													
7	Network control													
<b>Step 7</b>	<b>no ap dot11 {5ghz   24ghz} shutdown</b> <b>Example:</b> <pre data-bbox="289 1325 813 1350">Device(config)# no ap dot11 5ghz shutdown</pre>	Reenables the network.												
<b>Step 8</b>	<b>ap dot11 {5ghz   24ghz} dot11n guard-interval {any   long}</b> <b>Example:</b> <pre data-bbox="289 1499 748 1549">Device(config)# ap dot11 5ghz dot11n guard-interval long</pre>	Configures the guard interval for the network.												
<b>Step 9</b>	<b>ap dot11 {5ghz   24ghz} dot11n rifs rx</b> <b>Example:</b> <pre data-bbox="289 1669 850 1694">Device(config)# ap dot11 5ghz dot11n rifs rx</pre>	Configures the Reduced Interframe Space (RIFS) for the network.												
<b>Step 10</b>	<b>end</b> <b>Example:</b> <pre data-bbox="289 1808 532 1833">Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.												

## Configuring 802.11h Parameters (CLI)

### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 5ghz shutdown`
3. `{ap | no ap} dot11 5ghz channelswitch mode switch_mode`
4. `ap dot11 5ghz power-constraint value`
5. `no ap dot11 5ghz shutdown`
6. `end`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	<b>ap dot11 5ghz shutdown</b> <b>Example:</b> Device(config)# <code>ap dot11 5ghz shutdown</code>	Disables the 802.11a network.
Step 3	<b>{ap   no ap} dot11 5ghz channelswitch mode <i>switch_mode</i></b> <b>Example:</b> Device(config)# <code>ap dot11 5ghz channelswitch mode 0</code>	Enables or disables the access point to announce when it is switching to a new channel.  You can enter a 0 or 1 for the <b>channelswitch</b> parameter to specify whether transmissions are restricted until the actual channel switch (0) or are not restricted (1). The default value is disabled.
Step 4	<b>ap dot11 5ghz power-constraint <i>value</i></b> <b>Example:</b> Device(config)# <code>ap dot11 5ghz power-constraint 200</code>	Configures the 802.11h power constraint value in a range from zero through 255.  The default value for the value parameter is 3 dB.
Step 5	<b>no ap dot11 5ghz shutdown</b> <b>Example:</b> Device(config)# <code>no ap dot11 5ghz shutdown</code>	Reenables the 802.11a network.
Step 6	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Monitoring Configuration Settings for Band Selection, 802.11 Bands, and Parameters

## Monitoring Configuration Settings Using Band Selection and 802.11 Bands Commands

This section describes the new commands for band selection and 802.11 bands.

The following commands can be used to monitor band selection, and 802.11 bands and parameters the .

**Table 173: Monitoring Configuration Settings Using Band Selection and 802.11 Bands Commands**

Command	Purpose
<b>show ap dot11 5ghz network</b>	Displays 802.11a bands network parameters, 802.11a operational rates, 802.11n MCS settings, and 802.11n status information.
<b>show ap dot11 24ghz network</b>	Displays 802.11b bands network parameters, 802.11b/g operational rates, 802.11n MCS settings, and 802.11n status information.
<b>show wireless dot11h</b>	Displays 802.11h configuration parameters.
<b>show wireless band-select</b>	Displays band select configuration settings.

### Example: Viewing the Configuration Settings for 5-GHz Band

```

Device# show ap dot11 5ghz network
802.11a Network : Enabled
11nSupport : Enabled
  802.11a Low Band : Enabled
  802.11a Mid Band : Enabled
  802.11a High Band : Enabled

802.11a Operational Rates
  802.11a 6M : Mandatory
  802.11a 9M : Supported
  802.11a 12M : Mandatory
  802.11a 18M : Supported
  802.11a 24M : Mandatory
  802.11a 36M : Supported
  802.11a 48M : Supported
  802.11a 54M : Supported
802.11n MCS Settings:
  MCS 0 : Supported
  MCS 1 : Supported
  MCS 2 : Supported
  MCS 3 : Supported
  MCS 4 : Supported
  MCS 5 : Supported
  MCS 6 : Supported
  MCS 7 : Supported

```

## Example: Viewing the Configuration Settings for 5-GHz Band

## Example: Viewing the status of 802.11h Parameters

```

Device# show wireless dot11h
Power Constraint: 0
Channel Switch: 0
Channel Switch Mode: 0

```

## Example: Verifying the Band Selection Settings

```
Device# show wireless band-select
Band Select Probe Response      : per WLAN enabling
Cycle Count                     : 2
Cycle Threshold (millisec)     : 200
Age Out Suppression (sec)      : 20
Age Out Dual Band (sec)        : 60
Client RSSI (dBm)              : 80
```

# Configuration Examples for Band Selection, 802.11 Bands, and Parameters

## Examples: Band Selection Configuration

This example shows how to set the probe cycle count and time threshold for a new scanning cycle period for band select:

```
Device# configure terminal
Device(config)# wireless client band-select cycle-count 3
Device(config)# wireless client band-select cycle-threshold 5000
Device(config)# end
```

This example shows how to set the suppression expire to the band select:

```
Device# configure terminal
Device(config)# wireless client band-select expire suppression 100
Device(config)# end
```

This example shows how to set the dual band expire for the band select:

```
Device# configure terminal
Device(config)# wireless client band-select expire dual-band 100
Device(config)# end
```

This example shows how to set the client RSSI threshold for the band select:

```
Device# configure terminal
Device(config)# wireless client band-select client-rssi 40
Device(config)# end
```

This example shows how to configure band selection on specific WLANs:

```
Device# configure terminal
Device(config)# wlan wlan1 25 ssid12
Device(config-wlan)# band-select
Device(config)# end
```

## Examples: 802.11 Bands Configuration

This example shows how to configure 802.11 bands using beacon interval, fragmentation, and dynamic transmit power control:

```
Device# configure terminal
Device(config)# ap dot11 5ghz shutdown
Device(config)# ap dot11 24ghz shutdown
Device(config)# ap dot11 5ghz beaconperiod 500
Device(config)# ap dot11 5ghz fragmentation 300
Device(config)# ap dot11 5ghz dtpc
Device(config)# wireless client association limit 50 interval 1000
Device(config)# ap dot11 5ghz rate 36 mandatory
Device(config)# no ap dot11 5ghz shutdown
Device(config)# no ap dot11 24ghz shutdown
Device(config)# ap dot11 24ghz dot11g
Device(config)#end
```

## Examples: 802.11n Configuration

This example shows how to configure 802.11n parameters for 5-GHz band using aggregation method:

```
Device# configure terminal
Device(config)# ap dot11 5ghz dot11n
Device(config)# ap dot11 5ghz dot11n mcs tx 20
Device(config)# wlan wlan1 25 ssid12
Device(config-wlan)# wmm require\
Device(config-wlan)# exit
Device(config)# ap dot11 5ghz shutdown
Device(config)# ap dot11 5ghz dot11n a-mpdu tx priority all
Device(config)# no ap dot11 5ghz shutdown
Device(config)#exit
```

This example shows how to configure the guard interval for 5-GHz band:

```
Device# configure terminal
Device(config)# ap dot11 5ghz dot11n
Device(config)# ap dot11 5ghz dot11n mcs tx 20
Device(config)# wlan wlan1 25 ssid12
Device(config-wlan)# wmm require\
Device(config-wlan)# exit
Device(config)# no ap dot11 5ghz shutdown
Device(config)# ap dot11 5ghz dot11n guard-interval long
Device(config)#end
```

This example shows how to configure the RIFS for 5-GHz band:

```
Device# configure terminal
Device(config)# ap dot11 5ghz dot11n
Device(config)# ap dot11 5ghz dot11n mcs tx 20
Device(config)# wlan wlan1 25 ssid12
Device(config-wlan)# wmm require\
Device(config-wlan)# exit
Device(config)# ap dot11 5ghz shutdown
Device(config)# ap dot11 5ghz dot11n rifs rx
Device(config)#end
```

## Examples: 802.11h Configuration

This example shows how to configure the access point to announce when it is switching to a new channel using restriction transmission:

```
Device# configure terminal
Device(config)# ap dot11 5ghz shutdown
Device(config)# ap dot11 5ghz channelswitch mode 0
Device(config)# no ap dot11 5ghz shutdown
Device(config)#end
```

This example shows how to configure the 802.11h power constraint for 5-GHz band:

```
Device# configure terminal
Device(config)# ap dot11 5ghz shutdown
Device(config)# ap dot11 5ghz power-constraint 200
Device(config)# no ap dot11 5ghz shutdown
Device(config)#end
```

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for Aggressive Load Balancing

- You can configure aggressive load balancing only from the command-line interface.
- Aggressive load balancing is disabled by default, you must enable it manually.
- You can enable load balancing either separately or together with the band select configurations.
- When the band select is enabled on the dual-band clients, the load balancing parameter selects only the lowest load radio from 5-GHz radios. For the 2.4-GHz clients, there is no probe information of the client on 5 GHz and therefore the load balancing algorithm can only be selected between radio on 2.4 GHz.
- You can operate load balancing of clients between access points on the same device but not for the clients between access points on the different device.
- The load balancing uses an existing association denial mechanism based on the number of client on the radio and the band select is implemented by the distributed probe response suppression on the access point only.

# Information for Configuring Aggressive Load Balancing Parameters

## Aggressive Load Balancing

Enabling aggressive load balancing on the controller allows lightweight access points to load balance wireless clients across access points. You can enable aggressive load balancing using the controller.

When a wireless client attempts to associate to a lightweight access point, association response packets are sent to the client with an 802.11 response packet including status code 17. The code 17 indicates that the AP is busy. The AP responds with an association response bearing 'success' if the AP threshold is not met, and with code 17 (AP busy) if the AP utilization threshold is reached or exceeded and another less busy AP heard the client request.

For example, if the number of clients on AP1 is more than the number of clients on AP2 plus the load-balancing window, then AP1 is considered to be busier than AP2. When a client attempts to associate to AP1, it receives an 802.11 response packet with status code 17, indicating that the access point is busy, and the client attempts to associate to a different access point.

You can configure the controller to deny client associations up to 10 times (if a client attempted to associate 11 times, it would be allowed to associate on the 11th try). You can also enable or disable load balancing on a particular WLAN, which is useful if you want to disable load balancing for a select group of clients (such as time-sensitive voice clients).

**Note**

Voice Client does not authenticate when delay is configured more than 300 ms. To avoid this configure a Central-Auth, Local Switching WLAN with CCKM, configure a Parent Router between AP and WLC with a delay of 600 ms (300 ms UP and 300 ms DOWN and try associating the voice client

The maximum number of client associations that the access points can support is dependent upon the following factors:

- The maximum number of client associations differs for lightweight and autonomous Cisco IOS access points.
- There may be a limit per radio and an overall limit per AP.
- AP hardware (the 16-MB APs have a lower limit than the 32-MB and higher APs)

The Client Association Limits for Lightweight Access Points are as follows:

- For 16-MB APs, the limit is 128 clients per AP. This limit is applicable to 1100 and 1200 series APs.
- For 32-MB and higher APs, there is no per-AP limit.

The maximum Client Association Limits per-radio for all of the Cisco IOS APs is 200 associations.

---

**Note** With 32-MB and higher lightweight Cisco IOS APs, with two radios, up to  $200 + 200 = 400$  associations are supported.

---

The maximum Client Association Limits per Autonomous Cisco IOS access point is around 80 to 127 clients per AP. This number varies depending on the following factors:

- AP model (whether it is 16 MB or 32 MB or higher)
- Cisco IOS software release
- Hardware configuration (two radios use more memory than one)
- Enabled features (WDS functionality in particular)

The per-radio limit is about 200 associations. One association will likely hit the per-AP limit first. Unlike Cisco Unified Wireless Network, autonomous Cisco IOS supports per-SSID/per-AP association limits. This limit is configured using the max-associations CLI, under dot11 SSID. The maximum number is 255 associations (which is also the default number).

---

**Note** For a FlexConnect AP the association is locally handled. The load-balancing decisions are taken at the Cisco WLC. A FlexConnect AP initially responds to the client before knowing the result of calculations at the Cisco WLC. Load-balancing doesn't take effect when the FlexConnect AP is in standalone mode.

FlexConnect AP does not send (re)association response with status 17 for Load-Balancing as Local mode APs do; instead, it first sends (re)association with status 0 (success) and then death with reason 5.

---

# How to Configure Aggressive Load Balancing

## Configuring Aggressive Load Balancing (CLI)

### SUMMARY STEPS

1. Set the client window for aggressive load balancing by entering this command:
2. Set the denial count for load balancing by entering this command:
3. Save your changes by entering this command:
4. Enter WLAN configuration mode by entering this command:
5. Enable load balancing on the specific WLAN by entering this command:
6. Verify your settings by entering this command:
7. Save your changes by entering this command:

### DETAILED STEPS

---

**Step 1** Set the client window for aggressive load balancing by entering this command:

**wireless load-balancing window** *client\_count*

You can enter a value between 0 and 20 for the *client\_count* parameter.

**Step 2** Set the denial count for load balancing by entering this command:

**wireless load-balancing denial** *denial\_count*

You can enter a value between 1 and 10 for the *denial\_count* parameter.

**Step 3** Save your changes by entering this command:

**write memory**

**Step 4** Enter WLAN configuration mode by entering this command:

**wlan** *profile-name wlan\_ID SSID*

You can enter a profile name with up to 32 alphanumeric characters for *profile-name* . You can enter a value between 1 and 512 for *wlan\_ID* parameter. You can enter a network name of up to 32 alphanumeric characters for *SSID* parameter.

**Step 5** Enable load balancing on the specific WLAN by entering this command:

**load-balance**

You can use **no load-balance** command to disable load balancing. .

**Step 6** Verify your settings by entering this command:

**show wireless load-balancing**

```
Aggressive Load Balancing.....: per WLAN enabling
Aggressive Load Balancing Window (clients).....: 5
Aggressive Load Balancing Denial Count.....: 3

Statistics
Total Denied Count (clients).....: 0
Total Denial Sent (messages).....: 0
Exceeded Denial Max Limit Count (times).....: 0
None 5G Candidate Count (times).....: 0
None 2.4G Candidate Count (times).....: 0
```

**Step 7** Save your changes by entering this command:

**write memory**

## Monitoring Aggressive Load Balancing

This section describes the new command for aggressive load balancing.

The following command can be used to monitor aggressive load balancing on the .

**Table 174: Monitoring Aggressive Load Balancing Command**

Command	Purpose

<b>show wireless load-balancing</b>	Displays the status of the load-balancing feature.
-------------------------------------	--

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for Configuring Client Roaming

The following are the restrictions that you should be aware while configuring client roaming:

- Cisco Compatible Extensions (CCX) support is enabled automatically for every WLAN on the device and cannot be disabled. The device stores the CCX version of the client in its client database and uses it to generate and respond to CCX frames appropriately. Clients must support CCXv4 or v5 (or CCXv2 for access point assisted roaming) to utilize these roaming enhancements.
- Client roaming between 600 Series Access points is not supported.

## Information About Client Roaming

The controllers deliver high-end wireless services to the clients roaming across wireless network. Now, the wireless services are integrated with the switches, thus delivering a value-added Cisco unified new mobility

architecture. This unified architecture enables client-roaming services to both wireless and wired clients with seamless, fast- roaming services.

The new mobility architecture supports fast client roaming services using logical categorization of network into Mobility Domains (MDs), Mobility Groups (MGs), Mobility Subdomains (MSDs), and Switch Peer Groups (SPGs) using systems such as Mobility Oracle (MO), Mobility Controller (MC), and Mobility Agent (MA).

- A **Mobility Domain** is the entire domain across which client roaming is supported. It is a collection of mobility groups. For example, a campus network can be considered as a mobility domain.
- A **Mobility Group** is a collection of mobility subdomains across which fast roaming is supported. The mobility group can be one or more buildings within a campus across which frequent roaming is supported.
- A **Mobility Subdomain** is an autonomous portion of the mobility domain network. Each mobility subdomain contains one mobility controller (MC) and a collection of SPGs. A subdomain is equivalent to an 802.11r key domain.
- A **Switch Peer Group** is a collection of mobility agents.
- The **Mobility Oracle** acts as the point of contact for mobility events that occur across mobility subdomains. The mobility oracle also maintains a local database of each client in the entire mobility domain, their home and current subdomain. There is only one MO for an entire mobility domain. The Cisco WLC 5700 Series Controllers or Cisco Unified Wireless Networking Solution controller can act as MO.
- The **Mobility Controller** provides mobility management services for inter-SPG roaming events. The MC sends the configuration like SPG name and SPG peer member list to all of the mobility agents under its subdomain. The Cisco WLC 5700 Series Controllers, Cisco Catalyst 3850 Switch, or Cisco Unified Wireless Networking Solution controller can act as MC. The MC has MC functionality and MA functionality that is running internally into it.
- The **Mobility Agent** is the component that maintains client mobility state machine for a mobile client. All APs are connected to the mobility agent.

The New mobility architecture supports seamless roaming in the following scenarios:

- Intra-switch roaming—The client roaming between APs managed by same mobility agent.
- Intra-SPG roaming—The client roaming between mobility agents in the same SPG.
- Inter-SPG, Intra-subdomain roaming—The client roaming between mobility agents in different SPGs within the same subdomain.
- Inter-subdomain roaming—The client roaming between mobility agents across a subdomain.

### Fast Roaming

New mobility architecture supports fast roaming when clients roam within a mobility group by eliminating the need for full authentication. Security polices should be same across the switches for fast roaming.

### Local, anchor, foreign MAs and MCs

When a client joins an MA initially and its point of attachment has not changed, that MA is referred as local or associated MA. The MC to which this MA is associated is referred as local or associated MC.

When a client roams between two MAs, the MA to which the client was previously associated is the anchor MA (point of attachment) and the MA to which the client is currently associated is the foreign or associated

MA (point of presence). The MCs to which these MAs are associated are referred as anchor, foreign, or associated MCs, respectively.

## Inter-Subnet Roaming

Multiple-controller deployments support client roaming across access points managed by controllers in the same mobility group on different subnets. This roaming is transparent to the client because the session is sustained and a tunnel between the controllers allows the client to continue using the same DHCP-assigned or client-assigned IP address as long as the session remains active. The tunnel is torn down, and the client must reauthenticate when the client sends a DHCP Discover with a 0.0.0.0 client IP address or a 169.254.\*.\* client auto-IP address or when the operator-set user timeout is exceeded.

## Voice-over-IP Telephone Roaming

802.11 voice-over-IP (VoIP) telephones actively seek out associations with the strongest RF signal to ensure the best quality of service (QoS) and the maximum throughput. The minimum VoIP telephone requirement of 20-millisecond or shorter latency time for the roaming handover is easily met by the Cisco Wireless solution, which has an average handover latency of 5 or fewer milliseconds when open authentication is used. This short latency period is controlled by controllers rather than allowing independent access points to negotiate roaming handovers.

The Cisco Wireless solution supports 802.11 VoIP telephone roaming across lightweight access points managed by controllers on different subnets, as long as the controllers are in the same mobility group. This roaming is transparent to the VoIP telephone because the session is sustained and a tunnel between controllers allows the VoIP telephone to continue using the same DHCP-assigned IP address as long as the session remains active. The tunnel is torn down, and the VoIP client must reauthenticate when the VoIP telephone sends a DHCP Discover with a 0.0.0.0 VoIP telephone IP address or a 169.254.\*.\* VoIP telephone auto-IP address or when the operator-set user timeout is exceeded.

## CCX Layer 2 Client Roaming

The controller supports five CCX Layer 2 client roaming enhancements:

- Access point assisted roaming—This feature helps clients save scanning time. When a CCXv2 client associates to an access point, it sends an information packet to the new access point listing the characteristics of its previous access point. Roaming time decreases when the client recognizes and uses an access point list built by compiling all previous access points to which each client was associated and sent (unicast) to the client immediately after association. The access point list contains the channels, BSSIDs of neighbor access points that support the client's current SSID(s), and time elapsed since disassociation.
- Enhanced neighbor list—This feature focuses on improving a CCXv4 client's roam experience and network edge performance, especially when servicing voice applications. The access point provides its associated client information about its neighbors using a neighbor-list update unicast message.
- Enhanced neighbor list request (E2E)—The End-2-End specification is a Cisco and Intel joint program that defines new protocols and interfaces to improve the overall voice and roaming experience. It applies only to Intel clients in a CCX environment. Specifically, it enables Intel clients to request a neighbor list at will. When this occurs, the access point forwards the request to the controller. The controller receives the request and replies with the current CCX roaming sublist of neighbors for the access point to which the client is associated.

**Note** To see whether a particular client supports E2E, choose **Wireless > Clients** on the controller GUI, click the **Detail** link for the desired client, and look at the E2E Version text box in the Client Properties area.

- Roam reason report—This feature enables CCXv4 clients to report the reason why they roamed to a new access point. It also allows network administrators to build and monitor a roam history.
- Directed roam request—This feature enables the controller to send directed roam requests to the client in situations when the controller can better service the client on an access point different from the one to which it is associated. In this case, the controller sends the client a list of the best access points that it can join. The client can either honor or ignore the directed roam request. Non-CCX clients and clients running CCXv3 or below must not take any action. No configuration is required for this feature.

# How to Configure Layer 2 or Layer 3 Roaming

## Configuring Layer 2 or Layer 3 Roaming

### Before you begin

To configure the mobility agent for Layer 2 or Layer 3 roaming, the following requisites should be considered:

- SSID and security polices should be same across MAs for Layer 2 and Layer 3 roaming.
- Client VLAN ID should be same for Layer 2 roaming and different for Layer 3 roaming.
- Bridge domain ID and client VLAN IDs should be same for Layer 2 roaming. Either one or both of the bridge domain ID and client VLAN ID should be different for Layer 3 roaming.

### SUMMARY STEPS

1. **configure terminal**
2. **wlan wlan\_profile\_name wlan\_ID SSID\_network\_name**
3. **no mobility anchor sticky**
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan_profile_name wlan_ID SSID_network_name</b>  <b>Example:</b> Device(config) # <b>wlan wlan1</b>	Enters WLAN configuration mode.

	Command or Action	Purpose
Step 3	<b>no mobility anchor sticky</b> <b>Example:</b> Device(config-wlan)# <b>no mobility anchor sticky</b>	(Optional) Disables Layer 2 anchoring.
Step 4	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring CCX Client Roaming Parameters (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **ap dot11 {5ghz | 24ghz} l2roam rf-params { default | custom min-rssi roam-hyst scan-thresh trans-time }**
3. **end**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>ap dot11 {5ghz   24ghz} l2roam rf-params { default   custom min-rssi roam-hyst scan-thresh trans-time }</b> <b>Example:</b> Device# <b>ap dot11 5ghz l2roam rf-params custom -80</b>	<p>Configures CCX Layer 2 client roaming parameters.</p> <p>To choose the default RF parameters, enter the <b>default</b> option.</p> <p>To fine-tune the RF parameters that affect client roaming, enter the <b>custom</b> option and then enter any one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Minimum RSSI</b>—Indicates minimum Received Signal Strength Indicator (RSSI) required for the client to associate to an access point.</li> </ul> <p>If the client's average received signal power dips below this threshold, reliable communication is usually impossible. Therefore, clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached.</p> <p>You can configure the minimum RSSI range from –50 through –90 dBm and the default value is –85 dBm.</p> <ul style="list-style-type: none"> <li>• <b>Hysteresis</b>—Indicates how much greater the signal strength of a neighboring access point must be for the client to roam to it.</li> </ul>

	Command or Action	Purpose
		<p>This parameter is intended to reduce the amount of roaming between access points if the client is physically located on or near the border between two access points.</p> <p>You can configure the hysteresis range from 3 through 20 dB and the default is 3 dB.</p> <ul style="list-style-type: none"> <li>• Scan Threshold—Indicates a minimum RSSI that is allowed before the client should roam to a better access point.</li> </ul> <p>When the RSSI drops below the specified value, the client must be able to roam to a better access point within the specified transition time. This parameter also provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when the RSSI is below the threshold.</p> <p>You can configure the RSSI range from –50 through –90 dBm and the default value is –72 dBm.</p> <ul style="list-style-type: none"> <li>• Transition Time—Indicates the maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client’s associated access point is below the scan threshold.</li> </ul> <p>The Scan Threshold and Transition Time parameters guarantee a minimum level of client roaming performance. Together with the highest expected client speed and roaming hysteresis, these parameters make it possible to design a wireless LAN network that supports roaming simply by ensuring a certain minimum overlap distance between access points.</p> <p>You can configure the time period in the range from 1 through 5 seconds and the default time is 5 seconds.</p>
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p> <p>Device(config)# <b>end</b></p>	<p>Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

## Example

## Configuring Mobility Oracle

### SUMMARY STEPS

1. `configure terminal`
2. `wireless mobility oracle`
3. `end`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>configure terminal</code> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>wireless mobility oracle</code> <b>Example:</b> Device(config)# <code>wireless mobility oracle</code>	Enables mobility oracle on the controller.
Step 3	<code>end</code> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Example

## Configuring Mobility Controller

### SUMMARY STEPS

1. `configure terminal`
2. `wireless mobility controller`
3. `wireless mobility controller peer-group switch-peer-group-name`
4. `wireless mobility controller peer-group switch-peer-group-name member ip ip-address {public-ip public-ip-address}`
5. `wireless mobility controller peer-group switch-peer-group-name multicast`
6. `wireless mobility controller peer-group switch-peer-group-name multicast ip peer-group-multicast-ip-addr`
7. `wireless mobility controller peer-groups switch-peer-group-name bridge-domain-id id`
8. `wireless mobility group member ip ip-address [public-ip public-ip-address] [group group-name]`
9. `wireless mobility dscp value`

10. **wireless mobility group keepalive** *{count | interval}*
11. **wireless mobility group name** *name*
12. **wireless mobility oracle ipmo-ip-address**
13. **wireless management interface** *interface-name*
14. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless mobility controller</b> <b>Example:</b> Device(config)# <b>wireless mobility controller</b>	Enables wireless mobility controller.
<b>Step 3</b>	<b>wireless mobility controller peer-group</b> <i>switch-peer-group-name</i> <b>Example:</b> Device(config)# <b>wireless mobility controller peer-group SPG1</b>	Configures a switch peer group name. You can enter up to 31 case-sensitive ASCII printable characters for the group name. Spaces are not allowed in mobility group. <b>Note</b> The <b>No</b> form of the command deletes the switch peer group.
<b>Step 4</b>	<b>wireless mobility controller peer-group</b> <i>switch-peer-group-name member ip ip-address {public-ip public-ip-address}</i> <b>Example:</b> Device(config)# <b>wireless mobility controller peer-group SPG1 member ip 10.0.0.1</b>	Adds a mobility group member to a switch peer group. <b>Note</b> The <b>No</b> form of the command deletes the member from the switch peer group.
<b>Step 5</b>	<b>wireless mobility controller peer-group</b> <i>switch-peer-group-name multicast</i> <b>Example:</b> Device(config)# <b>wireless mobility controller peer-group SPG1 multicast</b>	Configures the multicast mode within a switch peer group.
<b>Step 6</b>	<b>wireless mobility controller peer-group</b> <i>switch-peer-group-name multicast ip peer-group-multicast-ip-addr</i> <b>Example:</b> Device(config)# <b>wireless mobility controller peer-group SPG1 multicast ip 10.0.0.4</b>	Configures the multicast IP address for a switch peer group. <b>Note</b> The <b>No</b> form of the command deletes the multicast IP for the switch peer group.

	Command or Action	Purpose
Step 7	<p><b>wireless mobility controller</b>  <b>peer-group</b> <i>switch-peer-group-name</i> <b>bridge-domain-id</b> <i>id</i></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility controller peer-group SPG bridge-domain-id 10.0.0.5</pre>	<p>Configures the bridge domain ID for a switch peer group. The default is zero.</p> <p><b>Note</b> The <b>No</b> form of command sets the bridge domain ID to the default value.</p>
Step 8	<p><b>wireless mobility group member ip</b> <i>ip-address</i> [<b>public-ip</b> <i>public-ip-address</i>] [<b>group</b> <i>group-name</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility group member ip 10.0.0.1</pre>	<p>Adds a mobility group member.</p> <p><b>Note</b> The <b>No</b> form of the command removes the member from the group. The default group name is the group name of MC.</p>
Step 9	<p><b>wireless mobility dscp</b> <i>value</i></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility dscp 46</pre>	<p>Sets the DSCP value for mobility control packet.</p> <p>You can configure the DSCP value in a range from 0 through 63. The default value is 46.</p>
Step 10	<p><b>wireless mobility group keepalive</b> {<i>count</i>   <i>interval</i>}</p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility group keepalive count</pre>	<p>Configures the wireless mobility group keepalive count which is the number of keepalive retries before a member status is termed DOWN and keepalive interval which is interval between two keepalives.</p>
Step 11	<p><b>wireless mobility group name</b> <i>name</i></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility group name group1</pre>	<p>Specifies the case sensitive wireless mobility group name which can be ASCII printable string up to 31 characters.</p>
Step 12	<p><b>wireless mobility oracle ip</b> <i>ip-address</i></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility oracle ip 10.0.0.5</pre>	<p>Configures the mobility oracle IP address.</p>
Step 13	<p><b>wireless management interface</b> <i>interface-name</i></p> <p><b>Example:</b></p> <pre>Device(config)# wireless management interface Vlan21</pre>	<p>Configures the wireless management interface.</p>
Step 14	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

## Example

## Configuring Mobility Agent

### SUMMARY STEPS

1. **configure terminal**
2. **wireless mobility controller ip** *ip-address*
3. **wireless mobility load-balance**
4. **wireless mobility load-balance threshold** *threshold -value*
5. **wireless management interface** *interface-name*
6. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless mobility controller ip</b> <i>ip-address</i> <b>Example:</b> Device(config)# <b>wireless mobility controller ip</b> 10.10.10.20	Sets the IP address of the mobility controller.
<b>Step 3</b>	<b>wireless mobility load-balance</b> <b>Example:</b> Device(config)# <b>wireless mobility load-balance</b>	Configures wireless mobility load balancing.
<b>Step 4</b>	<b>wireless mobility load-balance threshold</b> <i>threshold -value</i> <b>Example:</b> Device(config)# <b>wireless mobility load-balance</b> threshold 100	Configures the number of clients that can be local or anchored on the MA. You can configure the threshold value in a range from 100 to 2000. The default value is 1000.
<b>Step 5</b>	<b>wireless management interface</b> <i>interface-name</i> <b>Example:</b> Device(config)# <b>wireless management interface</b> Vlan21	Configures wireless management interface for the mobility agent.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Monitoring Client Roaming Parameters

This section describes the new commands for the client parameters.

The following commands can be used to monitor the client roaming parameters on the .

**Table 175: Monitoring Client Roaming Parameters Commands**

Command	Purpose
<b>show ap dot11 {5ghz   24ghz} l2roam rf-param</b>	Displays the current RF parameters configured for client roaming for the 802.11a or 802.11b/g network.
<b>show ap dot11 {5ghz   24ghz} l2roam statistics</b>	Displays the CCX Layer 2 client roaming statistics for the 802.11a or 802.11b/g network.
<b>show ap dot11 {5ghz   24ghz} l2roam mac-address mac-address statistics</b>	Displays the CCX Layer 2 client roaming statistics for a particular access point.

## Monitoring Mobility Configurations

This section describes the new commands for monitoring mobility configurations.

The following command can be used to monitor mobility configurations on the Mobility Oracle, Mobility Controller, and Mobility Agent.

**Table 176: Monitoring Mobility Configuration Commands on the Mobility Controller and Mobility Agent**

Command	Purpose
<b>show wireless mobility summary</b>	Displays the summary information for the Mobility Controller and Mobility Agent.
<b>show wireless mobility statistics</b>	Displays mobility statistics.
<b>show wireless mobility dtls connections</b>	Displays established DTLS connections.

**Table 177: Monitoring Mobility Configuration Commands on the Mobility Oracle**

Command	Purpose
<b>show wireless mobility oracle summary</b>	Displays the status of the Mobility Controllers known to the Mobility Oracle.
<b>show wireless mobility oracle client summary</b>	Displays the information of a list of clients in the Mobility Oracle database.
<b>show wireless mobility oracle client detail client -mac-address</b>	Displays the detailed information of a particular client in the Mobility Oracle database.

<b>show wireless mobility oracle</b> <i>mc-ip</i>	Displays the information of a list of clients in the Mobility Oracle database that are anchored or associated to a specified Mobility Controller.
---	---

**Table 178: Monitoring Mobility Configuration Commands on the Mobility Controller**

Command	Purpose
<b>show wireless mobility controller client summary</b>	Displays a list of clients in the subdomain.
<b>show wireless mobility controller client</b> <i>mac-address detail</i>	Displays detailed information for a client in a subdomain.
<b>show wireless mobility agent</b> <i>ma-ip client summary</i>	Displays a list of clients anchored or associated to a specified Mobility Agent.
<b>show wireless mobility ap-list</b>	Displays the list of Cisco APs known to the mobility group.

**Table 179: Monitoring Mobility Configuration Commands on the Mobility Agent**

Command	Purpose
<b>show wireless mobility load-balance summary</b>	Displays the summary of mobility load-balance properties.

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Application Visibility and Control

Application Visibility and Control (AVC) classifies applications using deep packet inspection techniques with the Network-Based Application Recognition engine, and provides application-level visibility and control (QoS) in wireless networks. After the applications are recognized, the AVC feature enables you to either drop, mark, or police the data traffic.

AVC is configured by defining a class map in a QoS client policy to match a protocol.

Using AVC, we can detect more than 1000 applications. AVC enables you to perform real-time analysis and create policies to reduce network congestion, costly network link usage, and infrastructure upgrades.

**Note** You can view list of 30 applications in Top Applications in Monitor Summary section of the UI.

Traffic flows are analyzed and recognized using the NBAR2 engine at the access point. For more information about the NBAR2 Protocol Library, see [http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/qos\\_nbar/prot\\_lib/config\\_library/nbar-prot-pack-library.html](http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/qos_nbar/prot_lib/config_library/nbar-prot-pack-library.html). The specific flow is marked with the recognized protocol or application, such as WebEx. This per-flow information can be used for application visibility using Flexible NetFlow (FNF).

AVC QoS actions are applied with AVC filters in both upstream and downstream directions. The QoS actions supported for upstream flow are drop, mark, and police, and for downstream flow are mark and police. AVC QoS is applicable only when the application is classified correctly and matched with the class map filter in the policy map. For example, if the policy has a filter based on an application name, and the traffic has also been classified to the same application name, then the action specified for this match in the policy will be applied. For all QoS actions, refer [Supported AVC Class Map and Policy Map Formats, on page 2162](#).

### Application Visibility and Control Protocol Packs

Protocol packs are a means to distribute protocol updates outside the controller software release trains, and can be loaded on the controller without replacing the controller software.

The Application Visibility and Control Protocol Pack (AVC Protocol Pack) is a single compressed file that contains multiple Protocol Description Language (PDL) files and a manifest file. A set of required protocols can be loaded, which helps AVC to recognize additional protocols for classification on your network. The manifest file gives information about the protocol pack, such as the protocol pack name, version, and some information about the available PDLs in the protocol pack.

The AVC Protocol Packs are released to specific AVC engine versions. You can load a protocol pack if the engine version on the controller platform is the same or higher than the version required by the protocol pack.

## Supported AVC Class Map and Policy Map Formats

### Supported AVC Class Map Format

Class Map Format	Class Map Example	Direction
<b>match protocol</b> <i>protocol name</i>	<code>class-map match-any webex-class match protocol webex-media</code>	Both upstream and downstream
<b>match protocol attribute category</b> <i>category-name</i>	<code>class-map match-any IM match protocol attribute category instant-messaging</code>	Both upstream and downstream
<b>match protocol attribute sub-category</b> <i>sub-category-name</i>	<code>class-map match-any realtimeconferencing match protocol attribute sub-category voice-video-chat-collaboration</code>	Both upstream and downstream

Class Map Format	Class Map Example	Direction
<b>match protocol attribute application-group</b> <i>application-group-name</i>	<code>class-map match-any skype match protocol attribute application-group skype-group</code>	Both upstream and downstream
Combination filters	<code>class-map match-any webex-class match protocol webex match dscp 45 match wlan user-priority 6</code>	Upstream only

**Supported AVC Policy Format**

Policy Format	QoS Action
Upstream client policy based on match protocol filter	Mark, police, and drop
Downstream client policy based on match protocol filter	Mark and police

The following table describes the detailed AVC policy format with an example:

AVC Policy Format	AVC Policy Example	Direction
Basic set	<code>policy-map webex-policy class webex-class set dscp ef //or set up,cos</code>	Upstream and downstream
Basic police	<code>policy-map webex-policy class webex-class police 5000000</code>	Upstream and downstream
Basic set and police	<code>policy-map webex-policy class webex-class set dscp ef //or set up,cos police 5000000</code>	Upstream and downstream
Multiple set and police including default	<code>policy-map webex-policy class webex-class set dscp af31 //or set up,cos  police 4000000 class class-webex-category set dscp ef //or set up,cos police 6000000 class class-default set dscp &lt;&gt;</code>	Upstream and downstream

AVC Policy Format	AVC Policy Example	Direction
Hierarchical police	<pre> policy-map webex-policy   class webex-class   police 5000000   service-policy   client-in-police-only    policy-map   client-in-police-only   class webex-class   police 100000   class class-webex-category   set dscp ef //or set up,cos   police 6000000   police 200000 </pre>	Upstream and downstream
Hierarchical set and police	<pre> policy-map webex-policy   class class-default   police 1500000   service policy   client-up-child   policy-map webex-policy   class webex-class   police 100000   set dscp ef   class class-webex-category   police 200000   set dscp af31 </pre>	
Drop action	<p>Any of the above examples apply to this format with this additional example:</p> <pre> policy-map webex-policy   class webex-class   drop   class netflix   set dscp ef //or set up,cos   police 6000000   class class-default   set dscp &lt;&gt; </pre>	Upstream only

## Prerequisites for Application Visibility and Control

- The access points should be AVC capable.
- For the control part of AVC (QoS) to work, the application visibility feature with FNF has to be configured.

# Guidelines for Inter-Device Roaming with Application Visibility and Control

Follow these guidelines to prevent clients from getting excluded due to malformed QoS policies:

- When a new QoS policy is added to the device, a QoS policy with the same name should be added to other device within the same roam or mobility domain.
- When a device is loaded with a software image of a later release, the new policy formats are supported. If you have upgraded the software image from an earlier release to a later release, you should save the configuration separately. When an earlier release image is loaded, some QoS policies might show as not supported, and you should restore those QoS policies to supported policy formats.

## Restrictions for Application Visibility and Control

- AVC is supported only on the following access points:
  - Cisco Aironet 1260 Series Access Points
  - Cisco Aironet 1600 Series Access Points
  - Cisco Aironet 2600 Series Access Point
  - Cisco Aironet 2600 Series Wireless Access Points
  - Cisco Aironet 2700 Series Access Point
  - Cisco Aironet 3500 Series Access Points
  - Cisco Aironet 3600 Series Access Points
- AVC is not supported on Cisco Aironet 702W, 702I (128 M memory), and 1530 Series Access Points.
- Dropping or marking of the data traffic (control part) is not supported for software Release 3.3.
- Dropping or marking of the data traffic (control part) is supported in software Release 3E.
- Only the applications that are recognized with application visibility can be used for applying QoS control.
- Multicast traffic classification is not supported.
- Only the applications that are recognized with App visibility can be used for applying QoS control.
- IPv6 including ICMPv6 traffic classifications are not supported.
- Datalink is not supported for NetFlow fields for AVC.
- The following commands are not supported for AVC flow records:
  - **collect flow username**
  - **collect interface { input | output }**
  - **collect wireless client ipv4 address**
  - **match interface { input | output }**
  - **match transport igmp type**
- The template timeout cannot be modified on exporters configured with AVC. Even if the template timeout value is configured to a different value, only the default value of 600 seconds is used.

- For the username information in the AVC-based record templates, ensure that you configure the options **records** to get the user MAC address to username mapping. For more information, refer [Creating a Flow Exporter \(Optional\)](#), on page 2169.
- When there is a mix of AVC-enabled APs such as 3600, and non-AVC-enabled APs such as 1140, and the chosen policy for the client is AVC-enabled, the policy will not be sent to the APs that cannot support AVC.
- Only ingress AVC statistics are supported. The frequency of statistics updates depends on the number of clients loaded at the AP at that time. Statistics are not supported for very large policy format sizes.
- The total number of flows for which downstream AVC QoS supported per client is 1000.
- The maximum number of flows supported for Catalyst 3850 Series Switch is 48 K.
- These are some class map and policy map-related restrictions. For supported policy formats, see [Supported AVC Class Map and Policy Map Formats](#), on page 2162.
  - AVC and non-AVC classes cannot be defined together in a policy in a downstream direction. For example, when you have a class map with match protocol, you cannot use any other type of match filter in the policy map in the downstream direction.
  - Drop action is not applicable for the downstream AVC QoS policy.
  - Match protocol is not supported in ingress or egress for SSID policy.
- Google shares resources among several of their services because of which for some of the traffic it is not possible to say it is unique to one application. Therefore we added google-services for traffic that cannot be distinguished. The behavior you experience is expected.

# How to Configure Application Visibility and Control

## Configuring Application Visibility and Control (CLI)

To configure Application Visibility, follow these general steps:

1. Create a flow record by specifying keys and non-key fields to the flow.
2. Create an optional flow exporter by specifying the flow record as an option.
3. Create a flow monitor based on the flow record and flow exporter.
4. Configure WLAN to apply flow monitor in IPv4 input or output direction.

To configure Application Control, follow these general steps:

1. Create an AVC QoS policy.
2. Attach AVC QoS policy to the client in one of three ways: configuring WLAN, using ACS or ISE, or adding local policies.

## Creating a Flow Record

By default, **wireless avc basic** (flow record) is available. When you click **Apply** from the GUI, then the record is mapped to the flow monitor.

Default flow record cannot be edited or deleted. If you require a new flow record, you need to create one and map it to the flow monitor from CLI.

## SUMMARY STEPS

1. **configure terminal**
2. **flow record** *flow\_record\_name*
3. **description** *string*
4. **match ipv4 protocol**
5. **match ipv4 source address**
6. **match ipv4 destination address**
7. **match transport source-port**
8. **match transport destination-port**
9. **match flow direction**
10. **match application name**
11. **match wireless ssid**
12. **collect counter bytes long**
13. **collect counter packets long**
14. **collect wireless ap mac address**
15. **collect wireless client mac address**
16. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>flow record</b> <i>flow_record_name</i>  <b>Example:</b> Device(config)# <b>flow record record1</b> Device (config-flow-record)#	Enters flow record configuration mode.
<b>Step 3</b>	<b>description</b> <i>string</i>  <b>Example:</b> Device (config-flow-record) # <b>description IPv4flow</b>	(Optional) Describes the flow record as a maximum 63-character string.
<b>Step 4</b>	<b>match ipv4 protocol</b>  <b>Example:</b> Device (config-flow-record) # <b>match ipv4 protocol</b>	Specifies a match to the IPv4 protocol.
<b>Step 5</b>	<b>match ipv4 source address</b>  <b>Example:</b> Device (config-flow-record) # <b>match ipv4 source address</b>	Specifies a match to the IPv4 source address-based field.

	Command or Action	Purpose
Step 6	<b>match ipv4 destination address</b> <b>Example:</b> Device (config-flow-record)# <b>match ipv4 destination address</b>	Specifies a match to the IPv4 destination address-based field.
Step 7	<b>match transport source-port</b> <b>Example:</b> Device (config-flow-record)# <b>match transport source-port</b>	Specifies a match to the transport layer source-port field.
Step 8	<b>match transport destination-port</b> <b>Example:</b> Device (config-flow-record)# <b>match transport destination-port</b>	Specifies a match to the transport layer destination-port field.
Step 9	<b>match flow direction</b> <b>Example:</b> Device (config-flow-record)# <b>match flow direction</b>	Specifies a match to the direction the flow was monitored in.
Step 10	<b>match application name</b> <b>Example:</b> Device (config-flow-record)# <b>match application name</b>	Specifies a match to the application name.  <b>Note</b> This action is mandatory for AVC support, as this allows the flow to be matched against the application.
Step 11	<b>match wireless ssid</b> <b>Example:</b> Device (config-flow-record)# <b>match wireless ssid</b>	Specifies a match to the SSID name identifying the wireless network.
Step 12	<b>collect counter bytes long</b> <b>Example:</b> Device (config-flow-record)# <b>collect counter bytes long</b>	Specifies to collect counter fields total bytes.
Step 13	<b>collect counter packets long</b> <b>Example:</b> Device (config-flow-record)# <b>collect counter bytes long</b>	Specifies to collect counter fields total packets.
Step 14	<b>collect wireless ap mac address</b> <b>Example:</b> Device (config-flow-record)# <b>collect wireless ap mac address</b>	Specifies to collect the BSSID with MAC addresses of the access points that the wireless client is associated with.
Step 15	<b>collect wireless client mac address</b> <b>Example:</b>	Specifies to collect MAC address of the client on the wireless network.

	Command or Action	Purpose
	Device (config-flow-record) # <b>collect wireless client mac address</b>	
<b>Step 16</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Creating a Flow Exporter (Optional)

You can create a flow export to define the export parameters for a flow. This is an optional procedure for configuring flow parameters.

### SUMMARY STEPS

1. **configure terminal**
2. **flow exporter** *flow\_exporter\_name*
3. **description** *string*
4. **destination** *{hostname | ip-address}*
5. **transport udp** *port-value*
6. **option application-table timeout** *seconds* (optional)
7. **option usermac-table timeout** *seconds* (optional)
8. **end**
9. **show flow exporter**
10. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>flow exporter</b> <i>flow_exporter_name</i>  <b>Example:</b> Device(config)# <b>flow exporter record1</b> Device (config-flow-exporter)#	Enters flow exporter configuration mode.
<b>Step 3</b>	<b>description</b> <i>string</i>  <b>Example:</b> Device(config-flow-exporter) # <b>description IPv4flow</b>	Describes the flow record as a maximum 63-character string.
<b>Step 4</b>	<b>destination</b> <i>{hostname   ip-address}</i>  <b>Example:</b> Device (config-flow-exporter) # <b>destination 10.99.1.4</b>	Specifies the hostname or IPv4 address of the system to which the exporter sends data.

	Command or Action	Purpose
<b>Step 5</b>	<b>transport udp</b> <i>port-value</i> <b>Example:</b> Device (config-flow-exporter) # <b>transport udp</b> 2	Configures a port value for the UDP protocol.
<b>Step 6</b>	<b>option application-table timeout</b> <i>seconds (optional)</i> <b>Example:</b> Device (config-flow-exporter) # <b>option application-table timeout</b> 500	(Optional) Specifies application table timeout option. The valid range is from 1 to 86400 seconds.
<b>Step 7</b>	<b>option usermac-table timeout</b> <i>seconds (optional)</i> <b>Example:</b> Device (config-flow-exporter) # <b>option usermac-table timeout</b> 1000	(Optional) Specifies wireless usermac-to-username table option. The valid range is from 1 to 86400 seconds.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device (config) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 9</b>	<b>show flow exporter</b> <b>Example:</b> Device # <b>show flow exporter</b>	Verifies your configuration.
<b>Step 10</b>	<b>end</b> <b>Example:</b> Device (config) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Creating a Flow Monitor

You can create a flow monitor and associate it with a flow record and a flow exporter.

### SUMMARY STEPS

1. **configure terminal**
2. **flow monitor** *monitor-name*
3. **description** *description*
4. **record** *record-name*
5. **exporter** *exporter-name*
6. **cache timeout** { **active** | **inactive** } (Optional)
7. **end**
8. **show flow monitor**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>flow monitor</b> <i>monitor-name</i> <b>Example:</b> Device (config)# <b>flow monitor</b> flow-monitor-1	Creates a flow monitor and enters flow monitor configuration mode.
Step 3	<b>description</b> <i>description</i> <b>Example:</b> Device (config-flow-monitor)# <b>description</b> flow-monitor-1	Creates a description for the flow monitor.
Step 4	<b>record</b> <i>record-name</i> <b>Example:</b> Device (config-flow-monitor)# <b>record</b> flow-record-1	Specifies the name of a recorder that was created previously.
Step 5	<b>exporter</b> <i>exporter-name</i> <b>Example:</b> Device (config-flow-monitor)# <b>exporter</b> flow-exporter-1	Specifies the name of an exporter that was created previously.
Step 6	<b>cache timeout</b> { <b>active</b>   <b>inactive</b> } (Optional) <b>Example:</b> Device (config-flow-monitor)# <b>cache timeout active</b> 1800 Device (config-flow-monitor)# <b>cache timeout inactive</b> 200	Specifies to configure flow cache parameters. You can configure for a time period of 1 to 604800 seconds (optional). <b>Note</b> To achieve optimal result for the AVC flow monitor, we recommend you to configure the inactive cache timeout value to be greater than 90 seconds.
Step 7	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
Step 8	<b>show flow monitor</b> <b>Example:</b> Device # <b>show flow monitor</b>	Verifies your configuration.

## Creating AVC QoS Policy

To create AVC QoS policy, perform these general steps:

1. Create a class map with match protocol filters.
2. Create a policy map.

3. Apply a policy map to the client in one of the following ways:
  - a. Apply a policy map over WLAN either from the CLI or GUI.
  - b. Apply a policy map through the AAA server (ACS server or ISE) from the CLI.  
For more information, refer to the *Cisco Identity Services Engine User Guide* and *Cisco Secure Access Control System User Guide*.
  - c. Apply local policies either from the CLI or GUI.

## Creating a Class Map

You need to create a class map before configuring any match protocol filter. The QoS actions such as marking, policing, and dropping can be applied to the traffic. The AVC match protocol filters are applied only for the wireless clients. Refer [8.0 protocol pack](#) for the protocols supported.

### SUMMARY STEPS

1. **configure terminal**
2. **class-map** *class-map-name*
3. **match protocol** { *application-name* | **attribute category** *category-name* | **attribute sub-category** *sub-category-name* | **attribute application-group** *application-group-name* }
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>class-map</b> <i>class-map-name</i> <b>Example:</b> Device(config)# <b>class-map webex-class</b>	Creates a class map.
<b>Step 3</b>	<b>match protocol</b> { <i>application-name</i>   <b>attribute category</b> <i>category-name</i>   <b>attribute sub-category</b> <i>sub-category-name</i>   <b>attribute application-group</b> <i>application-group-name</i> } <b>Example:</b> Device(config)# <b>class-map webex-class</b> Device(config-cmap)# <b>match protocol webex-media</b>  Device(config)# <b>class-map class-webex-category</b> Device(config-cmap)# <b>match protocol attribute category webex-media</b>  Device# <b>class-map class-webex-sub-category</b>	Specifies match to the application name, category name, subcategory name, or application group.

	Command or Action	Purpose
	<pre>Device(config-cmap)# match protocol attribute sub-category webex-media  Device# class-map class-webex-application-group Device(config-cmap)# match protocol attribute application-group webex-media</pre>	
<b>Step 4</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Creating a Policy Map

### SUMMARY STEPS

1. **configure terminal**
2. **policy-map** *policy-map-name*
3. **class** [*class-map-name* | **class-default**]
4. **police** *rate-bps burst-byte* [**exceed-action** {**drop** | **policed-dscp-transmit**}]
5. **set** {**dscp** *new-dscp* | **cos** *cos-value*}
6. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>policy-map</b> <i>policy-map-name</i></p> <p><b>Example:</b></p> <pre>Device(config)# policy-map webex-policy Device(config-pmap)#</pre>	<p>Creates a policy map by entering the policy map name, and enters policy-map configuration mode.</p> <p>By default, no policy maps are defined.</p> <p>The default behavior of a policy map is to set the DSCP to 0 if the packet is an IP packet and to set the CoS to 0 if the packet is tagged. No policing is performed.</p> <p><b>Note</b> To delete an existing policy map, use the <b>no policy-map</b> <i>policy-map-name</i> global configuration command.</p>
<b>Step 3</b>	<p><b>class</b> [<i>class-map-name</i>   <b>class-default</b>]</p> <p><b>Example:</b></p> <pre>Device(config-pmap)# class-map webex-class Device(config-pmap-c)#</pre>	<p>Defines a traffic classification, and enters policy-map class configuration mode.</p> <p>By default, no policy map and class maps are defined.</p> <p>If a traffic class has already been defined by using the <b>class-map</b> global configuration command, specify its name for <i>class-map-name</i> in this command.</p>

	Command or Action	Purpose
		<p>A <b>class-default</b> traffic class is predefined and can be added to any policy. It is always placed at the end of a policy map. With an implied <b>match any</b> is included in the <b>class-default</b> class, all packets that have not already matched the other traffic classes will match <b>class-default</b>.</p> <p><b>Note</b> To delete an existing class map, use the <b>no class class-map-name</b> policy-map configuration command.</p>
<b>Step 4</b>	<p><b>police</b> <i>rate-bps burst-byte</i> [<b>exceed-action</b> {<b>drop</b>   <b>policed-dscp-transmit</b>}]</p> <p><b>Example:</b></p> <pre>Device(config-pmap-c)# police 100000 80000 drop</pre>	<p>Defines a policer for the classified traffic.</p> <p>By default, no policer is defined.</p> <ul style="list-style-type: none"> <li>For <i>rate-bps</i>, specify an average traffic rate in bits per second (b/s). The range is 8000 to 10000000000.</li> <li>For <i>burst-byte</i>, specify the normal burst size in bytes. The range is 8000 to 1000000.</li> <li>(Optional) Specifies the action to take when the rates are exceeded. Use the <b>exceed-action drop</b> keywords to drop the packet. Use the <b>exceed-action policed-dscp-transmit</b> keywords to mark down the DSCP value (by using the policed-DSCP map) and to send the packet.</li> </ul>
<b>Step 5</b>	<p><b>set</b> {<b>dscp</b> <i>new-dscp</i>   <b>cos</b> <i>cos-value</i>}</p> <p><b>Example:</b></p> <pre>Device(config-pmap-c)# set dscp 45</pre>	<p>Classifies IP traffic by setting a new value in the packet.</p> <ul style="list-style-type: none"> <li>For <b>dscp</b> <i>new-dscp</i>, enter a new DSCP value to be assigned to the classified traffic. The range is 0 to 63.</li> </ul>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

### What to do next

After creating your policy maps, attach the traffic policy or policies to an interface using the **service-policy** command.

## Configuring Local Policies (CLI)

### Configuring Local Policies (CLI)

To configure local policies, complete these procedures:

1. Create a service template.
2. Create an interface template.
3. Create a parameter map.

4. Create a policy map.
5. Apply a local policy on a WLAN.

### Creating a Service Template (CLI)

#### SUMMARY STEPS

1. **configure terminal**
2. **service-template** *service-template-name*
3. **access-group** *acl\_list*
4. **vlan** *vlan\_id*
5. **absolute-timer** *seconds*
6. **service-policy qos** { **input** | **output** }
7. **end**

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>service-template</b> <i>service-template-name</i> <b>Example:</b> Device(config)# <b>service-template</b> <b>cisco-phone-template</b> Device(config-service-template)#	Enters service template configuration mode.
<b>Step 3</b>	<b>access-group</b> <i>acl_list</i> <b>Example:</b> Device(config-service-template)# <b>access-group</b> <b>foo-acl</b>	Specifies the access list to be applied.
<b>Step 4</b>	<b>vlan</b> <i>vlan_id</i> <b>Example:</b> Device(config-service-template)# <b>vlan 100</b>	Specifies VLAN ID. You can specify a value from 1 to 4094.
<b>Step 5</b>	<b>absolute-timer</b> <i>seconds</i> <b>Example:</b> Device(config-service-template)# <b>absolute-timer 20</b>	Specifies session timeout value for service template. You can specify a value from 1 to 65535.
<b>Step 6</b>	<b>service-policy qos</b> { <b>input</b>   <b>output</b> } <b>Example:</b>	Configures QoS policies for the client.

	Command or Action	Purpose
	Device(config-service-template)# <b>service-policy qos input foo-qos</b>	
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

### Creating a Parameter Map (CLI)

Parameter map is preferred to use than class map.

### SUMMARY STEPS

1. **configure terminal**
2. **parameter-map type subscriber attribute-to-service** *parameter-map-name*
3. *map-index* **map** { **device-type** | **mac-address** | **oui** | **user-role** | **username** } { **eq** | **not-eq** | **regex** *filter-name* }
4. **interface-template** *interface-template-name*
5. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type subscriber attribute-to-service</b> <i>parameter-map-name</i> <b>Example:</b> Device(config)# <b>parameter-map type subscriber attribute-to-service Aironet-Policy-para</b>	Specifies the parameter map type and name.
<b>Step 3</b>	<i>map-index</i> <b>map</b> { <b>device-type</b>   <b>mac-address</b>   <b>oui</b>   <b>user-role</b>   <b>username</b> } { <b>eq</b>   <b>not-eq</b>   <b>regex</b> <i>filter-name</i> } <b>Example:</b> Device(config-parameter-map-filter)# <b>10 map device-type eq "WindowsXP-Workstation"</b>	Specifies parameter map attribute filter criteria.
<b>Step 4</b>	<b>interface-template</b> <i>interface-template-name</i> <b>Example:</b> Device(config-parameter-map-filter-submode)#	Enters service template configuration mode.

	Command or Action	Purpose
	<code>interface-template cisco-phone-template</code> Device(config-parameter-map-filter-submode)#	
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

### Creating a Policy Map (CLI)

#### SUMMARY STEPS

1. **configure terminal**
2. **policy-map type control subscriber** *policy-map-name*
3. **event identity-update** { **match-all** | **match-first** }
4. *class\_number* **class** { *class\_map\_name* | **always** } { **do-all** | **do-until-failure** | **do-until-success** }
5. *action-index* **map attribute-to-service table** *parameter-map-name*
6. **end**

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>policy-map type control subscriber</b> <i>policy-map-name</i>  <b>Example:</b> Device(config)# <b>policy-map type control subscriber</b> <b>Aironet-Policy</b>	Specifies the policy map type.
<b>Step 3</b>	<b>event identity-update</b> { <b>match-all</b>   <b>match-first</b> }  <b>Example:</b> Device(config-policy-map)# <b>event identity-update</b> <b>match-all</b>	Specifies match criteria to the policy map.
<b>Step 4</b>	<i>class_number</i> <b>class</b> { <i>class_map_name</i>   <b>always</b> } { <b>do-all</b>   <b>do-until-failure</b>   <b>do-until-success</b> }	Configures the local profiling policy class map number and specifies how to perform the action. The class map configuration mode includes the following command options:

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Device(config-class-control-policymap)# 1 class local_policy1_class do-until-success</pre>	<ul style="list-style-type: none"> <li>• <b>always</b>—Executes without doing any matching but return success.</li> <li>• <b>do-all</b>—Executes all the actions.</li> <li>• <b>do-until-failure</b>—Execute all the actions until any match failure is encountered. This is the default value.</li> <li>• <b>do-until-success</b>—Execute all the actions until any match success happens.</li> </ul>
<b>Step 5</b>	<p><i>action-index</i> <b>map</b> <i>attribute-to-service</i> <b>table</b> <i>parameter-map-name</i></p> <p><b>Example:</b></p> <pre>Device(config-policy-map)# 10 map attribute-to-service table Aironet-Policy-para</pre>	Specifies parameter map table to be used.
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Applying a Local Policy for a Device on a WLAN (CLI)

### Before you begin

If the service policy contains any device type-based rules in the parameter map, ensure that the device classifier is already enabled.

**Note** You should use the **device classification** command to classify the device for it to be displayed correctly on the show command output.

## SUMMARY STEPS

1. **configure terminal**
2. **wlan** *wlan-name*
3. **service-policy type control subscriber** *polycymapname*
4. **profiling local http** (optional)
5. **profiling radius http** (optional)
6. **no shutdown**
7. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>wlan wlan-name</b> <b>Example:</b> Device(config)# <b>wlan wlan1</b>	Enters WLAN configuration mode.
Step 3	<b>service-policy type control subscriber policymapname</b> <b>Example:</b> Device(config-wlan)# <b>service-policy type control subscriber Aironet-Policy</b>	Applies local policy to WLAN.
Step 4	<b>profiling local http (optional)</b> <b>Example:</b> Device(config-wlan)# <b>profiling local http</b>	Enables only profiling of devices based on HTTP protocol (optional).
Step 5	<b>profiling radius http (optional)</b> <b>Example:</b> Device(config-wlan)# <b>profiling radius http</b>	Enables profiling of devices on ISE (optional).
Step 6	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# <b>no shutdown</b>	Specifies not to shut down the WLAN.
Step 7	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Related Topics

## Configuring WLAN to Apply Flow Monitor in IPV4 Input/Output Direction

## SUMMARY STEPS

1. **configure terminal**
2. **wlan wlan-id**
3. **ip flow monitor monitor-name {input | output}**

## 4. end

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-id</b> <b>Example:</b> Device (config) # <b>wlan 1</b>	Enters WLAN configuration submode. For <i>wlan-id</i> , enter the WLAN ID. The range is 1 to 64.
<b>Step 3</b>	<b>ip flow monitor monitor-name {input   output}</b> <b>Example:</b> Device (config-wlan) # <b>ip flow monitor flow-monitor-1 input</b>	Associates a flow monitor to the WLAN for input or output packets.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Monitoring Application Visibility and Control

## Monitoring Application Visibility and Control (CLI)

This section describes the new commands for application visibility.

The following commands can be used to monitor application visibility on the and access points.

**Table 180: Monitoring Application Visibility Commands on the**

Command	Purpose
<b>show avc client client-mac top n application</b> [aggregate   upstream   downstream]	Displays information about top "N" applications for the given client MAC.
<b>show avc wlan ssid top n application</b> [aggregate   upstream   downstream]	Displays information about top "N" applications for the given SSID.
<b>avc top user[enable   disable]</b>	Enables or disables the information about top "N" application.
<b>show avc wlan wlan-id application app name topN</b> [aggregate   upstream   downstream]	Displays to know network usage information on a per user basis within an application

<b>show wlan id</b> <i>wlan-id</i>	Displays information whether AVC is enabled or disabled on a particular WLAN.
<b>show flow monitor</b> <i>flow_monitor_name</i> <b>cache</b>	Displays information about flow monitors.
<b>show wireless client mac-address</b> <i>mac-address</i> <b>service-policy</b> { <b>input</b>   <b>output</b> }	Displays information about policy mapped to the wireless clients.
<b>show ip nbar protocol-discovery</b> [ <b>interface</b> <i>interface-type</i> <i>interface-number</i> ] [ <b>stats</b> { <b>byte-count</b>   <b>bit-rate</b>   <b>packet-count</b>   <b>max-bit-rate</b> }] [ <b>protocol</b> <i>protocol-name</i>   <b>top-nnumber</b> ]	Displays the statistics gathered by the NBAR Protocol Discovery feature.  • (Optional) Enter keywords and arguments to fine-tune the statistics displayed. For more information on each of the keywords, refer to the <b>show ip nbar protocol-discovery</b> command in Cisco IOS Quality of Service Solutions Command Reference.  <b>Note</b> When you configure NBAR, you must enable Protocol Discovery on the interface.
<b>show policy-map target</b> <b>show policy-map</b> <b>show policy-map</b> <i>policy-name</i> <b>show policy-map interface</b> <i>interface-type</i> <i>interface-number</i>	Displays information about policy map.

Table 181: Clearing Application Visibility Statistics Commands

Command	Purpose
<b>clear avc client</b> <i>mac</i> <b>stats</b>	Clears the statistics per client.
<b>clear avc wlan</b> <i>wlan-name</i> <b>stats</b>	Clears the statistics per WLAN.

## Examples: Application Visibility and Control

### Examples: Application Visibility Configuration

This example shows how to create a flow record, create a flow monitor, apply the flow record to the flow monitor, and apply the flow monitor on a WLAN:

```
Device# configure terminal
Device(config)# flow record fr_v4
Device(config-flow-record)# match ipv4 protocol
Device(config-flow-record)# match ipv4 source address
Device(config-flow-record)# match ipv4 destination address
```

```

Device(config-flow-record)# match transport destination-port
Device(config-flow-record)# match flow direction
Device(config-flow-record)# match application name
Device(config-flow-record)# match wireless ssid
Device(config-flow-record)# collect counter bytes long
Device(config-flow-record)# collect counter packets long
Device(config-flow-record)# collect wireless ap mac address
Device(config-flow-record)# collect wireless client mac address
Device(config)#end

```

```

Device# configure terminal
Device# flow monitor fm_v4
Device(config-flow-monitor)# record fr_v4
Device(config-flow-monitor)# cache timeout active 1800
Device(config)#end

```

```

Device(config)#wlan wlan1
Device(config-wlan)#ip flow monitor fm_v4 input
Device(config-wlan)#ip flow mon fm-v4 output
Device(config)#end

```

## Examples: Application Visibility and Control QoS Configuration

This example shows how to create class maps with apply match protocol filters for application name, category, and subcategory:

```

Device# configure terminal
Device(config)# class-map cat-browsing
Device(config-cmap)# match protocol attribute category browsing
Device(config-cmap)#end

```

```

Device# configure terminal
Device(config)# class-map cat-fileshare
Device(config-cmap)# match protocol attribute category file-sharing
Device(config-cmap)#end

```

```

Device# configure terminal
Device(config)# class-map match-any subcat-terminal
Device(config-cmap)# match protocol attribute sub-category terminal
Device(config-cmap)#end

```

```

Device# configure terminal
Device(config)# class-map match-any webex-meeting
Device(config-cmap)# match protocol webex-meeting
Device(config-cmap)#end

```

This example shows how to create policy maps and define existing class maps for upstream QoS:

```

Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class cat-browsing
Device(config-pmap-c)# police 150000
Device(config-pmap-c)# set dscp 12
Device(config-pmap-c)#end

```

```

Device# configure terminal
Device(config)# policy-map test-avc-up

```

```
Device(config-pmap) # class cat-fileshare
Device(config-pmap-c) # police 1000000
Device(config-pmap-c) # set dscp 20
Device(config-pmap-c) #end

Device# configure terminal
Device(config) # policy-map test-avc-up
Device(config-pmap) # class subcat-terminal
Device(config-pmap-c) # police 120000
Device(config-pmap-c) # set dscp 15
Device(config-pmap-c) #end

Device# configure terminal
Device(config) # policy-map test-avc-up
Device(config-pmap) # class webex-meeting
Device(config-pmap-c) # police 50000000
Device(config-pmap-c) # set dscp 21
Device(config-pmap-c) #end
```

This example shows how to create policy maps and define existing class maps for downstream QoS:

```
Device# configure terminal
Device(config) # policy-map test-avc-down
Device(config-pmap) # class cat-browsing
Device(config-pmap-c) # police 200000
Device(config-pmap-c) # set dscp 10
Device(config-pmap-c) #end

Device# configure terminal
Device(config) # policy-map test-avc-up
Device(config-pmap) # class cat-fileshare
Device(config-pmap-c) # police 300000
Device(config-pmap-c) # set wlan user-priority 2
Device(config-pmap-c) # set dscp 20
Device(config-pmap-c) #end

Device# configure terminal
Device(config) # policy-map test-avc-up
Device(config-pmap) # class subcat-terminal
Device(config-pmap-c) # police 100000
Device(config-pmap-c) # set dscp 25
Device(config-pmap-c) #end

Device# configure terminal
Device(config) # policy-map test-avc-up
Device(config-pmap) # class webex-meeting
Device(config-pmap-c) # police 60000000
Device(config-pmap-c) # set dscp 41
Device(config-pmap-c) #end
```

This example shows how to apply defined QoS policy on a WLAN:

```
Device# configure terminal
Device(config) # wlan alpha
Device(config-wlan) # shut
Device(config-wlan) #end
Device(config-wlan) #service-policy client input test-avc-up
```

```
Device(config-wlan)#service-policy client output test-avc-down
Device(config-wlan)#no shut
Device(config-wlan)#end
```

## Example: Configuring QoS Attribute for Local Profiling Policy

The following example shows how to configure QoS attribute for a local profiling policy:

```
Device(config)# class-map type control subscriber match-all local_policy1_class
Device(config-filter-control-classmap)# match device-type android
Device(config)# service-template local_policy1_template
Device(config-service-template)# vlan 40
Device(config-service-template)# service-policy qos output local_policy1
Device(config)# policy-map type control subscriber local_policy1
Device(config-event-control-policymap)# event identity-update match-all
Device(config-class-control-policymap)# 1 class local_policy1_class do-until-success
Device(config-action-control-policymap)# 1 activate service-template local_policy1_template
Device(config)# wlan open_auth 9
Device(config-wlan)# client vlan VLAN40
Device(config-wlan)# service-policy type control subscriber local_policy1
```

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Voice and Video Parameters

You can confirm the following points before configuring voice and video parameters:

- Ensure that the device has access points connected to it.
- Configure SSID.

## Restrictions for Voice and Video Parameters

The following are the restrictions that you should keep in mind while configuring voice and video parameters:

- SIP CAC can be used for the 9971 Cisco phones that support TSPEC-based admission control. You can also use the phones that support Status code 17.

- SIP snooping is supported for providing voice priority to the non-TSPEC SIP phones.
- TSPEC for video CAC is not supported.
- Cisco 792x IP phones that are admitted as non-WMM devices with 11K enabled will experience audio problems with the phones.

---

**Note** Disable 11K for voice WLAN for all 792x Cisco IP phones that are admitted as non-WMM devices with 11K enabled. Upgrade the firmware on Cisco Unified Call Manager to 1.4.5 to resolve this issue. Refer to the Cisco Unified Call Manager configuration guide for more information.

---

## Information About Configuring Voice and Video Parameters

Three parameters on the device affect voice and/or video quality:

- Call Admission Control
- Expedited bandwidth requests
- Unscheduled automatic power save delivery

Call Admission Control (CAC) and UAPSD are supported on Cisco Compatible Extensions (CCX) v4 and v5; however, these parameters are also supported even without CCX but on any device implementing WMM (that supports 802.1e). Expedited bandwidth requests are supported only on CCXv5.

Traffic stream metrics (TSM) can be used to monitor and report issues with voice quality.

## Call Admission Control

Call Admission Control (CAC) enables an access point to maintain controlled quality of service (QoS) when the wireless LAN is experiencing congestion. The WMM protocol deployed in CCXv4 maintains QoS under differing network loads.

Two types of Over The Air (OTA) CAC are available: static-based CAC and load-based CAC.

The device supports the following QoS policies:

- User-defined policies: You can define your own QoS policies. You can have more control over these policies than the existing metal policies.
- System-defined precious metal policies: To support backward compatibility.
  - Platinum: Used for VoIP clients.
  - Gold: Used for video clients.
  - Silver: Used for best effort traffic.
  - Bronze: Used for NRT traffic.

## Static-Based CAC

Voice over WLAN applications supporting WMM and TSPEC can specify how much bandwidth or shared medium time is required to initiate a call. Bandwidth-based, or static, CAC enables the access point to determine whether it is capable of accommodating a particular call. The access point rejects the call if necessary in order to maintain the maximum allowed number of calls with acceptable quality.

The QoS setting for a WLAN determines the level of bandwidth-based CAC support. To use bandwidth-based CAC with voice applications, the WLAN must be configured for Platinum QoS. With bandwidth-based CAC, the access point bandwidth availability is determined based on the amount of bandwidth currently used by the access point clients, to which the bandwidth requested by the Voice over WLAN applications is added. If this total exceeds a configured bandwidth threshold, the new call is rejected.

---

**Note** You must enable admission control (ACM) for CCXv4 clients that have WMM enabled. Otherwise, bandwidth-based CAC does not operate properly for these CCXv4 clients.

---

## Load-Based CAC

Load-based CAC incorporates a measurement scheme that takes into account the bandwidth consumed by all traffic types (including that from clients), cochannel access point loads, and coallocated channel interference, for voice and video applications. Load-based CAC also covers the additional bandwidth consumption resulting from PHY and channel impairment.

In load-based CAC, the access point continuously measures and updates the utilization of the RF channel (that is, the mean time of bandwidth that has been exhausted), channel interference, and the additional calls that the access point can admit. The access point admits a new call only if the channel has enough unused bandwidth to support that call. By doing so, load-based CAC prevents oversubscription of the channel and maintains QoS under all conditions of WLAN loading and interference.

---

**Note** If you disable load-based CAC, the access points start using bandwidth-based CAC.

---

## IOSd Call Admission Control

IOSd Call Admission Control (CAC) controls bandwidth availability from device to access point.

You can configure class-based, unconditional packet marking features on your switch for CAC.

CAC is a concept that applies to voice and video traffic only—not data traffic. If an influx of data traffic oversubscribes a particular link in the network, queueing, buffering, and packet drop decisions resolve the congestion. The extra traffic is simply delayed until the interface becomes available to send the traffic, or, if traffic is dropped, the protocol or the end user initiates a timeout and requests a retransmission of the information.

Network congestion cannot be resolved in this manner when real-time traffic, sensitive to both latency and packet loss, is present, without jeopardizing the quality of service (QoS) expected by the users of that traffic. For real-time delay-sensitive traffic such as voice, it is better to deny network access under congestion conditions than to allow traffic onto the network to be dropped and delayed, causing intermittent impaired QoS and resulting in customer dissatisfaction.

CAC is therefore a deterministic and informed decision that is made before a voice call is established and is based on whether the required network resources are available to provide suitable QoS for the new call.

Based on the admit CAC CLI configuration in addition to the existing CAC algorithm, device allows either voice or video with TSPEC or SIP snooping. The **admit cac** CLI is mandatory for the voice call to pass through.

If the BSSID policer is configured for the voice or video traffic, then additional checks are performed on the packets.

## Expedited Bandwidth Requests

The expedited bandwidth request feature enables CCXv5 clients to indicate the urgency of a WMM traffic specifications (TSPEC) request (for example, an e911 call) to the WLAN. When the controller receives this request, it attempts to facilitate the urgency of the call in any way possible without potentially altering the quality of other TSPEC calls that are in progress.

You can apply expedited bandwidth requests to both bandwidth-based and load-based CAC. Expedited bandwidth requests are disabled by default. When this feature is disabled, the controller ignores all expedited requests and processes TSPEC requests as normal TSPEC requests.

The following table lists examples of TSPEC request handling for normal TSPEC requests and expedited bandwidth requests.

**Table 182: TSPEC Request Handling Examples**

CAC Mode	Reserved bandwidth for voice calls	Usage	Normal TSPEC Request	TSPEC with Expedited Bandwidth Request
Bandwidth-based CAC	75% (default setting)	Less than 75%	Admitted	Admitted
		Between 75% and 90% (reserved bandwidth for voice calls exhausted)	Rejected	Admitted
		More than 90%	Rejected	Rejected
Load-based CAC		Less than 75%	Admitted	Admitted
		Between 75% and 85% (reserved bandwidth for voice calls exhausted)	Rejected	Admitted
		More than 85%	Rejected	Rejected

<sup>26</sup> For bandwidth-based CAC, the voice call bandwidth usage is per access point radio and does not take into account cochannel access points. For load-based CAC, the voice call bandwidth usage is measured for the entire channel.

<sup>27</sup> Bandwidth-based CAC (consumed voice and video bandwidth) or load-based CAC (channel utilization [Pb]).

**Note** Admission control for TSPEC G711-20ms and G711-40 ms codec types are supported.

## U-APSD

Unscheduled automatic power save delivery (U-APSD) is a QoS facility defined in IEEE 802.11e that extends the battery life of mobile clients. In addition to extending battery life, this feature reduces the latency of traffic flow delivered over the wireless media. Because U-APSD does not require the client to poll each individual packet buffered at the access point, it allows delivery of multiple downlink packets by sending a single uplink trigger packet. U-APSD is enabled automatically when WMM is enabled.

## Traffic Stream Metrics

In a voice-over-wireless LAN (VoWLAN) deployment, traffic stream metrics (TSM) can be used to monitor voice-related metrics on the client-access point air interface. It reports both packet latency and packet loss. You can isolate poor voice quality issues by studying these reports.

The metrics consist of a collection of uplink (client side) and downlink (access point side) statistics between an access point and a client device that supports CCX v4 or later releases. If the client is not CCX v4 or CCXv5 compliant, only downlink statistics are captured. The client and access point measure these metrics. The access point also collects the measurements every 5 seconds, prepares 90-second reports, and then sends the reports to the controller. The controller organizes the uplink measurements on a client basis and the downlink measurements on an access point basis and maintains an hour's worth of historical data. To store this data, the controller requires 32 MB of additional memory for uplink metrics and 4.8 MB for downlink metrics.

TSM can be configured through either the GUI or the CLI on a per radio-band basis (for example, all 802.11a radios). The controller saves the configuration in flash memory so that it persists across reboots. After an access point receives the configuration from the controller, it enables TSM on the specified radio band.

This table shows the upper limit for TSM entries in different controller series.

TSM Entries	5700
MAX AP TSM entries	100
MAX Client TSM entries	250
MAX TSM entries	100*250=25000

**Note** Once the upper limit is reached, additional TSM entries cannot be stored and sent to WCS or NCS. If client TSM entries are full and AP TSM entries are available, then only the AP entries are stored, and viceversa. This leads to partial output. TSM cleanup occurs every one hour. Entries are removed only for those APs and clients that are not in the system.

## Information About Configuring Voice Prioritization Using Preferred Call Numbers

You can configure a device to provide support for SIP calls from VoWLAN clients that do not support TSPEC-based calls. This feature is known as SIP CAC support. If bandwidth is available in the configured voice pool, the SIP call uses the normal flow and the device allocates the bandwidth to those calls.

You can also prioritize up to six preferred call numbers. When a call comes to one of the configured preferred numbers, the device does not check the configured maximum voice bandwidth. The device allocates the bandwidth needed for the call, even if it exceeds the maximum bandwidth for voice configured for voice CAC. The preferred call will be rejected if bandwidth allocation exceeds 85% of the radio bandwidth. The bandwidth allocation is 85 percent of the entire bandwidth pool, not just from the maximum configured voice pool. The bandwidth allocation is the same even for roaming calls.

You must configure the following parameters before configuring voice prioritization:

- Set WLAN QoS to allow voice calls to pass through.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.

## Information About EDCA Parameters

Enhanced distributed channel access (EDCA) parameters are designed to provide preferential wireless channel access for voice, video, and other quality-of-service (QoS) traffic.

## How to Configure Voice and Video Parameters

### Configuring Voice Parameters (CLI)

#### Before you begin

Ensure that you have configured SIP-based CAC.

You should have created a class map for CAC before beginning this procedure.

#### SUMMARY STEPS

1. **show wlan summary**
2. **show wlan *wlan\_id***
3. **configure terminal**
4. **policy-map *policy-map name***
5. **class {*class-name* | **class-default**}**
6. **admit cac wmm-tspec**
7. **service-policy *policy-map name***
8. **end**
9. **wlan *wlan\_profile\_name* *wlan\_ID* *SSID\_network\_name* wlan shutdown**

10. **wlan** *wlan\_profile\_name* *wlan\_ID* *SSID\_network\_name*
11. **wlan** *wlan\_name* **call-snoop**
12. **wlan** *wlan\_name* **service-policy input** *input\_policy\_name*
13. **wlan** *wlan\_name* **service-policy output** *ouput\_policy\_name*
14. **wlan** *wlan\_name* **service-policy input** *ingress\_policy\_name*
15. **wlan** *wlan\_name* **service-policy output** *egress\_policy\_name*
16. **ap dot11** {5ghz | 24ghz} **shutdown**
17. **ap dot11** {5ghz | 24ghz} **cac voice sip**
18. **ap dot11** {5ghz | 24ghz} **cac voice acm**
19. **ap dot11** {5ghz | 24ghz} **cac voice max-bandwidth** *bandwidth*
20. **ap dot11** {5ghz | 24ghz} **cac voice roam-bandwidth** *bandwidth*
21. **no wlan** **shutdown**
22. **no ap dot11** {5ghz | 24ghz} **shutdown**
23. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>show wlan summary</b> <b>Example:</b> Device# <b>show wlan summary</b>	Specifies all of the WLANs configured on the device.
<b>Step 2</b>	<b>show wlan</b> <i>wlan_id</i> <b>Example:</b> Device# <b>show wlan 25</b>	Specifies the WLAN that you plan to modify. For voice over WLAN, ensure that the WLAN is configured for WMM and the QoS level is set to Platinum.
<b>Step 3</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 4</b>	<b>policy-map</b> <i>policy-map name</i> <b>Example:</b> Device(config)# <b>policy-map test_2000</b> Device(config-pmap)#	Enters policy map configuration mode. Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy. In WLAN, you need to configure service-policy for these commands to take effect.
<b>Step 5</b>	<b>class</b> { <i>class-name</i>   <b>class-default</b> } <b>Example:</b> Device(config-pmap)# <b>class test_1000</b> Device(config-pmap-c)#	Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Specifies the name of the class whose policy you want to create or change. You can also create a system default class for unclassified packets.

	Command or Action	Purpose
<b>Step 6</b>	<b>admit cac wmm-tspec</b> <b>Example:</b> Device(config-pmap-c) # <b>admit cac wmm-tspec</b> Device(config-pmap-c) #	(Optional) Admits the request for Call Admission Control (CAC) for policy map.
<b>Step 7</b>	<b>service-policy policy-map name</b> <b>Example:</b> Device(config-pmap-c) # <b>service-policy test_2000</b> Device(config-pmap-c) #	Configures the QoS service policy.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device(config) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 9</b>	<b>wlan wlan_profile_name wlan_ID SSID_network_name wlan shutdown</b> <b>Example:</b> Device(config) # <b>wlan wlan1</b> Device(config-wlan) # <b>wlan shutdown</b>	Disables all WLANs with WMM enabled prior to changing the video parameters.
<b>Step 10</b>	<b>wlan wlan_profile_name wlan_ID SSID_network_name</b> <b>Example:</b> Device(config) # <b>wlan wlan1</b> Device(config-wlan) # <b>wlan shutdown</b>	Disables all WLANs with WMM enabled prior to changing the voice parameters.
<b>Step 11</b>	<b>wlan wlan_name call-snoop</b> <b>Example:</b> Device(config) # <b>wlan wlan1 call-snoop</b>	Enables the call-snooping on a particular WLAN.
<b>Step 12</b>	<b>wlan wlan_name service-policy input input_policy_name</b> <b>Example:</b> Device(config) # <b>wlan wlan1</b> Device(config-wlan) # <b>service-policy input platinum-up</b>	Configures input SSID policy on a particular WLAN to voice.
<b>Step 13</b>	<b>wlan wlan_name service-policy output output_policy_name</b> <b>Example:</b> Device(config) # <b>wlan wlan1</b> Device(config-wlan) # <b>service-policy output platinum</b>	Configures output SSID policy on a particular WLAN to voice.
<b>Step 14</b>	<b>wlan wlan_name service-policy input ingress_policy_name</b>	Configures ingress SSID policy on a particular WLAN as user-defined policy.

	Command or Action	Purpose
	<b>Example:</b> Device(config)# wlan wlan1 Device(config-wlan)# service-policy input policy1	
<b>Step 15</b>	<b>wlan wlan_name service-policy output egress_policy_name</b> <b>Example:</b> Device(config)# wlan wlan1 Device(config-wlan)# service-policy output policy2	Configures egress SSID policy on a particular WLAN as user-defined policy.
<b>Step 16</b>	<b>ap dot11 {5ghz   24ghz} shutdown</b> <b>Example:</b>	Disables the radio network. Device(config)# ap dot11 5ghz shutdown
<b>Step 17</b>	<b>ap dot11 {5ghz   24ghz} cac voice sip</b> <b>Example:</b> Device(config)# ap dot11 5ghz cac voice sip	Enables or disables SIP IOSd CAC for the 802.11a or 802.11b/g network.
<b>Step 18</b>	<b>ap dot11 {5ghz   24ghz} cac voice acm</b> <b>Example:</b> Device(config)# ap dot11 5ghz cac voice acm	Enables or disables bandwidth-based voice CAC for the 802.11a or 802.11b/g network.
<b>Step 19</b>	<b>ap dot11 {5ghz   24ghz} cac voice max-bandwidth bandwidth</b> <b>Example:</b> Device(config)# ap dot11 5ghz cac voice max-bandwidth 85	Sets the percentage of maximum bandwidth allocated to clients for voice applications on the 802.11a or 802.11b/g network. The bandwidth range is 5 to 85%, and the default value is 75%. Once the client reaches the value specified, the access point rejects new videos on this network.
<b>Step 20</b>	<b>ap dot11 {5ghz   24ghz} cac voice roam-bandwidth bandwidth</b> <b>Example:</b> Device(config)# ap dot11 5ghz cac voice roam-bandwidth 10	Sets the percentage of maximum allocated bandwidth reserved for roaming voice clients. The bandwidth range is 0 to 25%, and the default value is 6%. The device reserves this much bandwidth from the maximum allocated bandwidth for roaming voice clients.
<b>Step 21</b>	<b>no wlan shutdown</b> <b>Example:</b> Device(config-wlan)# no wlan shutdown	Reenables all WLANs with WMM enabled.
<b>Step 22</b>	<b>no ap dot11 {5ghz   24ghz} shutdown</b> <b>Example:</b> Device(config)# no ap dot11 5ghz shutdown	Reenables the radio network.
<b>Step 23</b>	<b>end</b> <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Example

## Configuring Video Parameters (CLI)

### SUMMARY STEPS

1. `show wlan summary`
2. `show wlan wlan_id`
3. `configure terminal`
4. `policy-map policy-map name`
5. `class {class-name | class-default}`
6. `admit cac wmm-tspec`
7. `service-policy policy-map name`
8. `end`
9. `wlan wlan_profile_name`
10. `ap dot11 {5ghz | 24ghz} shutdown`
11. `ap dot11 {5ghz | 24ghz} cac video acm`
12. `ap dot11 {5ghz | 24ghz} cac video load-based`
13. `ap dot11 {5ghz | 24ghz} cac video max-bandwidth bandwidth`
14. `ap dot11 {5ghz | 24ghz} cac video roam-bandwidth bandwidth`
15. `no wlan shutdown wlan_id`
16. `no ap dot11 {5ghz | 24ghz} shutdown`
17. `end`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>show wlan summary</b> <b>Example:</b> Device# <code>show wlan summary</code>	Specifies all of the WLANs configured on the device.
Step 2	<b>show wlan <i>wlan_id</i></b> <b>Example:</b> Device# <code>show wlan 25</code>	Specifies the WLAN that you plan to modify.
Step 3	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
Step 4	<b>policy-map <i>policy-map name</i></b> <b>Example:</b> Device(config)# <code>policy-map test_2000</code>	Enters policy map configuration mode.  Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.

	Command or Action	Purpose
	Device(config-pmap)#	In WLAN, you need to configure service-policy for these commands to take effect.
<b>Step 5</b>	<b>class</b> { <i>class-name</i>   <b>class-default</b> } <b>Example:</b> Device(config-pmap)# <b>class test_1000</b> Device(config-pmap-c)#	Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change.  Specifies the name of the class whose policy you want to create or change.  You can also create a system default class for unclassified packets.
<b>Step 6</b>	<b>admit cac wmm-tspec</b> <b>Example:</b> Device(config-pmap-c)# <b>admit cac wmm-tspec</b> Device(config-pmap-c)#	(Optional) Admits the request for Call Admission Control (CAC) for policy map.
<b>Step 7</b>	<b>service-policy</b> <i>policy-map name</i> <b>Example:</b> Device(config-pmap-c)# <b>service-policy test_2000</b> Device(config-pmap-c)#	Configures the QoS service policy.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 9</b>	<b>wlan</b> <i>wlan_profile_name</i> <b>Example:</b> Device(config)# <b>wlan wlan1</b> Device(config-wlan)# <b>wlan shutdown</b>	Disables all WLANs with WMM enabled prior to changing the video parameters.
<b>Step 10</b>	<b>ap dot11</b> { <b>5ghz</b>   <b>24ghz</b> } <b>shutdown</b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz shutdown</b>	Disables the radio network.
<b>Step 11</b>	<b>ap dot11</b> { <b>5ghz</b>   <b>24ghz</b> } <b>cac video acm</b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz cac video acm</b>	Enables or disables bandwidth-based video CAC for the 802.11a or 802.11b/g network.
<b>Step 12</b>	<b>ap dot11</b> { <b>5ghz</b>   <b>24ghz</b> } <b>cac video load-based</b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz cac video load-based</b>	Configures the load-based CAC method.  If you do not enter this command, then the default static CAC is applied.

	Command or Action	Purpose
<b>Step 13</b>	<b>ap dot11 {5ghz   24ghz} cac video max-bandwidth <i>bandwidth</i></b>  <b>Example:</b> Device(config)# <b>ap dot11 5ghz cac video max-bandwidth 20</b>	Sets the percentage of maximum bandwidth allocated to clients for video applications on the 802.11a or 802.11b/g network.  The bandwidth range is 5 to 85%, and the default value is 75%. The default value is 0, which means no bandwidth request control. The sum of the voice bandwidth and video bandwidth should not exceed 85% or configured maximum media bandwidth.
<b>Step 14</b>	<b>ap dot11 {5ghz   24ghz} cac video roam-bandwidth <i>bandwidth</i></b>  <b>Example:</b> Device(config)# <b>ap dot11 5ghz cac video roam-bandwidth 9</b>	Sets the percentage of maximum allocated bandwidth reserved for roaming clients for video.  The bandwidth range is 0 to 25%, and the default value is 0%.
<b>Step 15</b>	<b>no wlan shutdown <i>wlan_id</i></b>  <b>Example:</b> Device(config-wlan)# <b>no wlan shutdown 25</b>	Reenables all WLANs with WMM enabled.
<b>Step 16</b>	<b>no ap dot11 {5ghz   24ghz} shutdown</b>  <b>Example:</b> Device(config)# <b>no ap dot11 5ghz shutdown</b>	Reenables the radio network.
<b>Step 17</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

### Example

## Configuring SIP-Based CAC (CLI)

SIP CAC controls the total number of SIP calls that can be made.

### SUMMARY STEPS

1. **configure terminal**
2. **wlan *wlan-name***
3. **call-snoop**
4. **service-policy [client] input *policy-map name***
5. **service-policy [client] output *policy-map name***
6. **end**
7. **show wlan {*wlan-id* | *wlan-name*}**
8. **configure terminal**
9. **ap dot11 {5ghz | 24ghz} cac {voice | video} acm**

10. `ap dot11 {5ghz | 24ghz} cac voice sip`
11. `end`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	<b>wlan <i>wlan-name</i></b> <b>Example:</b> Device(config)# <code>wlan qos-wlan</code> Device(config-wlan)#	Enters WLAN configuration submode.
Step 3	<b>call-snoop</b> <b>Example:</b> Device(config-wlan)# <code>call-snoop</code>	Enables the call-snooping feature for a particular WLAN.
Step 4	<b>service-policy [client] input <i>policy-map name</i></b> <b>Example:</b> Device(config-wlan)# <code>service-policy input platinum-up</code>	Assigns a policy map to WLAN input traffic. Ensure that you provide QoS policy to voice for input traffic.
Step 5	<b>service-policy [client] output <i>policy-map name</i></b> <b>Example:</b> Device(config-wlan)# <code>service-policy output platinum</code>	Assigns policy map to WLAN output traffic. Ensure that you provide QoS policy to voice for output traffic.
Step 6	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
Step 7	<b>show wlan {<i>wlan-id</i>   <i>wlan-name</i>}</b> <b>Example:</b> Device# <code>show wlan qos-wlan</code>	Verifies the configured QoS policy on the WLAN.
Step 8	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
Step 9	<b>ap dot11 {5ghz   24ghz} cac {voice   video} acm</b> <b>Example:</b> Device(config)# <code>ap dot11 5ghz cac voice acm</code>	Enables the ACM static on the radio.  When enabling SIP snooping, use the static CAC, not the load-based CAC.
Step 10	<b>ap dot11 {5ghz   24ghz} cac voice sip</b>	Configures SIP-based CAC.

	Command or Action	Purpose
	<b>Example:</b> Device(config)# <b>ap dot11 5ghz cac voice sip</b>	
<b>Step 11</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

### Example

## Configuring a Preferred Call Number (CLI)

### Before you begin

You must set the following parameters before configuring a preferred call number.

- Set WLAN QoS to voice.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.
- Enable SIP-based CAC.

### SUMMARY STEPS

1. **configure terminal**
2. **wlan *wlan-name* qos platinum**
3. **ap dot11 {5ghz | 24ghz} cac {voice | video} acm**
4. **wlan *wlan-name***
5. **wireless sip preferred-call-no *call\_index* *call\_number***
6. **no wireless sip preferred-call-no *call\_index***
7. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>wlan-name</i> qos platinum</b> <b>Example:</b> Device(config)# <b>wlan wlan1</b> Device(config-wlan)# <b>qos platinum</b>	Sets QoS to voice on a particular WLAN.

	Command or Action	Purpose
Step 3	<b>ap dot11 {5ghz   24ghz} cac {voice   video} acm</b> <b>Example:</b> Device(config)# <b>ap dot11 5ghz cac voice acm</b>	Enables the static ACM on the radio.  When enabling SIP snooping, use the static CAC, not the load-based CAC.
Step 4	<b>wlan wlan-name</b> <b>Example:</b> Device(config)# <b>wlan wlan1</b> Device(config-wlan)# <b>call-snoop</b>	Enables the call-snooping feature for a particular WLAN.
Step 5	<b>wireless sip preferred-call-no call_index call_number</b> <b>Example:</b> Device(config)# <b>wireless sip preferred-call-no 1 555333</b>	Adds a new preferred call.
Step 6	<b>no wireless sip preferred-call-no call_index</b> <b>Example:</b> Device(config)# <b>no wireless sip preferred-call-no 1</b>	Removes a preferred call.
Step 7	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

### Example

## Configuring EDCA Parameters (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **ap dot11 {5ghz | 24ghz} shutdown**
3. **ap dot11 {5ghz | 24ghz} edca-parameters {custom-voice | optimized-video-voice | optimized-voice | svp-voice | wmm-default}**
4. **show ap dot11 {5ghz | 24ghz} network**
5. **no ap dot11 {5ghz | 24ghz} shutdown**
6. **end**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 2</b>	<b>ap dot11 {5ghz   24ghz} shutdown</b> <b>Example:</b> Device(config)# <code>ap dot11 5ghz shutdown</code>	Disables the radio network.
<b>Step 3</b>	<b>ap dot11 {5ghz   24ghz} edca-parameters {custom-voice   optimized-video-voice   optimized-voice   svp-voice   wmm-default}</b> <b>Example:</b> Device(config)# <code>ap dot11 5ghz edca-parameters optimized-voice</code>	Enables a specific EDCA parameters for the 802.11a or 802.11b/g network. <ul style="list-style-type: none"> <li>• <b>custom-voice</b>—Enables custom voice parameters for the 802.11a or 802.11b/g network.</li> <li>• <b>optimized-video-voice</b>—Enables EDCA voice- and video-optimized parameters for the 802.11a or 802.11b/g network. Choose this option when both voice and video services are deployed on your network.</li> <li>• <b>optimized-voice</b>—Enables non-SpectraLink voice-optimized profile parameters for the 802.11a or 802.11b/g network. Choose this option when voice services other than SpectraLink are deployed on your network.</li> <li>• <b>svp-voice</b>—Enables SpectraLink voice priority parameters for the 802.11a or 802.11b/g network. Choose this option if SpectraLink phones are deployed on your network to improve the quality of calls.</li> <li>• <b>wmm-default</b>—Enables the Wi-Fi Multimedia (WMM) default parameters for the 802.11a or 802.11b/g network. This is the default value. Choose this option when voice or video services are not deployed on your network.</li> </ul>
<b>Step 4</b>	<b>show ap dot11 {5ghz   24ghz} network</b> <b>Example:</b> Device(config)# <code>show ap dot11 5ghz network</code>	Displays the current status of MAC optimization for voice.
<b>Step 5</b>	<b>no ap dot11 {5ghz   24ghz} shutdown</b> <b>Example:</b> Device(config)# <code>no ap dot11 5ghz shutdown</code>	Reenables the radio network.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Example

## Monitoring Voice and Video Parameters

This section describes the new commands for the voice and video parameters.

The following commands can be used to monitor voice and video parameters.

**Table 183: Monitoring Voice Parameters Commands**

Command	Purpose
<code>show ap dot11 {5ghz   24ghz} network</code>	Displays the radio-based statistics for voice.
<code>show ap name ap_name dot11 24ghz tsm all</code>	Displays the TSM voice metrics and current status of MAC optimization for voice.
<code>show ap name apname cac voice</code>	Displays the information about CAC for a particular access point.
<code>show client detail client_mac</code>	Displays the U-APSD status for a particular client.
<code>show policy-map interface wireless client</code>	Displays the video client policy details.
<code>show access-list</code>	Displays the video client dynamic access-list from the device.
<code>show wireless client voice diag status</code>	<p>Displays information about whether voice diagnostics are enabled or disabled. If enabled, this also displays information about the clients in the watch list and the time remaining for the diagnostics of the voice call.</p> <p><b>Note</b> To work on voice diagnostics CLIs, you need to enter the following command: <b>debug voice-diagnostic mac-addr client_mac_01 client_mac_02</b></p>
<code>show wireless client voice diag tspec</code>	Displays the TSPEC information sent from the clients that are enabled for voice diagnostics.
<code>show wireless client voice diag qos-map</code>	Displays information about the QoS/DSCP mapping and packet statistics in each of the four queues: VO, VI, BE, BK. The different DSCP values are also displayed.
<code>show wireless client voice diag rssi</code>	Display the client's RSSI values in the last 5 seconds when voice diagnostics is enabled.
<code>show client voice-diag roam-history</code>	Displays information about the last three roaming calls. The output contains the timestamp, access point associated with roaming, roaming reason, and if there is a roaming failure, reason for roaming-failure.

<b>show policy-map interface wireless mac</b> <i>mac-address</i>	Displays information about the voice and video data packet statistics.
<b>show wireless media-stream client summary</b>	Displays a summary of the media stream and video client information.
<b>show controllers d0   b queue</b>	Displays which queue the packets are going through on an access point.
<b>show platform qos queue stats</b> <i>interface</i>	Displays which queue packets are going through from the device.

You can monitor the video parameters using the following commands.

**Table 184: Monitoring Video Parameters Commands**

Command	Purpose
<b>show ap join stats summary</b> <i>ap_mac</i>	Displays the last join error detail for a specific access point.
<b>show ip igmp snooping wireless mgid</b>	Displays the TSM voice metrics and current status of MAC optimization for voice.
<b>show wireless media-stream multicast-direct state</b>	Displays the media stream multicast-direct parameters.
<b>show wireless media-stream group summary</b>	Displays the summary of the media stream and client information.
<b>show wireless media-stream group detail</b> <i>group_name</i>	Displays the details of a specific media-stream group.
<b>show wireless media-stream client summary</b>	Displays the details for a set of media-stream clients.
<b>show wireless media-stream client detail</b> <i>group_name</i>	Displays the details for a set of media-stream clients.
<b>show ap dot11 {5ghz   24ghz} media-stream rrc</b>	Display the details of media stream.
<b>show wireless media-stream message details</b>	Displays information about the message configuration.
<b>show ap name</b> <i>ap-name</i> <b>auto-rf dot11 5ghz   i Util</b>	Displays the details of channel utilization.
<b>show controllers d0   b queue</b>	Displays which queue the packets are going through on an access point based on 2.4- and 5-GHz bands.
<b>show controllers d1   b queue</b>	Displays which queue the packets are going through on an access point based on 2.4- and 5-GHz bands.
<b>show cont d1   b Media</b>	Displays the video metric details on the band A or B.
<b>show capwap mcast mgid all</b>	Displays information about all of the multicast groups and their corresponding multicast group identifications (MGIDs) associated to the access point.

```
show capwap mcast mgid id id
```

Displays information about all of the video clients joined to the multicast group in a specific MGID.

# Configuration Examples for Voice and Video Parameters

## Example: Configuring Voice and Video

### Configuring Egress SSID Policy for Voice and Video

The following example shows how to create and configure an egress SSID policy for voice and video:

```
table-map egress_ssid_tb
  map from 24 to 24
  map from 34 to 34
  map from 46 to 46
  default copy

class-map match-any voice
  match dscp ef
class-map match-any video
  match dscp af41

policy-map ssid-cac
  class class-default
    shape average 25000000
    set dscp dscp table egress_ssid_tb
    queue-buffers ratio 0
    service-policy ssid-child-cac

policy-map ssid-child-cac
  class voice
    priority level 1
    police 5000000
    conform-action transmit
    exceed-action drop
    admit cac wmm-tspec
    rate 1000
    wlan-up 6 7
  class video
    priority level 2
    police 10000000
    conform-action transmit
    exceed-action drop
    admit cac wmm-tspec
    rate 3000
    wlan-up 4 5
```

### Configuring Ingress SSID Policy for Voice and Video

The following example shows how to create and configure an ingress SSID policy for voice and video:

```
table-map up_to_dscp
  map from 0 to 0
  map from 1 to 8
  map from 2 to 8
  map from 3 to 0
  map from 4 to 34
```

```

map from 5 to 34
map from 6 to 46
map from 7 to 48
default copy

policy-map ingress_ssid
class class-default
  set dscp wlan user-priority table up_to_dscp

```

### Configuring Egress Port Policy Voice and Video

The following example shows how to create and configure an egress port policy for voice and video:

```

policy-map port_child_policy
class non-client-nrt-class
bandwidth remaining ratio 10

class voice
priority level 1
police rate 3000000

class video
priority level 2
police rate 4000000

```

### Applying Ingress and Egress SSID policies for Voice and Video on a WLAN

The following example shows how to apply ingress and egress SSID policies for voice and video on a WLAN:

```

wlan voice_video 1 voice_video
service-policy input ingress_ssid
service-policy output ssid-cac

```

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring RFID Tag Tracking

The Device enables you to configure radio-frequency identification (RFID) tag tracking. RFID tags are small wireless devices that are affixed to assets for real-time location tracking. They operate by advertising their location using special 802.11 packets, which are processed by access points, the controller, and the location appliance.

## How to Configure RFID Tag Tracking

### Configuring RFID Tag Tracking (CLI)

#### SUMMARY STEPS

1. `location rfid status`
2. (Optional) `no location rfid status`

3. `location rfid timeout seconds`
4. `location rfid mobility vendor-name name`
5. (Optional) `no location rfid mobility name`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>location rfid status</b> <b>Example:</b> Device(config)# <code>location rfid status</code>	Enables RFID tag tracking. By default, RFID tag tracking is enabled.
<b>Step 2</b>	(Optional) <b>no location rfid status</b> <b>Example:</b> Device(config)# <code>no location rfid status</code>	Disables RFID tag tracking.
<b>Step 3</b>	<b>location rfid timeout seconds</b> <b>Example:</b> Device(config)# <code>location rfid timeout 1500</code>	Specifies a static timeout value (between 60 and 7200 seconds). The static timeout value is the amount of time that the device maintains tags before expiring them. For example, if a tag is configured to beacon every 30 seconds, we recommend that you set the timeout value to 90 seconds (approximately three times the beacon value). The default value is 1200 seconds.
<b>Step 4</b>	<b>location rfid mobility vendor-name name</b> <b>Example:</b> Device(config)# <code>location rfid mobility vendor-name Aerosct</code>	Enables RFID tag mobility for specific tags. When you enter the <b>location rfid mobility vendor-name</b> command, tags are unable to obtain a DHCP address for client mode when attempting to select and/or download a configuration. <b>Note</b> These commands can be used only for Pango tags. Therefore, the only valid entry for <b>vendor_name</b> is “pango” in all lowercase letters.
<b>Step 5</b>	(Optional) <b>no location rfid mobility name</b> <b>Example:</b> Device(config)# <code>no location rfid mobility test</code>	Disables RFID tag mobility for specific tags. When you enter the <b>no location rfid mobility</b> command, tags can obtain a DHCP address. If a tag roams from one subnet to another, it obtains a new address rather than retaining the anchor state.

## Monitoring RFID Tag Tracking Information

This section describes the new commands for the RFID tag tracking Information.

The following commands can be used to monitor the RFID tag tracking Information on the .

**Table 185: Monitoring RFID Tag Tracking Information Commands**

Command	Purpose
---------	---------

<b>show location rfid config</b>	Displays the current configuration for RFID tag tracking.
<b>show location rfid detail</b> <i>mac_address</i>	Displays the detailed information for a specific RFID tag.
<b>show location rfid summary</b>	Displays a list of all RFID tags currently connected to the .
<b>show location rfid client</b>	Displays a list of RFID tags that are associated to the as clients.

## Additional References RFID Tag Tracking

## Information About Configuring Location Settings

The device determines the location of client devices by gathering Received Signal Strength Indication (RSSI) measurements from access points all around the client of interest. The device can obtain location reports from up to 16 access points for clients, RFID tags, and rogue access points.

You can configure the path loss measurement (S60) request for normal clients or calibrating clients to improve location accuracy.

# How to Configure Location Settings

## Configuring Location Settings (CLI)

### SUMMARY STEPS

1. `configure terminal`
2. `location plm {calibrating [multiband | uniband] | client burst_interval}`
3. `location rssi-half-life {calibrating-client | client | rogue-aps | tags } seconds}`
4. `location expiry {calibrating-client | client | rogue-aps | tags } timeout}`
5. `location algorithm {rssi-average | simple}`
6. `location admin-tag string}`
7. `location civic-location identifier {identifier | host}`
8. `location custom-location identifier {identifier | host}`
9. `location geo-location identifier {identifier | host}`
10. `location prefer {cdp | lldp-med | static} weight priority_value}`
11. `location rfid {status | timeout | vendor-name}`
12. `end`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 2	<p><code>location plm {calibrating [multiband   uniband]   client <i>burst_interval</i>}</code></p> <p><b>Example:</b></p> <pre>Device(config)# location plm client 100</pre>	<p>Configures the path loss measurement (S60) request for calibrating clients or non-calibrating.</p> <p>The path loss measurement request improves the location accuracy. You can configure the <b>burst_interval</b> parameter for the normal, noncalibrating client from zero through 3600 seconds, and the default value is 60 seconds.</p> <p>You can configure the path loss measurement request for calibrating clients on the associated 802.11a or 802.11b/g radio or on the associated 802.11a/b/g radio.</p> <p>If a client does not send probes often or sends them only on a few channels, its location cannot be updated or cannot be updated accurately. The <b>location plm</b> command forces clients to send more packets on all channels. When a CCXv4 (or higher) client associates, the Device sends it a path loss measurement request, which instructs the client to transmit on the bands and channels that the access points are on (typically, channels 1, 6, and 11 for 2.4-GHz-only</p>

	Command or Action	Purpose
		access points) at a configurable interval (such as 60 seconds) indefinitely.
<b>Step 3</b>	<p><b>location rssi-half-life</b> {<b>calibrating-client</b>   <b>client</b>   <b>rogue-aps</b>   <b>tags</b> } <i>seconds</i></p> <p><b>Example:</b></p> <pre>Device(config)# location rssi-half-life calibrating-client 60</pre>	<p>Configures the RSSI half life for the clients, calibrating clients, RFID tags, and rogue access points.</p> <p>You can enter the <b>location rssi-half-life</b> parameter value for the clients, calibrating clients, RFID tags, and rogue access points as 0, 1, 2, 5, 10, 20, 30, 60, 90, 120, 180, or 300 seconds, and the default value is 0 seconds.</p> <p>Some client devices transmit at reduced power immediately after changing channels, and RF is variable, so RSSI values might vary considerably from packet to packet. The <b>location rssi-half-life</b> command increases accuracy by averaging nonuniformly arriving data using a configurable forget period (or half life).</p> <p><b>Note</b> We recommend that you do not use or modify the <b>location rssi-half-life</b> command.</p>
<b>Step 4</b>	<p><b>location expiry</b> {<b>calibrating-client</b>   <b>client</b>   <b>rogue-aps</b>   <b>tags</b> } <i>timeout</i></p> <p><b>Example:</b></p> <pre>Device(config)# location expiry calibrating-client 50</pre>	<p>Configures the RSSI timeout value for the clients, calibrating clients, RFID tags, and rogue access points.</p> <p>You can enter the RSSI timeout value for the clients, RFID tags, and rogue access points from 5 through 3600 seconds, and the default value is 5 seconds.</p> <p>For the calibrating clients, you can enter the RSSI timeout value from 0 through 3600 seconds, and the default value is 5 seconds.</p> <p>Ensuring that recent, strong RSSIs are retained by the CPU is critical to location accuracy. The <b>location expiry</b> command enables you to specify the length of time after which old RSSI averages expire.</p> <p><b>Note</b> We recommend that you do not use or modify the <b>location expiry</b> command.</p>
<b>Step 5</b>	<p><b>location algorithm</b> {<b>rssi-average</b>   <b>simple</b>}</p> <p><b>Example:</b></p> <pre>Device(config)# location algorithm rssi-average</pre>	<p>Configures the algorithm used to average RSSI and signal-to-noise ratio (SNR) values.</p> <p>You can enter the <b>location algorithm rssi-average</b> command to specify a more accurate algorithm but requires more CPU overhead or the <b>location algorithm simple</b> command to specify a faster algorithm that requires low CPU overhead but provides less accuracy.</p> <p><b>Note</b> We recommend that you do not use or modify the <b>location algorithm</b> command.</p>

	Command or Action	Purpose
<b>Step 6</b>	<b>location admin-tag</b> <i>string</i> <b>Example:</b> Device(config)# <b>location admin-tag</b>	Sets administrative tag or site information for the location of client devices.
<b>Step 7</b>	<b>location civic-location identifier</b> { <i>identifier</i>   <b>host</b> } <b>Example:</b> Device(config)# <b>location civic-location identifier</b> <b>host</b>	Specifies civic location information. You can set the civic location identifier either as a string or host.
<b>Step 8</b>	<b>location custom-location identifier</b> { <i>identifier</i>   <b>host</b> } <b>Example:</b> Device(config)# <b>location custom-location</b> <b>identifier host</b>	Specifies custom location information. You can set the custom location identifier either as a string or host.
<b>Step 9</b>	<b>location geo-location identifier</b> { <i>identifier</i>   <b>host</b> } <b>Example:</b> Device(config)# <b>location geo-location identifier</b> <b>host</b>	Specifies geographical location information of the client devices. You can set the location identifier either as a string or host.
<b>Step 10</b>	<b>location prefer</b> { <b>cdp</b>   <b>lldp-med</b>   <b>static</b> } <b>weight</b> <i>priority_value</i> <b>Example:</b> Device(config)# <b>location prefer weight cdp 50</b>	Sets location information source priority. You can enter the priority weight from zero through 255.
<b>Step 11</b>	<b>location rfid</b> { <b>status</b>   <b>timeout</b>   <b>vendor-name</b> } <b>Example:</b> Device(config)# <b>location rfid timeout 100</b>	Configures RFID tag tracking options such as RFID tag status, RFID timeout value, and RFID tag vendor name. You can enter the RFID timeout value in a range from 60 and 7200 seconds.
<b>Step 12</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

### Example

## Modifying the NMSP Notification Interval for Clients, RFID Tags, and Rogues (CLI)

The Network Mobility Services Protocol (NMSP) manages communication between the mobility services engine and the controller for incoming and outgoing traffic. If your application requires more frequent location updates, you can modify the NMSP notification interval (to a value between 1 and 180 seconds) for clients, active RFID tags, and rogue access points and clients.

**Note** The TCP port (16113) that the controller and mobility services engine communicate over must be open (not blocked) on any firewall that exists between the controller and the mobility services engine for NMSP to function.

## SUMMARY STEPS

1. **configure terminal**
2. **nmosp notification interval** {attachment *seconds* | location *seconds* | rssi [clients *interval* | rfid *interval* | rogues [ap | client ] *interval*]}
3. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>nmosp notification interval</b> {attachment <i>seconds</i>   location <i>seconds</i>   rssi [clients <i>interval</i>   rfid <i>interval</i>   rogues [ap   client ] <i>interval</i> ]} <b>Example:</b> Device(config)# <b>nmosp notification interval rssi rfid 50</b>	Sets the NMSP notification interval value for clients, RFID tags, and rogue clients and access points.  You can enter the NMSP notification interval value for RSSI measurement from 1 through 180 seconds.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

### Example

## Modifying the NMSP Notification threshold for Clients, RFID Tags, and Rogues (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **location notify-threshold** {clients | rogues ap | tags } *threshold*
3. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>location notify-threshold</b> {clients   rogues ap   tags } <i>threshold</i> <b>Example:</b> Device(config)# <code>location notify-threshold clients</code> 5	Configures the NMSP notification threshold for clients, RFID tags, and rogue clients and access points.  You can enter the RSSI threshold value from zero through 10 db.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Example

# Monitoring Location Settings and NMSP Settings

## Monitoring Location Settings (CLI)

This section describes the new commands for location settings.

The following commands can be used to monitor location settings on the .

**Table 186: Monitoring Location Settings Commands**

Command	Purpose
<code>show location summary</code>	Displays the current location configuration values.
<code>show location statistics rfid</code>	Displays the location-based RFID statistics.
<code>show location detail client_mac_addr</code>	Displays the RSSI table for a particular client.

## Monitoring NMSP Settings (CLI)

This section describes the new commands for NMSP settings.

The following commands can be used to monitor NMSP settings on the .

Table 187: Monitoring NMSP Settings Commands

Command	Purpose
<b>show nmosp attachment suppress interfaces</b>	Displays the attachment suppress interfaces.
<b>show nmosp capability</b>	Displays the NMSP capabilities.
<b>show nmosp notification interval</b>	Displays the NMSP notification intervals.
<b>show nmosp statistics connection</b>	Displays the connection-specific NMSP counters.
<b>show nmosp statistics summary</b>	Displays the common NMSP counters.
<b>show nmosp status</b>	Displays the status of active NMSP connections.
<b>show nmosp subscription detail</b>	Displays all of the mobility services to which the is subscribed.
<b>show nmosp subscription detail <i>ip_addr</i></b>	Displays details only for the mobility services subscribed to by a specific IP address.
<b>show nmosp subscription summary</b>	Displays details for all of the mobility services to which the is subscribed.

## Examples: Location Settings Configuration

This example shows how to configure the path loss measurement (S60) request for calibrating client on the associated 802.11a or 802.11b/g radio:

```
Device# configure terminal
Device(config)# location plm calibrating uniband
Device(config)# end
Device# show location summary
```

This example shows how to configure the RSSI half life for a rouge access point:

```
Device# configure terminal
Device(config)# location rssi-half-life rogue-aps 20
Device(config)# end
Device# show location summary
```

## Examples: NMSP Settings Configuration

This example shows how to configure the NMSP notification interval for RFID tags:

```
Device# configure terminal
Device(config)# nmosp notification interval rssi rfid 50
Device(config)# end
Device# show nmosp notification interval
```

This example shows how to configure the NMSP notification threshold for clients:

```
Device# configure terminal
Device(config)# nmsp notify-threshold 5
Device(config)# end
Device# show nmsp statistics summary
```

- [Feature History and Information For Monitoring Flow Control, on page 2225](#)

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Flow Control

Flow control is enabled by default on the device.

Flow control provides shim layers between WCM and Cisco IOS for a reliable IPC. Every component in WCM has a dedicated channel. Few of the components in WCM have leveraged flow control in that. There is no configuration of flow control from CLI. You can monitor the flow control for any channel.

## Monitoring Flow Control

This section describes the new commands for flow control.

The following commands can be used to monitor flow control on the device.

*Table 188: Monitoring Flow Control*

Command	Purpose
---------	---------

<code>show wireless flow-control <i>channel -id</i></code>	Displays information about flow control on a particular channel.
<code>show wireless flow-control <i>channel-id</i> statistics</code>	Displays statistical information about flow control on a particular channel.

## Examples: Monitoring Flow Control

This example shows how to view information pertaining to any channel:

```
Device# show wireless flow-control 3
Device#

Channel Name       : CAPWAP
FC State           : Disabled
Remote Server State : Enabled
Pass-thru Mode     : Disabled
EnQ Disabled       : Disabled
Queue Depth        : 2048
Max Retries        : 5
Min Retry Gap (mSec) : 3
```

This example shows how to view flow control for a particular channel:

```
Device# show wireless flow-control 3
Device#

Channel Name                : CAPWAP
# of times channel went into FC : 0
# of times channel came out of FC : 0
Total msg count received by the FC Infra : 1
Pass-thru msgs send count      : 0
Pass-thru msgs fail count      : 0
# of msgs successfully queued   : 0
# of msgs for which queuing failed : 0
# of msgs sent thru after queuing : 0
# of msgs sent w/o queuing      : 1
# of msgs for which send failed  : 0
# of invalid EAGAINS received    : 0
Highest watermark reached       : 0
# of times Q hit max capacity     : 0
Avg time channel stays in FC (mSec) : 0
```

## Feature History and Information For Monitoring Flow Control

Release	Feature Information
Cisco IOS XE 3.3SE	This feature was introduced.

## CHAPTER 113

# Configuring SDM Templates

- [Finding Feature Information, on page 2227](#)
- [Information About Configuring SDM Templates, on page 2227](#)
- [How to Configure SDM Templates, on page 2229](#)
- [Monitoring and Maintaining SDM Templates, on page 2230](#)
- [Configuration Examples for SDM Templates, on page 2231](#)
- [Feature History and Information for Configuring SDM Templates, on page 2232](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring SDM Templates

### SDM Templates

You can use SDM templates to configure system resources to optimize support for specific features, depending on how your device is used in the network. You can select a template to provide maximum system usage for some functions.

These templates are supported on your device:

- **Advanced**—The advanced template is available on all supported images for this release. It maximizes system resources for features like netflow, multicast groups, security ACEs, QoS ACEs, and so on.
- **VLAN**—The VLAN template is available only on the LAN Base license. The VLAN template disables routing and supports the maximum number of unicast MAC addresses. It would typically be selected for a Layer 2 device.

After you change the template and the system reboots, you can use the **show sdm prefer** privileged EXEC command to verify the new template configuration. If you enter the **show sdm prefer** command before you enter the **reload** privileged EXEC command, the **show sdm prefer** command shows the template currently in use and the template that will become active after a reload.

The default is the advanced template.

**Table 189: Approximate Number of Feature Resources Allowed by Templates**

Resource	Advanced	VLAN
Number of VLANs	4094	4094
Unicast MAC addresses	32 K	32 K
Overflow unicast MAC addresses	512	512
IGMP groups and multicast routes	4 K	4 K
Overflow IGMP groups and multicast routes	512	512
• Directly connected routes	16K	16 K
• Indirectly connected IP hosts	7 K	7 K
Policy-based routing ACEs	1024	0
QoS classification ACEs	3 K	3 K
Security ACEs	3 K	3 K
Netflow ACEs	1024	1024
Input Microflow policer ACEs:	256 K	0
Output Microflow policer ACEs:	256 K	0
FSPAN ACEs	256	256
Tunnels:	256	0
Control Plane Entries:	512	512
Input Netflow flows:	8 K	8 K
Output Netflow flows:	16 K	16 K
SGT/DGT entries:	4 K	4 K
SGT/DGT Overflow entries:	0	512

**Note** When the switch is used as a Wireless Mobility Agent, the only template allowed is the advanced template.

**Note** SDM templates do not create VLANs. You must create the VLANs before adding commands to the SDM templates.

The tables represent approximate hardware boundaries set when a template is selected. If a section of a hardware resource is full, all processing overflow is sent to the CPU, seriously impacting switch performance.

## SDM Templates and Switch Stacks

In a switch stack, all stack members must use the same SDM template that is stored on the active switch. When a new switch is added to a stack, the SDM configuration that is stored on the active switch overrides the template configured on an individual switch.

You can use the **show switch** privileged EXEC command to see if any stack members are in SDM mismatch mode.

# How to Configure SDM Templates

## Configuring SDM Templates

### Configuring the Switch SDM Template

#### Setting the SDM Template

Follow these steps to use the SDM template to maximize feature usage:

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **sdm prefer { advanced | vlan }**
4. **end**
5. **reload**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 3</b>	<p><code>sdm prefer { advanced   vlan }</code></p> <p><b>Example:</b></p> <p>Device(config)# <code>sdm prefer advanced</code></p>	<p>Specifies the SDM template to be used on the switch. The keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• <b>advanced</b> —Supports advanced features such as Netflow.</li> <li>• <b>vlan</b> —Maximizes VLAN configuration on the switch with no routing supported in hardware.</li> </ul> <p><b>Note</b> The <code>no sdm prefer</code> command and a default template is not supported.</p>
<b>Step 4</b>	<p><code>end</code></p> <p><b>Example:</b></p> <p>Device(config)# <code>end</code></p>	Returns to privileged EXEC mode.
<b>Step 5</b>	<p><code>reload</code></p> <p><b>Example:</b></p> <p>Device# <code>reload</code></p>	Reloads the operating system.

## Monitoring and Maintaining SDM Templates

Command	Purpose
<code>show sdm prefer</code>	Displays the SDM template in use.
<code>reload</code>	Reloads the switch to activate the newly configured SDM template.
<code>no sdm prefer</code>	Sets the default SDM template.

# Configuration Examples for SDM Templates

## Examples: Configuring SDM Templates

## Examples: Displaying SDM Templates

This is an example output showing the advanced template information:

```
Device# show sdm prefer

Showing SDM Template Info

This is the Advanced template.
Number of VLANs:                4094
Unicast MAC addresses:          32768
Overflow Unicast MAC addresses: 512
IGMP and Multicast groups:      8192
Overflow IGMP and Multicast groups: 512
Directly connected routes:      32768
Indirect routes:                8192
Security Access Control Entries: 3072
QoS Access Control Entries:      2816
Policy Based Routing ACEs:       1024
Netflow ACEs:                   1024
Input Microflow policer ACEs:    256
Output Microflow policer ACEs:   256
Flow SPAN ACEs:                 256
Tunnels:                        256
Control Plane Entries:          512
Input Netflow flows:            8192
Output Netflow flows:           16384

These numbers are typical for L2 and IPv4 features.
Some features such as IPv6, use up double the entry size;
so only half as many entries can be created.
```

Device#

This is an example output showing the VLAN template information:

```
Device# show sdm prefer vlan

Showing SDM Template Info

This is the VLAN template for a typical Layer 2 network.
Number of VLANs:                4094
Unicast MAC addresses:          32768
Overflow Unicast MAC addresses: 512
IGMP and Multicast groups:      8192
Overflow IGMP and Multicast groups: 512
Directly connected routes:      32768
Indirect routes:                8192
Security Access Control Entries: 3072
QoS Access Control Entries:      3072
Policy Based Routing ACEs:       0
Netflow ACEs:                   1024
```

```
Input Microflow policer ACEs:           0
Output Microflow policer ACEs:         0
Flow SPAN ACEs:                        256
Tunnels:                                0
Control Plane Entries:                 512
Input Netflow flows:                   16384
Output Netflow flows:                   8192
These numbers are typical for L2 and IPv4 features.
Some features such as IPv6, use up double the entry size;
so only half as many entries can be created.

Device#
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring System Message Logs

### System Message Logging

By default, a switch sends the output from system messages and **debug** privileged EXEC commands to a logging process. Stack members can trigger system messages. A stack member that generates a system message appends its hostname in the form of hostname-n, where n is a switch, and redirects the output to the logging process on the active switch. Though the active switch is a stack member, it does not append its hostname to system messages. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the active consoles after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on a standalone switch, and in the case of a switch stack, on the active switch. If a standalone switch or the stack master fails, the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet, through the console port, or through the Ethernet management port. In a switch stack, all stack member consoles provide the same console output.

**Note** The syslog format is compatible with 4.3 BSD UNIX.

## System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Depending on the switch, messages appear in one of these formats:

- *seq no:timestamp: %facility-severity-MNEMONIC:description (hostname-n)*
- *seq no:timestamp: %facility-severity-MNEMONIC:description*

The part of the message preceding the percent sign depends on the setting of these global configuration commands:

- **service sequence-numbers**
- **service timestamps log datetime**
- **service timestamps log datetime [localtime] [msec] [show-timezone]**
- **service timestamps log uptime**

**Table 190: System Log Message Elements**

Element	Description
<i>seq no:</i>	Stamps log messages with a sequence number only if the <b>service sequence-numbers</b> global configuration command is configured.

Element	Description
<i>timestamp</i> formats: <i>mm/dd h h:mm:ss</i> or <i>hh:mm:ss</i> (short uptime) or <i>d h</i> (long uptime)	Date and time of the message or event. This information appears only if the <b>service timestamps log [datetime   log]</b> global configuration command is configured.
<i>facility</i>	The facility to which the message refers (for example, SNMP, SYS, and so forth).
<i>severity</i>	Single-digit code from 0 to 7 that is the severity of the message.
<i>MNEMONIC</i>	Text string that uniquely describes the message.
<i>description</i>	Text string containing detailed information about the event being reported.
<i>hostname-n</i>	Hostname of a stack member and its switch number in the stack. Though the active switch is a stack member, it does <i>not</i> append its hostname to system messages.

## Default System Message Logging Settings

Table 191: Default System Message Logging Settings

Feature	Default Setting
System message logging to the console	Enabled.
Console severity	Debugging.
Logging file configuration	No filename specified.
Logging buffer size	4096 bytes.
Logging history size	1 message.
Time stamps	Disabled.
Synchronous logging	Disabled.
Logging server	Disabled.
Syslog server IP address	None configured.
Server facility	Local7
Server severity	Informational.

## Syslog Message Limits

If you enabled syslog message traps to be sent to an SNMP network management station by using the **snmp-server enable trap** global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level **warning** and numerically lower levels are stored in the history table even if syslog traps are not enabled.

When the history table is full (it contains the maximum number of message entries specified with the **logging history size** global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

The history table lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, *emergencies* equal 1, not 0, and *critical* equals 3, not 2.

## How to Configure System Message Logs

### Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console.

This task is optional.

#### SUMMARY STEPS

1. **configure terminal**
2. **logging buffered** [*size*]
3. **logging host**
4. **logging file flash:** *filename* [*max-file-size* [*min-file-size*]] [*severity-level-number* | *type*]
5. **end**
6. **terminal monitor**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>logging buffered</b> [ <i>size</i> ] <b>Example:</b> Device(config)# <b>logging buffered 8192</b>	Logs messages to an internal buffer on the switch or on a standalone switch or, in the case of a switch stack, on the active switch. The range is 4096 to 2147483647 bytes. The default buffer size is 4096 bytes.

	Command or Action	Purpose
		<p>If a standalone switch or the active switch fails, the log file is lost unless you previously saved it to flash memory. See Step 4.</p> <p><b>Note</b> Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the <b>show memory</b> privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should <i>not</i> be set to this amount.</p>
<b>Step 3</b>	<p><b>logging</b> <i>host</i></p> <p><b>Example:</b></p> <pre>Device(config)# logging 125.1.1.100</pre>	<p>Logs messages to a UNIX syslog server host.</p> <p><i>host</i> specifies the name or IP address of the host to be used as the syslog server.</p> <p>To build a list of syslog servers that receive logging messages, enter this command more than once.</p>
<b>Step 4</b>	<p><b>logging file flash:</b> <i>filename</i> [<i>max-file-size</i> [<i>min-file-size</i>]] [<i>severity-level-number</i>   <i>type</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# logging file flash:log_msg.txt 40960 4096 3</pre>	<p>Stores log messages in a file in flash memory on a standalone switch or, in the case of a switch stack, on the active switch.</p> <ul style="list-style-type: none"> <li><i>filename</i>—Enters the log message filename.</li> <li>(Optional) <b>max-file-size</b>—Specifies the maximum logging file size. The range is 4096 to 2147483647. The default is 4096 bytes.</li> <li>(Optional) <i>min-file-size</i>—Specifies the minimum logging file size. The range is 1024 to 2147483647. The default is 2048 bytes.</li> <li>(Optional) <i>severity-level-number</i>   <i>type</i>—Specifies either the logging severity level or the logging type. The severity range is 0 to 7.</li> </ul>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>
<b>Step 6</b>	<p><b>terminal monitor</b></p> <p><b>Example:</b></p> <pre>Device# terminal monitor</pre>	<p>Logs messages to a nonconsole terminal during the current session.</p> <p>Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.</p>

## Synchronizing Log Messages

You can synchronize unsolicited messages and **debug** privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and **debug** command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and **debug** command output appears on the console after the prompt for user input is returned. Therefore, unsolicited messages and **debug** command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.

This task is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **line** [**console** | **vty**] *line-number* [*ending-line-number*]
3. **logging synchronous** [**level** [*severity-level* | **all**] | **limit** *number-of-buffers*]
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>line</b> [ <b>console</b>   <b>vty</b> ] <i>line-number</i> [ <i>ending-line-number</i> ] <b>Example:</b> Device(config)# <b>line console</b>	Specifies the line to be configured for synchronous logging of messages. <ul style="list-style-type: none"> <li>• <b>console</b>—Specifies configurations that occur through the switch console port or the Ethernet management port.</li> <li>• <b>line vty line-number</b>—Specifies which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15.</li> </ul> You can change the setting of all 16 vty lines at once by entering: line vty 0 15 You can also change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter: line vty 2

	Command or Action	Purpose
		When you enter this command, the mode changes to line configuration.
Step 3	<p><b>logging synchronous</b> [level [<i>severity-level</i>   <b>all</b>]   <b>limit</b> <i>number-of-buffers</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# logging synchronous level 3 limit 1000</pre>	<p>Enables synchronous logging of messages.</p> <ul style="list-style-type: none"> <li>• (Optional) <b>level</b> <i>severity-level</i>—Specifies the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2.</li> <li>• (Optional) <b>level all</b>—Specifies that all messages are printed asynchronously regardless of the severity level.</li> <li>• (Optional) <b>limit</b> <i>number-of-buffers</i>—Specifies the number of buffers to be queued for the terminal after which new messages are dropped. The range is 0 to 2147483647. The default is 20.</li> </ul>
Step 4	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

## Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The **logging synchronous** global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press **Return**.

To reenable message logging after it has been disabled, use the **logging on** global configuration command.

This task is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **no logging console**
3. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>no logging console</b> <b>Example:</b> Device(config)# <b>no logging console</b>	Disables message logging.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.

## Enabling and Disabling Time Stamps on Log Messages

By default, log messages are not time-stamped.

This task is optional.

## SUMMARY STEPS

- configure terminal**
- Use one of these commands:
  - service timestamps log uptime**
  - service timestamps log datetime[msec | localtime | show-timezone]**
- end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	Use one of these commands: <ul style="list-style-type: none"> <li><b>service timestamps log uptime</b></li> </ul>	Enables log time stamps. <ul style="list-style-type: none"> <li><b>log uptime</b>—Enables time stamps on log messages, showing the time since the system was rebooted.</li> </ul>

	Command or Action	Purpose
	<ul style="list-style-type: none"> <li><code>service timestamps log datetime[msec   localtime   show-timezone]</code></li> </ul> <p><b>Example:</b></p> <pre>Device(config)# service timestamps log uptime</pre> <p>or</p> <pre>Device(config)# service timestamps log datetime</pre>	<ul style="list-style-type: none"> <li><b>log datetime</b>—Enables time stamps on log messages. Depending on the options selected, the time stamp can include the date, time in milliseconds relative to the local time zone, and the time zone name.</li> </ul>
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

## Enabling and Disabling Sequence Numbers in Log Messages

If there is more than one log message with the same time stamp, you can display messages with sequence numbers to view these messages. By default, sequence numbers in log messages are not displayed.

This task is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **service sequence-numbers**
3. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>service sequence-numbers</b></p> <p><b>Example:</b></p> <pre>Device(config)# service sequence-numbers</pre>	Enables sequence numbers.
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# <b>end</b>	

## Defining the Message Severity Level

Limit messages displayed to the selected device by specifying the severity level of the message.

This task is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **logging console** *level*
3. **logging monitor** *level*
4. **logging trap** *level*
5. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>logging console</b> <i>level</i> <b>Example:</b> Device(config)# <b>logging console 3</b>	Limits messages logged to the console.  By default, the console receives debugging messages and numerically lower levels.
<b>Step 3</b>	<b>logging monitor</b> <i>level</i> <b>Example:</b> Device(config)# <b>logging monitor 3</b>	Limits messages logged to the terminal lines.  By default, the terminal receives debugging messages and numerically lower levels.
<b>Step 4</b>	<b>logging trap</b> <i>level</i> <b>Example:</b> Device(config)# <b>logging trap 3</b>	Limits messages logged to the syslog servers.  By default, syslog servers receive informational messages and numerically lower levels.
<b>Step 5</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# <b>end</b>	

## Limiting Syslog Messages Sent to the History Table and to SNMP

This task explains how to limit syslog messages that are sent to the history table and to SNMP.

This task is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **logging history *level***
3. **logging history size *number***
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>logging history <i>level</i></b> <b>Example:</b> Device(config)# <b>logging history 3</b>	Changes the default level of syslog messages stored in the history file and sent to the SNMP server.  By default, <b>warnings</b> , <b>errors</b> , <b>critical</b> , <b>alerts</b> , and <b>emergencies</b> messages are sent.
<b>Step 3</b>	<b>logging history size <i>number</i></b> <b>Example:</b> Device(config)# <b>logging history size 200</b>	Specifies the number of syslog messages that can be stored in the history table.  The default is to store one message. The range is 0 to 500 messages.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.

## Logging Messages to a UNIX Syslog Daemon

This task is optional.

**Note** Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX **man syslogd** command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

### Before you begin

- Log in as root.
- Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server.

## SUMMARY STEPS

1. Add a line to the file `/etc/syslog.conf`.
2. Enter these commands at the UNIX shell prompt.
3. Make sure the syslog daemon reads the new changes.

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	Add a line to the file <code>/etc/syslog.conf</code> . <b>Example:</b> <pre>local7.debug /usr/adm/logs/cisco.log</pre>	<ul style="list-style-type: none"> <li>• <b>local7</b>—Specifies the logging facility.</li> <li>• <b>debug</b>—Specifies the syslog level. The file must already exist, and the syslog daemon must have permission to write to it.</li> </ul>
<b>Step 2</b>	Enter these commands at the UNIX shell prompt. <b>Example:</b> <pre>\$ touch /var/log/cisco.log \$ chmod 666 /var/log/cisco.log</pre>	Creates the log file. The syslog daemon sends messages at this level or at a more severe level to this file.
<b>Step 3</b>	Make sure the syslog daemon reads the new changes. <b>Example:</b> <pre>\$ kill -HUP `cat /etc/syslog.pid`</pre>	For more information, see the <b>man syslog.conf</b> and <b>man syslogd</b> commands on your UNIX system.

# Monitoring and Maintaining System Message Logs

## Monitoring Configuration Archive Logs

Command	Purpose
<code>show archive log config {all   number [end-number]   user username [session number] number [end-number]   statistics} [provisioning]</code>	Displays the entire configuration log or the log for specified parameters.

## Configuration Examples for System Message Logs

### Example: Stacking System Message

This example shows a partial switch system message for active switch and a stack member (hostname *Switch-2*):

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channell, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet1/0/1, changed
state to down 2
*Mar  1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar  1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)

00:00:46: %LINK-3-UPDOWN: Interface Port-channell, changed state to up (Switch-2)
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet2/0/1, changed state to up (Switch-2)
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet2/0/2, changed state to up (Switch-2)
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
(Switch-2)
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet2/0/1, changed
state to down 2 (Switch-2)
```

### Example: Switch System Message

This example shows a partial switch system message on a switch:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channell, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state
to down 2
*Mar  1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

```
*Mar 1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring Online Diagnostics

### Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the Device while the Device is connected to a live network.

The online diagnostics contain packet switching tests that check different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:

- Hardware components
- Interfaces (Ethernet ports and so forth)
- Solder joints

Online diagnostics are categorized as on-demand, scheduled, or health-monitoring diagnostics. On-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or at specified times when the Device is connected to a live network; and health-monitoring runs in the background with user-defined intervals. By default, the health-monitoring test runs for every 30 seconds.

After you configure online diagnostics, you can manually start diagnostic tests or display the test results. You can also see which tests are configured for the Device or switch stack and the diagnostic tests that have already run.

## How to Configure Online Diagnostics

### Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the Device, use the **diagnostic start** privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing:

#### SUMMARY STEPS

1. **diagnostic start switch *number* test {*name* | *test-id* | *test-id-range* | **all** | **basic** | **complete** | **minimal** | **non-disruptive** | **per-port**}**

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>diagnostic start switch <i>number</i> test {<i>name</i>   <i>test-id</i>   <i>test-id-range</i>   <b>all</b>   <b>basic</b>   <b>complete</b>   <b>minimal</b>   <b>non-disruptive</b>   <b>per-port</b>}</b></p> <p><b>Example:</b></p> <pre>Device# diagnostic start switch 2 test basic</pre>	<p>Starts the diagnostic tests.</p> <p>The <b>switch <i>number</i></b> keyword is supported only on stacking Device. The range is from 1 to 4.</p> <p>You can specify the tests by using one of these options:</p> <ul style="list-style-type: none"> <li>• <b><i>name</i></b>—Enters the name of the test.</li> <li>• <b><i>test-id</i></b>—Enters the ID number of the test.</li> <li>• <b><i>test-id-range</i></b>—Enters the range of test IDs by using integers separated by a comma and a hyphen.</li> <li>• <b>all</b>—Starts all of the tests.</li> <li>• <b>basic</b>— Starts the basic test suite.</li> <li>• <b>complete</b>—Starts the complete test suite.</li> <li>• <b>minimal</b>—Starts the minimal bootup test suite.</li> <li>• <b>non-disruptive</b>—Starts the non-disruptive test suite.</li> <li>• <b>per-port</b>—Starts the per-port test suite.</li> </ul>

## Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.

## Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis for a Device. Use the **no** form of this command to remove the scheduling.

### SUMMARY STEPS

1. **configure terminal**
2. **diagnostic schedule switch** *number test* {*name* | *test-id* | *test-id-range* | **all** | **basic** | **complete** | **minimal** | **non-disruptive** | **per-port**} {**daily** | **on** *mm dd yyyy hh:mm* | **port** *inter-port-number port-number-list* | **weekly** *day-of-week hh:mm*}

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 2	<b>diagnostic schedule switch</b> <i>number test</i> { <i>name</i>   <i>test-id</i>   <i>test-id-range</i>   <b>all</b>   <b>basic</b>   <b>complete</b>   <b>minimal</b>   <b>non-disruptive</b>   <b>per-port</b> } { <b>daily</b>   <b>on</b> <i>mm dd yyyy hh:mm</i>   <b>port</b> <i>inter-port-number port-number-list</i>   <b>weekly</b> <i>day-of-week hh:mm</i> } <b>Example:</b> Device(config)# <b>diagnostic schedule switch</b> 3 test 1-5 on July 3 2013 23:10	<p>Schedules on-demand diagnostic tests for a specific day and time.</p> <p>The <b>switch</b> <i>number</i> keyword is supported only on stacking switches. The range is from 1 to 4.</p> <p>When specifying the tests to be scheduled, use these options:</p> <ul style="list-style-type: none"> <li>• <i>name</i>—Name of the test that appears in the <b>show diagnostic content</b> command output.</li> <li>• <i>test-id</i>—ID number of the test that appears in the <b>show diagnostic content</b> command output.</li> <li>• <i>test-id-range</i>—ID numbers of the tests that appear in the <b>show diagnostic content</b> command output.</li> <li>• <b>all</b>—All test IDs.</li> <li>• <b>basic</b>—Starts the basic on-demand diagnostic tests.</li> <li>• <b>complete</b>—Starts the complete test suite.</li> <li>• <b>minimal</b>—Starts the minimal bootup test suite.</li> <li>• <b>non-disruptive</b>—Starts the non-disruptive test suite.</li> <li>• <b>per-port</b>—Starts the per-port test suite.</li> </ul>

	Command or Action	Purpose
		<p>You can schedule the tests as follows:</p> <ul style="list-style-type: none"> <li>• Daily—Use the <b>daily</b> <i>hh:mm</i> parameter.</li> <li>• Specific day and time—Use the <b>on</b> <i>mm dd yyyy hh:mm</i> parameter.</li> <li>• Weekly—Use the <b>weekly</b> <i>day-of-week hh:mm</i> parameter.</li> </ul>

## Configuring Health-Monitoring Diagnostics

You can configure health-monitoring diagnostic testing on a Device while it is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the Device to generate a syslog message because of a test failure, and enable a specific test.

Use the **no** form of this command to disable testing.

By default, health monitoring is disabled, but the Device generates a syslog message when a test fails.

Follow these steps to configure and enable the health-monitoring diagnostic tests:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **diagnostic monitor interval switch** *number test {name | test-id | test-id-range | all} hh:mm:ss milliseconds day*
4. **diagnostic monitor syslog**
5. **diagnostic monitor threshold switch** *number test {name | test-id | test-id-range | all} failure count count*
6. **diagnostic monitor switch** *number test {name | test-id | test-id-range | all}*
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 3</b>	<p><b>diagnostic monitor interval switch</b> <i>number</i> <b>test</b> {<i>name</i>   <i>test-id</i>   <i>test-id-range</i>   <b>all</b>} <i>hh:mm:ss</i> <i>milliseconds</i> <i>day</i></p> <p><b>Example:</b></p> <pre>Device(config)# diagnostic monitor interval switch 2 test 1 12:30:00 750 5</pre>	<p>Configures the health-monitoring interval of the specified tests.</p> <p>The <b>switch</b> <i>number</i> keyword is supported only on stacking switches. The range is from 1 to 9.</p> <p>When specifying the tests, use one of these parameters:</p> <ul style="list-style-type: none"> <li>• <i>name</i>—Name of the test that appears in the <b>show diagnostic content</b> command output.</li> <li>• <i>test-id</i>—ID number of the test that appears in the <b>show diagnostic content</b> command output.</li> <li>• <i>test-id-range</i>—ID numbers of the tests that appear in the <b>show diagnostic content</b> command output.</li> <li>• <b>all</b>—All of the diagnostic tests.</li> </ul> <p>When specifying the interval, set these parameters:</p> <ul style="list-style-type: none"> <li>• <i>hh:mm:ss</i>—Monitoring interval in hours, minutes, and seconds. The range for <i>hh</i> is 0 to 24, and the range for <i>mm</i> and <i>ss</i> is 0 to 60.</li> <li>• <i>milliseconds</i>—Monitoring interval in milliseconds (ms). The range is from 0 to 999.</li> <li>• <i>day</i>—Monitoring interval in the number of days. The range is from 0 to 20.</li> </ul>
<b>Step 4</b>	<p><b>diagnostic monitor syslog</b></p> <p><b>Example:</b></p> <pre>Device(config)# diagnostic monitor syslog</pre>	<p>(Optional) Configures the switch to generate a syslog message when a health-monitoring test fails.</p>
<b>Step 5</b>	<p><b>diagnostic monitor threshold switch</b> <i>number</i> <b>test</b> {<i>name</i>   <i>test-id</i>   <i>test-id-range</i>   <b>all</b>} <b>failure count</b> <i>count</i></p> <p><b>Example:</b></p> <pre>Device(config)# diagnostic monitor threshold switch 2 test 1 failure count 20</pre>	<p>(Optional) Sets the failure threshold for the health-monitoring tests.</p> <p>The <b>switch</b> <i>number</i> keyword is supported only on stacking switches. The range is from 1 to 9.</p> <p>When specifying the tests, use one of these parameters:</p> <ul style="list-style-type: none"> <li>• <i>name</i>—Name of the test that appears in the <b>show diagnostic content</b> command output.</li> <li>• <i>test-id</i>—ID number of the test that appears in the <b>show diagnostic content</b> command output.</li> <li>• <i>test-id-range</i>—ID numbers of the tests that appear in the <b>show diagnostic content</b> command output.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>all</b>—All of the diagnostic tests.</li> </ul> <p>The range for the failure threshold <i>count</i> is 0 to 99.</p>
<b>Step 6</b>	<p><b>diagnostic monitor switch</b> <i>number</i> <b>test</b> {<i>name</i>   <i>test-id</i>   <i>test-id-range</i>   <b>all</b>}</p> <p><b>Example:</b></p> <pre>Device(config)# diagnostic monitor switch 2 test 1</pre>	<p>Enables the specified health-monitoring tests.</p> <p>The <b>switch</b> <i>number</i> keyword is supported only on stacking switches. The range is from 1 to 9.</p> <p>When specifying the tests, use one of these parameters:</p> <ul style="list-style-type: none"> <li>• <i>name</i>—Name of the test that appears in the <b>show diagnostic content</b> command output.</li> <li>• <i>test-id</i>—ID number of the test that appears in the <b>show diagnostic content</b> command output.</li> <li>• <i>test-id-range</i>—ID numbers of the tests that appear in the <b>show diagnostic content</b> command output.</li> <li>• <b>all</b>—All of the diagnostic tests.</li> </ul>
<b>Step 7</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 8</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>	Verifies your entries.
<b>Step 9</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

### What to do next

Use the **no diagnostic monitor interval test***test-id* | *test-id-range* } global configuration command to change the interval to the default value or to zero. Use the **no diagnostic monitor syslog** command to disable generation of syslog messages when a health-monitoring test fails. Use the **diagnostic monitor threshold test***test-id* | *test-id-range* } **failure count** command to remove the failure threshold.

# Monitoring and Maintaining Online Diagnostics

## Displaying Online Diagnostic Tests and Test Results

You can display the online diagnostic tests that are configured for the Device or Device stack and check the test results by using the privileged EXEC **show** commands in this table:

*Table 192: Commands for Diagnostic Test Configuration and Results*

Command	Purpose
<b>show diagnostic content switch</b> [ <i>number</i>   <b>all</b> ]	Displays the online diagnostics configured for a switch. The <b>switch</b> [ <i>number</i>   <b>all</b> ] parameter is supported only on stacking switches.
<b>show diagnostic status</b>	Displays the currently running diagnostic tests.
<b>show diagnostic result switch</b> [ <i>number</i>   <b>all</b> ] [ <b>detail</b>   <b>test</b> { <i>name</i>   <i>test-id</i>   <i>test-id-range</i>   <b>all</b> } [ <b>detail</b> ]]	Displays the online diagnostics test results. The <b>switch</b> [ <i>number</i>   <b>all</b> ] parameter is supported only on stacking switches.
<b>show diagnostic switch</b> [ <i>number</i>   <b>all</b> ] [ <b>detail</b> ]	Displays the online diagnostics test results. The <b>switch</b> [ <i>number</i>   <b>all</b> ] parameter is supported only on stacking switches.
<b>show diagnostic schedule switch</b> [ <i>number</i>   <b>all</b> ]	Displays the online diagnostics test schedule. The <b>switch</b> [ <i>number</i>   <b>all</b> ] parameter is supported only on stacking switches.
<b>show diagnostic post</b>	Displays the POST results. (The output is the same as the <b>show post</b> command output.)

## Configuration Examples for Online Diagnostic Tests

### Examples: Start Diagnostic Tests

This example shows how to start a diagnostic test by using the test name:

```
Device# diagnostic start switch 2 test TestInlinePwrCtrlr
```

This example shows how to start all of the basic diagnostic tests:

```
Device# diagnostic start switch 1 test all
```

## Example: Configure a Health Monitoring Test

This example shows how to configure a health-monitoring test:

```
Device(config)# diagnostic monitor threshold switch 1 test 1 failure count 50
Device(config)# diagnostic monitor interval switch 1 test TestPortAsicStackPortLoopback
```

## Examples: Schedule Diagnostic Test

This example shows how to schedule diagnostic testing for a specific day and time on a specific switch:

```
Device(config)# diagnostic schedule test DiagThermalTest on June 3 2013 22:25
```

This example shows how to schedule diagnostic testing to occur weekly at a certain time on a specific switch:

```
Device(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly saturday 10:30
```

## Examples: Displaying Online Diagnostics

This example shows how to display on demand diagnostic settings:

```
Device# show diagnostic ondemand settings

Test iterations = 1
Action on test failure = continue
```

This example shows how to display diagnostic events for errors:

```
Device# show diagnostic events event-type error

Diagnostic events (storage for 500 events, 0 events recorded)
Number of events matching above criteria = 0

No diagnostic log entry exists.
```

This example shows how to display the description for a diagnostic test:

```
Device# show diagnostic description switch 1 test all

DiagGoldPktTest :
  The GOLD packet Loopback test verifies the MAC level loopback
  functionality. In this test, a GOLD packet, for which doppler
  provides the support in hardware, is sent. The packet loops back
  at MAC level and is matched against the stored packet. It is a non
  -disruptive test.

DiagThermalTest :
  This test verifies the temperature reading from the sensor is below the yellow
  temperature threshold. It is a non-disruptive test and can be run as a health
```

monitoring test.

DiagFanTest :

This test verifies all fan modules have been inserted and working properly on the board

It is a non-disruptive test and can be run as a health monitoring test.

DiagPhyLoopbackTest :

The PHY Loopback test verifies the PHY level loopback functionality. In this test, a packet is sent which loops back at PHY level and is matched against the stored packet. It is a disruptive test and cannot be run as a health monitoring test.

DiagScratchRegisterTest :

The Scratch Register test monitors the health of application-specific integrated circuits (ASICs) by writing values into registers and reading back the values from these registers. It is a non-disruptive test and can be run as a health monitoring test.

DiagPoETest :

This test checks the PoE controller functionality. This is a disruptive test and should not be performed during normal switch operation.

DiagStackCableTest :

This test verifies the stack ring loopback functionality in the stacking environment. It is a disruptive test and cannot be run as a health monitoring test.

DiagMemoryTest :

This test runs the exhaustive ASIC memory test during normal switch operation. NG3K utilizes mbist for this test. Memory test is very disruptive in nature and requires switch reboot after the test.

Device#

This example shows how to display the boot up level:

```
Device# show diagnostic bootup level
```

```
Current bootup diagnostic level: minimal
```

```
Device#
```

## Feature History and Information for Configuring Online Diagnostics

Release	Modification
Cisco IOS XE 3.3SE	This feature was introduced.

## CHAPTER 116

# Managing Configuration Files

---

- [Prerequisites for Managing Configuration Files, on page 2259](#)
- [Restrictions for Managing Configuration Files, on page 2259](#)
- [Information About Managing Configuration Files, on page 2259](#)
- [How to Manage Configuration File Information, on page 2266](#)
- [Additional References, on page 2295](#)

## Prerequisites for Managing Configuration Files

- You should have at least a basic familiarity with the Cisco IOS environment and the command-line interface.
- You should have at least a minimal configuration running on your system. You can create a basic configuration file using the **setup** command.

## Restrictions for Managing Configuration Files

- Many of the Cisco IOS commands described in this document are available and function only in certain configuration modes on the device.
- Some of the Cisco IOS configuration commands are only available on certain device platforms, and the command syntax may vary on different platforms.

## Information About Managing Configuration Files

### Types of Configuration Files

Configuration files contain the Cisco IOS software commands used to customize the functionality of your Cisco device. Commands are parsed (translated and executed) by the Cisco IOS software when the system is booted (from the startup-config file) or when you enter commands at the CLI in a configuration mode.

Startup configuration files (startup-config) are used during system startup to configure the software. Running configuration files (running-config) contain the current configuration of the software. The two configuration

files can be different. For example, you may want to change the configuration for a short time period rather than permanently. In this case, you would change the running configuration using the **configure terminal EXEC** command but not save the configuration using the **copy running-config startup-config EXEC** command.

To change the running configuration, use the **configure terminal** command, as described in the [Modifying the Configuration File \(CLI\)](#) section. As you use the Cisco IOS configuration modes, commands generally are executed immediately and are saved to the running configuration file either immediately after you enter them or when you exit a configuration mode.

To change the startup configuration file, you can either save the running configuration file to the startup configuration using the **copy running-config startup-config EXEC** command or copy a configuration file from a file server to the startup configuration (see the [Copying a Configuration File from a TFTP Server to the Device \(CLI\)](#) section for more information).

## Configuration Mode and Selecting a Configuration Source

To enter configuration mode on the device, enter the **configure** command at the privileged EXEC prompt. The Cisco IOS software responds with the following prompt asking you to specify the terminal, memory, or a file stored on a network server (network) as the source of configuration commands:

```
Configuring from terminal, memory, or network [terminal]?
```

Configuring from the terminal allows you to enter configuration commands at the command line, as described in the following section. See the [Re-executing the Configuration Commands in the Startup Configuration File \(CLI\)](#) section for more information.

Configuring from the network allows you to load and execute configuration commands over the network. See the [Copying a Configuration File from a TFTP Server to the Device \(CLI\)](#) section for more information.

## Configuration File Changes Using the CLI

The Cisco IOS software accepts one configuration command per line. You can enter as many configuration commands as you want. You can add comments to a configuration file describing the commands you have entered. Precede a comment with an exclamation point (!). Because comments are *not* stored in NVRAM or in the active copy of the configuration file, comments do not appear when you list the active configuration with the **show running-config** or **more system:running-config EXEC** command. Comments are not displayed when you list the startup configuration with the **show startup-config** or **more nvram:startup-config EXEC** mode command. Comments are stripped out of the configuration file when it is loaded onto the device. However, you can list the comments in configuration files stored on a File Transfer Protocol (FTP), Remote Copy Protocol (RCP), or Trivial File Transfer Protocol (TFTP) server. When you configure the software using the CLI, the software executes the commands as you enter them.

## Location of Configuration Files

Configuration files are stored in the following locations:

- The running configuration is stored in RAM.
- On all platforms except the Class A Flash file system platforms, the startup configuration is stored in nonvolatile random-access memory (NVRAM).

- On Class A Flash file system platforms, the startup configuration is stored in the location specified by the CONFIG\_FILE environment variable (see the [Specifying the CONFIG\\_FILE Environment Variable on Class A Flash File Systems \(CLI\)](#) section). The CONFIG\_FILE variable defaults to NVRAM and can be a file in the following file systems:
  - **nvr**am: (NVRAM)
  - **bootflash**: (internal flash memory)
  - **usbflash0**: (flash file system)

## Copy Configuration Files from a Network Server to the Device

You can copy configuration files from a TFTP, rcp, or FTP server to the running configuration or startup configuration of the device. You may want to perform this function for one of the following reasons:

- To restore a backed-up configuration file.
- To use the configuration file for another device. For example, you may add another device to your network and want it to have a similar configuration to the original device. By copying the file to the new device, you can change the relevant parts rather than recreating the whole file.
- To load the same configuration commands on to all of the devices in your network so that all of the devices have similar configurations.

The **copy {ftp: | rcp: | tftp:}system:running-config** EXEC command loads the configuration files into the device as if you were typing the commands on the command line. The device does not erase the existing running configuration before adding the commands. If a command in the copied configuration file replaces a command in the existing configuration file, the existing command is erased. For example, if the copied configuration file contains a different IP address in a particular command than the existing configuration, the IP address in the copied configuration is used. However, some commands in the existing configuration may not be replaced or negated. In this case, the resulting configuration file is a mixture of the existing configuration file and the copied configuration file, with the copied configuration file having precedence.

To restore a configuration file to an exact copy of a file stored on a server, you need to copy the configuration file directly to the startup configuration (using the **copy ftp: | rcp: | tftp:} nvr**am:startup-config command) and reload the device.

To copy configuration files from a server to a device, perform the tasks described in the following sections.

The protocol that you use depends on which type of server you are using. The FTP and rcp transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because the FTP and rcp transport mechanisms are built on and use the TCP/IP stack, which is connection-oriented.

### Copying a Configuration File from the Device to a TFTP Server

In some implementations of TFTP, you must create a dummy file on the TFTP server and give it read, write, and execute permissions before copying a file over it. Refer to your TFTP documentation for more information.

### Copying a Configuration File from the Device to an RCP Server

You can copy a configuration file from the device to an RCP server.

One of the first attempts to use the network as a resource in the UNIX community resulted in the design and implementation of the remote shell protocol, which included the remote shell (rsh) and remote copy (rcp) functions. Rsh and rcp give users the ability to execute commands remotely and copy files to and from a file system residing on a remote host or server on the network. The Cisco implementation of rsh and rcp interoperates with standard implementations.

The rcp **copy** commands rely on the rsh server (or daemon) on the remote system. To copy files using rcp, you need not create a server for file distribution, as you do with TFTP. You need only have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, rcp creates it for you.

Although the Cisco rcp implementation emulates the functions of the UNIX rcp implementation—copying files among systems on the network—the Cisco command syntax differs from the UNIX rcp command syntax. The Cisco rcp support offers a set of **copy** commands that use rcp as the transport mechanism. These rcp **copy** commands are similar in style to the Cisco TFTP **copy** commands, but they offer an alternative that provides faster performance and reliable delivery of data. These improvements are possible because the rcp transport mechanism is built on and uses the TCP/IP stack, which is connection-oriented. You can use rcp commands to copy system images and configuration files from the device to a network server and vice versa.

You also can enable rcp support to allow users on remote systems to copy files to and from the device.

To configure the Cisco IOS software to allow remote users to copy files to and from the device, use the **ip rcmd rcp-enable** global configuration command.

## Restrictions

The RCP protocol requires a client to send a remote username on each RCP request to a server. When you copy a configuration file from the device to a server using RCP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the **copy EXEC** command, if a username is specified.
2. The username set by the **ip rcmd remote-username** global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the device through Telnet and was authenticated through the **username** command, the device software sends the Telnet username as the remote username.
4. The device host name.

For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, you can specify that user name as the remote username.

Use the **ip rcmd remote-username** command to specify a username for all copies. (Rcmd is a UNIX routine used at the super-user level to execute commands on a remote machine using an authentication scheme based on reserved port numbers. Rcmd stands for “remote command”). Include the username in the **copy** command if you want to specify a username for that copy operation only.

If you are writing to the server, the RCP server must be properly configured to accept the RCP write request from the user on the device. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server. For example, suppose the device contains the following configuration lines:

```
hostname Device1
ip rcmd remote-username User0
```

If the device IP address translates to device1.example.com, then the .rhosts file for User0 on the RCP server should contain the following line:

```
Device1.example.com Device1
```

## Requirements for the RCP Username

The RCP protocol requires a client to send a remote username on each RCP request to a server. When you copy a configuration file from the device to a server using RCP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the **copy EXEC** command, if a username is specified.
2. The username set by the **ip rcmd remote-username** global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the device through Telnet and is authenticated through the **username** command, the device software sends the Telnet username as the remote username.
4. The device host name.

For the RCP copy request to execute, an account must be defined on the network server for the remote username. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your RCP server for more information.

## Copying a Configuration File from the Device to an FTP Server

You can copy a configuration file from the device to an FTP server.

### Understanding the FTP Username and Password

**Note** The password must not contain the special character '@'. If the character '@' is used, the copy fails to parse the IP address of the server.

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy a configuration file from the device to a server using FTP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the **copy EXEC** command, if a username is specified.
2. The username set by the **ip ftp username** global configuration command, if the command is configured.
3. Anonymous.

The device sends the first valid password it encounters in the following sequence:

1. The password specified in the **copy** command, if a password is specified.
2. The password set by the **ip ftp password** command, if the command is configured.
3. The device forms a password *username @devicename.domain* . The variable *username* is the username associated with the current session, *devicename* is the configured host name, and *domain* is the domain of the device.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the device.

If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your FTP server for more information.

Use the **ip ftp username** and **ip ftp password** global configuration commands to specify a username and password for all copies. Include the username in the **copy EXEC** command if you want to specify a username for that copy operation only.

## Copy Configuration Files from a Switch to Another Switch

You can copy the configurations from one switch to another. This is a 2-step process - Copy the configurations from the switch to the TFTP server, and then from TFTP to another switch.

To copy your current configurations from the switch, run the command **copy startup-config tftp:** and follow the instructions. The configurations are copied onto the TFTP server.

Then, login to another switch and run the command **copy tftp: startup-config** and follow the instructions. The configurations are now copied onto the other switch.

After the configurations are copied, to save your configurations, use **write memory** command and then either reload the switch or run the **copy startup-config running-config** command

For more information, see *Cisco IOS Configuration Fundamentals Command Reference, Cisco IOS XE Release 16.1 (Catalyst 3850 Switches)*.

## Configuration Files Larger than NVRAM

To maintain a configuration file that exceeds the size of NVRAM, you should be aware of the information in the following sections.

### Compressing the Configuration File

The **service compress-config** global configuration command specifies that the configuration file be stored compressed in NVRAM. Once the configuration file has been compressed, the device functions normally. When the system is booted, it recognizes that the configuration file is compressed, expands it, and proceeds normally. The **more nvram:startup-config EXEC** command expands the configuration before displaying it.

Before you compress configuration files, refer to the appropriate hardware installation and maintenance publication. Verify that your system's ROMs support file compression. If not, you can install new ROMs that support file compression.

The size of the configuration must not exceed three times the NVRAM size. For a 128-KB size NVRAM, the largest expanded configuration file size is 384 KB.

The **service compress-config** global configuration command works only if you have Cisco IOS software Release 10.0 or later release boot ROMs. Installing new ROMs is a one-time operation and is necessary only if you do not already have Cisco IOS Release 10.0 in ROM. If the boot ROMs do not recognize a compressed configuration, the following message is displayed:

```
Boot ROMs do not support NVRAM compression Config NOT written to NVRAM
```

## Storing the Configuration in Flash Memory on Class A Flash File Systems

On class A Flash file system devices, you can store the startup configuration in flash memory by setting the **CONFIG\_FILE** environment variable to a file in internal flash memory or flash memory in a PCMCIA slot.

See the [Specifying the CONFIG\\_FILE Environment Variable on Class A Flash File Systems \(CLI\)](#) section for more information.

Care must be taken when editing or changing a large configuration. Flash memory space is used every time a **copy system:running-config nvram:startup-config EXEC** command is issued. Because file management for flash memory (such as optimizing free space) is not done automatically, you must pay close attention to available flash memory. Use the **squeeze** command to reclaim used space. We recommend that you use a large-capacity Flash card of at least 20 MB.

## Loading the Configuration Commands from the Network

You can also store large configurations on FTP, RCP, or TFTP servers and download them at system startup. To use a network server to store large configurations, see the [Copying a Configuration File from the Device to a TFTP Server \(CLI\)](#) and [Configuring the Device to Download Configuration Files](#) sections for more information on these commands.

## Configuring the Device to Download Configuration Files

You can configure the device to load one or two configuration files at system startup. The configuration files are loaded into memory and read in as if you were typing the commands at the command line. Thus, the configuration for the device is a mixture of the original startup configuration and the one or two downloaded configuration files.

## Network Versus Host Configuration Files

For historical reasons, the first file the device downloads is called the network configuration file. The second file the device downloads is called the host configuration file. Two configuration files can be used when all of the devices on a network use many of the same commands. The network configuration file contains the standard commands used to configure all of the devices. The host configuration files contain the commands specific to one particular host. If you are loading two configuration files, the host configuration file should be the configuration file you want to have precedence over the other file. Both the network and host configuration files must reside on a network server reachable via TFTP, RCP, or FTP, and must be readable.

# How to Manage Configuration File Information

## Displaying Configuration File Information (CLI)

To display information about configuration files, complete the tasks in this section:

### SUMMARY STEPS

1. **enable**
2. **show boot**
3. **more *file-url***
4. **show running-config**
5. **show startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>show boot</b> <b>Example:</b> Device# show boot	Lists the contents of the BOOT environment variable (if set), the name of the configuration file pointed to by the CONFIG_FILE environment variable, and the contents of the BOOTLDR environment variable.
<b>Step 3</b>	<b>more <i>file-url</i></b> <b>Example:</b> Device# more 10.1.1.1	Displays the contents of a specified file.
<b>Step 4</b>	<b>show running-config</b> <b>Example:</b> Device# show running-config	Displays the contents of the running configuration file. (Command alias for the <b>more system:running-config</b> command.)
<b>Step 5</b>	<b>show startup-config</b> <b>Example:</b> Device# show startup-config	Displays the contents of the startup configuration file. (Command alias for the <b>more nvram:startup-config</b> command.)  On all platforms except the Class A Flash file system platforms, the default startup-config file usually is stored in NVRAM.  On the Class A Flash file system platforms, the CONFIG_FILE environment variable points to the default startup-config file.

	Command or Action	Purpose
		The CONFIG_FILE variable defaults to NVRAM.

## Modifying the Configuration File (CLI)

The Cisco IOS software accepts one configuration command per line. You can enter as many configuration commands as you want. You can add comments to a configuration file describing the commands you have entered. Precede a comment with an exclamation point (!). Because comments are *not* stored in NVRAM or in the active copy of the configuration file, comments do not appear when you list the active configuration with the **show running-config** or **more system:running-config EXEC** commands. Comments do not display when you list the startup configuration with the **show startup-config** or **more nvram:startup-config EXEC** mode commands. Comments are stripped out of the configuration file when it is loaded onto the device. However, you can list the comments in configuration files stored on a File Transfer Protocol (FTP), Remote Copy Protocol (RCP), or Trivial File Transfer Protocol (TFTP) server. When you configure the software using the CLI, the software executes the commands as you enter them. To configure the software using the CLI, use the following commands in privileged EXEC mode:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **configuration command**
4. Do one of the following:
  - **end**
  - **^Z**
5. **copy system:running-config nvram:startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Device> enable	Enables privileged EXEC mode.  • Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>configuration command</b> <b>Example:</b>  Device(config)# configuration command	Enter the necessary configuration commands. The Cisco IOS documentation set describes configuration commands organized by technology.
<b>Step 4</b>	Do one of the following:	Ends the configuration session and exits to EXEC mode.

	Command or Action	Purpose
	<ul style="list-style-type: none"> <li>• end</li> <li>• ^Z</li> </ul> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p><b>Note</b> When you press the Ctrl and Z keys simultaneously, ^Z is displayed to the screen.</p>
<b>Step 5</b>	<p><b>copy system:running-config nvram:startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy system:running-config nvram:startup-config</pre>	<p>Saves the running configuration file as the startup configuration file.</p> <p>You may also use the <b>copy running-config startup-config</b> command alias, but you should be aware that this command is less precise. On most platforms, this command saves the configuration to NVRAM. On the Class A Flash file system platforms, this step saves the configuration to the location specified by the CONFIG_FILE environment variable (the default CONFIG_FILE variable specifies that the file should be saved to NVRAM).</p>

### Examples

In the following example, the device prompt name of the device is configured. The comment line, indicated by the exclamation mark (!), does not execute any command. The **hostname** command is used to change the device name from device to new\_name. By pressing Ctrl-Z (^Z) or entering the **end** command, the user quits configuration mode. The **copy system:running-config nvram:startup-config** command saves the current configuration to the startup configuration.

```
Device# configure terminal
Device(config)# !The following command provides the switch host name.
Device(config)# hostname new_name
new_name(config)# end
new_name# copy system:running-config nvram:startup-config
```

When the startup configuration is NVRAM, it stores the current configuration information in text format as configuration commands, recording only non-default settings. The memory is checksummed to guard against corrupted data.

**Note** Some specific commands might not get saved to NVRAM. You need to enter these commands again if you reboot the machine. These commands are noted in the documentation. We recommend that you keep a list of these settings so that you can quickly reconfigure your device after rebooting.

## Copying a Configuration File from the Device to a TFTP Server (CLI)

To copy configuration information on a TFTP network server, complete the tasks in this section:

## SUMMARY STEPS

1. **enable**
2. **copy system:running-config tftp:** [[[//location ]/directory ]/filename ]
3. **copy nvram:startup-config tftp:** [[[//location ]/directory ]/filename ]

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>copy system:running-config tftp:</b> [[[//location ]/directory ]/filename ] <b>Example:</b> Device# copy system:running-config tftp: //server1/topdir/file10	Copies the running configuration file to a TFTP server.
<b>Step 3</b>	<b>copy nvram:startup-config tftp:</b> [[[//location ]/directory ]/filename ] <b>Example:</b> Device# copy nvram:startup-config tftp: //server1/1stidir/file10	Copies the startup configuration file to a TFTP server.

## Examples

The following example copies a configuration file from a device to a TFTP server:

```
Device# copy system:running-config tftp://172.16.2.155/tokyo-config
Write file tokyo-config on host 172.16.2.155? [confirm] Y
Writing tokyo-config!!! [OK]
```

## What to Do Next

After you have issued the **copy** command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the **copy** command and the current setting of the **file prompt** global configuration command.

## Copying a Configuration File from the Device to an RCP Server (CLI)

To copy a startup configuration file or a running configuration file from the device to an RCP server, use the following commands beginning in privileged EXEC mode:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip rcmd remote-username** *username*
4. **end**
5. Do one of the following:
  - **copy system:running-config rcp:** [[[//[username@]location ]/directory ]/filename ]
  - **copy nvram:startup-config rcp:** [[[//[username@]location ]/directory ]/filename ]

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ip rcmd remote-username</b> <i>username</i> <b>Example:</b> Device(config)# ip rcmd remote-username NetAdmin1	(Optional) Changes the default remote username.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# end	(Optional) Exits global configuration mode.
<b>Step 5</b>	Do one of the following: <ul style="list-style-type: none"> <li>• <b>copy system:running-config rcp:</b>                [[[//[username@]location ]/directory ]/filename ]</li> <li>• <b>copy nvram:startup-config rcp:</b>                [[[//[username@]location ]/directory ]/filename ]</li> </ul> <b>Example:</b> Device# copy system:running-config rcp: //NetAdmin1@example.com/dir-files/file1	<ul style="list-style-type: none"> <li>• Specifies that the device running configuration file is to be stored on an RCP server</li> <li>or</li> <li>• Specifies that the device startup configuration file is to be stored on an RCP server</li> </ul>

## Examples

### Storing a Running Configuration File on an RCP Server

The following example copies the running configuration file named `runfile2-config` to the `netadmin1` directory on the remote host with an IP address of `172.16.101.101`:

```
Device# copy system:running-config rcp://netadmin1@172.16.101.101/runfile2-config
Write file runfile2-config on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Device#
```

### Storing a Startup Configuration File on an RCP Server

The following example shows how to store a startup configuration file on a server by using RCP to copy the file:

```
Device# configure terminal

Device(config)# ip rcmd remote-username netadmin2

Device(config)# end

Device# copy nvram:startup-config rcp:

Remote host[]? 172.16.101.101

Name of configuration file to write [start-config]?
Write file start-config on host 172.16.101.101?[confirm]
![OK]
```

## What to Do Next

After you have issued the **copy EXEC** command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the **copy** command and the current setting of the **file prompt** global configuration command.

## Copying a Configuration File from the Device to the FTP Server (CLI)

To copy a startup configuration file or a running configuration file from the device to an FTP server, complete the following tasks:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ftp username** *username*
4. **ip ftp password** *password*
5. **end**
6. Do one of the following:
  - **copy system:running-config ftp:** `[[[//[username [:password ]@]location]/directory ]/filename ]`  
or

- **copy nvram:startup-config ftp:** [[[//[username [:password ]@]location]/directory ]/filename ]

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode on the device.
<b>Step 3</b>	<b>ip ftp username <i>username</i></b> <b>Example:</b> Device(config)# ip ftp username NetAdmin1	(Optional) Specifies the default remote username.
<b>Step 4</b>	<b>ip ftp password <i>password</i></b> <b>Example:</b> Device(config)# ip ftp password adminpassword	(Optional) Specifies the default password.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config)# end	(Optional) Exits global configuration mode. This step is required only if you override the default remote username or password (see Steps 2 and 3).
<b>Step 6</b>	Do one of the following: <ul style="list-style-type: none"> <li>• <b>copy system:running-config ftp:</b> [[[//[username [:password ]@]location]/directory ]/filename ] or</li> <li>• <b>copy nvram:startup-config ftp:</b> [[[//[username [:password ]@]location]/directory ]/filename ]</li> </ul> <b>Example:</b> Device# copy system:running-config ftp:	Copies the running configuration or startup configuration file to the specified location on the FTP server.

## Examples

### Storing a Running Configuration File on an FTP Server

The following example copies the running configuration file named runfile-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

```
Device# copy system:running-config ftp://netadmin1:mypass@172.16.101.101/runfile-config
Write file runfile-config on host 172.16.101.101?[confirm]
```

```
Building configuration...[OK]
Connected to 172.16.101.101
Device#
```

## Storing a Startup Configuration File on an FTP Server

The following example shows how to store a startup configuration file on a server by using FTP to copy the file:

```
Device# configure terminal

Device(config)# ip ftp username netadmin2

Device(config)# ip ftp password mypass

Device(config)# end

Device# copy nvram:startup-config ftp:

Remote host[]? 172.16.101.101

Name of configuration file to write [start-config]?
Write file start-config on host 172.16.101.101?[confirm]
![OK]
```

## What to Do Next

After you have issued the **copy EXEC** command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the **copy** command and the current setting of the **file prompt** global configuration command.

## Copying a Configuration File from a TFTP Server to the Device (CLI)

To copy a configuration file from a TFTP server to the device, complete the tasks in this section:

### SUMMARY STEPS

1. **enable**
2. **copy tftp:** [[[//location]/directory]/filename] **system:running-config**
3. **copy tftp:** [[[//location]/directory]/filename] **nvram:startup-config**
4. **copy tftp:** [[[//location]/directory]/filename] **flash-[n]:/directory/startup-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>copy tftp:</b> [[[//location]/directory]/filename] <b>system:running-config</b> <b>Example:</b>	Copies a configuration file from a TFTP server to the running configuration.

	Command or Action	Purpose
	Device# copy tftp://server1/dir10/datasource system:running-config	
<b>Step 3</b>	<b>copy tftp:</b> [[[//location]/directory]/filename] <b>nvrnram:startup-config</b>  <b>Example:</b>  Device# copy tftp://server1/dir10/datasource nvrnram:startup-config	Copies a configuration file from a TFTP server to the startup configuration.
<b>Step 4</b>	<b>copy tftp:</b> [[[//location]/directory]/filename]flash-[n]/directory/startup-config  <b>Example:</b>  Device# copy tftp://server1/dir10/datasource flash:startup-config	Copies a configuration file from a TFTP server to the startup configuration.

### Examples

In the following example, the software is configured from the file named **tokyo-config** at IP address 172.16.2.155:

```
Device# copy tftp://172.16.2.155/tokyo-config system:running-config

Configure using tokyo-config from 172.16.2.155? [confirm] Y

Booting tokyo-config from 172.16.2.155:!!! [OK - 874/16000 bytes]
```

## What to Do Next

After you have issued the **copy EXEC** command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the **copy** command and the current setting of the **file prompt** global configuration command.

## Copying a Configuration File from the rcp Server to the Device (CLI)

To copy a configuration file from an rcp server to the running configuration or startup configuration, complete the following tasks:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip rcmd remote-username *username***
4. **end**
5. Do one of the following:
  - **copy rcp:** [[[//username@]location]/directory]/filename]system:running-config

• **copy rcp:**[[[//[*username@*]*location*]/*directory*]/*filename*]**nvr**am:startup-config

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	(Optional) Enters configuration mode from the terminal. This step is required only if you override the default remote username (see Step 3).
<b>Step 3</b>	<b>ip rcmd remote-username <i>username</i></b> <b>Example:</b> Device(config)# ip rcmd remote-username NetAdmin1	(Optional) Specifies the remote username.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# end	(Optional) Exits global configuration mode. This step is required only if you override the default remote username (see Step 2).
<b>Step 5</b>	Do one of the following: <ul style="list-style-type: none"> <li>• <b>copy rcp:</b>[[[//[<i>username@</i>]<i>location</i>]/<i>directory</i>]/<i>filename</i>]<b>system:running-config</b></li> <li>• <b>copy rcp:</b>[[[//[<i>username@</i>]<i>location</i>]/<i>directory</i>]/<i>filename</i>]<b>nvr</b>am:startup-config</li> </ul> <b>Example:</b> Device# copy rcp://[user1@example.com/dir10/fileone] nvr:am:startup-config	Copies the configuration file from an rcp server to the running configuration or startup configuration.

## Examples

### Copy RCP Running-Config

The following example copies a configuration file named host1-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101, and loads and runs the commands on the device:

```
Device# copy rcp://netadmin1@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config:[OK]
Device#
%SYS-5-CONFIG: Configured from host1-config by rcp from 172.16.101.101
```

## Copy RCP Startup-Config

The following example specifies a remote username of netadmin1. Then it copies the configuration file named host2-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the startup configuration.

```
Device# configure terminal
Device(config)# ip rcmd remote-username netadmin1
Device(config)# end
Device# copy rcp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-config
Configure using host2-config from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config:[OK]
[OK]
Device#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by rcp from 172.16.101.101
```

## What to Do Next

After you have issued the **copy** EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the **copy** command and the current setting of the **file prompt** global configuration command.

## Copying a Configuration File from an FTP Server to the Device (CLI)

To copy a configuration file from an FTP server to the running configuration or startup configuration, complete the tasks in this section:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ftp username** *username*
4. **ip ftp password** *password*
5. **end**
6. Do one of the following:
  - **copy ftp:** [[[//[*username*[:*password*]@]*location*] /*directory* ]/*filename*]**system:running-config**
  - **copy ftp:** [[[ //[*username*[:*password*]@]*location*] /*directory* ]/*filename*]**nvram:startup-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b>  Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
Step 2	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	(Optional) Allows you to enter global configuration mode. This step is required only if you want to override the default remote username or password (see Steps 3 and 4).
Step 3	<b>ip ftp username <i>username</i></b> <b>Example:</b> Device(config)# ip ftp username NetAdmin1	(Optional) Specifies the default remote username.
Step 4	<b>ip ftp password <i>password</i></b> <b>Example:</b> Device(config)# ip ftp password adminpassword	(Optional) Specifies the default password.
Step 5	<b>end</b> <b>Example:</b> Device(config)# end	(Optional) Exits global configuration mode. This step is required only if you override the default remote username or password (see Steps 3 and 4).
Step 6	Do one of the following: <ul style="list-style-type: none"> <li>• <b>copy ftp:</b> [[[//[<i>username</i>[:<i>password</i>]@]<i>location</i>]/<i>directory</i> ]/<i>filename</i>]<b>system:running-config</b></li> <li>• <b>copy ftp:</b> [[[//[<i>username</i>[:<i>password</i>]@]<i>location</i>]/<i>directory</i>]/<i>filename</i>]<b>nvr:startup-config</b></li> </ul> <b>Example:</b> Device# copy ftp:nvr:startup-config	Using FTP copies the configuration file from a network server to running memory or the startup configuration.

## Examples

### Copy FTP Running-Config

The following example copies a host configuration file named host1-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101, and loads and runs the commands on the device:

```
Device# copy ftp://netadmin1:mypass@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config:![OK]
Device#
%SYS-5-CONFIG: Configured from host1-config by ftp from 172.16.101.101
```

### Copy FTP Startup-Config

The following example specifies a remote username of netadmin1. Then it copies the configuration file named host2-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the startup configuration:

```

Device# configure terminal
Device(config)# ip ftp username netadmin1
Device(config)# ip ftp password mypass
Device(config)# end
Device# copy ftp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[host1-config]? host2-config
Configure using host2-config from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config:[OK]
[OK]
Device#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by ftp from 172.16.101.101

```

## What to Do Next

After you have issued the **copy EXEC** command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the **copy** command and the current setting of the **file prompt** global configuration command.

## Maintaining Configuration Files Larger than NVRAM

To maintain a configuration file that exceeds the size of NVRAM, perform the tasks described in the following sections:

### Compressing the Configuration File (CLI)

To compress configuration files, complete the tasks in this section:

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **service compress-config**
4. **end**
5. Do one of the following:
  - Use FTP, RCP, or TFTP to copy the new configuration.
  - **configure terminal**
6. **copy system:running-config nvram:startup-config**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>service compress-config</b> <b>Example:</b>  Device(config)# service compress-config	Specifies that the configuration file be compressed.
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Device(config)# end	Exits global configuration mode.
<b>Step 5</b>	Do one of the following: <ul style="list-style-type: none"> <li>• Use FTP, RCP, or TFTP to copy the new configuration.</li> <li>• <b>configure terminal</b></li> </ul> <b>Example:</b>  Device# configure terminal	Enters the new configuration: <ul style="list-style-type: none"> <li>• If you try to load a configuration that is more than three times larger than the NVRAM size, the following error message is displayed:  “[buffer overflow - <i>file-size</i> /<i>buffer-size</i> bytes].”</li> </ul>
<b>Step 6</b>	<b>copy system:running-config nvram:startup-config</b> <b>Example:</b>  Device(config)# copy system:running-config nvram:startup-config	When you have finished changing the running-configuration, save the new configuration.

### Examples

The following example compresses a 129-KB configuration file to 11 KB:

```
Device# configure terminal

Device(config)# service compress-config

Device(config)# end

Device# copy tftp://172.16.2.15/tokyo-confg system:running-config

Configure using tokyo-confg from 172.16.2.155? [confirm] y

Booting tokyo-confg from 172.16.2.155:!!! [OK - 874/16000 bytes]
Device# copy system:running-config nvram:startup-config

Building configuration...
Compressing configuration from 129648 bytes to 11077 bytes
[OK]
```

## Storing the Configuration in Flash Memory on Class A Flash File Systems (CLI)

To store the startup configuration in flash memory, complete the tasks in this section:

### SUMMARY STEPS

1. **enable**
2. **copy nvram:startup-config** *flash-filesystem:filename*
3. **configure terminal**
4. **boot config flash-filesystem:** *filename*
5. **end**
6. Do one of the following:
  - Use FTP, RCP, or TFTP to copy the new configuration. If you try to load a configuration that is more than three times larger than the NVRAM size, the following error message is displayed: “[buffer overflow - *file-size* /*buffer-size* bytes].”
  - **configure terminal**
7. **copy system:running-config nvram:startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>copy nvram:startup-config</b> <i>flash-filesystem:filename</i> <b>Example:</b> Device# copy nvram:startup-config usbflash0:switch-config	Copies the current startup configuration to the new location to create the configuration file.
<b>Step 3</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 4</b>	<b>boot config flash-filesystem:</b> <i>filename</i> <b>Example:</b> Device(config)# boot config usbflash0:switch-config	Specifies that the startup configuration file be stored in flash memory by setting the CONFIG_FILE variable.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config)# end	Exits global configuration mode.

	Command or Action	Purpose
Step 6	<p>Do one of the following:</p> <ul style="list-style-type: none"> <li>Use FTP, RCP, or TFTP to copy the new configuration. If you try to load a configuration that is more than three times larger than the NVRAM size, the following error message is displayed: “[buffer overflow - <i>file-size</i> /<i>buffer-size</i> bytes].”</li> <li><b>configure terminal</b></li> </ul> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters the new configuration.
Step 7	<p><b>copy system:running-config nvram:startup-config</b></p> <p><b>Example:</b></p> <pre>Device(config)# copy system:running-config nvram:startup-config</pre>	When you have finished changing the running-configuration, save the new configuration.

### Examples

The following example stores the configuration file in usbflash0:

```
Device# copy nvram:startup-config usbflash0:switch-config
Device# configure terminal
Device(config)# boot config usbflash0:switch-config
Device(config)# end
Device# copy system:running-config nvram:startup-config
```

## Loading the Configuration Commands from the Network (CLI)

To use a network server to store large configurations, complete the tasks in this section:

### SUMMARY STEPS

1. **enable**
2. **copy system:running-config {ftp: | rcp: | tftp:}**
3. **configure terminal**
4. **boot network {ftp:[[//[username [:password ]@]location ]/directory ]/filename ] | rcp:[[//[username@]location ]/directory ]/filename ] | tftp:[[//location ]/directory ]/filename }**
5. **service config**
6. **end**
7. **copy system:running-config nvram:startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>copy system:running-config {ftp:   rcp:   tftp:}</b> <b>Example:</b>  Device# copy system:running-config ftp:	Saves the running configuration to an FTP, RCP, or TFTP server.
<b>Step 3</b>	<b>configure terminal</b> <b>Example:</b>  Device# configure terminal	Enters global configuration mode.
<b>Step 4</b>	<b>boot network {ftp:[[[//[username [:password ]@]location ]/directory ]/filename ]   rcp:[[[//[username@]location ]/directory ]/filename ]   tftp:[[[//[location ]/directory ]/filename ]}]}</b> <b>Example:</b>  Device(config)# boot network ftp://user1:guessme@example.com/dir10/file1	Specifies that the startup configuration file be loaded from the network server at startup.
<b>Step 5</b>	<b>service config</b> <b>Example:</b>  Device(config)# service config	Enables the switch to download configuration files at system startup.
<b>Step 6</b>	<b>end</b> <b>Example:</b>  Device(config)# end	Exits global configuration mode.
<b>Step 7</b>	<b>copy system:running-config nvram:startup-config</b> <b>Example:</b>  Device# copy system:running-config nvram:startup-config	Saves the configuration.

## Copying Configuration Files from Flash Memory to the Startup or Running Configuration (CLI)

To copy a configuration file from flash memory directly to your startup configuration in NVRAM or your running configuration, enter one of the commands in Step 2:

**SUMMARY STEPS**

1. **enable**
2. Do one of the following:
  - **copy filesystem:** *[partition-number:][filename ] nvram:startup-config*
  - **copy filesystem:** *[partition-number:][filename ] system:running-config*

**DETAILED STEPS**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	Do one of the following: <ul style="list-style-type: none"> <li>• <b>copy filesystem:</b> <i>[partition-number:][filename ] nvram:startup-config</i></li> <li>• <b>copy filesystem:</b> <i>[partition-number:][filename ] system:running-config</i></li> </ul> <b>Example:</b> Device# copy usbflash0:4:ios-upgrade-1 nvram:startup-config	<ul style="list-style-type: none"> <li>• Loads a configuration file directly into NVRAM or</li> <li>• Copies a configuration file to your running configuration</li> </ul>

**Examples**

The following example copies the file named ios-upgrade-1 from partition 4 of the flash memory PC Card in usbflash0 to the device startup configurations:

```
Device# copy usbflash0:4:ios-upgrade-1 nvram:startup-config
Copy 'ios-upgrade-1' from flash device as 'startup-config' ? [yes/no] yes
[OK]
```

**Copying Configuration Files Between Flash Memory File Systems (CLI)**

On platforms with multiple flash memory file systems, you can copy files from one flash memory file system, such as internal flash memory to another flash memory file system. Copying files to different flash memory file systems lets you create backup copies of working configurations and duplicate configurations for other devices. To copy a configuration file between flash memory file systems, use the following commands in EXEC mode:

**SUMMARY STEPS**

1. **enable**

2. **show** *source-filesystem*:
3. **copy** *source-filesystem*: [*partition-number*][:*filename* ] *dest-filesystem*: [*partition-number*][:*filename* ]

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>show</b> <i>source-filesystem</i> : <b>Example:</b> Device# show flash:	Displays the layout and contents of flash memory to verify the filename.
<b>Step 3</b>	<b>copy</b> <i>source-filesystem</i> : [ <i>partition-number</i> ][: <i>filename</i> ] <i>dest-filesystem</i> : [ <i>partition-number</i> ][: <i>filename</i> ] <b>Example:</b> Device# copy flash: usbflash0:	Copies a configuration file between flash memory devices. <ul style="list-style-type: none"> <li>• The source device and the destination device cannot be the same. For example, the <b>copy usbflash0: usbflash0:</b> command is invalid.</li> </ul>

### Example

The following example copies the file named `running-config` from partition 1 on internal flash memory to partition 1 of `usbflash0` on a device. In this example, the source partition is not specified, so the device prompts for the partition number:

```
Device# copy flash: usbflash0:

System flash
Partition  Size  Used   Free   Bank-Size  State      Copy Mode
1          4096K  3070K  1025K   4096K      Read/Write Direct
2          16384K  1671K  14712K  8192K      Read/Write Direct
[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 1]
System flash directory, partition 1:
File Length Name/status
1  3142748 dirt/network/mars-test/c3600-j-mz.latest
2   850    running-config
[3143728 bytes used, 1050576 available, 4194304 total]
usbflash0 flash directory:
File Length Name/status
1  1711088 dirt/gate/c3600-i-mz
2   850    running-config
[1712068 bytes used, 2482236 available, 4194304 total]
Source file name? running-config

Destination file name [running-config]?
Verifying checksum for 'running-config' (file # 2)... OK
Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]
Copy 'running-config' from flash: device
```

	Command or Action	Purpose
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Device(config)# end</pre>	(Optional) Exits configuration mode. This step is required only if you override the default remote username (see Steps 3 and 4).
<b>Step 6</b>	<b>copy ftp: [[//location]/directory ]/bundle_name flash:</b> <b>Example:</b> <pre>Device&gt;copy ftp:/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash:</pre>	Copies the configuration file from a network server to the flash memory device using FTP.

## What to Do Next

After you have issued the **copy EXEC** command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the **copy** command and the current setting of the **file prompt** global configuration command.

## Copying a Configuration File from an RCP Server to Flash Memory Devices (CLI)

To copy a configuration file from an RCP server to a flash memory device, complete the tasks in this section:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip rcmd remote-username *username***
4. **end**
5. **copy rcp: [[[[username@]location ]/directory ]/bundle\_name] flash:**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Device&gt; enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	(Optional) Enters global configuration mode. This step is required only if you override the default remote username or password (see Step 3).

	Command or Action	Purpose
<b>Step 3</b>	<b>ip rcmd remote-username</b> <i>username</i> <b>Example:</b>  Device(config)# ip rcmd remote-username Admin01	(Optional) Specifies the remote username.
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Device(config)# end	(Optional) Exits configuration mode. This step is required only if you override the default remote username or password (see Step 3).
<b>Step 5</b>	<b>copy rcp:</b> [[[//[username@]location ]/directory] /bundle_name] <b>flash:</b> <b>Example:</b>  Device# copy rcp://netadmin@172.16.101.101/bundle1 flash:	Copies the configuration file from a network server to the flash memory device using RCP. Respond to any device prompts for additional information or confirmation. Prompting depends on how much information you provide in the <b>copy</b> command and the current setting of the <b>file prompt</b> command.

## Copying a Configuration File from a TFTP Server to Flash Memory Devices (CLI)

To copy a configuration file from a TFTP server to a flash memory device, complete the tasks in this section:

### SUMMARY STEPS

1. **enable**
2. **copy tftp:** [[[//[location ]/directory ]/bundle\_name] **flash:**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>copy tftp:</b> [[[//[location ]/directory ]/bundle_name] <b>flash:</b> <b>Example:</b>  Device# copy tftp://cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash:	Copies the file from a TFTP server to the flash memory device. Reply to any device prompts for additional information or confirmation. Prompting depends on how much information you provide in the <b>copy</b> command and the current setting of the <b>file prompt</b> command.

### Examples

The following example shows the copying of the configuration file named switch-config from a TFTP server to the flash memory card inserted in usbflash0. The copied file is renamed new-config.

```
Device#
copy tftp:switch-config usbflash0:new-config
```

## Re-executing the Configuration Commands in the Startup Configuration File (CLI)

To re-execute the commands located in the startup configuration file, complete the task in this section:

### SUMMARY STEPS

1. enable
2. configure memory

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure memory</b> <b>Example:</b> Device# configure memory	Re-executes the configuration commands located in the startup configuration file.

## Clearing the Startup Configuration (CLI)

You can clear the configuration information from the startup configuration. If you reboot the device with no startup configuration, the device enters the Setup command facility so that you can configure the device from scratch. To clear the contents of your startup configuration, complete the task in this section:

### SUMMARY STEPS

1. enable
2. erase nvram

### DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	<b>Example:</b> <pre>Device&gt; enable</pre>	<ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>erase nvram</b> <b>Example:</b> <pre>Device# erase nvram</pre>	<p>Clears the contents of your startup configuration.</p> <p><b>Note</b> For all platforms except the Class A Flash file system platforms, this command erases NVRAM. The startup configuration file cannot be restored once it has been deleted. On Class A Flash file system platforms, when you use the <b>erase startup-config EXEC</b> command, the device erases or deletes the configuration pointed to by the CONFIG_FILE environment variable. If this variable points to NVRAM, the device erases NVRAM. If the CONFIG_FILE environment variable specifies a flash memory device and configuration filename, the device deletes the configuration file. That is, the device marks the file as “deleted,” rather than erasing it. This feature allows you to recover a deleted file.</p>

## Deleting a Specified Configuration File (CLI)

To delete a specified configuration on a specific flash device, complete the task in this section:

### SUMMARY STEPS

- enable
- delete *flash-filesystem:filename*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Device&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>delete <i>flash-filesystem:filename</i></b> <b>Example:</b>	<p>Deletes the specified configuration file on the specified flash device.</p>

	Command or Action	Purpose
	Device# delete usbflash0:myconfig	<p><b>Note</b> On Class A and B Flash file systems, when you delete a specific file in flash memory, the system marks the file as deleted, allowing you to later recover a deleted file using the <b>undelete</b> EXEC command. Erased files cannot be recovered. To permanently erase the configuration file, use the <b>squeeze</b> EXEC command. On Class C Flash file systems, you cannot recover a file that has been deleted. If you attempt to erase or delete the configuration file specified by the CONFIG_FILE environment variable, the system prompts you to confirm the deletion.</p>

## Specifying the CONFIG\_FILE Environment Variable on Class A Flash File Systems (CLI)

On Class A flash file systems, you can configure the Cisco IOS software to load the startup configuration file specified by the CONFIG\_FILE environment variable. The CONFIG\_FILE variable defaults to NVRAM. To change the CONFIG\_FILE environment variable, complete the tasks in this section:

### SUMMARY STEPS

1. enable
2. copy *[flash-url | ftp-url | rcp-url | tftp-url | system:running-config | nvram:startup-config] dest-flash-url*
3. configure terminal
4. boot config *dest-flash-url*
5. end
6. copy system:running-config nvram:startup-config
7. show boot

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<p><b>copy</b> <i>[flash-url   ftp-url   rcp-url   tftp-url   system:running-config   nvram:startup-config] dest-flash-url</i></p> <p><b>Example:</b></p> <pre>Device# copy system:running-config nvram:startup-config</pre>	<p>Copies the configuration file to the flash file system from which the device loads the file on restart.</p>

	Command or Action	Purpose
Step 3	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
Step 4	<b>boot config <i>dest-flash-url</i></b> <b>Example:</b> Device(config)# boot config 172.16.1.1	Sets the CONFIG_FILE environment variable. This step modifies the runtime CONFIG_FILE environment variable.
Step 5	<b>end</b> <b>Example:</b> Device(config)# end	Exits global configuration mode.
Step 6	<b>copy system:running-config nvram:startup-config</b> <b>Example:</b> Device# copy system:running-config nvram:startup-config	Saves the configuration performed in Step 3 to the startup configuration.
Step 7	<b>show boot</b> <b>Example:</b> Device# show boot	(Optional) Allows you to verify the contents of the CONFIG_FILE environment variable.

### Examples

The following example copies the running configuration file to the device. This configuration is then used as the startup configuration when the system is restarted:

```
Device# copy system:running-config usbflash0:config2
Device# configure terminal
Device(config)# boot config usbflash0:config2
Device(config)# end
Device# copy system:running-config nvram:startup-config
[ok]
Device# show boot
BOOT variable = usbflash0:rsp-boot-m
CONFIG_FILE variable = nvram:
Current CONFIG_FILE variable = usbflash0:config2
Configuration register is 0x010F
```

### What to Do Next

After you specify a location for the startup configuration file, the **nvram:startup-config** command is aliased to the new location of the startup configuration file. The **more nvram:startup-config EXEC** command

displays the startup configuration, regardless of its location. The **erase nvram:startup-config EXEC** command erases the contents of NVRAM and deletes the file pointed to by the CONFIG\_FILE environment variable.

When you save the configuration using the **copy system:running-config nvram:startup-config** command, the device saves a complete version of the configuration file to the location specified by the CONFIG\_FILE environment variable and a distilled version to NVRAM. A distilled version is one that does not contain access list information. If NVRAM contains a complete configuration file, the device prompts you to confirm your overwrite of the complete version with the distilled version. If NVRAM contains a distilled configuration, the device does not prompt you for confirmation and proceeds with overwriting the existing distilled configuration file in NVRAM.

---

**Note** If you specify a file in a flash device as the CONFIG\_FILE environment variable, every time you save your configuration file with the **copy system:running-config nvram:startup-config** command, the old configuration file is marked as “deleted,” and the new configuration file is saved to that device. Eventually, Flash memory fills up as the old configuration files still take up memory. Use the **squeeze EXEC** command to permanently delete the old configuration files and reclaim the space.

---

## Configuring the Device to Download Configuration Files

You can specify an ordered list of network configuration and host configuration filenames. The Cisco IOS XE software scans this list until it loads the appropriate network or host configuration file.

To configure the device to download configuration files at system startup, perform at least one of the tasks described in the following sections:

- [Configuring the Device to Download the Network Configuration File \(CLI\)](#)
- [Configuring the Device to Download the Host Configuration File \(CLI\)](#)

If the device fails to load a configuration file during startup, it tries again every 10 minutes (the default setting) until a host provides the requested files. With each failed attempt, the device displays the following message on the console terminal:

```
Booting host-config... [timed out]
```

If there are any problems with the startup configuration file, or if the configuration register is set to ignore NVRAM, the device enters the Setup command facility.

### Configuring the Device to Download the Network Configuration File (CLI)

To configure the Cisco IOS software to download a network configuration file from a server at startup, complete the tasks in this section:

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **boot network** {**ftp**:[[[//[username [:password ]@]location ]/directory ]/filename ] | **rep**:[[[//[username@]location ]/directory ]/filename ] | **tftp**:[[[//location ]/directory ]/filename ]}
4. **service config**

5. end
6. copy system:running-config nvram:startup-config

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
Step 3	<b>boot network</b> {ftp:[[//[username [:password ]@]location ]/directory ]/filename ]   rcp:[[//[username@]location ]/directory ]/filename ]   tftp:[[//[location ]/directory ]/filename ]} <b>Example:</b> Device(config)# boot network tftp:hostfile1	Specifies the network configuration file to download at startup, and the protocol to be used (TFTP, RCP, or FTP). <ul style="list-style-type: none"> <li>• If you do not specify a network configuration filename, the Cisco IOS software uses the default filename network-config. If you omit the address, the device uses the broadcast address.</li> <li>• You can specify more than one network configuration file. The software tries them in order entered until it loads one. This procedure can be useful for keeping files with different configuration information loaded on a network server.</li> </ul>
Step 4	<b>service config</b> <b>Example:</b> Device(config)# service config	Enables the system to automatically load the network file on restart.
Step 5	<b>end</b> <b>Example:</b> Device(config)# end	Exits global configuration mode.
Step 6	<b>copy system:running-config nvram:startup-config</b> <b>Example:</b> Device# copy system:running-config nvram:startup-config	Saves the running configuration to the startup configuration file.

## Configuring the Device to Download the Host Configuration File (CLI)

To configure the Cisco IOS software to download a host configuration file from a server at startup, complete the tasks in this section:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **boot host** {ftp:[[/[username [:password ]@]location ]/directory ]/filename ] | rcp:[[/[username@]location ]/directory ]/filename ] | tftp:[[/location ]/directory ]/filename ] }
4. **service config**
5. **end**
6. **copy system:running-config nvram:startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>boot host</b> {ftp:[[/[username [:password ]@]location ]/directory ]/filename ]   rcp:[[/[username@]location ]/directory ]/filename ]   tftp:[[/location ]/directory ]/filename ] } <b>Example:</b> Device(config)# boot host tftp:hostfile1	Specifies the host configuration file to download at startup, and the protocol to be used (FTP, RCP, or TFTP): <ul style="list-style-type: none"> <li>• If you do not specify a host configuration filename, the device uses its own name to form a host configuration filename by converting the name to all lowercase letters, removing all domain information, and appending “-config.” If no host name information is available, the software uses the default host configuration filename device-config. If you omit the address, the device uses the broadcast address.</li> <li>• You can specify more than one host configuration file. The Cisco IOS software tries them in order entered until it loads one. This procedure can be useful for keeping files with different configuration information loaded on a network server.</li> </ul>
<b>Step 4</b>	<b>service config</b> <b>Example:</b> Device(config)# service config	Enables the system to automatically load the host file upon restart.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config)# end	Exits global configuration mode.

	Command or Action	Purpose
Step 6	<b>copy system:running-config nvram:startup-config</b> <b>Example:</b> <pre>Device# copy system:running-config nvram:startup-config</pre>	Saves the running configuration to the startup configuration file.

### Example

In the following example, a device is configured to download the host configuration file named `hostfile1` and the network configuration file named `networkfile1`. The device uses TFTP and the broadcast address to obtain the file:

```
Device# configure terminal
Device(config)# boot host tftp:hostfile1
Device(config)# boot network tftp:networkfile1
Device(config)# service config
Device(config)# end
Device# copy system:running-config nvram:startup-config
```

## CHAPTER 117

# Configuration Replace and Configuration Rollback

---

- [Prerequisites for Configuration Replace and Configuration Rollback, on page 2297](#)
- [Restrictions for Configuration Replace and Configuration Rollback, on page 2298](#)
- [Information About Configuration Replace and Configuration Rollback, on page 2298](#)
- [How to Use Configuration Replace and Configuration Rollback, on page 2301](#)
- [Configuration Examples for Configuration Replace and Configuration Rollback, on page 2307](#)
- [Additional References, on page 2309](#)

## Prerequisites for Configuration Replace and Configuration Rollback

The format of the configuration files used as input by the Configuration Replace and Configuration Rollback feature must comply with standard Cisco software configuration file indentation rules as follows:

- Start all commands on a new line with no indentation, unless the command is within a configuration submode.
- Indent commands within a first-level configuration submode one space.
- Indent commands within a second-level configuration submode two spaces.
- Indent commands within subsequent submodes accordingly.

These indentation rules describe how the software creates configuration files for such commands as **show running-config** or **copy running-config destination-url**. Any configuration file generated on a Cisco device complies with these rules.

Free memory larger than the combined size of the two configuration files (the current running configuration and the saved replacement configuration) is required.

# Restrictions for Configuration Replace and Configuration Rollback

If the device does not have free memory larger than the combined size of the two configuration files (the current running configuration and the saved replacement configuration), the configuration replace operation is not performed.

Certain Cisco configuration commands such as those pertaining to physical components of a networking device (for example, physical interfaces) cannot be added or removed from the running configuration. For example, a configuration replace operation cannot remove the **interface ethernet 0** command line from the current running configuration if that interface is physically present on the device. Similarly, the **interface ethernet 1** command line cannot be added to the running configuration if no such interface is physically present on the device. A configuration replace operation that attempts to perform these types of changes results in error messages indicating that these specific command lines failed.

In very rare cases, certain Cisco configuration commands cannot be removed from the running configuration without reloading the device. A configuration replace operation that attempts to remove this type of command results in error messages indicating that these specific command lines failed.

## Information About Configuration Replace and Configuration Rollback

### Configuration Archive

The Cisco IOS configuration archive is intended to provide a mechanism to store, organize, and manage an archive of Cisco IOS configuration files to enhance the configuration rollback capability provided by the **configure replace** command. Before this feature was introduced, you could save copies of the running configuration using the **copy running-config destination-url** command, storing the replacement file either locally or remotely. However, this method lacked any automated file management. On the other hand, the Configuration Replace and Configuration Rollback feature provides the capability to automatically save copies of the running configuration to the Cisco IOS configuration archive. These archived files serve as checkpoint configuration references and can be used by the **configure replace** command to revert to previous configuration states.

The **archive config** command allows you to save Cisco IOS configurations in the configuration archive using a standard location and filename prefix that is automatically appended with an incremental version number (and optional timestamp) as each consecutive file is saved. This functionality provides a means for consistent identification of saved Cisco IOS configuration files. You can specify how many versions of the running configuration are kept in the archive. After the maximum number of files are saved in the archive, the oldest file is automatically deleted when the next, most recent file is saved. The **show archive** command displays information for all configuration files saved in the Cisco IOS configuration archive.

The Cisco IOS configuration archive, in which the configuration files are stored and available for use with the **configure replace** command, can be located on the following file systems: FTP, HTTP, RCP, TFTP.

## Configuration Replace

The **configure replace** privileged EXEC command provides the capability to replace the current running configuration with any saved Cisco IOS configuration file. This functionality can be used to revert to a previous configuration state, effectively rolling back any configuration changes that were made since the previous configuration state was saved.

When using the **configure replace** command, you must specify a saved Cisco IOS configuration as the replacement configuration file for the current running configuration. The replacement file must be a complete configuration generated by a Cisco IOS device (for example, a configuration generated by the **copy running-config destination-url** command), or, if generated externally, the replacement file must comply with the format of files generated by Cisco IOS devices. When the **configure replace** command is entered, the current running configuration is compared with the specified replacement configuration and a set of diffs is generated. The algorithm used to compare the two files is the same as that employed by the **show archive config differences** command. The resulting diffs are then applied by the Cisco IOS parser to achieve the replacement configuration state. Only the diffs are applied, avoiding potential service disruption from reapplying configuration commands that already exist in the current running configuration. This algorithm effectively handles configuration changes to order-dependent commands (such as access lists) through a multiple pass process. Under normal circumstances, no more than three passes are needed to complete a configuration replace operation, and a limit of five passes is performed to preclude any looping behavior.

The Cisco IOS **copy source-url running-config** privileged EXEC command is often used to copy a stored Cisco IOS configuration file to the running configuration. When using the **copy source-url running-config** command as an alternative to the **configure replace target-url** privileged EXEC command, the following major differences should be noted:

- The **copy source-url running-config** command is a merge operation and preserves all of the commands from both the source file and the current running configuration. This command does not remove commands from the current running configuration that are not present in the source file. In contrast, the **configure replace target-url** command removes commands from the current running configuration that are not present in the replacement file and adds commands to the current running configuration that need to be added.
- The **copy source-url running-config** command applies every command in the source file, whether or not the command is already present in the current running configuration. This algorithm is inefficient and, in some cases, can result in service outages. In contrast, the **configure replace target-url** command only applies the commands that need to be applied—no existing commands in the current running configuration are reapplied.
- A partial configuration file may be used as the source file for the **copy source-url running-config** command, whereas a complete Cisco IOS configuration file must be used as the replacement file for the **configure replace target-url** command.

A locking feature for the configuration replace operation was introduced. When the **configure replace** command is used, the running configuration file is locked by default for the duration of the configuration replace operation. This locking mechanism prevents other users from changing the running configuration while the replacement operation is taking place, which might otherwise cause the replacement operation to terminate unsuccessfully. You can disable the locking of the running configuration by using the **no lock** keyword when issuing the **configure replace** command.

The running configuration lock is automatically cleared at the end of the configuration replace operation. You can display any locks that may be currently applied to the running configuration using the **show configuration lock** command.

## Configuration Rollback

The concept of rollback comes from the transactional processing model common to database operations. In a database transaction, you might make a set of changes to a given database table. You then must choose whether to commit the changes (apply the changes permanently) or to roll back the changes (discard the changes and revert to the previous state of the table). In this context, rollback means that a journal file containing a log of the changes is discarded, and no changes are applied. The result of the rollback operation is to revert to the previous state, before any changes were applied.

The **configure replace** command allows you to revert to a previous configuration state, effectively rolling back changes that were made since the previous configuration state was saved. Instead of basing the rollback operation on a specific set of changes that were applied, the Cisco IOS configuration rollback capability uses the concept of reverting to a specific configuration state based on a saved Cisco IOS configuration file. This concept is similar to the database idea of saving a checkpoint (a saved version of the database) to preserve a specific state.

If the configuration rollback capability is desired, you must save the Cisco IOS running configuration before making any configuration changes. Then, after entering configuration changes, you can use that saved configuration file to roll back the changes (using the **configure replace target-url** command). Furthermore, because you can specify any saved Cisco IOS configuration file as the replacement configuration, you are not limited to a fixed number of rollbacks, as is the case in some rollback models.

### Configuration Rollback Confirmed Change

The Configuration Rollback Confirmed Change feature allows configuration changes to be performed with an optional requirement that they be confirmed. If this confirmation is not received, the configuration is returned to the state prior to the changes being applied. The mechanism provides a safeguard against inadvertent loss of connectivity between a network device and the user or management application due to configuration changes.

## Benefits of Configuration Replace and Configuration Rollback

- Allows you to revert to a previous configuration state, effectively rolling back configuration changes.
- Allows you to replace the current running configuration file with the startup configuration file without having to reload the device or manually undo CLI changes to the running configuration file, therefore reducing system downtime.
- Allows you to revert to any saved Cisco IOS configuration state.
- Simplifies configuration changes by allowing you to apply a complete configuration file to the device, where only the commands that need to be added or removed are affected.
- When using the **configure replace** command as an alternative to the **copy source-url running-config** command, increases efficiency and prevents risk of service outages by not reapplying existing commands in the current running configuration.

# How to Use Configuration Replace and Configuration Rollback

## Creating a Configuration Archive (CLI)

No prerequisite configuration is needed to use the **configure replace** command. Using the **configure replace** command in conjunction with the Cisco IOS configuration archive and the **archive config** command is optional but offers significant benefit for configuration rollback scenarios. Before using the **archive config** command, the configuration archive must be configured. Perform this task to configure the characteristics of the configuration archive.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **archive**
4. **path *url***
5. **maximum *number***
6. **time-period *minutes***
7. **end**
8. **archive config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
Step 3	<b>archive</b> <b>Example:</b> Device(config)# archive	Enters archive configuration mode.
Step 4	<b>path <i>url</i></b> <b>Example:</b>	Specifies the location and filename prefix for the files in the Cisco IOS configuration archive.

	Command or Action	Purpose
	Device(config-archive)# path flash:myconfiguration	<p><b>Note</b> If a directory is specified in the path instead of file, the directory name must be followed by a forward slash as follows: path flash:/directory/. The forward slash is not necessary after a filename; it is only necessary when specifying a directory.</p>
<b>Step 5</b>	<p><b>maximum</b> <i>number</i></p> <p><b>Example:</b></p> <pre>Device(config-archive)# maximum 14</pre>	<p>(Optional) Sets the maximum number of archive files of the running configuration to be saved in the Cisco IOS configuration archive.</p> <ul style="list-style-type: none"> <li>The <i>number</i> argument is the maximum number of archive files of the running configuration to be saved in the Cisco IOS configuration archive. Valid values are from 1 to 14. The default is 10.</li> </ul> <p><b>Note</b> Before using this command, you must configure the <b>path</b> command to specify the location and filename prefix for the files in the Cisco IOS configuration archive.</p>
<b>Step 6</b>	<p><b>time-period</b> <i>minutes</i></p> <p><b>Example:</b></p> <pre>Device(config-archive)# time-period 1440</pre>	<p>(Optional) Sets the time increment for automatically saving an archive file of the current running configuration in the Cisco IOS configuration archive.</p> <ul style="list-style-type: none"> <li>The <i>minutes</i> argument specifies how often, in minutes, to automatically save an archive file of the current running configuration in the Cisco IOS configuration archive.</li> </ul> <p><b>Note</b> Before using this command, you must configure the <b>path</b> command to specify the location and filename prefix for the files in the Cisco IOS configuration archive.</p>
<b>Step 7</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-archive)# end</pre>	Exits to privileged EXEC mode.
<b>Step 8</b>	<p><b>archive config</b></p> <p><b>Example:</b></p> <pre>Device# archive config</pre>	<p>Saves the current running configuration file to the configuration archive.</p> <p><b>Note</b> The <b>path</b> command must be configured before using this command.</p>

## Performing a Configuration Replace or Configuration Rollback Operation (CLI)

Perform this task to replace the current running configuration file with a saved Cisco IOS configuration file.

**Note** You must create a configuration archive before performing this procedure. See [Creating a Configuration Archive \(CLI\)](#) for detailed steps. The following procedure details how to return to that archived configuration in the event of a problem with the current running configuration.

### SUMMARY STEPS

1. **enable**
2. **configure replace** *target-url* [**nolock**] [**list**] [**force**] [**ignore case**] [**revert trigger** [**error** ] ] [**timer** *minutes* ] | **time** *minutes* ] ]
3. **configure revert** { **now** | **timer** { *minutes* | **idle** *minutes* } }
4. **configure confirm**
5. **exit**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> <pre>Device&gt; enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure replace</b> <i>target-url</i> [ <b>nolock</b> ] [ <b>list</b> ] [ <b>force</b> ] [ <b>ignore case</b> ] [ <b>revert trigger</b> [ <b>error</b> ] ] [ <b>timer</b> <i>minutes</i> ]   <b>time</b> <i>minutes</i> ] ] <b>Example:</b> <pre>Device# configure replace flash: startup-config time 120</pre>	Replaces the current running configuration file with a saved Cisco IOS configuration file. <ul style="list-style-type: none"> <li>• The <i>target - url</i> argument is a URL (accessible by the Cisco IOS file system) of the saved Cisco IOS configuration file that is to replace the current running configuration, such as the configuration file created using the <b>archive config</b> command.</li> <li>• The <b>list</b> keyword displays a list of the command lines applied by the Cisco IOS software parser during each pass of the configuration replace operation. The total number of passes performed is also displayed.</li> <li>• The <b>force</b> keyword replaces the current running configuration file with the specified saved Cisco IOS configuration file without prompting you for confirmation.</li> <li>• The <b>time minutes</b> keyword and argument specify the time (in minutes) within which you must enter the <b>configure confirm</b> command to confirm replacement of the current running configuration file. If the <b>configure confirm</b> command is not entered within the</li> </ul>

	Command or Action	Purpose
		<p>specified time limit, the configuration replace operation is automatically reversed (in other words, the current running configuration file is restored to the configuration state that existed prior to entering the <b>configure replace</b> command).</p> <ul style="list-style-type: none"> <li>• The <b>no</b>lock keyword disables the locking of the running configuration file that prevents other users from changing the running configuration during a configuration replace operation.</li> <li>• The <b>revert trigger</b> keywords set the following triggers for reverting to the original configuration: <ul style="list-style-type: none"> <li>• <b>error</b> —Reverts to the original configuration upon error.</li> <li>• <b>timer</b> <i>minutes</i> —Reverts to the original configuration if specified time elapses.</li> </ul> </li> <li>• The <b>ignore case</b> keyword allows the configuration to ignore the case of the confirmation command.</li> </ul>
<b>Step 3</b>	<p><b>configure revert</b> { <b>now</b>   <b>timer</b> { <i>minutes</i>   <b>idle</b> <i>minutes</i> } }</p> <p><b>Example:</b></p> <pre>Device# configure revert now</pre>	<p>(Optional) To cancel the timed rollback and trigger the rollback immediately, or to reset parameters for the timed rollback, use the <b>configure revert</b> command in privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• <b>now</b> —Triggers the rollback immediately.</li> <li>• <b>timer</b> —Resets the configuration revert timer. <ul style="list-style-type: none"> <li>• Use the <i>minutes</i> argument with the <b>timer</b> keyword to specify a new revert time in minutes.</li> <li>• Use the <b>idle</b> keyword along with a time in minutes to set the maximum allowable time period of no activity before reverting to the saved configuration.</li> </ul> </li> </ul>
<b>Step 4</b>	<p><b>configure confirm</b></p> <p><b>Example:</b></p> <pre>Device# configure confirm</pre>	<p>(Optional) Confirms replacement of the current running configuration file with a saved Cisco IOS configuration file.</p> <p><b>Note</b> Use this command only if the <b>time</b> <i>seconds</i> keyword and argument of the <b>configure replace</b> command are specified.</p>
<b>Step 5</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device# exit</pre>	<p>Exits to user EXEC mode.</p>

# Monitoring and Troubleshooting the Feature (CLI)

Perform this task to monitor and troubleshoot the Configuration Replace and Configuration Rollback feature.

## SUMMARY STEPS

1. **enable**
2. **show archive**
3. **debug archive versioning**
4. **debug archive config timestamp**
5. **exit**

## DETAILED STEPS

### Step 1 **enable**

Use this command to enable privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
Device#
```

### Step 2 **show archive**

Use this command to display information about the files saved in the Cisco IOS configuration archive.

**Example:**

```
Device# show archive
There are currently 1 archive configurations saved.
The next archive file will be named flash:myconfiguration-2
Archive # Name
0
1 flash:myconfiguration-1 <- Most Recent
2
3
4
5
6
7
8
9
10
11
12
13
14
```

The following is sample output from the **show archive** command after several archive files of the running configuration have been saved. In this example, the maximum number of archive files to be saved is set to three.

**Example:**

```
Device# show archive
There are currently 3 archive configurations saved.
The next archive file will be named flash:myconfiguration-8
```

```

Archive #  Name
0
1      :Deleted
2      :Deleted
3      :Deleted
4      :Deleted
5      flash:myconfiguration-5
6      flash:myconfiguration-6
7      flash:myconfiguration-7 <- Most Recent
8
9
10
11
12
13
14

```

### Step 3 debug archive versioning

Use this command to enable debugging of the Cisco IOS configuration archive activities to help monitor and troubleshoot configuration replace and rollback.

#### Example:

```

Device# debug archive versioning
Jan  9 06:46:28.419:backup_running_config
Jan  9 06:46:28.419:Current = 7
Jan  9 06:46:28.443:Writing backup file flash:myconfiguration-7
Jan  9 06:46:29.547: backup worked

```

### Step 4 debug archive config timestamp

Use this command to enable debugging of the processing time for each integral step of a configuration replace operation and the size of the configuration files being handled.

#### Example:

```

Device# debug archive config timestamp
Device# configure replace flash:myconfiguration force
Timing Debug Statistics for IOS Config Replace operation:
    Time to read file usbflash0:sample_2.cfg = 0 msec (0 sec)
    Number of lines read:55
    Size of file      :1054
Starting Pass 1
    Time to read file system:running-config = 0 msec (0 sec)
    Number of lines read:93
    Size of file      :2539
    Time taken for positive rollback pass = 320 msec (0 sec)
    Time taken for negative rollback pass = 0 msec (0 sec)
    Time taken for negative incremental diffs pass = 59 msec (0 sec)
    Time taken by PI to apply changes = 0 msec (0 sec)
    Time taken for Pass 1 = 380 msec (0 sec)
Starting Pass 2
    Time to read file system:running-config = 0 msec (0 sec)
    Number of lines read:55
    Size of file      :1054
    Time taken for positive rollback pass = 0 msec (0 sec)
    Time taken for negative rollback pass = 0 msec (0 sec)
    Time taken for Pass 2 = 0 msec (0 sec)
Total number of passes:1
Rollback Done

```

### Step 5 exit

Use this command to exit to user EXEC mode.

**Example:**

```
Device# exit
Device>
```

---

# Configuration Examples for Configuration Replace and Configuration Rollback

## Creating a Configuration Archive

The following example shows how to perform the initial configuration of the Cisco IOS configuration archive. In this example, flash:myconfiguration is specified as the location and filename prefix for the files in the configuration archive and a value of 10 is set as the maximum number of archive files to be saved.

```
configure terminal
!
archive
 path flash:myconfiguration
 maximum 10
end
```

## Replacing the Current Running Configuration with a Saved Cisco IOS Configuration File

The following example shows how to replace the current running configuration with a saved Cisco IOS configuration file named flash:myconfiguration. The **configure replace** command interactively prompts you to confirm the operation.

```
Device# configure replace flash:myconfiguration
This will apply all necessary additions and deletions
to replace the current running configuration with the
contents of the specified configuration file, which is
assumed to be a complete configuration, not a partial
configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
Total number of passes: 1
Rollback Done
```

In the following example, the **list** keyword is specified in order to display the command lines that were applied during the configuration replace operation:

```
Device# configure replace flash:myconfiguration list
This will apply all necessary additions and deletions
to replace the current running configuration with the
contents of the specified configuration file, which is
assumed to be a complete configuration, not a partial
configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
```

```
!Pass 1
!List of Commands:
no snmp-server community public ro
snmp-server community mystring ro

end
Total number of passes: 1
Rollback Done
```

## Reverting to the Startup Configuration File

The following example shows how to revert to the Cisco IOS startup configuration file using the **configure replace** command. This example also shows the use of the optional **force** keyword to override the interactive user prompt:

```
Device# configure replace flash:startup-config force
Total number of passes: 1
Rollback Done
```

## Performing a Configuration Replace Operation with the **configure confirm** Command

The following example shows the use of the **configure replace** command with the **time minutes** keyword and argument. You must enter the **configure confirm** command within the specified time limit to confirm replacement of the current running configuration file. If the **configure confirm** command is not entered within the specified time limit, the configuration replace operation is automatically reversed (in other words, the current running configuration file is restored to the configuration state that existed prior to entering the **configure replace** command).

```
Device# configure replace flash:startup-config time 120
This will apply all necessary additions and deletions
to replace the current running configuration with the
contents of the specified configuration file, which is
assumed to be a complete configuration, not a partial
configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
Total number of passes: 1
Rollback Done
Device# configure confirm
```

The following example shows the use of the **configure revert** command with the **timer** keyword. You must enter the **configure revert** command to cancel the timed rollback and trigger the rollback immediately, or to reset parameters for the timed rollback.

```
Device# configure revert timer 100
```

## Performing a Configuration Rollback Operation

The following example shows how to make changes to the current running configuration and then roll back the changes. As part of the configuration rollback operation, you must save the current running configuration before making changes to the file. In this example, the **archive config** command is used to save the current running configuration. The generated output of the **configure replace** command indicates that only one pass was performed to complete the rollback operation.

**Note** Before using the **archive config** command, you must configure the **path** command to specify the location and filename prefix for the files in the Cisco IOS configuration archive.

You first save the current running configuration in the configuration archive as follows:

```
archive config
```

You then enter configuration changes as shown in the following example:

```
configure terminal
!
user netops2 password rain
user netops3 password snow
exit
```

After having made changes to the running configuration file, assume you now want to roll back these changes and revert to the configuration that existed before the changes were made. The **show archive** command is used to verify the version of the configuration to be used as a replacement file. The **configure replace** command is then used to revert to the replacement configuration file as shown in the following example:

```
Device# show archive
There are currently 1 archive configurations saved.
The next archive file will be named flash:myconfiguration-2
Archive # Name
0
1 flash:myconfiguration-1 <- Most Recent
2
3
4
5
6
7
8
9
10
Device# configure replace flash:myconfiguration-1
Total number of passes: 1
Rollback Done
```

## Information About the Flash File System

The flash file system is a single flash device on which you can store files. It also provides several commands to help you manage software bundles and configuration files. The default flash file system on the device is named flash:

As viewed from the active device, or any stack member, flash: refers to the local flash device, which is the device attached to the same device on which the file system is being viewed. In a device stack, each of the flash devices from the various stack members can be viewed from the active device. The names of these flash file systems include the corresponding device member numbers. For example, flash-3:, as viewed from the active device, refers to the same file system as does flash: on stack member 3. Use the **show file systems** privileged EXEC command to list all file systems, including the flash file systems in the device stack.

Only one user at a time can manage the software bundles and configuration files for a device stack.

## Displaying Available File Systems

To display the available file systems on your device, use the **show file systems** privileged EXEC command as shown in this example for a standalone device:

```
Device# show file systems
File Systems:
  Size(b)    Free(b)    Type    Flags    Prefixes
*  15998976  5135872   flash  rw      flash:
      -      -        opaque rw      bs:
      -      -        opaque rw      vb:
```

## Displaying Available File Systems

```

524288      520138      nvram      rw      nvram:
-           -           network    rw      tftp:
-           -           opaque     rw      null:
-           -           opaque     rw      system:
-           -           opaque     ro      xmodem:
-           -           opaque     ro      ymodem:

```

This example shows a device stack. In this example, the active device is stack member 1; the file system on stack member 2 is displayed as flash-2; the file system on stack member 3 is displayed as flash-3; and so on up to stack member 9, displayed as flash-9: for a 9-member stack. The example also shows the crashinfo directories and a USB flash drive plugged into the active device:

```

Device# show file systems
File Systems:
  Size (b)      Free (b)      Type  Flags  Prefixes
145898496      5479424      disk  rw     crashinfo:crashinfo-1:

-              -            opaque rw     revrcsf:

```

**Table 193: show file systems Field Descriptions**

<b>Field</b>	<b>Value</b>
Size(b)	Amount of memory in the file system in bytes.
Free(b)	Amount of free memory in the file system in bytes.
Type	Type of file system. <b>disk</b> —The file system is for a flash memory device, USB flash, and crashinfo file. <b>network</b> —The file system for network devices; for example, an FTP server or and HTTP server. <b>nvr</b> am—The file system is for a NVRAM device. <b>opaque</b> —The file system is a locally generated pseudo file system (for example, the system) or a download interface, such as brimux. <b>unknown</b> —The file system is an unknown type.
Flags	Permission for file system. <b>ro</b> —read-only. <b>rw</b> —read/write. <b>wo</b> —write-only.

Field	Value
Prefixes	<p>Alias for file system.</p> <p><b>crashinfo:</b>—Crashinfo file.</p> <p><b>flash:</b>—Flash file system.</p> <p><b>ftp:</b>—FTP server.</p> <p><b>http:</b>—HTTP server.</p> <p><b>https:</b>—Secure HTTP server.</p> <p><b>nvr:</b>—NVRAM.</p> <p><b>null:</b>—Null destination for copies. You can copy a remote file to null to find its size.</p> <p><b>r:</b>—Remote Copy Protocol (RCP) server.</p> <p><b>s:</b>—Session Control Protocol (SCP) server.</p> <p><b>system:</b>—Contains the system memory, including the running configuration.</p> <p><b>t:</b>—TFTP network server.</p> <p><b>usbflash0:</b>—USB flash memory.</p> <p><b>x:</b>—Obtain the file from a network machine by using the Xmodem protocol.</p> <p><b>y:</b>—Obtain the file from a network machine by using the Ymodem protocol.</p>

## Setting the Default File System

You can specify the file system or directory that the system uses as the default file system by using the **cd** *filesystem:* privileged EXEC command. You can set the default file system to omit the *filesystem:* argument from related commands. For example, for all privileged EXEC commands that have the optional *filesystem:* argument, the system uses the file system specified by the **cd** command.

By default, the default file system is *flash:*.

You can display the current default file system as specified by the **cd** command by using the **pwd** privileged EXEC command.

## Displaying Information About Files on a File System

You can view a list of the contents of a file system before manipulating its contents. For example, before copying a new configuration file to flash memory, you might want to verify that the file system does not already contain a configuration file with the same name. Similarly, before copying a flash configuration file to another location, you might want to verify its filename for use in another command. To display information about files on a file system, use one of the privileged EXEC commands listed in the following table.

Table 194: Commands for Displaying Information About Files

Command	Description
<b>dir</b> [/all] [filesystem:filename]	Displays a list of files on a file system.
<b>show file systems</b>	Displays more information about each of the files on a file system.
<b>show file information</b> file-url	Displays information about a specific file.
<b>show file descriptors</b>	Displays a list of open file descriptors. File descriptors are the internal representations of open files. You can use this command to see if another user has a file open.

For example, to display a list of all files in a file system, use the **dir** privileged EXEC command:

```
device# dir flash:
Directory of flash:/
7386  -rwx      2097152 Jan 23 2013 14:06:49 +00:00 nvram_config
7378  drwx         4096 Jan 23 2013 09:35:11 +00:00 mnt
7385  -rw-      221775876 Jan 23 2013 14:15:13 +00:00
cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
7389  -rwx         556 Jan 21 2013 20:47:30 +00:00 vlan.dat
712413184 bytes total (445063168 bytes free)
device#
```

## Changing Directories and Displaying the Working Directory (CLI)

Follow these steps to change directories and to display the working directory:

### SUMMARY STEPS

1. **enable**
2. **dir filesystem:**
3. **cd directory\_name**
4. **pwd**
5. **cd**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>dir filesystem:</b> <b>Example:</b> Device# dir flash:	Displays the directories on the specified file system. For <i>filesystem:</i> , use flash: for the system board flash device. To access flash partitions of device members in a stack, use flash- <i>n</i> where <i>n</i> is the stack member number. For example, flash-4.
<b>Step 3</b>	<b>cd directory_name</b> <b>Example:</b> Device# cd new_configs	Navigates to the specified directory. The command example shows how to navigate to the directory named <i>new_configs</i> .
<b>Step 4</b>	<b>pwd</b> <b>Example:</b> Device# pwd	Displays the working directory.
<b>Step 5</b>	<b>cd</b> <b>Example:</b> Device# cd	Navigates to the default directory.

## Creating Directories (CLI)

Beginning in privileged EXEC mode, follow these steps to create a directory:

### SUMMARY STEPS

1. **dir filesystem:**
2. **mkdir directory\_name**
3. **dir filesystem:**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>dir filesystem:</b> <b>Example:</b> Device# dir flash:	Displays the directories on the specified file system. For <i>filesystem:</i> , use flash: for the system board flash device.
<b>Step 2</b>	<b>mkdir directory_name</b> <b>Example:</b> Device# mkdir new_configs	Creates a new directory. Directory names are case sensitive and are limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, slashes, quotes, semicolons, or colons.

	Command or Action	Purpose
Step 3	<b>dir filesystem:</b> <b>Example:</b> Device# dir flash:	Verifies your entry.

## Removing Directories

To remove a directory with all its files and subdirectories, use the **delete /force /recursive filesystem:/file-url** privileged EXEC command.

Use the **/recursive** keyword to delete the named directory and all subdirectories and the files contained in it. Use the **/force** keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process.

For *filesystem*, use **flash:** for the system board flash device. For *file-url*, enter the name of the directory to be deleted. All of the files in the directory and the directory are removed.

**Caution** When directories are deleted, their contents cannot be recovered.

## Copying Files

To copy a file from a source to a destination, use the **copy source-url destination-url** privileged EXEC command. For the source and destination URLs, you can use **running-config** and **startup-config** keyword shortcuts. For example, the **copy running-config startup-config** command saves the currently running configuration file to the NVRAM section of flash memory to be used as the configuration during system initialization.

You can also copy from special file systems (**xmodem:**, **ymodem:**) as the source for the file from a network machine that uses the Xmodem or Ymodem protocol.

Network file system URLs include ftp:, rcp:, tftp:, scp:, http:, and https: and have these syntaxes:

- FTP—ftp:[[/username [:password]@location]/directory]/filename
- RCP—rcp:[[/username@location]/directory]/filename
- TFTP—tftp:[[/location]/directory]/filename
- SCP—scp:[[/username [:password]@location]/directory]/filename
- HTTP—http:[[/username [:password]@location]/directory]/filename
- HTTPS—https:[[/username [:password]@location]/directory]/filename

**Note** The password must not contain the special character '@'. If the character '@' is used, the copy fails to parse the IP address of the server.

Local writable file systems include flash:

Some invalid combinations of source and destination exist. Specifically, you cannot copy these combinations:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the **copy flash: flash:** command is invalid)

## Copying Files from One Device in a Stack to Another Device in the Same Stack

To copy a file from one device in a stack to another device in the same stack, use the **flash-X:** notation, where **X** is the device number.

To view all devices in a stack, use the **show switch** command in privileged EXEC mode, as in the following example of a 9-member device stack:

```
Device# show switch
Switch/Stack Mac Address : 0006.f6b9.b580 - Local Mac Address Mac persistency wait time:
Indefinite
```

Switch#	Role	Mac Address	Priority	H/W Version	Current State
*1	Active	0006.f6b9.b580	15	P3B	Ready
2	Standby	0006.f6ba.0c80	14	P3B	Ready
3	Member	0006.f6ba.3300	7	P3B	Ready
4	Member	0006.f6b9.df80	6	P3B	Ready
5	Member	0006.f6ba.3880	13	P1A	Ready
6	Member	1ce6.c7b6.ef00	4	PP	Ready
7	Member	2037.06ce.2580	3	P2A	Ready
8	Member	2037.0653.7e00	2	P5A	Ready
9	Member	2037.0653.9280	1	P5B	Ready

To view all file systems available to copy on a specific device, use the **copy** command as in the following example of a 5-member stack:

```
Device# copy flash: ?
crashinfo-1: Copy to crashinfo-1: file system
crashinfo-2: Copy to crashinfo-2: file system
crashinfo-3: Copy to crashinfo-3: file system
crashinfo-4: Copy to crashinfo-4: file system
crashinfo-5: Copy to crashinfo-5: file system
crashinfo: Copy to crashinfo: file system
flash-1: Copy to flash-1: file system
flash-2: Copy to flash-2: file system
flash-3: Copy to flash-3: file system
flash-4: Copy to flash-4: file system
flash-5: Copy to flash-5: file system
flash: Copy to flash: file system
ftp: Copy to ftp: file system
http: Copy to http: file system
https: Copy to https: file system
null: Copy to null: file system
nvram: Copy to nvram: file system
rcp: Copy to rcp: file system
revrcsf: Copy to revrcsf: file system
running-config Update (merge with) current system configuration
scp: Copy to scp: file system
```

```

startup-config Copy to startup configuration
stby-crashinfo: Copy to stby-crashinfo: file system
stby-flash: Copy to stby-flash: file system
stby-nvram: Copy to stby-nvram: file system
stby-rcsf: Copy to stby-rcsf: file system
stby-usbflash0: Copy to stby-usbflash0: file system
syslog: Copy to syslog: file system
system: Copy to system: file system
tftp: Copy to tftp: file system
tmpsys: Copy to tmpsys: file system
usbflash0-1: Copy to usbflash0-1: file system
usbflash0-2: Copy to usbflash0-2: file system
usbflash0-3: Copy to usbflash0-3: file system
usbflash0-4: Copy to usbflash0-4: file system
usbflash0-5: Copy to usbflash0-5: file system
usbflash0: Copy to usbflash0: file system

```

Device#

This example shows how to copy a config file stored in the flash partition of device 2 to the flash partition of device 4. It assumes that device 2 and device 4 are in the same stack.

```
Device# copy flash-2:config.txt flash-4:config.txt
```

## Deleting Files

When you no longer need a file on a flash memory device, you can permanently delete it. To delete a file or directory from a specified flash device, use the **delete** [/force] [/recursive] [filesystem:] /file-url privileged EXEC command.

Use the **/recursive** keyword for deleting a directory and all subdirectories and the files contained in it. Use the **/force** keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the **/force** and **/recursive** keywords for deleting old software images that were installed by using the **archive download-sw** command but are no longer needed.

If you omit the *filesystem:* option, the device uses the default device specified by the **cd** command. For *file-url*, you specify the path (directory) and the name of the file to be deleted.

When you attempt to delete any files, the system prompts you to confirm the deletion.

---

**Caution** When files are deleted, their contents cannot be recovered.

---

This example shows how to delete the file *myconfig* from the default flash memory device:

```
Device# delete myconfig
```

## Creating, Displaying and Extracting Files (CLI)

You can create a file and write files into it, list the files in a file, and extract the files from a file as described in the next sections.

Beginning in privileged EXEC mode, follow these steps to create a file, display the contents, and extract it:

## SUMMARY STEPS

1. **archive tar /create** *destination-url* **flash:** */file-url*
2. **archive tar /table** *source-url*
3. **archive tar /xtract** *source-url* **flash:***/file-url* [*dir/file...*]
4. **more** [ */ascii* | */binary* | */ebcdic* ] */file-url*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>archive tar /create</b> <i>destination-url</i> <b>flash:</b> <i>/file-url</i></p> <p><b>Example:</b></p> <pre>device# archive tar /create tftp:172.20.10.30/saved. flash:/new-configs</pre>	<p>Creates a file and adds files to it.</p> <p>For <i>destination-url</i>, specify the destination URL alias for the local or network file system and the name of the file to create:</p> <ul style="list-style-type: none"> <li>• Local flash file system syntax: <p><b>flash:</b></p> </li> <li>• FTP syntax: <p><b>ftp:</b>[[<i>/username[:password]</i>@<i>location</i>]/<i>directory</i>]/-<i>filename</i>.</p> </li> <li>• RCP syntax: <p><b>rcp:</b>[[<i>/username@location</i>]/<i>directory</i>]/-<i>filename</i>.</p> </li> <li>• TFTP syntax: <p><b>tftp:</b>[[<i>//location</i>]/<i>directory</i>]/-<i>filename</i>.</p> </li> </ul> <p>For <b>flash:</b><i>/file-url</i>, specify the location on the local flash file system in which the new file is created. You can also specify an optional list of files or directories within the source directory to add to the new file. If none are specified, all files and directories at this level are written to the newly created file.</p>
<b>Step 2</b>	<p><b>archive tar /table</b> <i>source-url</i></p> <p><b>Example:</b></p> <pre>device# archive tar /table flash: /new_configs</pre>	<p>Displays the contents of a file.</p> <p>For <i>source-url</i>, specify the source URL alias for the local or network file system. The <i>-filename</i>. is the file to display. These options are supported:</p> <ul style="list-style-type: none"> <li>• Local flash file system syntax: <p><b>flash:</b></p> </li> <li>• FTP syntax: <p><b>ftp:</b>[[<i>/username[:password]</i>@<i>location</i>]/<i>directory</i>]/-<i>filename</i>.</p> </li> <li>• RCP syntax: <p><b>rcp:</b>[[<i>/username@location</i>]/<i>directory</i>]/-<i>filename</i>.</p> </li> <li>• TFTP syntax: <p><b>tftp:</b>[[<i>//location</i>]/<i>directory</i>]/-<i>filename</i>.</p> </li> </ul>

	Command or Action	Purpose
		You can also limit the file displays by specifying a list of files or directories after the file. Only those files appear. If none are specified, all files and directories appear.
<b>Step 3</b>	<p><b>archive tar /xtract</b> <i>source-url</i> <b>flash:</b>/<i>file-url</i> [<i>dir/file...</i>]</p> <p><b>Example:</b></p> <pre>device# archive tar /xtract tftp:/172.20.10.30/saved. flash:/new-configs</pre>	<p>Extracts a file into a directory on the flash file system.</p> <p>For <i>source-url</i>, specify the source URL alias for the local file system. The <i>-filename</i>. is the file from which to extract files. These options are supported:</p> <ul style="list-style-type: none"> <li>Local flash file system syntax: <ul style="list-style-type: none"> <li><b>flash:</b></li> </ul> </li> <li>FTP syntax: <ul style="list-style-type: none"> <li><b>ftp:</b>[[//<i>username</i>[:<i>password</i>][@<i>location</i>]/<i>directory</i>]/-<i>filename</i>.</li> </ul> </li> <li>RCP syntax: <ul style="list-style-type: none"> <li><b>rcp:</b>[[//<i>username</i>@<i>location</i>]/<i>directory</i>]/-<i>filename</i>.</li> </ul> </li> <li>TFTP syntax: <ul style="list-style-type: none"> <li><b>tftp:</b>[[//<i>location</i>]/<i>directory</i>]/-<i>filename</i>.</li> </ul> </li> </ul> <p>For <b>flash:</b>/<i>file-url</i> [<i>dir/file...</i>], specify the location on the local flash file system from which the file is extracted. Use the <i>dir/file...</i> option to specify a list of files or directories within the file to be extracted. If none are specified, all files and directories are extracted.</p>
<b>Step 4</b>	<p><b>more</b> [ /ascii   /binary   /ebcdic ] /<i>file-url</i></p> <p><b>Example:</b></p> <pre>device# more flash:/new-configs</pre>	Displays the contents of any readable file, including a file on a remote file system.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Introduction to Conditional Debugging

The Conditional Debugging feature allows you to selectively enable debugging and logging for the specific features based on the set of conditions you define. This feature is useful in systems where a large number of features are supported.

---

**Note** On Cisco IOS 16.1, only Control Plane Tracing is supported.

---

The Conditional debug allows you to debug in a very granular fashion in a network that is operating at scale even with a large number of features deployed. It allows you to observe detailed debugs for granular instances

within the system. This is very useful when we need to debug only a particular session among thousands of sessions. It is also possible to specify multiple conditions.

A condition refers to a feature or identity, where identity could be an interface, IP Address, or a MAC address and so on.

---

**Note** In Cisco IOS Release 16.1 the only condition that is supported is MAC address. The support for other features will be introduced in the releases that follow.

---

This is in contrast to the general debug command, that produces its output without discriminating on the feature objects that are being processed, which consumes lot of system resources and impacts the system performance.

## Introduction to Radioactive Tracing

Radioactive tracing provides the ability to stitch together a chain of execution for operations of interest across the system at an increased verbosity level. It provides a way to conditionally print debug information (upto DEBUG Level or upto a specified debug level) across threads, processes and function calls.

---

**Note** In Cisco IOS Release 16.1 the default level is **DEBUG**. The users cannot change this to another level. The support for other levels will be introduced in the releases that follow.

---

## Conditional Debugging and Radioactive Tracing

Radioactive Tracing when coupled with Conditional Debugging, enable us to have a single debug CLI to debug all executions contexts related to the condition without having to be aware of the various processes within the box that were part of a the control flow for a feature and without having to issue debugs at these processes individually.

## Location of Tracefiles

By default the tracefile logs will be generated for each process and saved into either the **/tmp/rp/trace** or **/tmp/fp/trace** directory. In this temp directory, the trace logs are written to files, which are of 1 MB size each. The directory can hold upto a maximum of 25 such files for a given process. When a tracefile in the **/tmp** directory reaches its 1MB limit or whatever size was configured for it at boot time, it is rotated out to an archive location under the **/crashinfo** partition under a **tracelogs** directory.

The **/tmp** directory only holds a single tracefile for a given process. Once the file reaches its filesize limit it is rotated out to **/crashinfo/tracelogs**. In the archive directory, upto 25 files are accumulated, after which the oldest one is replaced by the newly rotated file from **/tmp**.

The tracefiles are located in the crashinfo directory in the following formats:

1. Process-name\_Process-ID\_running-counter.timestamp.gz

Example: IOSRP\_R0-0.bin\_0.14239.20151101234827.gz

2. Process-name\_pmanlog\_Process-ID\_running-counter.timestamp.bin.gz

Example: wcm\_pmanlog\_R0-0.30360\_0.20151028233007.bin.gz

## Configuring Conditional Debugging

To configure conditional debugging, follow the steps given below:

.

### SUMMARY STEPS

1. enable
2. debug platform condition mac {mac-address}
3. debug platform condition start
4. show platform condition OR show debug
5. debug platform condition stop
6. request platform software trace archive [last {number} days] [target {crashinfo: | flashinfo:}]
7. request platform software trace filter-binary {wire | wireless} [context {mac-address} | level | module]
8. show platform software trace [filter-binary | level | message]
9. clear platform condition all

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>debug platform condition mac {mac-address}</b> <b>Example:</b> Device# debug platform condition mac bc16.6509.3314	Configures conditional debugging for the MAC Address specified.
Step 3	<b>debug platform condition start</b> <b>Example:</b> Device# debug platform condition start	Starts conditional debugging (this will start radioactive tracing if there is a match on one of the conditions above).
Step 4	<b>show platform condition OR show debug</b> <b>Example:</b> Device# show platform condition Device# show debug	Displays the current conditions set.

	Command or Action	Purpose
<b>Step 5</b>	<b>debug platform condition stop</b> <b>Example:</b> Device# <code>debug platform condition stop</code>	Stops conditional debugging (this will stop radioactive tracing).
<b>Step 6</b>	<b>request platform software trace archive [last {number} days] [target {crashinfo:  flashinfo:}]</b> <b>Example:</b> Device# <code>request platform software trace archive last 2 days</code>	(Optional) Displays historical logs of merged tracefiles on the system. Filter on any combination of number of days or location.
<b>Step 7</b>	<b>request platform software trace filter-binary {wire   wireless} [context {mac-address}   level   module]</b> <b>Example:</b> Device# <code>request platform software trace filter-binary wireless context bc16.6509.3314</code>	(Optional) Filter the modules to collate the information (wire or wireless) and then on the context of Mac address specified. These logs can be viewed off-line.  <b>Note</b> In Cisco IOS Release 16.1, from all the keywords available, the only keyword supported is wireless. This collects files from processes (ios, wcm, fman_rp, fman_fp, fed).
<b>Step 8</b>	<b>show platform software trace [filter-binary   level   message]</b> <b>Example:</b> Device# <code>show platform software trace message</code>	(Optional) Displays logs merged from the latest tracefile. Filter on any combination of application condition, trace module name, and trace level.  <ul style="list-style-type: none"> <li>• <b>filter-binary</b> - Filter the modules to collated, eg. wireless</li> <li>• <b>level</b> - Show trace levels</li> <li>• <b>message</b> - Show trace message ring contents</li> </ul> <b>Note</b> On Box: <ul style="list-style-type: none"> <li>• Available from IOS console in addition to linux shell.</li> <li>• Generates a file with merged logs on the box.</li> <li>• Displays merged logs only from staging area</li> </ul>
<b>Step 9</b>	<b>clear platform condition all</b> <b>Example:</b> Device# <code>clear platform condition all</code>	Clear all conditions.

### What to do next

**Note** The commands **request platform software trace filter-binary** and **show platform software trace filter-binary** work in a similar way. The only difference is:

- **request platform software trace filter-binary** - Sources the data from historical logs.
- **show platform software trace filter-binary** – Sources the data from the flash Temp directory.

**Note** The command **request platform software trace filter-binary wireless {mac-address}** generates 3 flash files:

- *collated\_log\_<.date..>*
- *mac\_log <.date..>*
- *mac\_database ..file*

Of these, *mac\_log <.date..>* is the most important file, as it gives the messages for the MAC we are debugging. The command **show platform software trace filter-binary** also generates the same flash files, and also prints the *mac\_log* on the screen.

## Recommended Workflow for Trace files

The Recommended Workflow for Trace files is listed below:

1. Request the tracelogs for a specific time period – Example 1 day  
Use the command:  
`Device#request platform software trace archive last 1 day`
2. The system generates a tar ball (.gz file) of the tracelogs in the location /flash:
3. Copy the file off the box. By copying the file, the tracelogs can be used to work offline. For more details on copying files, refer section below.
4. Delete the tracelog file (.gz) file from /flash: location. This ensures that there is enough space on the box for other operations.

## Copying tracefiles off the box

An example of the tracefile is shown below:

```
Device# dir crashinfo:/tracelogs
Directory of crashinfo:/tracelogs/

50664 -rwx 760 Sep 22 2015 11:12:21 +00:00 plogd_F0-0.bin_0.gz
50603 -rwx 991 Sep 22 2015 11:12:08 +00:00 fed_pmanlog_F0-0.bin_0.9558.20150922111208.gz
```

```

50610 -rw- 11 Nov 2 2015 00:15:59 +00:00 timestamp
50611 -rwx 1443 Sep 22 2015 11:11:31 +00:00
auto_upgrade_client_sh_pmanlog_R0-.bin_0.3817.20150922111130.gz
50669 -rwx 589 Sep 30 2015 03:59:04 +00:00 cfgwr-8021_R0-0.bin_0.gz
50612 -rwx 1136 Sep 22 2015 11:11:46 +00:00 reflector_803_R0-0.bin_0.1312.20150922111116.gz
50794 -rwx 4239 Nov 2 2015 00:04:32 +00:00 IOSRP_R0-0.bin_0.14239.20151101234827.gz
50615 -rwx 131072 Nov 2 2015 00:19:59 +00:00 linux_iosd_image_pmanlog_R0-0.bin_0
--More-

```

The trace files can be copied using one of the various options shown below:

```

Device# copy crashinfo:/tracelogs ?
crashinfo: Copy to crashinfo: file system
flash: Copy to flash: file system
ftp: Copy to ftp: file system
http: Copy to http: file system
https: Copy to https: file system
null: Copy to null: file system
nvram: Copy to nvram: file system
rcp: Copy to rcp: file system
running-config Update (merge with) current system configuration
scp: Copy to scp: file system
startup-config Copy to startup configuration
syslog: Copy to syslog: file system
system: Copy to system: file system
tftp: Copy to tftp: file system
tmpsys: Copy to tmpsys: file system

```

The general syntax for copying onto TFTP server is as follows:

```

Device# copy source: tftp:
Device# copy crashinfo:/tracelogs/IOSRP_R0-0.bin_0.14239.20151101234827.gz tftp:
Address or name of remote host []? 2.2.2.2
Destination filename [IOSRP_R0-0.bin_0.14239.20151101234827.gz]?

```

**Note** It is important to clear the switch of these generated report/archive files in order to have flash space available for tracelogs and other purposes.

## Configuration Examples for Conditional Debugging

The following is an output example of the *show platform condition* command.

```

Device# show platform condition
Conditional Debug Global State: Stop
Conditions Direction

```

```

-----|-----
MAC Address 0024.D7C7.0054 N/A
Feature Condition Type Value
-----|-----|-----

```

```

Device#

```

The following is an output example of the *show debug* command.

```

Device# show debug
IOSXE Conditional Debug Configs:
Conditional Debug Global State: Start
Conditions Direction

```

```
-----|-----
MAC Address 0024.D7C7.0054 N/A
Feature Condition Type Value
-----|-----
```

```
Packet Infra debugs:
Ip Address Port
-----|-----
```

```
Device#
```

The following is a sample of the *debug platform condition stop* command.

```
Device# debug platform condition stop
Conditional Debug Global State: Stop
```

## Monitoring Conditional Debugging

The table shown below lists the various commands that can be used to monitor conditional debugging.

Command	Purpose
<b>show platform condition</b>	Displays the current conditions set.
<b>show debug</b>	Displays the current debug conditions set.
<b>show platform software trace filter-binary</b>	Displays logs merged from the latest tracefile.
<b>request platform software trace filter-binary</b>	Displays historical logs of merged tracefiles on the system.

## CHAPTER 121

# Troubleshooting the Software Configuration

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the switch. Depending on the nature of the problem, you can use the command-line interface (CLI), Device Manager, or Network Assistant to identify and solve problems.

Additional troubleshooting information, such as LED descriptions, is provided in the hardware installation guide.

- [Finding Feature Information, on page 2335](#)
- [Information About Troubleshooting the Software Configuration, on page 2335](#)
- [How to Troubleshoot the Software Configuration, on page 2344](#)
- [Verifying Troubleshooting of the Software Configuration, on page 2356](#)
- [Scenarios for Troubleshooting the Software Configuration, on page 2358](#)
- [Configuration Examples for Troubleshooting Software, on page 2360](#)
- [Additional References for Troubleshooting Software Configuration, on page 2362](#)
- [Feature History and Information for Troubleshooting Software Configuration, on page 2363](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Troubleshooting the Software Configuration

### Software Failure on a Switch

Switch software can be corrupted during an upgrade by downloading the incorrect file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

**Related Topics**

[Recovering from a Software Failure](#), on page 2344

## Lost or Forgotten Password on a Device

The default configuration for the device allows an end user with physical access to the device to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the device.

**Note**

On these devices, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message reminds you to return to the default configuration during the recovery process.

## Power over Ethernet Ports

A Power over Ethernet (PoE) switch port automatically supplies power to one of these connected devices if the switch detects that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
- an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also detect the real-time power consumption of the device by monitoring and policing the power usage.

For more information, see the "Configuring PoE" chapter in the *Interface and Hardware Component Configuration Guide (Catalyst 3650 Switches)*.

**Related Topics**

[Scenarios to Troubleshoot Power over Ethernet \(PoE\)](#), on page 2358

## Disabled Port Caused by Power Loss

If a powered device (such as a Cisco IP Phone 7910) that is connected to a PoE Device port and powered by an AC power source loses power from the AC power source, the device might enter an error-disabled state. To recover from an error-disabled state, enter the **shutdown** interface configuration command, and then enter the **no shutdown** interface command. You can also configure automatic recovery on the Device to recover from the error-disabled state.

On a Device, the **errdisable recovery cause loopback** and the **errdisable recovery interval** *seconds* global configuration commands automatically take the interface out of the error-disabled state after the specified period of time.

## Disabled Port Caused by False Link-Up

If a Cisco powered device is connected to a port and you configure the port by using the **power inline never** interface configuration command, a false link-up can occur, placing the port into an error-disabled state. To take the port out of the error-disabled state, enter the **shutdown** and the **no shutdown** interface configuration commands.

You should not connect a Cisco powered device to a port that has been configured with the **power inline never** command.

## Ping

The Device supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:

- Normal response—The normal response (*hostname is alive*) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a *no-answer* message is returned.
- Unknown host—If the host does not exist, an *unknown host* message is returned.
- Destination unreachable—If the default gateway cannot reach the specified network, a *destination-unreachable* message is returned.
- Network or host unreachable—If there is no entry in the route table for the host or network, a *network or host unreachable* message is returned.

## Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. Traceroute finds the path by using the MAC address tables of the Device in the path. When the Device detects a device in the path that does not support Layer 2 traceroute, the Device continues to send Layer 2 trace queries and lets them time out.

The Device can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

## Layer 2 Traceroute Guidelines

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.

If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

- A Device is reachable from another Device when you can test connectivity by using the **ping** privileged EXEC command. All Device in the physical path must be reachable from each other.
- The maximum number of hops identified in the path is ten.
- You can enter the **traceroute mac** or the **traceroute mac ip** privileged EXEC command on a Device that is not in the physical path from the source device to the destination device. All Device in the path must be reachable from this switch.
- The **traceroute mac** command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.
- If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.
- If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.
- The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the Device uses the Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.
  - If an ARP entry exists for the specified IP address, the Device uses the associated MAC address and identifies the physical path.
  - If an ARP entry does not exist, the Device sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.
- When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.
- This feature is not supported in Token Ring VLANs.
- Layer 2 traceroute opens a listening socket on the User Datagram Protocol (UDP) port 2228 that can be accessed remotely with any IPv4 address, and does not require any authentication. This UDP socket allows to read VLAN information, links, presence of particular MAC addresses, and CDP neighbor information, from the device. This information can be used to eventually build a complete picture of the Layer 2 network topology.
- Layer 2 traceroute is enabled by default and can be disabled by running the **no l2 traceroute** command in global configuration mode. To re-enable Layer 2 traceroute, use the **l2 traceroute** command in global configuration mode.

## IP Traceroute

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your Device can participate as the source or destination of the **tracert** privileged EXEC command and might or might not appear as a hop in the **tracert** command output. If the Device is the destination of the **tracert**, it is displayed as the final destination in the **tracert** output. Intermediate Device do not show up in the **tracert** output if they are only bridging the packet from one port to another within the same VLAN. However, if the intermediate Device is a multilayer Device that is routing a particular packet, this Device shows up as a hop in the **tracert** output.

The **tracert** privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Tracert starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Tracert finds the address of the first hop by examining the source address field of the ICMP time-to-live-exceeded message.

To identify the next hop, **tracert** sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, **tracert** sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP *port-unreachable* error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.

## Time Domain Reflector Guidelines

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

TDR is supported on 10/100/1000 copper Ethernet ports and on Multigigabit Ethernet (100Mbps/1/2.5/5/10 Gbps) ports. It is not supported on SFP module ports.

TDR can detect these cabling problems:

- Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.
- Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire.

If one of the twisted-pair wires is open, TDR can find the length at which the wire is open.

**Note** When using the feature with Multigigabit Ethernet ports, the cable length is displayed only when an open or short condition is detected.

Use TDR to diagnose and resolve cabling problems in these situations:

- Replacing a Device
- Setting up a wiring closet
- Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

When you run TDR, the Device reports accurate information in these situations:

- The cable for the gigabit link is a solid-core cable.
- The open-ended cable is not terminated.

When you run TDR, the Device does not report accurate information in these situations:

- The cable for the gigabit link is a twisted-pair cable or is in series with a solid-core cable.
- The link is a 10-megabit or a 100-megabit link.
- The cable is a stranded cable.
- The link partner is a Cisco IP Phone.
- The link partner is not IEEE 802.3 compliant.

## Debug Commands

### Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

All **debug** commands are entered in privileged EXEC mode, and most **debug** commands take no arguments.

## System Report

System reports or crashinfo files save information that helps Cisco technical support representatives to debug problems that caused the Cisco IOS image to fail (crash). It is necessary to quickly and reliably collect critical crash information with high fidelity and integrity. Further, it is necessary to collect this information and bundle it in a way that it can be associated or identified with a specific crash occurrence.

System reports are generated in these situations:

- In case of a switch failure—A system report is generated on the member that failed; reports are not generated on other members in the stack.

- In case of a switchover—System reports are generated only on high availability (HA) member switches. reports are not generated for non-HA members.

The system does not generate reports in case of a reload.

During a process crash, the following is collected locally from the switch:

1. Full process core
2. Tracelogs
3. IOS syslogs (not guaranteed in case of non-active crashes)
4. System process information
5. Bootup logs
6. Reload logs
7. Certain types of /proc information

This information is stored in separate files which are then archived and compressed into one bundle. This makes it convenient to get a crash snapshot in one place, and can be then moved off the box for analysis. This report is generated before the switch goes down to rommon/bootloader.

Except for the full core and tracelogs, everything else is a text file.

### Crashinfo Files

By default the system report file will be generated and saved into the /crashinfo directory. If it cannot be saved to the crashinfo partition for lack of space, then it will be saved to the /flash directory.

To display the files, enter the **dir crashinfo:** command. The following is sample output of a crashinfo directory:

```
Switch#dir crashinfo:
Directory of crashinfo:/
46553 drwx 1024 Jun 29 2015 14:52:09 +00:00 ap_crash

25 -rw- 459709 Sep 9 2015 09:29:28 +00:00 system-report_1_20150909-092728-UTC.gz
26 -rw- 0 Sep 22 2015 11:11:33 +00:00 tracelogs.J8C

50601 drwx 10240 Oct 28 2015 22:42:50 +00:00 tracelogs

248354816 bytes total (204800000 bytes free)
```

System reports are located in the crashinfo directory in the following format:

```
system-report_[switch number]_[date]-[timestamp]-UTC.gz
```

After a switch crashes, check for a system report file. The name of the most recently generated system report file is stored in the `last_systemreport` file under the `crashinfo` directory. The system report and `crashinfo` files assist TAC while troubleshooting the issue.

The system report generated can be further copied using TFTP, HTTP and few other options.

```
Switch#copy crashinfo: ?
crashinfo: Copy to crashinfo: file system
flash: Copy to flash: file system
ftp: Copy to ftp: file system
http: Copy to http: file system
https: Copy to https: file system
null: Copy to null: file system
nvram: Copy to nvram: file system
rcp: Copy to rcp: file system
running-config Update (merge with) current system configuration
scp: Copy to scp: file system
startup-config Copy to startup configuration
syslog: Copy to syslog: file system
system: Copy to system: file system
tftp: Copy to tftp: file system
tmpsys: Copy to tmpsys: file system
```

The general syntax for copying onto TFTP server is as follows:

```
Switch#copy crashinfo: tftp:
Source filename [system-report_1_20150909-092728-UTC.gz]?
Address or name of remote host []? 1.1.1.1
Destination filename [system-report_1_20150909-092728-UTC.gz]?
```

The `tracelogs` from all members in the stack can be collected by issuing a trace archive command. This command provides time period options. The command syntax is as follows:

```
Switch#request platform software trace archive ?
last Archive trace files of last x days
target Location and name for the archive file
```

The `tracelogs` stored in `crashinfo:` or `flash:` directory from within the last 3650 days can be collected.

```
Switch# request platform software trace archive last ?
<1-3650> Number of days (1-3650)
Switch#request platform software trace archive last 3650 days target ?
crashinfo: Archive file name and location
flash: Archive file name and location
```

---

**Note** It is important to clear the system reports or trace archives from `flash` or `crashinfo` directory once they are copied out, in order to have space available for `tracelogs` and other purposes.

---

## Onboard Failure Logging on the Switch

You can use the onboard failure logging (OBFL) feature to collect information about the Device. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot Device problems. We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

By default, OBFL is enabled. It collects information about the Device and small form-factor pluggable (SFP) modules. The Device stores this information in the flash memory:

- CLI commands—Record of the OBFL CLI commands that are entered on a standalone Device or a switch stack member.
- Environment data—Unique device identifier (UDI) information for a standalone Device or a switch stack member and for all the connected FRU devices: the product identification (PID), the version identification (VID), and the serial number.
- Message—Record of the hardware-related system messages generated by a standalone Device or a switch stack member.
- Power over Ethernet (PoE)—Record of the power consumption of PoE ports on a standalone Device or a switch stack member.
- Temperature—Temperature of a standalone Device or a switch stack member.
- Uptime data—Time when a standalone Device or a switch stack member starts, the reason the Device restarts, and the length of time the Device has been running since it last restarted.
- Voltage—System voltages of a standalone Device or a switch stack member.

You should manually set the system clock or configure it by using Network Time Protocol (NTP).

When the Device is running, you can retrieve the OBFL data by using the **show logging onboard** privileged EXEC commands. If the Device fails, contact your Cisco technical support representative to find out how to retrieve the data.

When an OBFL-enabled Device is restarted, there is a 10-minute delay before logging of new data begins.

#### Related Topics

[Displaying OBFL Information](#), on page 2356

## Fan Failures

By default, the feature is disabled. When more than one of the fans fails in a field-replaceable unit (FRU) or in a power supply, the Device does not shut down, and this error message appears:

```
Multiple fan(FRU/PS) failure detected. System may get overheated. Change fan quickly.
```

The Device might overheat and shut down.

To enable the fan failures feature, enter the **system env fan-fail-action shut** privileged EXEC command. If more than one fan in the Device fails, the Device automatically shuts down, and this error message appears:

```
Faulty (FRU/PS) fans detected, shutting down system!
```

After the first fan shuts down, if the Device detects a second fan failure, the Device waits for 20 seconds before it shuts down.

To restart the Device, it must be power cycled.

## Possible Symptoms of High CPU Utilization

Excessive CPU utilization might result in these symptoms, but the symptoms might also result from other causes:

- Spanning tree topology changes
- EtherChannel links brought down due to loss of communication
- Failure to respond to management requests (ICMP ping, SNMP timeouts, slow Telnet or SSH sessions)
- UDLD flapping
- IP SLAs failures because of SLAs responses beyond an acceptable threshold
- DHCP or IEEE 802.1x failures if the switch does not forward or respond to requests

## How to Troubleshoot the Software Configuration

### Recovering from a Software Failure

#### Before you begin

This recovery procedure requires that you have physical access to the switch.

This procedure uses boot loader commands and TFTP to recover from a corrupted or incorrect image file.

- 
- Step 1** From your PC, download the software image file (*image.bin*) from Cisco.com.
- Step 2** Load the software image to your TFTP server.
- Step 3** Connect your PC to the switch Ethernet management port.
- Step 4** Unplug the switch power cord.
- Step 5** Press the **Mode** button, and at the same time, reconnect the power cord to the switch.
- Step 6** From the bootloader (ROMMON) prompt, ensure that you can ping your TFTP server.
- a) Set the IP address **switch: set IP\_ADDR *ip\_address subnet\_mask***
- Example:**
- ```
switch: set IP_ADDR 192.0.2.123/255.255.255.0
```
- b) Set the default router IP address **switch: set DEFAULT\_ROUTER *ip\_address***
- Example:**
- ```
switch: set DEFAULT_ROUTER 192.0.2.1
```
- c) Verify that you can ping the TFTP server **switch: ping *ip\_address\_of\_TFTP\_server***
- Example:**
- ```
switch: ping 192.0.2.15
ping 192.0.2.1 with 32 bytes of data...
Host 192.0.2.1 is alive.
```

```
switch:
```

**Step 7** Verify that you have a recovery image in your recovery partition (sda9:).

This recovery image is required for recovery using the emergency-install feature.

**Example:**

```
switch: dir sda9:
Directory of sda9:/

   2  drwx  1024      .
   2  drwx  1024     ..
  11  -rw- 18923068  c3850-recovery.bin

36939776 bytes available (20830208 bytes used)
switch:
```

**Step 8** From the bootloader (ROMMON) prompt, initiate the emergency-install feature that assists you in recovering the software image on your switch.

**WARNING:** The emergency install command will erase your entire boot flash!

**Example:**

```
Switch#
emergency-install
tftp://192.0.2.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin

The bootflash will be erased during install operation, continue (y/n)?y
Starting emergency recovery

## Recovering from a Lost or Forgotten Password

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

---

**Note** On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.

---

### SUMMARY STEPS

1. Connect a terminal or PC to the switch.
2. Set the line speed on the emulation software to 9600 baud.
3. Power off the standalone switch or the entire switch stack.
4. Reconnect the power cord to the or the active switch. Within 15 seconds, press the **Mode** button while the System LED is still flashing green. Continue pressing the **Mode** button until all the system LEDs turn on and remain solid; then release the **Mode** button.
5. After recovering the password, reload the switch or the active switch .
6. Power on the remaining switches in the stack.

### DETAILED STEPS

---

**Step 1** Connect a terminal or PC to the switch.

- Connect a terminal or a PC with terminal-emulation software to the switch console port. If you are recovering the password for a switch stack, connect to the console port of the active switch or
- Connect a PC to the Ethernet management port. If you are recovering the password for a switch stack, connect to the Ethernet management port of a stack member .

**Step 2** Set the line speed on the emulation software to 9600 baud.

**Step 3** Power off the standalone switch or the entire switch stack.

**Step 4** Reconnect the power cord to the or the active switch. Within 15 seconds, press the **Mode** button while the System LED is still flashing green. Continue pressing the **Mode** button until all the system LEDs turn on and remain solid; then release the **Mode** button.

•

```
Switch:
Xmodem file system is available.
Base ethernet MAC Address: 20:37:06:4d:e9:80
Verifying bootloader digital signature.
```

```
The system has been interrupted prior to loading the operating
system software, console will be reset to 9600 baud rate.
```

proceed to the *Procedure with Password Recovery Enabled* section, and follow the steps.

**Step 5** After recovering the password, reload the switch or the active switch .

On a switch:

```
Switch> reload
Proceed with reload? [confirm] y
```

On the active switch:

```
Switch> reload slot <stack-active-member-number>
Proceed with reload? [confirm] y
```

**Step 6** Power on the remaining switches in the stack.

---

[Lost or Forgotten Password on a Device](#), on page 2336

## Procedure with Password Recovery Enabled

If the password-recovery operation is enabled, this message appears:

---

**Step 1** Initialize the flash file system.

```
Device: flash_init
```

**Step 2** Ignore the startup configuration with the following command:

```
Device: SWITCH_IGNORE_STARTUP_CFG=1
```

**Step 3** Boot the switch with the *packages.conf* file from flash.

```
Device: boot flash:packages.conf
```

**Step 4** Terminate the initial configuration dialog by answering **No**.

```
Would you like to enter the initial configuration dialog? [yes/no]: No
```

**Step 5** At the switch prompt, enter privileged EXEC mode.

```
Device> enable  
Switch#
```

**Step 6** Copy the startup configuration to running configuration.

```
Device# copy startup-config running-config Destination filename [running-config]?
```

Press Return in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

**Step 7** Enter global configuration mode and change the **enable** password.

```
Device# configure terminal  
Device(config)#
```

**Step 8** Write the running configuration to the startup configuration file.

```
Device# copy running-config startup-config
```

**Step 9** Confirm that manual boot mode is enabled.

```
Device# show boot  
  
BOOT variable = flash:packages.conf;  
Manual Boot = yes  
Enable Break = yes
```

**Step 10** Reload the device.

```
Device# reload
```

**Step 11** Return the Bootloader parameters (previously changed in Steps 2 and 3) to their original values.

```
Device: switch: SWITCH_IGNORE_STARTUP_CFG=0
```

**Step 12** Boot the device with the *packages.conf* file from flash.

```
Device: boot flash:packages.conf
```

**Step 13** After the device boots up, disable manual boot on the device.

```
Device(config)# no boot manual
```

---

## Procedure with Password Recovery Disabled

If the password-recovery mechanism is disabled, this message appears:

```
The password-recovery mechanism has been triggered, but
is currently disabled. Access to the boot loader prompt
through the password-recovery mechanism is disallowed at
this point. However, if you agree to let the system be
reset back to the default system configuration, access
to the boot loader prompt can still be allowed.
```

```
Would you like to reset the system back to the default configuration (y/n)?
```

---

**Caution** Returning the Device to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup Device and VLAN configuration files.

---

- If you enter **n** (no), the normal boot process continues as if the **Mode** button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:

```
Press Enter to continue.....
```

- If you enter **y** (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.
- 

**Step 1** Choose to continue with password recovery and delete the existing configuration:

```
Would you like to reset the system back to the default configuration (y/n)? Y
```

**Step 2** Display the contents of flash memory:

```
Device: dir flash:
```

The Device file system appears.

```
Directory of flash:/
.
.
.i'
15494 drwx      4096  Jan 1 2000 00:20:20 +00:00  kirch
15508 -rw-    258065648  Sep 4 2013 14:19:03 +00:00
cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
162196684
```

**Step 3** Boot up the system:

Device: **boot**

You are prompted to start the setup program. To continue with password recovery, enter **N** at the prompt:

```
Continue with the configuration dialog? [yes/no]: N
```

**Step 4** At the Device prompt, enter privileged EXEC mode:

Device> **enable**

**Step 5** Enter global configuration mode:

Device# **configure terminal**

**Step 6** Change the password:

Device(config)# **enable secret password**

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

**Step 7** Return to privileged EXEC mode:

```
Device(config)# exit
Device#
```

**Note** Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized.

**Step 8** Write the running configuration to the startup configuration file:

Device# **copy running-config startup-config**

The new password is now in the startup configuration.

**Step 9** You must now reconfigure the Device. If the system administrator has the backup Device and VLAN configuration files available, you should use those.

## Preventing Switch Stack Problems

To prevent switch stack problems, you should do the following:

- Make sure that the Device that you add to or remove from the switch stack are powered off. For all powering considerations in switch stacks, see the “Switch Installation” chapter in the hardware installation guide.
- Press the **Mode** button on a stack member until the Stack mode LED is on. The last two port LEDs on the Device should be green. Depending on the Device model, the last two ports are either 10/100/1000 ports or small form-factor pluggable (SFP) module. If one or both of the last two port LEDs are not green, the stack is not operating at full bandwidth.
- We recommend using only one CLI session when managing the switch stack. Be careful when using multiple CLI sessions to the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.
- Manually assigning stack member numbers according to the placement of the Device in the stack can make it easier to remotely troubleshoot the switch stack. However, you need to remember that the Device have manually assigned numbers if you add, remove, or rearrange Device later. Use the **switch current-stack-member-number renumber new-stack-member-number** global configuration command to manually assign a stack member number.

If you replace a stack member with an identical model, the new Device functions with the exact same configuration as the replaced Device. This is also assuming the new Device is using the same member number as the replaced Device.

Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks. To recover from a partitioned switch stack, follow these steps:

1. Power off the newly created switch stacks.
2. Reconnect them to the original switch stack through their StackWise Plus ports.
3. Power on the Device.

For the commands that you can use to monitor the switch stack and its members, see the *Displaying Switch Stack Information* section.

## Preventing Autonegotiation Mismatches

The IEEE 802.3ab autonegotiation protocol manages the Device settings for speed (10 Mb/s, 100 Mb/s, and 1000 Mb/s, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.
- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize Device performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

- Let both ports autonegotiate both speed and duplex.

- Manually set the speed and duplex parameters for the ports on both ends of the connection.

---

**Note** If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

---

## Troubleshooting SFP Module Security and Identification

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the Device, the Device software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.

---

**Note** The security error message references the GBIC\_SECURITY facility. The Device supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces.

---

If you are using a non-Cisco SFP module, remove the SFP module from the Device, and replace it with a Cisco module. After inserting a Cisco SFP module, use the **errdisable recovery cause gbic-invalid** global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the Device brings the interface out of the error-disabled state and retries the operation. For more information about the **errdisable recovery** command, see the command reference for this release.

If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and reinsert the SFP module. If it continues to fail, the SFP module might be defective.

## Monitoring SFP Module Status

You can check the physical or operational status of an SFP module by using the **show interfaces transceiver** privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module. For more information, see the **show interfaces transceiver** command in the command reference for this release.

## Executing Ping

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or have IP routing configured to route between those subnets.

IP routing is disabled by default on all Device.

**Note** Though other protocol keywords are available with the **ping** command, they are not supported in this release.

Use this command to ping another device on the network from the Device:

| Command                                                                     | Purpose                                                                         |
|-----------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| <b>ping ip</b> <i>host</i>   <i>address</i><br><br>Device# ping 172.20.52.3 | Pings a remote host through IP or by supplying the hostname or network address. |

#### Related Topics

[Ping](#), on page 2337

[Example: Pinging an IP Host](#), on page 2360

## Monitoring Temperature

The Device monitors the temperature conditions and uses the temperature information to control the fans.

Use the **show env temperature status** privileged EXEC command to display the temperature value, state, and thresholds. The temperature value is the temperature in the Device (not the external temperature). You can configure only the yellow threshold level (in Celsius) by using the **system env temperature threshold yellow** *value* global configuration command to set the difference between the yellow and red thresholds. You cannot configure the green or red thresholds. For more information, see the command reference for this release.

## Monitoring the Physical Path

You can monitor the physical path that a packet takes from a source device to a destination device by using one of these privileged EXEC commands:

**Table 195: Monitoring the Physical Path**

| Command                                                                                                                                                                                                                          | Purpose                                                                                                                                              |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tracetroute mac</b> [ <b>interface</b> <i>interface-id</i> ]<br>{ <i>source-mac-address</i> } [ <b>interface</b> <i>interface-id</i> ]<br>{ <i>destination-mac-address</i> } [ <b>vlan</b> <i>vlan-id</i> ] [ <b>detail</b> ] | Displays the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address.                       |
| <b>tracetroute mac ip</b> { <i>source-ip-address</i>  <br><i>source-hostname</i> } { <i>destination-ip-address</i>  <br><i>destination-hostname</i> } [ <b>detail</b> ]                                                          | Displays the Layer 2 path taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname. |

## Executing IP Traceroute

**Note** Though other protocol keywords are available with the **traceroute** privileged EXEC command, they are not supported in this release.

| Command                                                         | Purpose                                                |
|-----------------------------------------------------------------|--------------------------------------------------------|
| <b>traceroute ip host</b><br>Device# traceroute ip 192.51.100.1 | Traces the path that packets take through the network. |

### Related Topics

[IP Traceroute](#), on page 2338

[Example: Performing a Traceroute to an IP Host](#), on page 2361

## Running TDR and Displaying the Results

To run TDR, enter the **test cable-diagnostics tdr interface interface-id** privileged EXEC command.

To display the results, enter the **show cable-diagnostics tdr interface interface-id** privileged EXEC command.

## Redirecting Debug and Error Message Output

By default, the network server sends the output from **debug** commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port or the Ethernet management port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

**Note** Be aware that the debugging destination you use affects system overhead. When you log messages to the console, very high overhead occurs. When you log messages to a virtual terminal, less overhead occurs. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

For more information about system message logging, see *Configuring System Message Logging*.

### Related Topics

[Debug Commands](#), on page 2340

## Using the show platform forward Command

The output from the **show platform forward** privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the

parameters entered about the packet, the output provides lookup table results and port maps used to calculate forwarding destinations, bitmaps, and egress information.

Most of the information in the output from the command is useful mainly for technical support personnel, who have access to detailed information about the Device application-specific integrated circuits (ASICs). However, packet forwarding information can also be helpful in troubleshooting.

## Using the show debug command

The **show debug** command is entered in privileged EXEC mode. This command displays all debug options available on the switch.

To view all conditional debug options run the command **show debug condition**. The commands can be listed by selecting either a condition identifier <1-1000> or *all* conditions.

To disable debugging, use the **no debug all** command.

### Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, it is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

For more information, see *Cisco IOS Configuration Fundamentals Command Reference, Cisco IOS XE Release 16.1 (Catalyst 3850 Switches)*.

## Configuring OBFL

### Caution

We recommend that you do not disable OBFL and that you do not remove the data stored in the flash memory.

- To enable OBFL, use the **hw-switch switch [switch-number] logging onboard [message level level]** global configuration command. On switches, the range for *switch-number* is from 1 to 9. Use the **message level level** parameter to specify the severity of the hardware-related messages that the switch generates and stores in the flash memory.
- To copy the OBFL data to the local network or a specific file system, use the **copy onboard switch switch-number url url-destination** privileged EXEC command.
- To disable OBFL, use the **no hw-switch switch [switch-number] logging onboard [message level]** global configuration command.
- To clear all the OBFL data in the flash memory except for the uptime and CLI command information, use the **clear onboard switch switch-number** privileged EXEC command.
- In a switch stack, you can enable OBFL on a standalone switch or on all stack members by using the **hw-switch switch [switch-number] logging onboard [message level level]** global configuration command.
- You can enable or disable OBFL on a member switch from the active switch.

For more information about the commands in this section, see the command reference for this release.

| <b>show onboard switch <i>switch-number</i> uptime</b><br>Device# show onboard switch 1 uptime           | Displays the time when a standalone switch or the specified stack members start, the reason the standalone switch or specified stack members restart, and the length of time that the standalone switch or specified stack members have been running since they last restarted. |
| <b>show onboard switch <i>switch-number</i> voltage</b><br>Device# show onboard switch 1 voltage         | Displays the system voltages of a standalone switch or the specified stack members.                                                                                                                                                                                             |
| <b>show onboard switch <i>switch-number</i> status</b><br>Device# show onboard switch 1 status           | Displays the status of a standalone switch or the specified stack members.                                                                                                                                                                                                      |

**Related Topics**

[Onboard Failure Logging on the Switch](#), on page 2342

[Configuring OBFL](#), on page 2355

**Example: Verifying the Problem and Cause for High CPU Utilization**

To determine if high CPU utilization is a problem, enter the **show processes cpu sorted** privileged EXEC command. Note the underlined information in the first line of the output example.

```
Device# show processes cpu sorted
CPU utilization for five seconds: 8%/0%; one minute: 7%; five minutes: 8%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
309 42289103 752750 56180 1.75% 1.20% 1.22% 0 RIP Timers
140 8820183 4942081 1784 0.63% 0.37% 0.30% 0 HRPC qos request
100 3427318 16150534 212 0.47% 0.14% 0.11% 0 HRPC pm-counters
192 3093252 14081112 219 0.31% 0.14% 0.11% 0 Spanning Tree
143 8 37 216 0.15% 0.01% 0.00% 0 Exec
...
<output truncated>
```

This example shows normal CPU utilization. The output shows that utilization for the last 5 seconds is 8%/0%, which has this meaning:

- The total CPU utilization is 8 percent, including both time running Cisco IOS processes and time spent handling interrupts.
- The time spent handling interrupts is zero percent.

**Table 197: Troubleshooting CPU Utilization Problems**

| Type of Problem                                                                  | Cause                                                                                                                           | Corrective Action                                                                                                                              |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Interrupt percentage value is almost as high as total CPU utilization value.     | The CPU is receiving too many packets from the network.                                                                         | Determine the source of the network packet. Stop the flow, or change the switch configuration. See the section on “Analyzing Network Traffic.” |
| Total CPU utilization is greater than 50% with minimal time spent on interrupts. | One or more Cisco IOS process is consuming too much CPU time. This is usually triggered by an event that activated the process. | Identify the unusual event, and troubleshoot the root cause. See the section on “Debugging Active Processes.”                                  |

# Scenarios for Troubleshooting the Software Configuration

## Scenarios to Troubleshoot Power over Ethernet (PoE)

Table 198: Power over Ethernet Troubleshooting Scenarios

| Symptom or Problem                                                                                                                                          | Possible Cause and Solution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Only one port does not have PoE.</p> <p>Trouble is on only one switch port. PoE and non-PoE devices do not work on this port, but do on other ports.</p> | <p>Verify that the powered device works on another PoE port.</p> <p>Use the <b>show run</b>, or <b>show interface status</b> user EXEC commands to verify that the port is not shut down or error-disabled.</p> <p><b>Note</b> Most switches turn off port power when the port is shut down, even though the IEEE specifications make this optional.</p> <p>Verify that the Ethernet cable from the powered device to the switch port is good: Connect a known good non-PoE Ethernet device to the Ethernet cable, and make sure that the powered device establishes a link and exchanges traffic with another host.</p> <p>Verify that the total cable length from the switch front panel to the powered device is not more than 100 meters.</p> <p>Disconnect the Ethernet cable from the switch port. Use a short Ethernet cable to connect a known good Ethernet device directly to this port on the switch front panel (not on a patch panel). Verify that it can establish an Ethernet link and exchange traffic with another host, or ping the port VLAN SVI. Next, connect a powered device to this port, and verify that it powers on.</p> <p>If a powered device does not power on when connected with a patch cord to the switch port, compare the total number of connected powered devices to the switch power budget (available PoE). Use the <b>show inline power</b> command to verify the amount of available power.</p> |

| Symptom or Problem                                                                                                                                                                                                        | Possible Cause and Solution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>No PoE on all ports or a group of ports.<br/>           Trouble is on all switch ports.<br/>           Nonpowered Ethernet devices cannot establish an Ethernet link on any port, and PoE devices do not power on.</p> | <p>If there is a continuous, intermittent, or reoccurring alarm related to power, replace the power supply if possible it is a field-replaceable unit. Otherwise, replace the switch.</p> <p>If the problem is on a consecutive group of ports but not all ports, the power supply is probably not defective, and the problem could be related to PoE regulators in the switch.</p> <p>Use the <b>show log</b> privileged EXEC command to review alarms or system messages that previously reported PoE conditions or status changes.</p> <p>If there are no alarms, use the <b>show interface status</b> command to verify that the ports are not shut down or error-disabled. If ports are error-disabled, use the <b>shut</b> and <b>no shut</b> interface configuration commands to reenable the ports.</p> <p>Use the <b>show env power</b> and <b>show power inline</b> privileged EXEC commands to review the PoE status and power budget (available PoE).</p> <p>Review the running configuration to verify that <b>power inline never</b> is not configured on the ports.</p> <p>Connect a nonpowered Ethernet device directly to a switch port. Use only a short patch cord. Do not use the existing distribution cables. Enter the <b>shut</b> and <b>no shut</b> interface configuration commands, and verify that an Ethernet link is established. If this connection is good, use a short patch cord to connect a powered device to this port and verify that it powers on. If the device powers on, verify that all intermediate patch panels are correctly connected.</p> <p>Disconnect all but one of the Ethernet cables from switch ports. Using a short patch cord, connect a powered device to only one PoE port. Verify the powered device does not require more power than can be delivered by the switch port.</p> <p>Use the <b>show power inline</b> privileged EXEC command to verify that the powered device can receive power when the port is not shut down. Alternatively, watch the powered device to verify that it powers on.</p> <p>If a powered device can power on when only one powered device is connected to the switch, enter the <b>shut</b> and <b>no shut</b> interface configuration commands on the remaining ports, and then reconnect the Ethernet cables one at a time to the switch PoE ports. Use the <b>show interface status</b> and <b>show power inline</b> privileged EXEC commands to monitor inline power statistics and port status.</p> <p>If there is still no PoE at any port, a fuse might be open in the PoE section of the power supply. This normally produces an alarm. Check the log again for alarms reported earlier by system messages.</p> |

| Symptom or Problem                                                                                                                                                                                                                    | Possible Cause and Solution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Cisco IP Phone disconnects or resets.</p> <p>After working normally, a Cisco phone or wireless access point intermittently reloads or disconnects from PoE.</p>                                                                    | <p>Verify all electrical connections from the switch to the powered device. Any unreliable connection results in power interruptions and irregular powered device functioning such as erratic powered device disconnects and reloads.</p> <p>Verify that the cable length is not more than 100 meters from the switch port to the powered device.</p> <p>Notice what changes in the electrical environment at the switch location or what happens at the powered device when the disconnect occurs.</p> <p>Notice whether any error messages appear at the same time a disconnect occurs. Use the <b>show log</b> privileged EXEC command to review error messages.</p> <p>Verify that an IP phone is not losing access to the Call Manager immediately before the reload occurs. (It might be a network problem and not a PoE problem.)</p> <p>Replace the powered device with a non-PoE device, and verify that the device works correctly. If a non-PoE device has link problems or a high error rate, the problem might be an unreliable cable connection between the switch port and the powered device.</p> |
| <p>Non-Cisco powered device does not work on Cisco PoE switch.</p> <p>A non-Cisco powered device is connected to a Cisco PoE switch, but never powers on or powers on and then quickly powers off. Non-PoE devices work normally.</p> | <p>Use the <b>show power inline</b> command to verify that the switch power budget (available PoE) is not depleted before or after the powered device is connected. Verify that sufficient power is available for the powered device type before you connect it.</p> <p>Use the <b>show interface status</b> command to verify that the switch detects the connected powered device.</p> <p>Use the <b>show log</b> command to review system messages that reported an overcurrent condition on the port. Identify the symptom precisely: Does the powered device initially power on, but then disconnect? If so, the problem might be an initial surge-in (or <i>inrush</i>) current that exceeds a current-limit threshold for the port.</p>                                                                                                                                                                                                                                                                                                                                                                    |

## Configuration Examples for Troubleshooting Software

### Example: Pinging an IP Host

This example shows how to ping an IP host:

```
Device# ping 172.20.52.3
```

```
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echoes to 172.20.52.3, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
Device#

**Table 199: Ping Output Display Characters**

| Character | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| !         | Each exclamation point means receipt of a reply.                          |
| .         | Each period means the network server timed out while waiting for a reply. |
| U         | A destination unreachable error PDU was received.                         |
| C         | A congestion experienced packet was received.                             |
| I         | User interrupted test.                                                    |
| ?         | Unknown packet type.                                                      |
| &         | Packet lifetime exceeded.                                                 |

To end a ping session, enter the escape sequence (**Ctrl-^ X** by default). Simultaneously press and release the **Ctrl**, **Shift**, and **6** keys and then press the **X** key.

## Example: Performing a Traceroute to an IP Host

This example shows how to perform a **traceroute** to an IP host:

```
Device# traceroute ip 192.0.2.10

Type escape sequence to abort.
Tracing the route to 192.0.2.10

 1 192.0.2.1 0 msec 0 msec 4 msec
 2 192.0.2.203 12 msec 8 msec 0 msec
 3 192.0.2.100 4 msec 0 msec 0 msec
 4 192.0.2.10 0 msec 4 msec 0 msec
```

The display shows the hop count, the IP address of the router, and the round-trip time in milliseconds for each of the three probes that are sent.

**Table 200: Traceroute Output Display Characters**

| Character | Description          |
|-----------|----------------------|
| *         | The probe timed out. |
| ?         | Unknown packet type. |

| Character | Description                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------|
| A         | Administratively unreachable. Usually, this output means that an access list is blocking traffic. |
| H         | Host unreachable.                                                                                 |
| N         | Network unreachable.                                                                              |
| P         | Protocol unreachable.                                                                             |
| Q         | Source quench.                                                                                    |
| U         | Port unreachable.                                                                                 |

To end a trace in progress, enter the escape sequence (**Ctrl-^ X** by default). Simultaneously press and release the **Ctrl**, **Shift**, and **6** keys and then press the **X** key.

## Example: Enabling All System Diagnostics

#### Caution

Because debugging output takes priority over other network traffic, and because the **debug all** privileged EXEC command generates more output than any other **debug** command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific **debug** commands.

This command disables all-system diagnostics:

```
Device# debug all
```

The **no debug all** privileged EXEC command disables all diagnostic output. Using the **no debug all** command is a convenient way to ensure that you have not accidentally left any **debug** commands enabled.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for VideoStream

Make sure that the multicast feature is enabled. We recommend configuring IP multicast on the controller with multicast-multicast mode.

Check for the IP address on the client machine. The machine should have an IP address from the respective VLAN.

Verify that the access points have joined the controllers.

## Restrictions for Configuring VideoStream

IGMP snooping is required to switch ON for this MC2UC feature to be functional.

# Information about VideoStream

The IEEE 802.11 wireless multicast delivery mechanism does not provide a reliable way to acknowledge lost or corrupted packets. The multicast frame packets are sent at a predetermined rate irrespective of the wireless client optimal data rate. As a result, if any multicast packet is lost in the air, it is not sent again which may cause an IP multicast stream unviewable. Also if the packets are delivered faster, the packets get congested.

The VideoStream feature makes the IP multicast stream delivery reliable over the air, by converting the multicast frame to a unicast frame over the air. Each VideoStream client acknowledges receiving a video IP multicast stream.

## How to Configure VideoStream

### Configuring Multicast-Direct Globally for Media-Stream

#### SUMMARY STEPS

1. **configure terminal**
2. **wireless multicast**
3. **IP igmp snooping**
4. **IP igmp snooping querier**
5. **wireless media-stream multicast-direct**
6. **wireless media-stream message**
7. **wireless media-stream group** <name> <startIp> <endIp>
8. **end**

#### DETAILED STEPS

|               | Command or Action                                                                                                                      | Purpose                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <code>configure terminal</code>                                            | Enters global configuration mode.                                                                                                                      |
| <b>Step 2</b> | <b>wireless multicast</b>                                                                                                              | Enables multicast for wireless forwarding.                                                                                                             |
| <b>Step 3</b> | <b>IP igmp snooping</b>                                                                                                                | Enables IGMP snooping on a per-VLAN basis. If the global setting is disabled, then all VLANs are treated as disabled, whether they are enabled or not. |
| <b>Step 4</b> | <b>IP igmp snooping querier</b>                                                                                                        | Configures a snooping querier on an interface when there is no multicast router in the VLAN to generate queries.                                       |
| <b>Step 5</b> | <b>wireless media-stream multicast-direct</b><br><br><b>Example:</b><br>(config) # <code>wireless media-stream multicast-direct</code> | Configures the global multicast-direct feature for the controller.                                                                                     |

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>wireless media-stream message</b><br><b>Example:</b><br><pre>(config)#<b>wireless media-stream message ?</b>   Email  Configure Session Announcement Email   Notes  Configure Session Announcement notes   URL    Configure Session Announcement URL   phone  Configure Session Announcement Phone number   &lt;cr&gt;</pre>                                                                                                                                                                                                                                                                                                     | Configures various message configuration parameters like phone, URL, email and notes. That is, when a media stream is refused (due to bandwidth constraints), a message can be sent to the user. These parameters configure the messages to send IT support email address, notes (message to display explaining why the stream was refused), URL to which the user can be redirected and the phone number that the user can call about the refused stream. |
| Step 7 | <b>wireless media-stream group&lt;name&gt;&lt;startIp&gt;&lt;endIp&gt;</b><br><b>Example:</b><br><pre>(config)#<b>wireless media-stream group grp1</b> <b>231.1.1.1 239.1.1.3</b> (config-media-stream)#?    avg-packet-size  Configures average packet size   default          Set a command to its defaults   exit             Exit sub-mode   max-bandwidth    Configures maximum Expected Stream Bandwidth in Kbps   no              Negate a command or set its defaults   policy          Configure media stream admission policy   qos            Configure Over the AIR QoS class, &lt;'video'&gt; ONLY    &lt;cr&gt;</pre> | configures each media stream and its parameters like expected multicast destination addresses, stream bandwidth consumption and stream priority parameters.                                                                                                                                                                                                                                                                                                |
| Step 8 | <b>end</b><br><b>Example:</b><br><pre>Device(config)# <b>end</b></pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                                                                                                                                                                                                                                                                        |

## Configuring Media-Stream for 802.11 bands

### SUMMARY STEPS

1. **configure terminal**
2. **ap dot11 24ghz | 5ghz media-stream multicast-direct**
3. **ap dot11 24ghz | 5ghz media-stream video-redirect**
4. **ap dot11 24ghz | 5ghz media-stream multicast-direct admission-besteffort**
5. **ap dot11 24ghz | 5ghz media-stream multicast-direct client-maximum [<value >]**
6. **ap dot11 24ghz | 5ghz media-stream multicast-direct radio-maximum 20**
7. **ap dot11 24ghz | 5ghz cac multimedia max-bandwidth [<bandwidth>]**
8. **ap dot11 24ghz | 5ghz cac media-stream multicast-direct min\_client\_rate [<dot11\_rate> ]**
9. **ap dot11 5ghz cac media-stream**
10. **ap dot11 5ghz cac multimedia**

11. `ap dot11 5ghz cac video`
12. `ap dot11 5ghz cac voice`
13. `end`

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                            |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                                                   | Enters global configuration mode.                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>ap dot11 24ghz   5ghz media-stream multicast-direct</b><br><br><b>Example:</b><br>Device (config)# <code>ap dot11 24ghz media-stream multicast-direct</code>                                                               | Configures if media stream (mc2uc) is allowed for 802.11 band                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>ap dot11 24ghz   5ghz media-stream video-redirect</b><br><br><b>Example:</b><br>Device (config)# <code>ap dot11 24ghz media-stream video-redirect</code>                                                                   | Configures to redirect unicast video traffic to best effort queue.                                                                                                                                                                                                                                 |
| <b>Step 4</b> | <b>ap dot11 24ghz   5ghz media-stream multicast-direct admission-besteffort</b><br><br><b>Example:</b><br>Device (config)# <code>ap dot11 24ghz media-stream multicast-direct admission-besteffort</code>                     | Configures the media stream to still be sent through the best effort queue if a media stream cannot be prioritized due to bandwidth availability limitations. Add <b>no</b> in the command to drop the stream if the media stream cannot be prioritized due to bandwidth availability limitations. |
| <b>Step 5</b> | <b>ap dot11 24ghz   5ghz media-stream multicast-direct client-maximum [&lt;value &gt;]</b><br><br><b>Example:</b><br>Device (config)# <code>ap dot11 24ghz media-stream multicast-direct client-max 15</code>                 | Configures maximum number of allowed media streams per individual client. The maximum is 15 and the default is 0. Value 0 denotes unlimited streams.                                                                                                                                               |
| <b>Step 6</b> | <b>ap dot11 24ghz   5ghz media-stream multicast-direct radio-maximum 20</b>                                                                                                                                                   | Configures maximum number of radio streams. The range is from 1 to 20. Default is 0. Value 0 denotes unlimited streams.                                                                                                                                                                            |
| <b>Step 7</b> | <b>ap dot11 24ghz   5ghz cac multimedia max-bandwidth [&lt;bandwidth&gt;]</b><br><br><b>Example:</b><br>Device (config)# <code>ap dot11 24ghz cac multimedia max-bandwidth 60</code>                                          | Configure maximum media (voice + video) bandwidth in %. The range is between 5% and 85%.                                                                                                                                                                                                           |
| <b>Step 8</b> | <b>ap dot11 24ghz   5ghz cac media-stream multicast-direct min_client_rate [&lt;dot11_rate&gt; ]</b><br><br><b>Example:</b><br>Device (config)# <code>ap dot11 24ghz cac media-stream multicast-direct min_client_rate</code> | Configures the minimum PHY rate needed for a client to send media-stream as unicast. Clients communicating below this rate will not receive the media stream as a unicast flow. Typically, this PHY rate is equal to or higher than the rate at which multicast frames are sent.                   |

|         | Command or Action                                                     | Purpose                                                                                                             |
|---------|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 9  | <code>ap dot11 5ghz cac media-stream</code>                           | Configures CAC parameters for media stream access category.                                                         |
| Step 10 | <code>ap dot11 5ghz cac multimedia</code>                             | Configures CAC parameters for media access category, used for voice and video.                                      |
| Step 11 | <code>ap dot11 5ghz cac video</code>                                  | Configures CAC parameters for video access category, used for voice signaling.                                      |
| Step 12 | <code>ap dot11 5ghz cac voice</code>                                  | Configures CAC parameters for voice access category.                                                                |
| Step 13 | <b>end</b><br><br><b>Example:</b><br>Device(config)# <code>end</code> | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Configuring WLAN to Stream Video

### SUMMARY STEPS

1. `configure terminal`
2. `wlan wlan_name`
3. `shutdown`
4. `media-stream multicast-direct`
5. `no shutdown`
6. `end`

### DETAILED STEPS

|        | Command or Action                                                                                                   | Purpose                                                               |
|--------|---------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <code>configure terminal</code>                         | Enters global configuration mode.                                     |
| Step 2 | <b>wlan wlan_name</b><br><br><b>Example:</b><br>(config)# <code>wlan wlan50</code>                                  | Enters the WLAN configuration mode.                                   |
| Step 3 | <b>shutdown</b><br><br><b>Example:</b><br>(config-wlan)# <code>shutdown</code>                                      | Disables the WLAN for configuring its parameters.                     |
| Step 4 | <b>media-stream multicast-direct</b><br><br><b>Example:</b><br>(config)# <code>media-stream multicast-direct</code> | Configures the multicast-direct feature on media-stream for the WLAN. |

|               | Command or Action                                                               | Purpose                                                                                                             |
|---------------|---------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>no shutdown</b><br><b>Example:</b><br><code>(config-wlan)#no shutdown</code> | Enables the WLAN.                                                                                                   |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><code>Device(config)# end</code>               | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Deleting a Media-Stream

### Before you begin

The media-stream should be enabled and configured for it to be deleted.

### SUMMARY STEPS

1. configure terminal
2. no wireless media-stream group media\_stream\_name
3. end

### DETAILED STEPS

|               | Command or Action                                                                                                                       | Purpose                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><code>Device# configure terminal</code>                                                 | Enters global configuration mode.                                                                                   |
| <b>Step 2</b> | <b>no wireless media-stream group media_stream_name</b><br><b>Example:</b><br><code>Device(config)#no wireless media-stream grp1</code> | Deletes the media-stream which bears the name mentioned in the command.                                             |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br><code>Device(config)# end</code>                                                                       | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Monitoring Media Streams

Table 201: Commands for monitoring media streams

| Commands                                                         | Description                                                   |
|------------------------------------------------------------------|---------------------------------------------------------------|
| <code>show wireless media-stream client detail group name</code> | Displays media stream client details of the particular group. |

| Commands                                                  | Description                                                              |
|-----------------------------------------------------------|--------------------------------------------------------------------------|
| show wireless media-stream client summary                 | Displays the media stream information of all the clients.                |
| show wireless media-stream group detail <i>group name</i> | Displays the media stream configuration details of the particular group. |
| show wireless media-stream group summary                  | Displays the media stream configuration details of all the groups.       |
| show wireless media-stream message details                | Displays the session announcement message details.                       |
| show wireless multicast                                   | Displays the multicast-direct configuration state.                       |
| show ap dot11 24ghz   5ghz media-stream rrc               | Displays 802.11 media Resource-Reservation-Control configurations.       |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for VTP

Before you create VLANs, you must decide whether to use the VLAN Trunking Protocol (VTP) in your network. Using VTP, you can make configuration changes centrally on one or more devices and have those changes automatically communicated to all the other devices in the network. Without VTP, you cannot send information about VLANs to other devices.

VTP is designed to work in an environment where updates are made on a single device and are sent through VTP to other devices in the domain. It does not work well in a situation where multiple updates to the VLAN database occur simultaneously on devices in the same domain, which would result in an inconsistency in the VLAN database.

The device supports a total of 4094 VLANs. However, the number of configured features affects the usage of the device hardware. If the device is notified by VTP of a new VLAN and the device is already using the maximum available hardware resources, it sends a message that there are not enough hardware resources available and shuts down the VLAN. The output of the **show vlan** user EXEC command shows the VLAN in a suspended state.

You can enable or disable VTP per port by entering the **[no] vtp** interface configuration command. When you disable VTP on trunking ports, all VTP instances for that port are disabled. You cannot set VTP to *off* for the MST database and *on* for the VLAN database on the same port.

When you globally set VTP mode to off, it applies to all the trunking ports in the system. However, you can specify on or off on a per-VTP instance basis. For example, you can configure the device as a VTP server for the VLAN database but with VTP *off* for the MST database.

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the device or device stack and that this trunk port is connected to the trunk port of another device. Otherwise, the device cannot receive any VTP advertisements.

## Restrictions for VTP

The following are restrictions for a VTP:

- You cannot have a device stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

#### Caution

Before adding a VTP client device to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other devices in the VTP domain. Devices in a VTP domain always use the VLAN configuration of the device with the highest VTP configuration revision number. If you add a device that has a revision number higher than the revision number in the VTP domain, it can erase all VLAN information from the VTP server and VTP domain.

## Information About VTP

### VTP

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP minimizes misconfigurations and configuration inconsistencies that can cause several problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

VTP functionality is supported across the stack, and all devices in the stack maintain the same VLAN and VTP configuration inherited from the active device. When a device learns of a new VLAN through VTP

messages or when a new VLAN is configured by the user, the new VLAN information is communicated to all devices in the stack.

When a device joins the stack or when stacks merge, the new devices get VTP information from the active device.

## VTP Domain

A VTP domain (also called a VLAN management domain) consists of one device or several interconnected devices or device stacks under the same administrative responsibility sharing the same VTP domain name. A device can be in only one VTP domain. You make global VLAN configuration changes for the domain.

By default, the device is in the VTP no-management-domain state until it receives an advertisement for a domain over a trunk link (a link that carries the traffic of multiple VLANs) or until you configure a domain name. Until the management domain name is specified or learned, you cannot create or modify VLANs on a VTP server, and VLAN information is not propagated over the network.

If the device receives a VTP advertisement over a trunk link, it inherits the management domain name and the VTP configuration revision number. The device then ignores advertisements with a different domain name or an earlier configuration revision number.

When you make a change to the VLAN configuration on a VTP server, the change is propagated to all devices in the VTP domain. VTP advertisements are sent over all IEEE trunk connections, including IEEE 802.1Q. VTP dynamically maps VLANs with unique names and internal index associates across multiple LAN types. Mapping eliminates excessive device administration required from network administrators.

If you configure a device for VTP transparent mode, you can create and modify VLANs, but the changes are not sent to other devices in the domain, and they affect only the individual device. However, configuration changes made when the device is in this mode are saved in the device running configuration and can be saved to the device startup configuration file.

## VTP Modes

Table 202: VTP Modes

| VTP Mode   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VTP server | <p>In VTP server mode, you can create, modify, and delete VLANs, and specify other configuration parameters (such as the VTP version) for the entire VTP domain. VTP servers advertise their VLAN configurations to other devices in the same VTP domain and synchronize their VLAN configurations with other devices based on advertisements received over trunk links.</p> <p>VTP server is the default mode.</p> <p>In VTP server mode, VLAN configurations are saved in NVRAM. If the device detects a failure while writing a configuration to NVRAM, VTP mode automatically changes from server mode to client mode. If this happens, the device cannot be returned to VTP server mode until the NVRAM is functioning.</p> |
| VTP client | <p>A VTP client functions like a VTP server and transmits and receives VTP updates on its trunks, but you cannot create, change, or delete VLANs on a VTP client. VLANs are configured on another device in the domain that is in server mode.</p> <p>In VTP versions 1 and 2 in VTP client mode, VLAN configurations are not saved in NVRAM. In VTP version 3, VLAN configurations are saved in NVRAM in client mode.</p>                                                                                                                                                                                                                                                                                                       |

| VTP Mode        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VTP transparent | <p>VTP transparent devices do not participate in VTP. A VTP transparent device does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. However, in VTP version 2 or version 3, transparent devices do forward VTP advertisements that they receive from other devices through their trunk interfaces. You can create, modify, and delete VLANs on a device in VTP transparent mode.</p> <p>When the device is in VTP transparent mode, the VTP and VLAN configurations are saved in NVRAM, but they are not advertised to other devices. In this mode, VTP mode and domain name are saved in the device running configuration, and you can save this information in the device startup configuration file by using the <b>copy running-config startup-config</b> privileged EXEC command.</p> <p>In a device stack, the running configuration and the saved configuration are the same for all devices in a stack.</p> |
| VTP off         | <p>A device in VTP off mode functions in the same manner as a VTP transparent device, except that it does not forward VTP advertisements on trunks.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## VTP Advertisements

Each device in the VTP domain sends periodic global configuration advertisements from each trunk port to a reserved multicast address. Neighboring devices receive these advertisements and update their VTP and VLAN configurations as necessary.

VTP advertisements distribute this global domain information:

- VTP domain name
- VTP configuration revision number
- Update identity and update timestamp
- MD5 digest VLAN configuration, including maximum transmission unit (MTU) size for each VLAN
- Frame format

VTP advertisements distribute this VLAN information for each configured VLAN:

- VLAN IDs (including IEEE 802.1Q)

- VLAN name
- VLAN type
- VLAN state
- Additional VLAN configuration information specific to the VLAN type

In VTP version 3, VTP advertisements also include the primary server ID, an instance number, and a start index.

#### Related Topics

[Prerequisites for VTP](#), on page 2377

## VTP Version 2

If you use VTP in your network, you must decide which version of VTP to use. By default, VTP operates in version 1.

VTP version 2 supports these features that are not supported in version 1:

- Token Ring support—VTP version 2 supports Token Ring Bridge Relay Function (TrBRF) and Token Ring Concentrator Relay Function (TrCRF) VLANs.
- Unrecognized Type-Length-Value (TLV) support—A VTP server or client propagates configuration changes to its other trunks, even for TLVs it is not able to parse. The unrecognized TLV is saved in NVRAM when the device is operating in VTP server mode.
- Version-Dependent Transparent Mode—In VTP version 1, a VTP transparent device inspects VTP messages for the domain name and version and forwards a message only if the version and domain name match. Although VTP version 2 supports only one domain, a VTP version 2 transparent device forwards a message only when the domain name matches.
- Consistency Checks—In VTP version 2, VLAN consistency checks (such as VLAN names and values) are performed only when you enter new information through the CLI or SNMP. Consistency checks are not performed when new information is obtained from a VTP message or when information is read from NVRAM. If the MD5 digest on a received VTP message is correct, its information is accepted.

#### Related Topics

[Enabling the VTP Version \(CLI\)](#), on page 2391

## VTP Version 3

VTP version 3 supports these features that are not supported in version 1 or version 2:

- Enhanced authentication—You can configure the authentication as **hidden** or **secret**. When **hidden**, the secret key from the password string is saved in the VLAN database file, but it does not appear in plain text in the configuration. Instead, the key associated with the password is saved in hexadecimal format in the running configuration. You must reenter the password if you enter a takeover command in the domain. When you enter the **secret** keyword, you can directly configure the password secret key.
- Support for extended range VLAN (VLANs 1006 to 4094) database propagation—VTP versions 1 and 2 propagate only VLANs 1 to 1005.

**Note** VTP pruning still applies only to VLANs 1 to 1005, and VLANs 1002 to 1005 are still reserved and cannot be modified.

- Support for any database in a domain—In addition to propagating VTP information, version 3 can propagate Multiple Spanning Tree (MST) protocol database information. A separate instance of the VTP protocol runs for each application that uses VTP.
- VTP primary server and VTP secondary servers—A VTP primary server updates the database information and sends updates that are honored by all devices in the system. A VTP secondary server can only back up the updated VTP configurations received from the primary server to its NVRAM.

By default, all devices come up as secondary servers. You can enter the **vtp primary** privileged EXEC command to specify a primary server. Primary server status is only needed for database updates when the administrator issues a takeover message in the domain. You can have a working VTP domain without any primary servers. Primary server status is lost if the device reloads or domain parameters change, even when a password is configured on the device.

### Related Topics

[Enabling the VTP Version \(CLI\)](#), on page 2391

## VTP Pruning

VTP pruning increases network available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to reach the destination devices. Without VTP pruning, a device floods broadcast, multicast, and unknown unicast traffic across all trunk links within a VTP domain even though receiving devices might discard them. VTP pruning is disabled by default.

VTP pruning blocks unneeded flooded traffic to VLANs on trunk ports that are included in the pruning-eligible list. Only VLANs included in the pruning-eligible list can be pruned. By default, VLANs 2 through 1001 are pruning eligible device trunk ports. If the VLANs are configured as pruning-ineligible, the flooding continues. VTP pruning is supported in all VTP versions.

**Figure 120: Flooding Traffic without VTP Pruning**

VTP pruning is disabled in the switched network. Port 1 on Device A and Port 2 on Device D are assigned to the Red VLAN. If a broadcast is sent from the host connected to Device A, Device A floods the broadcast and every device in the network receives it, even though Devices C, E, and F have no ports in the Red VLAN.

**Figure 121: Optimized Flooded Traffic VTP Pruning**

VTP pruning is enabled in the switched network. The broadcast traffic from Device A is not forwarded to Devices C, E, and F because traffic for the Red VLAN has been pruned on the links shown (Port 5 on Device B and Port 4 on Device D).

With VTP versions 1 and 2, when you enable pruning on the VTP server, it is enabled for the entire VTP domain. In VTP version 3, you must manually enable pruning on each device in the domain. Making VLANs pruning-eligible or pruning-ineligible affects pruning eligibility for those VLANs on that trunk only (not on all devices in the VTP domain).

VTP pruning takes effect several seconds after you enable it. VTP pruning does not prune traffic from VLANs that are pruning-ineligible. VLAN 1 and VLANs 1002 to 1005 are always pruning-ineligible; traffic from these VLANs cannot be pruned. Extended-range VLANs (VLAN IDs higher than 1005) are also pruning-ineligible.

#### Related Topics

[Enabling VTP Pruning \(CLI\)](#), on page 2393

## VTP and Device Stacks

VTP configuration is the same in all members of a device stack. When the device stack is in VTP server, client, or transparent mode, all devices in the stack carry the same VTP configuration.

- When a device joins the stack, it inherits the VTP and VLAN properties of the active switch.
- All VTP updates are carried across the stack.
- When VTP mode is changed in a device in the stack, the other devices in the stack also change VTP mode, and the device VLAN database remains consistent.

VTP version 3 functions the same on a standalone device or a stack except when the device stack is the primary server for the VTP database. In this case, the MAC address of the active switch is used as the primary server ID. If the active device reloads or is powered off, a new active switch is elected.

- If you do not configure the persistent MAC address feature, when the new active device is elected, it sends a takeover message using the current stack MAC address.

**Note** By default the persistent MAC address is on.

# VTP Configuration Guidelines

## VTP Configuration Requirements

When you configure VTP, you must configure a trunk port so that the device can send and receive VTP advertisements to and from other devices in the domain.

## VTP Settings

The VTP information is saved in the VTP VLAN database. When VTP mode is transparent, the VTP domain name and mode are also saved in the device running configuration file, and you can save it in the device startup configuration file by entering the **copy running-config startup-config** privileged EXEC command. You must use this command if you want to save VTP mode as transparent, even if the device resets.

When you save VTP information in the device startup configuration file and reboot the device, the device configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

## Domain Names for Configuring VTP

When configuring VTP for the first time, you must always assign a domain name. You must configure all devices in the VTP domain with the same domain name. Devices in VTP transparent mode do not exchange VTP messages with other devices, and you do not need to configure a VTP domain name for them.

---

**Note**

If the NVRAM and DRAM storage is sufficient, all devices in a VTP domain should be in VTP server mode.

---

---

**Caution**

Do not configure a VTP domain if all devices are operating in VTP client mode. If you configure the domain, it is impossible to make changes to the VLAN configuration of that domain. Make sure that you configure at least one device in the VTP domain for VTP server mode.

---

### Related Topics

## Passwords for the VTP Domain

You can configure a password for the VTP domain, but it is not required. If you do configure a domain password, all domain devices must share the same password and you must configure the password on each device in the management domain. Devices without a password or with the wrong password reject VTP advertisements.

If you configure a VTP password for a domain, a device that is booted without a VTP configuration does not accept VTP advertisements until you configure it with the correct password. After the configuration, the device accepts the next VTP advertisement that uses the same password and domain name in the advertisement.

If you are adding a new device to an existing network with VTP capability, the new device learns the domain name only after the applicable password has been configured on it.

**Caution**

When you configure a VTP domain password, the management domain does not function properly if you do not assign a management domain password to each device in the domain.

## VTP Version

Follow these guidelines when deciding which VTP version to implement:

- All devices in a VTP domain must have the same domain name, but they do not need to run the same VTP version.
- A VTP version 2-capable device can operate in the same VTP domain as a device running VTP version 1 if version 2 is disabled on the version 2-capable device (version 2 is disabled by default).
- If a device running VTP version 1, but capable of running VTP version 2, receives VTP version 3 advertisements, it automatically moves to VTP version 2.
- If a device running VTP version 3 is connected to a device running VTP version 1, the VTP version 1 device moves to VTP version 2, and the VTP version 3 device sends scaled-down versions of the VTP packets so that the VTP version 2 device can update its database.
- A device running VTP version 3 cannot move to version 1 or 2 if it has extended VLANs.
- Do not enable VTP version 2 on a device unless all of the devices in the same VTP domain are version-2-capable. When you enable version 2 on a device, all of the version-2-capable devices in the domain enable version 2. If there is a version 1-only device, it does not exchange VTP information with devices that have version 2 enabled.
- Cisco recommends placing VTP version 1 and 2 devices at the edge of the network because they do not forward VTP version 3 advertisements.
- If there are TrBRF and TrCRF Token Ring networks in your environment, you must enable VTP version 2 or version 3 for Token Ring VLAN switching to function properly. To run Token Ring and Token Ring-Net, disable VTP version 2.

- VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must configure these VLANs manually on each device. VTP version 3 supports extended-range VLANs and support for extended range VLAN database propagation.
- When a VTP version 3 device trunk port receives messages from a VTP version 2 device, it sends a scaled-down version of the VLAN database on that particular trunk in VTP version 2 format. A VTP version 3 device does not send VTP version 2-formatted packets on a trunk unless it first receives VTP version 2 packets on that trunk port.
- When a VTP version 3 device detects a VTP version 2 device on a trunk port, it continues to send VTP version 3 packets, in addition to VTP version 2 packets, to allow both kinds of neighbors to coexist on the same trunk.
- A VTP version 3 device does not accept configuration information from a VTP version 2 or version 1 device.
- Two VTP version 3 regions can only communicate in transparent mode over a VTP version 1 or version 2 region.
- Devices that are only VTP version 1 capable cannot interoperate with VTP version 3 devices.
- VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must manually configure these VLANs on each device.

# How to Configure VTP

## Configuring VTP Mode (CLI)

You can configure VTP mode as one of these:

- VTP server mode—In VTP server mode, you can change the VLAN configuration and have it propagated throughout the network.
- VTP client mode—In VTP client mode, you cannot change its VLAN configuration. The client device receives VTP updates from a VTP server in the VTP domain and then modifies its configuration accordingly.
- VTP transparent mode—In VTP transparent mode, VTP is disabled on the device. The device does not send VTP updates and does not act on VTP updates received from other device. However, a VTP transparent device running VTP version 2 does forward received VTP advertisements on its trunk links.
- VTP off mode—VTP off mode is the same as VTP transparent mode except that VTP advertisements are not forwarded.

When you configure a domain name, it cannot be removed; you can only reassign a device to a different domain.

### SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **vtp domain** *domain-name*
4. **vtp mode** {*client* | *server* | *transparent* | *off*} {*vlan* | *mst* | *unknown*}
5. **vtp password** *password*
6. **end**
7. **show vtp status**
8. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                      | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                              | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>vtp domain</b> <i>domain-name</i><br><b>Example:</b><br>Device(config)# <b>vtp domain eng_group</b>                                                                                         | <p>Configures the VTP administrative-domain name. The name can be 1 to 32 characters. All devices operating in VTP server or client mode under the same administrative responsibility must be configured with the same domain name.</p> <p>This command is optional for modes other than server mode. VTP server mode requires a domain name. If the device has a trunk connection to a VTP domain, the device learns the domain name from the VTP server in the domain.</p> <p>You should configure the VTP domain before configuring other VTP parameters.</p> |
| <b>Step 4</b> | <b>vtp mode</b> { <i>client</i>   <i>server</i>   <i>transparent</i>   <i>off</i> } { <i>vlan</i>   <i>mst</i>   <i>unknown</i> }<br><b>Example:</b><br>Device(config)# <b>vtp mode server</b> | <p>Configures the device for VTP mode (client, server, transparent, or off).</p> <ul style="list-style-type: none"> <li>• <b>vlan</b>—The VLAN database is the default if none are configured.</li> <li>• <b>mst</b>—The multiple spanning tree (MST) database.</li> <li>• <b>unknown</b>—An unknown database type.</li> </ul>                                                                                                                                                                                                                                   |
| <b>Step 5</b> | <b>vtp password</b> <i>password</i><br><b>Example:</b><br>Device(config)# <b>vtp password mypassword</b>                                                                                       | (Optional) Sets the password for the VTP domain. The password can be 8 to 64 characters. If you configure a VTP password, the VTP domain does not function properly if you do not assign the same password to each device in the domain.                                                                                                                                                                                                                                                                                                                         |

|               | Command or Action                                                                                                 | Purpose                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                          |
| <b>Step 7</b> | <b>show vtp status</b><br><b>Example:</b><br>Device# <b>show vtp status</b>                                       | Verifies your entries in the <i>VTP Operating Mode</i> and the <i>VTP Domain Name</i> fields of the display.                                                                                              |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves the configuration in the startup configuration file.<br>Only VTP mode and domain name are saved in the device running configuration and can be copied to the startup configuration file. |

## Configuring a VTP Version 3 Password (CLI)

You can configure a VTP version 3 password on the device.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **vtp password** *password* [**hidden** | **secret**]
4. **end**
5. **show vtp password**
6. **copy running-config startup-config**

**DETAILED STEPS**

|               | Command or Action                                         | Purpose                                                        |
|---------------|-----------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>              | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 3</b> | <b>vtp password</b> <i>password</i> [ <b>hidden</b>   <b>secret</b> ]<br><b>Example:</b><br>Device(config)# <code>vtp password mypassword hidden</code> | (Optional) Sets the password for the VTP domain. The password can be 8 to 64 characters. <ul style="list-style-type: none"> <li>• (Optional) <b>hidden</b>—Saves the secret key generated from the password string in the nvram:vlan.dat file. If you configure a takeover by configuring a VTP primary server, you are prompted to reenter the password.</li> <li>• (Optional) <b>secret</b>—Directly configures the password. The secret password must contain 32 hexadecimal characters.</li> </ul> |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 5</b> | <b>show vtp password</b><br><b>Example:</b><br>Device# <code>show vtp password</code>                                                                   | Verifies your entries. The output appears like this:<br>VTP password: 89914640C8D90868B6A0D8103847A733                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code>                                 | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Enabling the VTP Version (CLI)

VTP version 2 and version 3 are disabled by default.

- When you enable VTP version 2 on a device, every VTP version 2-capable device in the VTP domain enables version 2. To enable VTP version 3, you must manually configure it on each device.
- With VTP versions 1 and 2, you can configure the version only on devices in VTP server or transparent mode. If a device is running VTP version 3, you can change to version 2 when the device is in client mode if no extended VLANs exist, and no hidden password was configured.

**Caution** VTP version 1 and VTP version 2 are not interoperable on devices in the same VTP domain. Do not enable VTP version 2 unless every device in the VTP domain supports version 2.

- In TrCRF and TrBRF Token Ring environments, you must enable VTP version 2 or VTP version 3 for Token Ring VLAN switching to function properly. For Token Ring and Token Ring-Net media, disable VTP version 2.

**Caution** In VTP version 3, both the primary and secondary servers can exist on an instance in the domain.

## SUMMARY STEPS

1. enable

2. **configure terminal**
3. **vtp version {1 | 2 | 3}**
4. **end**
5. **show vtp status**
6. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                 | Purpose                                                              |
|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                         | Enables privileged EXEC mode. Enter your password if prompted.       |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                 | Enters the global configuration mode.                                |
| <b>Step 3</b> | <b>vtp version {1   2   3}</b><br><b>Example:</b><br>Device(config)# <b>vtp version 2</b>                         | Enables the VTP version on the device. The default is VTP version 1. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                     |
| <b>Step 5</b> | <b>show vtp status</b><br><b>Example:</b><br>Device# <b>show vtp status</b>                                       | Verifies that the configured VTP version is enabled.                 |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.             |

## Enabling VTP Pruning (CLI)

### Before you begin

VTP pruning is not designed to function in VTP transparent mode. If one or more devices in the network are in VTP transparent mode, you should do one of these actions:

- Turn off VTP pruning in the entire network.
- Turn off VTP pruning by making all VLANs on the trunk of the device upstream to the VTP transparent device pruning ineligible.

To configure VTP pruning on an interface, use the **switchport trunk pruning vlan** interface configuration command. VTP pruning operates when an interface is trunking. You can set VLAN pruning-eligibility, whether or not VTP pruning is enabled for the VTP domain, whether or not any given VLAN exists, and whether or not the interface is currently trunking.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vtp pruning**
4. **end**
5. **show vtp status**

### DETAILED STEPS

|        | Command or Action                                                                 | Purpose                                                                                                                                                     |
|--------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                         | Enables privileged EXEC mode. Enter your password if prompted.                                                                                              |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters the global configuration mode.                                                                                                                       |
| Step 3 | <b>vtp pruning</b><br><b>Example:</b><br>Device(config)# <b>vtp pruning</b>       | Enables pruning in the VTP administrative domain.<br><br>By default, pruning is disabled. You need to enable pruning on only one device in VTP server mode. |
| Step 4 | <b>end</b><br><b>Example:</b>                                                     | Returns to privileged EXEC mode.                                                                                                                            |

|               | Command or Action                                                           | Purpose                                                                    |
|---------------|-----------------------------------------------------------------------------|----------------------------------------------------------------------------|
|               | Device(config)# <b>end</b>                                                  |                                                                            |
| <b>Step 5</b> | <b>show vtp status</b><br><b>Example:</b><br>Device# <b>show vtp status</b> | Verifies your entries in the <i>VTP Pruning Mode</i> field of the display. |

## Configuring VTP on a Per-Port Basis (CLI)

With VTP version 3, you can enable or disable VTP on a per-port basis. You can enable VTP only on ports that are in trunk mode. Incoming and outgoing VTP traffic are blocked, not forwarded.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **vtp**
5. **end**
6. **show running-config interface** *interface-id*
7. **show vtp status**

**DETAILED STEPS**

|               | Command or Action                                                                 | Purpose                                                           |
|---------------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                         | Enables privileged EXEC mode. Enter your password if prompted.    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters the global configuration mode.                             |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b>                           | Identifies an interface, and enters interface configuration mode. |

|               | Command or Action                                                                                                                               | Purpose                            |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
|               | Device(config)# <code>interface gigabitethernet1/0/1</code>                                                                                     |                                    |
| <b>Step 4</b> | <b>vtp</b><br><b>Example:</b><br>Device(config)# <code>vtp</code>                                                                               | Enables VTP on the specified port. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                               | Returns to privileged EXEC mode.   |
| <b>Step 6</b> | <b>show running-config interface interface-id</b><br><b>Example:</b><br>Device# <code>show running-config interface gigabitethernet1/0/1</code> | Verifies the change to the port.   |
| <b>Step 7</b> | <b>show vtp status</b><br><b>Example:</b><br>Device# <code>show vtp status</code>                                                               | Verifies the configuration.        |

## Adding a VTP Client to a VTP Domain (CLI)

Follow these steps to verify and reset the VTP configuration revision number on a device *before* adding it to a VTP domain.

**Before you begin**

Before adding a VTP client to a VTP domain, always verify that its VTP configuration revision number is *lower* than the configuration revision number of the other devices in the VTP domain. Devices in a VTP domain always use the VLAN configuration of the device with the highest VTP configuration revision number. With VTP versions 1 and 2, adding a device that has a revision number higher than the revision number in the VTP domain can erase all VLAN information from the VTP server and VTP domain. With VTP version 3, the VLAN information is not erased.

You can use the **vtp mode transparent** global configuration command to disable VTP on the device and then to change its VLAN information without affecting the other devices in the VTP domain.

## SUMMARY STEPS

1. **enable**
2. **show vtp status**
3. **configure terminal**
4. **vtp domain *domain-name***
5. **end**
6. **show vtp status**
7. **configure terminal**
8. **vtp domain *domain-name***
9. **end**
10. **show vtp status**

## DETAILED STEPS

|               | Command or Action                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                              | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 2</b> | <b>show vtp status</b><br><b>Example:</b><br>Device# <b>show vtp status</b>                            | Checks the VTP configuration revision number.<br>If the number is 0, add the device to the VTP domain.<br>If the number is greater than 0, follow these substeps: <ul style="list-style-type: none"> <li>• Write down the domain name.</li> <li>• Write down the configuration revision number.</li> <li>• Continue with the next steps to reset the device configuration revision number.</li> </ul> |
| <b>Step 3</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                      | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 4</b> | <b>vtp domain <i>domain-name</i></b><br><b>Example:</b><br>Device(config)# <b>vtp domain domain123</b> | Changes the domain name from the original one displayed in Step 1 to a new name.                                                                                                                                                                                                                                                                                                                      |

|                | Command or Action                                                                                      | Purpose                                                                                                                             |
|----------------|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b>  | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                            | Returns to privileged EXEC mode. The VLAN information on the device is updated and the configuration revision number is reset to 0. |
| <b>Step 6</b>  | <b>show vtp status</b><br><b>Example:</b><br>Device# <b>show vtp status</b>                            | Verifies that the configuration revision number has been reset to 0.                                                                |
| <b>Step 7</b>  | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                      | Enters global configuration mode.                                                                                                   |
| <b>Step 8</b>  | <b>vtp domain <i>domain-name</i></b><br><b>Example:</b><br>Device(config)# <b>vtp domain domain012</b> | Enters the original domain name on the device                                                                                       |
| <b>Step 9</b>  | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                            | Returns to privileged EXEC mode. The VLAN information on the device is updated.                                                     |
| <b>Step 10</b> | <b>show vtp status</b><br><b>Example:</b><br>Device# <b>show vtp status</b>                            | (Optional) Verifies that the domain name is the same as in Step 1 and that the configuration revision number is 0.                  |

## Monitoring VTP

This section describes commands used to display and monitor the VTP configuration.

You monitor VTP by displaying VTP configuration information: the domain name, the current VTP revision, and the number of VLANs. You can also display statistics about the advertisements sent and received by the device.

*Table 203: VTP Monitoring Commands*

| Command                                  | Purpose                                                                                                                                                                                                                                                   |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show vtp counters</b>                 | Displays counters about VTP messages that have been sent and received.                                                                                                                                                                                    |
| <b>show vtp devices [conflict]</b>       | Displays information about all VTP version 3 devices in the domain. Conflicts are VTP version 3 devices with conflicting primary servers. The <b>show vtp devices</b> command does not display information when the device is in transparent or off mode. |
| <b>show vtp interface [interface-id]</b> | Displays VTP status and configuration for all interfaces or the specified interface.                                                                                                                                                                      |
| <b>show vtp password</b>                 | Displays the VTP password. The form of the password displayed depends on whether or not the <b>hidden</b> keyword was entered and if encryption is enabled on the device.                                                                                 |
| <b>show vtp status</b>                   | Displays the VTP device configuration information.                                                                                                                                                                                                        |

## Configuration Examples for VTP

### Example: Configuring a Switch as the Primary Server

This example shows how to configure a device as the primary server for the VLAN database (the default) when a hidden or secret password was configured:

```
Device# vtp primary vlan
Enter VTP password: mypassword
This switch is becoming Primary server for vlan feature in the VTP domain

VTP Database Conf Switch ID      Primary Server Revision System Name
-----
VLANDB          Yes  00d0.00b8.1400=00d0.00b8.1400 1          stp7

Do you want to continue (y/n) [n]? y
```

## Where to Go Next

After configuring VTP, you can configure the following:

- VLANs
- VLAN groups
- VLAN trunking
- Voice VLANs

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for VLANs

The following are prerequisites and considerations for configuring VLANs:

- Before you create VLANs, you must decide whether to use VLAN Trunking Protocol (VTP) to maintain global VLAN configuration for your network.
- If you plan to configure many VLANs on the device and to not enable routing, you can set the Switch Database Management (SDM) feature to the VLAN template, which configures system resources to support the maximum number of unicast MAC addresses.
- Devices running the LAN Base feature set support only static routing on SVIs.
- A VLAN should be present in the device to be able to add it to the VLAN group.

## Restrictions for VLANs

The following are restrictions for VLANs:

- The device supports per-VLAN spanning-tree plus (PVST+) or rapid PVST+ with a maximum of 128 spanning-tree instances. One spanning-tree instance is allowed per VLAN.
- The device supports IEEE 802.1Q trunking methods for sending VLAN traffic over Ethernet ports.
- Configuring an interface VLAN router's MAC address is not supported. The interface VLAN already has an MAC address assigned by default.
- Private VLANs are not supported on the device.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

## Information About VLANs

### Logical Networks

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can group end stations even if they are not physically located on the same LAN segment. Any device port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router or a device supporting fallback bridging. In a device stack, VLANs can be formed with ports across the stack. Because a VLAN is considered a separate logical network, it contains its own bridge Management Information Base (MIB) information and can support its own implementation of spanning tree.

**Figure 122: VLANs as Logically Defined Networks**

VLANs are often associated with IP subnetworks. For example, all the end stations in a particular IP subnet belong to the same VLAN. Interface VLAN membership on the device is assigned manually on an interface-by-interface basis. When you assign device interfaces to VLANs by using this method, it is known as interface-based, or static, VLAN membership.

Traffic between VLANs must be routed.

The device can route traffic between VLANs by using device virtual interfaces (SVIs). An SVI must be explicitly configured and assigned an IP address to route traffic between VLANs.

## Supported VLANs

The device supports VLANs in VTP client, server, and transparent modes. VLANs are identified by a number from 1 to 4094. VLAN 1 is the default VLAN and is created during system initialization. VLAN IDs 1002 through 1005 are reserved for Token Ring and FDDI VLANs. All of the VLANs except 1002 to 1005 are available for user configuration.

There are 3 VTP versions: VTP version 1, version 2, and version 3. All VTP versions support both normal and extended range VLANs, but only with VTP version 3, does the device propagate extended range VLAN configuration information. When extended range VLANs are created in VTP versions 1 and 2, their configuration information is not propagated. Even the local VTP database entries on the device are not updated, but the extended range VLANs configuration information is created and stored in the running configuration file.

You can configure up to 4094 VLANs on the device.

## VLAN Port Membership Modes

You configure a port to belong to a VLAN by assigning a membership mode that specifies the kind of traffic the port carries and the number of VLANs to which it can belong.

When a port belongs to a VLAN, the device learns and manages the addresses associated with the port on a per-VLAN basis.

Table 204: Port Membership Modes and Characteristics

| Membership Mode                                                                                                                   | VLAN Membership Characteristics                                                                                                                                                                                                                                                     | VTP Characteristics                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static-access                                                                                                                     | A static-access port can belong to one VLAN and is manually assigned to that VLAN.                                                                                                                                                                                                  | VTP is not required. If you do not want VTP to globally propagate information, set the VTP mode to transparent. To participate in VTP, there must be at least one trunk port on the device or the device stack connected to a trunk port of a second device or device stack. |
| Trunk (IEEE 802.1Q) :<br><ul style="list-style-type: none"> <li>IEEE 802.1Q— Industry-standard trunking encapsulation.</li> </ul> | A trunk port is a member of all VLANs by default, including extended-range VLANs, but membership can be limited by configuring the allowed-VLAN list. You can also modify the pruning-eligible list to block flooded traffic to VLANs on trunk ports that are included in the list. | VTP is recommended but not required. VTP maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP exchanges VLAN configuration messages with other devices over trunk links.                          |
| Voice VLAN                                                                                                                        | A voice VLAN port is an access port attached to a Cisco IP Phone, configured to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.                                                                                               | VTP is not required; it has no effect on a voice VLAN.                                                                                                                                                                                                                       |

## VLAN Configuration Files

Configurations for VLAN IDs 1 to 1005 are written to the `vlan.dat` file (VLAN database), and you can display them by entering the `show vlan` privileged EXEC command. The `vlan.dat` file is stored in flash memory. If the VTP mode is transparent, they are also saved in the device running configuration file.

In a device stack, the whole stack uses the same `vlan.dat` file and running configuration. On some devices, the `vlan.dat` file is stored in flash memory on the active device.

You use the interface configuration mode to define the port membership mode and to add and remove ports from VLANs. The results of these commands are written to the running-configuration file, and you can display the file by entering the `show running-config` privileged EXEC command.

When you save VLAN and VTP information (including extended-range VLAN configuration information) in the startup configuration file and reboot the device, the device configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration, and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is

ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

- If the VTP mode or domain name in the startup configuration does not match the VLAN database, the domain name and VTP mode and configuration for the VLAN IDs 1 to 1005 use the VLAN database information.
- In VTP versions 1 and 2, if VTP mode is server, the domain name and VLAN configuration for VLAN IDs 1 to 1005 use the VLAN database information. VTP version 3 also supports VLANs 1006 to 4094.

---

**Note** Ensure that you delete the `vlan.dat` file along with the configuration files before you reset the switch configuration using **write erase** command. This ensures that the switch reboots correctly on a reset.

---

## Normal-Range VLAN Configuration Guidelines

Normal-range VLANs are VLANs with IDs from 1 to 1005.

Follow these guidelines when creating and modifying normal-range VLANs in your network:

- Normal-range VLANs are identified with a number between 1 and 1001. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs.
- VLAN configurations for VLANs 1 to 1005 are always saved in the VLAN database. If the VTP mode is transparent, VTP and VLAN configurations are also saved in the device running configuration file.
- If the device is in VTP server or VTP transparent mode, you can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)
- Extended-range VLANs created in VTP transparent mode are not saved in the VLAN database and are not propagated. VTP version 3 supports extended range VLAN (VLANs 1006 to 4094) database propagation in VTP server mode.
- Before you can create a VLAN, the device must be in VTP server mode or VTP transparent mode. If the device is a VTP server, you must define a VTP domain or VTP will not function.
- The device does not support Token Ring or FDDI media. The device does not forward FDDI, FDDI-Net, TrCRF, or TrBRF traffic, but it does propagate the VLAN configuration through VTP.
- The device supports 128 spanning tree instances. If a device has more active VLANs than supported spanning-tree instances, spanning tree can be enabled on 128 VLANs and is disabled on the remaining VLANs. If you have already used all available spanning-tree instances on a device, adding another VLAN anywhere in the VTP domain creates a VLAN on that device that is not running spanning-tree. If you have the default allowed list on the trunk ports of that device (which is to allow all VLANs), the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that would not be broken, particularly if there are several adjacent devices that all have run out of spanning-tree instances. You can prevent this possibility by setting allowed lists on the trunk ports of devices that have used up their allocation of spanning-tree instances.

If the number of VLANs on the device exceeds the number of supported spanning-tree instances, we recommend that you configure the IEEE 802.1s Multiple STP (MSTP) on your device to map multiple VLANs to a single spanning-tree instance.

- When a device in a stack learns a new VLAN or deletes or modifies an existing VLAN (either through VTP over network ports or through the CLI), the VLAN information is communicated to all stack members.
- When a device joins a stack or when stacks merge, VTP information (the vlan.dat file) on the new devices will be consistent with the active device.

## Extended-Range VLAN Configuration Guidelines

Extended-range VLANs are VLANs with IDs from 1006 to 4094.

Follow these guidelines when creating extended-range VLANs:

- VLAN IDs in the extended range are not saved in the VLAN database and are not recognized by VTP unless the device is running VTP version 3.
- You cannot include extended-range VLANs in the pruning eligible range.
- For VTP version 1 or 2, you can set the VTP mode to transparent in global configuration mode. You should save this configuration to the startup configuration so that the device boots up in VTP transparent mode. Otherwise, you lose the extended-range VLAN configuration if the device resets. If you create extended-range VLANs in VTP version 3, you cannot convert to VTP version 1 or 2.
- In a device stack, the whole stack uses the same running configuration and saved configuration, and extended-range VLAN information is shared across the stack.

## How to Configure VLANs

### How to Configure Normal-Range VLANs

You can set these parameters when you create a new normal-range VLAN or modify an existing VLAN in the VLAN database:

- VLAN ID
- VLAN name
- VLAN type
  - Ethernet

- Fiber Distributed Data Interface [FDDI]
  - FDDI network entity title [NET]
  - TrBRF or TrCRF
  - Token Ring
  - Token Ring-Net
- 
- VLAN state (active or suspended)
  - Maximum transmission unit (MTU) for the VLAN
  - Security Association Identifier (SAID)
  - Bridge identification number for TrBRF VLANs
  - Ring number for FDDI and TrCRF VLANs
  - Parent VLAN number for TrCRF VLANs
  - Spanning Tree Protocol (STP) type for TrCRF VLANs
  - VLAN number to use when translating from one VLAN type to another

You can cause inconsistency in the VLAN database if you attempt to manually delete the `vlan.dat` file. If you want to modify the VLAN configuration, follow the procedures in this section.

## Creating or Modifying an Ethernet VLAN (CLI)

### Before you begin

With VTP version 1 and 2, if the device is in VTP transparent mode, you can assign VLAN IDs greater than 1006, but they are not added to the VLAN database.

The device supports only Ethernet interfaces. Because FDDI and Token Ring VLANs are not locally supported, you only configure FDDI and Token Ring media-specific characteristics for VTP global advertisements to other devices.

Although the device does not support Token Ring connections, a remote device with Token Ring connections could be managed from one of the supported devices. Devices running VTP Version 2 advertise information about these Token Ring VLANs:

- Token Ring TrBRF VLANs
- Token Ring TrCRF VLANs

### SUMMARY STEPS

1. **configure terminal**
2. **vlan *vlan-id***
3. **name *vlan-name***
4. **media { ethernet | fd-net | fddi | tokenring | trn-net }**
5. **remote-span**
6. **end**

7. show vlan {name *vlan-name* | id *vlan-id*}

## DETAILED STEPS

|               | Command or Action                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 2</b> | <b>vlan <i>vlan-id</i></b><br><b>Example:</b><br>Device(config)# <b>vlan 20</b>                                                  | Enters a VLAN ID, and enters VLAN configuration mode. Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify that VLAN.<br><b>Note</b> The available VLAN ID range for this command is 1 to 4094.                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>name <i>vlan-name</i></b><br><b>Example:</b><br>Device(config-vlan)# <b>name test20</b>                                       | (Optional) Enters a name for the VLAN. If no name is entered for the VLAN, the default is to append the <i>vlan-id</i> value with leading zeros to the word VLAN. For example, VLAN0004 is a default VLAN name for VLAN 4.                                                                                                                                                                                                           |
| <b>Step 4</b> | <b>media { ethernet   fd-net   fddi   tokenring   trn-net }</b><br><b>Example:</b><br>Device(config-vlan)# <b>media ethernet</b> | Configures the VLAN media type. Command options include: <ul style="list-style-type: none"> <li>• <b>ethernet</b>—Sets the VLAN media type as Ethernet.</li> <li>• <b>fd-net</b>—Sets the VLAN media type as FDDI net.</li> <li>• <b>fddi</b>—Sets the VLAN media type as FDDI.</li> <li>• <b>tokenring</b>—Sets the VLAN media type as Token Ring.</li> <li>• <b>trn-net</b>—Sets the VLAN media type as Token Ring net.</li> </ul> |
| <b>Step 5</b> | <b>remote-span</b><br><b>Example:</b><br>Device(config-vlan)# <b>remote-span</b>                                                 | (Optional) Configures the VLAN as the RSPAN VLAN for a remote SPAN session. For more information on remote SPAN, see the <i>Catalyst 3650 Network Management Configuration Guide</i> .                                                                                                                                                                                                                                               |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <b>show vlan {name <i>vlan-name</i>   id <i>vlan-id</i>}</b><br><b>Example:</b>                                                  | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                               |

|  | Command or Action                                | Purpose |
|--|--------------------------------------------------|---------|
|  | Device# <code>show vlan name test20 id 20</code> |         |

## Deleting a VLAN (CLI)

When you delete a VLAN from a device that is in VTP server mode, the VLAN is removed from the VLAN database for all devices in the VTP domain. When you delete a VLAN from a device that is in VTP transparent mode, the VLAN is deleted only on that specific device or a device stack.

You cannot delete the default VLANs for the different media types: Ethernet VLAN 1 and FDDI or Token Ring VLANs 1002 to 1005.

### Caution

When you delete a VLAN, any ports assigned to that VLAN become inactive. They remain associated with the VLAN (and thus inactive) until you assign them to a new VLAN.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `no vlan vlan-id`
4. `end`
5. `show vlan brief`
6. `copy running-config startup-config`

### DETAILED STEPS

|               | Command or Action                                                                       | Purpose                                                        |
|---------------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                 | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 3</b> | <b>no vlan <i>vlan-id</i></b><br><b>Example:</b><br>Device(config)# <b>no vlan 4</b>                              | Removes the VLAN by entering the VLAN ID.                |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                         |
| <b>Step 5</b> | <b>show vlan brief</b><br><b>Example:</b><br>Device# <b>show vlan brief</b>                                       | Verifies the VLAN removal.                               |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

**Assigning Static-Access Ports to a VLAN (CLI)**

You can assign a static-access port to a VLAN without having VTP globally propagate VLAN configuration information by disabling VTP (VTP transparent mode).

If you are assigning a port on a cluster member device to a VLAN, first use the **rcommand** privileged EXEC command to log in to the cluster member switch.

If you assign an interface to a VLAN that does not exist, the new VLAN is created.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **switchport mode access**
5. **switchport access vlan *vlan-id***
6. **end**
7. **show running-config interface *interface-id***

8. `show interfaces interface-id switchport`
9. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                                                                                                     | Purpose                                                              |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                              | Enables privileged EXEC mode. Enter your password if prompted.       |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                         | Enters global configuration mode                                     |
| Step 3 | <p><b>interface interface-id</b></p> <p><b>Example:</b></p> <pre>Device(config)# interface gigabitethernet2/0/1</pre>                                 | Enters the interface to be added to the VLAN.                        |
| Step 4 | <p><b>switchport mode access</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# switchport mode access</pre>                                      | Defines the VLAN membership mode for the port (Layer 2 access port). |
| Step 5 | <p><b>switchport access vlan vlan-id</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# switchport access vlan 2</pre>                            | Assigns the port to a VLAN. Valid VLAN IDs are 1 to 4094.            |
| Step 6 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# end</pre>                                                                            | Returns to privileged EXEC mode.                                     |
| Step 7 | <p><b>show running-config interface interface-id</b></p> <p><b>Example:</b></p> <pre>Device# show running-config interface gigabitethernet2/0/1</pre> | Verifies the VLAN membership mode of the interface.                  |

|               | Command or Action                                                                                                                              | Purpose                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b> | <b>show interfaces <i>interface-id</i> switchport</b><br><b>Example:</b><br><pre>Device# show interfaces gigabitethernet2/0/1 switchport</pre> | Verifies your entries in the <i>Administrative Mode</i> and the <i>Access Mode VLAN</i> fields of the display. |
| <b>Step 9</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre>                          | (Optional) Saves your entries in the configuration file.                                                       |

## How to Configure Extended-Range VLANs

Extended-range VLANs enable service providers to extend their infrastructure to a greater number of customers. The extended-range VLAN IDs are allowed for any **switchport** commands that allow VLAN IDs.

With VTP version 1 or 2, extended-range VLAN configurations are not stored in the VLAN database, but because VTP mode is transparent, they are stored in the device running configuration file, and you can save the configuration in the startup configuration file. Extended-range VLANs created in VTP version 3 are stored in the VLAN database.

You can change only the MTU size and the remote SPAN configuration state on extended-range VLANs; all other characteristics must remain at the default state.

### Creating an Extended-Range VLAN (CLI)

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vlan *vlan-id***
4. **remote-span**
5. **exit**
6. **end**
7. **show vlan id *vlan-id***
8. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                         | Purpose                                                                                         |
|--------|-----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                 | Enables privileged EXEC mode. Enter your password if prompted.                                  |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                         | Enters the global configuration mode.                                                           |
| Step 3 | <b>vlan <i>vlan-id</i></b><br><b>Example:</b><br>Device(config)# <b>vlan 2000</b><br>Device(config-vlan)# | Enters an extended-range VLAN ID and enters VLAN configuration mode. The range is 1006 to 4094. |
| Step 4 | <b>remote-span</b><br><b>Example:</b><br>Device(config-vlan)# <b>remote-span</b>                          | (Optional) Configures the VLAN as the RSPAN VLAN.                                               |
| Step 5 | <b>exit</b><br><b>Example:</b><br>Device(config-vlan)# <b>exit</b><br>Device(config)#                     | Returns to configuration mode.                                                                  |
| Step 6 | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                               | Returns to privileged EXEC mode.                                                                |
| Step 7 | <b>show vlan id <i>vlan-id</i></b><br><b>Example:</b><br>Device# <b>show vlan id 2000</b>                 | Verifies that the VLAN has been created.                                                        |
| Step 8 | <b>copy running-config startup-config</b><br><b>Example:</b>                                              | (Optional) Saves your entries in the configuration file.                                        |

| Command or Action                                       | Purpose |
|---------------------------------------------------------|---------|
| Device# <code>copy running-config startup-config</code> |         |

## Where to Go Next

After configuring VLANs, you can configure the following:

- VLAN groups
- VLAN Trunking Protocol (VTP)
- VLAN trunks
- VLAN Membership Policy Server (VMPS)
- Voice VLANs

- [Prerequisites for VLAN Groups, on page 2419](#)
- [Restrictions for VLAN Groups, on page 2419](#)
- [Information About VLAN Groups, on page 2420](#)
- [How to Configure VLAN Groups, on page 2420](#)
- [Where to Go Next, on page 2423](#)
- [Additional References, on page 2423](#)
- [Feature History and Information for VLAN Groups, on page 2424](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for VLAN Groups

- A VLAN should be present in the device to be able to add it to the VLAN group.
- For VLAN group to function properly, in addition to enabling DHCP snooping globally, you must ensure that DHCP snooping is enabled in all the VLANs.

## Restrictions for VLAN Groups

The number of VLANs mapped to a VLAN group is not limited by Cisco IOS Software Release. But if the number of VLANs in a VLAN group exceed the recommended value of 32, the mobility behavior is unexpected and in the VLAN group, L2 multicast breaks for some VLANs. So it is the responsibility of the administrator to configure feasible number of VLANs in a VLAN group. When a VLAN is added to a VLAN group mapped

to a WLAN which already has 32 VLANs, a warning is generated. But when a new VLAN group is mapped to a WLAN with more than 32 VLANs, an error is generated.

For expected behavior of the VLAN group, the VLANs mapped in the group must be present in the device. The static IP client behavior is not supported.

## Information About VLAN Groups

Whenever a client connects to a wireless network (WLAN), the client is placed in a VLAN that is associated with the WLAN. In a large venue such as an auditorium, a stadium, or a conference room where there are numerous wireless clients, having only a single WLAN to accommodate many clients might be a challenge.

The VLAN group feature uses a single WLAN that can support multiple VLANs. The clients can get assigned to one of the configured VLANs. This feature maps a WLAN to a single VLAN or multiple VLANs using the VLAN groups. When a wireless client associates to the WLAN, the VLAN is derived by an algorithm based on the MAC address of the wireless client. A VLAN is assigned to the client and the client gets the IP address from the assigned VLAN. This feature also extends the current AP group architecture and AAA override architecture, where the AP groups and AAA override can override a VLAN or a VLAN group to which the WLAN is mapped.

Behavior change introduced in Cisco IOS XE Release 3.7.0E: When a client associates with a WLAN and the WLAN is applied to a VLAN group, an index is calculated based on the MAC address of the client and the number of VLANs in the VLAN group using a hash algorithm. Based on this index, a VLAN is assigned to the client. If the index is "dirty," another index is generated in a round-robin manner and the VLAN is assigned to the client based on the newly generated index.

The system marks VLAN as "dirty" for 30 minutes when the clients are unable to receive IP address using DHCP. The system might not clear the "dirty" flag from the VLAN even after 30 minutes for a VLAN group. This is expected behavior because the timestamp of each interface has to be checked to see if it is greater than 30 minutes, due to which there is a lag of 5 minutes for the global timer to expire.

## Removing VLAN Group (CLI)

## SUMMARY STEPS

1. **configure terminal**
2. **vlan group** *WORD* **vlan-list** *vlan-ID*
3. **no vlan group** *WORD* **vlan-list** *vlan-ID*
4. **end**

## DETAILED STEPS

**Step 1** **configure terminal**

**Example:**

```
Device# configure terminal
```

Enters global command mode.

**Step 2** **vlan group** *WORD* **vlan-list** *vlan-ID*

**Example:**

```
Device(config)#vlan group vlangrp1 vlan-list 91-95
```

Creates a VLAN group with the given group name (vlangrp1) and adds all the VLANs listed in the command. The VLAN list ranges from 1 to 4096 and the recommended number of VLANs in a group is 32.

**Step 3** **no vlan group** *WORD* **vlan-list** *vlan-ID*

**Example:**

```
Device(config)#no vlan group vlangrp1 vlan-list 91-95
```

Removes the VLAN group with the given group name (vlangrp1).

**Step 4**    **end**

**Example:**

```
Device(config)#end
```

Exits the global configuration mode and returns to privileged EXEC mode. Alternatively, press **CTRL-Z** to exit the global configuration mode.

## Adding a VLAN Group to WLAN (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **wlan** *WORD number*
3. **client vlan** *WORD*
4. **end**

### DETAILED STEPS

|               | Command or Action                                                                                     | Purpose                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                     | Enters global command mode.                                                                                                                         |
| <b>Step 2</b> | <b>wlan</b> <i>WORD number</i><br><b>Example:</b><br>Device(config)# <b>wlan wlanname 512</b>         | Enables the WLAN to map a VLAN group using an identifier. The WLAN identifier values range from 1 to 512.                                           |
| <b>Step 3</b> | <b>client vlan</b> <i>WORD</i><br><b>Example:</b><br>Device(config-wlan)# <b>client vlan vlangrp1</b> | Maps the VLAN group to the WLAN by entering the VLAN identifier, VLAN group, or the VLAN name.                                                      |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config-wlan)# <b>end</b>                                      | Exits the global configuration mode and returns to privileged EXEC mode . Alternatively, press <b>CTRL-Z</b> to exit the global configuration mode. |

## Viewing VLANs in VLAN Groups (CLI)

| Commands                                | Description                                                                      |
|-----------------------------------------|----------------------------------------------------------------------------------|
| show vlan group                         | Displays the list of VLAN groups with its name and the VLANs that are available. |
| show vlan group group-name <group_name> | Displays the specified VLAN group details.                                       |

| Commands                                                 | Description                                         |
|----------------------------------------------------------|-----------------------------------------------------|
| <code>show wireless vlan group &lt;group_name&gt;</code> | Displays the specified wireless VLAN group details. |

## Where to Go Next

After configuring VLAN groups, you can configure the following:

- VLANs
- VLAN Trunking Protocol (VTP)
- VLAN trunks
- Voice VLANs

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for VLAN Trunks

The IEEE 802.1Q trunks impose these limitations on the trunking strategy for a network:

- In a network of Cisco devices connected through IEEE 802.1Q trunks, the devices maintain one spanning-tree instance for each VLAN allowed on the trunks. Non-Cisco devices might support one spanning-tree instance for all VLANs.

When you connect a Cisco device to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco device combines the spanning-tree instance of the VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q device. However, spanning-tree information for each VLAN is maintained by Cisco devices separated by a cloud of non-Cisco IEEE 802.1Q devices. The non-Cisco IEEE 802.1Q cloud separating the Cisco devices is treated as a single trunk link between the devices.

- Make sure the native VLAN for an IEEE 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.
- Disabling spanning tree on the native VLAN of an IEEE 802.1Q trunk without disabling spanning tree on every VLAN in the network can potentially cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an IEEE 802.1Q trunk or disable spanning tree on every VLAN in the network. Make sure your network is loop-free before disabling spanning tree.

## Restrictions for VLAN Trunks

The following are restrictions for VLAN trunks:

- A trunk port cannot be a secure port.
- Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the device propagates the setting that you entered to all ports in the group:
  - Allowed-VLAN list.
  - STP port priority for each VLAN.
  - STP Port Fast setting.
  - Trunk status:
    - If one port in a port group ceases to be a trunk, all ports cease to be trunks.
- We recommend that you configure no more than 24 trunk ports in Per VLAN Spanning Tree (PVST) mode and no more than 40 trunk ports in Multiple Spanning Tree (MST) mode.
- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.
- A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x on a dynamic port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.
- Dynamic Trunking Protocol (DTP) is not supported on tunnel ports.
- The device does not support Layer 3 trunks; you cannot configure subinterfaces or use the **encapsulation** keyword on Layer 3 interfaces. The device does support Layer 2 trunks and Layer 3 VLAN interfaces, which provide equivalent capabilities.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

# Information About VLAN Trunks

## Trunking Overview

A trunk is a point-to-point link between one or more Ethernet device interfaces and another networking device such as a router or a device. Ethernet trunks carry the traffic of multiple VLANs over a single link, and you can extend the VLANs across an entire network.

The following trunking encapsulations are available on all Ethernet interfaces:

- IEEE 802.1Q— Industry-standard trunking encapsulation.

## Trunking Modes

Ethernet trunk interfaces support different trunking modes. You can set an interface as trunking or nontrunking or to negotiate trunking with the neighboring interface. To autonegotiate trunking, the interfaces must be in the same VTP domain.

Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a Point-to-Point Protocol (PPP). However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations.

## Layer 2 Interface Modes

*Table 206: Layer 2 Interface Modes*

| Mode                                     | Function                                                                                                                                                                                                                                                             |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>switchport mode access</b>            | Puts the interface (access port) into permanent nontrunking mode and negotiates to convert the link into a nontrunk link. The interface becomes a nontrunk interface regardless of whether or not the neighboring interface is a trunk interface.                    |
| <b>switchport mode dynamic auto</b>      | Makes the interface able to convert the link to a trunk link. The interface becomes a trunk interface if the neighboring interface is set to <b>trunk</b> or <b>desirable</b> mode. The default switchport mode for all Ethernet interfaces is <b>dynamic auto</b> . |
| <b>switchport mode dynamic desirable</b> | Makes the interface actively attempt to convert the link to a trunk link. The interface becomes a trunk interface if the neighboring interface is set to <b>trunk</b> , <b>desirable</b> , or <b>auto</b> mode.                                                      |
| <b>switchport mode trunk</b>             | Puts the interface into permanent trunking mode and negotiates to convert the neighboring link into a trunk link. The interface becomes a trunk interface even if the neighboring interface is not a trunk interface.                                                |

| Mode                          | Function                                                                                                                                                                                                                                                     |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>switchport nonegotiate</b> | Prevents the interface from generating DTP frames. You can use this command only when the interface switchport mode is <b>access</b> or <b>trunk</b> . You must manually configure the neighboring interface as a trunk interface to establish a trunk link. |

## Allowed VLANs on a Trunk

By default, a trunk port sends traffic to and receives traffic from all VLANs. All VLAN IDs, 1 to 4094, are allowed on each trunk. However, you can remove VLANs from the allowed list, preventing traffic from those VLANs from passing over the trunk.

To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), DTP, and VTP in VLAN 1.

If a trunk port with VLAN 1 disabled is converted to a nontrunk port, it is added to the access VLAN. If the access VLAN is set to 1, the port will be added to VLAN 1, regardless of the **switchport trunk allowed** setting. The same is true for any VLAN that has been disabled on the port.

A trunk port can become a member of a VLAN if the VLAN is enabled, if VTP knows of the VLAN, and if the VLAN is in the allowed list for the port. When VTP detects a newly enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of the enabled VLAN. When VTP detects a new VLAN and the VLAN is not in the allowed list for a trunk port, the trunk port does not become a member of the new VLAN.

## Load Sharing on Trunk Ports

Load sharing divides the bandwidth supplied by parallel trunks connecting devices. To avoid loops, STP normally blocks all but one parallel link between devices. Using load sharing, you divide the traffic between the links according to which VLAN the traffic belongs.

You configure load sharing on trunk ports by using STP port priorities or STP path costs. For load sharing using STP port priorities, both load-sharing links must be connected to the same device. For load sharing using STP path costs, each load-sharing link can be connected to the same device or to two different devices.

## Network Load Sharing Using STP Priorities

When two ports on the same device form a loop, the device uses the STP port priority to decide which port is enabled and which port is in a blocking state. You can set the priorities on a parallel trunk port so that the port carries all the traffic for a given VLAN. The trunk port with the higher priority (lower values) for a VLAN is forwarding traffic for that VLAN. The trunk port with the lower priority (higher values) for the same VLAN remains in a blocking state for that VLAN. One trunk port sends or receives all traffic for the VLAN.

**Related Topics**

[Configuring Load Sharing Using STP Port Priorities \(CLI\)](#), on page 2436

## Network Load Sharing Using STP Path Cost

You can configure parallel trunks to share VLAN traffic by setting different path costs on a trunk and associating the path costs with different sets of VLANs, blocking different ports for different VLANs. The VLANs keep the traffic separate and maintain redundancy in the event of a lost link.

**Related Topics**

[Configuring Load Sharing Using STP Path Cost \(CLI\)](#), on page 2440

## Feature Interactions

Trunking interacts with other features in these ways:

- A trunk port cannot be a secure port.
- Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the device propagates the setting that you entered to all ports in the group:
  - Allowed-VLAN list.
  - STP port priority for each VLAN.
  - STP Port Fast setting.
  - Trunk status:

If one port in a port group ceases to be a trunk, all ports cease to be trunks.

- We recommend that you configure no more than 24 trunk ports in Per VLAN Spanning Tree (PVST) mode and no more than 40 trunk ports in Multiple Spanning Tree (MST) mode.
- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.
- A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x on a dynamic port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.

## How to Configure VLAN Trunks

To avoid trunking misconfigurations, configure interfaces connected to devices that do not support DTP to not forward DTP frames, that is, to turn off DTP.

- If you do not intend to trunk across those links, use the **switchport mode access** interface configuration command to disable trunking.

- To enable trunking to a device that does not support DTP, use the **switchport mode trunk** and **switchport nonegotiate** interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

## Configuring an Ethernet Interface as a Trunk Port

### Configuring a Trunk Port (CLI)

Because trunk ports send and receive VTP advertisements, to use VTP you must ensure that at least one trunk port is configured on the device and that this trunk port is connected to the trunk port of a second device. Otherwise, the device cannot receive any VTP advertisements.

#### Before you begin

By default, an interface is in Layer 2 mode. The default mode for Layer 2 interfaces is **switchport mode dynamic auto**. If the neighboring interface supports trunking and is configured to allow trunking, the link is a Layer 2 trunk or, if the interface is in Layer 3 mode, it becomes a Layer 2 trunk when you enter the **switchport** interface configuration command.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **switchport mode {dynamic {auto | desirable} | trunk}**
5. **switchport access vlan *vlan-id***
6. **switchport trunk native vlan *vlan-id***
7. **end**
8. **show interfaces *interface-id* switchport**
9. **show interfaces *interface-id* trunk**
10. **copy running-config startup-config**

#### DETAILED STEPS

**Defining the Allowed VLANs on a Trunk (CLI)**

VLAN 1 is the default VLAN on all trunk ports in all Cisco devices, and it has previously been a requirement that VLAN 1 always be enabled on every trunk link. You can use the VLAN 1 minimization feature to disable VLAN 1 on any individual VLAN trunk link so that no user traffic (including spanning-tree advertisements) is sent or received on VLAN 1.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **switchport mode trunk**
5. **switchport trunk allowed vlan { *word* | **add** | **all** | **except** | **none** | **remove** } *vlan-list***
6. **end**
7. **show interfaces *interface-id* switchport**
8. **copy running-config startup-config**

**DETAILED STEPS**

|               | Command or Action                                                | Purpose                                                        |
|---------------|------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre> | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>                     | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                  |

## Changing the Pruning-Eligible List (CLI)

The pruning-eligible list applies only to trunk ports. Each trunk port has its own eligibility list. VTP pruning must be enabled for this procedure to take effect.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport trunk pruning vlan** {**add** | **except** | **none** | **remove**} *vlan-list* [*,vlan* [*,vlan* [...]]]
5. **end**
6. **show interfaces** *interface-id* **switchport**
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                        | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b> <b>gigabitethernet2/0/1</b>                                  | Selects the trunk port for which VLANs should be pruned, and enters interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>switchport trunk pruning vlan</b> { <b>add</b>   <b>except</b>   <b>none</b>   <b>remove</b> } <i>vlan-list</i> [ <i>,vlan</i> [ <i>,vlan</i> [...]]] | Configures the list of VLANs allowed to be pruned from the trunk.<br><br>For explanations about using the <b>add</b> , <b>except</b> , <b>none</b> , and <b>remove</b> keywords, see the command reference for this release.<br><br>Separate non-consecutive VLAN IDs with a comma and no spaces; use a hyphen to designate a range of IDs. Valid IDs are 2 to 1001. Extended-range VLANs (VLAN IDs 1006 to 4094) cannot be pruned.<br><br>VLANs that are pruning-ineligible receive flooded traffic.<br><br>The default list of VLANs allowed to be pruned contains VLANs 2 to 1001. |

|        | Command or Action                                                                                                                          | Purpose                                                                         |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                | Returns to privileged EXEC mode.                                                |
| Step 6 | <b>show interfaces <i>interface-id</i> switchport</b><br><b>Example:</b><br>Device# <b>show interfaces gigabitethernet2/0/1 switchport</b> | Verifies your entries in the <i>Pruning VLANs Enabled</i> field of the display. |
| Step 7 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                          | (Optional) Saves your entries in the configuration file.                        |

## Configuring the Native VLAN for Untagged Traffic (CLI)

A trunk port configured with IEEE 802.1Q tagging can receive both tagged and untagged traffic. By default, the device forwards untagged traffic in the native VLAN configured for the port. The native VLAN is VLAN 1 by default.

The native VLAN can be assigned any VLAN ID.

If a packet has a VLAN ID that is the same as the outgoing port native VLAN ID, the packet is sent untagged; otherwise, the device sends the packet with a tag.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **switchport trunk native vlan *vlan-id***
5. **end**
6. **show interfaces *interface-id* switchport**
7. **copy running-config startup-config**

### DETAILED STEPS

|        | Command or Action                                         | Purpose                                                        |
|--------|-----------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                                    | Purpose                                                                                                                                   |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <code>configure terminal</code>                                                          | Enters the global configuration mode.                                                                                                     |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br><br>Device(config)# <code>interface gigabitethernet1/0/2</code>                           | Defines the interface that is configured as the IEEE 802.1Q trunk, and enters interface configuration mode.                               |
| <b>Step 4</b> | <b>switchport trunk native vlan <i>vlan-id</i></b><br><b>Example:</b><br><br>Device(config-if)# <code>switchport trunk native vlan 12</code>         | Configures the VLAN that is sending and receiving untagged traffic on the trunk port.<br><br>For <i>vlan-id</i> , the range is 1 to 4094. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><br>Device(config-if)# <code>end</code>                                                                             | Returns to privileged EXEC mode.                                                                                                          |
| <b>Step 6</b> | <b>show interfaces <i>interface-id</i> switchport</b><br><b>Example:</b><br><br>Device# <code>show interfaces gigabitethernet1/0/2 switchport</code> | Verifies your entries in the <i>Trunking Native Mode VLAN</i> field.                                                                      |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <code>copy running-config startup-config</code>                          | (Optional) Saves your entries in the configuration file.                                                                                  |

## Configuring Trunk Ports for Load Sharing

### Configuring Load Sharing Using STP Port Priorities (CLI)

If your device is a member of a device stack, you must use the **spanning-tree [vlan *vlan-id*] cost *cost*** interface configuration command instead of the **spanning-tree [vlan *vlan-id*] port-priority *priority*** interface configuration command to select an interface to put in the forwarding state. Assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last.

These steps describe how to configure a network with load sharing using STP port priorities.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vtp domain *domain-name***
4. **vtp mode server**
5. **end**
6. **show vtp status**
7. **show vlan**
8. **configure terminal**
9. **interface *interface-id***
10. **switchport mode trunk**
11. **end**
12. **show interfaces *interface-id* switchport**
13. Repeat the above steps on Device A for a second port in the device or device stack.
14. Repeat the above steps on Device B to configure the trunk ports that connect to the trunk ports configured on Device A.
15. **show vlan**
16. **configure terminal**
17. **interface *interface-id***
18. **spanning-tree vlan *vlan-range* port-priority *priority-value***
19. **exit**
20. **interface *interface-id***
21. **spanning-tree vlan *vlan-range* port-priority *priority-value***
22. **end**
23. **show running-config**
24. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                 | Purpose                                                                               |
|--------|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                         | Enables privileged EXEC mode. Enter your password if prompted.                        |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters global configuration mode on Device A.                                         |
| Step 3 | <b>vtp domain <i>domain-name</i></b><br><b>Example:</b>                           | Configures a VTP administrative domain.<br>The domain name can be 1 to 32 characters. |

|                | Command or Action                                                                                         | Purpose                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device(config)# <b>vtp domain workdomain</b>                                                              |                                                                                                                                                                 |
| <b>Step 4</b>  | <b>vtp mode server</b><br><b>Example:</b><br>Device(config)# <b>vtp mode server</b>                       | Configures Device A as the VTP server.                                                                                                                          |
| <b>Step 5</b>  | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                               | Returns to privileged EXEC mode.                                                                                                                                |
| <b>Step 6</b>  | <b>show vtp status</b><br><b>Example:</b><br>Device# <b>show vtp status</b>                               | Verifies the VTP configuration on both Device A and Device B.<br><br>In the display, check the <i>VTP Operating Mode</i> and the <i>VTP Domain Name</i> fields. |
| <b>Step 7</b>  | <b>show vlan</b><br><b>Example:</b><br>Device# <b>show vlan</b>                                           | Verifies that the VLANs exist in the database on Device A.                                                                                                      |
| <b>Step 8</b>  | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                         | Enters global configuration mode.                                                                                                                               |
| <b>Step 9</b>  | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet1/0/1</b> | Defines the interface to be configured as a trunk, and enters interface configuration mode.                                                                     |
| <b>Step 10</b> | <b>switchport mode trunk</b><br><b>Example:</b><br>Device(config-if)# <b>switchport mode trunk</b>        | Configures the port as a trunk port.                                                                                                                            |
| <b>Step 11</b> | <b>end</b><br><b>Example:</b>                                                                             | Returns to privileged EXEC mode.                                                                                                                                |

|                | Command or Action                                                                                                                                                        | Purpose                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device(config-if)# <b>end</b>                                                                                                                                            |                                                                                                                                                            |
| <b>Step 12</b> | <b>show interfaces <i>interface-id</i> switchport</b><br><b>Example:</b><br>Device# <b>show interfaces gigabitethernet1/0/1 switchport</b>                               | Verifies the VLAN configuration.                                                                                                                           |
| <b>Step 13</b> | Repeat the above steps on Device A for a second port in the device or device stack.                                                                                      |                                                                                                                                                            |
| <b>Step 14</b> | Repeat the above steps on Device B to configure the trunk ports that connect to the trunk ports configured on Device A.                                                  |                                                                                                                                                            |
| <b>Step 15</b> | <b>show vlan</b><br><b>Example:</b><br>Device# <b>show vlan</b>                                                                                                          | When the trunk links come up, VTP passes the VTP and VLAN information to Device B. This command verifies that Device B has learned the VLAN configuration. |
| <b>Step 16</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                        | Enters global configuration mode on Device A.                                                                                                              |
| <b>Step 17</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet1/0/1</b>                                                         | Defines the interface to set the STP port priority, and enters interface configuration mode.                                                               |
| <b>Step 18</b> | <b>spanning-tree vlan <i>vlan-range</i> port-priority <i>priority-value</i></b><br><b>Example:</b><br>Device(config-if)# <b>spanning-tree vlan 8-10 port-priority 16</b> | Assigns the port priority for the VLAN range specified. Enter a port priority value from 0 to 240. Port priority values increment by 16.                   |
| <b>Step 19</b> | <b>exit</b><br><b>Example:</b><br>Device(config-if)# <b>exit</b>                                                                                                         | Returns to global configuration mode.                                                                                                                      |
| <b>Step 20</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b>                                                                                                                  | Defines the interface to set the STP port priority, and enters interface configuration mode.                                                               |

|                | Command or Action                                                                                                                                                                     | Purpose                                                                                                                                  |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device(config)# <b>interface</b> gigabitethernet1/0/2                                                                                                                                 |                                                                                                                                          |
| <b>Step 21</b> | <b>spanning-tree vlan</b> <i>vlan-range</i> <b>port-priority</b> <i>priority-value</i><br><b>Example:</b><br>Device(config-if)# <b>spanning-tree vlan</b> 3-6 <b>port-priority</b> 16 | Assigns the port priority for the VLAN range specified. Enter a port priority value from 0 to 240. Port priority values increment by 16. |
| <b>Step 22</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                                                                                        | Returns to privileged EXEC mode.                                                                                                         |
| <b>Step 23</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                                                                                                   | Verifies your entries.                                                                                                                   |
| <b>Step 24</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                                                                     | (Optional) Saves your entries in the configuration file.                                                                                 |

[Network Load Sharing Using STP Priorities](#), on page 2428

**Configuring Load Sharing Using STP Path Cost (CLI)**

These steps describe how to configure a network with load sharing using STP path costs.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport mode trunk**
5. **exit**
6. Repeat Steps 2 through 4 on a second interface in Device A or in Device A stack.
7. **end**
8. **show running-config**
9. **show vlan**
10. **configure terminal**

11. **interface** *interface-id*
12. **spanning-tree vlan** *vlan-range* **cost** *cost-value*
13. **end**
14. Repeat Steps 9 through 13 on the other configured trunk interface on Device A, and set the spanning-tree path cost to 30 for VLANs 8, 9, and 10.
15. **exit**
16. **show running-config**
17. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                       | Purpose                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                               | Enables privileged EXEC mode. Enter your password if prompted.                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                       | Enters global configuration mode on Device A.                                               |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b> <b>gigabitethernet1/0/1</b> | Defines the interface to be configured as a trunk, and enters interface configuration mode. |
| <b>Step 4</b> | <b>switchport mode trunk</b><br><b>Example:</b><br>Device(config-if)# <b>switchport mode trunk</b>                      | Configures the port as a trunk port.                                                        |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device(config-if)# <b>exit</b>                                                        | Returns to global configuration mode.                                                       |
| <b>Step 6</b> | Repeat Steps 2 through 4 on a second interface in Device A or in Device A stack.                                        |                                                                                             |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                             | Returns to privileged EXEC mode.                                                            |

|                | Command or Action                                                                                                                                        | Purpose                                                                                                                                                             |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b>  | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                                                                | Verifies your entries. In the display, make sure that the interfaces are configured as trunk ports.                                                                 |
| <b>Step 9</b>  | <b>show vlan</b><br><b>Example:</b><br>Device# <code>show vlan</code>                                                                                    | When the trunk links come up, Device A receives the VTP information from the other devices. This command verifies that Device A has learned the VLAN configuration. |
| <b>Step 10</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                  | Enters global configuration mode.                                                                                                                                   |
| <b>Step 11</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device (config)# <code>interface gigabitethernet1/0/1</code>                                  | Defines the interface on which to set the STP cost, and enters interface configuration mode.                                                                        |
| <b>Step 12</b> | <b>spanning-tree vlan <i>vlan-range</i> cost <i>cost-value</i></b><br><b>Example:</b><br>Device (config-if)# <code>spanning-tree vlan 2-4 cost 30</code> | Sets the spanning-tree path cost to 30 for VLANs 2 through 4.                                                                                                       |
| <b>Step 13</b> | <b>end</b><br><b>Example:</b><br>Device (config-if)# <code>end</code>                                                                                    | Returns to global configuration mode.                                                                                                                               |
| <b>Step 14</b> | Repeat Steps 9 through 13 on the other configured trunk interface on Device A, and set the spanning-tree path cost to 30 for VLANs 8, 9, and 10.         |                                                                                                                                                                     |
| <b>Step 15</b> | <b>exit</b><br><b>Example:</b><br>Device (config)# <code>exit</code>                                                                                     | Returns to privileged EXEC mode.                                                                                                                                    |
| <b>Step 16</b> | <b>show running-config</b><br><b>Example:</b>                                                                                                            | Verifies your entries. In the display, verify that the path costs are set correctly for both trunk interfaces.                                                      |

|                | Command or Action                                                                                                       | Purpose                                                  |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Voice VLANs

The following are the prerequisites for voice VLANs:

- Voice VLAN configuration is only supported on device access ports; voice VLAN configuration is not supported on trunk ports.

---

**Note**

Trunk ports can carry any number of voice VLANs, similar to regular VLANs. The configuration of voice VLANs is not supported on trunk ports.

---

- Before you enable voice VLAN, enable QoS on the device by entering the **trust device cisco-phone** interface configuration command. If you use the auto QoS feature, these settings are automatically configured.
- You must enable CDP on the device port connected to the Cisco IP Phone to send the configuration to the phone. (CDP is globally enabled by default on all device interfaces.)

## Restrictions for Voice VLANs

You cannot configure static secure MAC addresses in the voice VLAN.

## Information About Voice VLAN

### Voice VLANs

The voice VLAN feature enables access ports to carry IP voice traffic from an IP phone. When the device is connected to a Cisco 7960 IP Phone, the phone sends voice traffic with Layer 3 IP precedence and Layer 2 class of service (CoS) values, which are both set to 5 by default. Because the sound quality of an IP phone call can deteriorate if the data is unevenly sent, the device supports quality of service (QoS) based on IEEE 802.1p CoS. QoS uses classification and scheduling to send network traffic from the device in a predictable manner.

The Cisco 7960 IP Phone is a configurable device, and you can configure it to forward traffic with an IEEE 802.1p priority. You can configure the device to trust or override the traffic priority assigned by a Cisco IP Phone.

### Cisco IP Phone Voice Traffic

You can configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone. You can configure access ports on the device to send Cisco Discovery Protocol (CDP) packets that instruct an attached phone to send voice traffic to the device in any of these ways:

- In the voice VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN, untagged (no Layer 2 CoS priority value)

---

**Note** In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5 for voice traffic and 3 for voice control traffic).

---

## Cisco IP Phone Data Traffic

The device can also process tagged data traffic (traffic in IEEE 802.1Q or IEEE 802.1p frame types) from the device attached to the access port on the Cisco IP Phone. You can configure Layer 2 access ports on the device to send CDP packets that instruct the attached phone to configure the phone access port in one of these modes:

- In trusted mode, all traffic received through the access port on the Cisco IP Phone passes through the phone unchanged.
- In untrusted mode, all traffic in IEEE 802.1Q or IEEE 802.1p frames received through the access port on the Cisco IP Phone receive a configured Layer 2 CoS value. The default Layer 2 CoS value is 0. Untrusted mode is the default.

---

**Note** Untagged traffic from the device attached to the Cisco IP Phone passes through the phone unchanged, regardless of the trust state of the access port on the phone.

---

## Voice VLAN Configuration Guidelines

- Because a Cisco 7960 IP Phone also supports a connection to a PC or other device, a port connecting the device to a Cisco IP Phone can carry mixed traffic. You can configure a port to decide how the Cisco IP Phone carries voice traffic and data traffic.
- The voice VLAN should be present and active on the device for the IP phone to correctly communicate on the voice VLAN. Use the **show vlan** privileged EXEC command to see if the VLAN is present (listed in the display). If the VLAN is not listed, create the voice VLAN.
- The Power over Ethernet (PoE) devices are capable of automatically providing power to Cisco pre-standard and IEEE 802.3af-compliant powered devices if they are not being powered by an AC power source.
- The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.
- If the Cisco IP Phone and a device attached to the phone are in the same VLAN, they must be in the same IP subnet. These conditions indicate that they are in the same VLAN:
  - They both use IEEE 802.1p or untagged frames.
  - The Cisco IP Phone uses IEEE 802.1p frames, and the device uses untagged frames.
  - The Cisco IP Phone uses untagged frames, and the device uses IEEE 802.1p frames.
  - The Cisco IP Phone uses IEEE 802.1Q frames, and the voice VLAN is the same as the access VLAN.
- The Cisco IP Phone and a device attached to the phone cannot communicate if they are in the same VLAN and subnet but use different frame types because traffic in the same subnet is not routed (routing would eliminate the frame type difference).
- Voice VLAN ports can also be these port types:

- Dynamic access port.
- IEEE 802.1x authenticated port.

---

**Note** If you enable IEEE 802.1x on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the phone loses connectivity to the device for up to 30 seconds.

---

- Protected port.
- A source or destination port for a SPAN or RSPAN session.
- Secure port.

---

**Note** When you enable port security on an interface that is also configured with a voice VLAN, you must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN. When the port is connected to a Cisco IP Phone, the phone requires up to two MAC addresses. The phone address is learned on the voice VLAN and might also be learned on the access VLAN. Connecting a PC to the phone requires additional MAC addresses.

---

## How to Configure Voice VLAN

### Configuring Cisco IP Phone Voice Traffic (CLI)

You can configure a port connected to the Cisco IP Phone to send CDP packets to the phone to configure the way in which the phone sends voice traffic. The phone can carry voice traffic in IEEE 802.1Q frames for a specified voice VLAN with a Layer 2 CoS value. It can use IEEE 802.1p priority tagging to give voice traffic a higher priority and forward all voice traffic through the native (access) VLAN. The Cisco IP Phone can also send untagged voice traffic or use its own configuration to send voice traffic in the access VLAN. In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5).

#### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **trust device cisco-phone**
4. **switchport voice vlan** {*vlan-id* | **dot1p** | **none** | **untagged**}
5. **end**
6. Use one of the following:
  - **show interfaces** *interface-id* **switchport**
  - **show running-config interface** *interface-id*

## 7. copy running-config startup-config

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                         | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 2 | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet1/0/1</b>                                                                                 | Specifies the interface connected to the phone, and enters interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 3 | <b>trust device cisco-phone</b><br><b>Example:</b><br>Device(config-if)# <b>trust-device cisco-phone</b>                                                                                  | Configures the interface to trust incoming traffic packets for the Cisco IP phone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 4 | <b>switchport voice vlan {vlan-id   dot1p   none   untagged}</b><br><b>Example:</b><br>Device(config-if)# <b>switchport voice vlan dot1p</b>                                              | Configures the voice VLAN. <ul style="list-style-type: none"> <li>• <b>vlan-id</b>—Configures the phone to forward all voice traffic through the specified VLAN. By default, the Cisco IP Phone forwards the voice traffic with an IEEE 802.1Q priority of 5. Valid VLAN IDs are 1 to 4094.</li> <li>• <b>dot1p</b>—Configures the device to accept voice and data IEEE 802.1p priority frames tagged with VLAN ID 0 (the native VLAN). By default, the device drops all voice and data traffic tagged with VLAN 0. If configured for 802.1p the Cisco IP Phone forwards the traffic with an IEEE 802.1p priority of 5.</li> <li>• <b>none</b>—Allows the phone to use its own configuration to send untagged voice traffic.</li> <li>• <b>untagged</b>—Configures the phone to send untagged voice traffic.</li> </ul> |
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                                                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 6 | Use one of the following: <ul style="list-style-type: none"> <li>• <b>show interfaces interface-id switchport</b></li> <li>• <b>show running-config interface interface-id</b></li> </ul> | Verifies your voice VLAN entries or your QoS and voice VLAN entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|               | Command or Action                                                                                                                                                         | Purpose                                                  |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Device# show interfaces gigabitethernet1/0/1 switchport</pre> <p>or</p> <pre>Device# show running-config interface gigabitethernet1/0/1</pre> |                                                          |
| <b>Step 7</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                             | (Optional) Saves your entries in the configuration file. |

## Configuring the Priority of Incoming Data Frames (CLI)

You can connect a PC or other data device to a Cisco IP Phone port. To process tagged data traffic (in IEEE 802.1Q or IEEE 802.1p frames), you can configure the device to send CDP packets to instruct the phone how to send data packets from the device attached to the access port on the Cisco IP Phone. The PC can generate packets with an assigned CoS value. You can configure the phone to not change (trust) or to override (not trust) the priority of frames arriving on the phone port from connected devices.

Follow these steps to set the priority of data traffic received from the non-voice port on the Cisco IP Phone:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport priority extend** {*cos value* | **trust**}
5. **end**
6. **show interfaces** *interface-id* **switchport**
7. **copy running-config startup-config**

**DETAILED STEPS**

|               | Command or Action                           | Purpose                                                        |
|---------------|---------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <p><b>enable</b></p> <p><b>Example:</b></p> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Private VLANs

Private vlans are supported in transparent mode for VTP 1, 2 and 3. Private VLANs are also supported on server mode with VTP 3.

When configuring private VLANs on the device, always use the default Switch Database Management (SDM) template to balance system resources between unicast routes and Layer 2 entries. If another SDM template is configured, use the **sdm prefer default** global configuration command to set the default template.

# Restrictions for Private VLANs

---

**Note** In some cases, the configuration is accepted with no error messages, but the commands have no effect.

---

- Do not configure fallback bridging on devices with private VLANs.
- Do not configure a remote SPAN (RSPAN) VLAN as a private-VLAN primary or secondary VLAN.
- Do not configure private-VLAN ports on interfaces configured for these other features:
  - Dynamic-access port VLAN membership
  - Dynamic Trunking Protocol (DTP)
  - IPv6 Security Group (SG)
  - Port Aggregation Protocol (PAgP)
  - Link Aggregation Control Protocol (LACP)
  - Multicast VLAN Registration (MVR)
  - Voice VLAN
  - Web Cache Communication Protocol (WCCP)
- You can configure IEEE 802.1x port-based authentication on a private-VLAN port, but do not configure 802.1x with port security, voice VLAN, or per-user ACL on private-VLAN ports.
- A private-VLAN host or promiscuous port cannot be a SPAN destination port. If you configure a SPAN destination port as a private-VLAN port, the port becomes inactive.
- If you configure a static MAC address on a promiscuous port in the primary VLAN, you need not add the same static address to all associated secondary VLANs. Similarly, if you configure a static MAC address on a host port in a secondary VLAN, you need not add the same static MAC address to the associated primary VLAN. Also, when you delete a static MAC address from a private-VLAN port, you do not have to remove all instances of the configured MAC address from the private VLAN.

---

**Note** Dynamic MAC addresses learned in Secondary VLAN of a private VLAN are replicated to the Primary VLANs. All mac entries are learnt on secondary VLANs, even if the traffic ingresses from primary VLAN. If a mac-address is dynamically learnt in the primary VLAN it will not get replicated in the associated secondary VLANs.

---

- Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs.

# Information About Private VLANs

## Private VLAN Domains

The private VLAN feature addresses two problems that service providers face when using VLANs:

- When running the IP Base or IP Services image, the device supports up to 4094 active VLANs. If a service provider assigns one VLAN per customer, this limits the numbers of customers the service provider can support.
- To enable IP routing, each VLAN is assigned a subnet address space or a block of addresses, which can result in wasting the unused IP addresses, and cause IP address management problems.

**Figure 123: Private VLAN Domain**

Using private VLANs addresses the scalability problem and provides IP address management benefits for service providers and Layer 2 security for customers. Private VLANs partition a regular VLAN domain into subdomains. A subdomain is represented by a pair of VLANs: a *primary* VLAN and a *secondary* VLAN. A private VLAN can have multiple VLAN pairs, one pair for each subdomain. All VLAN pairs in a private VLAN share the same primary VLAN. The secondary VLAN ID differentiates one subdomain from another.

## Secondary VLANs

There are two types of secondary VLANs:

- Isolated VLANs—Ports within an isolated VLAN cannot communicate with each other at the Layer 2 level.
- Community VLANs—Ports within a community VLAN can communicate with each other but cannot communicate with ports in other communities at the Layer 2 level.

**Related Topics**

[Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface](#), on page 2473

[Example: Mapping Secondary VLANs to a Primary VLAN Interface](#), on page 2477

## Private VLANs Ports

Private VLANs provide Layer 2 isolation between ports within the same private VLAN. Private VLAN ports are access ports that are one of these types:

- **Promiscuous**—A promiscuous port belongs to the primary VLAN and can communicate with all interfaces, including the community and isolated host ports that belong to the secondary VLANs associated with the primary VLAN.
- **Isolated**—An isolated port is a host port that belongs to an isolated secondary VLAN. It has complete Layer 2 separation from other ports within the same private VLAN, except for the promiscuous ports. Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports.
- **Community**—A community port is a host port that belongs to a community secondary VLAN. Community ports communicate with other ports in the same community VLAN and with promiscuous ports. These interfaces are isolated at Layer 2 from all other interfaces in other communities and from isolated ports within their private VLAN.

**Note**

---

Trunk ports carry traffic from regular VLANs and also from primary, isolated, and community VLANs.

---

Primary and secondary VLANs have these characteristics:

- **Primary VLAN**—A private VLAN has only one primary VLAN. Every port in a private VLAN is a member of the primary VLAN. The primary VLAN carries unidirectional traffic downstream from the promiscuous ports to the (isolated and community) host ports and to other promiscuous ports.
- **Isolated VLAN**—A private VLAN has only one isolated VLAN. An isolated VLAN is a secondary VLAN that carries unidirectional traffic upstream from the hosts toward the promiscuous ports and the gateway.
- **Community VLAN**—A community VLAN is a secondary VLAN that carries upstream traffic from the community ports to the promiscuous port gateways and to other host ports in the same community. You can configure multiple community VLANs in a private VLAN.

A promiscuous port can serve only one primary VLAN, one isolated VLAN, and multiple community VLANs. Layer 3 gateways are typically connected to the device through a promiscuous port. With a promiscuous port, you can connect a wide range of devices as access points to a private VLAN. For example, you can use a promiscuous port to monitor or back up all the private VLAN servers from an administration workstation.

**Related Topics**

[Configuring a Layer 2 Interface as a Private VLAN Promiscuous Port](#), on page 2471

[Example: Configuring an Interface as a Host Port](#), on page 2476

[Example: Configuring an Interface as a Private VLAN Promiscuous Port](#), on page 2477

## Private VLANs in Networks

In a switched environment, you can assign an individual private VLAN and associated IP subnet to each individual or common group of end stations. The end stations need to communicate only with a default gateway to communicate outside the private VLAN.

You can use private VLANs to control access to end stations in these ways:

- Configure selected interfaces connected to end stations as isolated ports to prevent any communication at Layer 2. For example, if the end stations are servers, this configuration prevents Layer 2 communication between the servers.
- Configure interfaces connected to default gateways and selected end stations (for example, backup servers) as promiscuous ports to allow all end stations access to a default gateway.

You can extend private VLANs across multiple devices by trunking the primary, isolated, and community VLANs to other devices that support private VLANs. To maintain the security of your private VLAN configuration and to avoid other use of the VLANs configured as private VLANs, configure private VLANs on all intermediate devices, including devices that have no private VLAN ports.

## IP Addressing Scheme with Private VLANs

Assigning a separate VLAN to each customer creates an inefficient IP addressing scheme:

- Assigning a block of addresses to a customer VLAN can result in unused IP addresses.
- If the number of devices in the VLAN increases, the number of assigned address might not be large enough to accommodate them.

These problems are reduced by using private VLANs, where all members in the private VLAN share a common address space, which is allocated to the primary VLAN. Hosts are connected to secondary VLANs, and the DHCP server assigns them IP addresses from the block of addresses allocated to the primary VLAN. Subsequent IP addresses can be assigned to customer devices in different secondary VLANs, but in the same primary VLAN. When new devices are added, the DHCP server assigns them the next available address from a large pool of subnet addresses.

## Private VLANs Across Multiple Devices

*Figure 124: Private VLANs Across Switches*

As with regular VLANs, private VLANs can span multiple devices. A trunk port carries the primary VLAN and secondary VLANs to a neighboring device. The trunk port treats the private VLAN as any other VLAN. A feature of private VLANs across multiple devices is that traffic from an isolated port in Device A does not reach an isolated port on Device B.

Private VLANs are supported in transparent mode for VTP 1, 2 and 3. Private vlan is also supported on server mode for VTP 3. If we have a server client setup using VTP 3, private vlans configured on the server should be reflected on the client.

## Private-VLAN Interaction with Other Features

### Private VLANs and Unicast, Broadcast, and Multicast Traffic

In regular VLANs, devices in the same VLAN can communicate with each other at the Layer 2 level, but devices connected to interfaces in different VLANs must communicate at the Layer 3 level. In private VLANs, the promiscuous ports are members of the primary VLAN, while the host ports belong to secondary VLANs. Because the secondary VLAN is associated to the primary VLAN, members of these VLANs can communicate with each other at the Layer 2 level.

In a regular VLAN, broadcasts are forwarded to all ports in that VLAN. Private VLAN broadcast forwarding depends on the port sending the broadcast:

- An isolated port sends a broadcast only to the promiscuous ports or trunk ports.
- A community port sends a broadcast to all promiscuous ports, trunk ports, and ports in the same community VLAN.
- A promiscuous port sends a broadcast to all ports in the private VLAN (other promiscuous ports, trunk ports, isolated ports, and community ports).

Multicast traffic is routed or bridged across private VLAN boundaries and within a single community VLAN. Multicast traffic is not forwarded between ports in the same isolated VLAN or between ports in different secondary VLANs.

Private VLAN multicast forwarding supports the following:

- Sender can be outside the VLAN and the Receivers can be inside the VLAN domain.
- Sender can be inside the VLAN and the Receivers can be outside the VLAN domain.
- Sender and Receiver can both be in the same community vlan.

## Private VLANs and SVIs

In a Layer 3 device, a device virtual interface (SVI) represents the Layer 3 interface of a VLAN. Layer 3 devices communicate with a private VLAN only through the primary VLAN and not through secondary VLANs. Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

- If you try to configure a VLAN with an active SVI as a secondary VLAN, the configuration is not allowed until you disable the SVI.
- If you try to create an SVI on a VLAN that is configured as a secondary VLAN and the secondary VLAN is already mapped at Layer 3, the SVI is not created, and an error is returned. If the SVI is not mapped at Layer 3, the SVI is created, but it is automatically shut down.

When the primary VLAN is associated with and mapped to the secondary VLAN, any configuration on the primary VLAN is propagated to the secondary VLAN SVIs. For example, if you assign an IP subnet to the primary VLAN SVI, this subnet is the IP subnet address of the entire private VLAN.

## Private VLANs and Device Stacks

Private VLANs can operate within the device stack, and private-VLAN ports can reside on different stack members. However, the following changes to the stack can impact private-VLAN operation:

- If a stack contains only one private-VLAN promiscuous port and the stack member that contains that port is removed from the stack, host ports in that private VLAN lose connectivity outside the private VLAN.
- If a stack master stack that contains the only private-VLAN promiscuous port in the stack fails or leaves the stack and a new stack master is elected, host ports in a private VLAN that had its promiscuous port on the old stack master lose connectivity outside of the private VLAN.
- If two stacks merge, private VLANs on the winning stack are not affected, but private-VLAN configuration on the losing device is lost when that device reboots.

## Private VLAN with Dynamic Mac Address

The Mac addresses learnt in the secondary VLAN are replicated to the primary VLAN and not vice-versa. This saves the hardware l2 cam space. The primary VLAN is always used for forwarding lookups in both directions.

Dynamic MAC addresses learned in Primary VLAN of a private VLAN are then, if required, replicated in the secondary VLANs. For example, if a mac-address is dynamically received on the secondary VLAN, it will be learnt as part of primary VLAN. In case of isolated VLANs, a blocked entry for the same mac will be added to secondary VLAN in the mac address table. So, mac learnt on host ports in secondary domain are installed as blocked type entries. All mac entries are learnt on secondary VLANs, even if the traffic ingresses from primary VLAN.

However, if a mac-address is dynamically learnt in the primary VLAN it will not get replicated in the associated secondary VLANs.

## Private VLAN with Static Mac Address

Users are not required to replicate the Static Mac Address CLI for private VLAN hosts as compare to legacy model.

Example:

- In the legacy model, if the user configures a static mac address, they need to add same mac static mac-address in the associated VLAN too. For example, if mac-address A is user configured on port 1/0/1 in VLAN 101, where VLAN 101 is a secondary VLAN and VLAN 100 is a primary VLAN, then the user has to configure

```
mac-address static A vlan 101 interface G1/0/1
mac-address static A vlan 100 interface G1/0/1
```

- In this device, the user does not need to replicate the mac address to the associated VLAN. For the above example, user has to configure only

```
mac-address static A vlan 101 interface G1/0/1
```

## Private VLAN Interaction with VACL/QOS

Private VLANs are bidirectional in case of this device, as compared to “Unidirectional” in other platforms.

After layer-2 forward lookup, proper egress VLAN mapping happens and all the egress VLAN based feature processing happens in the egress VLAN context.

When a frame in Layer-2 is forwarded within a private VLAN, the VLAN map is applied at the ingress side and at the egress side. When a frame is routed from inside a private VLAN to an external port, the private-VLAN map is applied at the ingress side. Similarly, when the frame is routed from an external port to a Private VLAN, the private-VLAN is applied at the egress side. This is applicable to both bridged and routed traffic.

### Bridging:

- For upstream traffic from secondary VLAN to primary VLAN, the MAP of the secondary VLAN is applied on the ingress side and the MAP of the primary VLAN is applied on the egress side.
- For downstream traffic from primary VLAN to secondary VLAN, the MAP of the primary VLAN is applied in the ingress direction and the MAP of the secondary VLAN is applied in the egress direction.

### Routing

If we have two private VLAN domains - PV1 (sec1, prim1) and PV2 (sec2, prim2). For frames routed from PV1 to PV2:

- The MAP of sec1 and L3 ACL of prim1 is applied in the ingress port.
- The MAP of sec2 and L3 ACL of prim2 is applied in the egress port.

For packets going upstream or downstream from isolated host port to promiscuous port, the isolated VLAN’s VACL is applied in the ingress direction and primary VLAN’s VACL is applied in the egress direction. This allows user to configure different VACL for different secondary VLAN in a same primary VLAN domain.

---

**Note** 2-way community VLAN is now not required as the private VLANs on this device are always bi-directional.

---

## Private VLANs and HA Support

PVLAN will work seamlessly with High Availability (HA) feature. The Private VLAN existing on the master before switchover should be the same after switchover (new master should have similar PVLAN configuration both on IOS side and FED side as that of the old master).

# Private-VLAN Configuration Guidelines

## Default Private-VLAN Configurations

No private VLANs are configured.

## Secondary and Primary VLAN Configuration

Follow these guidelines when configuring private VLANs:

- Private VLANs are supported in transparent mode for VTP 1, 2 and 3. If the device is running VTP version 1 or 2, you must set VTP to transparent mode. After you configure a private VLAN, you should not change the VTP mode to client or server. VTP version 3 supports private VLANs in all modes.
- With VTP version 1 or 2, after you have configured private VLANs, use the **copy running-config startup-config** privileged EXEC command to save the VTP transparent mode configuration and private-VLAN configuration in the device startup configuration file. Otherwise, if the device resets, it defaults to VTP server mode, which does not support private VLANs. VTP version 3 does support private VLANs.
- VTP version 1 and 2 do not propagate private-VLAN configuration. You must configure private VLANs on each device where you want private-VLAN ports unless the devices are running VTP version 3, as VTP3 propagate private vlans.
- You cannot configure VLAN 1 or VLANs 1002 to 1005 as primary or secondary VLANs. Extended VLANs (VLAN IDs 1006 to 4094) can belong to private VLANs.
- A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it. An isolated or community VLAN can have only one primary VLAN associated with it.
- Although a private VLAN contains more than one VLAN, only one Spanning Tree Protocol (STP) instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.
- When copying a PVLAN configuration from a tftp server and applying it on a running-config, the PVLAN association will not be formed. You will need to check and ensure that the primary VLAN is associated to all the secondary VLANs.

You can also use **configure replace flash:config\_file force** instead of **copy flash:config\_file running-config**.

- You can enable DHCP snooping on private VLANs. When you enable DHCP snooping on the primary VLAN, it is propagated to the secondary VLANs. If you configure DHCP on a secondary VLAN, the configuration does not take effect if the primary VLAN is already configured.
- When you enable IP source guard on private-VLAN ports, you must enable DHCP snooping on the primary VLAN.
- We recommend that you prune the private VLANs from the trunks on devices that carry no traffic in the private VLANs.
- You can apply different quality of service (QoS) configurations to primary, isolated, and community VLANs.
- Note the following considerations for sticky ARP:
  - Sticky ARP entries are those learned on SVIs and Layer 3 interfaces. These entries do not age out.

- The **ip sticky-arp** global configuration command is supported only on SVIs belonging to private VLANs.
- The **ip sticky-arp** interface configuration command is only supported on:
  - Layer 3 interfaces
  - SVIs belonging to normal VLANs
  - SVIs belonging to private VLANs

For more information about using the **ip sticky-arp global** configuration and the **ip sticky-arp interface** configuration commands, see the command reference for this release.

- You can configure VLAN maps on primary and secondary VLANs. However, we recommend that you configure the same VLAN maps on private-VLAN primary and secondary VLANs.
- PVLANS are bidirectional. They can be applied at both the ingress and egress sides.

When a frame in Layer-2 is forwarded within a private VLAN, the VLAN map is applied at the ingress side and at the egress side. When a frame is routed from inside a private VLAN to an external port, the private-VLAN map is applied at the ingress side. Similarly, when the frame is routed from an external port to a Private VLAN, the private-VLAN is applied at the egress side.

#### Bridging

- For upstream traffic from secondary VLAN to primary VLAN, the MAP of the secondary VLAN is applied on the ingress side and the MAP of the primary VLAN is applied on the egress side.
- For downstream traffic from primary VLAN to secondary VLAN, the MAP of the primary VLAN is applied in the ingress direction and the MAP of the secondary VLAN is applied in the egress direction.

#### Routing

If we have two private VLAN domains - PV1 (sec1, prim1) and PV2 (sec2, prim2). For frames routed from PV1 to PV2:

- The MAP of sec1 and L3 ACL of prim1 is applied in the ingress port .
- The MAP of sec1 and L3 ACL of prim2 is applied in the egress port.
- For packets going upstream or downstream from isolated host port to promiscuous port, the isolated VLAN's VACL is applied in the ingress direction and primary VLAN'S VACL is applied in the egress direction. This allows user to configure different VACL for different secondary VLAN in a same primary VLAN domain.

To filter out specific IP traffic for a private VLAN, you should apply the VLAN map to both the primary and secondary VLANs.

- You can apply router ACLs only on the primary-VLAN SVIs. The ACL is applied to both primary and secondary VLAN Layer 3 traffic.
- Although private VLANs provide host isolation at Layer 2, hosts can communicate with each other at Layer 3.
- Private VLANs support these Switched Port Analyzer (SPAN) features:

- You can configure a private-VLAN port as a SPAN source port.
- You can use VLAN-based SPAN (VSPAN) on primary, isolated, and community VLANs or use SPAN on only one VLAN to separately monitor egress or ingress traffic.

## Private VLAN Port Configuration

Follow these guidelines when configuring private VLAN ports:

- Use only the private VLAN configuration commands to assign ports to primary, isolated, or community VLANs. Layer 2 access ports assigned to the VLANs that you configure as primary, isolated, or community VLANs are inactive while the VLAN is part of the private VLAN configuration. Layer 2 trunk interfaces remain in the STP forwarding state.
- Do not configure ports that belong to a PAGP or LACP EtherChannel as private VLAN ports. While a port is part of the private VLAN configuration, any EtherChannel configuration for it is inactive.
- Enable Port Fast and BPDU guard on isolated and community host ports to prevent STP loops due to misconfigurations and to speed up STP convergence. When enabled, STP applies the BPDU guard feature to all Port Fast-configured Layer 2 LAN ports. Do not enable Port Fast and BPDU guard on promiscuous ports.
- If you delete a VLAN used in the private VLAN configuration, the private VLAN ports associated with the VLAN become inactive.
- Private VLAN ports can be on different network devices if the devices are trunk-connected and the primary and secondary VLANs have not been removed from the trunk.

# How to Configure Private VLANs

## Configuring Private VLANs

To configure a private VLAN, perform these steps:

**Note** Private vlans are supported in transparent mode for VTP 1, 2 and 3. Private VLANs are also supported on server mode with VTP 3.

### SUMMARY STEPS

1. Set VTP mode to **transparent**.
2. Create the primary and secondary VLANs and associate them.
3. Configure interfaces to be isolated or community host ports, and assign VLAN membership to the host port.
4. Configure interfaces as promiscuous ports, and map the promiscuous ports to the primary-secondary VLAN pair.
5. If inter-VLAN routing will be used, configure the primary SVI, and map secondary VLANs to the primary.
6. Verify private-VLAN configuration.

## DETAILED STEPS

---

**Step 1** Set VTP mode to **transparent**.

**Note** Note: For VTP3, you can set mode to either server or transparent mode.

**Step 2** Create the primary and secondary VLANs and associate them.

See the [Configuring and Associating VLANs in a Private VLAN, on page 2466](#)

**Note** If the VLAN is not created already, the private-VLAN configuration process creates it.

**Step 3** Configure interfaces to be isolated or community host ports, and assign VLAN membership to the host port.

See the [Configuring a Layer 2 Interface as a Private VLAN Host Port, on page 2470](#)

**Step 4** Configure interfaces as promiscuous ports, and map the promiscuous ports to the primary-secondary VLAN pair.

See the [Configuring a Layer 2 Interface as a Private VLAN Promiscuous Port, on page 2471](#)

**Step 5** If inter-VLAN routing will be used, configure the primary SVI, and map secondary VLANs to the primary.

See the [Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface, on page 2473](#)

**Step 6** Verify private-VLAN configuration.

---

## Configuring and Associating VLANs in a Private VLAN

The **private-vlan** commands do not take effect until you exit VLAN configuration mode.

To configure and associate VLANs in a Private VLAN, perform these steps:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vtp mode transparent**
4. **vlan *vlan-id***
5. **private-vlan primary**
6. **exit**
7. **vlan *vlan-id***
8. **private-vlan isolated**
9. **exit**
10. **vlan *vlan-id***
11. **private-vlan community**
12. **exit**
13. **vlan *vlan-id***
14. **private-vlan community**
15. **exit**
16. **vlan *vlan-id***
17. **private-vlan association [add | remove] *secondary\_vlan\_list***

18. `end`
19. `show vlan private-vlan [type]` or `show interfaces status`
20. `copy running-config startup config`

## DETAILED STEPS

|               | Command or Action                                                                                        | Purpose                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                          | Enables privileged EXEC mode. Enter your password if prompted.                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                  | Enters the global configuration mode.                                                                                                                      |
| <b>Step 3</b> | <b>vtp mode transparent</b><br><b>Example:</b><br>Device(config)# <code>vtp mode transport</code>        | Sets VTP mode to transparent (disable VTP).<br><b>Note</b> For VTP3, you can set mode to either server or transparent mode                                 |
| <b>Step 4</b> | <b>vlan <i>vlan-id</i></b><br><b>Example:</b><br>Device(config)# <code>vlan 20</code>                    | Enters VLAN configuration mode and designates or creates a VLAN that will be the primary VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.            |
| <b>Step 5</b> | <b>private-vlan primary</b><br><b>Example:</b><br>Device(config-vlan)# <code>private-vlan primary</code> | Designates the VLAN as the primary VLAN.                                                                                                                   |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Device(config-vlan)# <code>exit</code>                                 | Returns to global configuration mode.                                                                                                                      |
| <b>Step 7</b> | <b>vlan <i>vlan-id</i></b><br><b>Example:</b><br>Device(config)# <code>vlan 501</code>                   | (Optional) Enters VLAN configuration mode and designates or creates a VLAN that will be an isolated VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094. |

|                | Command or Action                                                                                        | Purpose                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b>  | <b>private-vlan isolated</b><br><b>Example:</b><br>Device (config-vlan) # <b>private-vlan isolated</b>   | Designates the VLAN as an isolated VLAN.                                                                                                                   |
| <b>Step 9</b>  | <b>exit</b><br><b>Example:</b><br>Device (config-vlan) # <b>exit</b>                                     | Returns to global configuration mode.                                                                                                                      |
| <b>Step 10</b> | <b>vlan <i>vlan-id</i></b><br><b>Example:</b><br>Device (config) # <b>vlan 502</b>                       | (Optional) Enters VLAN configuration mode and designates or creates a VLAN that will be a community VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094. |
| <b>Step 11</b> | <b>private-vlan community</b><br><b>Example:</b><br>Device (config-vlan) # <b>private-vlan community</b> | Designates the VLAN as a community VLAN.                                                                                                                   |
| <b>Step 12</b> | <b>exit</b><br><b>Example:</b><br>Device (config-vlan) # <b>exit</b>                                     | Returns to global configuration mode.                                                                                                                      |
| <b>Step 13</b> | <b>vlan <i>vlan-id</i></b><br><b>Example:</b><br>Device (config) # <b>vlan 503</b>                       | (Optional) Enters VLAN configuration mode and designates or creates a VLAN that will be a community VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094. |
| <b>Step 14</b> | <b>private-vlan community</b><br><b>Example:</b><br>Device (config-vlan) # <b>private-vlan community</b> | Designates the VLAN as a community VLAN.                                                                                                                   |
| <b>Step 15</b> | <b>exit</b><br><b>Example:</b><br>Device (config-vlan) # <b>exit</b>                                     | Returns to global configuration mode.                                                                                                                      |

|         | Command or Action                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 16 | <p><b>vlan</b> <i>vlan-id</i></p> <p><b>Example:</b></p> <pre>Device(config)# <b>vlan</b> 20</pre>                                                                                                    | Enters VLAN configuration mode for the primary VLAN designated in Step 4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 17 | <p><b>private-vlan association</b> [<b>add</b>   <b>remove</b>]<br/><i>secondary_vlan_list</i></p> <p><b>Example:</b></p> <pre>Device(config-vlan)# <b>private-vlan association</b><br/>501-503</pre> | <p>Associates the secondary VLANs with the primary VLAN. It can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.</p> <ul style="list-style-type: none"> <li>• The <i>secondary_vlan_list</i> parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.</li> <li>• The <i>secondary_vlan_list</i> parameter can contain multiple community VLAN IDs but only one isolated VLAN ID.</li> <li>• Enter a <i>secondary_vlan_list</i>, or use the <b>add</b> keyword with a <i>secondary_vlan_list</i> to associate secondary VLANs with a primary VLAN.</li> <li>• Use the <b>remove</b> keyword with a <i>secondary_vlan_list</i> to clear the association between secondary VLANs and a primary VLAN.</li> <li>• The command does not take effect until you exit VLAN configuration mode.</li> </ul> |
| Step 18 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# <b>end</b></pre>                                                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 19 | <p><b>show vlan private-vlan</b> [<i>type</i>] or <b>show interfaces status</b></p> <p><b>Example:</b></p> <pre>Device# <b>show vlan private-vlan</b></pre>                                           | Verifies the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 20 | <p><b>copy running-config startup config</b></p> <p><b>Example:</b></p> <pre>Device# <b>copy running-config startup-config</b></pre>                                                                  | Saves your entries in the device startup configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configuring a Layer 2 Interface as a Private VLAN Host Port

Follow these steps to configure a Layer 2 interface as a private-VLAN host port and to associate it with primary and secondary VLANs:

**Note** Isolated and community VLANs are both secondary VLANs.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport mode private-vlan host**
5. **switchport private-vlan host-association** *primary\_vlan\_id secondary\_vlan\_id*
6. **end**
7. **show interfaces** [*interface-id*] **switchport**
8. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                          | Purpose                                                                         |
|---------------|----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                  | Enables privileged EXEC mode. Enter your password if prompted.                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                          | Enters the global configuration mode.                                           |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b> <b>gigabitethernet1/0/22</b>   | Enters interface configuration mode for the Layer 2 interface to be configured. |
| <b>Step 4</b> | <b>switchport mode private-vlan host</b><br><b>Example:</b><br>Device(config-if)# <b>switchport mode private-vlan host</b> | Configures the Layer 2 port as a private-VLAN host port.                        |

|        | Command or Action                                                                                                                                                                                           | Purpose                                                                                                                                           |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p><b>switchport private-vlan host-association</b> <i>primary_vlan_id</i> <i>secondary_vlan_id</i></p> <p><b>Example:</b></p> <pre>Device(config-if)# switchport private-vlan host-association 20 501</pre> | <p>Associates the Layer 2 port with a private VLAN.</p> <p><b>Note</b> This is a required step to associate the PVLAN to a Layer 2 interface.</p> |
| Step 6 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                                     | Returns to privileged EXEC mode.                                                                                                                  |
| Step 7 | <p><b>show interfaces</b> [<i>interface-id</i>] <b>switchport</b></p> <p><b>Example:</b></p> <pre>Device# show interfaces gigabitethernet1/0/22 switchport</pre>                                            | Verifies the configuration.                                                                                                                       |
| Step 8 | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                                               | (Optional) Saves your entries in the configuration file.                                                                                          |

## Configuring a Layer 2 Interface as a Private VLAN Promiscuous Port

Follow these steps to configure a Layer 2 interface as a private VLAN promiscuous port and map it to primary and secondary VLANs:

**Note** Isolated and community VLANs are both secondary VLANs.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport mode private-vlan promiscuous**

5. `switchport private-vlan mapping primary_vlan_id {add | remove} secondary_vlan_list`
6. `end`
7. `show interfaces [interface-id] switchport`
8. `copy running-config startup config`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface

If the private VLAN will be used for inter-VLAN routing, you configure an SVI for the primary VLAN and map secondary VLANs to the SVI.

**Note** Isolated and community VLANs are both secondary VLANs.

Follow these steps to map secondary VLANs to the SVI of a primary VLAN to allow Layer 3 switching of private VLAN traffic:

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface vlan** *primary\_vlan\_id*
4. **private-vlan mapping** [**add** | **remove**] *secondary\_vlan\_list*
5. **end**
6. **show interface private-vlan mapping**
7. **copy running-config startup config**

## DETAILED STEPS

## Monitoring Private VLANs

The following table displays the commands used to monitor private VLANs.

*Table 207: Private VLAN Monitoring Commands*

| Command                                          | Purpose                                                                       |
|--------------------------------------------------|-------------------------------------------------------------------------------|
| <code>show interfaces status</code>              | Displays the status of interfaces, including the VLANs to which they belongs. |
| <code>show vlan private-vlan [type]</code>       | Displays the private VLAN information for the Device or Device stack.         |
| <code>show interface switchport</code>           | Displays private VLAN configuration on interfaces.                            |
| <code>show interface private-vlan mapping</code> | Displays information about the private VLAN mapping for VLAN SVIs.            |
| <code>show platform vlan pvlan</code>            | Displays PVLAN information on FED side                                        |
| <code>show platform vlan pvlan hardware</code>   | Displays all the hardware resources held by PVLANS on FED side                |

## Configuration Examples for Private VLANs

### Example: Configuring and Associating VLANs in a Private VLAN

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, to associate them in a private VLAN, and to verify the configuration:

```

Device# configure terminal
Device(config)# vlan 20
Device(config-vlan)# private-vlan primary
Device(config-vlan)# exit
Device(config)# vlan 501
Device(config-vlan)# private-vlan isolated
Device(config-vlan)# exit
Device(config)# vlan 502
Device(config-vlan)# private-vlan community
Device(config-vlan)# exit
Device(config)# vlan 503
Device(config-vlan)# private-vlan community
Device(config-vlan)# exit
Device(config)# vlan 20
Device(config-vlan)# private-vlan association 501-503
Device(config-vlan)# end
Device# show vlan private-vlan
Primary   Secondary   Type
-----
20        501         isolated
20        502         community
20        503         community

```

## Example: Configuring an Interface as a Host Port

This example shows how to configure an interface as a private VLAN host port, associate it with a private VLAN pair, and verify the configuration:

```

Device# configure terminal
Device(config)# interface gigabitethernet1/0/22
Device(config-if)# switchport mode private-vlan host
Device(config-if)# switchport private-vlan host-association 20 501
Device(config-if)# end
Device# show interfaces gigabitethernet1/0/22 switchport
Name: Gi1/0/22
Switchport: Enabled
Administrative Mode: private-vlan host
Operational Mode: private-vlan host
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: 20 501
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan:
20 501

<output truncated>

```

[Configuring a Layer 2 Interface as a Private VLAN Promiscuous Port](#), on page 2471

**Example: Configuring an Interface as a Private VLAN Promiscuous Port**

This example shows how to configure an interface as a private VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport mode private-vlan promiscuous
Device(config-if)# switchport private-vlan mapping 20 add 501-503
Device(config-if)# end
```

Use the **show vlan private-vlan** or the **show interface status** privileged EXEC command to display primary and secondary VLANs and private-VLAN ports on the Device.

**Example: Mapping Secondary VLANs to a Primary VLAN Interface**

This example shows how to map the interfaces fo VLANs 501 and 502 to primary VLAN 10, which permits routing of secondary VLAN ingress traffic from private VLANs 501 and 502:

```
Device# configure terminal
Device(config)# interface vlan 20
Device(config-if)# private-vlan mapping 501-503
Device(config-if)# end
Device# show interfaces private-vlan mapping
Interface Secondary VLAN Type
-----
vlan20      501          isolated
vlan20      502          community
vlan20      503          community
```

**Example: Monitoring Private VLANs**

This example shows output from the **show vlan private-vlan** command:

```
Device# show vlan private-vlan
```

| Primary | Secondary | Type      | Ports             |
|---------|-----------|-----------|-------------------|
| 20      | 501       | isolated  | Gi1/0/22, Gi1/0/2 |
| 20      | 502       | community | Gi1/0/2           |
| 20      | 503       | community | Gi1/0/2           |

## Where to Go Next

You can configure the following:

- VTP
- VLANs
- VLAN trunking
- Voice VLANs

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for WLANs

- You can associate up to 16 WLANs with each access point group and assign specific access points to each group. Each access point advertises only the enabled WLANs that belong to its access point group. The access point (AP) does not advertise disabled WLANs in its access point group or WLANs that belong to another group.
- We recommend that you assign one set of VLANs for WLANs and a different set of VLANs for management interfaces to ensure that devices properly route VLAN traffic.

## Restrictions for WLANs

- Peer-to-peer blocking does not apply to multicast traffic.
- You can configure a maximum of up to 1000 clients.
- The WLAN name and SSID can have up to 32 characters. Spaces are not allowed in the WLAN profile name and SSID. WLAN name cannot be a keyword; for example, if you try to create a WLAN with the name as 's' by entering the **wlan s** command, it results in shutting down all WLANs because 's' is used as a keyword for shutdown.
- You cannot map a WLAN to VLAN0, and you cannot map VLANs 1002 to 1006.
- Dual stack clients with a static-IPv4 address is not supported.
- When creating a WLAN with the same SSID, you must create a unique profile name for each WLAN.
- When multiple WLANs with the same SSID get assigned to the same AP radio, you must have a unique Layer 2 security policy so that clients can safely select between them.
- When WLAN is local switching, associate the client to local-switching WLAN where AVC is enabled. Send some traffic from client, when you check the AVC stats after 90 sec. Cisco WLC shows stats under top-apps but does not show under client. There is timer issue so for the first slot Cisco WLC might not show stats for the clients .Earlier only 1 sec stats for a client is seen if the timers at AP and at WLC are off by 89 seconds. Now clearing of the stats is after 180 seconds so stats from 91 secs to 179 secs for a client is seen. This is done since two copies of the stats per client cannot be kept due to memory constraint in 5500.

---

**Caution**

Some clients might not be able to connect to WLANs properly if they detect the same SSID with multiple security policies. Use this feature with care.

## Information About WLANs

This feature enables you to control up to 64 WLANs for lightweight access points. Each WLAN has a separate WLAN ID, a separate profile name, and a WLAN SSID. All devices publish up to 16 WLANs to each connected access point, but you can create up to the maximum number of WLANs supported and then selectively publish these WLANs (using access point groups) to different access points to better manage your wireless network.

You can configure WLANs with different SSIDs or with the same SSID. An SSID identifies the specific wireless network that you want the device to access.

## Band Selection

Band selection enables client radios that are capable of dual-band (2.4- and 5-GHz) operation to move to a less congested 5-GHz access point. The 2.4-GHz band is often congested. Clients on this band typically experience interference from Bluetooth devices, microwave ovens, and cordless phones as well as co-channel interference from other access points because of the 802.11b/g limit of three nonoverlapping channels. To prevent these sources of interference and improve overall network performance, you can configure band selection on the device.

Band selection works by regulating probe responses to clients. It makes 5-GHz channels more attractive to clients by delaying probe responses to clients on 2.4-GHz channels.

[Prerequisites for WLANs](#), on page 2483  
[Restrictions for WLANs](#), on page 2484

## Off-Channel Scanning Defer

In deployments with certain power-save clients, you sometimes need to defer the Radio Resource Management's (RRM) normal off-channel scanning to avoid missing critical information from low-volume clients (for example, medical devices that use power-save mode and periodically send telemetry information). This feature improves the way that Quality of Service (QoS) interacts with the RRM scan defer feature.

You can use a client's Wi-Fi Multimedia (WMM) UP marking to configure the access point to defer off-channel scanning for a configurable period of time if it receives a packet marked UP.

Off-Channel Scanning Defer is essential to the operation of RRM, which gathers information about alternate channel choices such as noise and interference. Additionally, Off-Channel Scanning Defer is responsible for rogue detection. Devices that need to defer Off-Channel Scanning Defer should use the same WLAN as often

as possible. If there are many of these devices (and the possibility exists that Off-Channel Defer scanning could be completely disabled by the use of this feature), you should implement an alternative to local AP Off-Channel Scanning Defer, such as monitoring access points, or other access points in the same location that do not have this WLAN assigned.

You can assign a QoS policy (bronze, silver, gold, and platinum) to a WLAN to affect how packets are marked on the downlink connection from the access point regardless of how they were received on the uplink from the client. UP=1,2 is the lowest priority, and UP=0,3 is the next higher priority. The marking results of each QoS policy are as follows:

- Bronze marks all downlink traffic to UP= 1.
- Silver marks all downlink traffic to UP= 0.
- Gold marks all downlink traffic to UP=4.
- Platinum marks all downlink traffic to UP=6.

## DTIM Period

In the 802.11 networks, lightweight access points broadcast a beacon at regular intervals, which coincides with the Delivery Traffic Indication Map (DTIM). After the access point broadcasts the beacon, it transmits any buffered broadcast and multicast frames based on the value set for the DTIM period. This feature allows power-saving clients to wake up at the appropriate time if they are expecting broadcast or multicast data.

Typically, the DTIM value is set to 1 (to transmit broadcast and multicast frames after every beacon) or 2 (to transmit after every other beacon). For instance, if the beacon period of the 802.11 network is 100 ms and the DTIM value is set to 1, the access point transmits buffered broadcast and multicast frames 10 times per second. If the beacon period is 100 ms and the DTIM value is set to 2, the access point transmits buffered broadcast and multicast frames 5 times per second. Either of these settings are suitable for applications, including Voice Over IP (VoIP), that expect frequent broadcast and multicast frames.

However, the DTIM value can be set as high as 255 (to transmit broadcast and multicast frames after every 255th beacon) if all 802.11 clients have power save enabled. Because the clients have to listen only when the DTIM period is reached, they can be set to listen for broadcasts and multicasts less frequently which results in a longer battery life. For example, if the beacon period is 100 ms and you set the DTIM value to 100, the access point transmits buffered broadcast and multicast frames once every 10 seconds. This rate allows the power-saving clients to sleep longer before they have to wake up and listen for broadcasts and multicasts, which results in a longer battery life.

---

**Note**

A beacon period, which is specified in milliseconds on the device, is converted internally by the software to 802.11 Time Units (TUs), where 1 TU = 1.024 milliseconds. On Cisco's 802.11n access points, this value is rounded to the nearest multiple of 17 TUs. For example, a configured beacon period of 100 ms results in an actual beacon period of 104 ms.

---

Many applications cannot tolerate a long time between broadcast and multicast messages, which results in poor protocol and application performance. We recommend that you set a low DTIM value for 802.11 networks that support such clients.

## Session Timeouts

You can configure a WLAN with a session timeout. The session timeout is the maximum time for a client session to remain active before requiring reauthorization.

## Cisco Client Extensions

The Cisco Client Extensions (CCX) software is licensed to manufacturers and vendors of third-party client devices. The CCX code resident on these clients enables them to communicate wirelessly with Cisco access points and to support Cisco features that other client devices do not, including those features that are related to increased security, enhanced performance, fast roaming, and power management.

- The software supports CCX versions 1 through 5, which enables devices and their access points to communicate wirelessly with third-party client devices that support CCX. CCX support is enabled automatically for every WLAN on the device and cannot be disabled. However, you can configure Aironet information elements (IEs).
- If Aironet IE support is enabled, the access point sends an Aironet IE 0x85 (which contains the access point name, load, number of associated clients, and so on) in the beacon and probe responses of this WLAN, and the device sends Aironet IEs 0x85 and 0x95 (which contains the management IP address of the device and the IP address of the access point) in the reassociation response if it receives Aironet IE 0x85 in the reassociation request.

[Configuring Advanced WLAN Properties \(CLI\)](#), on page 2494

[Prerequisites for WLANs](#), on page 2483

[Restrictions for WLANs](#), on page 2484

## Peer-to-Peer Blocking

Peer-to-peer blocking is applied to individual WLANs, and each client inherits the peer-to-peer blocking setting of the WLAN to which it is associated. Peer-to-Peer enables you to have more control over how traffic is directed. For example, you can choose to have traffic bridged locally within the device, dropped by the device, or forwarded to the upstream VLAN.

Peer-to-peer blocking is supported for clients that are associated with the local switching WLAN.

## Diagnostic Channel

You can choose a diagnostic channel to troubleshoot why the client is having communication problems with a WLAN. You can test the client and access points to identify the difficulties that the client is experiencing and allow corrective measures to be taken to make the client operational on the network. You can use the device GUI or CLI to enable the diagnostic channel, and you can use the device CLI to run the diagnostic tests.

**Note** We recommend that you enable the diagnostic channel feature only for nonanchored SSIDs that use the management interface. CCX Diagnostic feature has been tested only with clients having Cisco ADU card

## Per-WLAN Radius Source Support

The device sources RADIUS traffic from the IP address of its management interface unless the configured RADIUS server exists on a VLAN accessible via one of the device Dynamic interfaces. If a RADIUS server is reachable via a device Dynamic interface, RADIUS requests to this specific RADIUS server will be sourced from the controller via the corresponding Dynamic interface.

By default, RADIUS packets sourced from the device will set the NAS-IP-Address attribute to that of the management interface's IP Address, regardless of the packet's source IP Address (Management or Dynamic, depending on topology).

When you enable per-WLAN RADIUS source support (Radius Server Overwrite interface) the NAS-IP-Address attribute is overwritten by the device to reflect the sourced interface. Also, RADIUS attributes are modified accordingly to match the identity. This feature virtualizes the device on the per-WLAN RADIUS traffic, where each WLAN can have a separate layer 3 identity. This feature is useful in deployments that integrate with ACS Network Access Restrictions and Network Access Profiles.

To filter WLANs, use the callStationID that is set by RFC 3580 to be in the APMAC:SSID format. You can also extend the filtering on the authentication server to be on a per-WLAN source interface by using the NAS-IP-Address attribute.

You can combine per-WLAN RADIUS source support with the normal RADIUS traffic source and some WLANs that use the management interface and others using the per-WLAN dynamic interface as the address source.

## How to Configure WLANs

### Creating WLANs (CLI)

#### SUMMARY STEPS

1. **configure terminal**
2. **wlan *profile-name* *wlan-id* [*ssid*]**
3. **end**

1. show wlan summary

### DETAILED STEPS

|               | Command or Action                                                               | Purpose                                                                                             |
|---------------|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>show wlan summary</b><br><b>Example:</b><br>Device# <b>show wlan summary</b> | Displays the list of all WLANs configured on the device. You can search for the WLAN in the output. |

**Example**

```
Device# show wlan summary
Number of WLANs: 4
```

| WLAN | Profile Name | SSID       | VLAN | Status |
|------|--------------|------------|------|--------|
| 1    | test1        | test1-ssid | 137  | UP     |
| 3    | test2        | test2-ssid | 136  | UP     |
| 2    | test3        | test3-ssid | 1    | UP     |
| 45   | test4        | test4-ssid | 1    | DOWN   |

You can also use wild cards to search WLANs. For example **show wlan summary include | variable**. Where variable is any search string in the output.

```
Device# show wlan summary | include test-wlan-ssid
1 test-wlan test-wlan-ssid 137 UP
```

## Enabling WLANs (CLI)

### SUMMARY STEPS

1. configure terminal
2. wlan *profile-name*
3. no shutdown

## 4. end

## DETAILED STEPS

|        | Command or Action                                                                       | Purpose                                                                                                             |
|--------|-----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters global configuration mode.                                                                                   |
| Step 2 | <b>wlan <i>profile-name</i></b><br><b>Example:</b><br>Device# <code>wlan test4</code>   | Enters the WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.          |
| Step 3 | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan)# <code>no shutdown</code>  | Enables the WLAN.                                                                                                   |
| Step 4 | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                       | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Configuring General WLAN Properties (CLI)

You can configure the following properties:

- Media stream
- Broadcast SSID
- Call Snooping
- Radio
- Interface
- Status

### SUMMARY STEPS

1. **configure terminal**
2. **wlan *profile-name***
3. **shutdown**
4. **broadcast-ssid**
5. **radio {all | dot11a | dot11ag | dot11bg | dot11g}**
6. **client vlan *vlan-identifier***
7. **ip multicast vlan *vlan-name***
8. **media-stream multicast-direct**
9. **call-snoop**
10. **no shutdown**
11. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                  | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 2 | <b>wlan <i>profile-name</i></b><br><b>Example:</b><br>Device# <code>wlan test4</code>                                    | Enters the WLAN configuration submenu. The <i>profile-name</i> is the profile name of the configured WLAN.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>shutdown</b><br><b>Example:</b><br>Device# <code>shutdown</code>                                                      | Disables the WLAN before configuring the parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 4 | <b>broadcast-ssid</b><br><b>Example:</b><br>Device(config-wlan)# <code>broadcast-ssid</code>                             | Broadcasts the SSID for this WLAN. This field is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 5 | <b>radio {all   dot11a   dot11ag   dot11bg   dot11g}</b><br><b>Example:</b><br>Device# <code>radio all</code>            | Enables radios on the WLAN. The keywords are as follows: <ul style="list-style-type: none"> <li>• <b>all</b>—Configures the WLAN on all radio bands.</li> <li>• <b>dot11a</b>—Configures the WLAN on only 802.11a radio bands.</li> <li>• <b>dot11g</b>—Configures the WLAN on 802.11ag radio bands.</li> <li>• <b>dot11bg</b>—Configures the WLAN on only 802.11b/g radio bands (only 802.11b if 802.11g is disabled).</li> <li>• <b>dot11ag</b>—Configures the wireless LAN on 802.11g radio bands only.</li> </ul> |
| Step 6 | <b>client vlan <i>vlan-identifier</i></b><br><b>Example:</b><br>Device# <code>client vlan test-vlan</code>               | Enables an interface group on the WLAN.<br><i>vlan-identifier</i> —Specifies the VLAN identifier. This can be the VLAN name, VLAN ID, or VLAN group name.                                                                                                                                                                                                                                                                                                                                                             |
| Step 7 | <b>ip multicast vlan <i>vlan-name</i></b><br><b>Example:</b><br>Device(config-wlan)# <code>ip multicast vlan test</code> | Enables IP multicast on a WLAN. The keywords are as follows: <ul style="list-style-type: none"> <li>• <b>vlan</b>—Specifies the VLAN ID.</li> <li>• <i>vlan-name</i>—Specifies the VLAN name.</li> </ul>                                                                                                                                                                                                                                                                                                              |
| Step 8 | <b>media-stream multicast-direct</b><br><b>Example:</b>                                                                  | Enables multicast VLANs on this WLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                | Command or Action                                                                | Purpose                                                                                                             |
|----------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|                | Device(config-wlan)# <b>media-stream multicast-direct</b>                        |                                                                                                                     |
| <b>Step 9</b>  | <b>call-snoop</b><br><b>Example:</b><br>Device(config-wlan)# <b>call-snoop</b>   | Enables call-snooping support.                                                                                      |
| <b>Step 10</b> | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan)# <b>no shutdown</b> | Enables the WLAN.                                                                                                   |
| <b>Step 11</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                      | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Configuring Advanced WLAN Properties (CLI)

You can configure the following advanced properties:

- AAA Override
- Coverage Hole Detection
- Session Timeout
- Cisco Client Extensions
- Diagnostic Channels
- Interface Override ACLs
- P2P Blocking
- Client Exclusion
- Maximum Clients Per WLAN
- Off Channel Scan Defer

**SUMMARY STEPS**

1. **configure terminal**
2. **wlan *profile-name***
3. **aaa-override**
4. **chd**
5. **session-timeout *time-in-seconds***
6. **ccx aironet-iesupport**

7. **diag-channel**
8. **ip access-group** [web] *acl-name*
9. **peer-blocking** [drop | forward-upstream]
10. **exclusionlist** *time-in-seconds*
11. **client association limit** *max-number-of-clients*
12. **channel-scan defer-priority** {defer-priority {0-7} | defer-time {0 - 6000}}
13. **end**

## DETAILED STEPS

|               | Command or Action                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 2</b> | <b>wlan</b> <i>profile-name</i><br><b>Example:</b><br>Device# <b>wlan test4</b>                                         | Enters the WLAN configuration submenu. The <i>profile-name</i> is the profile name of the configured WLAN.                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>aaa-override</b><br><b>Example:</b><br>Device(config-wlan)# <b>aaa-override</b>                                      | Enables AAA override.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>chd</b><br><b>Example:</b><br>Device(config-wlan)# <b>chd</b>                                                        | Enables coverage hole detection for this WLAN. This field is enabled by default.                                                                                                                                                                                                                                                                                                                 |
| <b>Step 5</b> | <b>session-timeout</b> <i>time-in-seconds</i><br><b>Example:</b><br>Device(config-wlan)# <b>session-timeout 450</b>     | Sets the session timeout in seconds. The range and default values vary according to the security configuration. If the WLAN security is configured to dot1x, the range is 300 to 86400 seconds and the default value is 1800 seconds. For all other WLAN security configurations, the range is 1 to 65535 seconds and the default value is 0 seconds. A value of 0 indicates no session timeout. |
| <b>Step 6</b> | <b>ccx aironet-iesupport</b><br><b>Example:</b><br>Device(config-wlan)# <b>ccx aironet-iesupport</b>                    | Enables support for Aironet IEs for this WLAN. This field is enabled by default.                                                                                                                                                                                                                                                                                                                 |
| <b>Step 7</b> | <b>diag-channel</b><br><b>Example:</b><br>Device(config-wlan)# <b>diag-channel</b>                                      | Enables diagnostic channel support to troubleshoot client communication issues on a WLAN.                                                                                                                                                                                                                                                                                                        |
| <b>Step 8</b> | <b>ip access-group</b> [web] <i>acl-name</i><br><b>Example:</b><br>Device(config)# <b>ip access-group test-acl-name</b> | Configures the WLAN ACL group. The variable <i>acl-name</i> specifies the user-defined IPv4 ACL name. The keyword <b>web</b> specifies the IPv4 web ACL.                                                                                                                                                                                                                                         |

|                | Command or Action                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 9</b>  | <b>peer-blocking</b> [ <b>drop</b>   <b>forward-upstream</b> ]<br><b>Example:</b><br>Device(config)# <b>peer-blocking drop</b>                                                                | Configures peer to peer blocking parameters. The keywords are as follows: <ul style="list-style-type: none"> <li>• <b>drop</b>—Enables peer-to-peer blocking on the drop action.</li> <li>• <b>forward-upstream</b>—Enables peer-to-peer blocking on the forward upstream action.</li> </ul>                                                                                                           |
| <b>Step 10</b> | <b>exclusionlist</b> <i>time-in-seconds</i><br><b>Example:</b><br>Device(config)# <b>exclusionlist 10</b>                                                                                     | Specifies the timeout in seconds. The valid range is from 0 to 2147483647. Enter 0 for no timeout. A zero (0) timeout indicates that the client is permanently added to the exclusion list.                                                                                                                                                                                                            |
| <b>Step 11</b> | <b>client association limit</b> <i>max-number-of-clients</i><br><b>Example:</b><br>Device(config)# <b>client association limit 200</b>                                                        | Sets the maximum number of clients that can be configured on a WLAN.                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 12</b> | <b>channel-scan defer-priority</b> { <b>defer-priority</b> { <b>0-7</b> }   <b>defer-time</b> { <b>0 - 6000</b> }}<br><b>Example:</b><br>Device(config)# <b>channel-scan defer-priority 6</b> | Sets the channel scan defer priority and defer time. The arguments are as follows: <ul style="list-style-type: none"> <li>• <b>defer-priority</b>—Specifies the priority markings for packets that can defer off-channel scanning. The range is from 0 to 7. The default is 3.</li> <li>• <b>defer-time</b>—Deferral time in milliseconds. The range is from 0 to 6000. The default is 100.</li> </ul> |
| <b>Step 13</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                                                   | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                                                                                                                                                                                                                    |

## Monitoring WLAN Properties (CLI)

| Command                                                | Description                                                                                                                                                                                                                    |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show wlan id <i>wlan-id</i></code>               | Displays WLAN properties based on the WLAN ID.                                                                                                                                                                                 |
| <code>show wlan name <i>wlan-name</i></code>           | Displays WLAN properties based on the WLAN name.                                                                                                                                                                               |
| <code>show wlan all</code>                             | Displays WLAN properties of all configured WLANs.                                                                                                                                                                              |
| <code>show wlan summary</code>                         | Displays a summary of all WLANs. The summary details includes the following information: <ul style="list-style-type: none"> <li>• WLAN ID</li> <li>• Profile name</li> <li>• SSID</li> <li>• VLAN</li> <li>• Status</li> </ul> |
| <code>show running-config wlan <i>wlan-name</i></code> | Displays the running configuration of a WLAN based on the WLAN name.                                                                                                                                                           |
| <code>show running-config <i>wlan</i></code>           | Displays the running configuration of all WLANs.                                                                                                                                                                               |

## Where to Go Next

Proceed to configure DHCP for WLANs.

# Configuring DHCP for WLANs

- [Finding Feature Information, on page 2499](#)
- [Prerequisites for Configuring DHCP for WLANs, on page 2499](#)
- [Restrictions for Configuring DHCP for WLANs, on page 2501](#)
- [Information About the Dynamic Host Configuration Protocol, on page 2501](#)
- [How to Configure DHCP for WLANs, on page 2504](#)
- [Additional References, on page 2507](#)
- [Feature Information for DHCP for WLANs, on page 2508](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring DHCP for WLANs

- To be able to use the DHCP option 82, you must configure DHCP on Cisco IOS software. By default, DHCP option 82 is enabled for all clients. You can control the wireless client behavior using the WLAN suboptions.
- The Cisco converged access platforms support internal DHCP server functionality. However, as a general deployment guideline to build large enterprise-class networks, we recommend that you use external DHCP server to provide dynamic IP addressing to wireless clients. Such distributed function reduces processing and configuration load on network devices and allows them to operate efficiently in large scale deployments.
- DHCP Snooping Configuration—DHCP snooping configuration is the required best practices configuration on for rapid client join function. DHCP snooping needs to be enabled on each client VLAN including the override VLAN if override is applied on the WLAN.

### Example of DHCP snooping configuration

1. Global DHCP snooping configuration:

a. Device(config)#**ip dhcp snooping**

```
Device(config)#ip dhcp snooping vlan 100
```

b. Enable `bootp-broadcast` command. This is required for clients that send DHCP messages with broadcast addresses and broadcast bit is set in the DHCP message:

```
Device(config)#ip dhcp snooping wireless bootp-broadcast enable
```

c. To not append DHCP Option information, enter this command:

```
Device(config)#no ip dhcp snooping information option
```

2. On the interface:

---

**Note** IP DHCP snooping trust is required on Port-Channel interface in addition to member link of the Port-Channel interface.

---

```
Device(config)#interface range TenGigabitEthernet 1/0/1 - 2
```

```
Device(config-if)#switchport mode trunk
```

```
Device(config-if)#switchport trunk allowed vlan 100
```

```
Device(config-if)#ip dhcp snooping trust
```

```
Device(config)#interface port-channel 1
```

```
Device(config-if)#switchport mode trunk
```

```
Device(config-if)#switchport trunk allowed vlan 100
```

```
Device(config-if)#ip dhcp snooping trust
```

---

**Note** DHCP snooping must be configured on the Guest Anchor for guest access similar to the Config above.

---

## Restrictions for Configuring DHCP for WLANs

- If you override the DHCP server in a WLAN, you must ensure that you configure the underlying Cisco IOS configuration to make sure that the DHCP server is reachable.
- WLAN DHCP override works only if DHCP service is enabled on the device.

You can configure DHCP service in the following ways:

- Configuring the DHCP pool on the device.
- Configuring a DHCP relay agent on the SVI. Note: the VLAN of the SVI must be mapped to the WLAN where DHCP override is configured.

## Information About the Dynamic Host Configuration Protocol

You can configure WLANs to use the same or different Dynamic Host Configuration Protocol (DHCP) servers or no DHCP server. Two types of DHCP servers are available: internal and external.

### Related Topics

[Prerequisites for Configuring DHCP for WLANs](#), on page 2499

[Restrictions for Configuring DHCP for WLANs](#), on page 2501

## Internal DHCP Servers

The devices contain an internal DHCP server. This server is typically used in branch offices that do not already have a DHCP server. The wireless network generally contains a maximum of 10 access points or fewer, with the access points on the same IP subnet as the device. The internal server provides DHCP addresses to wireless clients, direct-connect access points, and DHCP requests that are relayed from access points. Only lightweight access points are supported. When you want to use the internal DHCP server, you must set the management interface IP address of the device as the DHCP server IP address.

DHCP option 43 is not supported on the internal server. Therefore, the access point must use an alternative method to locate the management interface IP address of the device, such as local subnet broadcast, Domain Name System (DNS), or priming.

An internal DHCP server pool only serves the wireless clients of that device, not clients of other devices. Also, an internal DHCP server can serve only wireless clients, not wired clients.

When clients use the internal DHCP server of the device, IP addresses are not preserved across reboots. As a result, multiple clients can be assigned with the same IP address. To resolve any IP address conflicts, clients must release their existing IP address and request a new one. Wired guest clients are always on a Layer 2 network connected to a local or foreign device.

---

**Note** DHCPv6 is not supported in the internal DHCP servers.

---

[Restrictions for Configuring DHCP for WLANs](#), on page 2501

## External DHCP Servers

The operating system is designed to appear as a DHCP Relay to the network and as a DHCP server to clients with industry-standard external DHCP servers that support DHCP Relay, which means that each device appears as a DHCP Relay agent to the DHCP server and as a DHCP server at the virtual IP address to wireless clients.

Because the device captures the client IP address that is obtained from a DHCP server, it maintains the same IP address for that client during intra device, inter device, and inter-subnet client roaming.

---

**Note** External DHCP servers can support DHCPv6.

---

[Restrictions for Configuring DHCP for WLANs](#), on page 2501

## DHCP Assignments

You can configure DHCP on a per-interface or per-WLAN basis. We recommend that you use the primary DHCP server address that is assigned to a particular interface.

You can assign DHCP servers for individual interfaces. You can configure the management interface, AP-manager interface, and dynamic interface for a primary and secondary DHCP server, and you can configure the service-port interface to enable or disable DHCP servers. You can also define a DHCP server on a WLAN. In this case, the server overrides the DHCP server address on the interface assigned to the WLAN.

#### Security Considerations

For enhanced security, we recommend that you require all clients to obtain their IP addresses from a DHCP server. To enforce this requirement, you can configure all WLANs with a DHCP Addr. Assignment Required setting, which disallows client static IP addresses. If DHCP Addr. Assignment Required is selected, clients must obtain an IP address via DHCP. Any client with a static IP address is not allowed on the network. The device monitors DHCP traffic because it acts as a DHCP proxy for the clients.

**Note** WLANs that support management over wireless must allow management (device-servicing) clients to obtain an IP address from a DHCP server.

If slightly less security is tolerable, you can create WLANs with DHCP Addr. Assignment Required disabled. Clients then have the option of using a static IP address or obtaining an IP address from a designated DHCP server.

**Note** DHCP Addr. Assignment Required is not supported for wired guest LANs.

You can create separate WLANs with DHCP Addr. Assignment Required configured as disabled. This is applicable only if DHCP proxy is enabled for the device. You must not define the primary/secondary configuration DHCP server you should disable the DHCP proxy. These WLANs drop all DHCP requests and force clients to use a static IP address. These WLANs do not support management over wireless connections.

[Restrictions for Configuring DHCP for WLANs](#), on page 2501

## Information About DHCP Option 82

DHCP option 82 provides additional security when DHCP is used to allocate network addresses. It enables the device to act as a DHCP relay agent to prevent DHCP client requests from untrusted sources. You can configure the device to add option 82 information to DHCP requests from clients before forwarding the requests to the DHCP server.

*Figure 125: DHCP Option 82*

The access point forwards all DHCP requests from a client to the device. The device adds the DHCP option 82 payload and forwards the request to the DHCP server. The payload can contain the MAC address or the MAC address and SSID of the access point, depending on how you configure this option.

**Note** Any DHCP packets that already include a relay agent option are dropped at the device.

For DHCP option 82 to operate correctly, DHCP proxy must be enabled.

## Information About DHCP Scopes

Devices have built-in DHCP relay agents. However, when you desire network segments that do not have a separate DHCP server, the devices can have built-in DHCP scopes that assign IP addresses and subnet masks to wireless clients. Typically, one device can have one or more DHCP scopes that each provide a range of IP addresses.

DHCP scopes are needed for internal DHCP to work. Once DHCP is defined on the device, you can then point the primary DHCP server IP address on the management, AP-manager, and dynamic interfaces to the device's management interface.

# How to Configure DHCP for WLANs

## Configuring DHCP for WLANs (CLI)

Use this procedure to configure the following DHCP parameters on a WLAN:

- DHCP Option 82 Payload
- DHCP Required
- DHCP Override

**Before you begin**

- You must have admin privileges for configuring the WLAN.
- To configure the DHCP override, you must have the IP address of the DHCP server.

## SUMMARY STEPS

1. **configure terminal**
2. **shutdown**
3. **wlan *profile-name***
4. **ip dhcp opt82 {ascii | format {*add-ssid* | *ap-ethmac*} | rid}**
5. **ip dhcp required**
6. **ip dhcp server *ip-address***
7. **no shutdown**
8. **end**
9. **show wlan *wlan-name***

## DETAILED STEPS

|        | Command or Action                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Step 2 | <b>shutdown</b><br><b>Example:</b><br>Device(config)# <b>shutdown</b>                                                                                       | Shut down the WLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <b>wlan <i>profile-name</i></b><br><b>Example:</b><br>Device# <b>wlan test4</b>                                                                             | Enters the WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 4 | <b>ip dhcp opt82 {ascii   format {<i>add-ssid</i>   <i>ap-ethmac</i>}   rid}</b><br><b>Example:</b><br>Device(config)# <b>ip dhcp opt82 format add-ssid</b> | Specifies the DHCP82 payload on the WLAN. The keyword and arguments are as follows: <ul style="list-style-type: none"> <li>• <b>ascii</b>—Configures ASCII for DHCP Option 82. If this is not configured, the option 82 format is set to ASCII format.</li> <li>• <b>format</b>—Specifies the DHCP option 82 format. The following options are available:               <ul style="list-style-type: none"> <li>• <i>add-ssid</i>—Set RemoteID format that is the AP radio MAC address and SSID.</li> <li>• <i>ap-ethmac</i>—Set RemoteID format that is the AP Ethernet MAC address.</li> </ul> </li> </ul> <p><b>Note</b> If the format option is not configured, only the AP radio MAC address is used.</p> <ul style="list-style-type: none"> <li>• <b>rid</b>—Adds the Cisco 2 byte RID for DHCP option 82.</li> </ul> |

|               | Command or Action                                                                                            | Purpose                                                                                                             |
|---------------|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>ip dhcp required</b><br><b>Example:</b><br>Device(config-wlan) # <b>ip dhcp required</b>                  | Makes it mandatory for clients to get their IP address from the DHCP server. Static clients are not allowed.        |
| <b>Step 6</b> | <b>ip dhcp server ip-address</b><br><b>Example:</b><br>Device(config-wlan) # <b>ip dhcp server 200.1.1.2</b> | Defines a DHCP server on the WLAN that overrides the DHCP server address on the interface assigned to the WLAN.     |
| <b>Step 7</b> | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan) # <b>no shutdown</b>                            | Restarts the WLAN.                                                                                                  |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Device(config) # <b>end</b>                                                 | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |
| <b>Step 9</b> | <b>show wlan wlan-name</b><br><b>Example:</b><br>Device(config-wlan) # <b>show wlan test-wlan</b>            | Verifies the DHCP configuration.                                                                                    |

## Configuring DHCP Scopes (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **ip dhcp pool pool-name**
3. **network network-name mask-address**
4. **dns-server hostname**
5. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                             | Purpose                                                                                                             |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                       | Enters global configuration mode.                                                                                   |
| Step 2 | <b>ip dhcp pool <i>pool-name</i></b><br><b>Example:</b><br>Device(config)# <code>ip dhcp pool test-pool</code>                                | Configures the DHCP pool address.                                                                                   |
| Step 3 | <b>network <i>network-name mask-address</i></b><br><b>Example:</b><br>Device(dhcp-config)# <code>network 209.165.200.224 255.255.255.0</code> | Specifies the network number in dotted-decimal notation and the mask address.                                       |
| Step 4 | <b>dns-server <i>hostname</i></b><br><b>Example:</b><br>Device(dhcp-config)# <code>dns-server example.com</code>                              | Specifies the DNS name server. You can specify an IP address or a hostname.                                         |
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                             | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## CHAPTER 131

# Configuring WLAN Security

- [Finding Feature Information, on page 2509](#)
- [Prerequisites for Layer 2 Security, on page 2509](#)
- [Information About AAA Override, on page 2510](#)
- [How to Configure WLAN Security, on page 2510](#)
- [Additional References, on page 2515](#)
- [Feature Information about WLAN Layer 2 Security, on page 2516](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Layer 2 Security

WLANs with the same SSID must have unique Layer 2 security policies so that clients can make a WLAN selection based on information advertised in beacon and probe responses. The available Layer 2 security policies are as follows:

- None (open WLAN)
- Static WEP or 802.1X

---

**Note** Because static WEP and 802.1X are both advertised by the same bit in beacon and probe responses, they cannot be differentiated by clients. Therefore, they cannot both be used by multiple WLANs with the same SSID.

---

- WPA/WPA2

**Note**

- Although WPA and WPA2 cannot be used by multiple WLANs with the same SSID, you can configure two WLANs with the same SSID with WPA/TKIP with PSK and Wi-Fi Protected Access (WPA )/Temporal Key Integrity Protocol (TKIP) with 802.1X, or with WPA/TKIP with 802.1X or WPA/AES with 802.1X.
- A WLAN that is configured with TKIP support will not be enabled on an RM3000AC module.

**Related Topics**

- [Configuring Static WEP + 802.1X Layer 2 Security Parameters \(CLI\)](#), on page 2510
- [Configuring Static WEP Layer 2 Security Parameters \(CLI\)](#), on page 2511

- [Configuring Advanced WLAN Properties \(CLI\)](#), on page 2494
- [Information About AAA Override](#), on page 2510

## Information About AAA Override

The AAA Override option of a WLAN enables you to configure the WLAN for identity networking. It enables you to apply VLAN tagging, Quality of Service (QoS), and Access Control Lists (ACLs) to individual clients based on the returned RADIUS attributes from the AAA server.

**Related Topics**

- [Configuring Advanced WLAN Properties \(CLI\)](#), on page 2494

## How to Configure WLAN Security

### Configuring Static WEP + 802.1X Layer 2 Security Parameters (CLI)

**Before you begin**

You must have administrator privileges.

**SUMMARY STEPS**

1. **configure terminal**
2. **wlan *profile-name***
3. **security static-wep-key { authentication { open | sharedkey } | encryption { 104 | 40 } [ ascii | hex ] { 0 | 8 } } *wep-key wep-key-index1-4***
4. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Configuring Static WEP Layer 2 Security Parameters (CLI)

### Before you begin

You must have administrator privileges.

### SUMMARY STEPS

1. **configure terminal**
2. **wlan profile-name**
3. **security static-wep-key [ authentication { open | shared } | encryption { 104 | 40 } { ascii | hex } [ 0 | 8 ] ]**

## 4. end

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Configuring 802.1X Layer 2 Security Parameters (CLI)

**Before you begin**

You must have administrator privileges.

**SUMMARY STEPS**

1. **configure terminal**
2. **wlan *profile-name***
3. **security dot1x**
4. **security [authentication-list *auth-list-name* | encryption {0 | 104 | 40}**
5. **end**

**DETAILED STEPS**

|               | Command or Action                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                      |
| <b>Step 2</b> | <b>wlan <i>profile-name</i></b><br><b>Example:</b><br>Device# <b>wlan test4</b>                                                                                   | Enters the WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>security dot1x</b><br><b>Example:</b><br>Device(config-wlan) # <b>security dot1x</b>                                                                           | Specifies 802.1X security.                                                                                                                                                                                                                                                                                                                             |
| <b>Step 4</b> | <b>security [authentication-list <i>auth-list-name</i>   encryption {0   104   40}</b><br><b>Example:</b><br>Device(config-wlan) # <b>security encryption 104</b> | The keywords and arguments are as follows: <ul style="list-style-type: none"> <li>• <b>authentication-list</b>—Specifies the authentication list for IEEE 802.1X.</li> <li>• <b>encryption</b>—Specifies the length of the CKIP encryption key. The valid values are 0, 40, and 104. Zero (0) signifies no encryption. This is the default.</li> </ul> |

|               | Command or Action                                           | Purpose                                                                                                             |
|---------------|-------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|               |                                                             | <b>Note</b> All keys within a WLAN must be of the same size.                                                        |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b> | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## CHAPTER 132

# Setting Client Count Per WLAN

---

- [Finding Feature Information, on page 2517](#)
- [Restrictions for Setting Client Count for WLANs, on page 2517](#)
- [Information About Setting the Client Count per WLAN, on page 2518](#)
- [How to Configure Client Count Per WLAN, on page 2518](#)
- [Monitoring Client Connections \(CLI\), on page 2520](#)
- [Additional References for Client Connections, on page 2521](#)
- [Feature Information about Client Connections Per WLAN, on page 2522](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for Setting Client Count for WLANs

- When a WLAN has reached the limit on the maximum number of clients connected to it or an AP radio and a new client tries to join the WLAN, the client cannot connect to the WLAN until an existing client gets disconnected.
- Roaming clients are considered as new clients. The new client can connect to a WLAN, which has reached the maximum limit on the number of connected clients, only when an existing client gets disconnected.

---

**Note** For more information about the number of clients that are supported, see the product data sheet of your device.

---

## Information About Setting the Client Count per WLAN

You can set a limit to the number of clients that can connect to a WLAN, which is useful in scenarios where you have a limited number of clients that can connect to a device. For example, consider a scenario where the device can serve up to 256 clients on a WLAN and these clients can be shared between enterprise users (employees) and guest users. You can set a limit on the number of guest clients that can access a given WLAN. The number of clients that you can configure for each WLAN depends on the platform that you are using.

## How to Configure Client Count Per WLAN

### Configuring Client Count per WLAN (CLI)

#### SUMMARY STEPS

1. **configure terminal**
2. **wlan *profile-name***
3. **client association limit *limit***
4. **end**

#### DETAILED STEPS

|               | Command or Action                                                                                                                | Purpose                                                                                                                 |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <b>configure terminal</b>                                            | Enters global configuration mode.                                                                                       |
| <b>Step 2</b> | <b>wlan <i>profile-name</i></b><br><br><b>Example:</b><br>Device# <b>wlan test4</b>                                              | Enters the WLAN configuration submenu. The <i>profile-name</i> is the profile name of the configured WLAN.              |
| <b>Step 3</b> | <b>client association limit <i>limit</i></b><br><br><b>Example:</b><br>Device(config-wlan)# <b>client association limit 2000</b> | Configures the maximum number of client associations per WLAN. The range is 0 to 2000. A default value is 0 (no limit). |

|        | Command or Action                                                | Purpose                                                                                                             |
|--------|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>end</b><br><b>Example:</b><br>Device(wlan-config)# <b>end</b> | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-z</b> to exit global configuration mode. |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for 802.11w

- To configure 802.11w feature for optional and mandatory, you must have WPA and AKM configured.

---

**Note** The RNS (Robust Secure Network) IE must be enabled with an AES Cipher.

---

- To configure 802.11w as mandatory, you must enable PMF AKM in addition to WPA AKM.

### Related Topics

[Disabling 802.11w \(CLI\)](#), on page 2526

[Information About 802.11w](#), on page 2524

## Restrictions for 802.11w

- 802.11w cannot be applied on an open WLAN, WEP-encrypted WLAN, or a TKIP-encrypted WLAN.
- The WLAN on which 802.11w is configured must have either WPA2-PSK or WPA2-802.1x security configured.

## Information About 802.11w

Wi-Fi is a broadcast medium that enables any device to eavesdrop and participate either as a legitimate or rogue device. Control and management frames such as authentication/deauthentication, association/disassociation, beacons, and probes are used by wireless clients to select an AP and to initiate a session for network services.

Unlike data traffic which can be encrypted to provide a level of confidentiality, these frames must be heard and understood by all clients and therefore must be transmitted as open or unencrypted. While these frames cannot be encrypted, they must be protected from forgery to protect the wireless medium from attacks. For example, an attacker could spoof management frames from an AP to tear down a session between a client and AP.

The 802.11w protocol applies only to a set of robust management frames that are protected by the Management Frame Protection (PMF) service. These include Disassociation, Deauthentication, and Robust Action frames.

Management frames that are considered as robust action and therefore protected are the following:

- Spectrum Management
- QoS
- Block Ack
- SA Query
- Vendor-specific Protected

When 802.11w is implemented in the wireless medium, the following occur:

- Client protection is added by the AP adding cryptographic protection (by including the MIC information element) to deauthentication and disassociation frames preventing them from being spoofed in a DOS attack.
- Infrastructure protection is added by adding a Security Association (SA) teardown protection mechanism consisting of an Association Comeback Time and an SA-Query procedure preventing spoofed association request from disconnecting an already connected client.

# How to Configure 802.11w

## Configuring 802.11w (CLI)

**Before you begin**

WPA and AKM must be configured.

**SUMMARY STEPS**

1. **configure terminal**
2. **wlan *profile-name***
3. **shutdown**
4. **security pmf {*association-check association-comeback-time-in-seconds* | **mandatory** | **optional** | **saquery saquery-time-in-milliseconds**}**
5. **no shutdown**
6. **end**

**DETAILED STEPS**

|               | Command or Action                                                                                                                                                                         | Purpose                                                                                                                                                                                                                            |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                         | Enters global configuration mode.                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>wlan <i>profile-name</i></b><br><b>Example:</b><br>Device# <b>wlan test4</b>                                                                                                           | Enters the WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.                                                                                                                         |
| <b>Step 3</b> | <b>shutdown</b><br><b>Example:</b><br>Device <b>shutdown</b>                                                                                                                              | Shutdown the WLAN before configuring the PMF.                                                                                                                                                                                      |
| <b>Step 4</b> | <b>security pmf {<i>association-check association-comeback-time-in-seconds</i>   <b>mandatory</b>   <b>optional</b>   <b>saquery saquery-time-in-milliseconds</b>}</b><br><b>Example:</b> | Configures the PMF parameters with the following options: <ul style="list-style-type: none"> <li>• <b>association-comeback</b>—Configures the 802.11w association comeback time.<br/>The range is from 1 to 20 seconds.</li> </ul> |

|               | Command or Action                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <pre>Device(config-wlan) # security pmf saquery-retry-time 200</pre>           | <ul style="list-style-type: none"> <li>• <b>mandatory</b>—Requires clients to negotiate 802.11w PMF protection on a WLAN.</li> <li>• <b>optional</b>—Enables 802.11w PMF protection on a WLAN.</li> <li>• <b>saquery</b>—Time interval identified in milliseconds before which the SA query response is expected. If the device does not get a response, another SQ query is tried.</li> </ul> <p>The range is from 100 to 500 ms. The value must be specified in multiples of 100 milliseconds.</p> |
| <b>Step 5</b> | <p><b>no shutdown</b></p> <p><b>Example:</b></p> <pre>Device no shutdown</pre> | Restart the WLAN for the changes to take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan) # end</pre>  | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-z</b> to exit global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                  |

## Disabling 802.11w (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **wlan profile-name**
3. **shutdown**
4. **no security pmf [association-comeback association-check-comback-interval-seconds | mandatory | optional | saquery saquery-time-interval-milliseconds]**
5. **no shutdown**
6. **end**

### DETAILED STEPS

|               | Command or Action                                       | Purpose                           |
|---------------|---------------------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> | Enters global configuration mode. |

|               | Command or Action                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Monitoring 802.11w (CLI)

The following command can be used to monitor 802.11w:

| Command                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Feature Information for 802.11w

This table lists the features in this module and provides links to specific configuration information:

| Feature Name | Release            | Feature Information          |
|--------------|--------------------|------------------------------|
| 802.11w      | Cisco IOS XE 3.3SE | This feature was introduced. |

## CHAPTER 134

# Configuring Wi-Fi Direct Client Policy

- [Finding Feature Information, on page 2531](#)
- [Restrictions for the Wi-Fi Direct Client Policy, on page 2531](#)
- [Information About the Wi-Fi Direct Client Policy, on page 2531](#)
- [How to Configure Wi-Fi Direct Client Policy, on page 2532](#)
- [Additional References for Wi-Fi Direct Client Policy, on page 2534](#)
- [Feature Information about Wi-Fi Direct Client Policy, on page 2535](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for the Wi-Fi Direct Client Policy

- Wi-Fi Direct Client Policy is applicable to WLANs that have APs in local mode only.
- If WLAN applied client policy is invalid, the client is excluded with the exclusion reason being 'Client QoS Policy failure'.

## Information About the Wi-Fi Direct Client Policy

Devices that are Wi-Fi Direct capable can connect directly to each other quickly and conveniently to do tasks such as printing, synchronization, and sharing of data. Wi-Fi Direct devices may associate with multiple peer-to-peer (P2P) devices and with infrastructure wireless LANs (WLANs) concurrently. You can use the device to configure the Wi-Fi Direct Client Policy, on a per WLAN basis, where you can allow or disallow association of Wi-Fi devices with infrastructure WLANs, or disable Wi-Fi Direct Client Policy altogether for WLANs.

| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 2</b> | <b>wlan <i>profile-name</i></b><br><b>Example:</b><br>Device# <b>wlan test4</b>                                      | Enters the WLAN configuration submenu. The <i>profile-name</i> is the profile name of the configured WLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>wifidirect policy {permit   deny }</b><br><b>Example:</b><br>Device(config-wlan)# <b>wifidirect policy permit</b> | Configures the Wi-Fi Direct client policy on the WLAN using one of the following: <ul style="list-style-type: none"> <li>• <b>permit</b>—Enables Wi-Fi Direct clients to associate with the WLAN.</li> <li>• <b>deny</b>—When the Wi-Fi Direct policy is configured as "deny," the device permits or denies Wi-Fi Direct devices based on the device capabilities. A Wi-Fi Direct device reports these capabilities in its association request to the device and these are based on the Wi-Fi capabilities of the device. These include:               <ul style="list-style-type: none"> <li>• Concurrent operation</li> <li>• Cross connection</li> </ul> </li> </ul> |

|               | Command or Action                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                              | <p><b>Note</b> The command <b>no wifidirect policy</b> ignores the client's Wi-Fi direct status. Additionally, the access point also does not advertise any beacons and probes. Effectively, the <b>no</b> form of the command disables the Wi-Fi direct feature on the WLAN.</p> <p>If the Wi-Fi device supports either concurrent operations or cross connections or both, the client association is denied. The client can associate if the device does not support concurrent operations and cross connections.</p> |
| <b>Step 4</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# end</pre> | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-z</b> to exit global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                     |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for 802.11r Fast Transition

- 802.11r client association is not supported on access points in standalone mode.
- 802.11r fast roaming is not supported on access points in standalone mode.
- 802.11r fast roaming between local authentication and central authentication WLAN is not supported.
- For APs in FlexConnect mode, 802.11r fast roaming works only if the APs are in the same FlexConnect group.
- EAP LEAP method is not supported.
- TSpec is not supported for 802.11r fast roaming. Therefore, RIC IE handling is not supported.
- If WAN link latency exists, fast roaming is also delayed. Voice or data maximum latency should be verified. The device handles 802.11r Fast Transition authentication request during roaming for both Over-the-Air and Over-the-DS methods.

- This feature is supported only on open and WPA2 configured WLANs.
- Legacy clients cannot associate with a WLAN that has 802.11r enabled if the driver of the supplicant that is responsible for parsing the Robust Security Network Information Exchange (RSN IE) is old and not aware of the additional AKM suites in the IE. Due to this limitation, clients cannot send association requests to WLANs. These clients, however, can still associate with non-802.11r WLANs. Clients that are 802.11r capable can associate as 802.11i clients on WLANs that have both 802.11i and 802.11r Authentication Key Management Suites enabled.

The workaround is to enable or upgrade the driver of the legacy clients to work with the new 802.11r AKMs, after which the legacy clients can successfully associate with 802.11r enabled WLANs.

Another workaround is to have two SSIDs with the same name but with different security settings (FT and non-FT).

- Fast Transition resource request protocol is not supported because clients do not support this protocol. Also, the resource request protocol is an optional protocol.
- To avoid any Denial of Service (DoS) attack, each device allows a maximum of three Fast Transition handshakes with different APs.

[Information About 802.11r Fast Transition](#), on page 2538

## Information About 802.11r Fast Transition

802.11r, which is the IEEE standard for fast roaming, introduces a new concept of roaming where the initial handshake with the new AP is done even before the client roams to the target AP, which is called Fast Transition (FT). The initial handshake allows the client and APs to do the Pairwise Transient Key (PTK) calculation in advance. These PTK keys are applied to the client and AP after the client does the reassociation request or response exchange with new target AP.

802.11r provides two methods of roaming:

- Over-the-Air
- Over-the-DS (Distribution System)

The FT key hierarchy is designed to allow clients to make fast BSS transitions between APs without requiring reauthentication at every AP. WLAN configuration contains a new Authenticated Key Management (AKM) type called FT (Fast Transition).

From Release 3E, you can create an 802.11r WLAN that is also an WPAv2 WLAN. In earlier releases, you had to create separate WLANs for 802.11r and for normal security. Non-802.11r clients can now join 802.11r-enabled WLANs as the 802.11r WLANs can accept non-802.11r associations. If clients do not support mixed mode or 802.11r join, they can join non-802.11r WLANs. When you configure FT PSK and later define PSK, clients that can join only PSK can now join the WLAN in mixed mode.

### How a Client Roams

For a client to move from its current AP to a target AP using the FT protocols, the message exchanges are performed using one of the following two methods:

- Over-the-Air—The client communicates directly with the target AP using IEEE 802.11 authentication with the FT authentication algorithm.
- Over-the-DS—The client communicates with the target AP through the current AP. The communication between the client and the target AP is carried in FT action frames between the client and the current AP and is then sent through the device.

**Figure 126: Message Exchanges when Over the Air client roaming is configured**

This figure shows the sequence of message exchanges that occur when Over the Air client roaming is configured.

configured. . . . . Actual communication path

# How to Configure 802.11r Fast Transition

## Configuring 802.11r Fast Transition in an Open WLAN (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **wlan *profile-name***
3. **client vlan *vlan-id***
4. **no security wpa**
5. **no security wpa akm dot1x**
6. **no security wpa wpa2**
7. **no wpa wpa2 ciphers aes**
8. **security ft**

9. no shutdown
10. end

### DETAILED STEPS

|         | Command or Action                                                                                                       | Purpose                                                                                                            |
|---------|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1  | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                 | Enters global configuration mode.                                                                                  |
| Step 2  | <b>wlan profile-name</b><br><b>Example:</b><br>Device# <code>wlan test4</code>                                          | Enters the WLAN configuration submenu. The <i>profile-name</i> is the profile name of the configured WLAN.         |
| Step 3  | <b>client vlan vlan-id</b><br><b>Example:</b><br>Device(config-wlan)# <code>client vlan 0120</code>                     | Associate the client VLAN to the WLAN.                                                                             |
| Step 4  | <b>no security wpa</b><br><b>Example:</b><br>Device(config-wlan)# <code>no security wpa</code>                          | Disable WPA security.                                                                                              |
| Step 5  | <b>no security wpa akm dot1x</b><br><b>Example:</b><br>Device(config-wlan)# <code>no security wpa akm dot1x</code>      | Disable security AKM for dot1x.                                                                                    |
| Step 6  | <b>no security wpa wpa2</b><br><b>Example:</b><br>Device(config-wlan)# <code>no security wpa wpa2</code>                | Disables WPA2 security.                                                                                            |
| Step 7  | <b>no wpa wpa2 ciphers aes</b><br><b>Example:</b><br>Device(config-wlan)# <code>no security wpa wpa2 ciphers aes</code> | Disables WPA2 ciphers for AES.                                                                                     |
| Step 8  | <b>security ft</b><br><b>Example:</b><br>Device(config-wlan)# <code>security ft</code>                                  | Specifies the 802.11r fast transition parameters.                                                                  |
| Step 9  | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan)# <code>shutdown</code>                                     | Shutdown the WLAN.                                                                                                 |
| Step 10 | <b>end</b><br><b>Example:</b><br>Device(config-wlan)# <code>end</code>                                                  | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-z</b> to exit global configuration mode |

## Configuring 802.11r BSS Fast Transition on a Dot1x Security Enabled WLAN (CLI)

**SUMMARY STEPS**

1. **configure terminal**
2. **wlan *profile-name***
3. **client vlan *vlan-name***
4. **local-auth *local-auth-profile-eap***
5. **security dot1x authentication-list default**
6. **security ft**
7. **security wpa akm ft dot1x**
8. **no shutdown**
9. **end**

**DETAILED STEPS**

|               | Command or Action                                                                                                                              | Purpose                                                                                                           |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                              | Enters global configuration mode.                                                                                 |
| <b>Step 2</b> | <b>wlan <i>profile-name</i></b><br><b>Example:</b><br>Device# <b>wlan test4</b>                                                                | Enters the WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.        |
| <b>Step 3</b> | <b>client vlan <i>vlan-name</i></b><br><b>Example:</b><br>Device(config-wlan)# <b>client vlan 0120</b>                                         | Associate the client VLAN to this WLAN.                                                                           |
| <b>Step 4</b> | <b>local-auth <i>local-auth-profile-eap</i></b><br><b>Example:</b><br>Device(config-wlan)# <b>local-auth</b>                                   | Enable the local auth EAP profile.                                                                                |
| <b>Step 5</b> | <b>security dot1x authentication-list default</b><br><b>Example:</b><br>Device(config-wlan)# <b>security dot1x authentication-list default</b> | Enable security authentication list for dot1x security. The configuration is similar for any dot1x security WLAN. |

|        | Command or Action                                                                                            | Purpose                                                                                                            |
|--------|--------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>security ft</b><br><b>Example:</b><br>Device(config-wlan)# <b>security ft</b>                             | Enables 802.11r Fast Transition on this WLAN.                                                                      |
| Step 7 | <b>security wpa akm ft dot1x</b><br><b>Example:</b><br>Device(config-wlan)# <b>security wpa akm ft dot1x</b> | Enables 802.1x security on the WLAN.                                                                               |
| Step 8 | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan)# <b>no shutdown</b>                             | Enable the WLAN.                                                                                                   |
| Step 9 | <b>end</b><br><b>Example:</b><br>Device(config-wlan)# <b>end</b>                                             | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-z</b> to exit global configuration mode |

## Configuring 802.11r Fast Transition on a PSK Security Enabled WLAN (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **wlan *profile-name***
3. **client vlan *vlan-name***
4. **no security wpa akm dot1x**
5. **security wpa akm ft psk**
6. **security wpa akm psk set-key {ascii {0 | 8} | hex {0 | 8}}**
7. **security ft**
8. **no shutdown**
9. **end**

### DETAILED STEPS

|        | Command or Action                                                                 | Purpose                           |
|--------|-----------------------------------------------------------------------------------|-----------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters global configuration mode. |

|               | Command or Action                                                                                                                                                       | Purpose                                                                                                            |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>wlan</b> <i>profile-name</i><br><b>Example:</b><br>Device# <b>wlan test4</b>                                                                                         | Enters the WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.         |
| <b>Step 3</b> | <b>client vlan</b> <i>vlan-name</i><br><b>Example:</b><br>Device(config-wlan)# <b>client vlan 0120</b>                                                                  | Associates the client VLAN to this WLAN.                                                                           |
| <b>Step 4</b> | <b>no security wpa akm dot1x</b><br><b>Example:</b><br>Device(config-wlan)# <b>no security wpa akm dot1x</b>                                                            | Disables security AKM for dot1x.                                                                                   |
| <b>Step 5</b> | <b>security wpa akm ft psk</b><br><b>Example:</b><br>Device(config-wlan)# <b>security wpa akm ft psk</b>                                                                | Configures FT PSK support.                                                                                         |
| <b>Step 6</b> | <b>security wpa akm psk set-key</b> {ascii {0   8}   hex {0   8}}<br><b>Example:</b><br>Device(config-wlan)# <b>security wpa akm psk set-key</b><br><b>ascii 0 test</b> | Configures PSK AKM shared key.                                                                                     |
| <b>Step 7</b> | <b>security ft</b><br><b>Example:</b><br>Device(config-wlan)# <b>security ft</b>                                                                                        | Configures 802.11r Fast Transition.                                                                                |
| <b>Step 8</b> | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan)# <b>no shutdown</b>                                                                                        | Enables the WLAN.                                                                                                  |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Device(config-wlan)# <b>end</b>                                                                                                        | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-z</b> to exit global configuration mode |

## Monitoring 802.11r Fast Transition (CLI)

The following command can be used to monitor 802.11r Fast Transition:

| Command                                      | Description                                                  |
|----------------------------------------------|--------------------------------------------------------------|
| <code>show wlan name <i>wlan-name</i></code> | Displays a summary of the configured parameters on the WLAN. |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for Assisted Roaming

- The assisted roaming feature is supported across multiple devices.
- This feature is supported only on 802.11n capable indoor access points. For a single band configuration, a maximum of 6 neighbors are visible in a neighbor list. For dual band configuration, a maximum of 12 neighbors are visible.
- You can configure assisted roaming only using the device CLI.

# Information About Assisted Roaming

The 802.11k standard allows clients to request neighbor reports containing information about known neighbor access points that are candidates for a service set transition. The use of the 802.11k neighbor list can limit the need for active and passive scanning.

The assisted roaming feature is based on an intelligent and client optimized neighbor list.

Unlike the Cisco Client Extension (CCX) neighbor list, the 802.11k neighbor list is generated dynamically on-demand and is not maintained on the device. The 802.11k neighbor list is based on the location of the clients without requiring the mobility services engine (MSE). Two clients on the same device but different APs can have different neighbor lists delivered depending on their individual relationship with the surrounding APs.

By default, the neighbor list contains only neighbors in the same band with which the client is associated. However, a switch exists that allows 802.11k to return neighbors in both bands.

Clients send requests for neighbor lists only after associating with the APs that advertize the RRM (Radio Resource Management) capability information element (IE) in the beacon. The neighbor list includes information about BSSID, channel, and operation details of the neighboring radios.

## Assembling and Optimizing the Neighbor List

When the device receives a request for an 802.11k neighbor list, the following occurs:

1. The device searches the RRM neighbor table for a list of neighbors on the same band as the AP with which the client is currently associated with.
2. The device checks the neighbors according to the RSSI (Received Signal Strength Indication) between the APs, the current location of the present AP, the floor information of the neighboring AP from Cisco Prime Infrastructure, and roaming history information on the device to reduce the list of neighbors to six per band. The list is optimized for APs on the same floor.

## Assisted Roaming for Non-802.11k Clients

It is also possible to optimize roaming for non-802.11k clients. You can generate a prediction neighbor list for each client without the client requiring to send an 802.11k neighbor list request. When this is enabled on a WLAN, after each successful client association/reassociation, the same neighbor list optimization is applied on the non-802.11k client to generate the neighbor list and store the list in the mobile station software data structure. Clients at different locations have different lists because the client probes are seen with different RSSI values by different neighbors. Because clients usually probe before any association or reassociation, this list is constructed with the most updated probe data and predicts the next AP that the client is likely to roam to.

We discourage clients from roaming to those less desirable neighbors by denying association if the association request to an AP does not match the entries on the stored prediction neighbor list.

Similar to aggressive load balancing, there is a switch to turn on the assisted roaming feature both on a per-WLAN basis and globally. The following options are available:

- Denial count—Maximum number of times a client is refused association.
- Prediction threshold—Minimum number of entries required in the prediction list for the assisted roaming feature to be activated.

Because both load balancing and assisted roaming are designed to influence the AP that a client associates with, it is not possible to enable both the options at the same time on a WLAN.

3. **wlan *wlan-id***
4. **assisted-roaming neighbor-list**
5. **assisted-roaming dual-list**
6. **assisted-roaming prediction**
7. **wireless assisted-roaming prediction-minimum *count***
8. **wireless assisted-roaming denial-maximum *count***
9. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                           | Enters global configuration mode.                                                                                                                                                                               |
| <b>Step 2</b> | <b>wireless assisted-roaming floor-bias <i>dBm</i></b><br><br><b>Example:</b><br>Device(config)# <code>wireless assisted-roaming floor-bias 20</code> | Configures neighbor floor label bias. The valid range is from 5 to 25 dBm, and the default value is 15 dBm.                                                                                                     |
| <b>Step 3</b> | <b>wlan <i>wlan-id</i></b><br><br><b>Example:</b><br>Device(config)# <code>wlan wlan1</code>                                                          | Enters the WLAN configuration submode. The <i>wlan-name</i> is the profile name of the configured WLAN.                                                                                                         |
| <b>Step 4</b> | <b>assisted-roaming neighbor-list</b><br><br><b>Example:</b><br>Device(wlan)# <code>assisted-roaming neighbor-list</code>                             | Configures an 802.11k neighbor list for a WLAN. By default, assisted roaming is enabled on the neighbor list when you create a WLAN. The <b>no</b> form of the command disables assisted roaming neighbor list. |

|               | Command or Action                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                  |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>assisted-roaming dual-list</b><br><b>Example:</b><br>Device(wlan) # <b>assisted-roaming dual-list</b>                                    | Configures a dual-band 802.11k dual list for a WLAN. By default, assisted roaming is enabled on the dual list when you create a WLAN. The <b>no</b> form of the command disables assisted roaming dual list.                                                                                                             |
| <b>Step 6</b> | <b>assisted-roaming prediction</b><br><b>Example:</b><br>Device(wlan) # <b>assisted-roaming prediction</b>                                  | Configures assisted roaming prediction list feature for a WLAN. By default, the assisted roaming prediction list is disabled.<br><br><b>Note</b> A warning message is displayed and load balancing is disabled for the WLAN if load balancing is already enabled for the WLAN.                                           |
| <b>Step 7</b> | <b>wireless assisted-roaming prediction-minimum count</b><br><b>Example:</b><br>Device# <b>wireless assisted-roaming prediction-minimum</b> | Configures the minimum number of predicted APs required for the prediction list feature to be activated. The default value is 3.<br><br><b>Note</b> If the number of the AP in the prediction assigned to the client is less than the number that you specify, the assisted roaming feature will not apply on this roam. |
| <b>Step 8</b> | <b>wireless assisted-roaming denial-maximum count</b><br><b>Example:</b><br>Device# <b>wireless assisted-roaming denial-maximum 8</b>       | Configures the maximum number of times a client can be denied association if the association request is sent to an AP does not match any AP on the prediction. The valid range is from 1 to 10, and the default value is 5.                                                                                              |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Device(config) # <b>end</b>                                                                                | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                                                                                                                                      |

## Configuration Examples for Assisted Roaming

This example shows how to configure the neighbor floor label bias:

```
Device# configure terminal
Device(config)# wireless assisted-roaming floor-bias 10
Device(config)# end
Device# show wlan id 23
```

This example shows how to disable neighbor list on a specific WLAN:

```
Device# configure terminal
Device(config)# wlan test1
Device(config) (wlan)# no assisted-roaming neighbor-list
Device(config) (wlan)# end
Device# show wlan id 23
```

This example shows how to configure the prediction list on a specific WLAN:

```
Device# configure terminal
Device(config)# wlan test1
Device(config) (wlan)# assisted-roaming prediction
Device(config) (wlan)# end
Device# show wlan id 23
```

This example shows how to configure the prediction list based on assisted roaming prediction threshold and maximum denial count on a specific WLAN:

```
Device# configure terminal
Device(config)# wireless assisted-roaming prediction-minimum 4
Device(config)# wireless assisted-roaming denial-maximum 4
Device(config) (wlan)# end
Device# show wlan id 23
```

## CHAPTER 137

# Configuring Access Point Groups

- [Finding Feature Information, on page 2555](#)
- [Prerequisites for Configuring AP Groups, on page 2555](#)
- [Restrictions for Configuring Access Point Groups, on page 2556](#)
- [Information About Access Point Groups, on page 2556](#)
- [How to Configure Access Point Groups, on page 2557](#)
- [Additional References, on page 2559](#)
- [Feature History and Information for Access Point Groups, on page 2560](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring AP Groups

The following are the prerequisites for creating access point groups on a device:

- The required access control list (ACL) must be defined on the router that serves the VLAN or subnet.
- Multicast traffic is supported with access point group VLANs. However, if the client roams from one access point to another, the client might stop receiving multicast traffic, unless IGMP snooping is enabled.

### Related Topics

[Information About Access Point Groups, on page 2556](#)

[Restrictions for Configuring Access Point Groups, on page 2556](#)

## Restrictions for Configuring Access Point Groups

- Suppose that the interface mapping for a WLAN in the AP group table is the same as the WLAN interface. If the WLAN interface is changed, the interface mapping for the WLAN in the AP group table also changes to the new WLAN interface.  
  
Suppose that the interface mapping for a WLAN in the AP group table is different from the one defined for the WLAN. If the WLAN interface is changed, then the interface mapping for the WLAN in the AP group table does not change to the new WLAN interface.
- If you clear the configuration on the device, all of the access point groups disappear except for the default access point group “default-group,” which is created automatically.
- The default access point group can have up to 16 WLANs associated with it. The WLAN IDs for the default access point group must be less than or equal to 16. If a WLAN with an ID greater than 16 is created in the default access point group, the WLAN SSID will not be broadcasted. All WLAN IDs in the default access point group must have an ID that is less than or equal to 16. WLANs with IDs greater than 16 can be assigned to custom access point groups.
- We recommend that you configure all Flex+Bridge APs in a mesh tree (in the same sector) in the same AP group and the same FlexConnect group, to inherit the WLAN-VLAN mappings properly.

## Information About Access Point Groups

After you create up to 512 WLANs on the device, you can selectively publish them (using access point groups) to different access points to better manage your wireless network. In a typical deployment, all users on a WLAN are mapped to a single interface on the device. Therefore, all users that are associated with that WLAN are on the same subnet or VLAN. However, you can choose to distribute the load among several interfaces or to a group of users based on specific criteria such as individual departments (such as Marketing) by creating access point groups. Additionally, these access point groups can be configured in separate VLANs to simplify network administration.

# How to Configure Access Point Groups

## Creating Access Point Groups

### Before you begin

You must have administrator privileges to perform this operation.

### SUMMARY STEPS

1. **configure terminal**
2. **ap group** *ap-group-name*
3. **wlan** *wlan-name*
4. (Optional) **vlan** *vlan-name*
5. **end**

### DETAILED STEPS

|        | Command or Action                                                                                           | Purpose                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                           | Enters global configuration mode.                                                                                   |
| Step 2 | <b>ap group</b> <i>ap-group-name</i><br><b>Example:</b><br>Device(config)# <b>ap group my-ap-group</b>      | Creates an access point group.                                                                                      |
| Step 3 | <b>wlan</b> <i>wlan-name</i><br><b>Example:</b><br>Device(config-apgroup)# <b>wlan wlan-name</b>            | Associates the AP group to a WLAN.                                                                                  |
| Step 4 | (Optional) <b>vlan</b> <i>vlan-name</i><br><b>Example:</b><br>Device(config-apgroup)# <b>vlan test-vlan</b> | Assigns the access point group to a VLAN.                                                                           |
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                 | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

### Example

This example shows how to create an AP group:

```
Device# configure terminal
Device(config-apgroup)# ap group test-ap-group-16
Device(config-wlan-apgroup)# wlan test-ap-group-16
Device(config-wlan-apgroup)# vlan VLAN1300
```
