## CONTENTS

---

### PREFACE

#### **Preface** **xcv**

Document Conventions **xcv**

Related Documentation **xcvii**

Obtaining Documentation and Submitting a Service Request **xcvii**

---

### CHAPTER 1

#### **Using the Command-Line Interface** **1**

Information About Using the Command-Line Interface **1**

Command Modes **1**

Understanding Abbreviated Commands **3**

No and Default Forms of Commands **4**

CLI Error Messages **4**

Configuration Logging **4**

Using the Help System **5**

How to Use the CLI to Configure Features **6**

Configuring the Command History **6**

Changing the Command History Buffer Size **6**

Recalling Commands **6**

Disabling the Command History Feature **7**

Enabling and Disabling Editing Features **7**

Editing Commands Through Keystrokes **7**

Editing Command Lines That Wrap **8**

Searching and Filtering Output of show and more Commands **9**

Accessing the CLI on a Switch Stack **10**

Accessing the CLI Through a Console Connection or Through Telnet **10**

---

### CHAPTER 2

#### **Using the Web Graphical User Interface** **13**

Prerequisites for Using the Web GUI 13

Information About Using The Web GUI 14

    Web GUI Features 14

Connecting the Console Port of the Switch 15

Logging On to the GUI 15

Enabling Web and Secure Web Modes 16

Configuring the Switch Web GUI 16

---

**PART I**

**CleanAir 21**

---

**CHAPTER 3**

**Configuring Cisco CleanAir 23**

Finding Feature Information 23

Prerequisites for CleanAir 23

Restrictions for CleanAir 24

Information About CleanAir 25

    Cisco CleanAir Components 25

    Terms Used in Cisco CleanAir 27

    Interference Types that Cisco CleanAir can Detect 27

    Interference Device Merging 28

    Persistent Devices 29

        Persistent Devices Detection 29

        Persistent Device Avoidance 29

    EDRRM and AQR Update Mode 29

    CleanAir High Availability 29

How to Configure CleanAir 30

    Enabling CleanAir for 2.4-GHz Band 30

    Configuring a CleanAir Alarm for 2.4-GHz Air-Quality and Devices 30

    Configuring Interference Reporting for 2.4-GHz Devices 32

    Enabling CleanAir for 5-GHz Band 33

    Configuring a CleanAir Alarm for 5-GHz Air-Quality and Devices 34

    Configuring Interference Reporting for 5-GHz devices 35

    Configuring EDRRM for CleanAir-Events 36

    Configuring Persistent Device Avoidance 37

    Configuring Cisco CleanAir using the Controller GUI 38

Configuring Cisco CleanAir on the Cisco Wireless LAN Controller (GUI)	38
Configuring Cisco CleanAir on an Access Point (GUI)	40
Configuring Cisco Spectrum Expert	40
Configuring Spectrum Expert (GUI)	40
Configuring Spectrum Expert (CLI)	41
Monitoring CleanAir Parameters	43
Monitoring the Interference Devices	45
Monitoring the Interference Devices (GUI)	46
Monitoring the Worst Air Quality of Radio Bands (GUI)	46
Configuration Examples for Configuring CleanAir	47
CleanAir FAQs	48
Additional References	49

---

**PART II**
**Interface and Hardware Component 51**

---

**CHAPTER 4**
**Configuring Interface Characteristics 53**

Finding Feature Information	53
Information About Configuring Interface Characteristics	53
Interface Types	53
Port-Based VLANs	54
Switch Ports	54
Routed Ports	55
Switch Virtual Interfaces	56
EtherChannel Port Groups	57
Power over Ethernet Ports	57
Using the Switch USB Ports	57
USB Mini-Type B Console Port	57
Interface Connections	58
Default Ethernet Interface Configuration	59
Interface Speed and Duplex Mode	60
Speed and Duplex Configuration Guidelines	60
IEEE 802.3x Flow Control	61
Layer 3 Interfaces	62
How to Configure Interface Characteristics	63

Configuring Interfaces	63
Adding a Description for an Interface	64
Configuring a Range of Interfaces	65
Configuring and Using Interface Range Macros	66
Configuring Ethernet Interfaces	68
Setting the Interface Speed and Duplex Parameters	68
Configuring IEEE 802.3x Flow Control	69
Configuring Layer 3 Interfaces	70
Configuring Logical Layer 3 GRE Tunnel Interfaces	71
Configuring SVI Autostate Exclude	73
Shutting Down and Restarting the Interface	74
Configuring the Console Media Type	75
Configuring the USB Inactivity Timeout	76
Monitoring Interface Characteristics	77
Monitoring Interface Status	77
Clearing and Resetting Interfaces and Counters	78
Configuration Examples for Interface Characteristics	78
Adding a Description to an Interface: Example	78
Configuring a Range of Interfaces: Examples	78
Configuring and Using Interface Range Macros: Examples	79
Setting Interface Speed and Duplex Mode: Example	79
Configuring Layer 3 Interfaces: Example	80
Configuring the Console Media Type: Example	80
Configuring the USB Inactivity Timeout: Example	80
Additional References for the Interface Characteristics Feature	81
Feature History and Information for Configuring Interface Characteristics	82

**CHAPTER 5****Configuring Auto-MDIX 83**

Prerequisites for Auto-MDIX	83
Restrictions for Auto-MDIX	83
Information about Configuring Auto-MDIX	84
Auto-MDIX on an Interface	84
How to Configure Auto-MDIX	84
Configuring Auto-MDIX on an Interface	84

Example for Configuring Auto-MDIX	85
Additional References	86
Feature History and Information for Auto-MDIX	86

**CHAPTER 6****Configuring Ethernet Management Port 87**

Finding Feature Information	87
Prerequisites for Ethernet Management Ports	87
Information about the Ethernet Management Port	87
Ethernet Management Port Direct Connection to a Switch	88
Ethernet Management Port Connection to Stack Switches using a Hub	88
Ethernet Management Port and Routing	88
Supported Features on the Ethernet Management Port	89
How to Configure the Ethernet Management Port	90
Disabling and Enabling the Ethernet Management Port	90
Additional References	91
Feature Information for Ethernet Management Ports	92

**CHAPTER 7****Configuring LLDP, LLDP-MED, and Wired Location Service 93**

Finding Feature Information	93
LLDP, LLDP-MED, and Wired Location Service Overview	93
LLDP	93
LLDP Supported TLVs	94
LLDP and Cisco Switch Stacks	94
LLDP and Cisco Medianet	94
LLDP-MED	94
LLDP-MED Supported TLVs	94
Wired Location Service	96
Default LLDP Configuration	97
Restrictions for LLDP	97
How to Configure LLDP, LLDP-MED, and Wired Location Service	98
Enabling LLDP	98
Configuring LLDP Characteristics	99
Configuring LLDP-MED TLVs	101
Configuring Network-Policy TLV	102

- Configuring Location TLV and Wired Location Service 104
  - Enabling Wired Location Service on the Switch 106
- Configuration Examples for LLDP, LLDP-MED, and Wired Location Service 108
  - Configuring Network-Policy TLV: Examples 108
- Monitoring and Maintaining LLDP, LLDP-MED, and Wired Location Service 108
- Additional References for LLDP, LLDP-MED, and Wired Location Service 109
- Feature Information for LLDP, LLDP-MED, and Wired Location Service 110

---

**CHAPTER 8**

**Configuring System MTU 111**

- Configuring System MTU 111
  - Finding Feature Information 111
  - Information about the MTU 111
    - Restrictions for System MTU 111
    - System MTU Value Application 111
- Configuring the System MTU 112
  - Configuring the System MTU 112
  - Configuring Protocol-Specific MTU 112
- Configuration Examples for System MTU 113
  - Example: Configuring the System MTU 113
  - Example: Configuring Protocol-Specific MTU 113
- Additional References for System MTU 114
- Feature Information for System MTU 114

---

**CHAPTER 9**

**Configuring Internal Power Supplies 115**

- Information About Internal Power Supplies 115
- How to Configure Internal Power Supplies 115
  - Configuring Internal Power Supply 115
- Monitoring Internal Power Supplies 116
- Configuration Examples for Internal Power Supplies 116
- Additional References 117
- Feature History and Information for Internal Power Supplies 118

---

**CHAPTER 10**

**Configuring PoE 119**

- Finding Feature Information 119

Information about PoE	119
Power over Ethernet Ports	119
Supported Protocols and Standards	119
Powered-Device Detection and Initial Power Allocation	120
Power Management Modes	121
Cisco Universal Power Over Ethernet	124
How to Configure PoE	124
Configuring a Power Management Mode on a PoE Port	124
Enabling Power on Signal/Spare Pairs	126
Configuring Power Policing	126
Monitoring Power Status	129
Additional References	129
Feature Information for PoE	130

**CHAPTER 11****Configuring EEE 131**

Finding Feature Information	131
Information About EEE	131
EEE Overview	131
Default EEE Configuration	132
Restrictions for EEE	132
How to Configure EEE	132
Enabling or Disabling EEE	132
Monitoring EEE	133
Configuration Examples for Configuring EEE	133
Additional References	134
Feature History and Information for Configuring EEE	134

**PART III****IPv6 135****CHAPTER 12****Configuring MLD Snooping 137**

Finding Feature Information	137
Information About Configuring IPv6 MLD Snooping	137
Understanding MLD Snooping	138
MLD Messages	139

MLD Queries	139
Multicast Client Aging Robustness	140
Multicast Router Discovery	140
MLD Reports	140
MLD Done Messages and Immediate-Leave	140
Topology Change Notification Processing	141
MLD Snooping in Switch Stacks	141
How to Configure IPv6 MLD Snooping	142
Default MLD Snooping Configuration	142
MLD Snooping Configuration Guidelines	142
Enabling or Disabling MLD Snooping on the Switch (CLI)	143
Enabling or Disabling MLD Snooping on a VLAN (CLI)	144
Configuring a Static Multicast Group (CLI)	144
Configuring a Multicast Router Port (CLI)	145
Enabling MLD Immediate Leave (CLI)	146
Configuring MLD Snooping Queries (CLI)	147
Disabling MLD Listener Message Suppression (CLI)	148
Displaying MLD Snooping Information	149
Configuration Examples for Configuring MLD Snooping	150
Configuring a Static Multicast Group: Example	150
Configuring a Multicast Router Port: Example	150
Enabling MLD Immediate Leave: Example	151
Configuring MLD Snooping Queries: Example	151

---

**CHAPTER 13**

<b>Configuring IPv6 Unicast Routing</b>	<b>153</b>
Finding Feature Information	153
Information About Configuring IPv6 Unicast Routing	153
Understanding IPv6	153
IPv6 Addresses	154
Supported IPv6 Unicast Routing Features	154
Unsupported IPv6 Unicast Routing Features	159
IPv6 Feature Limitations	159
IPv6 and Switch Stacks	160
Default IPv6 Configuration	161

Configuring IPv6 Addressing and Enabling IPv6 Routing (CLI)	161
Configuring IPv4 and IPv6 Protocol Stacks (CLI)	164
Configuring Default Router Preference (CLI)	166
Configuring IPv6 ICMP Rate Limiting (CLI)	167
Configuring CEF and dCEF for IPv6	168
Configuring Static Routing for IPv6 (CLI)	168
Configuring RIP for IPv6 (CLI)	171
Configuring OSPF for IPv6 (CLI)	173
Configuring EIGRP for IPv6	175
Configuring IPv6 Unicast Reverse Path Forwarding	175
Displaying IPv6	176
Configuring DHCP for IPv6 Address Assignment	177
Default DHCPv6 Address Assignment Configuration	177
DHCPv6 Address Assignment Configuration Guidelines	177
Enabling DHCPv6 Server Function (CLI)	177
Enabling DHCPv6 Client Function (CLI)	180
Configuration Examples for IPv6 Unicast Routing	181
Configuring IPv6 Addressing and Enabling IPv6 Routing: Example	181
Configuring Default Router Preference: Example	182
Configuring IPv4 and IPv6 Protocol Stacks: Example	182
Enabling DHCPv6 Server Function: Example	182
Enabling DHCPv6 Client Function: Example	183
Configuring IPv6 ICMP Rate Limiting: Example	183
Configuring Static Routing for IPv6: Example	183
Configuring RIP for IPv6: Example	183
Displaying IPv6: Example	183
<b>CHAPTER 14</b>	
<b>Implementing IPv6 Multicast</b>	<b>185</b>
Finding Feature Information	185
Information About Implementing IPv6 Multicast Routing	185
IPv6 Multicast Overview	185
IPv6 Multicast Routing Implementation	186
IPv6 Multicast Listener Discovery Protocol	186
Multicast Queriers and Hosts	186

MLD Access Group	187
Explicit Tracking of Receivers	187
Protocol Independent Multicast	187
PIM-Sparse Mode	187
IPv6 BSR: Configure RP Mapping	188
PIM-Source Specific Multicast	188
Routable Address Hello Option	189
PIM IPv6 Stub Routing	189
Static Mroutes	190
MRIB	190
MFIB	190
MFIB	191
IPv6 Multicast Process Switching and Fast Switching	191
Multiprotocol BGP for the IPv6 Multicast Address Family	192
Implementing IPv6 Multicast	192
Enabling IPv6 Multicast Routing	192
Customizing and Verifying the MLD Protocol	193
Customizing and Verifying MLD on an Interface	193
Implementing MLD Group Limits	194
Configuring Explicit Tracking of Receivers to Track Host Behavior	196
Resetting the MLD Traffic Counters	196
Clearing the MLD Interface Counters	197
Configuring PIM	197
Configuring PIM-SM and Displaying PIM-SM Information for a Group Range	197
Configuring PIM Options	198
Resetting the PIM Traffic Counters	200
Clearing the PIM Topology Table to Reset the MRIB Connection	200
Configuring PIM IPv6 Stub Routing	202
PIM IPv6 Stub Routing Configuration Guidelines	202
Default IPv6 PIM Routing Configuration	202
Enabling IPV6 PIM Stub Routing	203
Monitoring IPv6 PIM Stub Routing	204
Configuring a BSR	205
Configuring a BSR and Verifying BSR Information	205

Sending PIM RP Advertisements to the BSR	206
Configuring BSR for Use Within Scoped Zones	206
Configuring BSR Switches to Announce Scope-to-RP Mappings	207
Configuring SSM Mapping	208
Configuring Static Mroutes	209
Using MFIB in IPv6 Multicast	210
Verifying MFIB Operation in IPv6 Multicast	210
Resetting MFIB Traffic Counters	211

**CHAPTER 15**

<b>Configuring IPv6 Client IP Address Learning</b>	<b>213</b>
Prerequisites for IPv6 Client Address Learning	213
Information About IPv6 Client Address Learning	213
SLAAC Address Assignment	214
Stateful DHCPv6 Address Assignment	215
Static IP Address Assignment	216
Router Solicitation	216
Router Advertisement	216
Neighbor Discovery	217
Neighbor Discovery Suppression	217
RA Guard	217
RA Throttling	218
Configuring IPv6 Unicast (CLI)	218
Configuring RA Guard Policy (CLI)	219
Applying RA Guard Policy (CLI)	220
Configuring RA Throttle Policy (CLI)	221
Applying RA Throttle Policy on VLAN (CLI)	222
Configuring IPv6 Snooping (CLI)	222
Configuring IPv6 ND Suppress Policy (CLI)	223
Configuring IPv6 Snooping on VLAN/PortChannel	224
Configuring IPv6 on Switch (CLI)	225
Configuring DHCP Pool (CLI)	225
Configuring Stateless Auto Address Configuration Without DHCP (CLI)	226
Configuring Stateless Auto Address Configuration With DHCP (CLI)	227
Configuring Stateful DHCP Locally (CLI)	228

Configuring Stateful DHCP Externally (CLI)	230
Monitoring IPv6 Clients (GUI)	232
Verifying IPv6 Address Learning Configuration	232
Additional References	233
Feature Information for IPv6 Client Address Learning	234

**CHAPTER 16****Configuring IPv6 WLAN Security 235**

Prerequisites for IPv6 WLAN Security	235
Restrictions for IPv6 WLAN Security	235
Information About IPv6 WLAN Security	235
How to Configure IPv6 WLAN Security	238
Configuring Local Authentication	238
Creating a Local User	238
Creating a Client VLAN and Interface	238
Configuring a EAP Profile	239
Creating a Local Authentication Model	242
Creating a Client WLAN	243
Configuring Local Authentication with WPA2+AES	244
Configuring External RADIUS Server	248
Configuring RADIUS Authentication Server Host	248
Configuring RADIUS Authentication Server Group	249
Creating a Client VLAN	250
Creating 802.1x WLAN Using an External RADIUS Server	251
Additional References	252
Feature Information for IPv6 WLAN Security	253

**CHAPTER 17****Configuring IPv6 ACL 255**

Prerequisites for IPv6 ACL	255
Restrictions for IPv6 ACL	255
Information About IPv6 ACL	256
Understanding IPv6 ACLs	256
Types of ACL	257
Per User IPv6 ACL	257
Filter ID IPv6 ACL	257

Downloadable IPv6 ACL	257
IPv6 ACLs and Switch Stacks	258
Configuring IPv6 ACLs	258
Default IPv6 ACL Configuration	258
Interaction with Other Features and Switches	258
How To Configure an IPv6 ACL	259
Creating IPv6 ACL	259
Applying an IPv6 to an Interface	263
Creating WLAN IPv6 ACL	264
Verifying IPv6 ACL	265
Displaying IPv6 ACLs	265
Configuration Examples for IPv6 ACL	265
Example: Creating IPv6 ACL	265
Example: Applying IPv6 ACLs	266
Example: Displaying IPv6 ACLs	266
Example: Configuring RA Throttling and NS Suppression	266
Example: Configuring RA Guard Policy	267
Example: Configuring IPv6 Neighbor Binding	269
Additional References	269
Feature Information for IPv6 ACLs	270

---

**CHAPTER 18**

<b>Configuring IPv6 Web Authentication</b>	<b>271</b>
Prerequisites for IPv6 Web Authentication	271
Restrictions for IPv6 Web Authentication	271
Information About IPv6 Web Authentication	272
Web Authentication Process	272
How to Configure IPv6 Web Authentication	273
Disabling WPA	273
Enabling Security on the WLAN	274
Enabling a Parameter Map on the WLAN	274
Enabling Authentication List on WLAN	275
Configuring a Global WebAuth WLAN Parameter Map	275
Configuring the WLAN	276
Enabling IPv6 in Global Configuration Mode	277

Verifying IPv6 Web Authentication 278

    Verifying the Parameter Map 278

    Verifying Authentication List 278

Additional References 279

Feature Information for IPv6 Web Authentication 280

---

CHAPTER 19

**Configuring IPv6 Client Mobility 281**

    Prerequisites for IPv6 Client Mobility 281

    Restrictions For IPv6 Client Mobility 281

    Information About IPv6 Client Mobility 282

        Using Router Advertisement 282

        RA Throttling and NS suppression 283

        IPv6 Address Learning 284

        Handling Multiple IP Addresses 284

        IPv6 Configuration 284

        High Availability 285

    Verifying IPv6 Client Mobility 285

    Monitoring IPv6 Client Mobility 285

    Additional References 286

    Feature Information For IPv6 Client Mobility 287

---

CHAPTER 20

**Configuring IPv6 Mobility 289**

    Pre-requisites for IPv6 Mobility 289

    Information About IPv6 Mobility 289

        Inter Controller Roaming 289

        Intra Subnet Roaming with Sticky Anchoring, and Inter Subnet Roaming 290

    How to Configure IPv6 Mobility 290

    Monitoring IPv6 Mobility 290

    Additional References 292

    Feature Information for IPv6 Mobility 293

---

PART IV

**IP 295**

---

CHAPTER 21

**Configuring HSRP 297**

Configuring HSRP	297
Finding Feature Information	297
Information About Configuring HSRP	297
HSRP Overview	297
HSRP Versions	299
Multiple HSRP	300
SSO HSRP	300
HSRP and Switch Stacks	301
Configuring HSRP for IPv6	301
How to Configure HSRP	301
Default HSRP Configuration	301
HSRP Configuration Guidelines	301
Enabling HSRP	302
Configuring HSRP Priority	304
Configuring MHSRP	306
Configuring HSRP Authentication and Timers	312
Enabling HSRP Support for ICMP Redirect Messages	314
Configuring HSRP Groups and Clustering	314
Verifying HSRP	314
Verifying HSRP Configurations	314
Configuration Examples for Configuring HSRP	315
Enabling HSRP: Example	315
Configuring HSRP Priority: Example	315
Configuring MHSRP: Example	315
Configuring HSRP Authentication and Timer: Example	316
Configuring HSRP Groups and Clustering: Example	316
Additional References for Configuring HSRP	316
Feature Information for Configuring HSRP	317

---

**PART V**
**Layer 2/3 319**

---

**CHAPTER 22**
**Configuring Spanning Tree Protocol 321**

Finding Feature Information	321
Restrictions for STP	321

Information About Spanning Tree Protocol	322
Spanning Tree Protocol	322
Spanning-Tree Topology and BPDUs	323
Bridge ID, Device Priority, and Extended System ID	324
Port Priority Versus Path Cost	325
Spanning-Tree Interface States	326
How a Switch or Port Becomes the Root Switch or Root Port	329
Spanning Tree and Redundant Connectivity	329
Spanning-Tree Address Management	330
Accelerated Aging to Retain Connectivity	330
Spanning-Tree Modes and Protocols	330
Supported Spanning-Tree Instances	331
Spanning-Tree Interoperability and Backward Compatibility	331
STP and IEEE 802.1Q Trunks	332
Spanning Tree and Switch Stacks	332
Default Spanning-Tree Configuration	333
How to Configure Spanning-Tree Features	334
Changing the Spanning-Tree Mode (CLI)	334
Disabling Spanning Tree (CLI)	335
Configuring the Root Switch (CLI)	336
Configuring a Secondary Root Device (CLI)	337
Configuring Port Priority (CLI)	338
Configuring Path Cost (CLI)	339
Configuring the Device Priority of a VLAN (CLI)	341
Configuring the Hello Time (CLI)	342
Configuring the Forwarding-Delay Time for a VLAN (CLI)	342
Configuring the Maximum-Aging Time for a VLAN (CLI)	343
Configuring the Transmit Hold-Count (CLI)	344
Monitoring Spanning-Tree Status	345
Additional References for Spanning-Tree Protocol	346
Feature Information for STP	347
<b>CHAPTER 23</b>	<b>Configuring Multiple Spanning-Tree Protocol</b>
	349
	Finding Feature Information
	349

Prerequisites for MSTP	349
Restrictions for MSTP	350
Information About MSTP	351
MSTP Configuration	351
MSTP Configuration Guidelines	351
Root Switch	352
Multiple Spanning-Tree Regions	353
IST, CIST, and CST	353
Operations Within an MST Region	354
Operations Between MST Regions	354
IEEE 802.1s Terminology	355
Illustration of MST Regions	355
Hop Count	356
Boundary Ports	357
IEEE 802.1s Implementation	357
Port Role Naming Change	357
Interoperation Between Legacy and Standard Switches	358
Detecting Unidirectional Link Failure	358
MSTP and Switch Stacks	359
Interoperability with IEEE 802.1D STP	359
RSTP Overview	359
Port Roles and the Active Topology	360
Rapid Convergence	360
Synchronization of Port Roles	362
Bridge Protocol Data Unit Format and Processing	363
Topology Changes	364
Protocol Migration Process	365
Default MSTP Configuration	365
How to Configure MSTP Features	366
Specifying the MST Region Configuration and Enabling MSTP (CLI)	366
Configuring the Root Switch (CLI)	368
Configuring a Secondary Root Switch (CLI)	369
Configuring Port Priority (CLI)	371
Configuring Path Cost (CLI)	372

Configuring the Switch Priority (CLI)	373
Configuring the Hello Time (CLI)	375
Configuring the Forwarding-Delay Time (CLI)	376
Configuring the Maximum-Aging Time (CLI)	376
Configuring the Maximum-Hop Count (CLI)	377
Specifying the Link Type to Ensure Rapid Transitions (CLI)	378
Designating the Neighbor Type (CLI)	379
Restarting the Protocol Migration Process (CLI)	380
Additional References for MSTP	381
Feature Information for MSTP	382

---

**CHAPTER 24**
**Configuring Optional Spanning-Tree Features 383**

Finding Feature Information	383
Restriction for Optional Spanning-Tree Features	383
Information About Optional Spanning-Tree Features	384
PortFast	384
BPDU Guard	384
BPDU Filtering	385
UplinkFast	385
Cross-Stack UplinkFast	387
How Cross-Stack UplinkFast Works	388
Events That Cause Fast Convergence	389
BackboneFast	390
EtherChannel Guard	392
Root Guard	392
Loop Guard	393
How to Configure Optional Spanning-Tree Features	394
Enabling PortFast (CLI)	394
Enabling BPDU Guard (CLI)	395
Enabling BPDU Filtering (CLI)	396
Enabling UplinkFast for Use with Redundant Links (CLI)	398
Disabling UplinkFast (CLI)	399
Enabling BackboneFast (CLI)	400
Enabling EtherChannel Guard (CLI)	401

Enabling Root Guard (CLI)	402
Enabling Loop Guard (CLI)	403
Monitoring the Spanning-Tree Status	404
Additional References for Optional Spanning Tree Features	405
Feature Information for Optional Spanning-Tree Features	406

---

**CHAPTER 25**
**Configuring EtherChannels 407**

Finding Feature Information	407
Restrictions for EtherChannels	407
Information About EtherChannels	408
EtherChannel Overview	408
EtherChannel Modes	409
EtherChannel on Switches	409
EtherChannel Link Failover	411
Channel Groups and Port-Channel Interfaces	411
Port Aggregation Protocol	412
PAgP Modes	412
PAgP Learn Method and Priority	413
PAgP Interaction with Other Features	414
Link Aggregation Control Protocol	414
LACP Modes	415
LACP and Link Redundancy	415
LACP Interaction with Other Features	416
EtherChannel On Mode	416
Load-Balancing and Forwarding Methods	416
MAC Address Forwarding	417
IP Address Forwarding	417
Load-Balancing Advantages	418
EtherChannel and Switch Stacks	419
Switch Stack and PAgP	419
Switch Stacks and LACP	420
Default EtherChannel Configuration	420
EtherChannel Configuration Guidelines	421
Layer 2 EtherChannel Configuration Guidelines	422

Layer 3 EtherChannel Configuration Guidelines	423
Auto-LAG	423
Auto-LAG Configuration Guidelines	424
How to Configure EtherChannels	425
Configuring Layer 2 EtherChannels (CLI)	425
Configuring Layer 3 EtherChannels (CLI)	427
Configuring EtherChannel Load-Balancing (CLI)	429
Configuring EtherChannel Extended Load-Balancing (CLI)	431
Configuring the PAgP Learn Method and Priority (CLI)	432
Configuring LACP Hot-Standby Ports	433
Configuring the LACP Max Bundle Feature (CLI)	434
Configuring LACP Port-Channel Standalone Disable	434
Configuring the LACP Port Channel Min-Links Feature (CLI)	435
Configuring the LACP System Priority (CLI)	436
Configuring the LACP Port Priority (CLI)	437
Configuring Auto-LAG Globally	439
Configuring Auto-LAG on a Port Interface	440
Configuring Persistence with Auto-LAG	441
Monitoring EtherChannel, PAgP, and LACP Status	441
Configuration Examples for Configuring EtherChannels	442
Configuring Layer 2 EtherChannels: Examples	442
Configuring Layer 3 EtherChannels: Examples	443
Configuring LACP Hot-Standby Ports: Example	444
Configuring Auto LAG: Examples	444
Additional References for EtherChannels	446
Feature Information for EtherChannels	446

**CHAPTER 26****Configuring Flex Links and the MAC Address-Table Move Update Feature 449**

Finding Feature Information	449
Restrictions for Configuring Flex Links and MAC Address-Table Move Update	449
Information About Flex Links and MAC Address-Table Move Update	450
Flex Links	450
Flex Links Configuration	451
VLAN Flex Links Load Balancing and Support	451

Multicast Fast Convergence with Flex Links Failover	452
Learning the Other Flex Links Port as the mrouter Port	452
Generating IGMP Reports	453
Leaking IGMP Reports	453
MAC Address-Table Move Update	453
Flex Links VLAN Load Balancing Configuration Guidelines	455
MAC Address-Table Move Update Configuration Guidelines	456
Default Flex Links and MAC Address-Table Move Update Configuration	456
How to Configure Flex Links and the MAC Address-Table Move Update Feature	456
Configuring Flex Links (CLI)	456
Configuring a Preemption Scheme for a Pair of Flex Links (CLI)	457
Configuring VLAN Load Balancing on Flex Links (CLI)	459
Configuring MAC Address-Table Move Update (CLI)	460
Configuring a Switch to Obtain and Process MAC Address-Table Move Update Messages (CLI)	461
Monitoring Flex Links, Multicast Fast Convergence, and MAC Address-Table Move Update	462
Configuration Examples for Flex Links	462
Configuring Flex Links: Examples	462
Configuring VLAN Load Balancing on Flex Links: Examples	463
Configuring the MAC Address-Table Move Update: Examples	464
Configuring Multicast Fast Convergence with Flex Links Failover: Examples	465
Additional References for Flex Links and MAC Address-Table Move Update	467
Feature Information for Flex Links and MAC Address-Table Move Update	468

---

**CHAPTER 27**
**Configuring UniDirectional Link Detection** 469

Finding Feature Information	469
Restrictions for Configuring UDLD	469
Information About UDLD	470
Modes of Operation	470
Normal Mode	470
Aggressive Mode	470
Methods to Detect Unidirectional Links	471
Neighbor Database Maintenance	471
Event-Driven Detection and Echoing	471

- UDLD Reset Options 472
- Default UDLD Configuration 472
- How to Configure UDLD 472
  - Enabling UDLD Globally (CLI) 472
  - Enabling UDLD on an Interface (CLI) 474
- Monitoring and Maintaining UDLD 475
- Additional References for UDLD 475
- Feature Information for UDLD 476

---

**PART VI**

**Lightweight Access Point 477**

---

**CHAPTER 28**

**Configuring the Switch for Access Point Discovery 479**

- Finding Feature Information 479
- Prerequisites for Configuring the Switch for Access Point Discovery 479
- Restrictions for Configuring the Switch for Access Point Discovery 480
- Information About Configuring the Switch for Access Point Discovery 480
  - Access Point Communication Protocols 481
  - Viewing Access Point Join Information 481
  - Troubleshooting the Access Point Join Process 481
- How to Configure Access Point Discovery 482
  - Configuring the Syslog Server for Access Points (GUI) 482
  - Configuring the Syslog Server for Access Points (CLI) 482
  - Monitoring Access Point Join Information (CLI) 483
  - Searching for Access Point Radios (GUI) 484
  - Monitoring the Interface Details (GUI) 484
- Configuration Examples for Configuring the Switch for Access Point Discovery 484
  - Displaying the MAC Addresses of all Access Points: Example 484
  - DHCP Option 43 for Lightweight Cisco Aironet Access Points Configuration Example 486
- Configuring AP Pass Through 486
  - Information About AP Pass Through 486
  - Configuring AP Pass Through 486

---

**CHAPTER 29**

**Configuring Data Encryption 489**

- Finding Feature Information 489

Prerequisites for Configuring Data Encryption	489
Restrictions for Configuring Data Encryption	489
Information About Data Encryption	490
How to Configure Data Encryption	490
Configuring Data Encryption (CLI)	490
Configuring Data Encryption (GUI)	491
Configuration Examples for Configuring Data Encryption	491
Displaying Data Encryption States for all Access Points: Examples	491

**CHAPTER 30****Configuring Retransmission Interval and Retry Count 493**

Finding Feature Information	493
Prerequisites for Configuring the Access Point Retransmission Interval and Retry Count	493
Information About Retransmission Interval and Retry Count	494
How to Configure Access Point Retransmission Interval and Retry Count	494
Configuring the Access Point Retransmission Interval and Retry Count (CLI)	494
Configuring the Access Point Retransmission Interval and Retry Count (GUI)	495
Viewing CAPWAP Maximum Transmission Unit Information (CLI)	496
Viewing CAPWAP Maximum Transmission Unit Information (GUI)	496
Configuration Examples for Configuring Access Point Retransmission Interval and Retry Count	497
Viewing the CAPWAP Retransmission Details: Example	497
Viewing Maximum Transmission Unit Information: Example	497

**CHAPTER 31****Configuring Adaptive Wireless Intrusion Prevention System 499**

Finding Feature Information	499
Prerequisites for Configuring wIPS	499
How to Configure wIPS on Access Points	500
Configuring wIPS on an Access Point (CLI)	500
Configuring wIPS on an Access Point (GUI)	501
Monitoring wIPS Information	502
Configuration Examples for Configuring wIPS on Access Points	502
Displaying the Monitor Configuration Channel Set: Example	502
Displaying wIPS Information: Examples	503

**CHAPTER 32****Configuring Authentication for Access Points 505**

Finding Feature Information	505
Prerequisites for Configuring Authentication for Access Points	505
Restrictions for Configuring Authentication for Access Points	506
Information about Configuring Authentication for Access Points	506
How to Configure Authentication for Access Points	506
Configuring Global Credentials for Access Points (CLI)	506
Configuring Global Credentials for Access Points (GUI)	508
Configuring Authentication for Access Points (CLI)	509
Configuring Authentication for Access Points (GUI)	511
Configuring the Switch for Authentication (CLI)	512
Configuration Examples for Configuring Authentication for Access Points	513
Displaying the Authentication Settings for Access Points: Examples	513

---

**CHAPTER 33**
**Converting Autonomous Access Points to Lightweight Mode 515**

Finding Feature Information	515
Prerequisites for Converting Autonomous Access Points to Lightweight Mode	515
Information About Autonomous Access Points Converted to Lightweight Mode	516
Reverting from Lightweight Mode to Autonomous Mode	516
Using DHCP Option 43 and DHCP Option 60	516
How Converted Access Points Send Crash Information to the Switch	517
Uploading Memory Core Dumps from Converted Access Points	517
Displaying MAC Addresses for Converted Access Points	517
Configuring a Static IP Address for a Lightweight Access Point	517
How to Convert a Lightweight Access Point Back to an Autonomous Access Point	518
Converting a Lightweight Access Point Back to an Autonomous Access Point (CLI)	518
Converting a Lightweight Access Point Back to an Autonomous Access Point (Using the Mode Button and a TFTP Server)	518
Authorizing Access Points (CLI)	519
Authorizing Access Points (GUI)	520
Disabling the Reset Button on Converted Access Points (CLI)	520
Monitoring the AP Crash Log Information	521
How to Configure a Static IP Address on an Access Point	522
Configuring a Static IP Address on an Access Point (CLI)	522
Configuring a Static IP Address on an Access Point (GUI)	523

Recovering the Access Point Using the TFTP Recovery Procedure	524
Configuration Examples for Converting Autonomous Access Points to Lightweight Mode	524
Displaying the IP Address Configuration for Access Points: Example	524
Displaying Access Point Crash File Information: Example	525

---

<b>CHAPTER 34</b>	<b>Using Cisco Workgroup Bridges</b>	<b>527</b>
	Finding Feature Information	527
	Information About Cisco Workgroup Bridges and non-Cisco Workgroup bridges	527
	Monitoring the Status of Workgroup Bridges	528
	Debugging WGB Issues (CLI)	528
	Configuration Examples for Configuring Workgroup Bridges	529
	WGB Configuration: Example	529

---

<b>CHAPTER 35</b>	<b>Configuring Probe Request Forwarding</b>	<b>531</b>
	Finding Feature Information	531
	Information About Configuring Probe Request Forwarding	531
	How to Configure Probe Request Forwarding (CLI)	531

---

<b>CHAPTER 36</b>	<b>Optimizing RFID Tracking</b>	<b>533</b>
	Finding Feature Information	533
	Optimizing RFID Tracking on Access Points	533
	How to Optimize RFID Tracking on Access Points	533
	Optimizing RFID Tracking on Access Points (CLI)	533
	Configuration Examples for Optimizing RFID Tracking	534
	Displaying all the Access Points in Monitor Mode: Example	534

---

<b>CHAPTER 37</b>	<b>Configuring Country Codes</b>	<b>537</b>
	Finding Feature Information	537
	Prerequisites for Configuring Country Codes	537
	Information About Configuring Country Codes	538
	How to Configure Country Codes (CLI)	538
	Configuration Examples for Configuring Country Codes	540
	Displaying Channel List for Country Codes: Example	540

---

<b>CHAPTER 38</b>	<b>Configuring Link Latency</b>	<b>543</b>
	Finding Feature Information	543
	Prerequisites for Configuring Link Latency	543
	Restrictions for Configuring Link Latency	543
	Information About Configuring Link Latency	544
	TCP MSS	544
	Link Tests	544
	How to Configure Link Latency	545
	Configuring Link Latency (CLI)	545
	Configuring Link Latency (GUI)	547
	How to Configure TCP MSS	548
	Configuring TCP MSS (CLI)	548
	Configuring TCP MSS (GUI)	549
	Performing a Link Test (CLI)	549
	Configuration Examples for Configuring Link Latency	550
	Running a Link Test: Example	550
	Displaying Link Latency Information: Example	550
	Displaying TCP MSS Settings: Example	551

---

<b>CHAPTER 39</b>	<b>Configuring Power over Ethernet</b>	<b>553</b>
	Finding Feature Information	553
	Information About Configuring Power over Ethernet	553
	How to Configure Power over Ethernet	553
	Configuring Power over Ethernet (CLI)	553
	Configuring Power over Ethernet (GUI)	554
	Configuration Examples for Configuring Power over Ethernet	556
	Displaying Power over Ethernet Information: Example	556

---

<b>PART VII</b>	<b>Mobility</b>	<b>557</b>
-----------------	-----------------	------------

---

<b>CHAPTER 40</b>	<b>Information About Mobility</b>	<b>559</b>
	Overview	559
	Wired and Wireless Mobility	560

Features of Mobility	560
Sticky Anchoring for Low Latency Roaming	562
Bridge Domain ID and L2/L3 Roaming	562
Link Down Behavior	562
Platform Specific Scale Requirement for the Mobility Controller	563

---

**CHAPTER 41**      **Mobility Network Elements**    565

Mobility Agent	565
Mobility Controller	566
Mobility Oracle	567
Guest Controller	567

---

**CHAPTER 42**      **Mobility Control Protocols**    569

About Mobility Control Protocols	569
Initial Association and Roaming	569
Initial Association	570
Intra Switch Handoff	571
Intra Switch Peer Group Handoff	571
Inter Switch Peer Group Handoff	572
Inter Sub Domain Handoff	573
Inter Mobility Group Handoff	575

---

**CHAPTER 43**      **Configuring Mobility**    577

Configuring Mobility Controller	577
Configuring Converged Access Controllers	577
Creating Peer Groups, Peer Group Member, and Bridge Domain ID (CLI)	577
Creating Peer Groups, Peer Group Member, and Bridge Domain ID (GUI)	579
Configuring Local Mobility Group (CLI)	579
Configuring Local Mobility Group (GUI)	580
Adding a Peer Mobility Group (CLI)	581
Adding a Peer Mobility Group (GUI)	581
Configuring Optional Parameters for Roaming Behavior	582
Pointing the Mobility Controller to a Mobility Oracle (CLI)	582
Pointing the Mobility Controller to a Mobility Oracle (GUI)	583

- Configuring Guest Controller 583
- Configuring Guest Anchor 584
- Configuring Mobility Agent 585
  - Configuring Mobility Agent by Pointing to Mobility Controller (CLI) 585
  - Configuring Mobility Agent by Pointing to Mobility Controller (GUI) 586
  - Configuring the Mobility Controller for the Mobility Agent (CLI) 586
  - Adding a Mobility Controller Role to the Mobility Agent 587
  - Configuring Optional Parameters on a Mobility Agent (CLI) 587

---

**PART VIII**

**Network Management 589**

---

**CHAPTER 44**

**Configuring Cisco IOS Configuration Engine 591**

- Finding Feature Information 591
- Prerequisites for Configuring the Configuration Engine 591
- Restrictions for Configuring the Configuration Engine 592
- Information About Configuring the Configuration Engine 592
  - Cisco Configuration Engine Software 592
  - Configuration Service 593
  - Event Service 593
  - NameSpace Mapper 594
  - Cisco Networking Services IDs and Device Hostnames 594
    - ConfigID 594
    - DeviceID 594
    - Hostname and DeviceID 595
    - Hostname, DeviceID, and ConfigID 595
  - Cisco IOS CNS Agents 595
    - Initial Configuration 595
    - Incremental (Partial) Configuration 596
    - Synchronized Configuration 597
  - Automated CNS Configuration 597
- How to Configure the Configuration Engine 598
  - Enabling the CNS Event Agent 598
  - Enabling the Cisco IOS CNS Agent 599
  - Enabling an Initial Configuration for Cisco IOS CNS Agent 601

Refreshing DeviceIDs	606
Enabling a Partial Configuration for Cisco IOS CNS Agent	607
Monitoring CNS Configurations	609
Additional References	610
Feature History and Information for the Configuration Engine	611

**CHAPTER 45****Configuring the Cisco Discovery Protocol 613**

Finding Feature Information	613
Information About CDP	613
CDP Overview	613
CDP and Stacks	614
Default CDP Configuration	614
How to Configure CDP	614
Configuring CDP Characteristics	614
Disabling CDP	616
Enabling CDP	617
Disabling CDP on an Interface	618
Enabling CDP on an Interface	620
Monitoring and Maintaining CDP	621
Additional References	622
Feature History and Information for Cisco Discovery Protocol	623

**CHAPTER 46****Configuring Simple Network Management Protocol 625**

Finding Feature Information	625
Prerequisites for SNMP	625
Restrictions for SNMP	627
Information About SNMP	628
SNMP Overview	628
SNMP Manager Functions	628
SNMP Agent Functions	628
SNMP Community Strings	629
SNMP MIB Variables Access	629
SNMP Notifications	630
SNMP ifIndex MIB Object Values	630

Default SNMP Configuration	631
SNMP Configuration Guidelines	631
How to Configure SNMP	632
Disabling the SNMP Agent	632
Configuring Community Strings	633
Configuring SNMP Groups and Users	635
Configuring SNMP Notifications	638
Setting the Agent Contact and Location Information	643
Limiting TFTP Servers Used Through SNMP	644
Configuring Trap Flags for SNMP	646
Enabling SNMP Wireless Trap Notification	647
Monitoring SNMP Status	648
SNMP Examples	649
Additional References	650
Feature History and Information for Simple Network Management Protocol	651

---

**CHAPTER 47**

<b>Configuring Service Level Agreements</b>	<b>653</b>
Finding Feature Information	653
Restrictions on SLAs	653
Information About SLAs	654
Cisco IOS IP Service Level Agreements (SLAs)	654
Network Performance Measurement with Cisco IOS IP SLAs	655
IP SLA Responder and IP SLA Control Protocol	656
Response Time Computation for IP SLAs	656
IP SLAs Operation Scheduling	657
IP SLA Operation Threshold Monitoring	657
UDP Jitter	658
How to Configure IP SLAs Operations	659
Default Configuration	659
Configuration Guidelines	659
Configuring the IP SLA Responder	660
Implementing IP SLA Network Performance Measurement	661
Analyzing IP Service Levels by Using the UDP Jitter Operation	665
Analyzing IP Service Levels by Using the ICMP Echo Operation	669

Monitoring IP SLA Operations	672
Monitoring IP SLA Operation Examples	673
Additional References	673
Feature History and Information for Service Level Agreements	675

**CHAPTER 48****Configuring Local Policies 677**

Finding Feature Information	677
Restrictions for Configuring Local Policies	677
Information About Configuring Local Policies	678
How to Configure Local Policies	679
Configuring Local Policies (CLI)	679
Creating a Service Template (CLI)	680
Creating an Interface Template (CLI)	681
Creating a Parameter Map (CLI)	681
Creating a Class Map (CLI)	683
Creating a Policy Map (CLI)	683
Applying a Local Policy for a Device on a WLAN (CLI)	684
Configuring Local Policies (GUI)	686
Creating a Service Template (GUI)	686
Creating a Policy Map (GUI)	687
Applying Local Policies to WLAN (GUI)	688
Monitoring Local Policies	688
Examples: Local Policies Configuration	689
Additional References for Configuring Local Policies	690
Feature History for Performing Local Policies Configuration	691

**CHAPTER 49****Configuring SPAN and RSPAN 693**

Finding Feature Information	693
Prerequisites for SPAN and RSPAN	693
Restrictions for SPAN and RSPAN	694
Information About SPAN and RSPAN	695
SPAN and RSPAN	695
Local SPAN	696
Remote SPAN	697

SPAN and RSPAN Concepts and Terminology	697
SPAN and RSPAN Interaction with Other Features	703
SPAN and RSPAN and Device Stacks	704
Flow-Based SPAN	704
Default SPAN and RSPAN Configuration	705
Configuration Guidelines	705
SPAN Configuration Guidelines	705
RSPAN Configuration Guidelines	706
FSPAN and FRSPAN Configuration Guidelines	706
How to Configure SPAN and RSPAN	706
Creating a Local SPAN Session	706
Creating a Local SPAN Session and Configuring Incoming Traffic	709
Specifying VLANs to Filter	711
Configuring a VLAN as an RSPAN VLAN	713
Creating an RSPAN Source Session	715
Specifying VLANs to Filter	717
Creating an RSPAN Destination Session	718
Creating an RSPAN Destination Session and Configuring Incoming Traffic	721
Configuring an FSPAN Session	723
Configuring an FRSPAN Session	726
Monitoring SPAN and RSPAN Operations	728
SPAN and RSPAN Configuration Examples	729
Example: Configuring Local SPAN	729
Examples: Creating an RSPAN VLAN	730
Additional References	731
Feature History and Information for SPAN and RSPAN	732

---

**CHAPTER 50**
**Configuring Wireshark 735**

Finding Feature Information	735
Prerequisites for Wireshark	735
Restrictions for Wireshark	735
Information About Wireshark	737
Wireshark Overview	737
Capture Points	737

Attachment Points	738
Filters	739
Actions	739
Storage of Captured Packets to Buffer in Memory	740
Storage of Captured Packets to a .pcap File	740
Packet Decoding and Display	741
Packet Storage and Display	741
Wireshark Capture Point Activation and Deactivation	742
Wireshark Features	742
Guidelines for Wireshark	744
Default Wireshark Configuration	746
How to Configure Wireshark	747
Defining a Capture Point	747
Adding or Modifying Capture Point Parameters	752
Deleting Capture Point Parameters	754
Deleting a Capture Point	756
Activating and Deactivating a Capture Point	757
Clearing the Capture Point Buffer	760
Monitoring Wireshark	762
Configuration Examples for Wireshark	762
Example: Displaying a Brief Output from a .pcap File	762
Example: Displaying Detailed Output from a .pcap File	763
Example: Simple Capture and Display	765
Example: Simple Capture and Store	766
Example: Using Buffer Capture	769
Example: Capture Sessions	775
Example: Capture and Store in Lock-step Mode	776
Example: Simple Capture and Store of Packets in Egress Direction	777
Additional References	779
Feature History and Information for WireShark	780

---

**PART IX**
**QoS 781**

---

**CHAPTER 51**
**Configuring QoS 783**

Finding Feature Information	783
Prerequisites for QoS	783
QoS Components	784
QoS Terminology	784
Information About QoS	785
QoS Overview	785
Modular QoS Command-Line Interface	785
Wireless QoS Overview	785
QoS and IPv6 for Wireless	786
Wired and Wireless Access Supported Features	787
Supported QoS Features on Wireless Targets	788
Port Policies	790
Radio Policies	792
SSID Policies	793
Client Policies	793
Hierarchical QoS	794
Hierarchical Wireless QoS	795
QoS Implementation	796
Layer 2 Frame Prioritization Bits	797
Layer 3 Packet Prioritization Bits	798
End-to-End QoS Solution Using Classification	798
Packet Classification	798
QoS Wired Model	800
Ingress Port Activity	801
Egress Port Activity	801
Classification	801
Access Control Lists	802
Class Maps	802
Policy Maps	803
Policing	804
Token-Bucket Algorithm	805
Marking	805
Packet Header Marking	805
Switch Specific Information Marking	806

Table Map Marking	806
Traffic Conditioning	807
Policing	808
Shaping	809
Queueing and Scheduling	810
Bandwidth	811
Weighted Tail Drop	811
Priority Queues	813
Queue Buffer	813
Queueing in Wireless	814
Trust Behavior	815
Trust Behavior for Wired and Wireless Ports	815
Port Security on a Trusted Boundary for Cisco IP Phones	816
Wireless QoS Mobility	817
Inter-Switch Roaming	817
Intra-Switch Roaming	818
Precious Metal Policies for Wireless QoS	818
Standard QoS Default Settings	818
Default Wired QoS Configuration	818
Default Wireless QoS Configuration	820
Configuring Auto QoS for Wireless	820
Information About Auto QoS for Wireless	820
Configuring Auto QoS for Wireless (GUI)	822
Configuring Auto QoS for Wireless (CLI)	822
Guidelines for QoS Policies	823
Restrictions for QoS on Wired Targets	823
Restrictions for QoS on Wireless Targets	826
How to Configure QoS	828
Configuring Class, Policy, and Table Maps	828
Creating a Traffic Class (CLI)	828
Creating a Traffic Policy (CLI)	831
Configuring Client Policies (GUI)	835
Configuring Client Policies	837
Configuring Class-Based Packet Marking (CLI)	838

Configuring Class Maps for Voice and Video (CLI)	843
Attaching a Traffic Policy to an Interface (CLI)	844
Configuring SSID Policies (GUI)	846
Applying an SSID or Client Policy on a WLAN (CLI)	847
Classifying, Policing, and Marking Traffic on Physical Ports by Using Policy Maps (CLI)	848
Classifying, Policing, and Marking Traffic on SVIs by Using Policy Maps (CLI)	852
Configuring Table Maps (CLI)	855
Configuring Trust	857
Configuring Trust Behavior for Wireless Traffic (CLI)	857
Configuring QoS Features and Functionality	858
Configuring Call Admission Control (CLI)	858
Configuring Bandwidth (CLI)	865
Configuring Police (CLI)	867
Configuring Priority (CLI)	869
Configuring Queues and Shaping	871
Configuring Egress Queue Characteristics	871
Configuring Queue Buffers (CLI)	872
Configuring Queue Limits (CLI)	874
Configuring Shaping (CLI)	876
Configuring Precious Metal Policies (CLI)	878
Configuring QoS Policies for Multicast Traffic (CLI)	879
Configuring Port Policies (GUI)	880
Applying or Changing Port Policies (GUI)	881
Applying a QoS Policy on a WLAN (GUI)	881
Monitoring QoS	883
Monitoring SSID and Client Policies Statistics (GUI)	885
Configuration Examples for QoS	886
Examples: Classification by Access Control Lists	886
Examples: Class of Service Layer 2 Classification	886
Examples: Class of Service DSCP Classification	887
Examples: VLAN ID Layer 2 Classification	887
Examples: Classification by DSCP or Precedence Values	887
Examples: Hierarchical Classification	888
Examples: Hierarchical Policy Configuration	888

Examples: Classification for Voice and Video	889
Examples: Wireless QoS Policy Classified by Voice, Video, and Multicast Traffic	890
Examples: Configuring Downstream SSID Policy	891
Examples: Ingress SSID Policies	892
Examples: Client Policies	893
Examples: Average Rate Shaping Configuration	895
Examples: Queue-limit Configuration	896
Examples: Queue Buffers Configuration	897
Examples: Policing Action Configuration	897
Examples: Policer VLAN Configuration	898
Examples: Policing Units	898
Examples: Single-Rate Two-Color Policing Configuration	899
Examples: Dual-Rate Three-Color Policing Configuration	899
Examples: Table Map Marking Configuration	900
Example: Table Map Configuration to Retain CoS Markings	901
Where to Go Next	901
Additional References for QoS	901
Feature History and Information for QoS	903

---

**CHAPTER 52**
**Configuring Auto-QoS 905**

Finding Feature Information	905
Prerequisites for Auto-QoS	905
Restrictions for Auto-QoS	905
Information About Configuring Auto-QoS	907
Auto-QoS Overview	907
Auto-QoS Compact Overview	907
Auto-QoS Global Configuration Templates	907
Auto-QoS Policy and Class Maps	907
Effects of Auto-QoS on Running Configuration	908
Effects of Auto-QoS Compact on Running Configuration	908
How to Configure Auto-QoS	909
Configuring Auto-QoS (CLI)	909
Upgrading Auto-QoS (CLI)	911
Enabling Auto-QoS Compact	913

Monitoring Auto-QoS	914
Troubleshooting Auto-QoS	914
Configuration Examples for Auto-QoS	915
Example: auto qos trust cos	915
Example: auto qos trust dscp	917
Example: auto qos video cts	920
Example: auto qos video ip-camera	923
Example: auto qos video media-player	926
Example: auto qos voip trust	928
Example: auto qos voip cisco-phone	931
Example: auto qos voip cisco-softphone	934
auto qos classify police	939
auto qos global compact	944
Where to Go Next for Auto-QoS	944
Additional References for Auto-QoS	944

**Radio Resource Management 947**

---

**CHAPTER 53**
**Configuring Radio Resource Management 949**

Finding Feature Information	949
Prerequisites for Configuring Radio Resource Management	949
Restrictions for Radio Resource Management	950
Information About Radio Resource Management	950
Radio Resource Monitoring	951
Information About RF Groups	951
RF Group Leader	952
RF Group Name	953
Mobility Controller	953
Mobility Agent	954
Information About Rogue Access Point Detection in RF Groups	954
Transmit Power Control	955
Overriding the TPC Algorithm with Minimum and Maximum Transmit Power Settings	955
Dynamic Channel Assignment	955

Coverage Hole Detection and Correction	957
How to Configure RRM	958
Configuring Advanced RRM CCX Parameters (CLI)	958
Configuring Neighbor Discovery Type (CLI)	958
Configuring RRM Profile Thresholds, Monitoring Channels, and Monitoring Intervals (GUI)	959
Configuring RF Groups	960
Configuring the RF Group Mode (GUI)	960
Configuring RF Group Selection Mode (CLI)	961
Configuring an RF Group Name (CLI)	962
Configuring an RF Group Name (GUI)	962
Configuring Members in a 802.11 Static RF Group (CLI)	963
Configuring Transmit Power Control	963
Configuring the Tx-Power Control Threshold (CLI)	963
Configuring the Tx-Power Level (CLI)	964
Configuring Transmit Power Control (GUI)	964
Configuring 802.11 RRM Parameters	966
Configuring Advanced 802.11 Channel Assignment Parameters (CLI)	966
Configuring Dynamic Channel Assignment (GUI)	968
Configuring 802.11 Coverage Hole Detection (CLI)	971
Configuring Coverage Hole Detection (GUI)	972
Configuring 802.11 Event Logging (CLI)	973
Configuring 802.11 Statistics Monitoring (CLI)	974
Configuring the 802.11 Performance Profile (CLI)	975
Configuring Rogue Access Point Detection in RF Groups	976
Configuring Rogue Access Point Detection in RF Groups (CLI)	976
Enabling Rogue Access Point Detection in RF Groups (GUI)	977
Monitoring RRM Parameters and RF Group Status	978
Monitoring RRM Parameters	978
Monitoring RF Group Status (CLI)	979
Monitoring RF Group Status (GUI)	980
Examples: RF Group Configuration	980
Information About ED-RRM	980
Configuring ED-RRM on the Cisco Wireless LAN Controller (CLI)	981
Configuring ED-RRM (GUI)	981

<b>Configuring IP Unicast Routing</b>	<b>1011</b>
Finding Feature Information	1012
Information About Configuring IP Unicast Routing	1012
Information About IP Routing	1012
Types of Routing	1013
IP Routing and Switch Stacks	1014
Classless Routing	1015
Address Resolution	1016
Proxy ARP	1017
ICMP Router Discovery Protocol	1017
UDP Broadcast Packets and Protocols	1018
Broadcast Packet Handling	1018
IP Broadcast Flooding	1018
How to Configure IP Routing	1019
How to Configure IP Addressing	1020
Default IP Addressing Configuration	1020
Assigning IP Addresses to Network Interfaces	1022
Using Subnet Zero	1023
Disabling Classless Routing	1024
Configuring Address Resolution Methods	1025
Defining a Static ARP Cache	1025
Setting ARP Encapsulation	1027
Enabling Proxy ARP	1028
Routing Assistance When IP Routing is Disabled	1029
Proxy ARP	1029
Default Gateway	1029
ICMP Router Discovery Protocol (IRDP)	1030
Configuring Broadcast Packet Handling	1032
Enabling Directed Broadcast-to-Physical Broadcast Translation	1033
Forwarding UDP Broadcast Packets and Protocols	1034
Establishing an IP Broadcast Address	1036
Flooding IP Broadcasts	1037
Monitoring and Maintaining IP Addressing	1038

How to Configure IP Unicast Routing	1039
Enabling IP Unicast Routing	1039
Example of Enabling IP Routing	1040
What to Do Next	1040
Information About RIP	1041
Summary Addresses and Split Horizon	1041
How to Configure RIP	1042
Default RIP Configuration	1042
Configuring Basic RIP Parameters	1042
Configuring RIP Authentication	1045
Configuring Summary Addresses and Split Horizon	1046
Configuring Split Horizon	1048
Configuration Example for Summary Addresses and Split Horizon	1049
Information About OSPF	1050
OSPF Nonstop Forwarding	1050
OSPF NSF Awareness	1050
OSPF NSF Capability	1051
OSPF Area Parameters	1051
Other OSPF Parameters	1052
LSA Group Pacing	1052
Loopback Interfaces	1053
How to Configure OSPF	1053
Default OSPF Configuration	1053
Configuring Basic OSPF Parameters	1054
Configuring OSPF Interfaces	1056
Configuring OSPF Area Parameters	1058
Configuring Other OSPF Parameters	1060
Changing LSA Group Pacing	1062
Configuring a Loopback Interface	1063
Monitoring OSPF	1064
Configuration Examples for OSPF	1065
Example: Configuring Basic OSPF Parameters	1065
Information About EIGRP	1065
EIGRP Features	1065

EIGRP Components	1066
EIGRP Nonstop Forwarding	1066
EIGRP NSF Awareness	1067
EIGRP NSF Capability	1067
EIGRP Stub Routing	1067
How to Configure EIGRP	1068
Default EIGRP Configuration	1069
Configuring Basic EIGRP Parameters	1070
Configuring EIGRP Interfaces	1072
Configuring EIGRP Route Authentication	1073
Monitoring and Maintaining EIGRP	1075
Information About BGP	1076
BGP Network Topology	1076
Nonstop Forwarding Awareness	1077
Information About BGP Routing	1077
Routing Policy Changes	1078
BGP Decision Attributes	1079
Route Maps	1080
BGP Filtering	1080
Prefix List for BGP Filtering	1080
BGP Community Filtering	1081
BGP Neighbors and Peer Groups	1081
Aggregate Routes	1081
Routing Domain Confederations	1082
BGP Route Reflectors	1082
Route Dampening	1082
More BGP Information	1083
How to Configure BGP	1083
Default BGP Configuration	1083
Enabling BGP Routing	1086
Managing Routing Policy Changes	1088
Configuring BGP Decision Attributes	1089
Configuring BGP Filtering with Route Maps	1091
Configuring BGP Filtering by Neighbor	1092

Configuring BGP Filtering by Access Lists and Neighbors	1093
Configuring Prefix Lists for BGP Filtering	1094
Configuring BGP Community Filtering	1096
Configuring BGP Neighbors and Peer Groups	1097
Configuring Aggregate Addresses in a Routing Table	1100
Configuring Routing Domain Confederations	1101
Configuring BGP Route Reflectors	1102
Configuring Route Dampening	1104
Monitoring and Maintaining BGP	1105
Configuration Examples for BGP	1106
Example: Configuring BGP on Routers	1106
Information About ISO CLNS Routing	1107
Connectionless Routing	1107
IS-IS Dynamic Routing	1108
Nonstop Forwarding Awareness	1109
IS-IS Global Parameters	1109
IS-IS Interface Parameters	1110
How to Configure ISO CLNS Routing	1110
Default IS-IS Configuration	1110
Enabling IS-IS Routing	1112
Configuring IS-IS Global Parameters	1114
Configuring IS-IS Interface Parameters	1118
Monitoring and Maintaining ISO IGRP and IS-IS	1120
Configuration Examples for ISO CLNS Routing	1122
Example: Configuring IS-IS Routing	1122
Information About Multi-VRF CE	1122
Understanding Multi-VRF CE	1123
Network Topology	1123
Packet-Forwarding Process	1124
Network Components	1124
VRF-Aware Services	1125
How to Configure Multi-VRF CE	1125
Default Multi-VRF CE Configuration	1125
Multi-VRF CE Configuration Guidelines	1126

Configuring VRFs	1126
Configuring VRF-Aware Services	1128
Configuring VRF-Aware Services for ARP	1129
Configuring VRF-Aware Services for Ping	1129
Configuring VRF-Aware Services for SNMP	1129
Configuring VRF-Aware Services for uRPF	1130
Configuring VRF-Aware RADIUS	1131
Configuring VRF-Aware Services for Syslog	1131

**CHAPTER 59****Configuring RADIUS 1209**

Finding Feature Information	1209
Prerequisites for Configuring RADIUS	1209
Restrictions for Configuring RADIUS	1210
Information about RADIUS	1211
RADIUS and Switch Access	1211
RADIUS Overview	1211
RADIUS Operation	1212
RADIUS Change of Authorization	1213
Change-of-Authorization Requests	1214
CoA Request Response Code	1216
CoA Request Commands	1217
Stacking Guidelines for Session Termination	1219
Default RADIUS Configuration	1220
RADIUS Server Host	1220
RADIUS Login Authentication	1221
AAA Server Groups	1222
AAA Authorization	1222
RADIUS Accounting	1222
Vendor-Specific RADIUS Attributes	1222
Vendor-Proprietary RADIUS Server Communication	1234
How to Configure RADIUS	1234
Identifying the RADIUS Server Host	1234
Configuring RADIUS Login Authentication	1237
Defining AAA Server Groups	1239

Configuring RADIUS Authorization for User Privileged Access and Network Services	1241
Starting RADIUS Accounting	1242
Establishing a Session with a Router if the AAA Server is Unreachable	1244
Configuring Settings for All RADIUS Servers	1244
Configuring the Switch to Use Vendor-Specific RADIUS Attributes	1245
Configuring the Switch for Vendor-Proprietary RADIUS Server Communication	1247
Configuring CoA on the Switch	1248
Configuring RADIUS Server Load Balancing	1250
Monitoring CoA Functionality	1251
Configuration Examples for Controlling Switch Access with RADIUS	1251
Examples: Identifying the RADIUS Server Host	1251
Example: Using Two Different RADIUS Group Servers	1251
Examples: Configuring the Switch to Use Vendor-Specific RADIUS Attributes	1252
Example: Configuring the Switch for Vendor-Proprietary RADIUS Server Communication	1252
Additional References	1253
Feature Information for RADIUS	1254

**CHAPTER 60****Configuring Kerberos 1255**

Finding Feature Information	1255
Prerequisites for Controlling Switch Access with Kerberos	1255
Restrictions for Controlling Switch Access with Kerberos	1256
Information about Kerberos	1256
Kerberos and Switch Access	1256
Kerberos Overview	1256
Kerberos Operation	1258
Authenticating to a Boundary Switch	1258
Obtaining a TGT from a KDC	1259
Authenticating to Network Services	1259
How to Configure Kerberos	1259
Monitoring the Kerberos Configuration	1259
Additional References	1260
Feature Information for Kerberos	1260

**CHAPTER 61****Configuring Local Authentication and Authorization 1261**

Finding Feature Information 1261

How to Configure Local Authentication and Authorization 1261

    Configuring the Switch for Local Authentication and Authorization 1261

Monitoring Local Authentication and Authorization 1264

Additional References 1264

Feature Information for Local Authentication and Authorization 1264

**CHAPTER 64**

<b>Configuring IPv4 ACLs</b>	<b>1287</b>
Finding Feature Information	1287
Restrictions for Configuring IPv4 Access Control Lists	1287
Information about Network Security with ACLs	1288
Cisco TrustSec and ACLs	1289
ACL Overview	1289
Access Control Entries	1289
ACL Supported Types	1289
Supported ACLs	1289
ACL Precedence	1290
Port ACLs	1290
Router ACLs	1291
VLAN Maps	1292
ACEs and Fragmented and Unfragmented Traffic	1292
ACEs and Fragmented and Unfragmented Traffic Examples	1292
ACLs and Switch Stacks	1293
Active Switch and ACL Functions	1293
Stack Member and ACL Functions	1294
Active Switch Failure and ACLs	1294
Standard and Extended IPv4 ACLs	1294
IPv4 ACL Switch Unsupported Features	1294
Access List Numbers	1294
Numbered Standard IPv4 ACLs	1295
Numbered Extended IPv4 ACLs	1296
Named IPv4 ACLs	1296
ACL Logging	1297
Smart Logging	1297
Hardware and Software Treatment of IP ACLs	1297

VLAN Map Configuration Guidelines	1298
VLAN Maps with Router ACLs	1298
VLAN Maps and Router ACL Configuration Guidelines	1299
Time Ranges for ACLs	1299
IPv4 ACL Interface Considerations	1300
How to Configure ACLs	1300
Configuring IPv4 ACLs	1300
Creating a Numbered Standard ACL	1301
Creating a Numbered Extended ACL	1302
Creating Named Standard ACLs	1305
Creating Extended Named ACLs	1307
Configuring Time Ranges for ACLs	1308
Applying an IPv4 ACL to a Terminal Line	1310
Applying an IPv4 ACL to an Interface	1311
Creating Named MAC Extended ACLs	1312
Applying a MAC ACL to a Layer 2 Interface	1314
Configuring VLAN Maps	1315
Creating a VLAN Map	1316
Applying a VLAN Map to a VLAN	1318
Configuring VACL Logging	1319
Monitoring IPv4 ACLs	1320
Configuration Examples for ACLs	1321
Examples: Using Time Ranges with ACLs	1321
Examples: Including Comments in ACLs	1322
Examples: Troubleshooting ACLs	1322
IPv4 ACL Configuration Examples	1323
ACLs in a Small Networked Office	1323
Examples: ACLs in a Small Networked Office	1324
Example: Numbered ACLs	1325
Examples: Extended ACLs	1325
Examples: Named ACLs	1326
Examples: Time Range Applied to an IP ACL	1326
Examples: Configuring Commented IP ACL Entries	1327
Examples: ACL Logging	1327

Configuration Examples for ACLs and VLAN Maps	1329
Example: Creating an ACL and a VLAN Map to Deny a Packet	1329
Example: Creating an ACL and a VLAN Map to Permit a Packet	1329
Example: Default Action of Dropping IP Packets and Forwarding MAC Packets	1329
Example: Default Action of Dropping MAC Packets and Forwarding IP Packets	1330
Example: Default Action of Dropping All Packets	1330
Configuration Examples for Using VLAN Maps in Your Network	1331
Example: Wiring Closet Configuration	1331
Example: Restricting Access to a Server on Another VLAN	1332
Example: Denying Access to a Server on Another VLAN	1332
Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs	1333
Example: ACLs and Switched Packets	1333
Example: ACLs and Bridged Packets	1333
Example: ACLs and Routed Packets	1334
Example: ACLs and Multicast Packets	1335
Additional References	1335
Feature Information for IPv4 Access Control Lists	1336

**CHAPTER 65****Configuring IPv6 ACLs 1339**

Finding Feature Information	1339
IPv6 ACLs Overview	1339
Switch Stacks and IPv6 ACLs	1340
Interactions with Other Features and Switches	1340
Restrictions for IPv6 ACLs	1340
Default Configuration for IPv6 ACLs	1341
Configuring IPv6 ACLs	1341
Attaching an IPv6 ACL to an Interface	1345
Monitoring IPv6 ACLs	1346

<b>CHAPTER 67</b>	<b>Configuring IP Source Guard 1371</b>
	Finding Feature Information 1371
	Information About IP Source Guard 1371
	IP Source Guard 1371
	IP Source Guard for Static Hosts 1372
	IP Source Guard Configuration Guidelines 1373
	How to Configure IP Source Guard 1373

Enabling IP Source Guard	1373
Configuring IP Source Guard for Static Hosts on a Layer 2 Access Port	1374
Monitoring IP Source Guard	1376
Additional References	1377

**CHAPTER 68****Configuring Dynamic ARP Inspection 1379**

Finding Feature Information	1379
Restrictions for Dynamic ARP Inspection	1379
Understanding Dynamic ARP Inspection	1381
Interface Trust States and Network Security	1382
Rate Limiting of ARP Packets	1383
Relative Priority of ARP ACLs and DHCP Snooping Entries	1384
Logging of Dropped Packets	1384
Default Dynamic ARP Inspection Configuration	1384
Relative Priority of ARP ACLs and DHCP Snooping Entries	1385
Configuring ARP ACLs for Non-DHCP Environments	1385
Configuring Dynamic ARP Inspection in DHCP Environments	1387
Limiting the Rate of Incoming ARP Packets	1390
Performing Dynamic ARP Inspection Validation Checks	1391
Monitoring DAI	1393
Verifying the DAI Configuration	1393
Additional References	1394

**CHAPTER 69****Configuring IEEE 802.1x Port-Based Authentication 1395**

Finding Feature Information	1395
Information About 802.1x Port-Based Authentication	1395
Port-Based Authentication Process	1396
Port-Based Authentication Initiation and Message Exchange	1398
Authentication Manager for Port-Based Authentication	1399
Port-Based Authentication Methods	1399
Per-User ACLs and Filter-Ids	1400
Port-Based Authentication Manager CLI Commands	1401
Ports in Authorized and Unauthorized States	1402
Port-Based Authentication and Switch Stacks	1403

802.1x Host Mode	1404
802.1x Multiple Authentication Mode	1404
Multi-auth Per User VLAN assignment	1405
MAC Move	1406
MAC Replace	1407
802.1x Accounting	1407
802.1x Accounting Attribute-Value Pairs	1408
802.1x Readiness Check	1409
Switch-to-RADIUS-Server Communication	1409
802.1x Authentication with VLAN Assignment	1409
802.1x Authentication with Per-User ACLs	1411
802.1x Authentication with Downloadable ACLs and Redirect URLs	1412
Cisco Secure ACS and Attribute-Value Pairs for the Redirect URL	1413
Cisco Secure ACS and Attribute-Value Pairs for Downloadable ACLs	1414
VLAN ID-based MAC Authentication	1414
802.1x Authentication with Guest VLAN	1415
802.1x Authentication with Restricted VLAN	1416
802.1x Authentication with Inaccessible Authentication Bypass	1417
Inaccessible Authentication Bypass Support on Multiple-Authentication Ports	1417
Inaccessible Authentication Bypass Authentication Results	1417
Inaccessible Authentication Bypass Feature Interactions	1417

802.1x User Distribution	1419
802.1x User Distribution Configuration Guidelines	1419
IEEE 802.1x Authentication with Voice VLAN Ports	1420
IEEE 802.1x Authentication with Port Security	1420
IEEE 802.1x Authentication with Wake-on-LAN	1421
IEEE 802.1x Authentication with MAC Authentication Bypass	1421
Network Admission Control Layer 2 IEEE 802.1x Validation	1422
Flexible Authentication Ordering	1423
OpenIx Authentication	1423
Multidomain Authentication	1424
Limiting Login for Users	1425
802.1x Supplicant and Authenticator Switches with Network Edge Access Topology (NEAT)	1425

Voice Aware 802.1x Security	1427
Common Session ID	1427
How to Configure 802.1x Port-Based Authentication	1428
Default 802.1x Authentication Configuration	1428
802.1x Authentication Configuration Guidelines	1429
802.1x Authentication	1429
VLAN Assignment, Guest VLAN, Restricted VLAN, and Inaccessible Authentication Bypass	1430
MAC Authentication Bypass	1431
Maximum Number of Allowed Devices Per Port	1431
Configuring 802.1x Readiness Check	1432
Configuring Voice Aware 802.1x Security	1433
Configuring 802.1x Violation Modes	1435
Configuring 802.1x Authentication	1436
Configuring 802.1x Port-Based Authentication	1437
Configuring Switch-to-RADIUS-Server Communication	1439
Configuring the Host Mode	1441
Configuring Periodic Re-Authentication	1442
Changing the Quiet Period	1443
Changing the Switch-to-Client Retransmission Time	1444
Setting the Switch-to-Client Frame-Retransmission Number	1446
Setting the Re-Authentication Number	1447
Enabling MAC Move	1447
Enabling MAC Replace	1448
Configuring 802.1x Accounting	1450
Configuring a Guest VLAN	1451
Configuring a Restricted VLAN	1452
Configuring Number of Authentication Attempts on a Restricted VLAN	1453
Configuring 802.1x Inaccessible Authentication Bypass with Critical Voice VLAN	1455
Example of Configuring Inaccessible Authentication Bypass	1457
Configuring 802.1x Authentication with WoL	1458
Configuring MAC Authentication Bypass	1459
Formatting a MAC Authentication Bypass Username and Password	1460
Configuring 802.1x User Distribution	1461

Example of Configuring VLAN Groups	1462
Configuring NAC Layer 2 802.1x Validation	1462
Configuring Limiting Login for Users	1464
Configuring an Authenticator Switch with NEAT	1465
Configuring a Supplicant Switch with NEAT	1467
Configuring 802.1x Authentication with Downloadable ACLs and Redirect URLs	1469
Configuring Downloadable ACLs	1470
Configuring a Downloadable Policy	1471
Configuring VLAN ID-based MAC Authentication	1473
Configuring Flexible Authentication Ordering	1474
Configuring Open1x	1475
Disabling 802.1x Authentication on the Port	1477
Resetting the 802.1x Authentication Configuration to the Default Values	1478
Monitoring 802.1x Statistics and Status	1479
Additional References	1479
Feature Information for 802.1x Port-Based Authentication	1480

<b>Configuring Web-Based Authentication</b>	<b>1505</b>
Finding Feature Information	1505
Web-Based Authentication Overview	1505
Device Roles	1506
Host Detection	1507
Session Creation	1507
Authentication Process	1508
Local Web Authentication Banner	1508
Web Authentication Customizable Web Pages	1511
Guidelines	1511
Authentication Proxy Web Page Guidelines	1512
Redirection URL for Successful Login Guidelines	1513
Custom Web Authentication Guidelines	1513
Web-based Authentication Interactions with Other Features	1513
Port Security	1513
LAN Port IP	1513
Gateway IP	1514
ACLs	1514
Context-Based Access Control	1514
EtherChannel	1514
How to Configure Web-Based Authentication	1514
Default Web-Based Authentication Configuration	1514
Web-Based Authentication Configuration Guidelines and Restrictions	1515
Web-Based Authentication Configuration Task List	1516
Configuring the Authentication Rule and Interfaces	1516
Configuring AAA Authentication	1518
Configuring Switch-to-RADIUS-Server Communication	1520
Configuring the HTTP Server	1521
Customizing the Authentication Proxy Web Pages	1522

Specifying a Redirection URL for Successful Login	1524
Configuring the Web-Based Authentication Parameters	1524
Configuring a Web-Based Authentication Local Banner	1525
Configuring Web-Based Authentication without SVI	1526
Configuring Web-Based Authentication with VRF Aware	1528
Removing Web-Based Authentication Cache Entries	1529
Downloading Web Authentication Tar Bundle (CLI)	1529
Downloading Web Authentication Tar Bundle (GUI)	1530
Integrating Customized Web Authentication Pages into a Parameter Map (CLI)	1531
Linking Image in Custom Pages	1532
Sample Web Authentication Login HTML	1533
Configuring a Parameter Map for Local Web Authentication (CLI)	1534
Monitoring Web-Based Authentication Status	1537
Feature Information for Web-Based Authentication	1537

**CHAPTER 72****Configuring Port-Based Traffic Control 1539**

Overview of Port-Based Traffic Control	1540
Finding Feature Information	1540
Information About Storm Control	1540
Storm Control	1540
How Traffic Activity is Measured	1540
Traffic Patterns	1541
How to Configure Storm Control	1542
Configuring Storm Control and Threshold Levels	1542
Finding Feature Information	1545
Information About Protected Ports	1545
Protected Ports	1545
Default Protected Port Configuration	1545
Protected Ports Guidelines	1545
How to Configure Protected Ports	1546
Configuring a Protected Port	1546
Monitoring Protected Ports	1547
Where to Go Next	1547
Additional References	1547

Feature Information	1548
Finding Feature Information	1548
Information About Port Blocking	1549
Port Blocking	1549
How to Configure Port Blocking	1549
Blocking Flooded Traffic on an Interface	1549
Monitoring Port Blocking	1551
Where to Go Next	1551
Additional References	1551
Feature Information	1552
Prerequisites for Port Security	1552
Restrictions for Port Security	1552
Information About Port Security	1552
Port Security	1552
Types of Secure MAC Addresses	1553
Sticky Secure MAC Addresses	1553
Security Violations	1553
Port Security Aging	1555
Port Security and Switch Stacks	1555
Default Port Security Configuration	1555
Port Security Configuration Guidelines	1555
Overview of Port-Based Traffic Control	1557
How to Configure Port Security	1557
Enabling and Configuring Port Security	1557
Enabling and Configuring Port Security Aging	1563
Configuration Examples for Port Security	1565

**CHAPTER 76****Managing Rogue Devices 1629**

Finding Feature Information	1629
Information About Rogue Devices	1629
Validating Rogue Devices Using MSE	1634
How to Configure Rogue Detection	1634
Configuring Rogue Detection (CLI)	1634
Configuring Rogue Detection (GUI)	1636
Monitoring Rogue Detection	1637
Examples: Rogue Detection Configuration	1637
Additional References for Rogue Detection	1638
Feature History and Information For Performing Rogue Detection Configuration	1639

**CHAPTER 77****Classifying Rogue Access Points 1641**

Finding Feature Information	1641
Information About Classifying Rogue Access Points	1641
Restrictions on Classifying Rogue Access Points	1644
How to Classify Rogue Access Points	1645
Configuring Rogue Classification Rules (CLI)	1645
Configuring Rogue Classification Rules (GUI)	1648
Viewing and Classifying Rogue Devices (GUI)	1650
Examples: Classifying Rogue Access Points	1652

Additional References for Classifying Rogue Access Points	1652
Feature History and Information For Classifying Rogue Access Points	1653

**CHAPTER 78****Configuring wIPS 1655**

Finding Feature Information	1655
Information About wIPS	1655
How to Configure wIPS on an Access Point	1661
Configuring wIPS on an Access Point (CLI)	1661
Configuring wIPS on an Access Point (GUI)	1662
Monitoring wIPS Information	1662
Examples: wIPS Configuration	1662
Additional References for Configuring wIPS	1663
Feature History for Performing wIPS Configuration	1663

**CHAPTER 79****Configuring Intrusion Detection System 1665**

Finding Feature Information	1665
Information About Intrusion Detection System	1665
How to Configure Intrusion Detection System	1666
Configuring IDS Sensors	1666
Monitoring Intrusion Detection System	1667

**PART XIII****Stack Manager and High Availability 1669****CHAPTER 80****Managing Switch Stacks 1671**

Finding Feature Information	1671
Prerequisites for Switch Stacks	1671
Restrictions for Switch Stacks	1672
Information About Switch Stacks	1672
Switch Stack Overview	1672
Supported Features in a Switch Stack	1672
Switch Stack Membership	1673
Changes to Switch Stack Membership	1673
Stack Member Numbers	1674
Stack Member Priority Values	1675

Switch Stack Bridge ID and MAC Address	1676
Persistent MAC Address on the Switch Stack	1676
Active and Standby Switch Election and Reelection	1676
Switch Stack Configuration Files	1677
Offline Configuration to Provision a Stack Member	1678
Effects of Adding a Provisioned Switch to a Switch Stack	1678
Effects of Replacing a Provisioned Switch in a Switch Stack	1680
Effects of Removing a Provisioned Switch from a Switch Stack	1680
Upgrading a Switch Running Incompatible Software	1680
Auto-Upgrade	1680
Auto-Advise	1681
SDM Template Mismatch in Switch Stacks	1682
Switch Stack Management Connectivity	1682
Connectivity to Specific Stack Members	1682
Connectivity to the Switch Stack Through an IP Address	1683
Connectivity to the Switch Stack Through Console Ports or Ethernet Management Ports	1683
How to Configure a Switch Stack	1683
Enabling the Persistent MAC Address Feature	1683
Assigning a Stack Member Number	1685
Setting the Stack Member Priority Value	1686
Provisioning a New Member for a Switch Stack	1687
Removing Provisioned Switch Information	1688
Displaying Incompatible Switches in the Switch Stack	1689
Upgrading an Incompatible Switch in the Switch Stack	1689
Troubleshooting the Switch Stack	1689
Accessing the Diagnostic Console of a Stack Member	1689
Temporarily Disabling a Stack Port	1690
Reenabling a Stack Port While Another Member Starts	1691
Monitoring the Switch Stack	1691
Configuration Examples for Switch Stacks	1692
Switch Stack Configuration Scenarios	1692
Enabling the Persistent MAC Address Feature: Example	1694
Provisioning a New Member for a Switch Stack: Example	1694
show switch stack-ports summary Command Output: Example	1694

Software Loopback: Examples	1696
Software Loopback with Connected Stack Cables: Examples	1697
Software Loopback with no Connected Stack Cable: Example	1697
Finding a Disconnected Stack Cable: Example	1697
Fixing a Bad Connection Between Stack Ports: Example	1698
Additional References for Switch Stacks	1699

**CHAPTER 81**

<b>Configuring Cisco NSF with SSO</b>	<b>1701</b>
Finding Feature Information	1701
Prerequisites for NSF with SSO	1701
Restrictions for NSF with SSO	1702
Information About NSF with SSO	1702
Overview of NSF with SSO	1702
SSO Operation	1703
Cisco Express Forwarding	1704
How to Configure Cisco NSF with SSO	1705
Configuring SSO	1705
Configuring SSO Example	1705
Verifying CEF NSF	1706

**CHAPTER 82**

<b>Configuring Wireless High Availability</b>	<b>1707</b>
Finding Feature Information	1707
Information about High Availability	1707
Information About Redundancy	1708
Configuring Redundancy in Access Points	1708
Configuring Heartbeat Messages	1709
Information about Access Point Stateful Switch Over	1709
Initiating Graceful Switchover	1710
Configuring EtherChannels for High Availability	1710
Configuring LACP	1711
Troubleshooting High Availability	1712
Access the Standby Console	1712
Before a Switchover	1712
After a Switchover	1713

Viewing Redundancy Switchover History (GUI)	1714
Viewing Switchover States (GUI)	1714
Monitoring the Switch Stack	1716
LACP Configuration: Example	1716
Flex Link Configuration: Example	1718

**PART XIV**
**System Management 1721**

---

**CHAPTER 83**
**Administering the System 1723**

Finding Feature Information	1723
Information About Administering the Switch	1723
System Time and Date Management	1723
System Clock	1724
Network Time Protocol	1724
NTP Stratum	1725
NTP Associations	1726
NTP Security	1726
NTP Implementation	1726
NTP Version 4	1727
System Name and Prompt	1727
Stack System Name and Prompt	1727
Default System Name and Prompt Configuration	1727
DNS	1728
Default DNS Settings	1728
Login Banners	1728
Default Banner Configuration	1728
MAC Address Table	1728
MAC Address Table Creation	1729
MAC Addresses and VLANs	1729
MAC Addresses and Switch Stacks	1729
Default MAC Address Table Settings	1730
ARP Table Management	1730
How to Administer the Switch	1730
Configuring the Time and Date Manually	1730

Setting the System Clock	1731
Configuring the Time Zone	1731
Configuring Summer Time (Daylight Saving Time)	1732
Configuring a System Name	1735
Setting Up DNS	1736
Configuring a Message-of-the-Day Login Banner	1738
Configuring a Login Banner	1739
Managing the MAC Address Table	1740
Changing the Address Aging Time	1740
Configuring MAC Address Change Notification Traps	1741
Configuring MAC Address Move Notification Traps	1743
Configuring MAC Threshold Notification Traps	1745
Adding and Removing Static Address Entries	1747
Configuring Unicast MAC Address Filtering	1748
Monitoring and Maintaining Administration of the Switch	1750
Configuration Examples for Switch Administration	1751
Example: Setting the System Clock	1751
Examples: Configuring Summer Time	1751
Example: Configuring a MOTD Banner	1751
Example: Configuring a Login Banner	1752
Example: Configuring MAC Address Change Notification Traps	1752
Example: Configuring MAC Threshold Notification Traps	1752
Example: Adding the Static Address to the MAC Address Table	1752
Example: Configuring Unicast MAC Address Filtering	1753
Additional References for Switch Administration	1753
Feature History and Information for Switch Administration	1754

---

**CHAPTER 84**
**Performing Switch Setup Configuration 1755**

Finding Feature Information	1755
Information About Performing Switch Setup Configuration	1755
Switch Boot Process	1755
Software Installer Features	1756
Software Boot Modes	1757
Installed Boot Mode	1757

Bundle Boot Mode	1757
Boot Mode for a Switch Stack	1758
Switches Information Assignment	1758
DHCP-Based Autoconfiguration Overview	1759
DHCP Client Request Process	1759
DHCP-based Autoconfiguration and Image Update	1760
Restrictions for DHCP-based Autoconfiguration	1761
DHCP Autoconfiguration	1761
DHCP Auto-Image Update	1761
DHCP Server Configuration Guidelines	1761
Purpose of the TFTP Server	1762
Purpose of the DNS Server	1763
How to Obtain Configuration Files	1763
How to Control Environment Variables	1764
Common Environment Variables	1765
Scheduled Reload of the Software Image	1766
How to Perform Switch Setup Configuration	1767
Configuring DHCP Autoconfiguration (Only Configuration File)	1767
Configuring DHCP Auto-Image Update (Configuration File and Image)	1769
Configuring the Client to Download Files from DHCP Server	1772
Manually Assigning IP Information to Multiple SVIs	1773
Modifying the Switch Startup Configuration	1774
Specifying the Filename to Read and Write the System Configuration	1774
Manually Booting the Switch	1775
Booting the Switch in Installed Mode	1777
Booting the Switch in Bundle Mode	1778
Booting a Specific Software Image On a Switch Stack	1779
Configuring a Scheduled Software Image Reload	1780
Monitoring Switch Setup Configuration	1781
Example: Verifying the Switch Running Configuration	1781
Examples: Displaying Software Bootup in Install Mode	1782
Example: Emergency Installation	1784
Configuration Examples for Performing Switch Setup	1785
Example: Configuring a Switch as a DHCP Server	1785

Example: Configuring DHCP Auto-Image Update	1785
Example: Configuring a Switch to Download Configurations from a DHCP Server	1786
Examples: Scheduling Software Image Reload	1786
Additional References For Performing Switch Setup	1787
Feature History and Information For Performing Switch Setup Configuration	1788

**CHAPTER 85****Configuring Right-To-Use Licenses 1789**

Finding Feature Information	1789
Restrictions for Configuring RTU Licenses	1789
Information About Configuring RTU Licenses	1790
Right-To-Use Licensing	1790
Right-To-Use Image Based Licenses	1790
Right-To-Use License States	1790
License Activation for Switch Stacks	1791
Mobility Controller Mode	1791
Right-To-Use AP-Count Licensing	1792
Right-to-Use AP-Count Evaluation Licenses	1792
Right-To-Use Adder AP-Count Rehosting Licenses	1793
How to Configure RTU Licenses	1793
Activating an Imaged Based License	1793
Activating an AP-Count License	1794
Obtaining an Upgrade or Capacity Adder License	1795
Rehosting a License	1796
Changing Mobility Mode	1796
Monitoring and Maintaining RTU Licenses	1797
Configuration Examples for RTU Licensing	1798
Examples: Activating RTU Image Based Licenses	1798
Examples: Displaying RTU Licensing Information	1798
Example: Displaying RTU License Details	1800
Example: Displaying RTU License Mismatch	1801
Example: Displaying RTU Licensing Usage	1802
Additional References for RTU Licensing	1803
Feature History and Information for RTU Licensing	1804

**CHAPTER 86**

**Configuring Administrator Usernames and Passwords 1805**

- Finding Feature Information **1805**
- Information About Configuring Administrator Usernames and Passwords **1805**
- Configuring Administrator Usernames and Passwords **1806**
- Examples: Administrator Usernames and Passwords Configuration **1808**
- Additional References for Administrator Usernames and Passwords **1808**
- Feature History and Information For Performing Administrator Usernames and Passwords Configuration **1809**

**CHAPTER 87**

**Configuring 802.11 parameters and Band Selection 1811**

- Finding Feature Information **1811**
- Restrictions on Band Selection, 802.11 Bands, and Parameters **1811**
- Information About Configuring Band Selection, 802.11 Bands, and Parameters **1812**
  - Band Selection **1812**
  - 802.11 Bands **1813**
  - 802.11n Parameter **1813**
  - 802.11h Parameter **1813**
- How to Configure 802.11 Bands and Parameters **1814**
  - Configuring Band Selection (CLI) **1814**
  - Configuring the 802.11 Bands (CLI) **1815**
  - Configuring the 802.11 Bands (GUI) **1817**
  - Configuring 802.11n Parameters (CLI) **1819**

Configuring Application Visibility (GUI)	1872
Configuring Application Visibility and Control (GUI)	1873
Monitoring Application Visibility and Control	1874
Monitoring Application Visibility and Control (CLI)	1874
Monitoring Application Visibility and Control (GUI)	1875
Monitoring SSID and Client Policies Statistics (GUI)	1876
Examples: Application Visibility and Control	1877
Examples: Application Visibility Configuration	1877
Examples: Application Visibility and Control QoS Configuration	1877
Example: Configuring QoS Attribute for Local Profiling Policy	1879
Additional References for Application Visibility and Control	1880
Feature History and Information For Application Visibility and Control	1881

**CHAPTER 91**

<b>Configuring Voice and Video Parameters</b>	<b>1883</b>
Finding Feature Information	1883
Prerequisites for Voice and Video Parameters	1883

Restrictions for Voice and Video Parameters	1883
Information About Configuring Voice and Video Parameters	1884
Call Admission Control	1884
Static-Based CAC	1885
Load-Based CAC	1885
IOSd Call Admission Control	1885
Expedited Bandwidth Requests	1886
U-APSD	1887
Traffic Stream Metrics	1887
Information About Configuring Voice Prioritization Using Preferred Call Numbers	1888
Information About EDCA Parameters	1888
How to Configure Voice and Video Parameters	1889
Configuring Voice Parameters (CLI)	1889
Configuring Video Parameters (CLI)	1892
Configuring SIP-Based CAC (CLI)	1894
Configuring a Preferred Call Number (CLI)	1896
Configuring EDCA Parameters (CLI)	1897
Configuring EDCA Parameters (GUI)	1898
Monitoring Voice and Video Parameters	1899
Configuration Examples for Voice and Video Parameters	1901
Example: Configuring Voice and Video	1901
Additional References for Voice and Video Parameters	1903
Feature History and Information For Performing Voice and Video Parameters Configuration	1904

---

**CHAPTER 92**

<b>Configuring RFID Tag Tracking</b>	<b>1905</b>
Finding Feature Information	1905
Information About Configuring RFID Tag Tracking	1905
How to Configure RFID Tag Tracking	1905
Configuring RFID Tag Tracking (CLI)	1905
Monitoring RFID Tag Tracking Information	1906
Additional References RFID Tag Tracking	1907
Feature History and Information For Performing RFID Tag Tracking Configuration	1908

---

**CHAPTER 93**

<b>Configuring Location Settings</b>	<b>1909</b>
--------------------------------------	-------------

Finding Feature Information	1909
Information About Configuring Location Settings	1909
How to Configure Location Settings	1910
Configuring Location Settings (CLI)	1910
Modifying the NMSP Notification Interval for Clients, RFID Tags, and Rogues (CLI)	1913
Modifying the NMSP Notification threshold for Clients, RFID Tags, and Rogues (CLI)	1914
Monitoring Location Settings and NMSP Settings	1914
Monitoring Location Settings (CLI)	1914
Monitoring NMSP Settings (CLI)	1915
Examples: Location Settings Configuration	1915
Examples: NMSP Settings Configuration	1916
Additional References for Location Settings	1916
Feature History and Information For Performing Location Settings Configuration	1917

---

**CHAPTER 94****Monitoring Flow Control 1919**

Finding Feature Information	1919
Information About Flow Control	1919
Monitoring Flow Control	1919
Examples: Monitoring Flow Control	1920
Additional References for Monitoring Flow Control	1921
Feature History and Information For Monitoring Flow Control	1921

---

**CHAPTER 95****Configuring SDM Templates 1923**

Finding Feature Information	1923
Information About Configuring SDM Templates	1923
SDM Templates	1923
SDM Templates and Switch Stacks	1925
How to Configure SDM Templates	1925
Configuring SDM Templates	1925
Configuring the Switch SDM Template	1925
Monitoring and Maintaining SDM Templates	1926
Configuration Examples for SDM Templates	1926
Examples: Configuring SDM Templates	1926
Examples: Displaying SDM Templates	1926

Feature History and Information for Configuring SDM Templates 1928

---

**CHAPTER 96**

**Configuring System Message Logs 1929**

Finding Feature Information 1929

Restrictions for Configuring System Message Logs 1929

Information About Configuring System Message Logs 1930

System Message Logging 1930

System Log Message Format 1930

Default System Message Logging Settings 1931

Syslog Message Limits 1932

Enabling Syslog Trap Messages 1932

How to Configure System Message Logs 1932

Setting the Message Display Destination Device 1932

Synchronizing Log Messages 1934

Disabling Message Logging 1936

Enabling and Disabling Time Stamps on Log Messages 1936

Enabling and Disabling Sequence Numbers in Log Messages 1937

Defining the Message Severity Level 1938

Limiting Syslog Messages Sent to the History Table and to SNMP 1939

Logging Messages to a UNIX Syslog Daemon 1939

Monitoring and Maintaining System Message Logs 1940

Monitoring Configuration Archive Logs 1940

Configuration Examples for System Message Logs 1940

Example: Stacking System Message 1940

Example: Switch System Message 1941

Additional References for System Message Logs 1941

Feature History and Information For System Message Logs 1942

---

**CHAPTER 97**

**Configuring Online Diagnostics 1943**

Finding Feature Information 1943

Information About Configuring Online Diagnostics 1943

Online Diagnostics 1943

How to Configure Online Diagnostics 1944

Starting Online Diagnostic Tests 1944

Configuring Online Diagnostics	1945
Scheduling Online Diagnostics	1945
Configuring Health-Monitoring Diagnostics	1946
Monitoring and Maintaining Online Diagnostics	1949
Displaying Online Diagnostic Tests and Test Results	1949
Configuration Examples for Online Diagnostic Tests	1949
Examples: Start Diagnostic Tests	1949
Example: Configure a Health Monitoring Test	1950
Examples: Schedule Diagnostic Test	1950
Examples: Displaying Online Diagnostics	1950
Additional References for Online Diagnostics	1951
Feature History and Information for Configuring Online Diagnostics	1952

**CHAPTER 98****Managing Configuration Files 1953**

Prerequisites for Managing Configuration Files	1953
Restrictions for Managing Configuration Files	1953
Information About Managing Configuration Files	1953
Types of Configuration Files	1953
Configuration Mode and Selecting a Configuration Source	1954
Configuration File Changes Using the CLI	1954
Location of Configuration Files	1954
Copy Configuration Files from a Network Server to the Switch	1955
Copying a Configuration File from the Switch to a TFTP Server	1955
Copying a Configuration File from the Switch to an RCP Server	1955
Copying a Configuration File from the Switch to an FTP Server	1957
Copy Configuration Files from a Switch to Another Switch	1958
Configuration Files Larger than NVRAM	1958
Compressing the Configuration File	1958
Storing the Configuration in Flash Memory on Class A Flash File Systems	1959
Loading the Configuration Commands from the Network	1959
Configuring the Switch to Download Configuration Files	1959
Network Versus Host Configuration Files	1959
How to Manage Configuration File Information	1960
Displaying Configuration File Information (CLI)	1960

Modifying the Configuration File (CLI)	1961
Copying a Configuration File from the Switch to a TFTP Server (CLI)	1962
What to Do Next	1963
Copying a Configuration File from the Switch to an RCP Server (CLI)	1963
Examples	1964
What to Do Next	1965
Copying a Configuration File from the Switch to the FTP Server (CLI)	1965
Examples	1966
What to Do Next	1966
Copying a Configuration File from a TFTP Server to the Switch (CLI)	1966
What to Do Next	1967
Copying a Configuration File from the rcp Server to the Switch (CLI)	1967
Examples	1968
What to Do Next	1969
Copying a Configuration File from an FTP Server to the Switch (CLI)	1969
Examples	1970
What to Do Next	1971
Maintaining Configuration Files Larger than NVRAM	1971
Compressing the Configuration File (CLI)	1971
Storing the Configuration in Flash Memory on Class A Flash File Systems (CLI)	1972
Loading the Configuration Commands from the Network (CLI)	1974
Copying Configuration Files from Flash Memory to the Startup or Running Configuration (CLI)	1975
Copying Configuration Files Between Flash Memory File Systems (CLI)	1976
Copying a Configuration File from an FTP Server to Flash Memory Devices (CLI)	1977
What to Do Next	1978
Copying a Configuration File from an RCP Server to Flash Memory Devices (CLI)	1978
Copying a Configuration File from a TFTP Server to Flash Memory Devices (CLI)	1979
Re-executing the Configuration Commands in the Startup Configuration File (CLI)	1979
Clearing the Startup Configuration (CLI)	1980
Deleting a Specified Configuration File (CLI)	1981
Specifying the CONFIG_FILE Environment Variable on Class A Flash File Systems (CLI)	1981
What to Do Next	1983
Configuring the Switch to Download Configuration Files	1983

Configuring the Switch to Download the Network Configuration File (CLI)	1983
Configuring the Switch to Download the Host Configuration File (CLI)	1985
Additional References	1986

**CHAPTER 99****Configuration Replace and Configuration Rollback 1989**

Prerequisites for Configuration Replace and Configuration Rollback	1989
Restrictions for Configuration Replace and Configuration Rollback	1990
Information About Configuration Replace and Configuration Rollback	1990
Configuration Archive	1990
Configuration Replace	1991
Configuration Rollback	1992
Configuration Rollback Confirmed Change	1992
Benefits of Configuration Replace and Configuration Rollback	1992
How to Use Configuration Replace and Configuration Rollback	1993
Creating a Configuration Archive (CLI)	1993
Performing a Configuration Replace or Configuration Rollback Operation (CLI)	1994
Monitoring and Troubleshooting the Feature (CLI)	1997
Configuration Examples for Configuration Replace and Configuration Rollback	1999
Creating a Configuration Archive	1999
Replacing the Current Running Configuration with a Saved Cisco IOS Configuration File	1999
Reverting to the Startup Configuration File	2000
Performing a Configuration Replace Operation with the configure confirm Command	2000
Performing a Configuration Rollback Operation	2000
Additional References	2001

**CHAPTER 100****Working with the Flash File System 2005**

Information About the Flash File System	2005
Displaying Available File Systems	2005
Setting the Default File System	2008
Displaying Information About Files on a File System	2008
Changing Directories and Displaying the Working Directory (CLI)	2009
Creating Directories (CLI)	2010
Removing Directories	2010
Copying Files	2011

Copying Files from One Switch in a Stack to Another Switch in the Same Stack	2011
Deleting Files	2013
Creating, Displaying and Extracting Files (CLI)	2013
Additional References	2015

**CHAPTER 101****Working with Cisco IOS XE Software Bundles 2017**

About Software Bundles and Packages	2017
Bundle and Package File Location on the Switch	2017
Upgrading Cisco IOS XE Software	2018
Upgrading Cisco IOS XE Software: Install Mode	2018
Upgrading Cisco IOS XE Software Install Mode Example	2018
Upgrading Cisco IOS XE Software: Bundle Mode	2019
Upgrading Cisco IOS XE Software Bundle Mode Example	2019
Converting from the Bundle Running Mode to the Install Running Mode	2020
Converting from the Bundle Running Mode to the Install Running Mode Example	2020
Copying IOS XE Package and Bundle Files from One Stack Member to Another	2021
Copying IOS XE Package and Bundle Files from One Stack Member to Another Example	2021
Upgrading a Switch Running Incompatible Software	2023
Upgrading a Switch Running Incompatible Software Example	2023
Upgrading a Switch Running in Incompatible Running Mode	2024
Upgrading a Switch Running in Incompatible Running Mode Example	2024
Additional References	2026

**CHAPTER 102****Troubleshooting the Software Configuration 2029**

Finding Feature Information	2029
Information About Troubleshooting the Software Configuration	2029
Software Failure on a Switch	2029
Lost or Forgotten Password on a Switch	2030
Power over Ethernet Ports	2030
Disabled Port Caused by Power Loss	2030
Disabled Port Caused by False Link-Up	2031
Ping	2031
Layer 2 Traceroute	2031
Layer 2 Traceroute Guidelines	2031

IP Traceroute	2032
Time Domain Reflector Guidelines	2033
Debug Commands	2034
Crashinfo Files	2034
System Reports	2035
Onboard Failure Logging on the Switch	2036
Fan Failures	2036
Possible Symptoms of High CPU Utilization	2037
How to Troubleshoot the Software Configuration	2037
Recovering from a Software Failure	2037
Recovering from a Lost or Forgotten Password	2039
Procedure with Password Recovery Enabled	2040
Procedure with Password Recovery Disabled	2042
Preventing Switch Stack Problems	2044
Preventing Autonegotiation Mismatches	2044
Troubleshooting SFP Module Security and Identification	2045
Monitoring SFP Module Status	2045
Executing Ping	2045
Monitoring Temperature	2046
Monitoring the Physical Path	2046
Executing IP Traceroute	2047
Running TDR and Displaying the Results	2047
Redirecting Debug and Error Message Output	2047
Using the show platform forward Command	2047
Using the show debug command	2048
Configuring OBFL	2048
Verifying Troubleshooting of the Software Configuration	2049
Displaying OBFL Information	2049
Example: Verifying the Problem and Cause for High CPU Utilization	2050
Scenarios for Troubleshooting the Software Configuration	2051
Scenarios to Troubleshoot Power over Ethernet (PoE)	2051
Configuration Examples for Troubleshooting Software	2053
Example: Pinging an IP Host	2053
Example: Performing a Traceroute to an IP Host	2054

Example: Enabling All System Diagnostics	2055
Additional References for Troubleshooting Software Configuration	2055
Feature History and Information for Troubleshooting Software Configuration	2056

**CHAPTER 106**
**Configuring VLANs 2097**

Finding Feature Information	2097
Prerequisites for VLANs	2097
Restrictions for VLANs	2098
Information About VLANs	2098
Logical Networks	2098
Supported VLANs	2099
VLAN Port Membership Modes	2099
VLAN Configuration Files	2100
Normal-Range VLAN Configuration Guidelines	2101
Extended-Range VLAN Configuration Guidelines	2102

How to Configure VLANs	2102
How to Configure Normal-Range VLANs	2102
Creating or Modifying an Ethernet VLAN (CLI)	2103
Deleting a VLAN (CLI)	2105
Assigning Static-Access Ports to a VLAN (CLI)	2106
How to Configure Extended-Range VLANs	2108
Creating an Extended-Range VLAN (CLI)	2108
How to Configure VLANs (GUI)	2109
Creating Layer2 VLAN (GUI)	2109
Creating Layer3 Interface (GUI)	2110
Viewing Layer2 VLAN (GUI)	2110
Viewing Layer3 Interface (GUI)	2111
Removing Layer2 VLAN (GUI)	2111
Removing Layer3 Interface (GUI)	2112
Monitoring VLANs	2112
Where to Go Next	2113
Additional References	2114
Feature History and Information for VLANs	2115

---

**CHAPTER 107**
**Configuring VLAN Groups 2117**

Finding Feature Information	2117
Prerequisites for VLAN Groups	2117
Restrictions for VLAN Groups	2117
Information About VLAN Groups	2118
How to Configure VLAN Groups	2118
Creating VLAN Groups (CLI)	2118
Removing VLAN Group (CLI)	2119
Creating VLAN Groups (GUI)	2119
Adding a VLAN Group to WLAN (CLI)	2120
Adding a VLAN Group to WLAN (GUI)	2120
Removing VLAN Groups (GUI)	2121
Viewing VLANs in VLAN Groups (CLI)	2121
Viewing VLAN Groups (GUI)	2121
Where to Go Next	2122

Additional References	2122
Feature History and Information for VLAN Groups	2124

**CHAPTER 108****Configuring VLAN Trunks 2125**

Finding Feature Information	2125
Prerequisites for VLAN Trunks	2125
Restrictions for VLAN Trunks	2126
Information About VLAN Trunks	2127
Trunking Overview	2127
Trunking Modes	2127
Layer 2 Interface Modes	2127
Allowed VLANs on a Trunk	2128
Load Sharing on Trunk Ports	2128
Network Load Sharing Using STP Priorities	2128
Network Load Sharing Using STP Path Cost	2129
Feature Interactions	2129
How to Configure VLAN Trunks	2129
Configuring an Ethernet Interface as a Trunk Port	2130
Configuring a Trunk Port (CLI)	2130
Defining the Allowed VLANs on a Trunk (CLI)	2132
Changing the Pruning-Eligible List (CLI)	2133
Configuring the Native VLAN for Untagged Traffic (CLI)	2134
Configuring Trunk Ports for Load Sharing	2136
Configuring Load Sharing Using STP Port Priorities (CLI)	2136
Configuring Load Sharing Using STP Path Cost (CLI)	2139
Where to Go Next	2141
Additional References	2142
Feature History and Information for VLAN Trunks	2143

**CHAPTER 109****Configuring Voice VLANs 2145**

Finding Feature Information	2145
Prerequisites for Voice VLANs	2145
Restrictions for Voice VLANs	2146
Information About Voice VLAN	2146

Voice VLANs	2146
Cisco IP Phone Voice Traffic	2146
Cisco IP Phone Data Traffic	2147
Voice VLAN Configuration Guidelines	2147
How to Configure Voice VLAN	2148
Configuring Cisco IP Phone Voice Traffic (CLI)	2148
Configuring the Priority of Incoming Data Frames (CLI)	2150
Monitoring Voice VLAN	2152
Where to Go Next	2152
Additional References	2152
Feature History and Information for Voice VLAN	2153

---

**CHAPTER 110**
**Configuring Private VLANs 2155**

Finding Feature Information	2155
Prerequisites for Private VLANs	2155
Restrictions for Private VLANs	2155
Information About Private VLANs	2156
Private VLAN Domains	2156
Secondary VLANs	2157
Private VLANs Ports	2157
Private VLANs in Networks	2158
IP Addressing Scheme with Private VLANs	2159
Private VLANs Across Multiple Switches	2159
Private-VLAN Interaction with Other Features	2160
Private VLANs and Unicast, Broadcast, and Multicast Traffic	2160
Private VLANs and SVIs	2160
Private VLANs and Switch Stacks	2161
Private VLAN with Dynamic Mac Address	2161
Private VLAN with Static Mac Address	2161
Private VLAN Interaction with VACL/QOS	2161
Private VLANs and HA Support	2162
Private-VLAN Configuration Guidelines	2162
Default Private-VLAN Configurations	2162
Secondary and Primary VLAN Configuration	2162

Private VLAN Port Configuration	2164
How to Configure Private VLANs	2165
Configuring Private VLANs	2165
Configuring and Associating VLANs in a Private VLAN	2166
Configuring a Layer 2 Interface as a Private VLAN Host Port	2169
Configuring a Layer 2 Interface as a Private VLAN Promiscuous Port	2170
Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface	2172
Monitoring Private VLANs	2174
Configuration Examples for Private VLANs	2174
Example: Configuring and Associating VLANs in a Private VLAN	2174
Example: Configuring an Interface as a Host Port	2175
Example: Configuring an Interface as a Private VLAN Promiscuous Port	2176
Example: Mapping Secondary VLANs to a Primary VLAN Interface	2176
Example: Monitoring Private VLANs	2176
Where to Go Next	2177

## Preface

- [Document Conventions, on page xcv](#)
- [Related Documentation, on page xcvi](#)
- [Obtaining Documentation and Submitting a Service Request, on page xcvi](#)

## Document Conventions

This document uses the following conventions:

Convention	Description
^ or Ctrl	Both the ^ symbol and Ctrl represent the Control (Ctrl) key on a keyboard. For example, the key combination <b>^D</b> or <b>Ctrl-D</b> means that you hold down the Control key while you press the D key. (Keys are indicated in capital letters but are not case sensitive.)
<b>bold font</b>	Commands and keywords and user-entered text appear in <b>bold font</b> .
<i>Italic font</i>	Document titles, new or emphasized terms, and arguments for which you supply values are in <i>italic font</i> .
Courier font	Terminal sessions and information the system displays appear in <code>courier font</code> .
<b>Bold Courier font</b>	<b>Bold Courier font</b> indicates text that the user must enter.
[x]	Elements in square brackets are optional.
...	An ellipsis (three consecutive nonbolded periods without spaces) after a syntax element indicates that the element can be repeated.
	A vertical line, called a pipe, indicates a choice within a set of keywords or arguments.
[x   y]	Optional alternative keywords are grouped in brackets and separated by vertical bars.
{x   y}	Required alternative keywords are grouped in braces and separated by vertical bars.

Convention	Description
[x {y   z}]	Nested set of square brackets or braces indicate optional or required choices within optional or required elements. Braces and a vertical bar within square brackets indicate a required choice within an optional element.
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.
< >	Nonprinting characters such as passwords are in angle brackets.
[ ]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

### Reader Alert Conventions

This document may use the following conventions for reader alerts:

**Note** Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

**Tip** Means *the following information will help you solve a problem*.

**Caution** Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

**Timesaver** Means *the described action saves time*. You can save time by performing the action described in the paragraph.

### Warning

**IMPORTANT SAFETY INSTRUCTIONS**

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

SAVE THESE INSTRUCTIONS

## Related Documentation

# Using the Command-Line Interface

---

- [Information About Using the Command-Line Interface, on page 1](#)
- [How to Use the CLI to Configure Features, on page 6](#)

## Information About Using the Command-Line Interface

### Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

You can start a CLI session through a console connection, through Telnet, an SSH, or by using the browser.

When you start a session, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as **show** commands, which show the current configuration status, and **clear** commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode .

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode.

Table 1: Command Mode Summary

Mode	Access Method	Prompt	Exit Method	About This Mode
User EXEC	Begin a session using Telnet, SSH, or console.	Switch>	Enter <b>logout</b> or <b>quit</b> .	Use this mode to <ul style="list-style-type: none"> <li>• Change terminal settings.</li> <li>• Perform basic tests.</li> <li>• Display system information.</li> </ul>
Privileged EXEC	While in user EXEC mode, enter the <b>enable</b> command.	Switch#	Enter <b>disable</b> to exit.	Use this mode to verify commands that you have entered. Use a password to protect access to this mode.  Use this mode to execute privilege EXEC commands for access points. These commands are not part of the running config of the controller, they are sent to the IOS config of the access point.
Global configuration	While in privileged EXEC mode, enter the <b>configure</b> command.	Switch(config)#	To exit to privileged EXEC mode, enter <b>exit</b> or <b>end</b> , or press <b>Ctrl-Z</b> .	Use this mode to configure parameters that apply to the entire switch.  Use this mode to configure access point commands that are part of the running config of the controller.

Mode	Access Method	Prompt	Exit Method	About This Mode
VLAN configuration	While in global configuration mode, enter the <b>vlan</b> <i>vlan-id</i> command.	Switch(config-vlan) #	To exit to global configuration mode, enter the <b>exit</b> command.  To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> .	Use this mode to configure VLAN parameters. When VTP mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005) and save configurations in the switch startup configuration file.
Interface configuration	While in global configuration mode, enter the <b>interface</b> command (with a specific interface).	Switch(config-if) #	To exit to global configuration mode, enter <b>exit</b> .  To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> .	Use this mode to configure parameters for the Ethernet ports.
Line configuration	While in global configuration mode, specify a line with the <b>line vty</b> or <b>line console</b> command.	Switch(config-line) #	To exit to global configuration mode, enter <b>exit</b> .  To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> .	Use this mode to configure parameters for the terminal line.

## Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the **show configuration** privileged EXEC command in an abbreviated form:

```
Switch# show conf
```

## No and Default Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to reenable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values.

## CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your switch.

**Table 2: Common CLI Error Messages**

Error Message	Meaning	How to Get Help
% Ambiguous command: "show con"	You did not enter enough characters for your switch to recognize the command.	Reenter the command followed by a question mark (?) without any space between the command and the question mark.  The possible keywords that you can enter with the command appear.
% Incomplete command.	You did not enter all of the keywords or values required by this command.	Reenter the command followed by a question mark (?) with a space between the command and the question mark.  The possible keywords that you can enter with the command appear.
% Invalid input detected at '^' marker.	You entered the command incorrectly. The caret (^) marks the point of the error.	Enter a question mark (?) to display all of the commands that are available in this command mode.  The possible keywords that you can enter with the command appear.

## Configuration Logging

You can log and view changes to the switch configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

---

**Note** Only CLI or HTTP changes are logged.

---

## Using the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>help</b> <b>Example:</b> Switch# <b>help</b>	Obtains a brief description of the help system in any command mode.
<b>Step 2</b>	<i>abbreviated-command-entry</i> ? <b>Example:</b> Switch# <b>di?</b> dir disable disconnect	Obtains a list of commands that begin with a particular character string.
<b>Step 3</b>	<i>abbreviated-command-entry</i> <Tab> <b>Example:</b> Switch# <b>sh conf</b> <tab> Switch# <b>show configuration</b>	Completes a partial command name.
<b>Step 4</b>	<b>?</b> <b>Example:</b> Switch> <b>?</b>	Lists all commands available for a particular command mode.
<b>Step 5</b>	<i>command</i> ? <b>Example:</b> Switch> <b>show ?</b>	Lists the associated keywords for a command.
<b>Step 6</b>	<i>command keyword</i> ? <b>Example:</b> Switch(config)# <b>cdp holdtime ?</b> <10-255> Length of time (in sec) that receiver must keep this packet	Lists the associated arguments for a keyword.

# How to Use the CLI to Configure Features

## Configuring the Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.

### Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. This procedure is optional.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>terminal history</b> [ <i>size number-of-lines</i> ] <b>Example:</b> Switch# <b>terminal history size 200</b>	Changes the number of command lines that the switch records during the current terminal session in privileged EXEC mode. You can configure the size from 0 to 256.

### Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

**Note** The arrow keys function only on ANSI-compatible terminals such as VT100s.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>Ctrl-P</b> or use the <b>up arrow</b> key	Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.
<b>Step 2</b>	<b>Ctrl-N</b> or use the <b>down arrow</b> key	Returns to more recent commands in the history buffer after recalling commands with <b>Ctrl-P</b> or the up arrow key. Repeat the key sequence to recall successively more recent commands.
<b>Step 3</b>	<b>show history</b> <b>Example:</b> Switch# <b>show history</b>	Lists the last several commands that you just entered in privileged EXEC mode. The number of commands that appear is controlled by the setting of the <b>terminal history</b> global

	Command or Action	Purpose
		configuration command and the <b>history</b> line configuration command.

## Disabling the Command History Feature

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. This procedure is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>terminal no history</b>  <b>Example:</b> Switch# <code>terminal no history</code>	Disables the feature during the current terminal session in privileged EXEC mode.

## Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it and reenables it.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>terminal editing</b>  <b>Example:</b> Switch# <code>terminal editing</code>	Reenables the enhanced editing mode for the current terminal session in privileged EXEC mode.
<b>Step 2</b>	<b>terminal no editing</b>  <b>Example:</b> Switch# <code>terminal no editing</code>	Disables the enhanced editing mode for the current terminal session in privileged EXEC mode.

## Editing Commands Through Keystrokes

The keystrokes help you to edit the command lines. These keystrokes are optional.

**Note** The arrow keys function only on ANSI-compatible terminals such as VT100s.

*Table 3: Editing Commands*

Editing Commands	Description
<b>Ctrl-B</b> or use the <b>left arrow</b> key	Moves the cursor back one character.

<b>Ctrl-F</b> or use the <b>right arrow</b> key	Moves the cursor forward one character.
<b>Ctrl-A</b>	Moves the cursor to the beginning of the command line.
<b>Ctrl-E</b>	Moves the cursor to the end of the command line.
<b>Esc B</b>	Moves the cursor back one word.
<b>Esc F</b>	Moves the cursor forward one word.
<b>Ctrl-T</b>	Transposes the character to the left of the cursor with the character located at the cursor.
<b>Delete</b> or <b>Backspace</b> key	Erases the character to the left of the cursor.
<b>Ctrl-D</b>	Deletes the character at the cursor.
<b>Ctrl-K</b>	Deletes all characters from the cursor to the end of the command line.
<b>Ctrl-U</b> or <b>Ctrl-X</b>	Deletes all characters from the cursor to the beginning of the command line.
<b>Ctrl-W</b>	Deletes the word to the left of the cursor.
<b>Esc D</b>	Deletes from the cursor to the end of the word.
<b>Esc C</b>	Capitalizes at the cursor.
<b>Esc L</b>	Changes the word at the cursor to lowercase.
<b>Esc U</b>	Capitalizes letters from the cursor to the end of the word.
<b>Ctrl-V</b> or <b>Esc Q</b>	Designates a particular keystroke as an executable command, perhaps as a shortcut.
<b>Return</b> key	<p>Scrolls down a line or screen on displays that are longer than the terminal screen can display.</p> <p><b>Note</b> The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including <b>show</b> command output. You can use the <b>Return</b> and <b>Space</b> bar keystrokes whenever you see the More prompt.</p>
<b>Space</b> bar	Scrolls down one screen.
<b>Ctrl-L</b> or <b>Ctrl-R</b>	Redisplays the current command line if the switch suddenly sends a message to your screen.

## Editing Command Lines That Wrap

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press **Ctrl-B** or the left arrow key repeatedly. You can also press **Ctrl-A** to immediately move to the beginning of the line.

**Note** The arrow keys function only on ANSI-compatible terminals such as VT100s.

The following example shows how to wrap a command line that extends beyond a single line on the screen.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>access-list</b> <b>Example:</b> <pre>Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 Switch(config)# \$ 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 255.25 Switch(config)# \$t tcp 10.15.22.25 255.255.255.0 131.108.1.20 255.255.255.0 eq Switch(config)# \$15.22.25 255.255.255.0 10.15.22.35 255.255.255.0 eq 45</pre>	Displays the global configuration command entry that extends beyond one line.  When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign (\$) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.
<b>Step 2</b>	<b>Ctrl-A</b> <b>Example:</b> <pre>Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.2\$</pre>	Checks the complete syntax.  The dollar sign (\$) appears at the end of the line to show that the line has been scrolled to the right.
<b>Step 3</b>	<b>Return key</b>	Execute the commands.  The software assumes that you have a terminal screen that is 80 columns wide. If you have a different width, use the <b>terminal width</b> privileged EXEC command to set the width of your terminal.  Use line wrapping with the command history feature to recall and modify previous complex command entries.

## Searching and Filtering Output of show and more Commands

You can search and filter the output for **show** and **more** commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<p><code>{show   more} command   {begin   include   exclude} regular-expression</code></p> <p><b>Example:</b></p> <pre>Switch# show interfaces   include protocol Vlan1 is up, line protocol is up Vlan10 is up, line protocol is down GigabitEthernet1/0/1 is up, line protocol is down GigabitEthernet1/0/2 is up, line protocol is up</pre>	<p>Searches and filters the output.</p> <p>Expressions are case sensitive. For example, if you enter <code>  exclude output</code>, the lines that contain <b>output</b> are not displayed, but the lines that contain <b>output</b> appear.</p>

## Accessing the CLI on a Switch Stack

You can access the CLI through a console connection, through Telnet, a SSH, or by using the browser.

You manage the switch stack and the stack member interfaces through the active switch. You cannot manage stack members on an individual switch basis. You can connect to the active switch through the console port or the Ethernet management port of one or more stack members. Be careful with using multiple CLI sessions on the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

**Note** We recommend using one CLI session when managing the switch stack.

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

To debug the standby switch, use the **session standby ios** privileged EXEC command from the active switch to access the IOS console of the standby switch. To debug a specific stack member, use the **session switch stack-member-number** privileged EXEC command from the active switch to access the diagnostic shell of the stack member. For more information about these commands, see the switch command reference.

## Accessing the CLI Through a Console Connection or Through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the switch console or connect a PC to the Ethernet management port and then power on the switch, as described in the hardware installation guide that shipped with your switch.

If your switch is already configured, you can access the CLI through a local console connection or through a remote Telnet session, but your switch must first be configured for this type of access.

You can use one of these methods to establish a connection with the switch:

**Procedure**

- Connect the switch console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the switch hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.
  - The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.
  - The switch supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.

## CHAPTER 2

# Using the Web Graphical User Interface

- Prerequisites for Using the Web GUI, on page 13
- Information About Using The Web GUI, on page 14
- Connecting the Console Port of the Switch , on page 15
- Logging On to the GUI, on page 15
- Enabling Web and Secure Web Modes , on page 16
- Configuring the Switch Web GUI, on page 16

## Prerequisites for Using the Web GUI

### Wired Web UI (Device Manager) System Requirements

Hardware Requirements

*Table 4: Minimum Hardware Requirements*

Processor Speed	DRAM	Number of Colors	Resolution	Font Size
233 MHz minimum <a href="#">1</a>	512 MB <a href="#">2</a>	256	1024 x 768	Small

<sup>1</sup> We recommend 1 GHz.

<sup>2</sup> We recommend 1 GB DRAM.

Software Requirements

- – Windows 7, Windows Vista, Windows XP, Windows 2003, or Windows 2000
- – Microsoft Internet Explorer 6.0 and 7.0, and Mozilla Firefox up to version 26.0, with JavaScript enabled.

### Wireless Web UI Software Requirements

- Operating Systems
  - Windows 7
  - Windows 8

- Mac OS X 10.8
- Browsers:
  - Google Chrome, version 35
  - Microsoft Internet Explorer, versions 10 or 11
  - Mozilla Firefox, version 30 or later
  - Safari, version 6.1

## Information About Using The Web GUI

A web browser, or graphical user interface (GUI), is built into each switch.

You can use either the service port interface or the management interface to access the GUI. We recommend that you use the service-port interface. Click Help at the top of any page in the GUI to display online help. You might need to disable your browser's pop-up blocker to view the online help.

## Web GUI Features

The switch web GUI supports the following:

The Configuration Wizard—After initial configuration of the IP address and the local username/password or auth via the authentication server (privilege 15 needed), the wizard provides a method to complete the initial wireless configuration. Start the wizard through Configuration -> Wizard and follow the nine-step process to configure the following:

- Admin Users
- SNMP System Summary
- Management Port
- Wireless Management
- RF Mobility and Country code
- Mobility configuration
- WLANs
- 802.11 Configuration
- Set Time

The Monitor tab:

- Displays summary details of switch, clients, and access points.
- Displays all radio and AP join statistics.
- Displays air quality on access points.
- Displays list of all Cisco Discovery Protocol (CDP) neighbors on all interfaces and the CDP traffic information.
- Displays all rogue access points based on their classification—friendly, malicious, ad hoc, classified, and unclassified.

The Configuration tab:

- Enables you to configure the switch for all initial operation using the web Configuration Wizard. The wizard allows you to configure user details, management interface, and so on.
- Enables you to configure the system, internal DHCP server, management, and mobility management parameters.
- Enables you to configure the switch, WLAN, and radios.
- Enables you to configure and set security policies on your switch.
- Enables you to access the switch operating system software management commands.

The Administration tab enables you to configure system logs.

## Connecting the Console Port of the Switch

### Before you begin

Before you can configure the switch for basic operations, you need to connect it to a PC that uses a VT-100 terminal emulation program (such as HyperTerminal, ProComm, Minicom, or Tip).

### Procedure

- 
- Step 1** Connect one end of a null-modem serial cable to the switch's RJ-45 console port and the other end to your PC's serial port.
  - Step 2** Plug the AC power cord into the switch and a grounded 100 to 240 VAC, 50/60-Hz electrical outlet. Turn on the power supply. The bootup script displays operating system software initialization (code download and power-on self-test verification) and basic configuration. If the switch passes the power-on self-test, the bootup script runs the configuration wizard, which prompts you for basic configuration input.
  - Step 3** Enter **yes**. Proceed with basic initial setup configuration parameters in the CLI setup wizard. Specify the IP address for the service port which is the gigabitethernet 0/0 interface.

After entering the configuration parameters in the configuration wizard, you can access the Web GUI. Now, the switch is configured with the IP address for service port.

---

## Logging On to the GUI

---

**Note** Do not configure TACACS authentication when the controller is set to use local authentication.

---

### Procedure

- 
- Step 1** Enter the switch IP address in your browser's address bar. For a secure connection, enter **https://ip-address**. For a less secure connection, enter **http://ip-address**.
  - Step 2** When prompted, enter a valid username and password and click **OK**.

**Note** The administrative username and password that you created in the configuration wizard are case sensitive. The default username is admin, and the default password is cisco.

The Accessing page appears.

---

## Enabling Web and Secure Web Modes

### Procedure

---

- Step 1** Choose **Configuration > Controller > Switch > Management > Protocol Management > HTTP-HTTPS**. The **HTTP-HTTPS Configuration** page appears.
- Step 2** To enable web mode, which allows users to access the switch GUI using “http://ip-address,” choose Enabled from the HTTP Access drop-down list. Otherwise, choose Disabled. Web mode (HTTP) is not a secure connection.
- Step 3** To enable secure web mode, which allows users to access the switch GUI using “https://ip-address,” choose Enabled from the HTTPS Access drop-down list. Otherwise, choose Disabled. Secure web mode (HTTPS) is a secure connection.
- Step 4** Choose to track the device in the IP Device Tracking check box.
- Step 5** Choose to enable the trust point in the Enable check box.
- Step 6** Choose the trustpoints from the Trustpoints drop-down list.
- Step 7** Enter the amount of time, in seconds, before the web session times out due to inactivity in the HTTP Timeout-policy (1 to 600 sec) text box.  
The valid range is from 1 to 600 seconds.
- Step 8** Enter the server life time in the Server Life Time (1 to 86400 sec) text box.  
The valid range is from 1 to 86400 seconds.
- Step 9** Enter the maximum number of connection requests that the server can accept in the Maximum number of Requests (1 to 86400) text box.  
The valid range is from 1 to 86400 connections.
- Step 10** Click **Apply**.
- Step 11** Click **Save Configuration**.
- 

## Configuring the Switch Web GUI

The configuration wizard enables you to configure basic settings on the switch. You can run the wizard after you receive the switch from the factory or after the switch has been reset to factory defaults. The configuration wizard is available in both GUI and CLI formats.

## Procedure

---

- Step 1** Connect your PC to the service port and configure an IPv4 address to use the same subnet as the switch. The switch is loaded with IOS XE image and the service port interface is configured as gigabitethernet 0/0.
- Step 2** Start Internet Explorer 10 (or later), Firefox 2.0.0.11 (or later), or Google Chrome on your PC and enter the management interface IP address on the browser window. The management interface IP address is same as the gigabitethernet 0/0 (also known as service port interface). When you log in for the first time, you need to enter HTTP username and password. By default, the username is **admin** and the password is **cisco**.
- You can use both HTTP and HTTPS when using the service port interface. HTTPS is enabled by default and HTTP can also be enabled.
- When you log in for the first time, the **Accessing Cisco Switch Accessing Cisco Controller <Model Number> <Hostname>** page appears.
- Step 3** On the **Accessing Cisco Switch Accessing Cisco Controller** page, click the **Wireless Web GUI** link to access switch web GUI **Home** page.
- Step 4** Choose **Configuration > Wizard** to perform all steps that you need to configure the switch initially. The **Admin Users** page appears.
- Step 5** On the **Admin Users** page, enter the administrative username to be assigned to this switch in the User Name text box and the administrative password to be assigned to this switch in the Password and Confirm Password text boxes. Click **Next**.
- The default username is **admin** and the default password is **cisco**. You can also create a new administrator user for the switch. You can enter up to 24 ASCII characters for username and password.
- The **SNMP System Summary** page appears.
- Step 6** On the **SNMP System Summary** page, enter the following SNMP system parameters for the switch, and click **Next**:
- Customer-definable switch location in the Location text box.
  - Customer-definable contact details such as phone number with names in the Contact text box.
  - Choose **enabled** to send SNMP notifications for various SNMP traps or **disabled** not to send SNMP notifications for various SNMP traps from the SNMP Global Trap drop-down list.
  - Choose **enabled** to send system log messages or **disabled** not to send system log messages from the SNMP Logging drop-down list.
- Note** The SNMP trap server, must be reachable through the distribution ports (and not through the gigabitethernet0/0 service or management interface).
- The **Management Port** page appears.
- Step 7** In the **Management Port** page, enter the following parameters for the management port interface (gigabitethernet 0/0) and click **Next**.
- Interface IP address that you assigned for the service port in the IP Address text box.
  - Network mask address of the management port interface in the Netmask text box.

- The IPv4 Dynamic Host Configuration Protocol (DHCP) address for the selected port in the IPv4 DHCP Server text box.

The **Wireless Management** page appears.

**Step 8** In the **Wireless Management** page, enter the following wireless interface management details, and click **Next**.

- Choose the interface—VLAN, or Ten Gigabit Ethernet from the Select Interface drop-down list.
- VLAN tag identifier, or 0 for no VLAN tag in the VLAN id text box.
- IP address of wireless management interface where access points are connected in the IP Address text box.
- Network mask address of the wireless management interface in the Netmask text box.
- DHCP IPv4 IP address in the IPv4 DHCP Server text box.

When selecting VLAN as interface, you can specify the ports as –Trunk or Access ports from the selected list displayed in the Switch Port Configuration text box.

The **RF Mobility and Country Code** page appears.

**Step 9** In the **RF Mobility and Country Code** page, enter the RF mobility domain name in the RF Mobility text box, choose current country code from the Country Code drop-down list, and click **Next**. From the GUI, you can select only one country code.

**Note** Before configuring RF grouping parameters and mobility configuration, ensure that you refer to the relevant conceptual content and then proceed with the configuration.

The **Mobility Configuration** page with mobility global configuration settings appears.

**Step 10** In the **Mobility Configuration** page, view and enter the following mobility global configuration settings, and click **Next**.

- Displays Mobility Controller in the Mobility Role text box.
- Displays mobility protocol port number in the Mobility Protocol Port text box.
- Displays the mobility group name in the Mobility Group Name text box.
- Displays whether DTLS is enabled in the DTLS Mode text box.  
DTLS is a standards-track Internet Engineering Task Force (IETF) protocol based on TLS.
- Displays mobility domain identifier for 802.11 radios in the Mobility Domain ID for 802.11 radios text box.
- Displays the number of members configured on the switch in the Mobility Domain Member Count text box.
- To enable the controller as a Mobility Oracle, select the Mobility Oracle Enabled check box.

**Note** Only the controller can be configured as Mobility Oracle. You cannot configure the switch as Mobility Oracle.

The Mobility Oracle is optional, it maintains the client database under one complete mobility domain.

- The amount of time (in seconds) between each ping request sent to an peer switch in the Mobility Keepalive Interval (1-30)sec text box.

Valid range is from 1 to 30 seconds, and the default value is 10 seconds.

- Number of times a ping request is sent to an peer switch before the peer is considered to be unreachable in the Mobility Keepalive Count (3-20) text box.

The valid range is from 3 to 20, and the default value is 3.

- The DSCP value that you can set for the mobility switch in the Mobility Control Message DSCP Value (0-63) text box.

The valid range is 0 to 63, and the default value is 0.

The **WLANS** page appears.

### Step 11

In the **Mobility Configuration** page, view and enter the following mobility global configuration settings, and click **Next**.

- Choose **Mobility Controller** or **Mobility Agent** from the Mobility Role drop-down list:
  - If Mobility Agent is chosen, enter the mobility controller IP address in the Mobility Controller IP Address text box and mobility controller IP address in the Mobility Controller Public IP Address text box.
  - If Mobility Controller is chosen, then the mobility controller IP address and mobility controller public IP address are displayed in the respective text boxes.
- Displays mobility protocol port number in the Mobility Protocol Port text box.
- Displays the mobility switch peer group name in the Mobility Switch Peer Group Name text box.
- Displays whether DTLS is enabled in the DTLS Mode text box.

DTLS is a standards-track Internet Engineering Task Force (IETF) protocol based on TLS.
- Displays mobility domain identifier for 802.11 radios in the Mobility Domain ID for 802.11 radios text box.
- The amount of time (in seconds) between each ping request sent to an peer switch in the Mobility Keepalive Interval (1-30)sec text box.

Valid range is from 1 to 30 seconds, and the default value is 10 seconds.
- Number of times a ping request is sent to an peer switch before the peer is considered to be unreachable in the Mobility Keepalive Count (3-20) text box.

The valid range is from 3 to 20, and the default value is 3.
- The DSCP value that you can set for the mobility switch in the Mobility Control Message DSCP Value (0-63) text box.

The valid range is 0 to 63, and the default value is 0.
- Displays the number of mobility switch peer group member configured in the Switch Peer Group Members Configured text box.

The **WLANS** page appears.

**Step 12** In the **WLANs** page, enter the following WLAN configuration parameters, and click **Next**.

- WLAN identifier in the WLAN ID text box.
- SSID of the WLAN that the client is associated with in the SSID text box.
- Name of the WLAN used by the client in the Profile Name text box.

The **802.11 Configuration** page appears.

**Step 13** In the **802.11 Configuration** page, check either one or both 802.11a/n/ac and 802.11b/g/n check boxes to enable the 802.11 radios, and click **Next**.

The **Set Time** page appears.

**Step 14** In the **Set Time** page, you can configure the time and date on the switch based on the following parameters, and click **Next**.

- Displays current timestamp on the switch in the Current Time text box.
- Choose either Manual or NTP from the Mode drop-down list.  
On using the NTP server, all access points connected to the switch, synchronizes its time based on the NTP server settings available.
- Choose date on the switch from the Year, Month, and Day drop-down list.
- Choose time from the Hours, Minutes, and Seconds drop-down list.
- Enter the time zone in the Zone text box and select the off setting required when compared to the current time configured on the switch from the Offset drop-down list.

The **Save Wizard** page appears.

**Step 15** In the **Save Wizard** page, you can review the configuration settings performed on the switch using these steps, and if you wish to change any configuration value, click **Previous** and navigate to that page.

You can save the switch configuration created using the wizard only if a success message is displayed for all the wizards. If the **Save Wizard** page displays errors, you must recreate the wizard for initial configuration of the switch.

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for CleanAir

You can configure Cisco CleanAir only on CleanAir-enabled access points.

Only Cisco CleanAir-enabled access points using the following access point modes can perform Cisco CleanAir spectrum monitoring:

- **Local**—In this mode, each Cisco CleanAir-enabled access point radio provides air quality and interference detection reports for the current operating channel only.
- **Monitor**—When Cisco CleanAir is enabled in monitor mode, the access point provides air quality and interference detection reports for all monitored channels.

The following options are available:

- All— All channels
- DCA—Channel selection governed by the DCA list
- Country—All channel legal within a regulatory domain

---

**Note** The access point does not participate in AQ HeatMap in Prime Infrastructure.

---

- SE-Connect—This mode enables a user to connect a Spectrum Expert application running on an external Microsoft Windows XP or Vista PC to a Cisco CleanAir-enabled access point in order to display and analyze detailed spectrum data. The Spectrum Expert application connects directly to the access point, bypassing the switch. An access point in SE-Connect mode does not provide any Wi-Fi, RF, or spectrum data to the switch. All CleanAir system functionality is suspended while the AP is in this mode, and no clients are served. This mode is intended for remote troubleshooting only. Up to three active Spectrum Expert connections are possible.
- Only Cisco Catalyst 3850 and 3650 Switches can function as a Mobility Agent.
- Cisco Catalyst 3850, 3650 Switches and Cisco 5760 Wireless LAN Controllers can function as Mobility Controllers.

## Restrictions for CleanAir

- Access points in monitor mode do not transmit Wi-Fi traffic or 802.11 packets. They are excluded from radio resource management (RRM) planning and are not included in the neighbor access point list. IDR clustering depends on the switch's ability to detect neighboring in-network access points. Correlating interference device detections from multiple access points is limited between monitor-mode access points.
- SE-connect is an access point mode similar to local mode or monitor mode. The access point provides spectrum information to Spectrum Expert only for the current channel(s). The spectrum data is available for the current active channel(s) and the common monitored channel list is available. The access point continues to send AQ (Air Quality) and IDR (Interference Device Reports) reports to the switch and perform normal activities according to the current mode. Sniffer and rogue detections access point modes are incompatible with all types of CleanAir spectrum monitoring.
- Local Mode access point—Serves WLAN clients with the time slicing off-channel scanning and listens for 50 ms on each channel, and scans configurable feature scanning for all/country/DCA channels.
- Monitor Mode access point—Does not serve WLAN clients and are dedicated to scanning only. These access points listen for 1.2 s on each channel, and scans all channels.

- Cisco recommends a ratio of 1 monitor mode access point for every 5 local mode access points, this may also vary based on the network design and expert guidance for best coverage.
- Spectrum Expert (Windows XP laptop client) and AP should be pingable, otherwise; it will not work.

## Information About CleanAir

Cisco CleanAir is a spectrum intelligence solution designed to proactively manage the challenges of a shared wireless spectrum. All of the users of the shared spectrum can be seen (both native devices and foreign interferers). It also enables the network to act upon this information. For example, the interfering device can be manually removed or the system can automatically change the channel away from the interference.

A Cisco CleanAir system consists of CleanAir-enabled access points, wireless controller modules, mobility controllers, mobility anchors and next generation switches. The access points join the mobility controller directly or through the mobility anchor. They collect information about all devices that operate in the industrial, scientific, and medical (ISM) bands, identify and evaluate the information as a potential interference source, and forward it to the switch. The switch controls the access points, collects spectrum data, and forwards information to Cisco Prime Infrastructure (PI) or a Cisco Mobility Services Engine (MSE) upon request.

Any networking configurations can be performed only on the mobility controller, configurations cannot be performed in the MA mode. However, any radio level CleanAir configurations can be done using mobility anchor.

For every device operating in the unlicensed band, Cisco CleanAir tells what it is, where it is, how it is impacting the wireless network, and what actions should be taken. It simplifies RF.

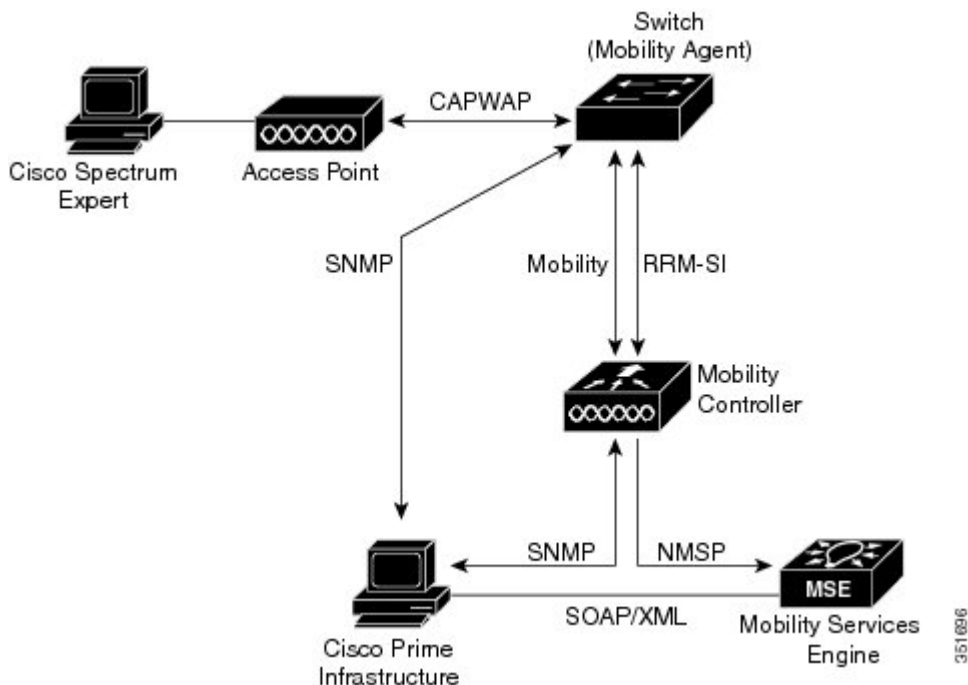

Wireless LAN systems operate in unlicensed 2.4-GHz and 5-GHz ISM bands. Many devices like microwave ovens, cordless phones, and Bluetooth devices also operate in these bands and can negatively affect the Wi-Fi operations.

Some of the most advanced WLAN services, such as voice over wireless and IEEE 802.11n radio communications, could be significantly impaired by the interference caused by other legal users of the ISM bands. The integration of Cisco CleanAir functionality addresses this problem of radio frequency (RF) interference.

## Cisco CleanAir Components

The basic Cisco CleanAir architecture consists of Cisco CleanAir-enabled APs and switch. Cisco Prime Infrastructure (PI), Mobility Services Engine (MSE) and Cisco Spectrum Expert are optional system components. Cisco PI and MSE provide user interfaces for advanced spectrum capabilities such as historic charts, tracking interference devices, location services and impact analysis.

Figure 1: Cisco CleanAir Solution

An access point equipped with Cisco CleanAir technology collects information about non-Wi-Fi interference sources, processes it, and forwards it to the MA. The access point sends AQR and IDR reports to the controller.

The mobility controller (MC) controls and configures CleanAir-capable access points, collects and processes spectrum data, and provides it to the PI and/or the MSE. The MC provides local user interfaces (GUI and CLI) to configure basic CleanAir features and services and display current spectrum information. The MC also does detection, merging and mitigation of interference devices using RRM TPC and DCM. For details on Interference Device Merging, see [Interference Device Merging, on page 28](#).

Cisco PI provides advanced user interfaces for CleanAir that include feature enabling and configuration, consolidated display information, historic AQ records and reporting engines. PI also shows charts of interference devices, AQ trends, and alerts.

Cisco MSE is required for location and historic tracking of interference devices, and provides coordination and consolidation of interference reports across multiple controllers. MSE also provides adaptive Wireless Intrusion Prevention System (WIPS) service that provides comprehensive over-the-air threat detection, location and mitigation. MSE also merges all the interference data.

To obtain detailed spectrum data that can be used to generate RF analysis plots similar to those provided by a spectrum analyzer, you can configure a Cisco CleanAir-enabled access point to connect directly to a Microsoft Windows XP or Vista PC running the Cisco Spectrum Expert application.

The switch performs the following tasks in a Cisco CleanAir system:

- Configures Cisco CleanAir capabilities on the access point.
- Provides interfaces (GUI, CLI, and SNMP) for configuring Cisco CleanAir features and retrieving data.
- Displays spectrum data.
- Collects and processes AQRs from the access point and stores them in the air quality database. AQRs contains information about the total interference from all identified sources represented by Air Quality Index (AQI) and summary for the most severe interference categories. The CleanAir system can also

- include unclassified interference information under per interference type reports which enable you to take action in cases where the interference due to unclassified interfering devices is frequent.
- Collects and processes Interference Device Reports (IDRs) from the access point and stores them in the interference device database.
  - Forwards spectrum data to Prime Infrastructure and the MSE.

## Terms Used in Cisco CleanAir

*Table 5: CleanAir-related Terms*

Term	Description
AQI	Air Quality Index. The AQI is an indicator of air quality, based on the air pollutants. An AQI of 0 is bad and an AQI > 85 is good.
AQR	Air Quality Report. AQRs contain information about the total interference from all identified sources represented by AQI and summary of the most severe interference categories. AQRs are sent every 15 minutes to the Mobility Controller and every 30 seconds in the Rapid mode.
DC	Duty Cycle. Percentage of time that the channel is utilized by a device.
EDRRM	EDRRM Event Driven RRM. EDRRM allows an access point in distress to bypass normal RRM intervals and immediately change channels.
IDR	Interference Device Reports that the access point sends to the controller.
ISI	Interference Severity Index. The ISI is an indicator of the severity of the interference.
MA	Mobility Agent. An MA is either an access switch that has a wireless module running on it or an MC with an internal MA running on it. An MA is the wireless component that maintains client mobility state machine for a mobile client that is connected to an access point to the device that the MA is running on.
MC	Mobility Controller. An MC provides mobility management services for inter-peer group roaming events. The MC provides a central point of contact for management and sends the configuration to all the mobility agents under its sub-domain of their mobility configuration, peer group membership and list of members.
RSSI	Received Signal Strength Indicator. RSSI is a measurement of the power present in a received radio signal. It is the power at which an access point sees the interferer device.

## Interference Types that Cisco CleanAir can Detect

Cisco CleanAir can detect interference, report on the location and severity of the interference, and recommend different mitigation strategies. Two such mitigation strategies are persistent device avoidance and spectrum event-driven RRM. New

Wi-Fi chip-based RF management systems share these characteristics:

- Any RF energy that cannot be identified as a Wi-Fi signal is reported as noise.
- Noise measurements that are used to assign a channel plan tend to be averaged over a period of time to avoid instability or rapid changes that can be disruptive to certain client devices.
- Averaging measurements reduces the resolution of the measurement. As such, a signal that disrupts clients might not look like it needs to be mitigated after averaging.

- All RF management systems available today are reactive in nature.

Cisco CleanAir is different and can positively identify not only the source of the noise but also its location and potential impact to a WLAN. Having this information allows you to consider the noise within the context of the network and make intelligent and, where possible, proactive decisions. For CleanAir, two types of interference events are common:

- Persistent interference
- Spontaneous interference

Persistent interference events are created by devices that are stationary in nature and have intermittent but largely repeatable patterns of interference. For example, consider the case of a microwave oven located in a break room. Such a device might be active for only 1 or 2 minutes at a time. When operating, however, it can be disruptive to the performance of the wireless network and associated clients. Using Cisco CleanAir, you can positively identify the device as a microwave oven rather than indiscriminate noise. You can also determine exactly which part of the band is affected by the device, and because you can locate it, you can understand which access points are most severely affected. You can then use this information to direct RRM in selecting a channel plan that avoids this source of interference for the access points within its range. Because this interference is not active for a large portion of the day, existing RF management applications might attempt to again change the channels of the affected access points. Persistent device avoidance is unique, however, in that it remains in effect as long as the source of interference is periodically detected to refresh the persistent status. The Cisco CleanAir system knows that the microwave oven exists and includes it in all future planning. If you move either the microwave oven or the surrounding access points, the algorithm updates RRM automatically.

---

**Note** Spectrum event-driven RRM can be triggered only by Cisco CleanAir-enabled access points in local mode.

---

Spontaneous interference is interference that appears suddenly on a network, perhaps jamming a channel or a range of channels completely. The Cisco CleanAir spectrum event-driven RRM feature allows you to set a threshold for air quality (AQ) that, if exceeded, triggers an immediate channel change for the affected access point. Most RF management systems can avoid interference, but this information takes time to propagate through the system. Cisco CleanAir relies on AQ measurements to continuously evaluate the spectrum and can trigger a move within 30 seconds. For example, if an access point detects interference from a video camera, it can recover by changing channels within 30 seconds of the camera becoming active. Cisco CleanAir also identifies and locates the source of interference so that more permanent mitigation of the device can be performed at a later time.

In the case of Bluetooth devices, Cisco CleanAir-enabled access points can detect and report interference only if the devices are actively transmitting. Bluetooth devices have extensive power save modes. For example, interference can be detected when data or voice is being streamed between the connected devices.

## Interference Device Merging

The Interference Devices (ID) messages are processed on a Mobility Controller (MC). The Mobility Anchor (MA) forwards the ID messages from APs and hence they are processed on the MC. The MC has visibility of the neighbor information across APs connected to different MAs.

ID merging logic requires AP neighbor information. Neighbor information is obtained from the RRM module. This api only gives neighbor information to the APs directly connected to MC.

Currently the AP neighbor list on MA is synced to MC once every 3 minutes; hence the AP neighbor list obtained by this api could be at most 3 mins old. This delay results in delay in merging of Devices as they

are discovered. The subsequent periodic merge will pick up the updated neighbor information and merge is performed

## Persistent Devices

Some interference devices such as outdoor bridges and Microwave Ovens only transmit when needed. These devices can cause significant interference to the local WLAN due to short duration and periodic operation remain largely undetected by normal RF management metrics. With CleanAir the RRM DCA algorithm can detect, measure, register and remember the impact and adjust the DCA algorithm. This minimizes the use of channels affected by the persistent devices in the channel plan local to the interference source. Cisco CleanAir detects and stores the persistent device information in the switch and this information is used to mitigate interfering channels.

### Persistent Devices Detection

CleanAir-capable Monitor Mode access point collects information about persistent devices on all configured channels and store the information in controller. Local/Bridge mode AP detects interference devices on the serving channels only.

### Persistent Device Avoidance

When a Persistent Device (PD) is detected in the CleanAir module, it is reported to the RRM module on the MA. This information is used in the channel selection by the subsequent EDRRM Event Driven RRM (ED-RRM) signal sent to the RRM module.

## EDRRM and AQR Update Mode

EDRRM is a feature that allows an access point that is in distress to bypass normal RRM intervals and immediately change channels. A CleanAir access point always monitors AQ and reports the AQ every 15 minutes. AQ only reports classified interference devices. The key benefit of EDRRM is very fast action time. If an interfering device is operating on an active channel and causes enough AQ degradation to trigger an EDRRM, then no clients will be able to use that channel or the access point. You must remove the access point from the channel. EDRRM is not enabled by default, you must first enable CleanAir and then enable EDRRM.

AQRs are only available on the MC. The mode configuration and timers are held in Radio Control Block (RCB) on MA (for APs connected to MA). There is no change to the current API available for EMS/NMS. No change is required for directly connected APs as RCB (spectrum config and timers) is available locally. For remote APs (APs connected to MA), three new control messages are added. These three messages are for enable, restart timer and disable rapid update mode for a given AP MAC address and slot.

#### Related Topics

## CleanAir High Availability

CleanAir configuration (network and radio) is stateful during the switchover. On the MC, Embedded Instrumentation Core (EICORE) provides the sync on network configurations across active and standby nodes. The radio configurations are synced using the HA Infrastructure. The CleanAir configurations on MA are pulled from the MC upon joining. The network configuration is not stored in the EICORE on MA, hence it is synced using HA Infrastructure.

CleanAir Data (AQ and IDR) reports are not stateful, that is, the standby and active nodes are not synced. On switchover, the APs send the reports to the current active slot. The RRM Client (HA Infra Client) is used for CleanAir HA sync.

## How to Configure CleanAir

### Enabling CleanAir for 2.4-GHz Band

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz cleanair</b> <b>Example:</b> Switch(config)# <code>ap dot11 24ghz cleanair</code> Switch(config)# <code>no ap dot11 24ghz cleanair</code>	Enables the CleanAir feature on 802.11b network. Add <b>no</b> in the command to disable CleanAir on the 802.11b network.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Persistent Device Avoidance

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>	<p>Enters global configuration mode.</p>
<b>Step 2</b>	<p><b>ap dot11 {24ghz   5ghz} rrm channel device</b></p> <p><b>Example:</b></p> <pre>Switch(config)#ap dot11 24ghz rrm channel device</pre>	<p>Enables the persistent non Wi-Fi device avoidance in the 802.11 channel assignment. Add the <b>no</b> form of the command to disable the persistent device avoidance.</p>
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	<p>Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

# Configuring Cisco CleanAir using the Controller GUI

## Configuring Cisco CleanAir on the Cisco Wireless LAN Controller (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > 802.11a/n or 802.11b/g/n > CleanAir** to open the **802.11a (or 802.11b) > CleanAir** page.
- Step 2** Select the **CleanAir** check box to enable Cisco CleanAir functionality on the 802.11a/n or 802.11b/g/n network, or unselect it to prevent the switch from detecting spectrum interference. By default, the Cisco CleanAir is disabled.
- Step 3** Select the **Report Interferers** check box to enable the Cisco CleanAir system to report any detected sources of interference, or unselect it to prevent the switch from reporting interferers. The default value is selected.
- Note** Device Security alarms, Event Driven RRM, and the Persistence Device Avoidance algorithm do not work if Report Interferers are disabled.
- Step 4** Select the **Persistent Device Propagation** check box to enable propagation of information about persistent devices that can be detected by CleanAir. Persistent device propagation enables you to propagate information about persistent devices to the neighboring access points connected to the same switch. Persistent interferers are present at the location and interfere with the WLAN operations even if they are not detectable at all times.
- Step 5** Ensure that any sources of interference that need to be detected and reported by the Cisco CleanAir system appear in the Interferences to Detect box and any that do not need to be detected appear in the Interferences to Ignore box. Use the > and < buttons to move interference sources between these two boxes. By default, all interference sources are detected. The sources of interference that you can choose depend on the type of radio, 802.11a/n/ac or 802.11b/g/n, and are as follows:
- **802.11 FH**—A 802.11 FH device
  - **802.15.4**—A 802.15.4 or ZigBee device
  - **Continuous Transmitter**—A continuous transmitter
  - **Bluetooth Discovery**—A Bluetooth device
  - **DECT-like Phone**—A digital enhanced cordless communication (DECT)-compatible phone
  - **Microsoft**—A Microsoft device
  - **SuperAG**—A 802.11a/g SuperAG device
  - **Microwave Phone**—A microwave phone
  - **Jammer**—A jamming device
  - **Canopy**—A canopy bridge device
  - **TDD Transmitter**—A time division duplex (TDD) transmitter device
  - **Video Camera**—An analog video camera
  - **WiFi Invalid Channel**—A WiFi invalid channel
  - **WiFi Inverted**—A device using spectrally inverted Wi-Fi signals (I and Q signals of the RF signal are inverted)
  - **WiMAX Fixed**—A WiMAX fixed device (802.11a/n only)
  - **WiMAX Mobile**—A WiMAX mobile device (802.11a/n only)

**Note** Access points that are associated to the switch send interference reports only for the interferers that appear in the Interferences to Detect box. This functionality allows you to filter out interferers that you do not want as well as any that may be flooding the network and causing performance problems for the switch or Prime Infrastructure. Filtering allows the system to resume normal performance levels.

**Step 6** Configure Cisco CleanAir alarms as follows:

- a) Select the **Enable AQI (Air Quality Index) Trap** check box to enable the triggering of air quality alarms, or unselect the box to disable this feature. The default value is selected.
- b) If you selected the **Enable AQI Trap** check box in *Step a*, enter a value between 1 and 100 (inclusive) in the AQI Alarm Threshold text box to specify the threshold at which you want the air quality alarm to be triggered. When the air quality falls below the threshold level, the alarm is triggered. A value of 1 represents the worst air quality, and 100 represents the best. The default value is 35.
- c) Enter the AQI threshold in the **AQI Alarm Threshold** text box. An alarm is generated when the air quality reaches a threshold value. The default is 35. The range is from 1 and 100.
- d) Select the **Enable Interference For Security Alarm** check box to trigger interferer alarms when the switch detects specified device types, or unselect it to disable this feature. The default value is selected.
- e) Make sure that any sources of interference that need to trigger interferer alarms appear in the **Trap on These Types** box and any that do not need to trigger interferer alarms appear in the **Do Not Trap on These Types** box. Use the > and < buttons to move interference sources between these two boxes. By default, all interference sources trigger interferer alarms.

For example, if you want the switch to send an alarm when it detects a jamming device, select the **Enable Interference For Security Alarm** check box and move the jamming device to the **Trap on These Types** box.

**Step 7** Click **Apply**.

**Step 8** Trigger spectrum event-driven radio resource management (RRM) to run when a Cisco CleanAir-enabled access point detects a significant level of interference as follows:

- a) Look at the **EDRRM** field to see the current status of spectrum event-driven RRM and, if enabled, the Sensitivity Threshold field to see the threshold level at which event-driven RRM is invoked.
- b) If you want to change the current status of event-driven RRM or the sensitivity level, go to the **802.11a (or 802.11b) > RRM > Dynamic Channel Assignment (DCA)** page.
- c) Select the **EDRRM** check box to trigger RRM to run when an access point detects a certain level of interference, or unselect it to disable this feature. The default value is selected.
- d) If you selected the **EDRRM** check box in *Step c*, choose **Low**, **Medium**, **High**, or **Custom** from the Sensitivity Threshold drop-down list to specify the threshold at which you want RRM to be triggered. When the interference for the access point rises above the threshold level, RRM initiates a local dynamic channel assignment (DCA) run and changes the channel of the affected access point radio if possible to improve network performance. EDRRM prevents the access point from returning to the original channel for three hours after the event.

High—Represents an increased sensitivity to changes in the environment.

Custom—Allows you to set a threshold value in the Custom Sensitivity Threshold field. The default sensitivity is 35.

Low—Represents a decreased sensitivity to changes in the environment.

The EDRRM AQ threshold value for low sensitivity is 35, medium sensitivity is 50, and high sensitivity is 60.

e) Click **Apply**.

**Step 9** Click **Save Configuration**.

---

## Configuring Cisco CleanAir on an Access Point (GUI)

### Procedure

---

**Step 1** Choose **Configuration > Wireless > Access Points > Radios > 802.11a/n or 802.11b/g/n** to open the 802.11a/n (or 802.11b/g/n) Radios page.

**Step 2** Select the check box adjacent to the desired access point and click **Configure**. The 802.11a/n (or 802.11b/g/n) Radios page appears.

The **CleanAir Capable** field shows whether this access point can support CleanAir functionality. If it can, go to the next step to enable or disable CleanAir for this access point. If the access point cannot support CleanAir functionality, you cannot enable CleanAir for this access point.

**Note** By default, the Cisco CleanAir functionality is enabled on the radios.

**Step 3** Enable Cisco CleanAir functionality for this access point by choosing **Enable** from the CleanAir Admin Status drop-down list. To disable CleanAir functionality for this access point, choose **Disable**. The default value is Enable. This setting overrides the global CleanAir configuration for this access point.

**Step 4** Click **Apply**.

**Step 5** Click **Save Configuration**.

---

## Configuring Cisco Spectrum Expert

### Configuring Spectrum Expert (GUI)

#### Before you begin

- Spectrum Expert (Windows XP laptop client) and access point should be pingable, otherwise; it will not work.
- Prior to establishing a connection between the Spectrum Expert console and the access point, make sure that IP address routing is properly configured and the network spectrum interface (NSI) ports are open in any intervening firewalls.
- The access point must be a TCP server listening on ports 37540 for 2.4 GHz and 37550 for 5 GHz frequencies. These ports must be opened for the spectrum expert application to connect to the access point using the NSI protocol.
- You can view the NSI key from the switch CLI by using the **show ap name ap\_name config dot11 {24ghz | 5ghz}** command.

## Procedure

---

- Step 1** Ensure that Cisco CleanAir functionality is enabled for the access point that will be connected to the Spectrum Expert console.
- Note** The SE-Connect mode is set for the entire access point, not just a single radio. However, the Spectrum Expert console connects to a single radio at a time.
- Step 2** Choose **Configuration > Wireless > Access Points > All APs** to open the All APs page.
- Step 3** Click the name of the desired access point to open the All APs > Details page.
- Step 4** Choose **SE-Connect** from the AP Mode drop-down list. This mode is available only for access points that are capable of supporting Cisco CleanAir functionality. For the SE-Connect mode to appear as an available option, the access point must have at least one spectrum-capable radio in the Enable state.
- Step 5** Click **Apply** to commit your changes.
- Step 6** Click **OK** when prompted to reboot the access point.
- Step 7** On the Windows PC, access the Cisco Software Center from this URL:  
<http://www.cisco.com/cisco/software/navigator.html>
- Step 8** Click **Product > Wireless > Cisco Spectrum Intelligence > Cisco Spectrum Expert > Cisco Spectrum Expert Wi-Fi**, and then download the Spectrum Expert 4.1.11 executable (\*.exe) file.
- Step 9** Run the Spectrum Expert application on the PC.
- Step 10** When the Connect to Sensor dialog box appears, enter the IP address of the access point, choose the access point radio, and enter the 16-byte network spectrum interface (NSI) key to authenticate. The Spectrum Expert application opens a TCP/IP connection directly to the access point using the NSI protocol.
- When an access point in SE-Connect mode joins a switch, it sends a Spectrum Capabilities notification message, and the switch responds with a Spectrum Configuration Request. The request contains the 16-byte random NSI key generated by the switch for NSI authentication. The switch generates one key per access point, which the access point stores until it is rebooted.
- Note** You can establish up to three Spectrum Expert console connections per access point radio.
- Step 11** Verify that the Spectrum Expert console is connected to the access point by selecting the Slave Remote Sensor text box in the bottom right corner of the Spectrum Expert application. If the two devices are connected, the IP address of the access point appears in this text box.
- Step 12** Use the Spectrum Expert application to view and analyze spectrum data from the access point.
- 

## Configuring Spectrum Expert (CLI)

### Before you begin

- Spectrum Expert (Windows XP laptop client) and access point should be pingable, otherwise; it will not work.
- Prior to establishing a connection between the Spectrum Expert console and the access point, make sure that IP address routing is properly configured and the network spectrum interface (NSI) ports are open in any intervening firewalls.

- The access point must be a TCP server listening on ports 37540 for 2.4-GHz and 37550 for 5-GHz frequencies. These ports must be opened for the spectrum expert application to connect to the access point using the NSI protocol.
- You can view the NSI key from the switch CLI by using the **show ap name *ap\_name* config dot11 {24ghz | 5ghz}** command.

## Procedure

**Step 1** To configure the access point for SE-Connect mode, enter this command:

```
ap name ap_name mode se-connect
```

**Example:**

```
Switch#ap name Cisco_AP3500 mode se-connect
```

**Step 2** When prompted to reboot the access point, enter **Y**.

**Step 3** To view the NSI key for the access point, enter this command:

```
show ap name ap_name config dot11 {24ghz | 5ghz}
```

**Example:**

```
Switch#show ap name Cisco_AP3500 config dot11 24ghz
```

```
<snippet>
```

```
CleanAir Management Information
  CleanAir Capable                : Yes
  CleanAir Management Admin State : Enabled
  CleanAir Management Operation State : Up
  CleanAir NSI Key                 : 274F1F9B1A5206683FAF57D87BFFBC9B
  CleanAir Sensor State            : Configured
```

```
<snippet>
```

## What to do next

On the Windows PC, download Cisco Spectrum Expert:

- Access the Cisco Software Center from this URL: <http://www.cisco.com/cisco/software/navigator.html>
- Click **Product > Wireless > Cisco Spectrum Intelligence > Cisco Spectrum Expert > Cisco Spectrum Expert Wi-Fi**, and then download the Spectrum Expert 4.1.11 executable (\*.exe) file.
- Run the Spectrum Expert application on the PC.
- When the Connect to Sensor dialog box appears, enter the IP address of the access point, choose the access point radio, and enter the 16-byte network spectrum interface (NSI) key to authenticate. The Spectrum Expert application opens a TCP/IP connection directly to the access point using the NSI protocol.

When an access point in SE-Connect mode joins a switch, it sends a Spectrum Capabilities notification message, and the switch responds with a Spectrum Configuration Request. The request contains the 16-byte random NSI key generated by the switch for use in NSI authentication. The switch generates one key per access point, which the access point stores until it is rebooted.

**Note** You can establish up to three Spectrum Expert console connections per access point radio.

- Verify that the Spectrum Expert console is connected to the access point by selecting the Slave Remote Sensor text box in the bottom right corner of the Spectrum Expert application. If the two devices are connected, the IP address of the access point appears in this text box.
- Use the Spectrum Expert application to view and analyze spectrum data from the access point.

## Monitoring CleanAir Parameters

You can monitor CleanAir parameters using the following commands:

**Table 6: Commands for Monitoring CleanAir**

Commands	Description
show ap dot11 24ghz cleanair air-quality summary	Displays CleanAir Air Quality (AQ) data for 2.4-GHz band
show ap dot11 24ghz cleanair air-quality worst	Displays CleanAir Air Quality (AQ) worst data for 2.4-GHz band
show ap dot11 24ghz cleanair config	Displays CleanAir Configuration for 2.4-GHz band
show ap dot11 24ghz cleanair device type all	Displays all CleanAir Interferers for 2.4-GHz band
show ap dot11 24ghz cleanair device type bt-discovery	Displays CleanAir Interferers of type BT Discovery for 2.4-GHz band
show ap dot11 24ghz cleanair device type bt-link	Displays CleanAir Interferers of type BT Link for 2.4-GHz band
show ap dot11 24ghz cleanair device type canopy	Displays CleanAir Interferers of type Canopy for 2.4-GHz band
show ap dot11 24ghz cleanair device type cont-tx	Displays CleanAir Interferers of type Continuous transmitter for 2.4-GHz band
show ap dot11 24ghz cleanair device type dect-like	Displays CleanAir Interferers of type DECT Like for 2.4-GHz band
show ap dot11 24ghz cleanair device type fh	Displays CleanAir Interferers of type 802.11FH for 2.4-GHz band
show ap dot11 24ghz cleanair device type inv	Displays CleanAir Interferers of type WiFi Inverted for 2.4-GHz band
show ap dot11 24ghz cleanair device type jammer	Displays CleanAir Interferers of type Jammer for 2.4-GHz band

Commands	Description
show ap dot11 24ghz cleanair device type mw-oven	Displays CleanAir Interferers of type MW Oven for 2.4-GHz band
show ap dot11 24ghz cleanair device type nonstd	Displays CleanAir Interferers of type WiFi Inv. Ch for 2.4-GHz band
show ap dot11 24ghz cleanair device type persistent	Displays CleanAir Interferers of type Persistent for 2.4-GHz band
show ap dot11 24ghz cleanair device type superag	Displays CleanAir Interferers of type SuperAG for 2.4-GHz band
show ap dot11 24ghz cleanair device type tdd-tx	Displays CleanAir Interferers of type TDD Transmit for 2.4-GHz band
show ap dot11 24ghz cleanair device type video	Displays CleanAir Interferers of type Video Camera for 2.4-GHz band
show ap dot11 24ghz cleanair device type wimax-fixed	Displays CleanAir Interferers of type WiMax Fixed for 2.4-GHz band
show ap dot11 24ghz cleanair device type wimax-mobile	Displays CleanAir Interferers of type WiMax Mobile for 2.4-GHz band
show ap dot11 24ghz cleanair device type xbox	Displays CleanAir Interferers of type Xbox for 2.4-GHz band
show ap dot11 24ghz cleanair device type zigbee	Displays CleanAir Interferers of type zigbee for 2.4-GHz band
show ap dot11 5ghz cleanair air-quality summary	Displays CleanAir Air Quality (AQ) data for 5-GHz band
show ap dot11 5ghz cleanair air-quality worst	Displays CleanAir Air Quality (AQ) worst data for 5-GHz band
show ap dot11 5ghz cleanair config	Displays CleanAir Configuration for 5-GHz band
show ap dot11 5ghz cleanair device type all	Displays all CleanAir Interferers for 5-GHz band
show ap dot11 5ghz cleanair device type canopy	Displays CleanAir Interferers of type Canopy for 5-GHz band
show ap dot11 5ghz cleanair device type cont-tx	Displays CleanAir Interferers of type Continuous TX for 5-GHz band
show ap dot11 5ghz cleanair device type dect-like	Displays CleanAir Interferers of type DECT Like for 5-GHz band
show ap dot11 5ghz cleanair device type inv	Displays CleanAir Interferers of type WiFi Inverted for 5-GHz band
show ap dot11 5ghz cleanair device type jammer	Displays CleanAir Interferers of type Jammer for 5-GHz band

Commands	Description
show ap dot11 5ghz cleanair device type nonstd	Displays CleanAir Interferers of type WiFi Inv. Ch for 5-GHz band
show ap dot11 5ghz cleanair device type persistent	Displays CleanAir Interferers of type Persistent for 5-GHz band
show ap dot11 5ghz cleanair device type superag	Displays CleanAir Interferers of type SuperAG for 5-GHz band
show ap dot11 5ghz cleanair device type tdd-tx	Displays CleanAir Interferers of type TDD Transmit for 5-GHz band
show ap dot11 5ghz cleanair device type video	Displays CleanAir Interferers of type Video Camera for 5-GHz band
show ap dot11 5ghz cleanair device type wimax-fixed	Displays CleanAir Interferers of type WiMax Fixed for 5-GHz band
show ap dot11 5ghz cleanair device type wimax-mobile	Displays CleanAir Interferers of type WiMax Mobile for 5-GHz band

You can also check the CleanAir status of the access points using the switch GUI:

### Procedure

Choose **Monitor > Wireless > Access Points > 802.11 a/n/ac or 802.11 b/g/n**.

The **Radios** page is displayed showing a list of access points that are associated with the switch. You can see the CleanAir Admin and CleanAir Status.

The Cisco CleanAir status is one of the following:

- **UP**—The spectrum sensor for the access point radio is currently operational (error code 0).
- **DOWN**—The spectrum sensor for the access point radio is currently not operational because an error has occurred. The most likely reason for the error is that the access point radio is disabled (error code 8). To correct this error, enable the radio.
- **ERROR**—The spectrum sensor for the access point radio has crashed (error code 128), making CleanAir monitoring nonoperational for this radio. If this error occurs, reboot the access point. If the error continues to appear, you might want to disable Cisco CleanAir functionality on the radio.
- **N/A**—This access point radio is not capable of supporting Cisco CleanAir functionality.

## Monitoring the Interference Devices

When a CleanAir-enabled access point detects interference devices, detections of the same device from multiple sensors are merged together to create clusters. Each cluster is given a unique ID. Some devices conserve power by limiting the transmit time until actually needed which results in the spectrum sensor to temporarily stop detecting the device. This device is then correctly marked as down. A down device is correctly removed from the spectrum database. In cases when all the interferer detections for a specific devices are reported, the

cluster ID is kept alive for an extended period of time to prevent possible device detection bouncing. If the same device is detected again, it is merged with the original cluster ID and the device detection history is preserved.

For example, some bluetooth headsets operate on battery power. These devices employ methods to reduce power consumption, such as turning off the transmitter when not actually needed. Such devices can appear to come and go from the classification. To manage these devices, CleanAir keeps the cluster IDs longer and they are remerged into a single record upon detection. This process smoothens the user records and accurately represents the device history.

## Monitoring the Interference Devices (GUI)

### Before you begin

You can configure Cisco CleanAir only on CleanAir-enabled access points.

### Procedure

---

**Step 1** Choose **Monitor > Interferers > Cisco CleanAir > 802.11a/n or 802.11b/g/n > Interference Devices** to open the Cisco APs > Interference Devices page.

This page shows the following information:

- **AP Name**—The name of the access point where the interference device is detected.
- **Interferer Type**—Type of the interferer.
- **Affected Channel**—Channel that the device affects.
- **Severity**—Severity index of the interfering device.
- **Duty Cycle (%)**—Proportion of time during which the interfering device was active.
- **RSSI**—Receive signal strength indicator (RSSI) of the access point.
- **DevID**—Device identification number that uniquely identified the interfering device.
- **ClusterID**—Cluster identification number that uniquely identifies the type of the devices.

**Step 2** Click the **Filter** icon or choose the **Quick Filter** option from the Show drop-down list to display the information about interference devices based on a particular criteria.

---

## Monitoring the Worst Air Quality of Radio Bands (GUI)

### Procedure

---

Choose **Monitor > Cisco CleanAir > Worst Air-Quality** to open the Air Quality Report page.

This page shows the air quality of both the 802.11a/n and 802.11b/g/n radio bands. This page displays the following information:

- **AP Name**—Name of the access point that reported the worst air quality for the 802.11 radio band.
- **Channel Number**—Radio channel with the worst reported air quality.
- **Minimum Air Quality Index**—Minimum air quality for this radio channel. The range is from 1 to 100. An air quality index (AQI) value of 100 is the best, and 1 is the worst.
- **Average Air Quality Index**—Average air quality for this radio channel. The range is from 1 to 100. An air quality index (AQI) value of 100 is the best, and 1 is the worst.
- **Interference Device Count**—Number of interferers detected by the radios on the 802.11 radio band.

## Configuration Examples for Configuring CleanAir

### Enabling CleanAir on 2.4-GHz Band and an Access Point: Example

This example shows how to enable CleanAir on the 2.4-GHz band and an access point operating in the channel:

```
Switch#configure terminal
Switch(config)#ap dot11 24ghz cleanair
Switch(config)#exit
Switch#ap name TAP1 dot11 24ghz cleanair
Switch#end
```

### Configuring a CleanAir Alarm for 2.4-GHz Air-Quality and Devices: Example

This example shows how to configure a CleanAir Alarm for 2.4-GHz Air-Quality threshold of 50 dBm and an Xbox device:

```
Switch#configure terminal
Switch(config)#ap dot11 24ghz cleanair alarm air-quality threshold 50
Switch(config)#ap dot11 24ghz cleanair alarm device xbox
Switch(config)#end
```

### Configuring Interference Reporting for 5-GHz Devices: Example

This example shows how to configure interference reporting for 5-GHz devices:

```
Switch#configure terminal
Switch(config)#ap dot11 5ghz cleanair alarm device xbox
Switch(config)#end
```

### Configuring EDRRM for CleanAir-Events: Example

This example shows how to enable an EDRRM cleanair-event in the 2.4-GHz band and configure high sensitivity to non Wi-Fi interference:

```
Switch#configure terminal
Switch(config)#ap dot11 24ghz rrm channel cleanair-event
Switch(config)#ap dot11 24ghz rrm channel cleanair-event sensitivity high
Switch(config)#end
```

### Configuring Persistent Device Avoidance: Example

This example shows how to enable persistent non Wi-Fi device avoidance in the 2.4-GHz band:

```
Switch#configure terminal
Switch(config)#ap dot11 24ghz rrm channel device
Switch(config)#end
```

### Configuring an Access Point for SE-Connect Mode: Example

This example shows how to configure an access point in the SE-Connect mode:

```
Switch#ap name Cisco_AP3500 mode se-connect
```

## CleanAir FAQs

**Q.** How do I check if my MC is up?

**A.** To check if the MC is up, use the command: **show wireless mobility summary**.

This example shows how to display the mobility summary:

```
Switch#show wireless mobility summary

Mobility Controller Summary:
Mobility Role                : Mobility Controller
Mobility Protocol Port       : 16666
Mobility Group Name          : MG-AK
Mobility Oracle              : Disabled
Mobility Oracle IP Address   : 0.0.0.0
DTLS Mode                    : Enabled
Mobility Domain ID for 802.11r : 0x39b2
Mobility Keepalive Interval  : 10
Mobility Keepalive Count     : 3
Mobility Control Message DSCP Value : 48
Mobility Domain Member Count : 2
Link Status is Control Link Status : Data Link Status
Controllers configured in the Mobility Domain:
IP          Public IP      Group Name      Multicast IP      Link Status
-----
9.6.136.10 -              MG-AK          0.0.0.0          UP      : UP
```

**Q.** Multiple access points detect the same interference device, however, the switch shows them as separate clusters or different suspected devices clustered together. Why does this happen?

**A.** Access points must be RF neighbors for the switch to consider the merging of devices that are detected by these access points. The access point takes time to establish neighbor relationships. A few minutes after the switch reboots or a change in the RF group and similar events, clustering will not be very accurate.

**Q.** Can I merge two monitor mode access points using a switch?

**A.** No, you cannot merge two monitor mode access points using a switch. You can merge the monitor mode access points only using MSE.

**Q.** How do I view neighbor access points?

**A.** To view neighbor access points, use the command: **show ap ap\_name auto-rf dot11 {24ghz | 5ghz}**

This example shows how to display the neighbor access points:

```
Switch#show ap name AS-5508-5-AP3 auto-rf dot11 24ghz
```

```
<snippet>
```

```
Nearby APs
```

```
AP 0C85.259E.C350 slot 0           : -12 dBm on 1 (10.10.0.5)
AP 0C85.25AB.CCA0 slot 0           : -24 dBm on 6 (10.10.0.5)
AP 0C85.25C7.B7A0 slot 0           : -26 dBm on 11 (10.10.0.5)
AP 0C85.25DE.2C10 slot 0           : -24 dBm on 6 (10.10.0.5)
AP 0C85.25DE.C8E0 slot 0           : -14 dBm on 11 (10.10.0.5)
AP 0C85.25DF.3280 slot 0           : -31 dBm on 6 (10.10.0.5)
AP 0CD9.96BA.5600 slot 0           : -44 dBm on 6 (10.0.0.2)
AP 24B6.5734.C570 slot 0           : -48 dBm on 11 (10.0.0.2)
```

```
<snippet>
```

**Q.** What are the debug commands available for CleanAir?

**A.** The debug commands for CleanAir are:

```
debug cleanair {all | error | event | internal-event | nmsp | packet}
```

```
debug rrm {all | channel | detail | error | group | ha | manager | message | packet  
| power | prealarm | profile | radar | rf-change | scale | spectrum}
```

**Q.** Why are CleanAir Alarms not generated for interferer devices?

**A.** Verify that the access points are CleanAir-capable and CleanAir is enabled both on the access point and the switch.

**Q.** Can the Cisco Catalyst 3850 and 3650 Series Switches function as a Mobility Agent (MA)?

**A.** Yes, the Cisco Catalyst 3850 and 3650 Series Switches can function as an MA.

**Q.** Are CleanAir configurations available on the MA?

**A.** From Release 3.3 SE, CleanAir configurations are available on the MA. You can use the following two CleanAir commands on the MA:

- **show ap dot11 5ghz cleanair config**
- **show ap dot11 24ghz cleanair config**

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring Interface Characteristics

### Interface Types

This section describes the different types of interfaces supported by the switch. The rest of the chapter describes configuration procedures for physical interface characteristics.

---

**Note** The stack ports on the rear of the stacking-capable switches are not Ethernet ports and cannot be configured.

---

## Port-Based VLANs

A VLAN is a switched network that is logically segmented by function, team, or application, without regard to the physical location of the users. Packets received on a port are forwarded only to ports that belong to the same VLAN as the receiving port. Network devices in different VLANs cannot communicate with one another without a Layer 3 device to route traffic between the VLANs.

VLAN partitions provide hard firewalls for traffic in the VLAN, and each VLAN has its own MAC address table. A VLAN comes into existence when a local port is configured to be associated with the VLAN, when the VLAN Trunking Protocol (VTP) learns of its existence from a neighbor on a trunk, or when a user creates a VLAN. VLANs can be formed with ports across the stack.

To configure VLANs, use the **vlan** *vlan-id* global configuration command to enter VLAN configuration mode. The VLAN configurations for normal-range VLANs (VLAN IDs 1 to 1005) are saved in the VLAN database. If VTP is version 1 or 2, to configure extended-range VLANs (VLAN IDs 1006 to 4094), you must first set VTP mode to transparent. Extended-range VLANs created in transparent mode are not added to the VLAN database but are saved in the switch running configuration. With VTP version 3, you can create extended-range VLANs in client or server mode. These VLANs are saved in the VLAN database.

In a switch stack, the VLAN database is downloaded to all switches in a stack, and all switches in the stack build the same VLAN database. The running configuration and the saved configuration are the same for all switches in a stack.

Add ports to a VLAN by using the **switchport** interface configuration commands:

- Identify the interface.
- For a trunk port, set trunk characteristics, and, if desired, define the VLANs to which it can belong.
- For an access port, set and define the VLAN to which it belongs.

## Switch Ports

Switch ports are Layer 2-only interfaces associated with a physical port. Switch ports belong to one or more VLANs. A switch port can be an access port or a trunk port. You can configure a port as an access port or trunk port or let the Dynamic Trunking Protocol (DTP) operate on a per-port basis to set the switchport mode by negotiating with the port on the other end of the link. Switch ports are used for managing the physical interface and associated Layer 2 protocols and do not handle routing or bridging.

Configure switch ports by using the **switchport** interface configuration commands.

## Access Ports

An access port belongs to and carries the traffic of only one VLAN (unless it is configured as a voice VLAN port). Traffic is received and sent in native formats with no VLAN tagging. Traffic arriving on an access port is assumed to belong to the VLAN assigned to the port. If an access port receives a tagged packet (Inter-Switch Link [ISL] or IEEE 802.1Q tagged), the packet is dropped, and the source address is not learned.

The types of access ports supported are:

- Static access ports are manually assigned to a VLAN (or through a RADIUS server for use with IEEE 802.1x).

You can also configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.

## Trunk Ports

A trunk port carries the traffic of multiple VLANs and by default is a member of all VLANs in the VLAN database.

Although by default, a trunk port is a member of every VLAN known to the VTP, you can limit VLAN membership by configuring an allowed list of VLANs for each trunk port. The list of allowed VLANs does not affect any other port but the associated trunk port. By default, all possible VLANs (VLAN ID 1 to 4094) are in the allowed list. A trunk port can become a member of a VLAN only if VTP knows of the VLAN and if the VLAN is in the enabled state. If VTP learns of a new, enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of that VLAN and traffic is forwarded to and from the trunk port for that VLAN. If VTP learns of a new, enabled VLAN that is not in the allowed list for a trunk port, the port does not become a member of the VLAN, and no traffic for the VLAN is forwarded to or from the port.

## Tunnel Ports

Tunnel ports are used in IEEE 802.1Q tunneling to segregate the traffic of customers in a service-provider network from other customers who are using the same VLAN number. You configure an asymmetric link from a tunnel port on a service-provider edge switch to an IEEE 802.1Q trunk port on the customer switch. Packets entering the tunnel port on the edge switch, already IEEE 802.1Q-tagged with the customer VLANs, are encapsulated with another layer of an IEEE 802.1Q tag (called the metro tag), containing a VLAN ID unique in the service-provider network, for each customer. The double-tagged packets go through the service-provider network keeping the original customer VLANs separate from those of other customers. At the outbound interface, also a tunnel port, the metro tag is removed, and the original VLAN numbers from the customer network are retrieved.

Tunnel ports cannot be trunk ports or access ports and must belong to a VLAN unique to each customer.

## Routed Ports

A routed port is a physical port that acts like a port on a router; it does not have to be connected to a router. A routed port is not associated with a particular VLAN, as is an access port. A routed port behaves like a regular router interface, except that it does not support VLAN subinterfaces. Routed ports can be configured with a Layer 3 routing protocol. A routed port is a Layer 3 interface only and does not support Layer 2 protocols, such as DTP and STP.

Configure routed ports by putting the interface into Layer 3 mode with the **no switchport** interface configuration command. Then assign an IP address to the port, enable routing, and assign routing protocol characteristics by using the **ip routing** and **router protocol** global configuration commands.

**Note** Entering a **no switchport** interface configuration command shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 2 mode into Layer 3 mode, the previous configuration information related to the affected interface might be lost.

The number of routed ports that you can configure is not limited by software. However, the interrelationship between this number and the number of other features being configured might impact CPU performance because of hardware limitations.

---

**Note** The IP Base image supports static routing and the Routing Information Protocol (RIP). For full Layer 3 routing or for fallback bridging, you must enable the IP Services image on the standalone switch, or the active switch.

---

## Switch Virtual Interfaces

A switch virtual interface (SVI) represents a VLAN of switch ports as one interface to the routing or bridging function in the system. You can associate only one SVI with a VLAN. You configure an SVI for a VLAN only to route between VLANs or to provide IP host connectivity to the switch. By default, an SVI is created for the default VLAN (VLAN 1) to permit remote switch administration. Additional SVIs must be explicitly configured.

---

**Note** You cannot delete interface VLAN 1.

---

SVIs provide IP host connectivity only to the system. SVIs are created the first time that you enter the **vlan** interface configuration command for a VLAN interface. The VLAN corresponds to the VLAN tag associated with data frames on an ISL or IEEE 802.1Q encapsulated trunk or the VLAN ID configured for an access port. Configure a VLAN interface for each VLAN for which you want to route traffic, and assign it an IP address.

Although the switch stack or switch supports a total of 1005 VLANs and SVIs, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might impact CPU performance because of hardware limitations.

When you create an SVI, it does not become active until it is associated with a physical port.

### SVI Autostate Exclude

The line state of an SVI with multiple ports on a VLAN is in the *up* state when it meets these conditions:

- The VLAN exists and is active in the VLAN database on the switch
- The VLAN interface exists and is not administratively down.
- At least one Layer 2 (access or trunk) port exists, has a link in the *up* state on this VLAN, and is in the spanning-tree forwarding state on the VLAN.

---

**Note** The protocol link state for VLAN interfaces come up when the first switchport belonging to the corresponding VLAN link comes up and is in STP forwarding state.

---

The default action, when a VLAN has multiple ports, is that the SVI goes down when all ports in the VLAN go down. You can use the SVI autostate exclude feature to configure a port so that it is not included in the SVI line-state up-or-down calculation. For example, if the only active port on the VLAN is a monitoring port, you might configure autostate exclude on that port so that the VLAN goes down when all other ports go down. When enabled on a port, **autostate exclude** applies to all VLANs that are enabled on that port.

The VLAN interface is brought up when one Layer 2 port in the VLAN has had time to converge (transition from STP listening-learning state to forwarding state). This prevents features such as routing protocols from

using the VLAN interface as if it were fully operational and minimizes other problems, such as routing black holes.

## EtherChannel Port Groups

EtherChannel port groups treat multiple switch ports as one switch port. These port groups act as a single logical port for high-bandwidth connections between switches or between switches and servers. An EtherChannel balances the traffic load across the links in the channel. If a link within the EtherChannel fails, traffic previously carried over the failed link changes to the remaining links. You can group multiple trunk ports into one logical trunk port, group multiple access ports into one logical access port, group multiple tunnel ports into one logical tunnel port, or group multiple routed ports into one logical routed port. Most protocols operate over either single ports or aggregated switch ports and do not recognize the physical ports within the port group. Exceptions are the DTP, the Cisco Discovery Protocol (CDP), and the Port Aggregation Protocol (PAgP), which operate only on physical ports.

When you configure an EtherChannel, you create a port-channel logical interface and assign an interface to the EtherChannel. For Layer 3 interfaces, you manually create the logical interface by using the **interface port-channel** global configuration command. Then you manually assign an interface to the EtherChannel by using the **channel-group** interface configuration command. For Layer 2 interfaces, use the **channel-group** interface configuration command to dynamically create the port-channel logical interface. This command binds the physical and logical ports together.

## Power over Ethernet Ports

A PoE-capable switch port automatically supplies power to one of these connected devices if the switch senses that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

## Using the Switch USB Ports

### USB Mini-Type B Console Port

The switch has the following console ports:

- USB mini-Type B console connection
- RJ-45 console port

Console output appears on devices connected to both ports, but console input is active on only one port at a time. By default, the USB connector takes precedence over the RJ-45 connector.

---

**Note** Windows PCs require a driver for the USB port. See the hardware installation guide for driver installation instructions.

---

Use the supplied USB Type A-to-USB mini-Type B cable to connect a PC or other device to the switch. The connected device must include a terminal emulation application. When the switch detects a valid USB connection to a powered-on device that supports host functionality (such as a PC), input from the RJ-45 console is immediately disabled, and input from the USB console is enabled. Removing the USB connection immediately reenables input from the RJ-45 console connection. An LED on the switch shows which console connection is in use.

## Console Port Change Logs

At software startup, a log shows whether the USB or the RJ-45 console is active. Each switch in a stack issues this log. Every switch always first displays the RJ-45 media type.

In the sample output, Switch 1 has a connected USB console cable. Because the bootloader did not change to the USB console, the first log from Switch 1 shows the RJ-45 console. A short time later, the console changes and the USB console log appears. Switch 2 and Switch 3 have connected RJ-45 console cables.

```
switch-stack-1
*Mar  1 00:01:00.171: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
*Mar  1 00:01:00.431: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.
```

```
switch-stack-2
*Mar  1 00:01:09.835: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

```
switch-stack-3
*Mar  1 00:01:10.523: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

When the USB cable is removed or the PC de-activates the USB connection, the hardware automatically changes to the RJ-45 console interface:

```
switch-stack-1
Mar  1 00:20:48.635: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

You can configure the console type to always be RJ-45, and you can configure an inactivity timeout for the USB connector.

## Interface Connections

Devices within a single VLAN can communicate directly through any switch. Ports in different VLANs cannot exchange data without going through a routing device. With a standard Layer 2 switch, ports in different VLANs have to exchange information through a router. By using the switch with routing enabled, when you configure both VLAN 20 and VLAN 30 with an SVI to which an IP address is assigned, packets can be sent from Host A to Host B directly through the switch with no need for an external router.

Figure 2: Connecting VLANs with the Switch

**Note** Switches running the LAN Base image support configuring only 16 static routes on SVIs.

## Default Ethernet Interface Configuration

To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the **switchport** interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

This table shows the Ethernet interface default configuration, including some features that apply only to Layer 2 interfaces.

Table 7: Default Layer 2 Ethernet Interface Configuration

Feature	Default Setting
Operating mode	Layer 2 or switching mode ( <b>switchport</b> command).
Allowed VLAN range	VLANs 1– 4094.
Default VLAN (for access ports)	VLAN 1 (Layer 2 interfaces only).
Native VLAN (for IEEE 802.1Q trunks)	VLAN 1 (Layer 2 interfaces only).
VLAN trunking	Switchport mode dynamic auto (supports DTP) (Layer 2 interfaces only).
Port enable state	All ports are enabled.
Port description	None defined.
Speed	Autonegotiate. (Not supported on the 10-Gigabit interfaces.)
Duplex mode	Autonegotiate. (Not supported on the 10-Gigabit interfaces.)

Feature	Default Setting
Flow control	Flow control is set to <b>receive: off</b> . It is always off for sent packets.
EtherChannel (PAgP)	Disabled on all Ethernet ports.
Port blocking (unknown multicast and unknown unicast traffic)	Disabled (not blocked) (Layer 2 interfaces only).
Broadcast, multicast, and unicast storm control	Disabled.
Protected port	Disabled (Layer 2 interfaces only).
Port security	Disabled (Layer 2 interfaces only).
Port Fast	Disabled.
Auto-MDIX	Enabled.  <b>Note</b> The switch might not support a pre-standard powered device—such as Cisco IP phones and access points that do not fully support IEEE 802.3af—if that powered device is connected to the switch through a crossover cable. This is regardless of whether auto-MDIX is enabled on the switch port.
Power over Ethernet (PoE)	Enabled (auto).

## Interface Speed and Duplex Mode

Ethernet interfaces on the switch operate at 10, 100, 1000, or 10,000 Mb/s and in either full- or half-duplex mode. In full-duplex mode, two stations can send and receive traffic at the same time. Normally, 10-Mb/s ports operate in half-duplex mode, which means that stations can either receive or send traffic.

Switch models include Gigabit Ethernet (10/100/1000-Mb/s) ports, 10-Gigabit Ethernet ports, and small form-factor pluggable (SFP) module slots supporting SFP modules.

## Speed and Duplex Configuration Guidelines

When configuring an interface speed and duplex mode, note these guidelines:

- The 10-Gigabit Ethernet ports do not support the speed and duplex features. These ports operate only at 10,000 Mb/s and in full-duplex mode.
- Do not disable Auto-Negotiation on PoE switches.
- Gigabit Ethernet (10/100/1000-Mb/s) ports support all speed options and all duplex options (auto, half, and full). However, Gigabit Ethernet ports operating at 1000 Mb/s do not support half-duplex mode.
- For SFP module ports, the speed and duplex CLI options change depending on the SFP module type:

- The 1000BASE-*x* (where *x* is -BX, -CWDM, -LX, -SX, and -ZX) SFP module ports support the **nonegotiate** keyword in the **speed** interface configuration command. Duplex options are not supported.
- The 1000BASE-T SFP module ports support the same speed and duplex options as the 10/100/1000-Mb/s ports.
- If both ends of the line support autonegotiation, we highly recommend the default setting of **auto** negotiation.
- If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces; do not use the **auto** setting on the supported side.
- When STP is enabled and a port is reconfigured, the switch can take up to 30 seconds to check for loops. The port LED is amber while STP reconfigures. As best practice, we suggest configuring the speed and duplex options on a link to auto or to fixed on both the ends. If one side of the link is configured to auto and the other side is configured to fixed, the link will not be up and this is expected.
- As best practice, we suggest configuring the speed and duplex options on a link to auto or to fixed on both the ends. If one side of the link is configured to auto and the other side is configured to fixed, the link will not be up and this is expected.

**Caution**

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

## IEEE 802.3x Flow Control

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port by sending a pause frame to stop sending until the condition clears. Upon receipt of a pause frame, the sending device stops sending any data packets, which prevents any loss of data packets during the congestion period.

**Note**

Flow control is not supported on Catalyst 3850 and Catalyst 3650 Series Switches (CSCu133405).

**Note**

The switch ports can receive, but not send, pause frames.

You use the **flowcontrol** interface configuration command to set the interface's ability to **receive** pause frames to **on**, **off**, or **desired**. The default state is **off**.

When set to **desired**, an interface can operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.

These rules apply to flow control settings on the device:

- **receive on** (or **desired**): The port cannot send pause frames but can operate with an attached device that is required to or can send pause frames; the port can receive pause frames.

- **receive off:** Flow control does not operate in either direction. In case of congestion, no indication is given to the link partner, and no pause frames are sent or received by either device.

## Layer 3 Interfaces

The switch supports these types of Layer 3 interfaces:

- **SVIs:** You should configure SVIs for any VLANs for which you want to route traffic. SVIs are created when you enter a VLAN ID following the **interface vlan** global configuration command. To delete an SVI, use the **no interface vlan** global configuration command. You cannot delete interface VLAN 1.

---

**Note** When you create an SVI, it does not become active until it is associated with a physical port.

---

When configuring SVIs, you can also configure SVI autostate exclude on a port in the SVI to exclude that port from being included in determining SVI line-state status.

- **Routed ports:** Routed ports are physical ports configured to be in Layer 3 mode by using the **no switchport** interface configuration command.
- **Layer 3 EtherChannel ports:** EtherChannel interfaces made up of routed ports.

A Layer 3 switch can have an IP address assigned to each routed port and SVI.

There is no defined limit to the number of SVIs and routed ports that can be configured in a switch or in a switch stack. However, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might have an impact on CPU usage because of hardware limitations. If the switch is using its maximum hardware resources, attempts to create a routed port or SVI have these results:

- If you try to create a new routed port, the switch generates a message that there are not enough resources to convert the interface to a routed port, and the interface remains as a switchport.
- If you try to create an extended-range VLAN, an error message is generated, and the extended-range VLAN is rejected.
- If the switch is notified by VLAN Trunking Protocol (VTP) of a new VLAN, it sends a message that there are not enough hardware resources available and shuts down the VLAN. The output of the **show vlan** user EXEC command shows the VLAN in a suspended state.
- If the switch attempts to boot up with a configuration that has more VLANs and routed ports than hardware can support, the VLANs are created, but the routed ports are shut down, and the switch sends a message that this was due to insufficient hardware resources.

All Layer 3 interfaces require an IP address to route traffic. This procedure shows how to configure an interface as a Layer 3 interface and how to assign an IP address to an interface.

**Note** If the physical port is in Layer 2 mode (the default), you must enter the **no switchport** interface configuration command to put the interface into Layer 3 mode. Entering a **no switchport** command disables and then re-enables the interface, which might generate messages on the device to which the interface is connected. Furthermore, when you put an interface that is in Layer 2 mode into Layer 3 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration

# How to Configure Interface Characteristics

## Configuring Interfaces

These general instructions apply to all interface configuration processes.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface</b> <b>Example:</b> <pre>Switch(config)# interface gigabitethernet1/0/1 Switch(config-if)#</pre>	Identifies the interface type, the switch number (only on stacking-capable switches), and the number of the connector.  <b>Note</b> You do not need to add a space between the interface type and the interface number. For example, in the preceding line, you can specify either <b>gigabitethernet 1/0/1</b> , <b>gigabitethernet1/0/1</b> , <b>gi 1/0/1</b> , or <b>gi1/0/1</b> .
<b>Step 4</b>	Follow each <b>interface</b> command with the interface configuration commands that the interface requires.	Defines the protocols and applications that will run on the interface. The commands are collected and applied to the interface when you enter another interface command or enter <b>end</b> to return to privileged EXEC mode.

	Command or Action	Purpose
<b>Step 5</b>	<b>interface range</b> or <b>interface range macro</b>	(Optional) Configures a range of interfaces.  <b>Note</b> Interfaces configured in a range must be the same type and must be configured with the same feature options.
<b>Step 6</b>	<b>show interfaces</b>	Displays a list of all interfaces on or configured for the switch. A report is provided for each interface that the device supports or for the specified interface.

## Adding a Description for an Interface

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b>  Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface</b> <i>interface-id</i>  <b>Example:</b>  Switch(config)# <b>interface</b> <b>gigabitethernet1/0/2</b>	Specifies the interface for which you are adding a description, and enter interface configuration mode.
<b>Step 4</b>	<b>description</b> <i>string</i>  <b>Example:</b>  Switch(config-if)# <b>description</b> <b>Connects</b> <b>to Marketing</b>	Adds a description (up to 240 characters) for an interface.
<b>Step 5</b>	<b>end</b>  <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	<code>Switch(config-if)# end</code>	
<b>Step 6</b>	<b>show interfaces <i>interface-id</i> description</b>	Verifies your entry.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b>  <code>Switch# copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Configuring a Range of Interfaces

To configure multiple interfaces with the same configuration parameters, use the **interface range** global configuration command. When you enter the interface-range configuration mode, all command parameters that you enter are attributed to all interfaces within that range until you exit this mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  <code>Switch&gt; enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  <code>Switch# configure terminal</code>	Enters global configuration mode.
<b>Step 3</b>	<b>interface range {<i>port-range</i>   <b>macro</b> <i>macro_name</i>}</b> <b>Example:</b>  <code>Switch(config)# interface range macro</code>	Specifies the range of interfaces (VLANs or physical ports) to be configured, and enter interface-range configuration mode. <ul style="list-style-type: none"> <li>You can use the <b>interface range</b> command to configure up to five port ranges or a previously defined macro.</li> <li>The <b>macro</b> variable is explained in the <a href="#">Configuring and Using Interface Range Macros</a>, on page 66.</li> <li>In a comma-separated <i>port-range</i>, you must enter the interface type for each entry and enter spaces before and after the comma.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>In a hyphen-separated <i>port-range</i>, you do not need to re-enter the interface type, but you must enter a space before the hyphen.</li> </ul> <p><b>Note</b> Use the normal configuration commands to apply the configuration parameters to all interfaces in the range. Each command is executed as it is entered.</p>
<b>Step 4</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show interfaces</b> [ <i>interface-id</i> ] <b>Example:</b> <pre>Switch# show interfaces</pre>	Verifies the configuration of the interfaces in the range.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring and Using Interface Range Macros

You can create an interface range macro to automatically select a range of interfaces for configuration. Before you can use the **macro** keyword in the **interface range macro** global configuration command string, you must use the **define interface-range** global configuration command to define the macro.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Switch# <code>configure terminal</code>	
<b>Step 3</b>	<p><b>define interface-range</b> <i>macro_name</i> <i>interface-range</i></p> <p><b>Example:</b></p> <pre>Switch(config)# define interface-range enet_list gigabitethernet1/0/1 - 2</pre>	<p>Defines the interface-range macro, and save it in NVRAM.</p> <ul style="list-style-type: none"> <li>• The <i>macro_name</i> is a 32-character maximum character string.</li> <li>• A macro can contain up to five comma-separated interface ranges.</li> <li>• Each <i>interface-range</i> must consist of the same port type.</li> </ul> <p><b>Note</b> Before you can use the <b>macro</b> keyword in the <b>interface range macro</b> global configuration command string, you must use the <b>define interface-range</b> global configuration command to define the macro.</p>
<b>Step 4</b>	<p><b>interface range macro</b> <i>macro_name</i></p> <p><b>Example:</b></p> <pre>Switch(config)# interface range macro enet_list</pre>	<p>Selects the interface range to be configured using the values saved in the interface-range macro called <i>macro_name</i>.</p> <p>You can now use the normal configuration commands to apply the configuration to all interfaces in the defined macro.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<p><b>show running-config   include define</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config   include define</pre>	Shows the defined interface range macro configuration.
<b>Step 7</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

# Configuring Ethernet Interfaces

## Setting the Interface Speed and Duplex Parameters

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config)# interface gigabitethernet1/0/3</pre>	Specifies the physical interface to be configured, and enter interface configuration mode.
<b>Step 4</b>	<b>speed {10   100   1000   2500   5000   10000   auto [10   100   1000   2500   5000   10000]   nonegotiate}</b> <b>Example:</b> <pre>Switch(config-if)# speed 10</pre>	Enter the appropriate speed parameter for the interface: <ul style="list-style-type: none"> <li>• Enter <b>10, 100, 1000 2500, 5000, or 10000</b> to set a specific speed for the interface.</li> <li>• Enter <b>auto</b> to enable the interface to autonegotiate speed with the connected device. If you specify a speed and also set the <b>auto</b> keyword, the port autonegotiates only at the specified speeds.</li> <li>• The <b>nonegotiate</b> keyword is available only for SFP module ports. SFP module ports operate only at 1000 Mb/s but can be configured to not negotiate if connected to a device that does not support autonegotiation.</li> </ul>
<b>Step 5</b>	<b>duplex {auto   full   half}</b> <b>Example:</b> <pre>Switch(config-if)# duplex half</pre>	This command is not available on a 10-Gigabit Ethernet interface.  Enter the duplex parameter for the interface.  Enable half-duplex mode (for interfaces operating only at 10 or 100 Mb/s). You cannot

	Command or Action	Purpose
		configure half-duplex mode for interfaces operating at 1000 Mb/s. You can configure the duplex setting when the speed is set to <b>auto</b> .
<b>Step 6</b>	<b>end</b> <b>Example:</b>  Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show interfaces <i>interface-id</i></b> <b>Example:</b>  Switch# <b>show interfaces</b> <b>gigabitethernet1/0/3</b>	Displays the interface speed and duplex mode configuration.
<b>Step 8</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <b>copy running-config</b> <b>startup-config</b>	(Optional) Saves your entries in the configuration file.
<b>Step 9</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <b>copy running-config</b> <b>startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring IEEE 802.3x Flow Control

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters global configuration mode
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b>  Switch(config)# <b>interface</b>	Specifies the physical interface to be configured, and enter interface configuration mode.

	Command or Action	Purpose
	<code>gigabitethernet1/0/1</code>	
<b>Step 3</b>	<b>flowcontrol {receive} {on   off   desired}</b> <b>Example:</b> <pre>Switch(config-if)# flowcontrol receive on</pre>	Configures the flow control mode for the port.
<b>Step 4</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show interfaces <i>interface-id</i></b> <b>Example:</b> <pre>Switch# show interfaces gigabitethernet1/0/1</pre>	Verifies the interface flow control settings.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring Layer 3 Interfaces

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>interface</b> { <i>gigabitethernet interface-id</i> }   { <i>vlan vlan-id</i> }   { <i>port-channel port-channel-number</i> } <b>Example:</b> <pre>Switch(config)# interface gigabitethernet1/0/2</pre>	Specifies the interface to be configured as a Layer 3 interface, and enter interface configuration mode.
<b>Step 4</b>	<b>no switchport</b> <b>Example:</b> <pre>Switch(config-if)# no switchport</pre>	For physical ports only, enters Layer 3 mode.
<b>Step 5</b>	<b>ip address</b> <i>ip_address subnet_mask</i> <b>Example:</b> <pre>Switch(config-if)# ip address 192.20.135.21 255.255.255.0</pre>	Configures the IP address and IP subnet.
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b> <pre>Switch(config-if)# no shutdown</pre>	Enables the interface.
<b>Step 7</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 8</b>	<b>show interfaces</b> [ <i>interface-id</i> ] 	Verifies the configuration.
<b>Step 9</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring Logical Layer 3 GRE Tunnel Interfaces

### Before you begin

Generic Routing Encapsulation (GRE) is a tunneling protocol used to encapsulate network layer protocols inside virtual point-to-point links. A GRE tunnel only provides encapsulation and not encryption.

**Attention**

Beginning in Cisco IOS XE Release 3.7.2E, GRE tunnels are supported on the hardware on Cisco Catalyst switches. When GRE is configured without tunnel options, packets are hardware-switched. When GRE is configured with tunnel options (such as key, checksum, etc.), packets are switched in the software. A maximum of 10 GRE tunnels are supported.

**Note**

Other features like Access Control Lists (ACL) and Quality of Service (QoS) are not supported for the GRE tunnels.

To configure a GRE tunnel, perform this task:

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>interface</b> <i>tunnel number</i>  <b>Example:</b> <code>Switch(config)#<b>interface tunnel 2</b></code>	Enables tunneling on the interface.
<b>Step 2</b>	<b>ip address</b> <i>ip_address subnet_mask</i>  <b>Example:</b> <code>Switch(config)#<b>ip address 100.1.1.1 255.255.255.0</b></code>	Configures the IP address and IP subnet.
<b>Step 3</b>	<b>tunnel source</b> { <i>ip_address</i>   <i>type_number</i> }  <b>Example:</b> <code>Switch(config)#<b>tunnel source 10.10.10.1</b></code>	Configures the tunnel source.
<b>Step 4</b>	<b>tunnel destination</b> { <i>host_name</i>   <i>ip_address</i> }  <b>Example:</b> <code>Switch(config)#<b>tunnel destination 10.10.10.2</b></code>	Configures the tunnel destination.
<b>Step 5</b>	<b>tunnel mode gre ip</b>  <b>Example:</b> <code>Switch(config)#<b>tunnel mode gre ip</b></code>	Configures the tunnel mode.
<b>Step 6</b>	<b>end</b>  <b>Example:</b> <code>Switch(config)#<b>end</b></code>	Exist configuration mode.

## Configuring SVI Autostate Exclude

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <b>interface</b> <b>gigabitethernet1/0/2</b>	Specifies a Layer 2 interface (physical port or port channel), and enter interface configuration mode.
<b>Step 4</b>	<b>switchport autostate exclude</b> <b>Example:</b> Switch(config-if)# <b>switchport autostate</b> <b>exclude</b>	Excludes the access or trunk port when defining the status of an SVI line state (up or down)
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running config interface <i>interface-id</i></b>	(Optional) Shows the running configuration. Verifies the configuration.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config</b> <b>startup-config</b>	(Optional) Saves your entries in the configuration file.

## Shutting Down and Restarting the Interface

Shutting down an interface disables all functions on the specified interface and marks the interface as unavailable on all monitoring command displays. This information is communicated to other network servers through all dynamic routing protocols. The interface is not mentioned in any routing updates.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>interface {vlan <i>vlan-id</i>}   {  gigabitethernet<i>interface-id</i>}   {port-channel  <i>port-channel-number</i>}</b> <b>Example:</b> <pre>Switch(config)# interface  gigabitethernet1/0/2</pre>	Selects the interface to be configured.
<b>Step 4</b>	<b>shutdown</b> <b>Example:</b> <pre>Switch(config-if)# shutdown</pre>	Shuts down an interface.
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> <pre>Switch(config-if)# no shutdown</pre>	Restarts an interface.
<b>Step 6</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show running-config</b> <b>Example:</b>	Verifies your entries.

	Command or Action	Purpose
	Switch# <code>show running-config</code>	

## Configuring the Console Media Type

Follow these steps to set the console media type to RJ-45. If you configure the console as RJ-45, USB console operation is disabled, and input comes only through the RJ-45 connector.

This configuration applies to all switches in a stack.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<code>enable</code> <b>Example:</b> Switch> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<code>configure terminal</code> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<code>line console 0</code> <b>Example:</b> Switch(config)# <code>line console 0</code>	Configures the console and enters line configuration mode.
<b>Step 4</b>	<code>media-type rj45</code> <b>Example:</b> Switch(config-line)# <code>media-type rj45</code>	Configures the console media type to be only RJ-45 port. If you do not enter this command and both types are connected, the USB port is used by default.
<b>Step 5</b>	<code>end</code> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 6</b>	<code>copy running-config startup-config</code> <b>Example:</b> Switch# <code>copy running-config</code>	(Optional) Saves your entries in the configuration file.

	Command or Action	Purpose
	<code>startup-config</code>	

## Configuring the USB Inactivity Timeout

The configurable inactivity timeout reactivates the RJ-45 console port if the USB console port is activated but no input activity occurs on it for a specified time period. When the USB console port is deactivated due to a timeout, you can restore its operation by disconnecting and reconnecting the USB cable.

**Note** The configured inactivity timeout applies to all switches in a stack. However, a timeout on one switch does not cause a timeout on other switches in the stack.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <code>Switch&gt; enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <code>Switch# configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>line console 0</b> <b>Example:</b> <code>Switch(config)# line console 0</code>	Configures the console and enters line configuration mode.
<b>Step 4</b>	<b>usb-inactivity-timeout <i>timeout-minutes</i></b> <b>Example:</b> <code>Switch(config-line)# usb-inactivity-timeout 30</code>	Specify an inactivity timeout for the console port. The range is 1 to 240 minutes. The default is to have no timeout configured.
<b>Step 5</b>	<b>copy running-config startup-config</b> <b>Example:</b> <code>Switch# copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

# Monitoring Interface Characteristics

## Monitoring Interface Status

Commands entered at the privileged EXEC prompt display information about the interface, including the versions of the software and the hardware, the configuration, and statistics about the interfaces.

**Table 8: Show Commands for Interfaces**

Command	Purpose
<b>show interfaces</b> <i>interface-id</i> <b>status</b> [ <b>err-disabled</b> ]	Displays interface status or a list of interfaces in the error-disabled state.
<b>show interfaces</b> [ <i>interface-id</i> ] <b>switchport</b>	Displays administrative and operational status of switching (nonrouting) ports. You can use this command to find out if a port is in routing or in switching mode.
<b>show interfaces</b> [ <i>interface-id</i> ] <b>description</b>	Displays the description configured on an interface or all interfaces and the interface status.
<b>show ip interface</b> [ <i>interface-id</i> ]	Displays the usability status of all interfaces configured for IP routing or the specified interface.
<b>show interface</b> [ <i>interface-id</i> ] <b>stats</b>	Displays the input and output packets by the switching path for the interface.
<b>show interfaces</b> <i>interface-id</i>	(Optional) Displays speed and duplex on the interface.
<b>show interfaces transceiver dom-supported-list</b>	(Optional) Displays Digital Optical Monitoring (DOM) status on the connect SFP modules.
<b>show interfaces transceiver properties</b>	(Optional) Displays temperature, voltage, or amount of current on the interface.
<b>show interfaces</b> [ <i>interface-id</i> ] [{ <b>transceiver properties</b>   <b>detail</b> }] <i>module number</i>	Displays physical and operational status about an SFP module.
<b>show running-config interface</b> [ <i>interface-id</i> ]	Displays the running configuration in RAM for the interface.
<b>show version</b>	Displays the hardware configuration, software version, the names and sources of configuration files, and the boot images.
<b>show controllers ethernet-controller</b> <i>interface-id</i> <b>phy</b>	Displays the operational state of the auto-MDIX feature on the interface.

## Clearing and Resetting Interfaces and Counters

Table 9: Clear Commands for Interfaces

Command	Purpose
<code>clear counters [interface-id]</code>	Clears interface counters.
<code>clear interface interface-id</code>	Resets the hardware logic on an interface.
<code>clear line [number   console 0   vty number]</code>	Resets the hardware logic on an asynchronous serial line.

**Note** The **clear counters** privileged EXEC command does not clear counters retrieved by using Simple Network Management Protocol (SNMP), but only those seen with the **show interface** privileged EXEC command.

## Configuration Examples for Interface Characteristics

### Adding a Description to an Interface: Example

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# description Connects to Marketing
Switch(config-if)# end
Switch# show interfaces gigabitethernet1/0/2 description
Interface Status      Protocol Description
Gi1/0/2    admin down    down    Connects to Marketing
```

### Configuring a Range of Interfaces: Examples

This example shows how to use the **interface range** global configuration command to set the speed to 100 Mb/s on ports 1 to 4 on switch 1:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet1/0/1 - 4
Switch(config-if-range)# speed 100
```

This example shows how to use a comma to add different interface type strings to the range to enable Gigabit Ethernet ports 1 to 3 and 10-Gigabit Ethernet ports 1 and 2 to receive flow-control pause frames:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet1/0/1 - 3 , tengigabitethernet1/0/1 - 2
Switch(config-if-range)# flowcontrol receive on
```

If you enter multiple configuration commands while you are in interface-range mode, each command is executed as it is entered. The commands are not batched and executed after you exit interface-range mode. If you exit interface-range configuration mode while the commands are being executed, some commands might not be executed on all interfaces in the range. Wait until the command prompt reappears before exiting interface-range configuration mode.

## Configuring and Using Interface Range Macros: Examples

This example shows how to define an interface-range named *enet\_list* to include ports 1 and 2 on switch 1 and to verify the macro configuration:

```
Switch# configure terminal
Switch(config)# define interface-range enet_list gigabitEthernet1/0/1 - 2
Switch(config)# end
Switch# show running-config | include define
define interface-range enet_list GigabitEthernet1/0/1 - 2
```

This example shows how to create a multiple-interface macro named *macro1*:

```
Switch# configure terminal
Switch(config)# define interface-range macro1 gigabitEthernet1/0/1 - 2, gigabitEthernet1/0/5
- 7, tengigabitEthernet1/0/1 -2
Switch(config)# end
```

This example shows how to enter interface-range configuration mode for the interface-range macro *enet\_list*:

```
Switch# configure terminal
Switch(config)# interface range macro enet_list
Switch(config-if-range)#
```

This example shows how to delete the interface-range macro *enet\_list* and to verify that it was deleted.

```
Switch# configure terminal
Switch(config)# no define interface-range enet_list
Switch(config)# end
Switch# show run | include define
Switch#
```

## Setting Interface Speed and Duplex Mode: Example

This example shows how to set the interface speed to 100 Mb/s and the duplex mode to half on a 10/100/1000 Mb/s port:

```
Switch# configure terminal
Switch(config)# interface gigabitEthernet1/0/3
Switch(config-if)# speed 10
Switch(config-if)# duplex half
```

This example shows how to set the interface speed to 100 Mb/s on a 10/100/1000 Mb/s port:

```
Switch# configure terminal
```

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# speed 100
```

## Configuring Layer 3 Interfaces: Example

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# no switchport
Switch(config-if)# ip address 192.20.135.21 255.255.255.0
Switch(config-if)# no shutdown
```

## Configuring the Console Media Type: Example

This example disables the USB console media type and enables the RJ-45 console media type.

```
Switch# configure terminal
Switch(config)# line console 0
Switch(config-line)# media-type rj45
```

This configuration terminates any active USB console media type in the stack. A log shows that this termination has occurred. This example shows that the console on switch 1 reverted to RJ-45.

```
*Mar 1 00:25:36.860: %USB_CONSOLE-6-CONFIG_DISABLE: Console media-type USB disabled by
system configuration, media-type reverted to RJ45.
```

At this point no switches in the stack allow a USB console to have input. A log entry shows when a console cable is attached. If a USB console cable is connected to switch 2, it is prevented from providing input.

```
*Mar 1 00:34:27.498: %USB_CONSOLE-6-CONFIG_DISALLOW: Console media-type USB is disallowed
by system configuration, media-type remains RJ45. (switch-stk-2)
```

This example reverses the previous configuration and immediately activates any USB console that is connected.

```
Switch# configure terminal
Switch(config)# line console 0
Switch(config-line)# no media-type rj45
```

## Configuring the USB Inactivity Timeout: Example

This example configures the inactivity timeout to 30 minutes:

```
Switch# configure terminal
Switch(config)# line console 0
Switch(config-line)# usb-inactivity-timeout 30
```

To disable the configuration, use these commands:

```
Switch# configure terminal
Switch(config)# line console 0
```

```
Switch(config-line)# no usb-inactivity-timeout
```

If there is no (input) activity on a USB console port for the configured number of minutes, the inactivity timeout setting applies to the RJ-45 port, and a log shows this occurrence:

```
*Mar 1 00:47:25.625: %USB_CONSOLE-6-INACTIVITY_DISABLE: Console media-type USB disabled due to inactivity, media-type reverted to RJ45.
```

At this point, the only way to reactivate the USB console port is to disconnect and reconnect the cable.

When the USB cable on the switch has been disconnected and reconnected, a log similar to this appears:

```
*Mar 1 00:48:28.640: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.
```

## Feature History and Information for Configuring Interface Characteristics

Release	Modification
Cisco IOS XE 3.2SE Cisco IOS XE 3.3SE Cisco IOS XE 3.3SE	This feature was introduced.

## CHAPTER 5

# Configuring Auto-MDIX

---

- [Prerequisites for Auto-MDIX, on page 83](#)
- [Restrictions for Auto-MDIX, on page 83](#)
- [Information about Configuring Auto-MDIX, on page 84](#)
- [How to Configure Auto-MDIX, on page 84](#)
- [Example for Configuring Auto-MDIX, on page 85](#)
- [Additional References, on page 86](#)
- [Feature History and Information for Auto-MDIX, on page 86](#)

## Prerequisites for Auto-MDIX

To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the **switchport** interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

Automatic medium-dependent interface crossover (auto-MDIX) is enabled by default.

Auto-MDIX is supported on all 10/100/1000-Mb/s and on 10/100/1000BASE-TX small form-factor pluggable (SFP)-module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.

## Restrictions for Auto-MDIX

The switch might not support a pre-standard powered device—such as Cisco IP phones and access points that do not fully support IEEE 802.3af—if that powered device is connected to the switch through a crossover cable. This is regardless of whether auto-MIDX is enabled on the switch port.

# Information about Configuring Auto-MDIX

## Auto-MDIX on an Interface

When automatic medium-dependent interface crossover (auto-MDIX) is enabled on an interface, the interface automatically detects the required cable connection type (straight through or crossover) and configures the connection appropriately. When connecting switches without the auto-MDIX feature, you must use straight-through cables to connect to devices such as servers, workstations, or routers and crossover cables to connect to other switches or repeaters. With auto-MDIX enabled, you can use either type of cable to connect to other devices, and the interface automatically corrects for any incorrect cabling. For more information about cabling requirements, see the hardware installation guide.

This table shows the link states that result from auto-MDIX settings and correct and incorrect cabling.

*Table 10: Link Conditions and Auto-MDIX Settings*

Local Side Auto-MDIX	Remote Side Auto-MDIX	With Correct Cabling	With Incorrect Cabling
On	On	Link up	Link up
On	Off	Link up	Link up
Off	On	Link up	Link up
Off	Off	Link up	Link down

## How to Configure Auto-MDIX

### Configuring Auto-MDIX on an Interface

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode

	Command or Action	Purpose
<b>Step 3</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> <pre>Switch(config)# <b>interface</b> <b>gigabitethernet1/0/1</b></pre>	Specifies the physical interface to be configured, and enter interface configuration mode.
<b>Step 4</b>	<b>speed auto</b> <b>Example:</b> <pre>Switch(config-if)# <b>speed auto</b></pre>	Configures the interface to autonegotiate speed with the connected device.
<b>Step 5</b>	<b>duplex auto</b> <b>Example:</b> <pre>Switch(config-if)# <b>duplex auto</b></pre>	Configures the interface to autonegotiate duplex mode with the connected device.
<b>Step 6</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if)# <b>end</b></pre>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# <b>copy running-config</b> <b>startup-config</b></pre>	(Optional) Saves your entries in the configuration file.

## Example for Configuring Auto-MDIX

This example shows how to enable auto-MDIX on a port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# speed auto
Switch(config-if)# duplex auto
Switch(config-if)# mdix auto
Switch(config-if)# end
```

## CHAPTER 6

# Configuring Ethernet Management Port

- [Finding Feature Information, on page 87](#)
- [Prerequisites for Ethernet Management Ports, on page 87](#)
- [Information about the Ethernet Management Port, on page 87](#)
- [How to Configure the Ethernet Management Port, on page 90](#)
- [Additional References, on page 91](#)
- [Feature Information for Ethernet Management Ports, on page 92](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Ethernet Management Ports

When connecting a PC to the Ethernet management port, you must first assign an IP address.

## Information about the Ethernet Management Port

The Ethernet management port, also referred to as the *Gi0/0* or *GigabitEthernet0/0* port, is a VRF (VPN routing/forwarding) interface to which you can connect a PC. You can use the Ethernet management port instead of the switch console port for network management. When managing a switch stack, connect the PC to the Ethernet management port on a stack member.

## Ethernet Management Port Direct Connection to a Switch

**Figure 3: Connecting a Switch to a PC**

This figure displays how to connect the Ethernet management port to the PC for a switch or a standalone

## Ethernet Management Port Connection to Stack Switches using a Hub

In a stack with only stack switches, all the Ethernet management ports on the stack members are connected to a hub to which the PC is connected. The active link is from the Ethernet management port on the active switch through the hub, to the PC. If the active switch fails and a new active switch is elected, the active link is now from the Ethernet management port on the new active switch to the PC.

**Figure 4: Connecting a Switch Stack to a PC**

This figure displays how a PC uses a hub to connect to a switch stack.

## Ethernet Management Port and Routing

By default, the Ethernet management port is enabled. The switch cannot route packets from the Ethernet management port to a network port, and the reverse. Even though the Ethernet management port does not support routing, you may need to enable routing protocols on the port.

**Figure 5: Network Example with Routing Protocols Enabled**

Enable routing protocols on the Ethernet management port when the PC is multiple hops away from the switch and the packets must pass through multiple Layer 3 devices to reach the PC.

In the above figure, if the Ethernet management port and the network ports are associated with the same routing process, the routes are propagated as follows:

- The routes from the Ethernet management port are propagated through the network ports to the network.
- The routes from the network ports are propagated through the Ethernet management port to the network.

Because routing is not supported between the Ethernet management port and the network ports, traffic between these ports cannot be sent or received. If this happens, data packet loops occur between the ports, which disrupt the switch and network operation. To prevent the loops, configure route filters to avoid routes between the Ethernet management port and the network ports.

## Supported Features on the Ethernet Management Port

The Ethernet management port supports these features:

- Express Setup (only in switch stacks)
- Network Assistant
- Telnet with passwords
- TFTP
- Secure Shell (SSH)
- DHCP-based autoconfiguration
- SMNP (only the ENTITY-MIB and the IF-MIB)
- IP ping
- Interface features
  - Speed—10 Mb/s, 100 Mb/s, and autonegotiation
  - Duplex mode—Full, half, and autonegotiation
  - Loopback detection
- Cisco Discovery Protocol (CDP)
- DHCP relay agent
- IPv4 access control lists (ACLs)
- Routing protocols

---

**Caution**

Before enabling a feature on the Ethernet management port, make sure that the feature is supported. If you try to configure an unsupported feature on the Ethernet Management port, the feature might not work properly, and the switch might fail.

---

# How to Configure the Ethernet Management Port

## Disabling and Enabling the Ethernet Management Port

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface gigabitethernet0/0</b> <b>Example:</b> Switch(config)# <code>interface gigabitethernet0/0</code>	Specifies the Ethernet management port in the CLI.
<b>Step 3</b>	<b>shutdown</b> <b>Example:</b> Switch(config-if)# <code>shutdown</code>	Disables the Ethernet management port.
<b>Step 4</b>	<b>no shutdown</b> <b>Example:</b> Switch(config-if)# <code>no shutdown</code>	Enables the Ethernet management port.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Switch(config-if)# <code>exit</code>	Exits interface configuration mode.
<b>Step 6</b>	<b>show interfaces gigabitethernet0/0</b> <b>Example:</b> Switch# <code>show interfaces gigabitethernet0/0</code>	Displays the link status.  To find out the link status to the PC, you can monitor the LED for the Ethernet management port. The LED is green (on) when the link is active, and the LED is off when the link is down. The LED is amber when there is a POST failure.

### What to do next

Proceed to manage or configure your switch using the Ethernet management port. Refer to the *Network Management Configuration Guide (Catalyst 3650 Switches)*.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## LLDP, LLDP-MED, and Wired Location Service Overview

### LLDP

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, switches, and controllers). CDP allows network management applications to automatically discover and learn about other Cisco devices connected to the network.

To support non-Cisco devices and to allow for interoperability between other devices, the switch supports the IEEE 802.1AB Link Layer Discovery Protocol (LLDP). LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol

runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

## LLDP Supported TLVs

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors. This protocol can advertise details such as configuration information, device capabilities, and device identity.

The switch supports these basic management TLVs. These are mandatory LLDP TLVs.

- Port description TLV
- System name TLV
- System description TLV
- System capabilities TLV
- Management address TLV

These organizationally specific LLDP TLVs are also advertised to support LLDP-MED.

- Port VLAN ID TLV (IEEE 802.1 organizationally specific TLVs)
- MAC/PHY configuration/status TLV (IEEE 802.3 organizationally specific TLVs)

## LLDP and Cisco Switch Stacks

A switch stack appears as a single switch in the network. Therefore, LLDP discovers the switch stack, not the individual stack members.

## LLDP and Cisco Medianet

When you configure LLDP or CDP location information on a per-port basis, remote devices can send Cisco Medianet location information to the switch. For information, go to [http://www.cisco.com/en/US/docs/ios/netmgmt/configuration/guide/nm\\_cdp\\_discover.html](http://www.cisco.com/en/US/docs/ios/netmgmt/configuration/guide/nm_cdp_discover.html).

## LLDP-MED

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices such as IP phones and network devices such as switches. It specifically provides support for voice over IP (VoIP) applications and provides additional TLVs for capabilities discovery, network policy, Power over Ethernet, inventory management and location information. By default, all LLDP-MED TLVs are enabled.

## LLDP-MED Supported TLVs

LLDP-MED supports these TLVs:

- LLDP-MED capabilities TLV

Allows LLDP-MED endpoints to determine the capabilities that the connected device supports and has enabled.

- Network policy TLV

Allows both network connectivity devices and endpoints to advertise VLAN configurations and associated Layer 2 and Layer 3 attributes for the specific application on that port. For example, the switch can notify a phone of the VLAN number that it should use. The phone can connect to any switch, obtain its VLAN number, and then start communicating with the call control.

By defining a network-policy profile TLV, you can create a profile for voice and voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode. These profile attributes are then maintained centrally on the switch and propagated to the phone.

- Power management TLV

Enables advanced power management between LLDP-MED endpoint and network connectivity devices. Allows switches and phones to convey power information, such as how the device is powered, power priority, and how much power the device needs.

LLDP-MED also supports an extended power TLV to advertise fine-grained power requirements, end-point power priority, and end-point and network connectivity-device power status. LLDP is enabled and power is applied to a port, the power TLV determines the actual power requirement of the endpoint device so that the system power budget can be adjusted accordingly. The switch processes the requests and either grants or denies power based on the current power budget. If the request is granted, the switch updates the power budget. If the request is denied, the switch turns off power to the port, generates a syslog message, and updates the power budget. If LLDP-MED is disabled or if the endpoint does not support the LLDP-MED power TLV, the initial allocation value is used throughout the duration of the connection.

You can change power settings by entering the **power inline** {**auto** [**max** *max-wattage*] | **never** | **static** [**max** *max-wattage*]} interface configuration command. By default the PoE interface is in **auto** mode; If no value is specified, the maximum is allowed (30 W).

- Inventory management TLV

Allows an endpoint to send detailed inventory information about itself to the switch, including information hardware revision, firmware version, software version, serial number, manufacturer name, model name, and asset ID TLV.

- Location TLV

Provides location information from the switch to the endpoint device. The location TLV can send this information:

- Civic location information

Provides the civic address information and postal information. Examples of civic location information are street address, road name, and postal community name information.

- ELIN location information

Provides the location information of a caller. The location is determined by the Emergency location identifier number (ELIN), which is a phone number that routes an emergency call to the local public safety answering point (PSAP) and which the PSAP can use to call back the emergency caller.

- Geographic location information

Provides the geographical details of a switch location such as latitude, longitude, and altitude of a switch.

- custom location

Provides customized name and value of a switch location.

## Wired Location Service

The switch uses the location service feature to send location and attachment tracking information for its connected devices to a Cisco Mobility Services Engine (MSE). The tracked device can be a wireless endpoint, a wired endpoint, or a wired switch or controller. The switch notifies the MSE of device link up and link down events through the Network Mobility Services Protocol (NMSP) location and attachment notifications.

The MSE starts the NMSP connection to the switch, which opens a server port. When the MSE connects to the switch there are a set of message exchanges to establish version compatibility and service exchange information followed by location information synchronization. After connection, the switch periodically sends location and attachment notifications to the MSE. Any link up or link down events detected during an interval are aggregated and sent at the end of the interval.

When the switch determines the presence or absence of a device on a link-up or link-down event, it obtains the client-specific information such as the MAC address, IP address, and username. If the client is LLDP-MED- or CDP-capable, the switch obtains the serial number and UDI through the LLDP-MED location TLV or CDP.

Depending on the device capabilities, the switch obtains this client information at link up:

- Slot and port specified in port connection
- MAC address specified in the client MAC address
- IP address specified in port connection
- 802.1X username if applicable
- Device category is specified as a *wired station*
- State is specified as *new*
- Serial number, UDI
- Model number
- Time in seconds since the switch detected the association

Depending on the device capabilities, the switch obtains this client information at link down:

- Slot and port that was disconnected
- MAC address
- IP address
- 802.1X username if applicable
- Device category is specified as a *wired station*
- State is specified as *delete*
- Serial number, UDI
- Time in seconds since the switch detected the disassociation

When the switch shuts down, it sends an attachment notification with the state *delete* and the IP address before closing the NMSP connection to the MSE. The MSE interprets this notification as disassociation for all the wired clients associated with the switch.

If you change a location address on the switch, the switch sends an NMSP location notification message that identifies the affected ports and the changed address information.

## Default LLDP Configuration

*Table 11: Default LLDP Configuration*

Feature	Default Setting
LLDP global state	Disabled
LLDP holdtime (before discarding)	120 seconds
LLDP timer (packet update frequency)	30 seconds
LLDP reinitialization delay	2 seconds
LLDP tlv-select	Disabled to send and receive all TLVs
LLDP interface state	Disabled
LLDP receive	Disabled
LLDP transmit	Disabled
LLDP med-tlv-select	Disabled to send all LLDP-MED TLVs. When LLDP is globally enabled, LLDP-MED-TLV is also enabled.

## Restrictions for LLDP

- If the interface is configured as a tunnel port, LLDP is automatically disabled.
- If you first configure a network-policy profile on an interface, you cannot apply the **switchport voice vlan** command on the interface. If the **switchport voice vlan *vlan-id*** is already configured on an interface, you can apply a network-policy profile on the interface. This way the interface has the voice or voice-signaling VLAN network-policy profile applied on the interface.
- You cannot configure static secure MAC addresses on an interface that has a network-policy profile.

# How to Configure LLDP, LLDP-MED, and Wired Location Service

## Enabling LLDP

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>lldp run</b> <b>Example:</b> Switch (config)# <b>lldp run</b>	Enables LLDP globally on the switch.
<b>Step 4</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch (config)# <b>interface</b> <b>gigabitethernet2/0/1</b>	Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.
<b>Step 5</b>	<b>lldp transmit</b> <b>Example:</b> Switch(config-if)# <b>lldp transmit</b>	Enables the interface to send LLDP packets.
<b>Step 6</b>	<b>lldp receive</b> <b>Example:</b> Switch(config-if)# <b>lldp receive</b>	Enables the interface to receive LLDP packets.
<b>Step 7</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	<code>Switch(config-if)# end</code>	
<b>Step 8</b>	<b>show lldp</b> <b>Example:</b> <code>Switch# show lldp</code>	Verifies the configuration.
<b>Step 9</b>	<b>copy running-config startup-config</b> <b>Example:</b> <code>Switch# copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Configuring LLDP Characteristics

You can configure the frequency of LLDP updates, the amount of time to hold the information before discarding it, and the initialization delay time. You can also select the LLDP and LLDP-MED TLVs to send and receive.

**Note** Steps 2 through 5 are optional and can be performed in any order.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <code>Switch&gt; enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <code>Switch# configure terminal</code>	Enters global configuration mode.
<b>Step 3</b>	<b>lldp holdtime seconds</b> <b>Example:</b> <code>Switch(config)# lldp holdtime 120</code>	(Optional) Specifies the amount of time a receiving device should hold the information from your device before discarding it.  The range is 0 to 65535 seconds; the default is 120 seconds.

	Command or Action	Purpose
<b>Step 4</b>	<b>lldp reinit <i>delay</i></b> <b>Example:</b> <pre>Switch(config)# lldp reinit 2</pre>	(Optional) Specifies the delay time in seconds for LLDP to initialize on an interface.  The range is 2 to 5 seconds; the default is 2 seconds.
<b>Step 5</b>	<b>lldp timer <i>rate</i></b> <b>Example:</b> <pre>Switch(config)# lldp timer 30</pre>	(Optional) Sets the sending frequency of LLDP updates in seconds.  The range is 5 to 65534 seconds; the default is 30 seconds.
<b>Step 6</b>	<b>lldp tlv-select</b> <b>Example:</b> <pre>Switch(config)# tlv-select</pre>	(Optional) Specifies the LLDP TLVs to send or receive.
<b>Step 7</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch (config)# interface gigabitethernet2/0/1</pre>	Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.
<b>Step 8</b>	<b>lldp med-tlv-select</b> <b>Example:</b> <pre>Switch (config-if)# lldp med-tlv-select inventory management</pre>	(Optional) Specifies the LLDP-MED TLVs to send or receive.
<b>Step 9</b>	<b>end</b> <b>Example:</b> <pre>Switch (config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 10</b>	<b>show lldp</b> <b>Example:</b> <pre>Switch# show lldp</pre>	Verifies the configuration.
<b>Step 11</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config</pre>	(Optional) Saves your entries in the configuration file.

	Command or Action	Purpose
	<code>startup-config</code>	

## Configuring LLDP-MED TLVs

By default, the switch only sends LLDP packets until it receives LLDP-MED packets from the end device. It then sends LLDP packets with MED TLVs, as well. When the LLDP-MED entry has been aged out, it again only sends LLDP packets.

By using the `lldp` interface configuration command, you can configure the interface not to send the TLVs listed in the following table.

**Table 12: LLDP-MED TLVs**

LLDP-MED TLV	Description
inventory-management	LLDP-MED inventory management TLV
location	LLDP-MED location TLV
network-policy	LLDP-MED network policy TLV
power-management	LLDP-MED power management TLV

Follow these steps to enable a TLV on an interface:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch (config)# interface gigabitethernet 2/0/1</pre>	Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.

	Command or Action	Purpose
<b>Step 4</b>	<b>lldp med-tlv-select</b> <b>Example:</b> <pre>Switch(config-if) # lldp med-tlv-select inventory management</pre>	Specifies the TLV to enable.
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if) # end</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring Network-Policy TLV

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>network-policy profile <i>profile number</i></b> <b>Example:</b> <pre>Switch(config) # network-policy profile 1</pre>	Specifies the network-policy profile number, and enter network-policy configuration mode. The range is 1 to 4294967295.
<b>Step 4</b>	<pre>{voice   voice-signaling} vlan [<i>vlan-id</i> {cos <i>cvalue</i>   dscp <i>dvalue</i>}]   [[dot1p {cos <i>cvalue</i>   dscp <i>dvalue</i>}]   none   untagged]</pre>	Configures the policy attributes: <ul style="list-style-type: none"> <li><b>voice</b>—Specifies the voice application type.</li> </ul>

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Switch(config-network-policy)# voice vlan 100 cos 4</pre>	<ul style="list-style-type: none"> <li>• <b>voice-signaling</b>—Specifies the voice-signaling application type.</li> <li>• <b>vlan</b>—Specifies the native VLAN for voice traffic.</li> <li>• <b>vlan-id</b>—(Optional) Specifies the VLAN for voice traffic. The range is 1 to 4094.</li> <li>• <b>cos cvalue</b>—(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.</li> <li>• <b>dscp dvalue</b>—(Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.</li> <li>• <b>dot1p</b>—(Optional) Configures the telephone to use IEEE 802.1p priority tagging and use VLAN 0 (the native VLAN).</li> <li>• <b>none</b>—(Optional) Do not instruct the IP telephone about the voice VLAN. The telephone uses the configuration from the telephone key pad.</li> <li>• <b>untagged</b>—(Optional) Configures the telephone to send untagged voice traffic. This is the default for the telephone.</li> <li>• <b>untagged</b>—(Optional) Configures the telephone to send untagged voice traffic. This is the default for the telephone.</li> </ul>
<b>Step 5</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config)# exit</pre>	Returns to global configuration mode.
<b>Step 6</b>	<p><b>interface interface-id</b></p> <p><b>Example:</b></p> <pre>Switch (config)# interface gigabitethernet2/0/1</pre>	Specifies the interface on which you are configuring a network-policy profile, and enter interface configuration mode.
<b>Step 7</b>	<p><b>network-policy profile number</b></p> <p><b>Example:</b></p>	Specifies the network-policy profile number.

	Command or Action	Purpose
	Switch(config-if)# <b>network-policy 1</b>	
<b>Step 8</b>	<b>lldp med-tlv-select network-policy</b> <b>Example:</b> Switch(config-if)# <b>lldp med-tlv-select network-policy</b>	Specifies the network-policy TLV.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 10</b>	<b>show network-policy profile</b> <b>Example:</b> Switch# <b>show network-policy profile</b>	Verifies the configuration.
<b>Step 11</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring Location TLV and Wired Location Service

Beginning in privileged EXEC mode, follow these steps to configure location information for an endpoint and to apply it to an interface.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>location {admin-tag <i>string</i>   civic-location identifier {<i>id</i>   <i>host</i>}   elin-location <i>string</i> identifier <i>id</i>   custom-location identifier {<i>id</i>   <i>host</i>}   geo-location identifier {<i>id</i>   <i>host</i>}}</b>	Specifies the location information for an endpoint. <ul style="list-style-type: none"> <li>• <b>admin-tag</b>—Specifies an administrative tag or site information.</li> </ul>

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Switch(config)# location civic-location   identifier 1 Switch(config-civic)# number 3550 Switch(config-civic)# primary-road-name   "Cisco Way" Switch(config-civic)# city "San Jose" Switch(config-civic)# state CA Switch(config-civic)# building 19 Switch(config-civic)# room C6 Switch(config-civic)# county "Santa   Clara" Switch(config-civic)# country US</pre>	<ul style="list-style-type: none"> <li>• <b>civic-location</b>—Specifies civic location information.</li> <li>• <b>elin-location</b>—Specifies emergency location information (ELIN).</li> <li>• <b>custom-location</b>—Specifies custom location information.</li> <li>• <b>geo-location</b>—Specifies geo-spatial location information.</li> <li>• <b>identifier <i>id</i></b>—Specifies the ID for the civic, ELIN, custom, or geo location.</li> <li>• <b>host</b>—Specifies the host civic, custom, or geo location.</li> <li>• <b><i>string</i></b>—Specifies the site or location information in alphanumeric format.</li> </ul>
<b>Step 3</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-civic)# exit</pre>	Returns to global configuration mode.
<b>Step 4</b>	<p><b>interface <i>interface-id</i></b></p> <p><b>Example:</b></p> <pre>Switch (config)# interface   gigabitethernet2/0/1</pre>	Specifies the interface on which you are configuring the location information, and enter interface configuration mode.
<b>Step 5</b>	<p><b>location {additional-location-information <i>word</i>   civic-location-id {<i>id</i>   <i>host</i>}   elin-location-id <i>id</i>   custom-location-id {<i>id</i>   <i>host</i>}   geo-location-id {<i>id</i>   <i>host</i>} }</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# location   elin-location-id 1</pre>	<p>Enters location information for an interface:</p> <ul style="list-style-type: none"> <li>• <b>additional-location-information</b>—Specifies additional information for a location or place.</li> <li>• <b>civic-location-id</b>—Specifies global civic location information for an interface.</li> <li>• <b>elin-location-id</b>—Specifies emergency location information for an interface.</li> <li>• <b>custom-location-id</b>—Specifies custom location information for an interface.</li> <li>• <b>geo-location-id</b>—Specifies geo-spatial location information for an interface.</li> <li>• <b>host</b>—Specifies the host location identifier.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <i>word</i>—Specifies a word or phrase with additional location information.</li> <li>• <i>id</i>—Specifies the ID for the civic, ELIN, custom, or geo location. The ID range is 1 to 4095.</li> </ul>
<b>Step 6</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 7</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>show location admin-tag</b> <i>string</i></li> <li>• <b>show location civic-location identifier</b> <i>id</i></li> <li>• <b>show location elin-location identifier</b> <i>id</i></li> </ul> <b>Example:</b> <pre>Switch# show location admin-tag</pre> OR <pre>Switch# show location civic-location identifier</pre> OR <pre>Switch# show location elin-location identifier</pre>	Verifies the configuration.
<b>Step 8</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Enabling Wired Location Service on the Switch

### Before you begin

For wired location to function, you must first enter the **ip device tracking** global configuration command.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>nmsp notification interval {attachment   location} interval-seconds</b> <b>Example:</b> <pre>Switch(config)# nmsp notification interval location 10</pre>	<p>Specifies the NMSP notification interval.</p> <p><b>attachment</b>—Specifies the attachment notification interval.</p> <p><b>location</b>—Specifies the location notification interval.</p> <p><i>interval-seconds</i>—Duration in seconds before the switch sends the MSE the location or attachment updates. The range is 1 to 30; the default is 30.</p>
<b>Step 4</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show network-policy profile</b> <b>Example:</b> <pre>Switch# show network-policy profile</pre>	Verifies the configuration.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

# Configuration Examples for LLDP, LLDP-MED, and Wired Location Service

## Configuring Network-Policy TLV: Examples

This example shows how to configure VLAN 100 for voice application with CoS and to enable the network-policy profile and network-policy TLV on an interface:

```
Switch# configure terminal
Switch(config)# network-policy 1
Switch(config-network-policy)# voice vlan 100 cos 4
Switch(config-network-policy)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# network-policy profile 1
Switch(config-if)# lldp med-tlv-select network-policy
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
Switchconfig-network-policy)# voice vlan dot1p cos 4
Switchconfig-network-policy)# voice vlan dot1p dscp 34
```

## Monitoring and Maintaining LLDP, LLDP-MED, and Wired Location Service

Commands for monitoring and maintaining LLDP, LLDP-MED, and wired location service.

Command	Description
<code>clear lldp counters</code>	Resets the traffic counters to zero.
<code>clear lldp table</code>	Deletes the LLDP neighbor information table.
<code>clear nmosp statistics</code>	Clears the NMSP statistic counters.
<code>show lldp</code>	Displays global information, such as frequency of transmissions, the holdtime for packets being sent, and the delay time before LLDP initializes on an interface.
<code>show lldp entry <i>entry-name</i></code>	Displays information about a specific neighbor. You can enter an asterisk (*) to display all neighbors, or you can enter the neighbor name.

Command	Description
<b>show lldp interface</b> [ <i>interface-id</i> ]	Displays information about interfaces with LLDP enabled.  You can limit the display to a specific interface.
<b>show lldp neighbors</b> [ <i>interface-id</i> ] [ <b>detail</b> ]	Displays information about neighbors, including device type, interface type and number, holdtime settings, capabilities, and port ID.  You can limit the display to neighbors of a specific interface or expand the display for more detailed information.
<b>show lldp traffic</b>	Displays LLDP counters, including the number of packets sent and received, number of packets discarded, and number of unrecognized TLVs.
<b>show location admin-tag</b> <i>string</i>	Displays the location information for the specified administrative tag or site.
<b>show location civic-location identifier</b> <i>id</i>	Displays the location information for a specific global civic location.
<b>show location elin-location identifier</b> <i>id</i>	Displays the location information for an emergency location
<b>show network-policy profile</b>	Displays the configured network-policy profiles.
<b>show nmsp</b>	Displays the NMSP information

## Feature Information for LLDP, LLDP-MED, and Wired Location Service

Release	Modification
Cisco IOS XE 3.2SE Cisco IOS XE 3.3SE Cisco IOS XE 3.3SE	This feature was introduced.

## CHAPTER 8

# Configuring System MTU

- [Configuring System MTU](#), on page 111

## Configuring System MTU

This module describes how to configure the Maximum Transmission Unit for a system on Catalyst 3650 Series Switches and Catalyst 3850 Series Switches.

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Information about the MTU

The default maximum transmission unit (MTU) size for frames received and sent on all switch interfaces is 1500 bytes.

### Restrictions for System MTU

When configuring the system MTU values, follow these guidelines:

- The switch does not support the MTU on a per-interface basis.
- If you enter the **system mtu bytes** global configuration command, the command does not take effect on the switch. This command only affects the system MTU size on Fast Ethernet switch ports.

### System MTU Value Application

In a switch stack, the MTU values applied to member switches depends upon the stack configuration. The following stack configurations are supported:

The upper limit of the IP or IPv6 MTU value is based on the switch or switch stack configuration and refers to the currently applied system MTU or the system jumbo MTU value. For more information about setting the MTU sizes, see the **system mtu** global configuration command in the command reference for this release.

## Configuring the System MTU

### Configuring the System MTU

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>system mtu bytes</b> <b>Example:</b> Switch(config)# system mtu 1600	Applies the Maximum Transmission Unit (MTU) size for all Ethernet interfaces on the switch or the switch stack. <ul style="list-style-type: none"> <li>• The MTU range is from 1500 to 9198. The default is 1500.</li> </ul>
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Switch(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.
<b>Step 5</b>	<b>show system mtu</b> <b>Example:</b> Switch# show system mtu	Displays the configured global MTU size.

### Configuring Protocol-Specific MTU

When system MTU changes, the range for the **ip mtu** command for interface also changes.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 3</b>	<b>interface <i>type number</i></b> <b>Example:</b> Switch(config)# <code>interface gigabitethernet 0/0</code>	Configures an interface and enters interface configuration mode.
<b>Step 4</b>	<b>ip mtu <i>bytes</i></b> <b>Example:</b> Switch(config-if)# <code>ip mtu 900</code>	Sets the maximum transmission unit (MTU) size of IP packets sent on an interface. <ul style="list-style-type: none"> <li>• The range is from 832 to 1500.</li> </ul>
<b>Step 5</b>	<b>ipv6 mtu <i>bytes</i></b> <b>Example:</b> Switch(config-if)# <code>ipv6 mtu 1300</code>	Set the MTU size of IPv6 packets sent on an interface. <ul style="list-style-type: none"> <li>• The range is from 1280 to 1500.</li> </ul>
<b>Step 6</b>	<b>end</b> <b>Example:</b> Switch(config-if)# <code>end</code>	Exits interface configuration mode and returns to privileged EXEC mode.
<b>Step 7</b>	<b>show system mtu</b> <b>Example:</b> Switch# <code>show system mtu</code>	Displays the configured global MTU size.

## Configuration Examples for System MTU

### Example: Configuring the System MTU

```
Switch# configure terminal
Switch(config)# system mtu 1600
Switch(config)# exit
```

### Example: Configuring Protocol-Specific MTU

```
Switch# configure terminal
Switch(config)# interface gigabitethernet 0/0
Switch(config-if)# ip mtu 900
Switch(config-if)# ipv6 mtu 1286
Switch(config-if)# end
```

# CHAPTER 9

## Configuring Internal Power Supplies

- [Information About Internal Power Supplies](#) , on page 115
- [How to Configure Internal Power Supplies](#), on page 115
- [Monitoring Internal Power Supplies](#), on page 116
- [Configuration Examples for Internal Power Supplies](#), on page 116
- [Additional References](#), on page 117
- [Feature History and Information for Internal Power Supplies](#), on page 118

### Information About Internal Power Supplies

See the switch installation guide for information about the power supplies.

### How to Configure Internal Power Supplies

#### Configuring Internal Power Supply

You can use the **power supply** EXEC command to configure and manage the internal power supply on the switch. The switch does not support the **no power supply** EXEC command.

Follow these steps beginning in user EXEC mode:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>power supply</b> <i>switch_number</i> <b>slot</b>{A   B} { <b>off</b>   <b>on</b> }</p> <p><b>Example:</b></p> <pre>Switch# power supply 1 slot A on</pre>	<p>Sets the specified power supply to <b>off</b> or <b>on</b> by using one of these keywords:</p> <ul style="list-style-type: none"> <li>• <b>A</b> —Selects the power supply in slot A.</li> <li>• <b>B</b> —Selects power supply in slot B.</li> </ul> <p><b>Note</b> Power supply slot B is the closest to the outer edge of the switch.</p>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>off</b> —Set the power supply off.</li> <li>• <b>on</b> —Set the power supply on.</li> </ul> <p>By default, the switch power supply is <b>on</b>.</p>
<b>Step 2</b>	<b>show environment power</b>  <b>Example:</b>  Switch# <code>show environment power</code>	Verifies your settings.

## Monitoring Internal Power Supplies

Table 13: Show Commands for Power Supplies

Command	Purpose
<code>show environment power [ all   switch <i>switch_number</i> ]</code>	(Optional) Displays the status of the internal power supplies for each switch in the stack or for the specified switch. The range is 1 to 9, depending on the switch member numbers in the stack.  The switch keywords are available only on stacking-capable switches.

## Configuration Examples for Internal Power Supplies

This example shows how to set the power supply in slot A to off:

```
Switch# power supply 1 slot A off
Disabling Power supply A may result in a power loss to PoE devices and/or switches ...
Continue? (yes/[no]): yes
Switch#
Jun 10 04:52:54.389: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered off
Jun 10 04:52:56.717: %PLATFORM_ENV-1-FAN_NOT_PRESENT: Fan is not present
Switch#
```

This example shows how to set the power supply in slot A to on:

```
Switch# power supply 1 slot A on
Jun 10 04:54:39.600: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered on
```

This example shows the output of the `show env power` command:

```
Switch# show env power
```

SW	PID	Serial#	Status	Sys Pwr	PoE Pwr	Watts

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information about PoE

### Power over Ethernet Ports

A PoE-capable switch port automatically supplies power to one of these connected devices if the switch senses that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

### Supported Protocols and Standards

The switch uses these protocols and standards to support PoE:

- CDP with power consumption—The powered device notifies the switch of the amount of power it is consuming. The switch does not reply to the power-consumption messages. The switch can only supply power to or remove power from the PoE port.
- Cisco intelligent power management—The powered device and the switch negotiate through power-negotiation CDP messages for an agreed-upon power-consumption level. The negotiation allows a high-power Cisco powered device, which consumes more than 7 W, to operate at its highest power mode. The powered device first boots up in low-power mode, consumes less than 7 W, and negotiates to obtain enough power to operate in high-power mode. The device changes to high-power mode only when it receives confirmation from the switch.

High-power devices can operate in low-power mode on switches that do not support power-negotiation CDP.

Cisco intelligent power management is backward-compatible with CDP with power consumption; the switch responds according to the CDP message that it receives. CDP is not supported on third-party powered devices; therefore, the switch uses the IEEE classification to determine the power usage of the device.

- IEEE 802.3af—The major features of this standard are powered-device discovery, power administration, disconnect detection, and optional powered-device power classification. For more information, see the standard.
- The Cisco UPOE feature provides the capability to source up to 60 W of power (2 x 30 W) over both signal and spare pairs of the RJ-45 Ethernet cable by using the Layer-2 power negotiation protocols such as CDP or LLDP. An LLDP and CDP request of 30 W and higher in presence of the 4-wire Cisco Proprietary spare-pair power TLV can provide power on the spare pair.

## Powered-Device Detection and Initial Power Allocation

The switch detects a Cisco pre-standard or an IEEE-compliant powered device when the PoE-capable port is in the no-shutdown state, PoE is enabled (the default), and the connected device is not being powered by an AC adaptor.

After device detection, the switch determines the device power requirements based on its type:

- The initial power allocation is the maximum amount of power that a powered device requires. The switch initially allocates this amount of power when it detects and powers the powered device. As the switch receives CDP messages from the powered device and as the powered device negotiates power levels with the switch through CDP power-negotiation messages, the initial power allocation might be adjusted.
- The switch classifies the detected IEEE device within a power consumption class. Based on the available power in the power budget, the switch determines if a port can be powered. [Table 15: IEEE Power Classifications](#), on page 120 lists these levels.

**Table 15: IEEE Power Classifications**

Class	Maximum Power Level Required from the Switch
0 (class status unknown)	15.4 W
1	4 W
2	7 W

Class	Maximum Power Level Required from the Switch
3	15.4 W
4	30 W (For IEEE 802.3at Type 2 powered devices)

The switch monitors and tracks requests for power and grants power only when it is available. The switch tracks its power budget (the amount of power available on the switch for PoE). The switch performs power-accounting calculations when a port is granted or denied power to keep the power budget up to date.

After power is applied to the port, the switch uses CDP to determine the *CDP-specific* power consumption requirement of the connected Cisco powered devices, which is the amount of power to allocate based on the CDP messages. The switch adjusts the power budget accordingly. This does not apply to third-party PoE devices. The switch processes a request and either grants or denies power. If the request is granted, the switch updates the power budget. If the request is denied, the switch ensures that power to the port is turned off, generates a syslog message, and updates the LEDs. Powered devices can also negotiate with the switch for more power.

With PoE+, powered devices use IEEE 802.3at and LLDP power with media dependent interface (MDI) type, length, and value descriptions (TLVs), Power-via-MDI TLVs, for negotiating power up to 30 W. Cisco pre-standard devices and Cisco IEEE powered devices can use CDP or the IEEE 802.3at power-via-MDI power negotiation mechanism to request power levels up to 30 W.

---

**Note** The initial allocation for Class 0, Class 3, and Class 4 powered devices is 15.4 W. When a device starts up and uses CDP or LLDP to send a request for more than 15.4 W, it can be allocated up to the maximum of 30 W.

---

---

**Note** The CDP-specific power consumption requirement is referred to as the *actual* power consumption requirement in the software configuration guides and command references.

---

If the switch detects a fault caused by an undervoltage, overvoltage, overtemperature, oscillator-fault, or short-circuit condition, it turns off power to the port, generates a syslog message, and updates the power budget and LEDs.

The PoE feature operates the same whether or not the switch is a stack member. The power budget is per switch and independent of any other switch in the stack. Election of a new active switch does not affect PoE operation. The active switch keeps track of the PoE status for all switches and ports in the stack and includes the status in output displays.

## Power Management Modes

The switch supports these PoE modes:

- **auto**—The switch automatically detects if the connected device requires power. If the switch discovers a powered device connected to the port and if the switch has enough power, it grants power, updates the power budget, turns on power to the port on a first-come, first-served basis, and updates the LEDs. For LED information, see the hardware installation guide.

If the switch has enough power for all the powered devices, they all come up. If enough power is available for all powered devices connected to the switch, power is turned on to all devices. If there is not enough

available PoE, or if a device is disconnected and reconnected while other devices are waiting for power, it cannot be determined which devices are granted or are denied power.

If granting power would exceed the system power budget, the switch denies power, ensures that power to the port is turned off, generates a syslog message, and updates the LEDs. After power has been denied, the switch periodically rechecks the power budget and continues to attempt to grant the request for power.

If a device being powered by the switch is then connected to wall power, the switch might continue to power the device. The switch might continue to report that it is still powering the device whether the device is being powered by the switch or receiving power from an AC power source.

If a powered device is removed, the switch automatically detects the disconnect and removes power from the port. You can connect a nonpowered device without damaging it.

You can specify the maximum wattage that is allowed on the port. If the IEEE class maximum wattage of the powered device is greater than the configured maximum value, the switch does not provide power to the port. If the switch powers a powered device, but the powered device later requests through CDP messages more than the configured maximum value, the switch removes power to the port. The power that was allocated to the powered device is reclaimed into the global power budget. If you do not specify a wattage, the switch delivers the maximum value. Use the **auto** setting on any PoE port. The auto mode is the default setting.

- **static**—The switch pre-allocates power to the port (even when no powered device is connected) and guarantees that power will be available for the port. The switch allocates the port configured maximum wattage, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed to be powered when it is connected to the static port. The port no longer participates in the first-come, first-served model.

However, if the powered-device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device is consuming more than the maximum wattage, the switch shuts down the powered device.

If you do not specify a wattage, the switch pre-allocates the maximum value. The switch powers the port only if it discovers a powered device. Use the **static** setting on a high-priority interface.

- **never**—The switch disables powered-device detection and never powers the PoE port even if an unpowered device is connected. Use this mode only when you want to make sure that power is never applied to a PoE-capable port, making the port a data-only port.

For most situations, the default configuration (auto mode) works well, providing plug-and-play operation. No further configuration is required. However, perform this task to configure a PoE port for a higher priority, to make it data only, or to specify a maximum wattage to disallow high-power powered devices on a port.

## Power Monitoring and Power Policing

When policing of the real-time power consumption is enabled, the switch takes action when a powered device consumes more power than the maximum amount allocated, also referred to as the *cutoff-power value*.

When PoE is enabled, the switch senses the real-time power consumption of the powered device. The switch monitors the real-time power consumption of the connected powered device; this is called *power monitoring* or *power sensing*. The switch also polices the power usage with the *power policing* feature.

Power monitoring is backward-compatible with Cisco intelligent power management and CDP-based power consumption. It works with these features to ensure that the PoE port can supply power to the powered device.

The switch senses the real-time power consumption of the connected device as follows:

1. The switch monitors the real-time power consumption on individual ports.
2. The switch records the power consumption, including peak power usage. The switch reports the information through the CISCO-POWER-ETHERNET-EXT-MIB.
3. If power policing is enabled, the switch polices power usage by comparing the real-time power consumption to the maximum power allocated to the device. The maximum power consumption is also referred to as the *cutoff power* on a PoE port.

If the device uses more than the maximum power allocation on the port, the switch can either turn off power to the port, or the switch can generate a syslog message and update the LEDs (the port LED is now blinking amber) while still providing power to the device based on the switch configuration. By default, power-usage policing is disabled on all PoE ports.

If error recovery from the PoE error-disabled state is enabled, the switch automatically takes the PoE port out of the error-disabled state after the specified amount of time.

If error recovery is disabled, you can manually re-enable the PoE port by using the **shutdown** and **no shutdown** interface configuration commands.

4. If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the PoE port, which could adversely affect the switch.

## Power Consumption Values

You can configure the initial power allocation and the maximum power allocation on a port. However, these values are only the configured values that determine when the switch should turn on or turn off power on the PoE port. The maximum power allocation is not the same as the actual power consumption of the powered device. The actual cutoff power value that the switch uses for power policing is not equal to the configured power value.

When power policing is enabled, the switch polices the power usage *at the switch port*, which is greater than the power consumption of the device. When you manually set the maximum power allocation, you must consider the power loss over the cable from the switch port to the powered device. The cutoff power is the sum of the rated power consumption of the powered device and the worst-case power loss over the cable.

We recommend that you enable power policing when PoE is enabled on your switch. For example, if policing is disabled and you set the cutoff-power value by using the **power inline auto max 6300** interface configuration command, the configured maximum power allocation on the PoE port is 6.3 W (6300 mW). The switch provides power to the connected devices on the port if the device needs up to 6.3 W. If the CDP-power negotiated value or the IEEE classification value exceeds the configured cutoff value, the switch does not provide power to the connected device. After the switch turns on power on the PoE port, the switch does not police the real-time power consumption of the device, and the device can consume more power than the maximum allocated amount, which could adversely affect the switch and the devices connected to the other PoE ports.

Because a standalone switch supports internal power supplies, the total amount of power available for the powered devices varies depending on the power supply configuration.

- If a power supply is removed and replaced by a new power supply with less power and the switch does not have enough power for the powered devices, the switch denies power to the PoE ports in auto mode in descending order of the port numbers. If the switch still does not have enough power, the switch then denies power to the PoE ports in static mode in descending order of the port numbers.
- If the new power supply supports more power than the previous one and the switch now has more power available, the switch grants power to the PoE ports in static mode in ascending order of the port numbers.

If it still has power available, the switch then grants power to the PoE ports in auto mode in ascending order of the port numbers.

## Cisco Universal Power Over Ethernet

Cisco Universal Power Over Ethernet (Cisco UPOE) is a Cisco proprietary technology that extends the IEEE 802.3at PoE standard to provide the capability to source up to 60 W of power over standard Ethernet cabling infrastructure (Class D or better) by using the spare pair of an RJ-45 cable (wires 4,5,7,8) with the signal pair (wires 1,2,3,6). Power on the spare pair is enabled when the switch port and end device mutually identify themselves as Cisco UPOE-capable using CDP or LLDP and the end device requests for power to be enabled on the spare pair. When the spare pair is powered, the end device can negotiate up to 60 W of power from the switch using CDP or LLDP.

If the end device is PoE-capable on both signal and spare pairs but does not support the CDP or LLDP extensions required for Cisco UPOE, a 4-pair forced mode configuration automatically enables power on both signal and spare pairs from the switch port.

## How to Configure PoE

### Configuring a Power Management Mode on a PoE Port

**Note** When you make PoE configuration changes, the port being configured drops power. Depending on the new configuration, the state of the other PoE ports, and the state of the power budget, the port might not be powered up again. For example, port 1 is in the auto and on state, and you configure it for static mode. The switch removes power from port 1, detects the powered device, and repowers the port. If port 1 is in the auto and on state and you configure it with a maximum wattage of 10 W, the switch removes power from the port and then redetects the powered device. The switch repowers the port only if the powered device is a class 1, class 2, or a Cisco-only powered device.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b>	Specifies the physical port to be configured, and enters interface configuration mode.

	Command or Action	Purpose
	Switch(config)# <b>interface</b> gigabitethernet2/0/1	
<b>Step 4</b>	<p><b>power inline</b> {<b>auto</b> [<b>max</b> <i>max-wattage</i>]   <b>never</b>   <b>static</b> [<b>max</b> <i>max-wattage</i>]}</p> <p><b>Example:</b> Switch(config-if)# <b>power inline auto</b></p>	<p>Configures the PoE mode on the port. The keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• <b>auto</b>—Enables powered-device detection. If enough power is available, automatically allocates power to the PoE port after device detection. This is the default setting.</li> <li>• <b>max</b> <i>max-wattage</i>—Limits the power allowed on the port. If no value is specified, the maximum is allowed.</li> <li>• <b>max</b> <i>max-wattage</i>—Limits the power allowed on the port. The range for Cisco UPOE ports is 4000 to 60000 mW. If no value is specified, the maximum is allowed.</li> <li>• <b>never</b> —Disables device detection, and disable power to the port.</li> </ul> <p><b>Note</b> If a port has a Cisco powered device connected to it, do not use the <b>power inline never</b> command to configure the port. A false link-up can occur, placing the port into the error-disabled state.</p> <ul style="list-style-type: none"> <li>• <b>static</b>—Enables powered-device detection. Pre-allocate (reserve) power for a port before the switch discovers the powered device. The switch reserves power for this port even when no device is connected and guarantees that power will be provided upon device detection.</li> </ul> <p>The switch allocates power to a port configured in static mode before it allocates power to a port configured in auto mode.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b> Switch(config-if)# <b>end</b></p>	Returns to privileged EXEC mode.
<b>Step 6</b>	<p><b>show power inline</b> [<i>interface-id</i>   <b>module</b> <i>switch-number</i>]</p> <p><b>Example:</b></p>	Displays PoE status for a switch or a switch stack, for the specified interface, or for a specified stack member.

	Command or Action	Purpose
	Switch# <code>show power inline</code>	The <code>module switch-number</code> keywords are supported only on stacking-capable switches.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Enabling Power on Signal/Spare Pairs

**Note** Do not enter this command if the end device cannot source inline power on the spare pair or if the end device supports the CDP or LLDP extensions for Cisco UPOE.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <code>interface gigabitethernet2/0/1</code>	Specifies the physical port to be configured, and enters interface configuration mode.
<b>Step 3</b>	<b>power inline four-pair forced</b> <b>Example:</b> Switch(config-if)# <code>power inline four-pair forced</code>	Enables power on both signal and spare pairs from a switch port.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config-if)# <code>end</code>	Returns to privileged EXEC mode.

## Configuring Power Policing

By default, the switch monitors the real-time power consumption of connected powered devices. You can configure the switch to police the power usage. By default, policing is disabled.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config)# interface gigabitethernet2/0/1</pre>	Specifies the physical port to be configured, and enter interface configuration mode.
<b>Step 4</b>	<b>power inline police [action {log   errdisable}]</b> <b>Example:</b> <pre>Switch(config-if)# power inline police</pre>	<p>If the real-time power consumption exceeds the maximum power allocation on the port, configures the switch to take one of these actions:</p> <ul style="list-style-type: none"> <li>• <b>power inline police</b>—Shuts down the PoE port, turns off power to it, and puts it in the error-disabled state.</li> </ul> <p><b>Note</b> You can enable error detection for the PoE error-disabled cause by using the <b>errdisable detect cause inline-power</b> global configuration command. You can also enable the timer to recover from the PoE error-disabled state by using the <b>errdisable recovery cause inline-power interval <i>interval</i></b> global configuration command.</p> <ul style="list-style-type: none"> <li>• <b>power inline police action errdisable</b>—Turns off power to the port if the real-time power consumption exceeds the maximum power allocation on the port.</li> <li>• <b>power inline police action log</b>—Generates a syslog message while still providing power to the port.</li> </ul> <p>If you do not enter the <b>action log</b> keywords, the default action shuts down the port and puts the port in the error-disabled state.</p>

	Command or Action	Purpose
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Switch(config-if) # <b>exit</b>	Returns to global configuration mode.
<b>Step 6</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>errdisable detect cause inline-power</b></li> <li>• <b>errdisable recovery cause inline-power</b></li> <li>• <b>errdisable recovery interval <i>interval</i></b></li> </ul> <b>Example:</b> Switch(config) # <b>errdisable detect cause inline-power</b> Switch(config) # <b>errdisable recovery cause inline-power</b> Switch(config) # <b>errdisable recovery interval 100</b>	(Optional) Enables error recovery from the PoE error-disabled state, and configures the PoE recover mechanism variables. By default, the recovery interval is 300 seconds. For <b>interval <i>interval</i></b> , specifies the time in seconds to recover from the error-disabled state. The range is 30 to 86400.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> Switch(config) # <b>exit</b>	Returns to privileged EXEC mode.
<b>Step 8</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>show power inline police</b></li> <li>• <b>show errdisable recovery</b></li> </ul> <b>Example:</b> Switch# <b>show power inline police</b> Switch# <b>show errdisable recovery</b>	Displays the power monitoring status, and verify the error recovery settings.
<b>Step 9</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

# Monitoring Power Status

Table 16: Show Commands for Power Status

Command	Purpose
<b>show env power switch</b> [ <i>switch-number</i> ]	(Optional) Displays the status of the internal power supplies for each switch in the stack or for the specified switch.  The range is 1 to 9, depending on the switch member numbers in the stack. These keywords are available only on stacking-capable switches.
<b>show power inline</b> [ <i>interface-id</i>   <b>module</b> <i>switch-number</i> ]	Displays PoE status for a switch or switch stack, for an interface, or for a specific switch in the stack.
<b>show power inline police</b>	Displays the power policing data.

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Information About EEE

#### EEE Overview

Energy Efficient Ethernet (EEE) is an IEEE 802.3az standard that is designed to reduce power consumption in Ethernet networks during idle periods.

EEE can be enabled on devices that support low power idle (LPI) mode. Such devices can save power by entering LPI mode during periods of low utilization. In LPI mode, systems on both ends of the link can save power by shutting down certain services. EEE provides the protocol needed to transition into and out of LPI mode in a way that is transparent to upper layer protocols and applications.

## Default EEE Configuration

EEE is disabled by default.

## Restrictions for EEE

EEE has the following restrictions:

- Changing the EEE configuration resets the interface because the device has to restart Layer 1 autonegotiation.
- You might want to enable the Link Layer Discovery Protocol (LLDP) for devices that require longer wakeup times before they are able to accept data on their receive paths. Doing so enables the device to negotiate for extended system wakeup times from the transmitting link partner.

## How to Configure EEE

You can enable or disable EEE on an interface that is connected to an EEE-capable link partner.

## Enabling or Disabling EEE

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <b>interface gigabitethernet1/0/1</b>	Specifies the interface to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>power efficient-ethernet auto</b> <b>Example:</b> Switch(config-if)# <b>power efficient-ethernet auto</b>	Enables EEE on the specified interface. When EEE is enabled, the device advertises and autonegotiates EEE to its link partner.
<b>Step 4</b>	<b>no power efficient-ethernet auto</b> <b>Example:</b>	Disables EEE on the specified interface.

	Command or Action	Purpose
	Switch(config-if)# <b>no power efficient-ethernet auto</b>	
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Monitoring EEE

Table 17: Commands for Displaying EEE Settings

Command	Purpose
<b>show eee capabilities interface</b> <i>interface-id</i>	Displays EEE capabilities for the specified interface.
<b>show eee status interface</b> <i>interface-id</i>	Displays EEE status information for the specified interface.

## Configuration Examples for Configuring EEE

This example shows how to enable EEE for an interface:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# power efficient-ethernet auto
```

This example shows how to disable EEE for an interface:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# no power efficient-ethernet auto
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring IPv6 MLD Snooping

---

**Note** To use IPv6 MLD Snooping, the switch must be running the LAN Base image.

---

You can use Multicast Listener Discovery (MLD) snooping to enable efficient distribution of IP Version 6 (IPv6) multicast data to clients and routers in a switched network on the switch. Unless otherwise noted, the term switch refers to a standalone switch and to a switch stack.

---

**Note** Stacking is supported only on Catalyst 2960-X switches running the LAN base image.

---

---

**Note** To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

On switches running the LAN Base feature set, the routing template is not supported.

---

---

**Note** For complete syntax and usage information for the commands used in this chapter, see the command reference for this release or the Cisco IOS documentation referenced in the procedures.

---

## Understanding MLD Snooping

In IP Version 4 (IPv4), Layer 2 switches can use Internet Group Management Protocol (IGMP) snooping to limit the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. In IPv6, MLD snooping performs a similar function. With MLD snooping, IPv6 multicast data is selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This list is constructed by snooping IPv6 multicast control packets.

MLD is a protocol used by IPv6 multicast routers to discover the presence of multicast listeners (nodes wishing to receive IPv6 multicast packets) on the links that are directly attached to the routers and to discover which multicast packets are of interest to neighboring nodes. MLD is derived from IGMP; MLD Version 1 (MLDv1) is equivalent to IGMPv2, and MLD Version 2 (MLDv2) is equivalent to IGMPv3. MLD is a subprotocol of Internet Control Message Protocol Version 6 (ICMPv6), and MLD messages are a subset of ICMPv6 messages, identified in IPv6 packets by a preceding Next Header value of 58.

The switch supports two versions of MLD snooping:

- MLDv1 snooping detects MLDv1 control packets and sets up traffic bridging based on IPv6 destination multicast addresses.
- MLDv2 basic snooping (MBSS) uses MLDv2 control packets to set up traffic forwarding based on IPv6 destination multicast addresses.

The switch can snoop on both MLDv1 and MLDv2 protocol packets and bridge IPv6 multicast data based on destination IPv6 multicast addresses.

---

**Note** The switch does not support MLDv2 enhanced snooping, which sets up IPv6 source and destination multicast address-based forwarding.

---

MLD snooping can be enabled or disabled globally or per VLAN. When MLD snooping is enabled, a per-VLAN IPv6 multicast address table is constructed in software and hardware. The switch then performs IPv6 multicast-address based bridging in hardware.

According to IPv6 multicast standards, the switch derives the MAC multicast address by performing a logical-OR of the four low-order octets of the switch MAC address with the MAC address of 33:33:00:00:00:00. For example, the IPv6 MAC address of FF02:DEAD:BEEF:1:3 maps to the Ethernet MAC address of 33:33:00:01:00:03.

A multicast packet is unmatched when the destination IPv6 address does not match the destination MAC address. The switch forwards the unmatched packet in hardware based the MAC address table. If the destination MAC address is not in the MAC address table, the switch floods the packet to all ports in the same VLAN as the receiving port.

## MLD Messages

MLDv1 supports three types of messages:

- Listener Queries are the equivalent of IGMPv2 queries and are either General Queries or Multicast-Address-Specific Queries (MASQs).
- Multicast Listener Reports are the equivalent of IGMPv2 reports
- Multicast Listener Done messages are the equivalent of IGMPv2 leave messages.

MLDv2 supports MLDv2 queries and reports, as well as MLDv1 Report and Done messages.

Message timers and state transitions resulting from messages being sent or received are the same as those of IGMPv2 messages. MLD messages that do not have valid link-local IPv6 source addresses are ignored by MLD routers and switches.

## MLD Queries

The switch sends out MLD queries, constructs an IPv6 multicast address database, and generates MLD group-specific and MLD group-and-source-specific queries in response to MLD Done messages. The switch also supports report suppression, report proxying, Immediate-Leave functionality, and static IPv6 multicast group address configuration.

When MLD snooping is disabled, all MLD queries are flooded in the ingress VLAN.

When MLD snooping is enabled, received MLD queries are flooded in the ingress VLAN, and a copy of the query is sent to the CPU for processing. From the received query, MLD snooping builds the IPv6 multicast address database. It detects multicast router ports, maintains timers, sets report response time, learns the querier IP source address for the VLAN, learns the querier port in the VLAN, and maintains multicast-address aging.

---

**Note**

When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the Catalyst 2960, 2960-S, 2960-C, 2960-X or 2960-CX switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

---

When a group exists in the MLD snooping database, the switch responds to a group-specific query by sending an MLDv1 report. When the group is unknown, the group-specific query is flooded to the ingress VLAN.

When a host wants to leave a multicast group, it can send out an MLD Done message (equivalent to IGMP Leave message). When the switch receives an MLDv1 Done message, if Immediate-Leave is not enabled, the switch sends an MASQ to the port from which the message was received to determine if other devices connected to the port should remain in the multicast group.

## Multicast Client Aging Robustness

You can configure port membership removal from addresses based on the number of queries. A port is removed from membership to an address only when there are no reports to the address on the port for the configured number of queries. The default number is 2.

## Multicast Router Discovery

Like IGMP snooping, MLD snooping performs multicast router discovery, with these characteristics:

- Ports configured by a user never age out.
- Dynamic port learning results from MLDv1 snooping queries and IPv6 PIMv2 packets.
- If there are multiple routers on the same Layer 2 interface, MLD snooping tracks a single multicast router on the port (the router that most recently sent a router control packet).
- Dynamic multicast router port aging is based on a default timer of 5 minutes; the multicast router is deleted from the router port list if no control packet is received on the port for 5 minutes.
- IPv6 multicast router discovery only takes place when MLD snooping is enabled on the switch.
- Received IPv6 multicast router control packets are always flooded to the ingress VLAN, whether or not MLD snooping is enabled on the switch.
- After the discovery of the first IPv6 multicast router port, unknown IPv6 multicast data is forwarded only to the discovered router ports (before that time, all IPv6 multicast data is flooded to the ingress VLAN).

## MLD Reports

The processing of MLDv1 join messages is essentially the same as with IGMPv2. When no IPv6 multicast routers are detected in a VLAN, reports are not processed or forwarded from the switch. When IPv6 multicast routers are detected and an MLDv1 report is received, an IPv6 multicast group address is entered in the VLAN MLD database. Then all IPv6 multicast traffic to the group within the VLAN is forwarded using this address. When MLD snooping is disabled, reports are flooded in the ingress VLAN.

When MLD snooping is enabled, MLD report suppression, called listener message suppression, is automatically enabled. With report suppression, the switch forwards the first MLDv1 report received by a group to IPv6 multicast routers; subsequent reports for the group are not sent to the routers. When MLD snooping is disabled, report suppression is disabled, and all MLDv1 reports are flooded to the ingress VLAN.

The switch also supports MLDv1 proxy reporting. When an MLDv1 MASQ is received, the switch responds with MLDv1 reports for the address on which the query arrived if the group exists in the switch on another port and if the port on which the query arrived is not the last member port for the address.

## MLD Done Messages and Immediate-Leave

When the Immediate-Leave feature is enabled and a host sends an MLDv1 Done message (equivalent to an IGMP leave message), the port on which the Done message was received is immediately deleted from the group. You enable Immediate-Leave on VLANs and (as with IGMP snooping), you should only use the feature on VLANs where a single host is connected to the port. If the port was the last member of a group, the group is also deleted, and the leave information is forwarded to the detected IPv6 multicast routers.

When Immediate Leave is not enabled in a VLAN (which would be the case when there are multiple clients for a group on the same port) and a Done message is received on a port, an MASQ is generated on that port.

The user can control when a port membership is removed for an existing address in terms of the number of MASQs. A port is removed from membership to an address when there are no MLDv1 reports to the address on the port for the configured number of queries.

The number of MASQs generated is configured by using the **ipv6 mld snooping last-listener-query count** global configuration command. The default number is 2.

The MASQ is sent to the IPv6 multicast address for which the Done message was sent. If there are no reports sent to the IPv6 multicast address specified in the MASQ during the switch maximum response time, the port on which the MASQ was sent is deleted from the IPv6 multicast address database. The maximum response time is the time configured by using the **ipv6 mld snooping last-listener-query-interval** global configuration command. If the deleted port is the last member of the multicast address, the multicast address is also deleted, and the switch sends the address leave information to all detected multicast routers.

When Immediate Leave is not enabled and a port receives an MLD Done message, the switch generates MASQs on the port and sends them to the IPv6 multicast address for which the Done message was sent. You can optionally configure the number of MASQs that are sent and the length of time the switch waits for a response before deleting the port from the multicast group.

When you enable MLDv1 Immediate Leave, the switch immediately removes a port from a multicast group when it detects an MLD Done message on that port. You should only use the Immediate-Leave feature when there is a single receiver present on every port in the VLAN. When there are multiple clients for a multicast group on the same port, you should not enable Immediate-Leave in a VLAN.

## Topology Change Notification Processing

When topology change notification (TCN) solicitation is enabled by using the **ipv6 mld snooping tcn query solicit** global configuration command, MLDv1 snooping sets the VLAN to flood all IPv6 multicast traffic with a configured number of MLDv1 queries before it begins sending multicast data only to selected ports. You set this value by using the **ipv6 mld snooping tcn flood query count** global configuration command. The default is to send two queries. The switch also generates MLDv1 global Done messages with valid link-local IPv6 source addresses when the switch becomes the STP root in the VLAN or when it is configured by the user. This is same as done in IGMP snooping.

## MLD Snooping in Switch Stacks

The MLD IPv6 group address databases are maintained on all switches in the stack, regardless of which switch learns of an IPv6 multicast group. Report suppression and proxy reporting are done stack-wide. During the maximum response time, only one received report for a group is forwarded to the multicast routers, regardless of which switch the report arrives on.

The election of a new stack master does not affect the learning or bridging of IPv6 multicast data; bridging of IPv6 multicast data does not stop during a stack master re-election. When a new switch is added to the stack, it synchronizes the learned IPv6 multicast information from the stack master. Until the synchronization is complete, data ingress on the newly added switch is treated as unknown multicast data.

# How to Configure IPv6 MLD Snooping

## Default MLD Snooping Configuration

Table 18: Default MLD Snooping Configuration

Feature	Default Setting
MLD snooping (Global)	Disabled.
MLD snooping (per VLAN)	Enabled. MLD snooping must be globally enabled for VLAN MLD snooping to take place.
IPv6 Multicast addresses	None configured.
IPv6 Multicast router ports	None configured.
MLD snooping Immediate Leave	Disabled.
MLD snooping robustness variable	Global: 2; Per VLAN: 0. <b>Note</b> The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count.
Last listener query count	Global: 2; Per VLAN: 0. <b>Note</b> The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count.
Last listener query interval	Global: 1000 (1 second); VLAN: 0. <b>Note</b> The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global interval.
TCN query solicit	Disabled.
TCN query count	2.
MLD listener suppression	Disabled.

## MLD Snooping Configuration Guidelines

When configuring MLD snooping, consider these guidelines:

- You can configure MLD snooping characteristics at any time, but you must globally enable MLD snooping by using the **ipv6 mld snooping** global configuration command for the configuration to take effect.
- When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500

switch in order for the switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

- MLD snooping and IGMP snooping act independently of each other. You can enable both features at the same time on the switch.
- The maximum number of multicast entries allowed on the switch or switch stack is determined by the configured SDM template.
- The maximum number of address entries allowed for the switch or switch stack is 4000.

## Enabling or Disabling MLD Snooping on the Switch (CLI)

By default, IPv6 MLD snooping is globally disabled on the switch and enabled on all VLANs. When MLD snooping is globally disabled, it is also disabled on all VLANs. When you globally enable MLD snooping, the VLAN configuration overrides the global configuration. That is, MLD snooping is enabled only on VLAN interfaces in the default state (enabled).

You can enable and disable MLD snooping on a per-VLAN basis or for a range of VLANs, but if you globally disable MLD snooping, it is disabled in all VLANs. If global snooping is enabled, you can enable or disable VLAN snooping.

Beginning in privileged EXEC mode, follow these steps to globally enable MLD snooping on the switch:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 mld snooping</b> <b>Example:</b>  Switch(config)# <b>ipv6 mld snooping</b>	Enables MLD snooping on the switch.
<b>Step 3</b>	<b>end</b> <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 4</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch(config)# <b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

	Command or Action	Purpose
<b>Step 5</b>	<b>reload</b> <b>Example:</b> <pre>Switch(config)# reload</pre>	Reload the operating system.

## Enabling or Disabling MLD Snooping on a VLAN (CLI)

Beginning in privileged EXEC mode, follow these steps to enable MLD snooping on a VLAN.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 mld snooping</b> <b>Example:</b> <pre>Switch(config)# ipv6 mld snooping</pre>	Enables MLD snooping on the switch.
<b>Step 3</b>	<b>ipv6 mld snooping vlan <i>vlan-id</i></b> <b>Example:</b> <pre>Switch(config)# ipv6 mld snooping vlan 1</pre>	Enables MLD snooping on the VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094. <b>Note</b> MLD snooping must be globally enabled for VLAN snooping to be enabled.
<b>Step 4</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# ipv6 mld snooping vlan 1</pre>	Returns to privileged EXEC mode.

## Configuring a Static Multicast Group (CLI)

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure an IPv6 multicast address and member ports for a VLAN.

Beginning in privileged EXEC mode, follow these steps to add a Layer 2 port as a member of a multicast group:

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode
<b>Step 2</b>	<b>ipv6 mld snooping vlan <i>vlan-id</i> static <i>ipv6_multicast_address</i> interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <b>ipv6 mld snooping vlan 1 static FF12::3 interface gigabitethernet 0/1</b>	Configures a multicast group with a Layer 2 port as a member of a multicast group: <ul style="list-style-type: none"> <li>• <i>vlan-id</i> is the multicast group VLAN ID. The VLAN ID range is 1 to 1001 and 1006 to 4094.</li> <li>• <i>ipv6_multicast_address</i> is the 128-bit group IPv6 address. The address must be in the form specified in RFC 2373.</li> <li>• <i>interface-id</i> is the member port. It can be a physical interface or a port channel (1 to 48).</li> </ul>
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 4</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>show ipv6 mld snooping address</b></li> <li>• <b>show ipv6 mld snooping address vlan <i>vlan-id</i></b></li> </ul> <b>Example:</b> Switch# <b>show ipv6 mld snooping address</b> or Switch# <b>show ipv6 mld snooping vlan 1</b>	Verifies the static member port and the IPv6 address.

## Configuring a Multicast Router Port (CLI)

**Note** Static connections to multicast routers are supported only on switch ports.

Beginning in privileged EXEC mode, follow these steps to add a multicast router port to a VLAN:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 mld snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <code>ipv6 mld snooping vlan 1 mrouter interface gigabitethernet 0/2</code>	Specifies the multicast router VLAN ID, and specify the interface to the multicast router. <ul style="list-style-type: none"> <li>• The VLAN ID range is 1 to 1001 and 1006 to 4094.</li> <li>• The interface can be a physical interface or a port channel. The port-channel range is 1 to 48.</li> </ul>
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 4</b>	<b>show ipv6 mld snooping mrouter [ vlan <i>vlan-id</i> ]</b> <b>Example:</b> Switch# <code>show ipv6 mld snooping mrouter vlan 1</code>	Verifies that IPv6 MLD snooping is enabled on the VLAN interface.

## Enabling MLD Immediate Leave (CLI)

Beginning in privileged EXEC mode, follow these steps to enable MLDv1 Immediate Leave:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 mld snooping vlan <i>vlan-id</i> immediate-leave</b> <b>Example:</b> Switch(config)# <code>ipv6 mld snooping vlan 1 immediate-leave</code>	Enables MLD Immediate Leave on the VLAN interface.

	Command or Action	Purpose
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 4</b>	<b>show ipv6 mld snooping vlan</b> <i>vlan-id</i> <b>Example:</b> Switch# <b>show ipv6 mld snooping vlan 1</b>	Verifies that Immediate Leave is enabled on the VLAN interface.

## Configuring MLD Snooping Queries (CLI)

Beginning in privileged EXEC mode, follow these steps to configure MLD snooping query characteristics for the switch or for a VLAN:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 mld snooping robustness-variable</b> <i>value</i> <b>Example:</b> Switch(config)# <b>ipv6 mld snooping robustness-variable 3</b>	(Optional) Sets the number of queries that are sent before switch will deletes a listener (port) that does not respond to a general query. The range is 1 to 3; the default is 2.
<b>Step 3</b>	<b>ipv6 mld snooping vlan</b> <i>vlan-id</i> <b>robustness-variable</b> <i>value</i> <b>Example:</b> Switch(config)# <b>ipv6 mld snooping vlan 1 robustness-variable 3</b>	(Optional) Sets the robustness variable on a VLAN basis, which determines the number of general queries that MLD snooping sends before aging out a multicast address when there is no MLD report response. The range is 1 to 3; the default is 0. When set to 0, the number used is the global robustness variable value.
<b>Step 4</b>	<b>ipv6 mld snooping last-listener-query-count</b> <i>count</i> <b>Example:</b> Switch(config)# <b>ipv6 mld snooping last-listener-query-count 7</b>	(Optional) Sets the number of MASQs that the switch sends before aging out an MLD client. The range is 1 to 7; the default is 2. The queries are sent 1 second apart.
<b>Step 5</b>	<b>ipv6 mld snooping vlan</b> <i>vlan-id</i> <b>last-listener-query-count</b> <i>count</i>	(Optional) Sets the last-listener query count on a VLAN basis. This value overrides the

	Command or Action	Purpose
	<b>Example:</b> <pre>Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-count 7</pre>	value configured globally. The range is 1 to 7; the default is 0. When set to 0, the global count value is used. Queries are sent 1 second apart.
<b>Step 6</b>	<b>ipv6 mld snooping last-listener-query-interval interval</b>  <b>Example:</b> <pre>Switch(config)# ipv6 mld snooping last-listener-query-interval 2000</pre>	(Optional) Sets the maximum response time that the switch waits after sending out a MASQ before deleting a port from the multicast group. The range is 100 to 32,768 thousands of a second. The default is 1000 (1 second).
<b>Step 7</b>	<b>ipv6 mld snooping vlan vlan-id last-listener-query-interval interval</b>  <b>Example:</b> <pre>Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-interval 2000</pre>	(Optional) Sets the last-listener query interval on a VLAN basis. This value overrides the value configured globally. The range is 0 to 32,768 thousands of a second. The default is 0. When set to 0, the global last-listener query interval is used.
<b>Step 8</b>	<b>ipv6 mld snooping tcn query solicit</b>  <b>Example:</b> <pre>Switch(config)# ipv6 mld snooping tcn query solicit</pre>	(Optional) Enables topology change notification (TCN) solicitation, which means that VLANs flood all IPv6 multicast traffic for the configured number of queries before sending multicast data to only those ports requesting to receive it. The default is for TCN to be disabled.
<b>Step 9</b>	<b>ipv6 mld snooping tcn flood query count count</b>  <b>Example:</b> <pre>Switch(config)# ipv6 mld snooping tcn flood query count 5</pre>	(Optional) When TCN is enabled, specifies the number of TCN queries to be sent. The range is from 1 to 10; the default is 2.
<b>Step 10</b>	<b>end</b>	Returns to privileged EXEC mode.
<b>Step 11</b>	<b>show ipv6 mld snooping querier [ vlan vlan-id]</b>  <b>Example:</b> <pre>Switch(config)# show ipv6 mld snooping querier vlan 1</pre>	(Optional) Verifies that the MLD snooping querier information for the switch or for the VLAN.

## Disabling MLD Listener Message Suppression (CLI)

MLD snooping listener message suppression is enabled by default. When it is enabled, the switch forwards only one MLD report per multicast router query. When message suppression is disabled, multiple MLD reports could be forwarded to the multicast routers.

Beginning in privileged EXEC mode, follow these steps to disable MLD listener message suppression:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>no ipv6 mld snooping listener-message-suppression</b> <b>Example:</b> Switch(config)# <b>no ipv6 mld snooping listener-message-suppression</b>	Disable MLD message suppression.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Return to privileged EXEC mode.
<b>Step 4</b>	<b>show ipv6 mld snooping</b> <b>Example:</b> Switch# <b>show ipv6 mld snooping</b>	Verify that IPv6 MLD snooping report suppression is disabled.

## Displaying MLD Snooping Information

You can display MLD snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display IPv6 group address multicast entries for a VLAN configured for MLD snooping.

*Table 19: Commands for Displaying MLD Snooping Information*

Command	Purpose
<b>show ipv6 mld snooping [ vlan vlan-id ]</b>	Displays the MLD snooping configuration information for all VLANs on the switch or for a specified VLAN.  (Optional) Enter <b>vlan vlan-id</b> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.

Command	Purpose
<b>show ipv6 mld snooping mrouter</b> [ <b>vlan</b> <i>vlan-id</i> ]	Displays information on dynamically learned and manually configured multicast router interfaces. When you enable MLD snooping, the switch automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces.  (Optional) Enters <b>vlan</b> <i>vlan-id</i> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.
<b>show ipv6 mld snooping querier</b> [ <b>vlan</b> <i>vlan-id</i> ]	Displays information about the IPv6 address and incoming port for the most-recently received MLD query messages in the VLAN.  (Optional) Enters <b>vlan</b> <i>vlan-id</i> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.
<b>show ipv6 mld snooping address</b> [ <b>vlan</b> <i>vlan-id</i> ] [ <b>count</b>   <b>dynamic</b>   <b>user</b> ]	Displays all IPv6 multicast address information or specific IPv6 multicast address information for the switch or a VLAN. <ul style="list-style-type: none"> <li>• Enters <b>count</b> to show the group count on the switch or in a VLAN.</li> <li>• Enters <b>dynamic</b> to display MLD snooping learned group information for the switch or for a VLAN.</li> <li>• Enters <b>user</b> to display MLD snooping user-configured group information for the switch or for a VLAN.</li> </ul>
<b>show ipv6 mld snooping address</b> <b>vlan</b> <i>vlan-id</i> [ <i>ipv6-multicast-address</i> ]	Displays MLD snooping for the specified VLAN and IPv6 multicast address.

## Configuration Examples for Configuring MLD Snooping

### Configuring a Static Multicast Group: Example

This example shows how to statically configure an IPv6 multicast group:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 2 static FF12::3 interface gigabitethernet
1/0/1
Switch(config)# end
```

### Configuring a Multicast Router Port: Example

This example shows how to add a multicast router port to VLAN 200:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 200 mrouter interface gigabitethernet
```

```
0/2
Switch(config)# exit
```

## Enabling MLD Immediate Leave: Example

This example shows how to enable MLD Immediate Leave on VLAN 130:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 130 immediate-leave
Switch(config)# exit
```

## Configuring MLD Snooping Queries: Example

This example shows how to set the MLD snooping global robustness variable to 3:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping robustness-variable 3
Switch(config)# exit
```

This example shows how to set the MLD snooping last-listener query count for a VLAN to 3:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 200 last-listener-query-count 3
Switch(config)# exit
```

This example shows how to set the MLD snooping last-listener query interval (maximum response time) to 2000 (2 seconds):

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000
Switch(config)# exit
```

# CHAPTER 13

## Configuring IPv6 Unicast Routing

- [Finding Feature Information, on page 153](#)
- [Information About Configuring IPv6 Unicast Routing, on page 153](#)
- [Configuring DHCP for IPv6 Address Assignment, on page 177](#)
- [Configuration Examples for IPv6 Unicast Routing, on page 181](#)

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Information About Configuring IPv6 Unicast Routing

This chapter describes how to configure IPv6 unicast routing on the switch.

**Note** To use all IPv6 features in this chapter, the switch or stack master must be running the IP services feature set. Switches running the IP base feature set support IPv6 static routing, RIP for IPv6, and OSPF. Switches running the LAN base feature set support only IPv6 host functionality.

### Understanding IPv6

IPv4 users can move to IPv6 and receive services such as end-to-end security, quality of service (QoS), and globally unique addresses. The IPv6 address space reduces the need for private addresses and Network Address Translation (NAT) processing by border routers at network edges.

For information about how Cisco Systems implements IPv6, go to:

[http://www.cisco.com/en/US/products/ps6553/products\\_ios\\_technology\\_home.html](http://www.cisco.com/en/US/products/ps6553/products_ios_technology_home.html)

For information about IPv6 and other features in this chapter

- See the *Cisco IOS IPv6 Configuration Library*.
- Use the Search field on Cisco.com to locate the Cisco IOS software documentation. For example, if you want information about static routes, you can enter *Implementing Static Routes for IPv6* in the search field to learn about static routes.

## IPv6 Addresses

The switch supports only IPv6 unicast addresses. It does not support site-local unicast addresses, or anycast addresses.

The IPv6 128-bit addresses are represented as a series of eight 16-bit hexadecimal fields separated by colons in the format: n:n:n:n:n:n:n:n. This is an example of an IPv6 address:

```
2031:0000:130F:0000:0000:09C0:080F:130B
```

For easier implementation, leading zeros in each field are optional. This is the same address without leading zeros:

```
2031:0:130F:0:0:9C0:80F:130B
```

You can also use two colons (::) to represent successive hexadecimal fields of zeros, but you can use this short version only once in each address:

```
2031:0:130F::09C0:080F:130B
```

For more information about IPv6 address formats, address types, and the IPv6 packet header, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of *Cisco IOS IPv6 Configuration Library* on Cisco.com.

In the “Information About Implementing Basic Connectivity for IPv6” chapter, these sections apply to the switch:

- IPv6 Address Formats
- IPv6 Address Type: Unicast
- IPv6 Address Type: Multicast
- IPv6 Address Output Display
- Simplified IPv6 Packet Header

## Supported IPv6 Unicast Routing Features

These sections describe the IPv6 protocol features supported by the switch:

The switch provides IPv6 routing capability over Routing Information Protocol (RIP) for IPv6, and Open Shortest Path First (OSPF) Version 3 Protocol. It supports up to 16 equal-cost routes and can simultaneously forward IPv4 and IPv6 frames at line rate.

### 128-Bit Wide Unicast Addresses

The switch supports aggregatable global unicast addresses and link-local unicast addresses. It does not support site-local unicast addresses.

- Aggregatable global unicast addresses are IPv6 addresses from the aggregatable global unicast prefix. The address structure enables strict aggregation of routing prefixes and limits the number of routing table entries in the global routing table. These addresses are used on links that are aggregated through organizations and eventually to the Internet service provider.

These addresses are defined by a global routing prefix, a subnet ID, and an interface ID. Current global unicast address allocation uses the range of addresses that start with binary value 001 (2000::/3). Addresses with a prefix of 2000::/3(001) through E000::/3(111) must have 64-bit interface identifiers in the extended unique identifier (EUI)-64 format.

- Link local unicast addresses can be automatically configured on any interface by using the link-local prefix FE80::/10(1111 1110 10) and the interface identifier in the modified EUI format. Link-local addresses are used in the neighbor discovery protocol (NDP) and the stateless autoconfiguration process. Nodes on a local link use link-local addresses and do not require globally unique addresses to communicate. IPv6 routers do not forward packets with link-local source or destination addresses to other links.

For more information, see the section about IPv6 unicast addresses in the “Implementing IPv6 Addressing and Basic Connectivity” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## DNS for IPv6

IPv6 supports Domain Name System (DNS) record types in the DNS name-to-address and address-to-name lookup processes. The DNS AAAA resource record types support IPv6 addresses and are equivalent to an A address record in IPv4. The switch supports DNS resolution for IPv4 and IPv6.

## Path MTU Discovery for IPv6 Unicast

The switch supports advertising the system maximum transmission unit (MTU) to IPv6 nodes and path MTU discovery. Path MTU discovery allows a host to dynamically discover and adjust to differences in the MTU size of every link along a given data path. In IPv6, if a link along the path is not large enough to accommodate the packet size, the source of the packet handles the fragmentation.

## ICMPv6

The Internet Control Message Protocol (ICMP) in IPv6 generates error messages, such as ICMP destination unreachable messages, to report errors during processing and other diagnostic functions. In IPv6, ICMP packets are also used in the neighbor discovery protocol and path MTU discovery.

## Neighbor Discovery

The switch supports NDP for IPv6, a protocol running on top of ICMPv6, and static neighbor entries for IPv6 stations that do not support NDP. The IPv6 neighbor discovery process uses ICMP messages and solicited-node multicast addresses to determine the link-layer address of a neighbor on the same network (local link), to verify the reachability of the neighbor, and to keep track of neighboring routers.

The switch supports ICMPv6 redirect for routes with mask lengths less than 64 bits. ICMP redirect is not supported for host routes or for summarized routes with mask lengths greater than 64 bits.

Neighbor discovery throttling ensures that the switch CPU is not unnecessarily burdened while it is in the process of obtaining the next hop forwarding information to route an IPv6 packet. The switch drops any additional IPv6 packets whose next hop is the same neighbor that the switch is actively trying to resolve. This drop avoids further load on the CPU.

## Default Router Preference

The switch supports IPv6 default router preference (DRP), an extension in router advertisement messages. DRP improves the ability of a host to select an appropriate router, especially when the host is multihomed and the routers are on different links. The switch does not support the Route Information Option in RFC 4191.

An IPv6 host maintains a default router list from which it selects a router for traffic to offlink destinations. The selected router for a destination is then cached in the destination cache. NDP for IPv6 specifies that routers that are reachable or probably reachable are preferred over routers whose reachability is unknown or suspect. For reachable or probably reachable routers, NDP can either select the same router every time or cycle through the router list. By using DRP, you can configure an IPv6 host to prefer one router over another, provided both are reachable or probably reachable.

For more information about DRP for IPv6, see the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## IPv6 Stateless Autoconfiguration and Duplicate Address Detection

The switch uses stateless autoconfiguration to manage link, subnet, and site addressing changes, such as management of host and mobile IP addresses. A host autonomously configures its own link-local address, and booting nodes send router solicitations to request router advertisements for configuring interfaces.

For more information about autoconfiguration and duplicate address detection, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## IPv6 Applications

The switch has IPv6 support for these applications:

- Ping, traceroute, Telnet, and TFTP
- Secure Shell (SSH) over an IPv6 transport
- HTTP server access over IPv6 transport
- DNS resolver for AAAA over IPv4 transport
- Cisco Discovery Protocol (CDP) support for IPv6 addresses

For more information about managing these applications, see the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## DHCP for IPv6 Address Assignment

DHCPv6 enables DHCP servers to pass configuration parameters, such as IPv6 network addresses, to IPv6 clients. The address assignment feature manages non-duplicate address assignment in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple prefix pools. Additional options, such as default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface, on multiple interfaces, or the server can automatically find the appropriate pool.

For more information and to configure these features, see the *Cisco IOS IPv6 Configuration Guide*.

This document describes only the DHCPv6 address assignment. For more information about configuring the DHCPv6 client, server, or relay agent functions, see the “Implementing DHCP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Static Routes for IPv6

Static routes are manually configured and define an explicit route between two networking devices. Static routes are useful for smaller networks with only one path to an outside network or to provide security for certain types of traffic in a larger network.

For more information about static routes, see the “Implementing Static Routes for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## RIP for IPv6

Routing Information Protocol (RIP) for IPv6 is a distance-vector protocol that uses hop count as a routing metric. It includes support for IPv6 addresses and prefixes and the all-RIP-routers multicast group address FF02::9 as the destination address for RIP update messages.

For more information about RIP for IPv6, see the “Implementing RIP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## OSPF for IPv6

The switch running the IP Base feature set supports Open Shortest Path First (OSPF) for IPv6, a link-state protocol for IP. For more information, see *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Configuring HSRP for IPv6

HSRP provides routing redundancy for routing IPv6 traffic not dependent on the availability of any single router. IPv6 hosts learn of available routers through IPv6 neighbor discovery router advertisement messages. These messages are multicast periodically or are solicited by hosts.

An HSRP IPv6 group has a virtual MAC address that is derived from the HSRP group number and a virtual IPv6 link-local address that is, by default, derived from the HSRP virtual MAC address. Periodic messages are sent for the HSRP virtual IPv6 link-local address when the HSRP group is active. These messages stop after a final one is sent when the group leaves the active state.

---

**Note** When configuring HSRP for IPv6, you must enable HSRP version 2 (HSRPv2) on the interface.

---

## EIGRP IPv6

Switches support the Enhanced Interior Gateway Routing Protocol (EIGRP) for IPv6. It is configured on the interfaces on which it runs and does not require a global IPv6 address. Switches running IP Lite only support EIGRPv6 stub routing.

Before running, an instance of EIGRP IPv6 requires an implicit or explicit router ID. An implicit router ID is derived from a local IPv6 address, so any IPv6 node always has an available router ID. However, EIGRP IPv6 might be running in a network with only IPv6 nodes and therefore might not have an available IPv6 router ID.

For more information about EIGRP for IPv6, see the “Implementing EIGRP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## EIGRPv6 Stub Routing

The EIGRPv6 stub routing feature, reduces resource utilization by moving routed traffic closer to the end user.

In a network using EIGRPv6 stub routing, the only allowable route for IPv6 traffic to the user is through a switch that is configured with EIGRPv6 stub routing. The switch sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

When using EIGRPv6 stub routing, you need to configure the distribution and remote routers to use EIGRPv6 and to configure only the switch as a stub. Only specified routes are propagated from the switch. The switch responds to all queries for summaries, connected routes, and routing updates.

Any neighbor that receives a packet informing it of the stub status does not query the stub router for any routes, and a router that has a stub peer does not query that peer. The stub router depends on the distribution router to send the proper updates to all peers.

In the figure given below, switch B is configured as an EIGRPv6 stub router. Switches A and C are connected to the rest of the WAN. Switch B advertises connected, static, redistribution, and summary routes to switch A and C. Switch B does not advertise any routes learned from switch A (and the reverse).

**Figure 6: EIGRP Stub Router Configuration**

For more information about EIGRPv6 stub routing, see “Implementing EIGRP for IPv6” section of the *Cisco IOS IP Configuration Guide, Volume 2 of 3: Routing Protocols, Release 12.4*.

## SNMP and Syslog Over IPv6

To support both IPv4 and IPv6, IPv6 network management requires both IPv6 and IPv4 transports. Syslog over IPv6 supports address data types for these transports.

SNMP and syslog over IPv6 provide these features:

- Support for both IPv4 and IPv6
- IPv6 transport for SNMP and to modify the SNMP agent to support traps for an IPv6 host
- SNMP- and syslog-related MIBs to support IPv6 addressing
- Configuration of IPv6 hosts as trap receivers

For support over IPv6, SNMP modifies the existing IP transport mapping to simultaneously support IPv4 and IPv6. These SNMP actions support IPv6 transport management:

- Opens User Datagram Protocol (UDP) SNMP socket with default settings
- Provides a new transport mechanism called `SR_IPV6_TRANSPORT`

- Sends SNMP notifications over IPv6 transport
- Supports SNMP-named access lists for IPv6 transport
- Supports SNMP proxy forwarding using IPv6 transport
- Verifies SNMP Manager feature works with IPv6 transport

For information on SNMP over IPv6, including configuration procedures, see the “Managing Cisco IOS Applications over IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

For information about syslog over IPv6, including configuration procedures, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## HTTP(S) Over IPv6

The HTTP client sends requests to both IPv4 and IPv6 HTTP servers, which respond to requests from both IPv4 and IPv6 HTTP clients. URLs with literal IPv6 addresses must be specified in hexadecimal using 16-bit values between colons.

The accept socket call chooses an IPv4 or IPv6 address family. The accept socket is either an IPv4 or IPv6 socket. The listening socket continues to listen for both IPv4 and IPv6 signals that indicate a connection. The IPv6 listening socket is bound to an IPv6 wildcard address.

The underlying TCP/IP stack supports a dual-stack environment. HTTP relies on the TCP/IP stack and the sockets for processing network-layer interactions.

Basic network connectivity (**ping**) must exist between the client and the server hosts before HTTP connections can be made.

For more information, see the “Managing Cisco IOS Applications over IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Unsupported IPv6 Unicast Routing Features

The switch does not support these IPv6 features:

- IPv6 virtual private network (VPN) routing and forwarding (VRF) table support
- IPv6 packets destined to site-local addresses
- Tunneling protocols, such as IPv4-to-IPv6 or IPv6-to-IPv4
- The switch as a tunnel endpoint supporting IPv4-to-IPv6 or IPv6-to-IPv4 tunneling protocols
- IPv6 unicast reverse-path forwarding
- IPv6 Web Cache Communication Protocol (WCCP)

## IPv6 Feature Limitations

Because IPv6 is implemented in switch hardware, some limitations occur due to the IPv6 compressed addresses in the hardware memory. These hardware limitations result in some loss of functionality and limits some features.

These are feature limitations.

- The switch cannot forward SNAP-encapsulated IPv6 packets in hardware. They are forwarded in software.

- The switch cannot apply QoS classification on source-routed IPv6 packets in hardware.

## IPv6 and Switch Stacks

The switch supports IPv6 forwarding across the stack and IPv6 host functionality on the stack master. The stack master runs the IPv6 unicast routing protocols and computes the routing tables. They receive the tables and create hardware IPv6 routes for forwarding. The stack master also runs all IPv6 applications.

---

**Note** To route IPv6 packets in a stack, all switches in the stack should be running the IP Base feature set.

---

If a new switch becomes the stack master, it recomputes the IPv6 routing tables and distributes them to the member switches. While the new stack master is being elected and is resetting, the switch stack does not forward IPv6 packets. The stack MAC address changes, which also changes the IPv6 address. When you specify the stack IPv6 address with an extended unique identifier (EUI) by using the **ipv6 address ipv6-prefix/prefix length eui-64** interface configuration command, the address is based on the interface MAC address. See the [Configuring IPv6 Addressing and Enabling IPv6 Routing \(CLI\)](#), on page 161.

If you configure the persistent MAC address feature on the stack and the stack master changes, the stack MAC address does not change for approximately 4 minutes.

These are the functions of IPv6 stack master and members:

- Stack master:
  - runs IPv6 routing protocols
  - generates routing tables
  - distributes routing tables to stack members that use dCEFv6
  - runs IPv6 host functionality and IPv6 applications
- Stack member (must be running the IP services feature set):
  - receives CEFv6 routing tables from the stack master
  - programs the routes into hardware

---

**Note** IPv6 packets are routed in hardware across the stack if the packet does not have exceptions (IPv6 Options) and the switches in the stack have not run out of hardware resources.

---

- flushes the CEFv6 tables on master re-election

## Default IPv6 Configuration

Table 20: Default IPv6 Configuration

Feature	Default Setting
SDM template	Advance desktop. Default is advanced template
IPv6 routing	Disabled globally and on all interfaces
CEFv6 or dCEFv6	Disabled (IPv4 CEF and dCEF are enabled by default)  <b>Note</b> When IPv6 routing is enabled, CEFv6 and dCEF6 are automatically enabled.
IPv6 addresses	None configured

## Configuring IPv6 Addressing and Enabling IPv6 Routing (CLI)

This section describes how to assign IPv6 addresses to individual Layer 3 interfaces and to globally forward IPv6 traffic on the switch.

Before configuring IPv6 on the switch, consider these guidelines:

- Not all features discussed in this chapter are supported by the switch. See the [Unsupported IPv6 Unicast Routing Features, on page 159](#).
- In the **ipv6 address** interface configuration command, you must enter the *ipv6-address* and *ipv6-prefix* variables with the address specified in hexadecimal using 16-bit values between colons. The *prefix-length* variable (preceded by a slash [/]) is a decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address).

To forward IPv6 traffic on an interface, you must configure a global IPv6 address on that interface. Configuring an IPv6 address on an interface automatically configures a link-local address and activates IPv6 for the interface. The configured interface automatically joins these required multicast groups for that link:

- solicited-node multicast group FF02:0:0:0:1::ff00::/104 for each unicast address assigned to the interface (this address is used in the neighbor discovery process.)
- all-nodes link-local multicast group FF02::1
- all-routers link-local multicast group FF02::2

To remove an IPv6 address from an interface, use the **no ipv6 address *ipv6-prefix/prefix length eui-64*** or **no ipv6 address *ipv6-address link-local*** interface configuration command. To remove all manually configured IPv6 addresses from an interface, use the **no ipv6 address** interface configuration command without arguments. To disable IPv6 processing on an interface that has not been explicitly configured with an IPv6 address, use the **no ipv6 enable** interface configuration command. To globally disable IPv6 routing, use the **no ipv6 unicast-routing** global configuration command.

For more information about configuring IPv6 routing, see the “Implementing Addressing and Basic Connectivity for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

Beginning in privileged EXEC mode, follow these steps to assign an IPv6 address to a Layer 3 interface and enable IPv6 routing:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>sdm prefer dual-ipv4-and-ipv6 { advanced   vlan }</b> <b>Example:</b> Switch(config)# <b>sdm prefer dual-ipv4-and-ipv6 default</b>	Selects an SDM template that supports IPv4 and IPv6. <ul style="list-style-type: none"> <li>• <b>advanced</b>—Sets the switch to the default template to balance system resources.</li> <li>• <b>vlan</b>—Maximizes VLAN configuration on the switch with no routing supported in hardware.</li> </ul> <p><b>Note</b> Advanced is available at all license levels. VLAN template is available only in LAN Base license.</p>
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 4</b>	<b>reload</b> <b>Example:</b> Switch# <b>reload</b>	Reloads the operating system.
<b>Step 5</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode after the switch reloads.
<b>Step 6</b>	<b>interface interface-id</b> <b>Example:</b> Switch(config)# <b>interface gigabitethernet 1/0/1</b>	Enters interface configuration mode, and specifies the Layer 3 interface to configure. The interface can be a physical interface, a switch virtual interface (SVI), or a Layer 3 EtherChannel.

	Command or Action	Purpose
<b>Step 7</b>	<b>no switchport</b> <b>Example:</b> <pre>Switch(config-if)# no switchport</pre>	Removes the interface from Layer 2 configuration mode (if it is a physical interface).
<b>Step 8</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>ipv6 address</b> <i>ipv6-prefix/prefix length eui-64</i></li> <li>• <b>ipv6 address</b> <i>ipv6-address/prefix length</i></li> <li>• <b>ipv6 address</b> <i>ipv6-address link-local</i></li> <li>• <b>ipv6 enable</b></li> <li>• <b>ipv6 address</b> <i>WORD</i></li> <li>• <b>ipv6 address</b> <i>autoconfig</i></li> <li>• <b>ipv6 address</b> <i>dhcp</i></li> </ul> <b>Example:</b> <pre>Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64  Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64  Switch(config-if)# ipv6 address 2001:0DB8:c18:1:: link-local  Switch(config-if)# ipv6 enable</pre>	<ul style="list-style-type: none"> <li>• Specifies a global IPv6 address with an extended unique identifier (EUI) in the low-order 64 bits of the IPv6 address. Specify only the network prefix; the last 64 bits are automatically computed from the switch MAC address. This enables IPv6 processing on the interface.</li> <li>• Manually configures an IPv6 address on the interface.</li> <li>• Specifies a link-local address on the interface to be used instead of the link-local address that is automatically configured when IPv6 is enabled on the interface. This command enables IPv6 processing on the interface.</li> <li>• Automatically configures an IPv6 link-local address on the interface, and enables the interface for IPv6 processing. The link-local address can only be used to communicate with nodes on the same link.</li> </ul>
<b>Step 9</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-if)# exit</pre>	Returns to global configuration mode.
<b>Step 10</b>	<b>ip routing</b> <b>Example:</b> <pre>Switch(config)# ip routing</pre>	Enables IP routing on the switch.
<b>Step 11</b>	<b>ipv6 unicast-routing</b> <b>Example:</b> <pre>Switch(config)# ipv6 unicast-routing</pre>	Enables forwarding of IPv6 unicast data packets.

	Command or Action	Purpose
<b>Step 12</b>	<b>end</b> <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 13</b>	<b>show ipv6 interface <i>interface-id</i></b> <b>Example:</b>  Switch# <b>show ipv6 interface gigabitethernet 1/0/1</b>	Verifies your entries.
<b>Step 14</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring IPv4 and IPv6 Protocol Stacks (CLI)

Beginning in privileged EXEC mode, follow these steps to configure a Layer 3 interface to support both IPv4 and IPv6 and to enable IPv6 routing.

**Note** To disable IPv6 processing on an interface that has not been configured with an IPv6 address, use the **no ipv6 enable** interface configuration command.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ip routing</b> <b>Example:</b>  Switch(config)# <b>ip routing</b>	Enables routing on the switch.
<b>Step 3</b>	<b>ipv6 unicast-routing</b> <b>Example:</b>	Enables forwarding of IPv6 data packets on the switch.

	Command or Action	Purpose
	Switch(config)# <b>ipv6 unicast-routing</b>	
<b>Step 4</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Switch(config)# <b>interface</b> <b>gigabitethernet 1/0/1</b>	Enters interface configuration mode, and specifies the Layer 3 interface to configure.
<b>Step 5</b>	<b>no switchport</b> <b>Example:</b> Switch(config-if)# <b>no switchport</b>	Removes the interface from Layer 2 configuration mode (if it is a physical interface).
<b>Step 6</b>	<b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ] <b>Example:</b> Switch(config-if)# <b>ip address 10.1.2.3</b> <b>255.255.255</b>	Specifies a primary or secondary IPv4 address for the interface.
<b>Step 7</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>ipv6 address</b> <i>ipv6-prefix/prefix length eui-64</i></li> <li>• <b>ipv6 address</b> <i>ipv6-address/prefix length</i></li> <li>• <b>ipv6 address</b> <i>ipv6-address link-local</i></li> <li>• <b>ipv6 enable</b></li> <li>• <b>ipv6 address</b><i>WORD</i></li> <li>• <b>ipv6 address</b><i>autoconfig</i></li> <li>• <b>ipv6 address</b><i>dhcp</i></li> </ul>	<ul style="list-style-type: none"> <li>• Specifies a global IPv6 address. Specify only the network prefix; the last 64 bits are automatically computed from the switch MAC address.</li> <li>• Specifies a link-local address on the interface to be used instead of the automatically configured link-local address when IPv6 is enabled on the interface.</li> <li>• Automatically configures an IPv6 link-local address on the interface, and enables the interface for IPv6 processing. The link-local address can only be used to communicate with nodes on the same link.</li> </ul> <p><b>Note</b> To remove all manually configured IPv6 addresses from an interface, use the <b>no ipv6 address</b> interface configuration command without arguments.</p>
<b>Step 8</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Switch(config)# <b>end</b>	
<b>Step 9</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>show interface</b> <i>interface-id</i></li> <li>• <b>show ip interface</b> <i>interface-id</i></li> <li>• <b>show ipv6 interface</b> <i>interface-id</i></li> </ul>	Verifies your entries.
<b>Step 10</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring Default Router Preference (CLI)

Router advertisement messages are sent with the default router preference (DRP) configured by the **ipv6 nd router-preference** interface configuration command. If no DRP is configured, RAs are sent with a medium preference.

A DRP is useful when two routers on a link might provide equivalent, but not equal-cost routing, and policy might dictate that hosts should prefer one of the routers.

For more information about configuring DRP for IPv6, see the “Implementing IPv6 Addresses and Basic Connectivity” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

Beginning in privileged EXEC mode, follow these steps to configure a DRP for a router on an interface.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b>  Switch(config)# <b>interface gigabitethernet 1/0/1</b>	Enters interface configuration mode and identifies the Layer 3 interface on which you want to specify the DRP.
<b>Step 3</b>	<b>ipv6 nd router-preference</b> { <b>high</b>   <b>medium</b>   <b>low</b> } <b>Example:</b>	Specifies a DRP for the router on the switch interface.

	Command or Action	Purpose
	Switch(config-if)# <b>ipv6 nd router-preference medium</b>	
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show ipv6 interface</b> <b>Example:</b> Switch# <b>show ipv6 interface</b>	Verifies the configuration.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring IPv6 ICMP Rate Limiting (CLI)

ICMP rate limiting is enabled by default with a default interval between error messages of 100 milliseconds and a bucket size (maximum number of tokens to be stored in a bucket) of 10.

Beginning in privileged EXEC mode, follow these steps to change the ICMP rate-limiting parameters:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 icmp error-interval interval [bucketsize]</b> <b>Example:</b> Switch(config)# <b>ipv6 icmp error-interval 50 20</b>	Configures the interval and bucket size for IPv6 ICMP error messages: <ul style="list-style-type: none"> <li><i>interval</i>—The interval (in milliseconds) between tokens being added to the bucket. The range is from 0 to 2147483647 milliseconds.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li><i>bucketsize</i>—(Optional) The maximum number of tokens stored in the bucket. The range is from 1 to 200.</li> </ul>
<b>Step 3</b>	<b>end</b>  <b>Example:</b>  <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 4</b>	<b>show ipv6 interface</b> [ <i>interface-id</i> ]  <b>Example:</b>  <pre>Switch# show ipv6 interface gigabitethernet 1/0/1</pre>	Verifies your entries.
<b>Step 5</b>	<b>copy running-config startup-config</b>  <b>Example:</b>  <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring CEF and dCEF for IPv6

Cisco Express Forwarding (CEF) is a Layer 3 IP switching technology to improve network performance. CEF implements an advanced IP look-up and forwarding algorithm to deliver maximum Layer 3 switching performance. It is less CPU-intensive than fast-switching route-caching, allowing more CPU processing power to be dedicated to packet forwarding. In a switch stack, the hardware uses distributed CEF (dCEF) in the stack. IPv4 CEF and dCEF are enabled by default. IPv6 CEF and dCEF are disabled by default, but automatically enabled when you configure IPv6 routing.

IPv6 CEF and dCEF are automatically disabled when IPv6 routing is unconfigured. IPv6 CEF and dCEF cannot be disabled through configuration. You can verify the IPv6 state by entering the **show ipv6 cef** privileged EXEC command.

To route IPv6 unicast packets, you must first globally configure forwarding of IPv6 unicast packets by using the **ipv6 unicast-routing** global configuration command, and you must configure an IPv6 address and IPv6 processing on an interface by using the **ipv6 address** interface configuration command.

For more information about configuring CEF and dCEF, see *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Configuring Static Routing for IPv6 (CLI)

Before configuring a static IPv6 route, you must enable routing by using the **ip routing** global configuration command, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** global configuration command, and enable IPv6 on at least one Layer 3 interface by configuring an IPv6 address on the interface.

For more information about configuring static IPv6 routing, see the “Implementing Static Routes for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 route <i>ipv6-prefix/prefix length</i></b> <b>{<i>ipv6-address</i>   <i>interface-id</i> [<i>ipv6-address</i>]}</b> <b>[<i>administrative distance</i>]</b> <b>Example:</b> <pre>Switch(config)# ipv6 route 2001:0DB8::/32 gigabitethernet2/0/1 130</pre>	Configures a static IPv6 route. <ul style="list-style-type: none"> <li>• <i>ipv6-prefix</i>—The IPv6 network that is the destination of the static route. It can also be a hostname when static host routes are configured.</li> <li>• <i>/prefix length</i>—The length of the IPv6 prefix. A decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.</li> <li>• <i>ipv6-address</i>—The IPv6 address of the next hop that can be used to reach the specified network. The IPv6 address of the next hop need not be directly connected; recursion is done to find the IPv6 address of the directly connected next hop. The address must be in the form documented in RFC 2373, specified in hexadecimal using 16-bit values between colons.</li> <li>• <i>interface-id</i>—Specifies direct static routes from point-to-point and broadcast interfaces. With point-to-point interfaces, there is no need to specify the IPv6 address of the next hop. With broadcast interfaces, you should always specify the IPv6 address of the next hop, or ensure that the specified prefix is assigned to the link, specifying a link-local address as the next hop. You can optionally specify the IPv6 address of the next hop to which packets are sent.</li> </ul>

	Command or Action	Purpose
		<p><b>Note</b> You must specify an <i>interface-id</i> when using a link-local address as the next hop (the link-local next hop must also be an adjacent router).</p> <ul style="list-style-type: none"> <li>• <i>administrative distance</i>—(Optional) An administrative distance. The range is 1 to 254; the default value is 1, which gives static routes precedence over any other type of route except connected routes. To configure a floating static route, use an administrative distance greater than that of the dynamic routing protocol.</li> </ul>
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 4</b>	<p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>show ipv6 static</b> [ <i>ipv6-address</i>   <i>ipv6-prefix/prefix length</i> ] [<b>interface</b> <i>interface-id</i> ] [<b>detail</b>][<b>recursive</b>] [<b>detail</b>]</li> <li>• <b>show ipv6 route static</b> [<i>updated</i>]</li> </ul> <p><b>Example:</b></p> <pre>Switch# show ipv6 static 2001:0DB8::/32 interface gigabitethernet2/0/1</pre> <p>OR</p> <pre>Switch# show ipv6 route static</pre>	<p>Verifies your entries by displaying the contents of the IPv6 routing table.</p> <ul style="list-style-type: none"> <li>• <b>interface</b> <i>interface-id</i>—(Optional) Displays only those static routes with the specified interface as an egress interface.</li> <li>• <b>recursive</b>—(Optional) Displays only recursive static routes. The <b>recursive</b> keyword is mutually exclusive with the <b>interface</b> keyword, but it can be used with or without the IPv6 prefix included in the command syntax.</li> <li>• <b>detail</b>—(Optional) Displays this additional information: <ul style="list-style-type: none"> <li>• For valid recursive routes, the output path set, and maximum resolution depth.</li> <li>• For invalid routes, the reason why the route is not valid.</li> </ul> </li> </ul>
<b>Step 5</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring RIP for IPv6 (CLI)

Before configuring the switch to run IPv6 RIP, you must enable routing by using the **ip routing** global configuration command, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** global configuration command, and enable IPv6 on any Layer 3 interfaces on which IPv6 RIP is to be enabled.

For more information about configuring RIP routing for IPv6, see the “Implementing RIP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com,

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 router rip name</b> <b>Example:</b>  Switch(config)# <b>ipv6 router rip cisco</b>	Configures an IPv6 RIP routing process, and enters router configuration mode for the process.
<b>Step 3</b>	<b>maximum-paths number-paths</b> <b>Example:</b>  Switch(config-router)# <b>maximum-paths 6</b>	(Optional) Define the maximum number of equal-cost routes that IPv6 RIP can support. The range is from 1 to 32, and the default is 16 routes.
<b>Step 4</b>	<b>exit</b> <b>Example:</b>  Switch(config-router)# <b>exit</b>	Returns to global configuration mode.
<b>Step 5</b>	<b>interface interface-id</b> <b>Example:</b>  Switch(config)# <b>interface</b> <b>gigabitethernet 1/0/1</b>	Enters interface configuration mode, and specifies the Layer 3 interface to configure.
<b>Step 6</b>	<b>ipv6 rip name enable</b> <b>Example:</b>  Switch(config-if)# <b>ipv6 rip cisco enable</b>	Enables the specified IPv6 RIP routing process on the interface.

	Command or Action	Purpose
<b>Step 7</b>	<p><b>ipv6 rip name default-information {only   originate}</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ipv6 rip cisco default-information only</pre>	<p>(Optional) Originates the IPv6 default route (::/0) into the RIP routing process updates sent from the specified interface.</p> <p><b>Note</b> To avoid routing loops after the IPv6 default route (::/0) is originated from any interface, the routing process ignores all default routes received on any interface.</p> <ul style="list-style-type: none"> <li>• <b>only</b>—Select to originate the default route, but suppress all other routes in the updates sent on this interface.</li> <li>• <b>originate</b>—Select to originate the default route in addition to all other routes in the updates sent on this interface.</li> </ul>
<b>Step 8</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 9</b>	<p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>show ipv6 rip [name] [ interface interface-id ] [ database ] [ next-hops ]</b></li> <li>• <b>show ipv6 rip</b></li> </ul> <p><b>Example:</b></p> <pre>Switch# show ipv6 rip cisco interface gigabitethernet2/0/1</pre> <p>or</p> <pre>Switch# show ipv6 rip</pre>	<ul style="list-style-type: none"> <li>• Displays information about current IPv6 RIP processes.</li> <li>• Displays the current contents of the IPv6 routing table.</li> </ul>
<b>Step 10</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring OSPF for IPv6 (CLI)

You can customize OSPF for IPv6 for your network. However, the defaults for OSPF in IPv6 are set to meet the requirements of most customers and features.

Follow these guidelines:

- Be careful when changing the defaults for IPv6 commands. Changing the defaults might adversely affect OSPF for the IPv6 network.
- Before you enable IPv6 OSPF on an interface, you must enable routing by using the **ip routing** global configuration command, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** global configuration command, and enable IPv6 on Layer 3 interfaces on which you are enabling IPv6 OSPF.

For more information about configuring OSPF routing for IPv6, see the “Implementing OSPF for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 router ospf process-id</b> <b>Example:</b> Switch(config)# <b>ipv6 router ospf 21</b>	Enables OSPF router configuration mode for the process. The process ID is the number assigned administratively when enabling the OSPF for IPv6 routing process. It is locally assigned and can be a positive integer from 1 to 65535.
<b>Step 3</b>	<b>area area-id range {ipv6-prefix/prefix length} [advertise   not-advertise] [cost cost]</b> <b>Example:</b> Switch(config)# <b>area .3 range 2001:0DB8::/32 not-advertise</b>	(Optional) Consolidates and summarizes routes at an area boundary. <ul style="list-style-type: none"> <li>• <i>area-id</i>—Identifier of the area about which routes are to be summarized. It can be specified as either a decimal value or as an IPv6 prefix.</li> <li>• <i>ipv6-prefix/prefix length</i>—The destination IPv6 network and a decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark (/) must precede the decimal value.</li> <li>• <b>advertise</b>—(Optional) Sets the address range status to advertise and generate a Type 3 summary link-state advertisement (LSA).</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>not-advertise</b>—(Optional) Sets the address range status to DoNotAdvertise. The Type 3 summary LSA is suppressed, and component networks remain hidden from other networks.</li> <li>• <b>cost <i>cost</i></b>—(Optional) Sets the metric or cost for this summary route, which is used during OSPF SPF calculation to determine the shortest paths to the destination. The value can be 0 to 16777215.</li> </ul>
<b>Step 4</b>	<b>maximum paths</b> <i>number-paths</i> <b>Example:</b> Switch(config)# <b>maximum paths 16</b>	(Optional) Defines the maximum number of equal-cost routes to the same destination that IPv6 OSPF should enter in the routing table. The range is from 1 to 32, and the default is 16 paths.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Switch(config-if)# <b>exit</b>	Returns to global configuration mode.
<b>Step 6</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Switch(config)# <b>interface</b> <b>gigabitethernet 1/0/1</b>	Enters interface configuration mode, and specifies the Layer 3 interface to configure.
<b>Step 7</b>	<b>ipv6 ospf</b> <i>process-id</i> <b>area</b> <i>area-id</i> [ <b>instance</b> <i>instance-id</i> ] <b>Example:</b> Switch(config-if)# <b>ipv6 ospf 21 area .3</b>	Enables OSPF for IPv6 on the interface. <ul style="list-style-type: none"> <li>• <b>instance</b> <i>instance-id</i>—(Optional) Instance identifier.</li> </ul>
<b>Step 8</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 9</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>show ipv6 ospf</b> [<i>process-id</i>] [<i>area-id</i>]  <b>interface</b> [<i>interface-id</i>]</li> </ul>	<ul style="list-style-type: none"> <li>• Displays information about OSPF interfaces.</li> </ul>

	Command or Action	Purpose
	<ul style="list-style-type: none"> <li>• <code>show ipv6 ospf [ process-id ] [ area-id ]</code></li> </ul> <p><b>Example:</b></p> <pre>Switch# show ipv6 ospf 21 interface gigabitethernet2/0/1</pre> <p>or</p> <pre>Switch# show ipv6 ospf 21</pre>	<ul style="list-style-type: none"> <li>• Displays general information about OSPF routing processes.</li> </ul>
<b>Step 10</b>	<p><code>copy running-config startup-config</code></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring EIGRP for IPv6

Before configuring the switch to run IPv6 EIGRP, enable routing by entering the **ip routing global configuration** command, enable the forwarding of IPv6 packets by entering the **ipv6 unicast-routing global configuration** command, and enable IPv6 on any Layer 3 interfaces on which you want to enable IPv6 EIGRP.

To set an explicit router ID, use the **show ipv6 eigrp** command to see the configured router IDs, and then use the **router-id** command.

As with EIGRP IPv4, you can use EIGRPv6 to specify your EIGRP IPv6 interfaces and to select a subset of those as passive interfaces. Use the **passive-interface** command to make an interface passive, and then use the **no passive-interface** command on selected interfaces to make them active. EIGRP IPv6 does not need to be configured on a passive interface.

For more configuration procedures, see the “Implementing EIGRP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Configuring IPv6 Unicast Reverse Path Forwarding

The unicast Reverse Path Forwarding (unicast RPF) feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including Smurf and Tribal Flood Network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.

- Unicast RPF is supported only in IP services.
- Do not configure Unicast RPF if the switch is in a mixed hardware stack combining more than one switch type.

For detailed IP unicast RPF configuration information, see the *Other Security Features* chapter in the *Cisco IOS Security Configuration Guide, Release 12.4*.

## Displaying IPv6

For complete syntax and usage information on these commands, see the Cisco IOS command reference publications.

**Table 21: Command for Monitoring IPv6**

Command	Purpose
<b>show ipv6 access-list</b>	Displays a summary of access lists.
<b>show ipv6 cef</b>	Displays Cisco Express Forwarding for IPv6.
<b>show ipv6 interface</b> <i>interface-id</i>	Displays IPv6 interface status and configuration.
<b>show ipv6 mtu</b>	Displays IPv6 MTU per destination cache.
<b>show ipv6 neighbors</b>	Displays IPv6 neighbor cache entries.
<b>show ipv6 ospf</b>	Displays IPv6 OSPF information.
<b>show ipv6 prefix-list</b>	Displays a list of IPv6 prefix lists.
<b>show ipv6 protocols</b>	Displays a list of IPv6 routing protocols on the switch.
<b>show ipv6 rip</b>	Displays IPv6 RIP routing protocol status.
<b>show ipv6 rip</b>	Displays IPv6 RIP routing protocol status.
<b>show ipv6 route</b>	Displays IPv6 route table entries.
<b>show ipv6 routers</b>	Displays the local IPv6 routers.
<b>show ipv6 static</b>	Displays IPv6 static routes.
<b>show ipv6 traffic</b>	Displays IPv6 traffic statistics.

**Table 22: Command for Displaying EIGRP IPv6 Information**

Command	Purpose
<b>show ipv6 eigrp</b> [ <i>as-number</i> ] <i>interface</i>	Displays information about interfaces configured for EIGRP IPv6.
<b>show ipv6 eigrp</b> [ <i>as-number</i> ] <i>neighbor</i>	Displays the neighbors discovered by EIGRP IPv6.
<b>show ipv6 interface</b> [ <i>as-number</i> ] <i>traffic</i>	Displays the number of EIGRP IPv6 packets sent and received.

Command	Purpose
<code>show ipv6 eigrptopology [as-number   ipv6-address]</code> [active   all-links   detail-links   pending   summary   zero-successors   Base]	Displays EIGRP entries in the IPv6 topology table.

## Configuring DHCP for IPv6 Address Assignment

This section describes only the DHCPv6 address assignment. For more information about configuring the DHCPv6 client, server, or relay agent functions, see the “Implementing DHCP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### Default DHCPv6 Address Assignment Configuration

By default, no DHCPv6 features are configured on the switch.

### DHCPv6 Address Assignment Configuration Guidelines

When configuring DHCPv6 address assignment, consider these guidelines:

- In the procedures, the specified interface must be one of these Layer 3 interfaces:
  - DHCPv6 IPv6 routing must be enabled on a Layer 3 interface.
  - SVI: a VLAN interface created by using the **interface vlan *vlan\_id*** command.
  - EtherChannel port channel in Layer 3 mode: a port-channel logical interface created by using the **interface port-channel *port-channel-number*** command.
- The switch can act as a DHCPv6 client, server, or relay agent. The DHCPv6 client, server, and relay function are mutually exclusive on an interface.
- The DHCPv6 client, server, or relay agent runs only on the master switch. When there is a stack master re-election, the new master switch retains the DHCPv6 configuration. However, the local RAM copy of the DHCP server database lease information is not retained.

### Enabling DHCPv6 Server Function (CLI)

Use the **no** form of the DHCP pool configuration mode commands to change the DHCPv6 pool characteristics. To disable the DHCPv6 server function on an interface, use the **no ipv6 dhcp server** interface configuration command.

Beginning in privileged EXEC mode, follow these steps to enable the DHCPv6 server function on an interface.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 dhcp pool <i>poolname</i></b> <b>Example:</b>  Switch(config)# <b>ipv6 dhcp pool 7</b>	Enters DHCP pool configuration mode, and define the name for the IPv6 DHCP pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).
<b>Step 3</b>	<b>address prefix <i>IPv6-prefix</i> {lifetime} {<i>t1 t1</i>   infinite}</b> <b>Example:</b>  Switch(config-dhcpv6)# <b>address prefix 2001:1000::0/64 lifetime 3600</b>	(Optional) Specifies an address prefix for address assignment.  This address must be in hexadecimal, using 16-bit values between colons.  <b>lifetime <i>t1 t1</i></b> —Specifies a time interval (in seconds) that an IPv6 address prefix remains in the valid state. The range is 5 to 4294967295 seconds. Specify <b>infinite</b> for no time interval.
<b>Step 4</b>	<b>link-address <i>IPv6-prefix</i></b> <b>Example:</b>  Switch(config-dhcpv6)# <b>link-address 2001:1002::0/64</b>	(Optional) Specifies a link-address IPv6 prefix.  When an address on the incoming interface or a link-address in the packet matches the specified IPv6 prefix, the server uses the configuration information pool.  This address must be in hexadecimal, using 16-bit values between colons.
<b>Step 5</b>	<b>vendor-specific <i>vendor-id</i></b> <b>Example:</b>  Switch(config-dhcpv6)# <b>vendor-specific 9</b>	(Optional) Enters vendor-specific configuration mode and specifies a vendor-specific identification number. This number is the vendor IANA Private Enterprise Number. The range is 1 to 4294967295.
<b>Step 6</b>	<b>suboption <i>number</i> {address <i>IPv6-address</i>   ascii <i>ASCII-string</i>   hex <i>hex-string</i>}</b> <b>Example:</b>  Switch(config-dhcpv6-vs)# <b>suboption 1 address 1000:235D::</b>	(Optional) Enters a vendor-specific suboption number. The range is 1 to 65535. Enter an IPv6 address, ASCII text, or a hex string as defined by the suboption parameters.
<b>Step 7</b>	<b>exit</b> <b>Example:</b>	Returns to DHCP pool configuration mode.

	Command or Action	Purpose
	<code>Switch(config-dhcpv6-vs) # exit</code>	
<b>Step 8</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-dhcpv6) # exit</pre>	Returns to global configuration mode.
<b>Step 9</b>	<p><b>interface <i>interface-id</i></b></p> <p><b>Example:</b></p> <pre>Switch(config) # interface gigabitethernet 1/0/1</pre>	Enters interface configuration mode, and specifies the interface to configure.
<b>Step 10</b>	<p><b>ipv6 dhcp server [<i>poolname</i>   <b>automatic</b>] [<b>rapid-commit</b>] [<i>preference value</i>] [<b>allow-hint</b>]</b></p> <p><b>Example:</b></p> <pre>Switch(config-if) # ipv6 dhcp server automatic</pre>	<p>Enables DHCPv6 server function on an interface.</p> <ul style="list-style-type: none"> <li>• <b>poolname</b>—(Optional) User-defined name for the IPv6 DHCP pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).</li> <li>• <b>automatic</b>—(Optional) Enables the system to automatically determine which pool to use when allocating addresses for a client.</li> <li>• <b>rapid-commit</b>—(Optional) Allows two-message exchange method.</li> <li>• <b>preference value</b>—(Optional) Configures the preference value carried in the preference option in the advertise message sent by the server. The range is from 0 to 255. The preference value default is 0.</li> <li>• <b>allow-hint</b>—(Optional) Specifies whether the server should consider client suggestions in the SOLICIT message. By default, the server ignores client hints.</li> </ul>
<b>Step 11</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config) # end</pre>	Returns to privileged EXEC mode.
<b>Step 12</b>	Do one of the following:	<ul style="list-style-type: none"> <li>• Verifies DHCPv6 pool configuration.</li> </ul>

	Command or Action	Purpose
	<ul style="list-style-type: none"> <li>• <code>show ipv6 dhcp pool</code></li> <li>• <code>show ipv6 dhcp interface</code></li> </ul> <p><b>Example:</b></p> <pre>Switch# show ipv6 dhcp pool</pre> <p>OR</p> <pre>Switch# show ipv6 dhcp interface</pre>	<ul style="list-style-type: none"> <li>• Verifies that the DHCPv6 server function is enabled on an interface.</li> </ul>
<b>Step 13</b>	<p><code>copy running-config startup-config</code></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Enabling DHCPv6 Client Function (CLI)

This task explains how to enable the DHCPv6 client on an interface.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><code>interface <i>interface-id</i></code></p> <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/1</pre>	Enters interface configuration mode, and specifies the interface to configure.
<b>Step 3</b>	<p><code>ipv6 address dhcp [<i>rapid-commit</i>]</code></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ipv6 address dhcp rapid-commit</pre>	Enables the interface to acquire an IPv6 address from the DHCPv6 server. <b>rapid-commit</b> —(Optional) Allow two-message exchange method for address assignment.
<b>Step 4</b>	<p><code>ipv6 dhcp client request [<i>vendor-specific</i>]</code></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ipv6 dhcp client</pre>	(Optional) Enables the interface to request the vendor-specific option.

	Command or Action	Purpose
	<code>request vendor-specific</code>	
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show ipv6 dhcp interface</b> <b>Example:</b> Switch# <code>show ipv6 dhcp interface</code>	Verifies that the DHCPv6 client is enabled on an interface.

## Configuration Examples for IPv6 Unicast Routing

### Configuring IPv6 Addressing and Enabling IPv6 Routing: Example

This example shows how to enable IPv6 with both a link-local address and a global address based on the IPv6 prefix 2001:0DB8:c18:1::/64. The EUI-64 interface ID is used in the low-order 64 bits of both addresses. Output from the **show ipv6 interface EXEC** command is included to show how the interface ID (20B:46FF:FE2F:D940) is appended to the link-local prefix FE80::/64 of the interface.

```
Switch(config)# ipv6 unicast-routing
Switch(config)# interface gigabitethernet1/0/11
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64
Switch(config-if)# end
Switch# show ipv6 interface gigabitethernet1/0/11
GigabitEthernet1/0/11 is up, line protocol is up
  IPv6 is enabled, link-local address is FE80::20B:46FF:FE2F:D940
  Global unicast address(es):
    2001:0DB8:c18:1:20B:46FF:FE2F:D940, subnet is 2001:0DB8:c18:1::/64 [EUI]
  Joined group address(es):
    FE02::1
    FE02::2
    FE02::1:FE2F:D940
  MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
  ND advertised reachable time is 0 milliseconds
  ND advertised retransmit interval is 0 milliseconds
  ND router advertisements are sent every 200 seconds
  ND router advertisements live for 1800 seconds
  Hosts use stateless autoconfig for addresses.
```

## Configuring Default Router Preference: Example

This example shows how to configure a DRP of *high* for the router on an interface.

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ipv6 nd router-preference high
Switch(config-if)# end
```

## Configuring IPv4 and IPv6 Protocol Stacks: Example

This example shows how to enable IPv4 and IPv6 routing on an interface.

```
Switch(config)# ip routing
Switch(config)# ipv6 unicast-routing
Switch(config)# interface fastethernet1/0/11
Switch(config-if)# no switchport
Switch(config-if)# ip address 192.168.99.1 255.255.255.0
Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64
Switch(config-if)# end
```

## Enabling DHCPv6 Server Function: Example

This example shows how to configure a pool called *engineering* with an IPv6 address prefix:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool engineering
Switch(config-dhcpv6)# address prefix 2001:1000::0/64
Switch(config-dhcpv6)# end
```

This example shows how to configure a pool called *testgroup* with three link-addresses and an IPv6 address prefix:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool testgroup
Switch(config-dhcpv6)# link-address 2001:1001::0/64
Switch(config-dhcpv6)# link-address 2001:1002::0/64
Switch(config-dhcpv6)# link-address 2001:2000::0/48
Switch(config-dhcpv6)# address prefix 2001:1003::0/64
Switch(config-dhcpv6)# end
```

This example shows how to configure a pool called *350* with vendor-specific options:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool 350
Switch(config-dhcpv6)# address prefix 2001:1005::0/48
Switch(config-dhcpv6)# vendor-specific 9
Switch(config-dhcpv6-vs)# suboption 1 address 1000:235D::1
Switch(config-dhcpv6-vs)# suboption 2 ascii "IP-Phone"
Switch(config-dhcpv6-vs)# end
```

## Enabling DHCPv6 Client Function: Example

This example shows how to acquire an IPv6 address and to enable the rapid-commit option:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ipv6 address dhcp rapid-commit
```

## Configuring IPv6 ICMP Rate Limiting: Example

This example shows how to configure an IPv6 ICMP error message interval of 50 milliseconds and a bucket size of 20 tokens.

```
Switch(config)#ipv6 icmp error-interval 50 20
```

## Configuring Static Routing for IPv6: Example

This example shows how to configure a floating static route to an interface with an administrative distance of 130:

```
Switch(config)# ipv6 route 2001:0DB8::/32 gigabitethernet2/0/1 130
```

## Configuring RIP for IPv6: Example

This example shows how to enable the RIP routing process *cisco* with a maximum of eight equal-cost routes and to enable it on an interface:

```
Switch(config)# ipv6 router rip cisco
Switch(config-router)# maximum-paths 8
Switch(config)# exit
Switch(config)# interface gigabitethernet2/0/11
Switch(config-if)# ipv6 rip cisco enable
```

## Displaying IPv6: Example

This is an example of the output from the **show ipv6 interface** privileged EXEC command:

```
Switch# show ipv6 interface
Vlan1 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::20B:46FF:FE2F:D940
Global unicast address(es):
  3FFE:C000:0:1:20B:46FF:FE2F:D940, subnet is 3FFE:C000:0:1::/64 [EUI]
Joined group address(es):
  FF02::1
  FF02::2
  FF02::1:FF2F:D940
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
```

```
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
<output truncated>
```

## CHAPTER 14

# Implementing IPv6 Multicast

- [Finding Feature Information, on page 185](#)
- [Information About Implementing IPv6 Multicast Routing, on page 185](#)
- [Implementing IPv6 Multicast, on page 192](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Implementing IPv6 Multicast Routing

This chapter describes how to implement IPv6 multicast routing on the switch.

Traditional IP communication allows a host to send packets to a single host (unicast transmission) or to all hosts (broadcast transmission). IPv6 multicast provides a third scheme, allowing a host to send a single data stream to a subset of all hosts (group transmission) simultaneously.

## IPv6 Multicast Overview

An IPv6 multicast group is an arbitrary group of receivers that want to receive a particular data stream. This group has no physical or geographical boundaries--receivers can be located anywhere on the Internet or in any private network. Receivers that are interested in receiving data flowing to a particular group must join the group by signaling their local switch. This signaling is achieved with the MLD protocol.

Switches use the MLD protocol to learn whether members of a group are present on their directly attached subnets. Hosts join multicast groups by sending MLD report messages. The network then delivers data to a potentially unlimited number of receivers, using only one copy of the multicast data on each subnet. IPv6 hosts that wish to receive the traffic are known as group members.

Packets delivered to group members are identified by a single multicast group address. Multicast packets are delivered to a group using best-effort reliability, just like IPv6 unicast packets.

The multicast environment consists of senders and receivers. Any host, regardless of whether it is a member of a group, can send to a group. However, only members of a group can listen to and receive the message.

A multicast address is chosen for the receivers in a multicast group. Senders use that address as the destination address of a datagram to reach all members of the group.

Membership in a multicast group is dynamic; hosts can join and leave at any time. There is no restriction on the location or number of members in a multicast group. A host can be a member of more than one multicast group at a time.

How active a multicast group is, its duration, and its membership can vary from group to group and from time to time. A group that has members may have no activity.

## IPv6 Multicast Routing Implementation

The Cisco IOS software supports the following protocols to implement IPv6 multicast routing:

- MLD is used by IPv6 switches to discover multicast listeners (nodes that want to receive multicast packets destined for specific multicast addresses) on directly attached links. There are two versions of MLD: MLD version 1 is based on version 2 of the Internet Group Management Protocol (IGMP) for IPv4, and MLD version 2 is based on version 3 of the IGMP for IPv4. IPv6 multicast for Cisco IOS software uses both MLD version 2 and MLD version 1. MLD version 2 is fully backward-compatible with MLD version 1 (described in RFC 2710). Hosts that support only MLD version 1 will interoperate with a switch running MLD version 2. Mixed LANs with both MLD version 1 and MLD version 2 hosts are likewise supported.
- PIM-SM is used between switches so that they can track which multicast packets to forward to each other and to their directly connected LANs.
- PIM in Source Specific Multicast (PIM-SSM) is similar to PIM-SM with the additional ability to report interest in receiving packets from specific source addresses (or from all but the specific source addresses) to an IP multicast address.

## IPv6 Multicast Listener Discovery Protocol

To start implementing multicasting in the campus network, users must first define who receives the multicast. The MLD protocol is used by IPv6 switches to discover the presence of multicast listeners (for example, nodes that want to receive multicast packets) on their directly attached links, and to discover specifically which multicast addresses are of interest to those neighboring nodes. It is used for discovering local group and source-specific group membership.

The MLD protocol provides a means to automatically control and limit the flow of multicast traffic throughout your network with the use of special multicast queriers and hosts.

## Multicast Queriers and Hosts

A multicast querier is a network device, such as a switch, that sends query messages to discover which network devices are members of a given multicast group.

A multicast host is a receiver, including switches, that send report messages to inform the querier of a host membership.

A set of queriers and hosts that receive multicast data streams from the same source is called a multicast group. Queriers and hosts use MLD reports to join and leave multicast groups and to begin receiving group traffic.

MLD uses the Internet Control Message Protocol (ICMP) to carry its messages. All MLD messages are link-local with a hop limit of 1, and they all have the switch alert option set. The switch alert option implies an implementation of the hop-by-hop option header.

## MLD Access Group

The MLD access group provides receiver access control in Cisco IOS IPv6 multicast switches. This feature limits the list of groups a receiver can join, and it allows or denies sources used to join SSM channels.

## Explicit Tracking of Receivers

The explicit tracking feature allows a switch to track the behavior of the hosts within its IPv6 network. This feature also enables the fast leave mechanism to be used with MLD version 2 host reports.

## Protocol Independent Multicast

Protocol Independent Multicast (PIM) is used between switches so that they can track which multicast packets to forward to each other and to their directly connected LANs. PIM works independently of the unicast routing protocol to perform send or receive multicast route updates like other protocols. Regardless of which unicast routing protocols are being used in the LAN to populate the unicast routing table, Cisco IOS PIM uses the existing unicast table content to perform the Reverse Path Forwarding (RPF) check instead of building and maintaining its own separate routing table.

You can configure IPv6 multicast to use either PIM-SM or PIM-SSM operation, or you can use both PIM-SM and PIM-SSM together in your network.

## PIM-Sparse Mode

IPv6 multicast provides support for intradomain multicast routing using PIM-SM. PIM-SM uses unicast routing to provide reverse-path information for multicast tree building, but it is not dependent on any particular unicast routing protocol.

PIM-SM is used in a multicast network when relatively few switches are involved in each multicast and these switches do not forward multicast packets for a group, unless there is an explicit request for the traffic. PIM-SM distributes information about active sources by forwarding data packets on the shared tree. PIM-SM initially uses shared trees, which requires the use of an RP.

Requests are accomplished via PIM joins, which are sent hop by hop toward the root node of the tree. The root node of a tree in PIM-SM is the RP in the case of a shared tree or the first-hop switch that is directly connected to the multicast source in the case of a shortest path tree (SPT). The RP keeps track of multicast groups and the hosts that send multicast packets are registered with the RP by that host's first-hop switch.

As a PIM join travels up the tree, switches along the path set up multicast forwarding state so that the requested multicast traffic will be forwarded back down the tree. When multicast traffic is no longer needed, a switch sends a PIM prune up the tree toward the root node to prune (or remove) the unnecessary traffic. As this PIM prune travels hop by hop up the tree, each switch updates its forwarding state appropriately. Ultimately, the forwarding state associated with a multicast group or source is removed.

A multicast data sender sends data destined for a multicast group. The designated switch (DR) of the sender takes those data packets, unicast-encapsulates them, and sends them directly to the RP. The RP receives these encapsulated data packets, de-encapsulates them, and forwards them onto the shared tree. The packets then

follow the (\*, G) multicast tree state in the switches on the RP tree, being replicated wherever the RP tree branches, and eventually reaching all the receivers for that multicast group. The process of encapsulating data packets to the RP is called registering, and the encapsulation packets are called PIM register packets.

## IPv6 BSR: Configure RP Mapping

PIM switches in a domain must be able to map each multicast group to the correct RP address. The BSR protocol for PIM-SM provides a dynamic, adaptive mechanism to distribute group-to-RP mapping information rapidly throughout a domain. With the IPv6 BSR feature, if an RP becomes unreachable, it will be detected and the mapping tables will be modified so that the unreachable RP is no longer used, and the new tables will be rapidly distributed throughout the domain.

Every PIM-SM multicast group needs to be associated with the IP or IPv6 address of an RP. When a new multicast sender starts sending, its local DR will encapsulate these data packets in a PIM register message and send them to the RP for that multicast group. When a new multicast receiver joins, its local DR will send a PIM join message to the RP for that multicast group. When any PIM switch sends a (\*, G) join message, the PIM switch needs to know which is the next switch toward the RP so that G (Group) can send a message to that switch. Also, when a PIM switch is forwarding data packets using (\*, G) state, the PIM switch needs to know which is the correct incoming interface for packets destined for G, because it needs to reject any packets that arrive on other interfaces.

A small set of switches from a domain are configured as candidate bootstrap switches (C-BSRs) and a single BSR is selected for that domain. A set of switches within a domain are also configured as candidate RPs (C-RPs); typically, these switches are the same switches that are configured as C-BSRs. Candidate RPs periodically unicast candidate-RP-advertisement (C-RP-Adv) messages to the BSR of that domain, advertising their willingness to be an RP. A C-RP-Adv message includes the address of the advertising C-RP, and an optional list of group addresses and mask length fields, indicating the group prefixes for which the candidacy is advertised. The BSR then includes a set of these C-RPs, along with their corresponding group prefixes, in bootstrap messages (BSMs) it periodically originates. BSMs are distributed hop-by-hop throughout the domain.

Bidirectional BSR support allows bidirectional RPs to be advertised in C-RP messages and bidirectional ranges in the BSM. All switches in a system must be able to use the bidirectional range in the BSM; otherwise, the bidirectional RP feature will not function.

## PIM-Source Specific Multicast

PIM-SSM is the routing protocol that supports the implementation of SSM and is derived from PIM-SM. However, unlike PIM-SM where data from all multicast sources are sent when there is a PIM join, the SSM feature forwards datagram traffic to receivers from only those multicast sources that the receivers have explicitly joined, thus optimizing bandwidth utilization and denying unwanted Internet broadcast traffic. Further, instead of the use of RP and shared trees, SSM uses information found on source addresses for a multicast group. This information is provided by receivers through the source addresses relayed to the last-hop switches by MLD membership reports, resulting in shortest-path trees directly to the sources.

In SSM, delivery of datagrams is based on (S, G) channels. Traffic for one (S, G) channel consists of datagrams with an IPv6 unicast source address S and the multicast group address G as the IPv6 destination address. Systems will receive this traffic by becoming members of the (S, G) channel. Signaling is not required, but receivers must subscribe or unsubscribe to (S, G) channels to receive or not receive traffic from specific sources.

MLD version 2 is required for SSM to operate. MLD allows the host to provide source information. Before SSM can run with MLD, SSM must be supported in the Cisco IOS IPv6 switch, the host where the application is running, and the application itself.

## Routable Address Hello Option

When an IPv6 interior gateway protocol is used to build the unicast routing table, the procedure to detect the upstream switch address assumes the address of a PIM neighbor is always same as the address of the next-hop switch, as long as they refer to the same switch. However, it may not be the case when a switch has multiple addresses on a link.

Two typical situations can lead to this situation for IPv6. The first situation can occur when the unicast routing table is not built by an IPv6 interior gateway protocol such as multicast BGP. The second situation occurs when the address of an RP shares a subnet prefix with downstream switches (note that the RP switch address has to be domain-wide and therefore cannot be a link-local address).

The routable address hello option allows the PIM protocol to avoid such situations by adding a PIM hello message option that includes all the addresses on the interface on which the PIM hello message is advertised. When a PIM switch finds an upstream switch for some address, the result of RPF calculation is compared with the addresses in this option, in addition to the PIM neighbor's address itself. Because this option includes all the possible addresses of a PIM switch on that link, it always includes the RPF calculation result if it refers to the PIM switch supporting this option.

Because of size restrictions on PIM messages and the requirement that a routable address hello option fits within a single PIM hello message, a limit of 16 addresses can be configured on the interface.

## PIM IPv6 Stub Routing

The PIM stub routing feature reduces resource usage by moving routed traffic closer to the end user.

In a network using PIM stub routing, the only allowable route for IPv6 traffic to the user is through a switch that is configured with PIM stub routing. PIM passive interfaces are connected to Layer 2 access domains, such as VLANs, or to interfaces that are connected to other Layer 2 devices. Only directly connected multicast receivers and sources are allowed in the Layer 2 access domains. The PIM passive interfaces do not send or process any received PIM control packets.

When using PIM stub routing, you should configure the distribution and remote routers to use IPv6 multicast routing and configure only the switch as a PIM stub router. The switch does not route transit traffic between distribution routers. You also need to configure a routed uplink port on the switch. The switch uplink port cannot be used with SVIs.

You must also configure EIGRP stub routing when configuring PIM stub routing on the switch. For more information, see the [EIGRPv6 Stub Routing, on page 157](#) section.

The redundant PIM stub router topology is not supported. The redundant topology exists when there is more than one PIM router forwarding multicast traffic to a single access domain. PIM messages are blocked, and the PIM assert and designated router election mechanisms are not supported on the PIM passive interfaces. Only the non-redundant access router topology is supported by the PIM stub feature. By using a non-redundant topology, the PIM passive interface assumes that it is the only interface and designated router on that access domain.

In the figure shown below, Switch A routed uplink port 25 is connected to the router and PIM stub routing is enabled on the VLAN 100 interfaces and on Host 3. This configuration allows the directly connected hosts to receive traffic from multicast source. See the [Configuring PIM IPv6 Stub Routing, on page 202](#) section for more information.

Figure 7: PIM Stub Router Configuration

## Static Mroutes

IPv6 static mroutes behave much in the same way as IPv4 static mroutes used to influence the RPF check. IPv6 static mroutes share the same database as IPv6 static routes and are implemented by extending static route support for RPF checks. Static mroutes support equal-cost multipath mroutes, and they also support unicast-only static routes.

## MRIB

The Multicast Routing Information Base (MRIB) is a protocol-independent repository of multicast routing entries instantiated by multicast routing protocols (routing clients). Its main function is to provide independence between routing protocols and the Multicast Forwarding Information Base (MFIB). It also acts as a coordination and communication point among its clients.

Routing clients use the services provided by the MRIB to instantiate routing entries and retrieve changes made to routing entries by other clients. Besides routing clients, MRIB also has forwarding clients (MFIB instances) and special clients such as MLD. MFIB retrieves its forwarding entries from MRIB and notifies the MRIB of any events related to packet reception. These notifications can either be explicitly requested by routing clients or spontaneously generated by the MFIB.

Another important function of the MRIB is to allow for the coordination of multiple routing clients in establishing multicast connectivity within the same multicast session. MRIB also allows for the coordination between MLD and routing protocols.

## MFIB

The MFIB is a platform-independent and routing-protocol-independent library for IPv6 software. Its main purpose is to provide a Cisco IOS platform with an interface with which to read the IPv6 multicast forwarding table and notifications when the forwarding table changes. The information provided by the MFIB has clearly defined forwarding semantics and is designed to make it easy for the platform to translate to its specific hardware or software forwarding mechanisms.

When routing or topology changes occur in the network, the IPv6 routing table is updated, and those changes are reflected in the MFIB. The MFIB maintains next-hop address information based on the information in the IPv6 routing table. Because there is a one-to-one correlation between MFIB entries and routing table entries, the MFIB contains all known routes and eliminates the need for route cache maintenance that is associated with switching paths such as fast switching and optimum switching.

## MFIB

**Note** Distributed MFIB has its significance only in a stacked environment where the Master distributes the MFIB information to the other stack members. In the following section the line cards are nothing but the member switches in the stack.

MFIB (MFIB) is used to switch multicast IPv6 packets on distributed platforms. MFIB may also contain platform-specific information on replication across line cards. The basic MFIB routines that implement the core of the forwarding logic are common to all forwarding environments.

MFIB implements the following functions:

- Relays data-driven protocol events generated in the line cards to PIM.
- Provides an MFIB platform application program interface (API) to propagate MFIB changes to platform-specific code responsible for programming the hardware acceleration engine. This API also includes entry points to switch a packet in software (necessary if the packet is triggering a data-driven event) and to upload traffic statistics to the software.

The combination of MFIB and MRIB subsystems also allows the switch to have a "customized" copy of the MFIB database in each line card and to transport MFIB-related platform-specific information from the RP to the line cards.

## IPv6 Multicast Process Switching and Fast Switching

A unified MFIB is used to provide both fast switching and process switching support for PIM-SM and PIM-SSM in IPv6 multicast. In process switching, the IOS daemon must examine, rewrite, and forward each packet. The packet is first received and copied into the system memory. The switch then looks up the Layer 3 network address in the routing table. The Layer 2 frame is then rewritten with the next-hop destination address and sent to the outgoing interface. The IOSd also computes the cyclic redundancy check (CRC). This switching method is the least scalable method for switching IPv6 packets.

IPv6 multicast fast switching allows switches to provide better packet forwarding performance than process switching. Information conventionally stored in a route cache is stored in several data structures for IPv6 multicast switching. The data structures provide optimized lookup for efficient packet forwarding.

In IPv6 multicast forwarding, the first packet is fast-switched if the PIM protocol logic allows it. In IPv6 multicast fast switching, the MAC encapsulation header is precomputed. IPv6 multicast fast switching uses the MFIB to make IPv6 destination prefix-based switching decisions. In addition to the MFIB, IPv6 multicast fast switching uses adjacency tables to prepend Layer 2 addressing information. The adjacency table maintains Layer 2 next-hop addresses for all MFIB entries.

The adjacency table is populated as adjacencies are discovered. Each time an adjacency entry is created (such as through ARP), a link-layer header for that adjacent node is precomputed and stored in the adjacency table. Once a route is determined, it points to a next hop and corresponding adjacency entry. It is subsequently used for encapsulation during switching of packets.

A route might have several paths to a destination prefix, such as when a switch is configured for simultaneous load balancing and redundancy. For each resolved path, a pointer is added for the adjacency corresponding to the next-hop interface for that path. This mechanism is used for load balancing across several paths.

## Multiprotocol BGP for the IPv6 Multicast Address Family

The multiprotocol BGP for the IPv6 multicast address family feature provides multicast BGP extensions for IPv6 and supports the same features and functionality as IPv4 BGP. IPv6 enhancements to multicast BGP include support for an IPv6 multicast address family and network layer reachability information (NLRI) and next hop (the next switch in the path to the destination) attributes that use IPv6 addresses.

Multicast BGP is an enhanced BGP that allows the deployment of interdomain IPv6 multicast. Multiprotocol BGP carries routing information for multiple network layer protocol address families; for example, IPv6 address family and for IPv6 multicast routes. The IPv6 multicast address family contains routes used for RPF lookup by the IPv6 PIM protocol, and multicast BGP IPv6 provides for interdomain transport of the same. Users must use multiprotocol BGP for IPv6 multicast when using IPv6 multicast with BGP because the unicast BGP learned routes will not be used for IPv6 multicast.

Multicast BGP functionality is provided through a separate address family context. A subsequent address family identifier (SAFI) provides information about the type of the network layer reachability information that is carried in the attribute. Multiprotocol BGP unicast uses SAFI 1 messages, and multiprotocol BGP multicast uses SAFI 2 messages. SAFI 1 messages indicate that the routes are only usable for IP unicast, but not IP multicast. Because of this functionality, BGP routes in the IPv6 unicast RIB must be ignored in the IPv6 multicast RPF lookup.

A separate BGP routing table is maintained to configure incongruent policies and topologies (for example, IPv6 unicast and multicast) by using IPv6 multicast RPF lookup. Multicast RPF lookup is very similar to the IP unicast route lookup.

No MRIB is associated with the IPv6 multicast BGP table. However, IPv6 multicast BGP operates on the unicast IPv6 RIB when needed. Multicast BGP does not insert or update routes into the IPv6 unicast RIB.

## Implementing IPv6 Multicast

### Enabling IPv6 Multicast Routing

Beginning in privileged EXEC mode, follow these steps:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<code>configure terminal</code>	Enter global configuration mode.
<b>Step 2</b>	<code>ipv6 multicast-routing</code> <b>Example:</b> <code>Switch (config)# ipv6 multicast-routing</code>	Enables multicast routing on all IPv6-enabled interfaces and enables multicast forwarding for PIM and MLD on all enabled interfaces of the switch.
<b>Step 3</b>	<code>copy running-config startup-config</code>	(Optional) Save your entries in the configuration file.

# Customizing and Verifying the MLD Protocol

## Customizing and Verifying MLD on an Interface

Beginning in privileged EXEC mode, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>type number</i> <b>Example:</b>  Switch(config)# <b>interface</b> <b>GigabitEthernet 1/0/1</b>	Specifies an interface type and number, and places the switch in interface configuration mode.
<b>Step 3</b>	<b>ipv6 mld join-group</b> [ <i>group-address</i> ] [ <b>include</b>   <b>exclude</b> ] { <i>source-address</i>   <b>source-list</b> [ <i>acl</i> ]} <b>Example:</b>  Switch (config-if) # <b>ipv6 mld join-group</b> <b>FF04::10</b>	Configures MLD reporting for a specified group and source.
<b>Step 4</b>	<b>ipv6 mld access-group</b> <i>access-list-name</i> <b>Example:</b>  Switch (config-if) # <b>ipv6 access-list</b> <b>acc-grp-1</b>	Allows the user to perform IPv6 multicast receiver access control.
<b>Step 5</b>	<b>ipv6 mld static-group</b> [ <i>group-address</i> ] [ <b>include</b>   <b>exclude</b> ] { <i>source-address</i>   <i>source-list</i> [ <i>acl</i> ]} <b>Example:</b>  Switch (config-if) # <b>ipv6 mld</b> <b>static-group ff04::10 include 100::1</b>	Statically forwards traffic for the multicast group onto a specified interface and cause the interface to behave as if a MLD joiner were present on the interface.
<b>Step 6</b>	<b>ipv6 mld query-max-response-time</b> <i>seconds</i> <b>Example:</b>  Switch (config-if) # <b>ipv6 mld</b> <b>query-max-response-time 20</b>	Configures the maximum response time advertised in MLD queries.
<b>Step 7</b>	<b>ipv6 mld query-timeout</b> <i>seconds</i> <b>Example:</b>  Switch (config-if) # <b>ipv6 mld</b> <b>query-timeout 130</b>	Configures the timeout value before the switch takes over as the querier for the interface.

	Command or Action	Purpose
<b>Step 8</b>	<b>exit</b> <b>Example:</b> <pre>Switch (config-if) # exit</pre>	Enter this command twice to exit interface configuration mode and enter privileged EXEC mode.
<b>Step 9</b>	<b>show ipv6 mld groups [link-local] [group-name   group-address] [interface-type interface-number] [detail   explicit]</b> <b>Example:</b> <pre>Switch # show ipv6 mld groups GigabitEthernet 1/0/1</pre>	Displays the multicast groups that are directly connected to the switch and that were learned through MLD.
<b>Step 10</b>	<b>show ipv6 mld groups summary</b> <b>Example:</b> <pre>Switch # show ipv6 mld groups summary</pre>	Displays the number of (*, G) and (S, G) membership reports present in the MLD cache.
<b>Step 11</b>	<b>show ipv6 mld interface [type number]</b> <b>Example:</b> <pre>Switch # show ipv6 mld interface GigabitEthernet 1/0/1</pre>	Displays multicast-related information about an interface.
<b>Step 12</b>	<b>debug ipv6 mld [group-name   group-address   interface-type]</b> <b>Example:</b> <pre>Switch # debug ipv6 mld</pre>	Enables debugging on MLD protocol activity.
<b>Step 13</b>	<b>debug ipv6 mld explicit [group-name   group-address]</b> <b>Example:</b> <pre>Switch # debug ipv6 mld explicit</pre>	Displays information related to the explicit tracking of hosts.
<b>Step 14</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Implementing MLD Group Limits

Per-interface and global MLD limits operate independently of each other. Both per-interface and global MLD limits can be configured on the same switch. The number of MLD limits, globally or per interface, is not configured by default; the limits must be configured by the user. A membership report that exceeds either the per-interface or the global state limit is ignored.

## Implementing MLD Group Limits Globally

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# <b>enable</b>	Enters global configuration mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>ipv6 mld [vrf vrf-name] state-limit number</b> <b>Example:</b> Switch(config)# <b>ipv6 mld state-limit 300</b>	Limits the number of MLD states globally.
<b>Step 4</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Implementing MLD Group Limits per Interface

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# <b>enable</b>	Enters global configuration mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface type number</b> <b>Example:</b> Switch(config)# <b>interface GigabitEthernet 1/0/1</b>	Specifies an interface type and number, and places the switch in interface configuration mode.

	Command or Action	Purpose
<b>Step 4</b>	<b>ipv6 mld limit</b> <i>number</i> [ <b>except</b> ] <i>access-list</i> <b>Example:</b> Switch(config-if) # <b>ipv6 mld limit 100</b>	Limits the number of MLD states on a per-interface basis.
<b>Step 5</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Configuring Explicit Tracking of Receivers to Track Host Behavior

The explicit tracking feature allows a switch to track the behavior of the hosts within its IPv6 network and enables the fast leave mechanism to be used with MLD version 2 host reports.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>type number</i> <b>Example:</b> Switch(config) # <b>interface GigabitEthernet 1/0/1</b>	Specifies an interface type and number, and places the switch in interface configuration mode.
<b>Step 3</b>	<b>ipv6 mld explicit-tracking</b> <i>access-list-name</i> <b>Example:</b> Switch(config-if) # <b>ipv6 mld explicit-tracking list1</b>	Enables explicit tracking of hosts.
<b>Step 4</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Resetting the MLD Traffic Counters

Beginning in privileged EXEC mode, follow these steps.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>clear ipv6 mld traffic</b> <b>Example:</b> Switch # <b>clear ipv6 mld traffic</b>	Resets all MLD traffic counters.

	Command or Action	Purpose
<b>Step 2</b>	<b>show ipv6 mld traffic</b> <b>Example:</b>  Switch # <code>show ipv6 mld traffic</code>	Displays the MLD traffic counters.
<b>Step 3</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Clearing the MLD Interface Counters

Beginning in privileged EXEC mode, follow these steps.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>clear ipv6 mld counters</b> <i>interface-type</i> <b>Example:</b>  Switch # <code>clear ipv6 mld counters Ethernet1/0</code>	Clears the MLD interface counters.
<b>Step 2</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Configuring PIM

This section explains how to configure PIM.

### Configuring PIM-SM and Displaying PIM-SM Information for a Group Range

Beginning in privileged EXEC mode, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>ipv6 pim rp-address</b> <i>ipv6-address[group-access-list]</i> <b>Example:</b>  Switch (config) # <code>ipv6 pim rp-address 2001:DB8::01:800:200E:8C6C acc-grp-1</code>	Configures the address of a PIM RP for a particular group range.
<b>Step 3</b>	<b>exit</b> <b>Example:</b>	Exits global configuration mode, and returns the switch to privileged EXEC mode.

	Command or Action	Purpose
	Switch (config) # <b>exit</b>	
<b>Step 4</b>	<b>show ipv6 pim interface</b> [state-on] [state-off] [type-number] <b>Example:</b> Switch # <b>show ipv6 pim interface</b>	Displays information about interfaces configured for PIM.
<b>Step 5</b>	<b>show ipv6 pim group-map</b> [group-name   group-address]   [group-range   group-mask] [info-source {bsr   default   embedded-rp   static}] <b>Example:</b> Switch # <b>show ipv6 pim group-map</b>	Displays an IPv6 multicast group mapping table.
<b>Step 6</b>	<b>show ipv6 pim neighbor</b> [detail] [interface-type interface-number   count] <b>Example:</b> Switch # <b>show ipv6 pim neighbor</b>	Displays the PIM neighbors discovered by the Cisco IOS software.
<b>Step 7</b>	<b>show ipv6 pim range-list</b> [config] [rp-address   rp-name] <b>Example:</b> Switch # <b>show ipv6 pim range-list</b>	Displays information about IPv6 multicast range lists.
<b>Step 8</b>	<b>show ipv6 pim tunnel</b> [interface-type interface-number] <b>Example:</b> Switch # <b>show ipv6 pim tunnel</b>	Displays information about the PIM register encapsulation and de-encapsulation tunnels on an interface.
<b>Step 9</b>	<b>debug ipv6 pim</b> [group-name   group-address   interface interface-type   bsr   group   mvpn   neighbor] <b>Example:</b> Switch # <b>debug ipv6 pim</b>	Enables debugging on PIM protocol activity.
<b>Step 10</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Configuring PIM Options

Beginning in privileged EXEC mode, follow these steps:

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>ipv6 pim spt-threshold infinity [group-list access-list-name]</b>  <b>Example:</b>  Switch (config) # <b>ipv6 pim spt-threshold infinity group-list acc-grp-1</b>	Configures when a PIM leaf switch joins the SPT for the specified groups.
<b>Step 3</b>	<b>ipv6 pim accept-register {list access-list   route-map map-name}</b>  <b>Example:</b>  Switch (config) # <b>ipv6 pim accept-register route-map reg-filter</b>	Accepts or rejects registers at the RP.
<b>Step 4</b>	<b>interface type number</b>  <b>Example:</b>  Switch (config) # <b>interface GigabitEthernet 1/0/1</b>	Specifies an interface type and number, and places the switch in interface configuration mode.
<b>Step 5</b>	<b>ipv6 pim dr-priority value</b>  <b>Example:</b>  Switch (config-if) # <b>ipv6 pim dr-priority 3</b>	Configures the DR priority on a PIM switch.
<b>Step 6</b>	<b>ipv6 pim hello-interval seconds</b>  <b>Example:</b>  Switch (config-if) # <b>ipv6 pim hello-interval 45</b>	Configures the frequency of PIM hello messages on an interface.
<b>Step 7</b>	<b>ipv6 pim join-prune-interval seconds</b>  <b>Example:</b>  Switch (config-if) # <b>ipv6 pim join-prune-interval 75</b>	Configures periodic join and prune announcement intervals for a specified interface.
<b>Step 8</b>	<b>exit</b>  <b>Example:</b>  Switch (config-if) # <b>exit</b>	Enter this command twice to exit interface configuration mode and enter privileged EXEC mode.

	Command or Action	Purpose
<b>Step 9</b>	<b>ipv6 pim join-prune statistic</b> [ <i>interface-type</i> ] <b>Example:</b> <pre>Switch (config-if) # show ipv6 pim join-prune statistic</pre>	Displays the average join-prune aggregation for the most recently aggregated packets for each interface.
<b>Step 10</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Resetting the PIM Traffic Counters

If PIM malfunctions or in order to verify that the expected number of PIM packets are received and sent, the user can clear PIM traffic counters. Once the traffic counters are cleared, the user can enter the `show ipv6 pim traffic` command to verify that PIM is functioning correctly and that PIM packets are being received and sent correctly.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>clear ipv6 pim traffic</b> <b>Example:</b> <pre>Switch # clear ipv6 pim traffic</pre>	Resets the PIM traffic counters.
<b>Step 2</b>	<b>show ipv6 pim traffic</b> <b>Example:</b> <pre>Switch # show ipv6 pim traffic</pre>	Displays the PIM traffic counters.
<b>Step 3</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Clearing the PIM Topology Table to Reset the MRIB Connection

No configuration is necessary to use the MRIB. However, users may in certain situations want to clear the PIM topology table in order to reset the MRIB connection and verify MRIB information.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>clear ipv6 pim topology</b> [ <i>group-name</i>   <i>group-address</i> ] <b>Example:</b>	Clears the PIM topology table.

	Command or Action	Purpose
	Switch # <code>clear ipv6 pim topology FF04::10</code>	
<b>Step 2</b>	<b>show ipv6 mrib client</b> [filter] [name {client-name   client-name : client-id}]  <b>Example:</b>  Switch # <code>show ipv6 mrib client</code>	Displays multicast-related information about an interface.
<b>Step 3</b>	<b>show ipv6 mrib route</b> {link-local   summary   [sourceaddress-or-name   *] [groupname-or-address [prefix-length]]]  <b>Example:</b>  Switch # <code>show ipv6 mrib route</code>	Displays the MRIB route information.
<b>Step 4</b>	<b>show ipv6 pim topology</b> [groupname-or-address [sourceaddress-or-name]   link-local   route-count [detail]]  <b>Example:</b>  Switch # <code>show ipv6 pim topology</code>	Displays PIM topology table information for a specific group or all groups.
<b>Step 5</b>	<b>debug ipv6 mrib client</b>  <b>Example:</b>  Switch # <code>debug ipv6 mrib client</code>	Enables debugging on MRIB client management activity.
<b>Step 6</b>	<b>debug ipv6 mrib io</b>  <b>Example:</b>  Switch # <code>debug ipv6 mrib io</code>	Enables debugging on MRIB I/O events.
<b>Step 7</b>	<b>debug ipv6 mrib proxy</b>  <b>Example:</b>  Switch # <code>debug ipv6 mrib proxy</code>	Enables debugging on MRIB proxy activity between the switch processor and line cards on distributed switch platforms.
<b>Step 8</b>	<b>debug ipv6 mrib route</b> [group-name   group-address]  <b>Example:</b>  Switch # <code>debug ipv6 mrib route</code>	Displays information about MRIB routing entry-related activity.
<b>Step 9</b>	<b>debug ipv6 mrib table</b>  <b>Example:</b>	Enables debugging on MRIB table management activity.

	Command or Action	Purpose
	Switch # <code>debug ipv6 mrib table</code>	
<b>Step 10</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Configuring PIM IPv6 Stub Routing

The PIM Stub routing feature supports multicast routing between the distribution layer and the access layer. It supports two types of PIM interfaces, uplink PIM interfaces, and PIM passive interfaces. A routed interface configured with the PIM passive mode does not pass or forward PIM control traffic, it only passes and forwards MLD traffic.

### PIM IPv6 Stub Routing Configuration Guidelines

- Before configuring PIM stub routing, you must have IPv6 multicast routing configured on both the stub router and the central router. You must also have PIM mode (sparse-mode) configured on the uplink interface of the stub router.
- The PIM stub router does not route the transit traffic between the distribution routers. Unicast (EIGRP) stub routing enforces this behavior. You must configure unicast stub routing to assist the PIM stub router behavior. For more information, see the [EIGRPv6 Stub Routing, on page 157](#) section.
- Only directly connected multicast (MLD) receivers and sources are allowed in the Layer 2 access domains. The PIM protocol is not supported in access domains.
- The redundant PIM stub router topology is not supported.

### Default IPv6 PIM Routing Configuration

This table displays the default IPv6 PIM routing configuration for the Switch.

*Table 23: Default Multicast Routing Configuration*

Feature	Default Setting
Multicast routing	Disabled on all interfaces.
PIM version	Version 2.
PIM mode	No mode is defined.
PIM stub routing	None configured.
PIM RP address	None configured.
PIM domain border	Disabled.
PIM multicast boundary	None.
Candidate BSRs	Disabled.
Candidate RPs	Disabled.

Feature	Default Setting
Shortest-path tree threshold rate	0 kb/s.
PIM router query message interval	30 seconds.

## Enabling IPv6 PIM Stub Routing

### Before you begin

PIM stub routing is disabled in IPv6 by default. Beginning in privileged EXEC mode, follow these steps to enable PIM stub routing on an interface.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>ipv6 multicast pim-passive-enable</b> <b>Example:</b> <pre>Switch(config-if)# ipv6 multicast pim-passive-enable</pre>	Enables IPv6 Multicast PIM routing on the switch.
<b>Step 4</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config)# interface gigabitethernet 9/0/6</pre>	<p>Specifies the interface on which you want to enable PIM stub routing, and enters interface configuration mode.</p> <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse mode on the interface, and join the interface as a statically connected member to an MLD static group.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>An SVI—A VLAN interface created by using the <b>interface vlan</b> <i>vlan-id</i> global configuration command. You will also need to enable IP PIM sparse mode on the VLAN, join the VLAN as a statically connected member to an MLD static group, and then enable MLD snooping on the VLAN, the MLD static group, and physical interface.</li> </ul> <p>These interfaces must have IPv6 addresses assigned to them.</p>
<b>Step 5</b>	<b>ipv6 pim</b> <b>Example:</b> <pre>Switch(config-if)# ipv6 pim</pre>	Enables the PIM on the interface.
<b>Step 6</b>	<b>ipv6 pim {bsr}   {dr-priority   value}   {hello-interval   seconds}   {join-prune-interval   seconds}   {passive}</b> <b>Example:</b> <pre>Switch(config-if)# ipv6 pim bsr dr-priority hello-interval join-prune-interval passive</pre>	<p>Configures the various PIM stub features on the interface.</p> <p>Enter <b>bsr</b> to configure BSR on a PIM switch</p> <p>Enter <b>dr-priority</b> to configure the DR priority on a PIM switch.</p> <p>Enter <b>hello-interval</b> to configure the frequency of PIM hello messages on an interface.</p> <p>Enter <b>join-prune-interval</b> to configure periodic join and prune announcement intervals for a specified interface.</p> <p>Enter <b>passive</b> to configure the PIM in the passive mode.</p>
<b>Step 7</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.

## Monitoring IPv6 PIM Stub Routing

Table 24: PIM Stub Configuration show Commands

Command	Purpose
<b>show ipv6 pim interface</b> <pre>Switch# show ipv6 pim interface</pre>	Displays the PIM stub that is enabled on each interface.

Command	Purpose
<b>show ipv6 mld groups</b>  Switch# <code>show ipv6 mld groups</code>	Displays the interested clients that have joined the specific multicast source group.
<b>show ipv6 mroute</b>  Switch# <code>show ipv6 mroute</code>	Verifies that the multicast stream forwards from the source to the interested clients.

## Configuring a BSR

The tasks included here are described below.

### Configuring a BSR and Verifying BSR Information

Beginning in privileged EXEC mode, follow these steps:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<code>configure terminal</code>	Enter global configuration mode.
<b>Step 2</b>	<b>ipv6 pim bsr candidate bsr</b> <code>ipv6-address[hash-mask-length] [priority priority-value]</code>  <b>Example:</b>  Switch (config) # <code>ipv6 pim bsr candidate bsr 2001:DB8:3000:3000::42 124 priority 10</code>	Configures a switch to be a candidate BSR.
<b>Step 3</b>	<b>interface type number</b>  <b>Example:</b>  Switch (config) # <code>interface GigabitEthernet 1/0/1</code>	Specifies an interface type and number, and places the switch in interface configuration mode.
<b>Step 4</b>	<b>ipv6 pim bsr border</b>  <b>Example:</b>  Switch (config-if) # <code>ipv6 pim bsr border</code>	Specifies an interface type and number, and places the switch in interface configuration mode.
<b>Step 5</b>	<b>exit</b>  <b>Example:</b>  Switch (config-if) # <code>exit</code>	Enter this command twice to exit interface configuration mode and enter privileged EXEC mode.

	Command or Action	Purpose
<b>Step 6</b>	<b>show ipv6 pim bsr {election   rp-cache   candidate-rp}</b>  <b>Example:</b>  <pre>Switch (config-if) # show ipv6 pim bsr election</pre>	Displays information related to PIM BSR protocol processing.
<b>Step 7</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Sending PIM RP Advertisements to the BSR

Beginning in privileged EXEC mode, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>ipv6 pim bsr candidate rp <i>ipv6-address</i> [group-list <i>access-list-name</i>] [priority <i>priority-value</i>] [interval seconds]</b>  <b>Example:</b>  <pre>Switch(config) # ipv6 pim bsr candidate rp 2001:DB8:3000:3000::42 priority 0</pre>	Sends PIM RP advertisements to the BSR.
<b>Step 3</b>	<b>interface <i>type number</i></b>  <b>Example:</b>  <pre>Switch(config) # interface GigabitEthernet 1/0/1</pre>	Specifies an interface type and number, and places the switch in interface configuration mode.
<b>Step 4</b>	<b>ipv6 pim bsr border</b>  <b>Example:</b>  <pre>Switch(config-if) # ipv6 pim bsr border</pre>	Configures a border for all BSMs of any scope on a specified interface.
<b>Step 5</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Configuring BSR for Use Within Scoped Zones

Beginning in privileged EXEC mode, follow these steps:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>ipv6 pim bsr candidate rp <i>ipv6-address</i> [<i>hash-mask-length</i>] [priority <i>priority-value</i>]</b>  <b>Example:</b>  Switch(config) # <b>ipv6 pim bsr candidate bsr 2001:DB8:1:1:4</b>	Configures a switch to be a candidate BSR.
<b>Step 3</b>	<b>ipv6 pim bsr candidate rp <i>ipv6-address</i> [<i>group-list access-list-name</i>] [priority <i>priority-value</i>] [<i>interval seconds</i>]</b>  <b>Example:</b>  Switch(config) # <b>ipv6 pim bsr candidate rp 2001:DB8:1:1:1 group-list list scope 6</b>	Configures the candidate RP to send PIM RP advertisements to the BSR.
<b>Step 4</b>	<b>interface <i>type number</i></b>  <b>Example:</b>  Switch(config-if) # <b>interface GigabitEthernet 1/0/1</b>	Specifies an interface type and number, and places the switch in interface configuration mode.
<b>Step 5</b>	<b>ipv6 multicast boundary scope <i>scope-value</i></b>  <b>Example:</b>  Switch(config-if) # <b>ipv6 multicast boundary scope 6</b>	Configures a multicast boundary on the interface for a specified scope.
<b>Step 6</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

**Configuring BSR Switches to Announce Scope-to-RP Mappings**

IPv6 BSR switches can be statically configured to announce scope-to-RP mappings directly instead of learning them from candidate-RP messages. A user might want to configure a BSR switch to announce scope-to-RP mappings so that an RP that does not support BSR is imported into the BSR. Enabling this feature also allows an RP positioned outside the enterprise's BSR domain to be learned by the known remote RP on the local candidate BSR switch.

Beginning in privileged EXEC mode, follow these steps:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>ipv6 pim bsr announced rp</b> <i>ipv6-address</i> <b>[group-list</b> <i>access-list-name</i> <b>]</b> <b>[priority</b> <i>priority-value</i>  <b>Example:</b>  <pre>Switch(config)# ipv6 pim bsr announced rp 2001:DB8:3000:3000::42 priority 0</pre>	Announces scope-to-RP mappings directly from the BSR for the specified candidate RP.
<b>Step 3</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Configuring SSM Mapping

When the SSM mapping feature is enabled, DNS-based SSM mapping is automatically enabled, which means that the switch will look up the source of a multicast MLD version 1 report from a DNS server.

You can use either DNS-based or static SSM mapping, depending on your switch configuration. If you choose to use static SSM mapping, you can configure multiple static SSM mappings. If multiple static SSM mappings are configured, the source addresses of all matching access lists will be used.

**Note** To use DNS-based SSM mapping, the switch needs to find at least one correctly configured DNS server, to which the switch may be directly attached.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>ipv6 mld ssm-map enable</b>  <b>Example:</b>  <pre>Switch(config) # ipv6 mld ssm-map enable</pre>	Enables the SSM mapping feature for groups in the configured SSM range.
<b>Step 3</b>	<b>no ipv6 mld ssm-map query dns</b>  <b>Example:</b>  <pre>Switch(config) # no ipv6 mld ssm-map query dns</pre>	Disables DNS-based SSM mapping.
<b>Step 4</b>	<b>ipv6 mld ssm-map static</b> <i>access-list</i> <i>source-address</i>  <b>Example:</b>	Configures static SSM mappings.

	Command or Action	Purpose
	<pre>Switch(config-if) # ipv6 mld ssm-map static SSM_MAP_ACL_2 2001:DB8:1::1</pre>	
<b>Step 5</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-if) # exit</pre>	Exits global configuration mode, and returns the switch to privileged EXEC mode.
<b>Step 6</b>	<b>show ipv6 mld ssm-map</b> [source-address] <b>Example:</b> <pre>Switch(config-if) # show ipv6 mld ssm-map</pre>	Displays SSM mapping information.
<b>Step 7</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Configuring Static Mroutes

Static multicast routes (mroutes) in IPv6 can be implemented as an extension of IPv6 static routes. You can configure your switch to use a static route for unicast routing only, to use a static multicast route for multicast RPF selection only, or to use a static route for both unicast routing and multicast RPF selection.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>ipv6 route</b> { <i>ipv6-prefix / prefix-length</i>   <i>ipv6-address   interface-type interface-number</i>   <i>ipv6-address</i> } [ <i>administrative-distance</i> ] [ <i>administrative-multicast-distance   unicast   multicast</i> ] [ <i>tag tag</i> ] <b>Example:</b> <pre>Switch (config) # ipv6 route 2001:DB8::/64 6::6 100</pre>	Establishes static IPv6 routes. The example shows a static route used for both unicast routing and multicast RPF selection.
<b>Step 3</b>	<b>exit</b> <b>Example:</b> <pre>Switch # exit</pre>	Exits global configuration mode, and returns the switch to privileged EXEC mode.
<b>Step 4</b>	<b>show ipv6 mroute</b> [link-local   [ <i>group-name</i>   <i>group-address</i> [ <i>source-address</i>   <i>source-name</i> ]]] [ <i>summary</i> ] [ <i>count</i> ]	Displays the contents of the IPv6 multicast routing table.

	Command or Action	Purpose
	<b>Example:</b>  Switch # <code>show ipv6 mroute ff07::1</code>	
<b>Step 5</b>	<b>show ipv6 mroute</b> [ <i>link-local</i>   <i>group-name</i>   <i>group-address</i> ] <b>active</b> [ <i>kbits</i> ]  <b>Example:</b>  Switch (config-if) # <code>show ipv6 mroute active</code>	Displays the active multicast streams on the switch.
<b>Step 6</b>	<b>show ipv6 rpf</b> [ <i>ipv6-prefix</i> ]  <b>Example:</b>  Switch (config-if) # <code>show ipv6 rpf 2001::1:1:2</code>	Checks RPF information for a given unicast host address and prefix.
<b>Step 7</b>	<b>copy running-config startup-config</b>	(Optional) Save your entries in the configuration file.

## Using MFIB in IPv6 Multicast

Multicast forwarding is automatically enabled when IPv6 multicast routing is enabled.

### Verifying MFIB Operation in IPv6 Multicast

Beginning in privileged EXEC mode, follow these steps:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>show ipv6 mfib</b> [ <i>linkscope</i>   <i>verbose</i>   <i>group-address-name</i>   <i>ipv6-prefix / prefix-length</i>   <i>source-address-name</i>   <i>count</i>   <i>interface</i>   <i>status</i>   <i>summary</i> ]  <b>Example:</b>  Switch # <code>show ipv6 mfib</code>	Displays the forwarding entries and interfaces in the IPv6 MFIB.
<b>Step 2</b>	<b>show ipv6 mfib</b> [ <i>all</i>   <i>linkscope</i>   <i>group-name</i>   <i>group-address</i> [ <i>source-name</i>   <i>source-address</i> ]] <b>count</b>  <b>Example:</b>  Switch # <code>show ipv6 mfib ff07::1</code>	Displays the contents of the IPv6 multicast routing table.

	Command or Action	Purpose
<b>Step 3</b>	<b>show ipv6 mfib interface</b> <b>Example:</b> Switch # <code>show ipv6 mfib interface</code>	Displays information about IPv6 multicast-enabled interfaces and their forwarding status.
<b>Step 4</b>	<b>show ipv6 mfib status</b> <b>Example:</b> Switch # <code>show ipv6 mfib status</code>	Displays general MFIB configuration and operational status.
<b>Step 5</b>	<b>show ipv6 mfib summary</b> <b>Example:</b> Switch # <code>show ipv6 mfib summary</code>	Displays summary information about the number of IPv6 MFIB entries and interfaces.
<b>Step 6</b>	<b>debug ipv6 mfib</b> [ <i>group-name</i>   <i>group-address</i> ] [ <i>adjacency</i>   <i>db</i>   <i>fs</i>   <i>init</i>   <i>interface</i>   <i>mrrib</i> [ <i>detail</i> ]   <i>nat</i>   <i>pak</i>   <i>platform</i>   <i>ppr</i>   <i>ps</i>   <i>signal</i>   <i>table</i> ] <b>Example:</b> Switch # <code>debug ipv6 mfib FF04::10 pak</code>	Enables debugging output on the IPv6 MFIB.

## Resetting MFIB Traffic Counters

Beginning in privileged EXEC mode, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>clear ipv6 mfib counters</b> [ <i>group-name</i>   <b>group-address</b> [ <i>source-address</i>   <i>source-name</i> ]] <b>Example:</b> Switch # <code>clear ipv6 mfib counters</code> <code>FF04::10</code>	Resets all active MFIB traffic counters.

## Prerequisites for IPv6 Client Address Learning

Before configuring IPv6 client address learning, configure the wireless clients to support IPv6.

### Related Topics

[Configuring RA Guard Policy \(CLI\)](#), on page 219

## Information About IPv6 Client Address Learning

Client Address Learning is configured on switch to learn the wireless client's IPv4 and IPv6 address and clients transition state maintained by the switch on an association, re-association, de-authentication and timeout.

There are three ways for IPv6 client to acquire IPv6 addresses:

- Stateless Address Auto-Configuration (SLAAC)
- Stateful DHCPv6
- Static Configuration

For all of these methods, the IPv6 client always sends neighbor solicitation DAD (Duplicate Address Detection) request to ensure there is no duplicate IP address on the network. The switch snoops the client's NDP and DHCPv6 packets to learn about its client IP addresses.

## SLAAC Address Assignment

The most common method for IPv6 client address assignment is Stateless Address Auto-Configuration (SLAAC). SLAAC provides simple plug-and-play connectivity where clients self-assign an address based on the IPv6 prefix. This process is achieved

Stateless Address Auto-Configuration (SLAAC) is configured as follows:

- Host sends a router solicitation message.
- Hosts wait for a Router Advertisement message.
- Hosts take the first 64 bits of the IPv6 prefix from the Router Advertisement message and combine it with the 64 bit EUI-64 address (in the case of ethernet, this is created from the MAC Address) to create a global unicast message. The host also uses the source IP address, in the IP header, of the Router Advertisement message, as its default gateway.
- Duplicate Address Detection is performed by IPv6 clients in order to ensure that random addresses that are picked do not collide with other clients.
- The choice of algorithm is up to the client and is often configurable.

The last 64 bits of the IP v6 address can be learned based on the following 2 algorithms:

- EUI-64 which is based on the MAC address of the interface, or
- Private addresses that are randomly generated.

**Figure 8: SLAAC Address Assignment**

The following Cisco IOS configuration commands from a Cisco-capable IPv6 router are used to enable SLAAC addressing and router advertisements:

```
ipv6 unicast-routing
interface Vlan20
```

```

description IPv6-SLAAC
ip address 192.168.20.1 255.255.255.0
ipv6 address FE80:DB8:0:20::1 linklocal
ipv6 address 2001:DB8:0:20::1/64
ipv6 enable
end

```

## Stateful DHCPv6 Address Assignment

**Figure 9: Stateful DHCPv6 Address Assignment**

The use of DHCPv6 is not required for IPv6 client connectivity if SLAAC is already deployed. There are two modes of operation for DHCPv6 called Stateless and Stateful.

The DHCPv6 Stateless mode is used to provide clients with additional network information that is not available in the router advertisement, but not an IPv6 address as this is already provided by SLAAC. This information can include the DNS domain name, DNS server(s), and other DHCP vendor-specific options. This interface configuration is for a Cisco IOS IPv6 router implementing stateless DHCPv6 with SLAAC enabled:

```

ipv6 unicast-routing
ipv6 dhcp pool IPV6_DHCPPPOOL
address prefix 2001:db8:5:10::/64
domain-name cisco.com
dns-server 2001:db8:6:6::1
interface Vlan20
description IPv6-DHCP-Stateless
ip address 192.168.20.1 255.255.255.0
ipv6 nd other-config-flag
ipv6 dhcp server IPV6_DHCPPPOOL
ipv6 address 2001:DB8:0:20::1/64
end

```

The DHCPv6 Stateful option, also known as managed mode, operates similarly to DHCPv4 in that it assigns unique addresses to each client instead of the client generating the last 64 bits of the address as in SLAAC. This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on a local Switch:

```

ipv6 unicast-routing
ipv6 dhcp pool IPV6_DHCPPPOOL
address prefix 2001:db8:5:10::/64
domain-name cisco.com
dns-server 2001:db8:6:6::1
interface Vlan20

```

```

description IPv6-DHCP-Stateful
ip address 192.168.20.1 255.255.255.0
ipv6 address 2001:DB8:0:20::1/64
ipv6 nd prefix 2001:DB8:0:20::/64 no-advertise
ipv6 nd managed-config-flag
ipv6 nd other-config-flag
ipv6 dhcp server IPV6_DHCPOOL
end

```

This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on an external DHCP server:

```

ipv6 unicast-routing
domain-name cisco.com
dns-server 2001:db8:6:6::1
interface Vlan20
description IPv6-DHCP-Stateful
ip address 192.168.20.1 255.255.255.0
ipv6 address 2001:DB8:0:20::1/64
ipv6 nd prefix 2001:DB8:0:20::/64 no-advertise
ipv6 nd managed-config-flag
ipv6 nd other-config-flag
ipv6 dhcp_relay destination 2001:DB8:0:20::2
end

```

## Static IP Address Assignment

Statically configured address on a client.

## Router Solicitation

A Router Solicitation message is issued by a host controller to facilitate local routers to transmit Router Advertisement from which it can obtain information about local routing or perform Stateless Auto-configuration. Router Advertisements are transmitted periodically and the host prompts with an immediate Router Advertisement using a Router Solicitation such as - when it boots or following a restart operation.

#### Related Topics

- [Configuring IPv6 ND Suppress Policy \(CLI\), on page 223](#)

## Router Advertisement

A Router Advertisement message is issued periodically by a router or in response to a Router Solicitation message from a host. The information contained in these messages is used by hosts to perform Stateless Auto-configuration and to modify its routing table.

#### Related Topics

- [Configuring IPv6 ND Suppress Policy \(CLI\), on page 223](#)

## Neighbor Discovery

IPv6 Neighbor Discovery is a set of messages and processes that determine relationships between neighboring nodes. Neighbor Discovery replaces ARP, ICMP Router Discovery, and ICMP Redirect used in IPv4.

IPv6 Neighbor Discovery inspection analyzes neighbor discovery messages in order to build a trusted binding table database, and IPv6 neighbor discovery packets that do not comply are dropped. The neighbor binding table in the switch tracks each IPv6 address and its associated MAC address. Clients are expired from the table according to Neighbor Binding timers.

### Related Topics

[Configuring IPv6 ND Suppress Policy \(CLI\)](#), on page 223

## Neighbor Discovery Suppression

The IPv6 addresses of wireless clients are cached by the switch. When the switch receives an NS multicast looking for an IPv6 address, and if the target address is known to the switch and belongs to one of its clients, the switch will reply with an NA message on behalf of the client. The result of this process generates the equivalent of the Address Resolution Protocol (ARP) table of IPv4 but is more efficient - uses generally fewer messages.

---

**Note** The switch acts like proxy and respond with NA, only when the **ipv6 nd suppress** command is configured

---

If the switch does not have the IPv6 address of a wireless client, the switch will not respond with NA and forward the NS packet to the wireless side. To resolve this, an NS Multicast Forwarding knob is provided. If this knob is enabled, the switch gets the NS packet for the IPv6 address that it does not have (cache miss) and forwards it to the wireless side. This packet reaches the intended wireless client and the client replies with NA.

This cache miss scenario occurs rarely, and only very few clients which do not implement complete IPv6 stack may not advertise their IPv6 address during NDP.

### Related Topics

[Configuring IPv6 ND Suppress Policy \(CLI\)](#), on page 223

## RA Guard

IPv6 clients configure IPv6 addresses and populate their router tables based on IPv6 router advertisement (RA) packets. The RA guard feature is similar to the RA guard feature of wired networks. RA guard increases the security of the IPv6 network by dropping the unwanted or rogue RA packets that come from wireless clients. If this feature is not configured, malicious IPv6 wireless clients announce themselves as the router for the network often with high priority, which would take higher precedence over legitimate IPv6 routers.

RA-Guard also examines the incoming RA's and decides whether to switch or block them based solely on information found in the message or in the switch configuration. The information available in the frames received is useful for RA validation:

- Port on which the frame is received
- IPv6 source address

- Prefix list

The following configuration information created on the switch is available to RA-Guard to validate against the information found in the received RA frame:

- Trusted/Untrusted ports for receiving RA-guard messages
- Trusted/Untrusted IPv6 source addresses of RA-sender
- Trusted/Untrusted Prefix list and Prefix ranges
- Router Preference

RA guard occurs at the switch. You can configure the switch to drop RA messages at the switch. All IPv6 RA messages are dropped, which protects other wireless clients and upstream wired network from malicious IPv6 clients.

```
//Create a policy for RA Guard//
ipv6 nd raguard policy raguard-router
trusted-port
device-role router

//Applying the RA Guard Policy on port/interface//
interface tengigabitethernet1/0/1 (Katana)
interface gigabitethernet1/0/1 (Edison)

ipv6 nd raguard attach-policy raguard-router
```

## RA Throttling

RA throttling allows the controller to enforce limits to RA packets headed toward the wireless network. By enabling RA throttling, routers that send many RA packets can be trimmed to a minimum frequency that will still maintain an IPv6 client connectivity. If a client sends an RS packet, an RA is sent back to the client. This RA is allowed through the controller and unicast to the client. This process ensures that the new clients or roaming clients are not affected by the RA throttling.

## Configuring IPv6 Unicast (CLI)

IPv6 unicasting must always be enabled on the switch and the controller. IPv6 unicast routing is disabled.

**Before you begin**

To enable the forwarding of IPv6 unicast datagrams, use the **ipv6 unicast-routing** command in global configuration mode. To disable the forwarding of IPv6 unicast datagrams, use the **no** form of this command.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>ipv6 unicast routing</b> <b>Example:</b>  Switch (config)# <code>ipv6 unicast routing</code>	enable the forwarding of IPv6 unicast datagrams

## Configuring RA Guard Policy (CLI)

Configure RA Guard policy on the switch to add IPv6 client addresses and populate the router table based on IPv6 router advertisement packets.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>ipv6 nd rguard policy rguard-router</b> <b>Example:</b>  Switch(config)# <code>ipv6 nd rguard policy rguard-router</code>	Defines the RA guard policy name and enters RA guard policy configuration mode.
<b>Step 3</b>	<b>trustedport</b> <b>Example:</b>  Switch(config-ra-guard)# <code>trustedport</code>	(Optional) Specifies that this policy is being applied to trusted ports.
<b>Step 4</b>	<b>device-role router</b> <b>Example:</b>  Switch(config-ra-guard)# <code>device-role router</code>	Specifies the role of the device attached to the port.

	Command or Action	Purpose
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Switch(config-ra-guard)# exit	Exits RA guard policy configuration mode and returns to global configuration mode.

## Applying RA Guard Policy (CLI)

Applying the RA Guard policy on the switch will block all the untrusted RA's.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface tengigabitethernet 1/0/1</b> <b>Example:</b> Switch (config)# interface tengigabitethernet 1/0/1	Specifies an interface type and number, and places the device in interface configuration mode.
<b>Step 3</b>	<b>ipv6 nd raguard attach-policy raguard-router</b> <b>Example:</b> Switch(config-if)# ipv6 nd raguard attach-policy raguard-router	Applies the IPv6 RA Guard feature to a specified interface.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Switch(config-if)# exit	Exits interface configuration mode.

## Configuring RA Throttle Policy (CLI)

Configure RA Throttle policy to allow the enforce the limits

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>ipv6 nd ra-throttler policy ra-throttler1</b> <b>Example:</b>  Switch(config)# <code>ipv6 nd ra-throttler policy ra-throttler1</code>	Define the router advertisement (RA) throttler policy name and enter IPv6 RA throttle policy configuration mode.
<b>Step 3</b>	<b>throttleperiod500</b> <b>Example:</b>  Switch(config-nd-ra-throttle)# <code>throttleperiod 500</code>	Configures the throttle period in an IPv6 RA throttler policy.
<b>Step 4</b>	<b>max-through10</b> <b>Example:</b>  Switch(config-nd-ra-throttle)# <code>max-through 500</code>	Limits multicast RAs per VLAN per throttle period.
<b>Step 5</b>	<b>allow-atleast 5 at-most 10</b> <b>Example:</b>  Switch(config-nd-ra-throttle)# <code>allow-atleast 5 at-most 10</code>	Limits the number of multicast RAs per device per throttle period in an RA throttler policy.

## Applying RA Throttle Policy on VLAN (CLI)

Applying the RA Throttle policy on a VLAN. By enabling RA throttling, routers that send many RA packets can be trimmed to a minimum frequency that will still maintain an IPv6 client connectivity.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>vlan configuration 1</b> <b>Example:</b> Switch(config)# <code>vlan configuration 1</code>	Configures a VLAN or a collection of VLANs and enters VLAN configuration mode.
<b>Step 3</b>	<b>ipv6 nd ra throttler attach-policy ra-throttler1</b> <b>Example:</b> Switch(config-vlan)# <code>ipv6 nd ra throttler attach-policy ra-throttler1</code>	Attaches an IPv6 RA throttler policy to a VLAN or a collection of VLANs.

## Configuring IPv6 Snooping (CLI)

IPv6 snooping must always be enabled on the switch and the controller.

### Before you begin

Enable IPv6 on the client machine.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>vlan configuration 1</b> <b>Example:</b>	Enters Vlan configuration mode.

	Command or Action	Purpose
	<code>Switch(config)# vlan configuration 1</code>	
<b>Step 2</b>	<b>ipv6 snooping</b> <b>Example:</b> <code>Switch(config-vlan)# ipv6 snooping</code>	Enables IPv6 snooping on the Vlan.
<b>Step 3</b>	<b>ipv6 nd suppress</b> <b>Example:</b> <code>Switch(config-vlan-config)# ipv6 nd suppress</code>	Enables the IPv6 ND suppress on the Vlan.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> <code>Switch(config-vlan-config)# exit</code>	Saves the configuration and comes out of the Vlan configuration mode.

**Related Topics**

## Configuring IPv6 ND Suppress Policy (CLI)

The IPv6 neighbor discovery (ND) multicast suppress feature stops as many ND multicast neighbor solicit (NS) messages as possible by dropping them (and responding to solicitations on behalf of the targets) or converting them into unicast traffic. This feature runs on a layer 2 switch or a wireless controller and is used to reduce the amount of control traffic necessary for proper link operations.

When an address is inserted into the binding table, an address resolution request sent to a multicast address is intercepted, and the device either responds on behalf of the address owner or, at layer 2, converts the request into a unicast message and forwards it to its destination.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <code>Switch(config)# enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <code>Switch# configure terminal</code>	Enters the global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>ipv6 nd suppress policy</b> <b>Example:</b> Switch (config)# ipv6 nd suppress policy	Defines the ND suppress policy name and enters ND suppress policy configuration mode.

**Related Topics**

[Neighbor Discovery](#), on page 217

[Neighbor Discovery Suppression](#), on page 217

## Configuring IPv6 Snooping on VLAN/PortChannel

Neighbor Discover (ND) suppress can be enabled or disabled on either the VLAN or a switchport.

**Before you begin****Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>vlan config901</b> <b>Example:</b> Switch(config)# vlan config901	Creates a VLAN and enter the VLAN configuration mode
<b>Step 2</b>	<b>ipv6 nd suppress</b> <b>Example:</b> Switch(config-vlan)# ipv6 nd suppress	Applies the IPv6 nd suppress on VLAN.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config-vlan)# end	Exits vlan configuration mode and enters the global configuration mode.
<b>Step 4</b>	<b>interface gi1/0/1</b> <b>Example:</b> Switch (config)# interface gi1/0/1	Creates a gigabitethernet port interface.
<b>Step 5</b>	<b>ipv6 nd suppress</b> <b>Example:</b> Switch(config-vlan)# ipv6 nd suppress	Applies the IPv6 nd suppress on the interface.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Switch(config-vlan)# end	Exits vlan configuration mode and enters the global configuration mode.

## Configuring IPv6 on Switch (CLI)

Use this configuration example to configure IPv6 on an interface.

### Before you begin

Enable IPv6 on the client and IPv6 support on the wired infrastructure.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>interface vlan 1</b>  <b>Example:</b> Switch(config)# interface vlan 1	Creates a interface and enters interface configuration mode.
<b>Step 2</b>	<b>ip address fe80::1 link-local</b>  <b>Example:</b> Switch(config-if)# ip address 198.51.100.1 255.255.255.0 Switch(config-if)# ipv6 address fe80::1 link-local Switch(config-if)# ipv6 address 2001:DB8:0:1:FFFF:1234::5/64 Switch(config-if)# ipv6 address 2001:DB8:0:0:E000::F/64	Configures IPv6 address on the interface using the link-local option.
<b>Step 3</b>	<b>ipv6 enable</b>  <b>Example:</b> Switch(config)# ipv6 enable	(Optional) Enables IPv6 on the interface.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Switch(config)# end	Exits from the interface mode.

## Configuring DHCP Pool (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>ipv6 dhcp pool v1an21</b>  <b>Example:</b> Switch(config)# ipv6 dhcp pool vlan1	Enters the configuration mode and configures the IPv6 DHCP pool on the Vlan.

	Command or Action	Purpose
<b>Step 2</b>	<b>address prefix</b> <b>2001:DB8:0:1:FFFF:1234::/64</b> <b>lifetime 300 10</b>  <b>Example:</b> <pre>Switch(config-dhcpv6)# address prefix 2001:DB8:0:1:FFFF:1234::/64 lifetime 300 10</pre>	Enters the configuration-dhcp mode and configures the address pool and its lifetime on a Vlan.
<b>Step 3</b>	<b>dns-server 2001:100:0:1::1</b>  <b>Example:</b> <pre>Switch(config-dhcpv6)# dns-server 2001:20:21::1</pre>	Configures the DNS servers for the DHCP pool.
<b>Step 4</b>	<b>domain-name example.com</b>  <b>Example:</b> <pre>Switch(config-dhcpv6)# domain-name example.com</pre>	Configures the domain name to complete unqualified host names.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

	<pre>Switch(config-if)# ipv6 address 2001:DB8:0:0:E000::F/64</pre>	
<b>Step 3</b>	<b>ipv6 enable</b> <b>Example:</b> <pre>Switch(config)# ipv6 enable</pre>	(Optional) Enables IPv6 on the interface.
<b>Step 4</b>	<b>no ipv6 nd managed-config-flag</b> <b>Example:</b> <pre>Switch(config)#interface vlan 1 Switch(config-if)# no ipv6 nd managed-config-flag</pre>	Ensures the attached hosts do not use stateful autoconfiguration to obtain addresses.
<b>Step 5</b>	<b>ipv6 nd other-config-flag</b> <b>Example:</b> <pre>Switch(config-if)# no ipv6 nd other-config-flag</pre>	Ensures the attached hosts do not use stateful autoconfiguration to obtain non-address options from DHCP (domain etc).
<b>Step 6</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Exits from the interface mode.

## Configuring Stateful DHCP Locally (CLI)

This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on a local Switch

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<b>ipv6 unicast-routing</b> <b>Example:</b> <pre>Switch(config)# ipv6 unicast-routing</pre>	Configures IPv6 for unicasting.
<b>Step 3</b>	<b>ipv6 dhcp pool IPv6_DHCPPPOOL</b> <b>Example:</b>	Enters the configuration mode and configures the IPv6 DHCP pool on the VLAN.

	Command or Action	Purpose
	Switch (config)# ipv6 dhcp pool IPv6_DHCPOOL	
<b>Step 4</b>	<b>address prefix</b> <b>2001:DB8:0:1:FFFF:1234::/64</b>  <b>Example:</b> Switch (config-dhcpv6)# address prefix 2001:DB8:0:1:FFFF:1234::/64	Specifies the address range to provide in the pool.
<b>Step 5</b>	<b>dns-server 2001:100:0:1::1</b>  <b>Example:</b> Switch (config-dhcpv6)# dns-server 2001:100:0:1::1	Provides the DNS server option to DHCP clients.
<b>Step 6</b>	<b>domain-name example.com</b>  <b>Example:</b> Switch (config-dhcpv6)# domain-name example.com	Provides the domain name option to DHCP clients.
<b>Step 7</b>	<b>exit</b>  <b>Example:</b> Switch (config-dhcpv6)# exit	Returns to the previous mode.
<b>Step 8</b>	<b>interface vlan1</b>  <b>Example:</b> Switch (config)# interface vlan 1	Enters the interface mode to configure the stateful DHCP.
<b>Step 9</b>	<b>description IPv6-DHCP-Stateful</b>  <b>Example:</b> Switch (config-if)# description IPv6-DHCP-Stateful	Enter description for the stateful IPv6 DHCP.
<b>Step 10</b>	<b>ipv6 address 2001:DB8:0:20::1/64</b>  <b>Example:</b> Switch (config-if)# ipv6 address 2001:DB8:0:20::1/64	Enters the IPv6 address for the stateful IPv6 DHCP.
<b>Step 11</b>	<b>ip address 192.168.20.1</b> <b>255.255.255.0</b>  <b>Example:</b> Switch (config-if)# ip address 192.168.20.1 255.255.255.0	Enters the IPv6 address for the stateful IPv6 DHCP.
<b>Step 12</b>	<b>ipv6 nd prefix 2001:db8::/64</b> <b>no-advertise</b>  <b>Example:</b>	Configures the IPv6 routing prefix advertisement that must not be advertised.

	Command or Action	Purpose
	Switch (config-if)# ipv6 nd prefix 2001:db8::/64 no-advertise	
<b>Step 13</b>	<b>ipv6 nd managed-config-flag</b> <b>Example:</b> Switch (config-if)# ipv6 nd managed-config-flag	Configures IPv6 interfaces neighbor discovery to allow the hosts to uses DHCP for address configuration.
<b>Step 14</b>	<b>ipv6 nd other-config-flag</b> <b>Example:</b> Switch (config-if)# ipv6 nd other-config-flag	Configures IPv6 interfaces neighbor discovery to allow the hosts to uses DHCP for non-address configuration.
<b>Step 15</b>	<b>ipv6 dhcp server IPv6_DHCPPPOOL</b> <b>Example:</b> Switch (config-if)# ipv6 dhcp server IPv6_DHCPPPOOL	Configures the DHCP server on the interface.

## Configuring Stateful DHCP Externally (CLI)

This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on an external DHCP server.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>ipv6 unicast-routing</b> <b>Example:</b> Switch(config)# ipv6 unicast-routing	Configures the IPv6 for unicasting.
<b>Step 3</b>	<b>dns-server 2001:100:0:1::1</b> <b>Example:</b> Switch (config-dhcpv6)# dns-server 2001:100:0:1::1	Provides the DNS server option to DHCP clients.

	Command or Action	Purpose
<b>Step 4</b>	<b>domain-name example.com</b> <b>Example:</b> Switch (config-dhcpv6)# domain-name example.com	Provides the domain name option to DHCP clients.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Switch (config-dhcpv6)# exit	Returns to the previous mode.
<b>Step 6</b>	<b>interface v1an1</b> <b>Example:</b> Switch (config)# interface v1an 1	Enters the interface mode to configure the stateful DHCP.
<b>Step 7</b>	<b>description IPv6-DHCP-Stateful</b> <b>Example:</b> Switch (config-if)# description IPv6-DHCP-Stateful	Enter description for the stateful IPv6 DHCP.
<b>Step 8</b>	<b>ipv6 address 2001:DB8:0:20::1/64</b> <b>Example:</b> Switch (config-if)# ipv6 address 2001:DB8:0:20::1/64	Enters the IPv6 address for the stateful IPv6 DHCP.
<b>Step 9</b>	<b>ip address 192.168.20.1 255.255.255.0</b> <b>Example:</b> Switch (config-if)# ip address 192.168.20.1 255.255.255.0	Enters the IPv6 address for the stateful IPv6 DHCP.
<b>Step 10</b>	<b>ipv6 nd prefix 2001:db8::/64 no-advertise</b> <b>Example:</b> Switch (config-if)# ipv6 nd prefix 2001:db8::/64 no-advertise	Configures the IPv6 routing prefix advertisement that must not be advertised.
<b>Step 11</b>	<b>ipv6 nd managed-config-flag</b> <b>Example:</b> Switch (config-if)# ipv6 nd managed-config-flag	Configures IPv6 interfaces neighbor discovery to allow the hosts to uses DHCP for address configuration.
<b>Step 12</b>	<b>ipv6 nd other-config-flag</b> <b>Example:</b> Switch (config-if)# ipv6 nd other-config-flag	Configures IPv6 interfaces neighbor discovery to allow the hosts to uses DHCP for non-address configuration.

	Command or Action	Purpose
<b>Step 13</b>	<b>ipv6 dhcp_relaydestination</b> <b>2001:DB8:0:20::2</b>  <b>Example:</b> <pre>Switch (config-if)# ipv6 dhcp_relay destination 2001:DB8:0:20::2</pre>	Configures the DHCP server on the interface.

## Monitoring IPv6 Clients (GUI)

To view the IPv6 clients associated with the Switch

**Procedure**

Select **Monitor > Clients**

The Clients page is displayed. The Clients page contains the following details:

- Client MAC Address— Displays the MAC address of the client.
- AP Name— Displays the access point name to which the client is connected to.
- WLAN— Displays the WLAN associated with the client.
- State— Displays the client authentication.
- Protocol— Displays the protocol used.

To view the client related general details, click the **Client MAC Address** parameter in the Clients page. The **Client > Detail** page displays IPv6 addresses of the client under the **General** tab.

## Verifying IPv6 Address Learning Configuration

This example displays the output of the **show ipv6 dhcp pool** command. This command displays the IPv6 service configuration on the switch. The vlan 21 configured pool detail displays 6 clients that are currently using addresses from the pool.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>show ipv6 dhcp pool</b>  <b>Example:</b> <pre>Switchshow ipv6 dhcp pool DHCPv6 pool: vlan21</pre>	Displays the IPv6 service configuration on the switch.

	Command or Action	Purpose
	Address allocation prefix: 2001:DB8:0:1:FFFF:1234::/64 valid 86400 preferred 86400 (6 in use, 0 conflicts) DNS server: 2001:100:0:1::1 Domain name: example.com Active clients: 6

- [How to Configure IPv6 WLAN Security, on page 238](#)
- [Additional References , on page 252](#)
- [Feature Information for IPv6 WLAN Security, on page 253](#)

## Prerequisites for IPv6 WLAN Security

A client VLAN must be mapped to the WLAN configured on the switch

## Restrictions for IPv6 WLAN Security

### RADIUS Server Support

- If multiple RADIUS servers are configured for redundancy, the user database must be identical in all the servers for the backup to work properly.

### Radius ACS Support

- You must configure RADIUS on both your Cisco Secure Access Control Server (ACS) and your switch
- RADIUS is supported on Cisco Secure ACS version 3.2 and later releases.

## Information About IPv6 WLAN Security

### Information About RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a client/server protocol that provides centralized security for users attempting to gain management access to a network. It serves as a back-end database similar to Local EAP and provides authentication and accounting services.

- **Authentication**—The process of verifying users when they attempt to log into the switch

Users must enter a valid username and password for the switch to authenticate users to the RADIUS server. If multiple databases are configured, then specify the sequence in which the backend database must be tried.

- **Accounting**— The process of recording user actions and changes.

Whenever a user successfully executes an action, the RADIUS accounting server logs the changed attributes, the user ID of the person who made the change, the remote host where the user is logged in, the date and time when the command was executed, the authorization level of the user, and a description of the action performed and the values provided. If the RADIUS accounting server is unreachable, the users can continue their sessions uninterrupted.

**User Datagram Protocol**— RADIUS uses User Datagram Protocol (UDP) for its transport. It maintains a database and listens on UDP port 1812 for incoming authentication requests and UDP port 1813 for incoming accounting requests. The switch, which requires access control, acts as the client and requests AAA services from the server. The traffic between the switch and the server is encrypted by an algorithm defined in the protocol and a shared secret key configured on both devices.

Configures multiple RADIUS accounting and authentication servers. For example, you can have one central RADIUS authentication server but several RADIUS accounting servers in different regions. If you configure multiple servers of the same type and the first one fails or becomes unreachable, the controller automatically tries the second one, then the third one if necessary, and so on.

When RADIUS method is configured for the WLAN, the switch will use the RADIUS method configured for the WLAN. When the WLAN is configured to use local EAP, the RADIUS method configured on the WLAN points to Local. The WLAN must also be configured with the name of the local EAP profile to use.

If no RADIUS method is configured in the WLAN, the switch will use the default RADIUS method defined in global mode.

### Information About Local EAP

Local EAP is an authentication method that allows users and wireless clients to be authenticated locally. It is designed for use in remote offices that maintain connectivity to wireless clients when the back-end system is disrupted or the external authentication server goes down. When you enable local EAP, the switch serves as the authentication server and the local user database, which removes dependence on an external authentication server. Local EAP retrieves user credentials from the local user database or the LDAP back-end database to authenticate users. Local EAP supports LEAP, EAP-FAST, EAP-TLS, PEAPv0/MSCHAPv2, and PEAPv1/GTC authentication between the controller and wireless clients.

Without an EAP profile name being provided, or if a name was provided for an EAP profile that does not exist, then EAP by default allows no EAP method for local authentication.

#### Note

The LDAP back-end database supports these local EAP methods: EAP-TLS, EAP-FAST/GTC, and PEAPv1/GTC. LEAP, EAP-FAST/MSCHAPv2, and PEAPv0. MSCHAPv2 is supported only if the LDAP server is set up to return a clear-text password.

**Note** Switch support Local EAP authentication against external LDAP databases such as Microsoft Active Directory and Novell's eDirectory. For more information about configuring the controller for Local EAP authentication against Novell's eDirectory, see the *Configure Unified Wireless Network for Authentication Against Novell's eDirectory Database* whitepaper.

# How to Configure IPv6 WLAN Security

## Configuring Local Authentication

### Creating a Local User

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global command mode.
<b>Step 2</b>	<b>username aaa_test</b> <b>Example:</b> Switch(config)# <b>username aaa_test</b>	Creates a username.
<b>Step 3</b>	<b>password 0 aaa_test</b> <b>Example:</b> Switch(config)# <b>usernameaaa_test</b> <b>password 0 aaa_test</b>	Assigns a password for the username.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode.

```
Switch# configure terminal
Switch(config)# username aaa_test password 0 aaa_test
Switch(config)# end
```

### Creating an Client VLAN and Interface

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global command mode.
<b>Step 2</b>	<b>vlan</b>	Creates a VLAN.

	Command or Action	Purpose
	<b>Example:</b> Switch(config)# vlan 137	
<b>Step 3</b>	<b>exit</b> <b>Example:</b> Switch (config-vlan)# exit	Exits VLAN configuration mode.
<b>Step 4</b>	<b>interface vlan <i>vlan_ID</i></b> <b>Example:</b> Switch (config)# interface vlan 137	Associates the VLAN to an interface.
<b>Step 5</b>	<b>ip address</b> <b>Example:</b> Switch(config-if)# ip address 10.7.137.10 255.255.255.0	Assigns an IP address to the VLAN interface.
<b>Step 6</b>	<b>ipv6 address</b> <b>Example:</b> Switch(config-if)#ipv6 address 2001:db8::20:1/64	Assigns an IPv6 address to the VLAN interface.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode.

**Example**

```
Switch# configure terminal
Switch(config)# vlan 137
Switch(config-vlan)#exit
Switch(config)#interface vlan 137
Switch(config-if)#ip address 10.7.137.10 255.255.255.0
Switch(config-if)#ipv6 address 2001:db8::20:1/64
Switch(config-if)#end
```

**Configuring a EAP Profile****Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>eap profile name</b> <b>Example:</b> Switch(config)# eap profile wcm_eap_prof	Creates a EAP profile.

	Command or Action	Purpose
<b>Step 2</b>	<b>method leap</b> <b>Example:</b> <code>Switch(config-eap-profile)# method leap</code>	Configures EAP-LEAP method on the profile.
<b>Step 3</b>	<b>method tls</b> <b>Example:</b> <code>Switch(config-eap-profile)# method tls</code>	Configures EAP-TLS method on the profile.
<b>Step 4</b>	<b>method peap</b> <b>Example:</b> <code>Switch(config-eap-profile)# method peap</code>	Configures PEAP method on the profile.
<b>Step 5</b>	<b>method mschapv2</b> <b>Example:</b> <code>Switch(config-eap-profile)# method mschapv2</code>	Configures EAP-MSCHAPV2 method on the profile.
<b>Step 6</b>	<b>method md5</b> <b>Example:</b> <code>Switch(config-eap-profile)# method md5</code>	Configures EAP-MD5 method on the profile.
<b>Step 7</b>	<b>method gtc</b> <b>Example:</b> <code>Switch(config-eap-profile)# method gtc</code>	Configures EAP-GTC method on the profile.
<b>Step 8</b>	<b>method fast profile my-fast</b> <b>Example:</b> <code>Switch(config-eap-profile)# eap method fast profile my-fast</code> <code>Switch (config-eap-profile)#description my_local eap profile</code>	Creates a EAP profile named my-fast.
<b>Step 9</b>	<b>description my_localeap profile</b> <b>Example:</b> <code>Switch (config-eap-profile)#description my_local eap profile</code>	Provides a description for the local profile.
<b>Step 10</b>	<b>exit</b> <b>Example:</b> <code>Switch (config-eap-profile)# exit</code>	Exits the eap-profile configuration mode.
<b>Step 11</b>	<b>eap method fast profilemyFast</b> <b>Example:</b> <code>Switch (config)# eap method fast profile myFast</code>	Configures the EAP method profile.

	Command or Action	Purpose
<b>Step 12</b>	<b>authority-id [identity information]</b> <b>Example:</b> <pre>Switch(config-eap-method-profile)# authority-id identity my_identity Switch(config-eap-method-profile)#authority-id information my_information</pre>	Configure the authority ID and information for the EAP method profile.
<b>Step 13</b>	<b>local-key 0 key-name</b> <b>Example:</b> <pre>Switch(config-eap-method-profile)# local-key 0 test</pre>	Configures the local server key.
<b>Step 14</b>	<b>pac-password 0 password</b> <b>Example:</b> <pre>Switch(config-eap-method-profile)# pac-password 0 test</pre>	Configures the PAC password for manual PAC provisioning.
<b>Step 15</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode.

### Example

```
Switch(config)#eap profile wcm_eap_prof
Switch(config-eap-profile)#method leap
Switch(config-eap-profile)#method tls
Switch(config-eap-profile)#method peap
Switch(config-eap-profile)#method mschapv2
Switch(config-eap-profile)#method md5
Switch(config-eap-profile)#method gtc
Switch(config-eap-profile)#eap method fast profile my-fast
Switch (config-eap-profile)#description my_local eap profile
Switch(config-eap-profile)# exit
Switch (config)# eap method fast profile myFast
Switch(config-eap-method-profile)#authority-id identity my_identity
Switch(config-eap-method-profile)#authority-id information my_information
Switch(config-eap-method-profile)#local-key 0 test
Switch(config-eap-method-profile)#pac-password 0 test
Switch(config-eap-method-profile)# end
```

## Creating a Local Authentication Model

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>aaa new-model</b>  <b>Example:</b> Switch(config)# aaa new-model	Creates a AAA authentication model.
<b>Step 2</b>	<b>authentication dot1x default local</b>  <b>Example:</b> Switch(config)# aaa authentication dot1x default local	Implies that the dot1x must use the default local RADIUS when no other method is found.
<b>Step 3</b>	<b>dot1x method_list local</b>  <b>Example:</b> Switch(config)# aaa authentication dot1x wcm_local local	Assigns the local authentication for wcm_local method list.
<b>Step 4</b>	<b>aaa authentication dot1x dot1x_name local</b>  <b>Example:</b> Switch(config)# aaa authentication dot1x aaa_auth local	Configures the local authentication for the dot1x method.
<b>Step 5</b>	<b>aaa authorization credential-download name local</b>  <b>Example:</b> Switch(config)# aaa authorization credential-download wcm_author local	Configures local database to download EAP credentials from Local/RADIUS/LDAP.
<b>Step 6</b>	<b>aaa local authentication auth-name authorization authorization-name</b>  <b>Example:</b> Switch(config)# aaa local authentication wcm_local authorization wcm_author	Selects local authentication and authorization.
<b>Step 7</b>	<b>session ID</b>  <b>Example:</b> Switch(config)# aaa session-id common	Configures a session ID for AAA.
<b>Step 8</b>	<b>dot1x system-auth-control</b>  <b>Example:</b> Switch(config)# dot1x system-auth-control	Enables dot.1x system authentication control.

**Example**

```
Switch(config)# aaa new-model
Switch(config)# aaa authentication dot1x default local
Switch(config)# aaa authentication dot1x wcm-local local
Switch(config)# aaa authentication dot1x aaa_auth local
Switch(config)# aaa authorization credential-download wcm_author local
Switch(config)# aaa local authentication wcm_local authorization wcm_author
Switch(config)# aaa session-id common
Switch(config)# dot1x system-auth-control
```

**Creating a Client WLAN**

**Note** This example uses 802.1x with dynamic WEP. You can use any other security mechanism supported by the wireless client and configurable on the switch

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global command mode.
<b>Step 2</b>	<b>wlan wlan name &lt;identifier&gt; SSID</b> <b>Example:</b> Switch(config)# wlan wlanProfileName 1 ngwcSSID	Creates a WLAN.
<b>Step 3</b>	<b>broadcast-ssid</b> <b>Example:</b> Switch(config-wlan)# broadcast-ssid	Configures to broadcast the SSID on a WLAN.
<b>Step 4</b>	<b>no security wpa</b> <b>Example:</b> Switch(config-wlan)# no security wpa	Disables the wpa for WLAN to enable 802.1x.
<b>Step 5</b>	<b>security dot1x</b> <b>Example:</b> Switch(config-wlan)# security dot1x	Configures the 802.1x encryption security for the WLAN.
<b>Step 6</b>	<b>security dot1x authentication-list wcm-local</b> <b>Example:</b> Switch(config-wlan)# security dot1x authentication-list wcm-local	Configures the server group mapping to the WLAN for dot1x authentication.

	Command or Action	Purpose
<b>Step 7</b>	<b>local-auth wcm_eap_prof</b> <b>Example:</b> Switch (config-wlan)# local-auth wcm_eap_profile	Configures the eap profile on the WLAN for local authentication.
<b>Step 8</b>	<b>client vlan 137</b> <b>Example:</b> Switch(config-wlan)# client vlan 137	Associates the VLAN to a WLAN.
<b>Step 9</b>	<b>no shutdown</b> <b>Example:</b> Switch(config-wlan)# no shutdown	Enables the WLAN.
<b>Step 10</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode.

**Example**

```
Switch# config terminal
Switch(config)#wlan wlanProfileName 1 ngwcSSID
Switch(config-wlan)#broadcast-ssid
Switch(config-wlan)#no security wpa
Switch(config-wlan)#security dot1x
Switch(config-wlan)#security dot1x authentication-list wcm-local
Switch (config-wlan)# local-auth wcm_eap_prof
Switch(config-wlan)#client vlan 137
Switch(config-wlan)#no shutdown
Switch(config-wlan)#end
Switch#
```

**Related Topics**

[Creating Client VLAN for WPA2+AES](#), on page 245

**Configuring Local Authentication with WPA2+AES****Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global command mode.
<b>Step 2</b>	<b>aaa new model</b> <b>Example:</b> Switch(config)# <b>aaa new-model</b>	Creates a AAA authentication model.

	Command or Action	Purpose
<b>Step 3</b>	<b>dot1x system-auth-control</b> <b>Example:</b> Switch(config)# dot1x system-auth-control	Enables dot1x system authentication control.
<b>Step 4</b>	<b>aaa authentication dot1x default local</b> <b>Example:</b> Switch(config)# aaa authentication dot1x default local	Configures the local authentication for the default dot1x method.
<b>Step 5</b>	<b>aaa local authorization credential-download default local</b> <b>Example:</b> Switch(config)# aaa authorization credential-download default local	Configures default database to download EAP credentials from local server.
<b>Step 6</b>	<b>aaa local authentication default authorization default</b> <b>Example:</b> Switch(config)# aaa local authentication default authorization default	Selects the default local authentication and authorization.
<b>Step 7</b>	<b>eap profile wcm_eap_profile</b> <b>Example:</b> Switch(config)# eap profile wcm_eap_profile	Creates an EAP profile.
<b>Step 8</b>	<b>method leap</b> <b>Example:</b> Switch(config)# method leap	Configures EAP-LEAP method on the profile.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode.

```
Switch# configure terminal
Switch(config)# aaa new-model
Switch(config)# dot1x system-auth-control
Switch(config)# aaa authentication dot1x default local
Switch(config)# aaa authorization credential-download default local
Switch(config)# aaa local authentication default authorization default
Switch(config)# eap profile wcm_eap_profile
Switch(config)# method leap
Switch(config)# end
```

## Creating Client VLAN for WPA2+AES

Create a VLAN for the WPA2+AES type of local authentication. This VLAN is later mapped to a WLAN.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global command mode.
<b>Step 2</b>	<b>vlan <code>vlan_ID</code></b> <b>Example:</b> Switch (config)# <code>vlan 105</code>	Creates a VLAN.
<b>Step 3</b>	<b>exit</b> <b>Example:</b> Switch (config-vlan)# <code>exit</code>	Exits from the VLAN mode.
<b>Step 4</b>	<b>interface vlan <code>vlan_ID</code></b> <b>Example:</b> Switch(config)# <code>interface vlan 105</code>	Associates the VLAN to the interface.
<b>Step 5</b>	<b>ip address</b> <b>Example:</b> Switch(config-if)# <code>ip address 10.8.105.10 255.255.255.0</code>	Assigns IP address to the VLAN interface.
<b>Step 6</b>	<b>ipv6 address</b> <b>Example:</b> Switch(config-if)# <code>ipv6 address 2001:db8::10:1/64</code>	Assigns IPv6 address to the VLAN interface.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> Switch (config-if)# <code>exit</code>	Exits from the interface mode.

```
Switch# configure terminal
Switch(config)# vlan105
Switch (config-vlan)# exit
Switch (config)# interface vlan 105
Switch(config-if)#ip address 10.8.105.10 255.255.255.0
Switch(config-if)#ipv6 address 2001:db8::10:1/64
Switch(config-if)#exit
Switch(config)#
```

- [Additional References, on page 269](#)
- [Feature Information for IPv6 ACLs, on page 270](#)

## Prerequisites for IPv6 ACL

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running the IP base feature set.

### Related Topics

[Creating IPv6 ACL, on page 259](#)

## Restrictions for IPv6 ACL

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most of the Cisco IOS-supported IPv6 ACLs with some exceptions:

- The switch does not support matching on these keywords: **flowlabel**, **routing header**, and **undetermined-transport**.
- The switch does not support reflexive ACLs (the **reflect** keyword).
- The switch does not apply MAC-based ACLs on IPv6 frames.
- When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware

forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.

- If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface

## Information About IPv6 ACL

An access control list (ACL) is a set of rules used to limit access to a particular interface (for example, if you want to restrict a wireless client from pinging the management interface of the controller). ACLs are configured on the switch and applied to the management interface, the AP-manager interface, any of the dynamic interfaces, or a WLAN to control data traffic to and from wireless clients or to the controller central processing unit (CPU) to control all traffic destined for the CPU.

You can also create a preauthentication ACL for web authentication. Such an ACL is used to allow certain types of traffic before authentication is complete.

IPv6 ACLs support the same options as IPv4 ACLs including source, destination, source and destination ports.

---

**Note** You can enable only IPv4 traffic in your network by blocking IPv6 traffic. That is, you can configure an IPv6 ACL to deny all IPv6 traffic and apply it on specific or all WLANs.

---

## Understanding IPv6 ACLs

A switch supports two types of IPv6 ACLs:

- IPv6 router ACLs are supported on outbound or inbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. IPv6 router ACLs apply only to IPv6 packets that are routed.
- IPv6 port ACLs are supported on inbound traffic on Layer 2 interfaces only. IPv6 port ACLs are applied to all IPv6 packets entering the interface.

A switch running the IP base feature set supports only input router IPv6 ACLs. It does not support port ACLs or output IPv6 router ACLs.

---

**Note** If you configure unsupported IPv6 ACLs, an error message appears and the configuration does not take effect.

---

The switch does not support VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface. As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs:

- When an input router ACL and input port ACL exist in an SVI, packets received on ports to which a port ACL is applied are filtered by the port ACL. Routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.

- When an output router ACL and input port ACL exist in an SVI, packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IPv6 packets are filtered by the router ACL. Other packets are not filtered.

**Note** If any port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, and any router ACLs attached to the SVI of the port VLAN are ignored.

## Types of ACL

### Per User IPv6 ACL

For the per-user ACL, the full access control entries (ACE) as the text strings are configured on the ACS.

The ACE is not configured on the Controller. The ACE is sent to the switch in the `ACCESS-Accept` attribute and applies it directly for the client. When a wireless client roams into an foreign switch, the ACEs are sent to the foreign switch as an AAA attribute in the mobility Handoff message. Output direction, using per-user ACL is not supported.

### Filter ID IPv6 ACL

For the filter-Id ACL, the full ACEs and the `acl name (filter-id)` is configured on the switch and only the `filter-id` is configured on the ACS. The `filter-id` is sent to the switch in the `ACCESS-Accept` attribute, and the switch looks up the `filter-id` for the ACEs, and then applies the ACEs to the client. When the client L2 roams to the foreign switch, only the `filter-id` is sent to the foreign switch in the mobility Handoff message. Output filtered ACL, using per-user ACL is not supported. The foreign switch has to configure the `filter-id` and ACEs beforehand.

### Downloadable IPv6 ACL

For the downloadable ACL (dACL), the full ACEs and the `dac1 name` are all configured on the ACS only.

**Note** The controller does not configure any ACL.

The ACS sends the `dac1 name` to the switch in its `ACCESS-Accept` attribute, which takes the `dac1 name` and sends the `dACL name` back to the ACS, for the ACEs, using the `access-request` attribute.

The ACS responds to the corresponding ACEs of the switch in the `access-accept` attribute. When the wireless client roams to an foreign switch, only the `dac1 name` is sent to the foreign switch in the mobility Handoff message. The foreign switch contacts the ACS server with the `dac1 name` to retrieve the ACEs.

## IPv6 ACLs and Switch Stacks

The stack master supports IPv6 ACLs in hardware and distributes the IPv6 ACLs to the stack members.

**Note** For full IPv6 functionality in a switch stack, all stack members must be running the IP services feature set.

If a new switch takes over as stack master, it distributes the ACL configuration to all stack members. The member switches sync up the configuration distributed by the new stack master and flush out entries that member switches sync up the configuration distributed by the new stack master and flush out entries that are not required.

When an ACL is modified, attached to, or detached from an interface, the stack master distributes the change to all stack members.

## Configuring IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

### Before you begin

Before configuring IPv6 ACLs, you must select one of the dual IPv4 and IPv6 SDM templates.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	Create an IPv6 ACL, and enter IPv6 access list configuration mode.	
<b>Step 2</b>	Configure the IPv6 ACL to block (deny) or pass (permit) traffic.	
<b>Step 3</b>	Apply the IPv6 ACL to the interface where the traffic needs to be filtered.	
<b>Step 4</b>	Apply the IPv6 ACL to an interface. For router ACLs, you must also configure an IPv6 address on the Layer 3 interface to which the ACL is applied.	

## Default IPv6 ACL Configuration

There are no IPv6 ACLs configured or applied.

## Interaction with Other Features and Switches

- If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.

- If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.
- You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

- You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.
- If the hardware memory is full, for any additional configured ACLs, packets are dropped to the CPU, and the ACLs are applied in software. When the hardware is full a message is printed to the console indicating the ACL has been unloaded and the packets will be dropped on the interface.

**Note** Only packets of the same type as the ACL that could not be added (ipv4, ipv6, MAC) will be dropped on the interface.

## How To Configure an IPv6 ACL

### Creating IPv6 ACL

Beginning in privileged EXEC mode, follow these steps to create an IPv6 ACL:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 access-list <i>acl_name</i></b> <b>Example:</b> ipv6 access-list access-list-name	Use a name to define an IPv6 access list and enter IPv6 access-list configuration mode.
<b>Step 3</b>	<b>{deny permit} protocol</b> <b>Example:</b> {deny   permit} protocol {source-ipv6-prefix/prefix-length   any   host source-ipv6-address} [operator [port-number]][destination-ipv6-prefix/prefix-length   any  host destination-ipv6-address} [operator [port-number]][dscp value] [fragments][log] [log-input]	Enter deny or permit to specify whether to deny or permit the packet if conditions are matched. These are the conditions: <ul style="list-style-type: none"> <li>• For protocol, enter the name or number of an Internet protocol: ahp, esp, icmp, ipv6, pcp, stcp, tcp, or udp, or an integer in the range 0 to 255 representing an IPv6 protocol number.</li> </ul>

	Command or Action	Purpose
	<pre>[routing] [sequence value] [time-range name]</pre>	<ul style="list-style-type: none"> <li>• The source-ipv6-prefix/prefix-length or destination-ipv6-prefix/ prefix-length is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).</li> <li>• Enter any as an abbreviation for the IPv6 prefix ::/0.</li> <li>• For host source-ipv6-address or destination-ipv6-address, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.</li> <li>• (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range.</li> </ul> <p>If the operator follows the source-ipv6-prefix/prefix-length argument, it must match the source port. If the operator follows the destination-ipv6-prefix/prefix-length argument, it must match the destination port.</p> <ul style="list-style-type: none"> <li>• (Optional) The port-number is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.</li> <li>• (Optional) Enter dscp value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.</li> <li>• (Optional) Enter fragments to check noninitial fragments. This keyword is visible only if the protocol is ipv6.</li> <li>• (Optional) Enter log to cause an logging message to be sent to the console about the packet that matches the entry. Enter</li> </ul>

	Command or Action	Purpose
		<p>log-input to include the input interface in the log entry. Logging is supported only for router ACLs.</p> <ul style="list-style-type: none"> <li>• (Optional) Enter routing to specify that IPv6 packets be routed.</li> <li>• (Optional) Enter sequence value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295</li> <li>• (Optional) Enter time-range name to specify the time range that applies to the deny or permit statement.</li> </ul>
<b>Step 4</b>	<p><b>{deny permit} tcp</b></p> <p><b>Example:</b></p> <pre>{deny   permit} tcp {source-ipv6-prefix/prefix-length   any    hostsource-ipv6-address} [operator [port-number]]{destination-ipv6-prefix/prefix-length    any   hostdestination-ipv6-address} [operator [port-number]][ack] [dscp value][established] [fin] [log][log-input] [neq {port   protocol}]  [psh] [range{port   protocol}] [rst][routing] [sequence value] [syn] [time-range name][urg]</pre>	<p>(Optional) Define a TCP access list and the access conditions.</p> <p>Enter tcp for Transmission Control Protocol. The parameters are the same as those described in Step 3, with these additional optional parameters:</p> <ul style="list-style-type: none"> <li>• ack—Acknowledgment bit set.</li> <li>• established—An established connection. A match occurs if the TCP datagram has the ACK or RST bits set.</li> <li>• fin—Finished bit set; no more data from sender.</li> <li>• neq {port   protocol}—Matches only packets that are not on a given port number.</li> <li>• psh—Push function bit set.</li> <li>• range {port   protocol}—Matches only packets in the port number range.</li> <li>• rst—Reset bit set.</li> <li>• syn—Synchronize bit set.</li> <li>• urg—Urgent pointer bit set.</li> </ul>
<b>Step 5</b>	<p><b>{deny permit} udp</b></p> <p><b>Example:</b></p> <pre>{deny   permit} udp {source-ipv6-prefix/prefix-length   any    hostsource-ipv6-address} [operator</pre>	<p>(Optional) Define a UDP access list and the access conditions.</p> <p>Enter udp for the User Datagram Protocol. The UDP parameters are the same as those described for TCP, except that the operator [port]] port number or name must be a UDP port number</p>

	Command or Action	Purpose
	<pre>[port-number]]{destination-ipv6-prefix/prefix-length   any   hostdestination-ipv6-address} [operator [port-number]][dscp value] [log][log-input] [neq {port  protocol}] [range {port  protocol}] [routing][sequence value][time-range name]</pre>	or name, and the established parameter is not valid for UDP.
<b>Step 6</b>	<p><b>{deny permit} icmp</b></p> <p><b>Example:</b></p> <pre>{deny   permit} icmp {source-ipv6-prefix/prefix-length   any   hosts}source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length   any   host}destination-ipv6-address} [operator [port-number]][icmp-type [icmp-code]  icmp-message] [dscpvalue] [log] [log-input] [routing] [sequence value][time-range name]</pre>	<p>(Optional) Define an ICMP access list and the access conditions.</p> <p>Enter icmp for Internet Control Message Protocol. The ICMP parameters are the same as those described for most IP protocols in Step 3a, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• icmp-type—Enter to filter by ICMP message type, a number from 0 to 255.</li> <li>• icmp-code—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.</li> <li>• icmp-message—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type names and code names, use the ? key or see command reference for this release.</li> </ul>
<b>Step 7</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 8</b>	<p><b>show ipv6 access-list</b></p> <p><b>Example:</b></p> <pre>show ipv6 access-list</pre>	Verify the access list configuration.
<b>Step 9</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>copy running-config startup-config</pre>	(Optional) Save your entries in the configuration file.

## Applying an IPv6 to an Interface

This section describes how to apply IPv6 ACLs to network interfaces. You can apply an IPv6 ACL to outbound or inbound traffic on layer 2 and Layer 3 interfaces. You can apply IPv6 ACLs only to inbound management traffic on Layer 3 interfaces.

Beginning in privileged EXEC mode, follow these steps to control access to an interface:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface interface_id</b> <b>Example:</b> Switch# <code>interface interface-id</code>	Identifies a Layer 2 interface (for port ACLs) or Layer 3 Switch Virtual interface (for router ACLs) on which to apply an access list, and enters interface configuration mode.
<b>Step 3</b>	<b>no switchport</b> <b>Example:</b> Switch# <code>no switchport</code>	Changes the interface from Layer 2 mode (the default) to Layer 3 mode (only if applying a router ACL).
<b>Step 4</b>	<b>ipv6 address ipv6_address</b> <b>Example:</b> Switch# <code>ipv6 address ipv6-address</code>	Configures an IPv6 address on a Layer 3 interface (for router ACLs). <b>Note</b> This command is not required on Layer 2 interfaces or if the interface has already been configured with an explicit IPv6 address.
<b>Step 5</b>	<b>ipv6 traffic-filter acl_name</b> <b>Example:</b> Switch# <code>ipv6 traffic-filter access-list-name {in   out}</code>	Applies the access list to incoming or outgoing traffic on the interface.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 7</b>	<b>show running-config interface tenGigabitEthernet 1/0/3</b> <b>Example:</b> Switch# <code>show running-config interface tenGigabitEthernet 1/0/3</code> ..... ..... Building configuration ..... ..... Current configuration : 98 bytes	Shows the configuration summary.

	Command or Action	Purpose
	<pre>! interface TenGigabitEthernet1/0/3  switchport mode trunk  ipv6 traffic-filter MyFilter out  end</pre>	
<b>Step 8</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

# Verifying IPv6 ACL

## Displaying IPv6 ACLs

You can display information about all configured access lists, all IPv6 access lists, or a specific access list by using one or more of the privileged EXEC commands.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>show access-list</b> <b>Example:</b> Switch# show access-lists	Displays all access lists configured on the switch
<b>Step 2</b>	<b>show ipv6 access-list <i>acl_name</i></b> <b>Example:</b> Switch# show ipv6 access-list [ <i>access-list-name</i> ]	Displays all configured IPv6 access list or the access list specified by name.

# Configuration Examples for IPv6 ACL

## Example: Creating IPv6 ACL

This example configures the IPv6 access list named CISCO. The first deny entry in the list denies all packets that have a destination TCP port number greater than 5000. The second deny entry denies packets that have a source UDP port number less than 5000. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets. The second permit entry in the list permits all other traffic. The second permit entry is necessary because an implicit deny -all condition is at the end of each IPv6 access list.

**Note** Logging is supported only on Layer 3 interfaces.

```
Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch (config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any
```

## Example: Applying IPv6 ACLs

This example shows how to apply the access list Cisco to outbound traffic on a Layer 3 interface.

```
Switch(config)# interface TenGigabitEthernet 1/0/3

Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter CISCO out
```

## Example: Displaying IPv6 ACLs

This is an example of the output from the **show access-lists** privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Switch #show access-lists
Extended IP access list hello
10 permit ip any any
IPv6 access list ipv6
permit ipv6 any any sequence 10
```

This is an example of the output from the **show ipv6 access-lists** privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Switch# show ipv6 access-list
IPv6 access list inbound
permit tcp any any eq bgp (8 matches) sequence 10
permit tcp any any eq telnet (15 matches) sequence 20
permit udp any any sequence 30

IPv6 access list outbound
deny udp any any sequence 10
deny tcp any any eq telnet sequence 20
```

## Example: Configuring RA Throttling and NS Suppression

This task describes how to create an RA throttle policy in order to help the power-saving wireless clients from being disturbed by frequent unsolicited periodic RA's. The unsolicited multicast RA is throttled by the controller.

### Before you begin

Enable IPv6 on the client machine.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 nd ra-throttler policy Mythrottle</b>  <b>Example:</b> Switch (config)# <b>ipv6 nd ra-throttler policy Mythrottle</b>	Creates a RA throttler policy called Mythrottle.

	Command or Action	Purpose
<b>Step 3</b>	<b>throttle-period 20</b> <b>Example:</b> Switch (config-nd-ra-throttle)# throttle-period 20	Determines the time interval segment during which throttling applies.
<b>Step 4</b>	<b>max-through 5</b> <b>Example:</b> Switch (config-nd-ra-throttle)# max-through 5	Determines how many initial RA's are allowed.
<b>Step 5</b>	<b>allow at-least 3 at-most 5</b> <b>Example:</b> Switch (config-nd-ra-throttle)# allow at-least 3 at-most 5	Determines how many RA's are allowed after the initial RAs have been transmitted, until the end of the interval segment.
<b>Step 6</b>	<b>switch (config)# vlan configuration 100</b> <b>Example:</b> Switch (config)# vlan configuration 100	Creates a per vlan configuration.
<b>Step 7</b>	<b>ipv6 nd suppress</b> <b>Example:</b> Switch (config)# ipv6 nd suppress	Disables the neighbor discovery on the Vlan.
<b>Step 8</b>	<b>ipv6 nd ra-th attach-policy attach-policy_name</b> <b>Example:</b> Switch (config)# ipv6 nd ra-throttle attach-policy attach-policy_name	Enables the router advertisement throttling.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Example: Configuring RA Guard Policy

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>ipv6 nd rguard policy MyPolicy</b> <b>Example:</b> Switch (config)# ipv6 nd rguard policy MyPolicy	

	Command or Action	Purpose
<b>Step 2</b>	<b>trusted-port</b> <b>Example:</b> Switch (config-nd-raguard)# trusted-port	Configures the trusted port for the policy created above.
<b>Step 3</b>	<b>device-role router</b> <b>Example:</b> Switch (config-nd-raguard)# device-role [host monitor router switch] Switch (config-nd-raguard)# device-role router	Defines the trusted device that can send RAs to the trusted port created above.
<b>Step 4</b>	<b>interface tenGigabitEthernet 1/0/1</b> <b>Example:</b> Switch (config)# interface tenGigabitEthernet 1/0/1	Configures the interface to the trusted device.
<b>Step 5</b>	<b>ipv6 nd raguard attach-policy MyPolicy</b> <b>Example:</b> Switch (config-if)# ipv6 nd raguard attach-policy Mypolicy	Configures and attaches the policy to trust the RA's received from the port.
<b>Step 6</b>	<b>vlan configuration 19-21,23</b> <b>Example:</b> Switch (config)# vlan configuration 19-21,23	Configures the wireless client vlans.
<b>Step 7</b>	<b>ipv6 nd suppress</b> <b>Example:</b> Switch (config-vlan-config)# ipv6 nd suppress	Suppresses the ND messages over wireless.
<b>Step 8</b>	<b>ipv6 snooping</b> <b>Example:</b> Switch (config-vlan-config)# ipv6 snooping	Captures IPv6 traffic.
<b>Step 9</b>	<b>ipv6 nd raguard attach-policy MyPolicy</b> <b>Example:</b> Switch (config-vlan-config)# ipv6 nd raguard attach-policy Mypolicy	Attaches the RA Guard policy to the wireless client vlans.
<b>Step 10</b>	<b>ipv6 nd ra-throttler attach-policy Mythrottle</b> <b>Example:</b> Switch (config-vlan-config)# ipv6 nd ra-throttler attach-policy Mythrottle	Attaches the RA throttling policy to the wireless client vlans.

## Example: Configuring IPv6 Neighbor Binding

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<pre>ipv6 neighbor binding [vlan ]19 2001:db8::25:4 interface tenGigabitEthernet 1/0/3 aaa.bbb.ccc</pre> <p><b>Example:</b></p> <pre>Switch (config)# ipv6 neighbor binding vlan 19 2001:db8::25:4 interface tenGigabitEthernet 1/0/3 aaa.bbb.ccc</pre>	Sets and validates the neighbor 2001:db8::25:4 only valid when transmitting on VLAN 19 through interface te1/0/3 with the source mac-address as aaa.bbb.ccc.

## Prerequisites for IPv6 Web Authentication

The following configurations must be in place before you start with IPv6 Web Authentication:

- IPv6 Device Tracking.
- IPv6 DHCP Snooping.
- Disable security of type 802.1x on the wlan.
- Each WLAN must have a vlan associated to it.
- Change the default wlan setting from **shutdown** to **no shutdown**.

## Information About IPv6 Web Authentication

Web authentication is a Layer 3 security feature and the switch disallows IP traffic (except DHCP and DNS -related packets) from a particular client until it supplies a valid username and password. It is a simple authentication method without the need for a supplicant or client utility. Web authentication is typically used by customers who deploy a guest-access network. Traffic from both, HTTP and HTTPS, page is allowed to display the login page.

### Note

Web authentication does not provide data encryption and is typically used as simple guest access for either a hot spot or campus atmosphere, where connectivity is always a factor.

A WLAN is configured as **security webauth** for web based authentication. The switch supports the following types of web based authentication:

- Web Authentication – The client enters the credentials in a web page which is then validated by the Wlan controller.
- Web Consent – The Wlan controller presents a policy page with Accept/Deny buttons. Click Accept button to access the network.

A Wlan is typically configured for open authentication, that is without Layer 2 authentication, when web-based authentication mechanism is used.

## Web Authentication Process

The following events occur when a WLAN is configured for web authentication:

- The user opens a web browser and enters a URL address, for example, *http://www.example.com*. The client sends out a DNS request for this URL to get the IP address for the destination. The switch bypasses the DNS request to the DNS server, which in turn responds with a DNS reply that contains the IP address of the destination *www.example.com*. This, in turn, is forwarded to the wireless clients.
- The client then tries to open a TCP connection with the destination IP address. It sends out a TCP SYN packet destined to the IP address of *www.example.com*.
- The switch has rules configured for the client and cannot act as a proxy for *www.example.com*. It sends back a TCP SYN-ACK packet to the client with source as the IP address of *www.example.com*. The client sends back a TCP ACK packet in order to complete the three-way TCP handshake and the TCP connection is fully established.
- The client sends an HTTP GET packet destined to *www.example.com*. The switch intercepts this packet and sends it for redirection handling. The HTTP application gateway prepares an HTML body and sends it back as the reply to the HTTP GET requested by the client. This HTML makes the client go to the default web-page of the switch, for example, *http://<Virtual-Server-IP>/login.html*.
- The client closes the TCP connection with the IP address, for example, *www.example.com*.
- If the client wants to go to virtual IP, the client tries to open a TCP connection with the virtual IP address of the switch. It sends a TCP SYN packet for virtual IP to the switch.

- The switch responds back with a TCP SYN-ACK and the client sends back a TCP ACK to the switch in order to complete the handshake.
- The client sends an HTTP GET for */login.html* destined to virtual IP in order to request for the login page.
- This request is allowed to the web server of the switch, and the server responds with the default login page. The client receives the login page in the browser window where the user can log in.

# How to Configure IPv6 Web Authentication

## Disabling WPA

### Before you begin

Disable 802.1x. A typical web authentication does not use Layer 2 security. Use this configuration to remove Layer 2 security.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>wlan test1 2 test1</b> <b>Example:</b> Switch(config)# <code>wlan test1 2 test1</code>	Creates a WLAN and assign an SSID to it.
<b>Step 3</b>	<b>no security wpa</b> <b>Example:</b> Switch(config-wlan)# <code>no security wpa</code>	Disables the WPA support for Wlan.

**What to do next**

Enable the following:

- Security Web Authentication.
- Parameter Local.
- Authentication List.

## Configuring a Global WebAuth WLAN Parameter Map

Use this example to configure a global web auth WLAN and add a parameter map to it.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>parameter-map type webauth global</b>  <b>Example:</b> Switch (config)# parameter-map type webauth global	Configures a global webauth and adds a parameter map to it.
<b>Step 2</b>	<b>virtual-ip ipv6 2001 : db8 : 4 : : 1</b>  <b>Example:</b> Switch (config-params-parameter-map)# virtual-ip ipv6 2001:db8:4::1	Defines a virtual gateway IP address that appears to the wireless clients for authentication.
<b>Step 3</b>	<b>ratelimit init-state-sessions 120</b>  <b>Example:</b> Switch (config-params-parameter-map)# ratelimit init-state-sessions 120	Sets the global ratelimit to limit the bandwidth that the web clients can use on the switch to avoid over-flooding attacks.

	Command or Action	Purpose
<b>Step 4</b>	<b>max-https-conns 70</b> <b>Example:</b> Switch (config-params-parameter-map) # max-http-conns 70	Sets the maximum number of attempted http connections on the switch to avoid over-flooding attacks.

**Related Topics**

## Configuring the WLAN

**Before you begin**

- The WLAN must have a Vlan associated with it. By default, a new Wlan is always associated with Vlan 1, which can be changed as per the configuration requirements.
- Configure and enable the WLAN to *no shutdown*. By default, the Wlan is configured with the *shutdown* parameter and is disabled.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>wlan 1</b> <b>Example:</b> Switch(config-wlan)# wlan 1 name vicweb ssid vicweb	Creates a wlan and assign an SSID to it.
<b>Step 2</b>	<b>client vlan interface ID</b> <b>Example:</b> Switch(config-wlan)# client vlan VLAN0136	Assigns the client to vlan interface.
<b>Step 3</b>	<b>security web-auth authentication list webauthlistlocal</b> <b>Example:</b> Switch(config-wlan)# security web-auth authentication-list webauthlistlocal	Configures web authentication for the wlan.
<b>Step 4</b>	<b>security web-auth parameter-map global</b> <b>Example:</b> Switch(config-wlan)# security web-auth parameter-map global	Configures the parameter map on the wlan.
<b>Step 5</b>	<b>no security wpa</b> <b>Example:</b> Switch(config-wlan)# no security wpa	Configures the security policy for a wlan. This enables the wlan.

	Command or Action	Purpose
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b> Switch(config-wlan)# no shutdown	Configures and enables the Wlan.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## CHAPTER 19

# Configuring IPv6 Client Mobility

- [Prerequisites for IPv6 Client Mobility, on page 281](#)
- [Restrictions For IPv6 Client Mobility, on page 281](#)
- [Information About IPv6 Client Mobility, on page 282](#)
- [Verifying IPv6 Client Mobility, on page 285](#)
- [Monitoring IPv6 Client Mobility, on page 285](#)
- [Additional References, on page 286](#)
- [Feature Information For IPv6 Client Mobility, on page 287](#)

## Prerequisites for IPv6 Client Mobility

To enable wireless IPv6 client connectivity, the underlying wired network must support IPv6 routing and an address assignment mechanism such as SLAAC or DHCPv6. The switch must have L2 adjacency to the IPv6 router, and the VLAN needs to be tagged when the packets enter the switch. APs do not require connectivity on an IPv6 network, as all traffic is encapsulated inside the IPv4 CAPWAP tunnel between the AP and switch.

## Restrictions For IPv6 Client Mobility

- When using the IPv6 Client Mobility, clients must support IPv6 with either static stateless auto configuration (such as Windows XP clients) or stateful DHCPv6 IP addressing (such as Windows 7 clients).
- To allow smooth operation of stateful DHCPv6 IP addressing, you must have a switch or router that supports the DHCP for IPv6 feature (such as the switch) that is configured to act like a DHCPv6 server, or you need a dedicated server such as a Windows 2008 server with a built-in DHCPv6 server. Cisco Catalyst 3850 switch and Cisco Catalyst 5700 switch can act as (internal) a DHCPv6 server.

---

**Note** To load the SDM IPv6 template in the Cisco Catalyst 3850 switch, enter the **sdm prefer dual-ipv4** and **v6 default** command and then reset the switch.

---

## Information About IPv6 Client Mobility

The Switch supports IPv6 mobility for IPv6-only or dual-stack nodes. The IPv6 Client Mobility is divided into:

- Link Layer and
- Network Layer

The link layer is handled by the 802.11 protocol which enables the client to roam to any AP in the same BSS (basic service set) identified by the same SSID without losing the link layer connectivity.

However, link layer mobility is not enough to make wireless client Layer 3 applications continue to work seamlessly while roaming. Cisco IOSd's wireless mobility module uses mobility tunneling to retain seamless connectivity for the client's Layer 3 PoP (point of presence) when the client roams across different subnets on different switches.

IPv6 is the next-generation network layer Internet protocol intended to replace IPv4 in the TCP/IP suite of protocols. This new version increases the internet global address space to accommodate users and applications that require unique global IP addresses. IPv6 incorporates 128-bit source and destination addresses, which provide significantly more addresses than the 32-bit IPv4 addresses.

To support IPv6 clients across controllers, ICMPv6 messages must be dealt with specially to ensure the IPv6 client remains on the same Layer 3 network. The switch keep track of IPv6 clients by intercepting the ICMPv6 messages to provide seamless mobility and protect the network from network attacks. The NDP (neighbor discovery packets) packets are converted from multicast to unicast and delivered individually per client. This unique solution ensures that Neighbor Discovery and Router Advertisement packets are not leaked across Vlans. Clients can receive specific Neighbor Discovery and Router Advertisement packets ensuring correct IPv6 addressing and avoids unnecessary multicast traffic.

The configuration for IPv6 mobility is the same as IPv4 mobility and requires no separate software on the client side to achieve seamless roaming. The switch must be part of the same mobility group. Both IPv4 and IPv6 client mobility are enabled by default.

IPv6 client mobility is used for the following:

- Retaining the client IPv6 multiple addresses in Layer-2 and Layer-3 roaming.
- IPv6 Neighbor Discovery Protocol (NDP) packet management.
- Client IPv6 addresses learning.

## Using Router Advertisement

The Neighbor Discovery Protocol (NDP) operates in the link-layer and is responsible for the discovery of other nodes on the link. It determines the link-layer addresses of other nodes, finds the available routers, and maintains reachability information about the paths to other active neighbor nodes.

Router Advertisement (RA) is one of the IPv6 Neighbor Discovery Protocol (NDP) packets that is used by the hosts to discover available routers, acquire the network prefix to generate the IPv6 addresses, link MTU, and so on. The routers send RA on a regular basis, or in response to hosts Router Solicitation messages.

IPv6 wireless client mobility manages the IPv6 RA packet. The converged access switch forwards the link-local all-nodes multicast RA packets to the local and roaming wireless nodes mapped on same VLAN the RA was received on.

Figure 1 illustrates the link-local all-nodes mcast RA forwarding issue in the wireless node mobility.

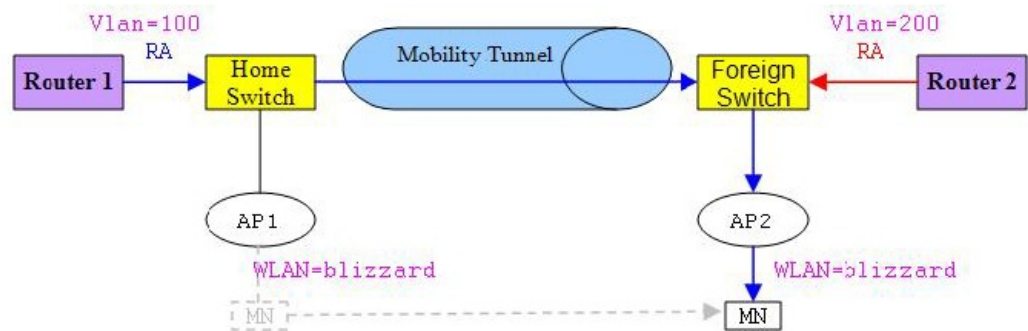

**Figure 11: Roaming Client Receiving Invalid RA from Router 2**

334007

Figure 2 illustrates how a roaming client “MN” receives RA from VLAN 200 in a foreign switch and how it acquires a new IP address and breaks into L3 mobility's point of presence.

**Figure 12: Roaming Client Receives Valid RA from Router 1**

## IPv6 Address Learning

There are three ways for IPv6 client to acquire IPv6 addresses:

- Stateless Address Auto-Configuration (SLAAC)
- Stateful DHCPv6
- Static configuration

For these methods, the IPv6 client always sends NS DAD (duplicate address detection) to ensure that there is no duplicated IP address on the network. The switch snoops the clients NDP and DHCPv6 packets to learn about its client IP addresses and then updates the controllers database. The database then informs the controller for the clients new IP address.

### Related Topics

[Verifying IPv6 Client Mobility](#), on page 285

[Monitoring IPv6 Client Mobility](#), on page 285

## Handling Multiple IP Addresses

In the case when the new IP address is received after RUN state, whether an addition or removal, the controller updates the new IP addresses on its local database for display purposes. Essentially, the IPv6 uses the existing or same PEM state machine code flow as in IPv4. When the IP addresses are requested by external entities, for example, from Prime Infrastructure, the controller will include all the available IP addresses, IPv4 and IPv6, in the API/SPI interface to the external entities.

An IPv6 client can acquire multiple IP addresses from stack for different purposes. For example, a link-local address for link local traffic, and a routable unique local or global address.

When the client is in the DHCP request state and the controller receives the first IP address notification from the database for either an IPv4 or IPv6 address, the PEM moves the client into the RUN state.

When a new IP address is received after the RUN state, either for addition or removal, the controller updates the new IP addresses on its local database for display purposes.

When the IP addresses are requested by external entities, for example, from Prime Infrastructure, the controller provides the available IP addresses, both IPv4 and IPv6, to the external entities.

## IPv6 Configuration

The switch supports IPv6 client as seamlessly as the IPv4 clients. The administrator must manually configure the Vlans to enable the IPV6, IPv6's snooping and throttling functionality. This will enable the NDP packets to throttle between the switch and its various clients

### Related Topics

[Verifying IPv6 Client Mobility](#), on page 285

[Monitoring IPv6 Client Mobility](#), on page 285

## High Availability

The switch will sync with the wireless clients when the clients IP address is hard to learn. When a switchover happens, the IPv6 neighbor binding table is synced to standby state. However, the wireless client will itself disassociate and reassociate to a new active state once the switchover is complete and the neighbor binding table is updated with latest information for that client.

If, during the reassociation, the client moves to another AP then the original entry in the binding table is marked as down for sometime and will be aged-out.

For the new entries joining the switch from another AP, the new IP address is learned and notified to the controller's database.

**Note** This feature is available only for the Cisco Catalyst 3850 Switch.

## Pre-requisites for IPv6 Mobility

The mobility and its related infrastructure must be configured and ready for use.

## Information About IPv6 Mobility

Mobility, or roaming, is a wireless LAN client's ability to maintain its association seamlessly from one access point to another securely and with as little latency as possible. This section explains how mobility works whenswitch are included in a wireless network.

When a wireless client associates and authenticates to an access point, the access point's switch places an entry for that client in its client database. This entry includes the client's MAC and IP addresses, security context and associations, quality of service (QoS) contexts, the WLAN, and the associated access point. The switch uses this information to forward frames and manage traffic to and from the wireless client.

When the wireless client moves its association from one access point to another, the switch simply updates the client database with the newly associated access point. If necessary, new security context and associations are established as well. The process becomes more complicated, however, when a client roams from an access point joined to one switch to an access point joined to a different switch. It also varies based on whether theswitch are operating on the same subnet.

## Inter Controller Roaming

When the client associates to an access point joined to a new switch, the new switch exchanges mobility messages with the original switch, and the client database entry is moved to the new switch if sticky anchoring is disabled.

**Related Topics**

[Monitoring IPv6 Mobility](#), on page 290

## Intra Subnet Roaming with Sticky Anchoring, and Inter Subnet Roaming

Inter-subnet roaming is similar to inter-controller roaming in that the switch exchange mobility messages on the client roam. However, instead of moving the client database entry to the new switch, the original switch marks the client with an "Anchor" entry in its own client database. The database entry is copied to the new switch client database and marked with a "Foreign" entry in the new switch. The roam remains transparent to the wireless client, and the client maintains its original IP address.

In inter-subnet roaming, WLANs on both anchor and foreign switch need to have the same network access privileges and no source-based routing or source-based firewalls in place. Otherwise, the clients may have network connectivity issues after the handoff.

For more information on configuring mobility see, the Cisco 5700 Wireless LAN Controller Mobility Configuration Guide, Cisco IOS XE, Release 3.2SE.

## How to Configure IPv6 Mobility

### Monitoring IPv6 Mobility

This chapter displays the mobility related IPv6 configuration. To see the mobility related configurations refer to the Cisco 5700 Wireless LAN Controller Mobility Configuration Guide, Cisco IOS XE 3.2SE.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>show ipv6 neighbors binding mac C0C1 . C06B . C4E2</b>  <b>Example:</b> Switch# show ipv6 neighbors binding mac C0C1.C06B.C4E2	Displays the IPv6 related mobility configurations.

**Example**

```
Switch# show ipv6 neighbors binding mac C0C1.C06B.C4E2
Binding Table has 45 entries, 37 dynamic (limit 100)
Codes: L - Local, S - Static, ND - Neighbor Discovery, DH - DHCP, PKT - Other Packet, API
- API created
Preflevel flags (prlvl):
0001:MAC and LLA match      0002:Orig trunk           0004:Orig access
0008:Orig trusted trunk    0010:Orig trusted access  0020:DHCP assigned
0040:Cga authenticated     0080:Cert authenticated   0100:Statically assigned
```

## CHAPTER 21

# Configuring HSRP

- [Configuring HSRP](#) , on page 297

## Configuring HSRP

This chapter describes how to use Hot Standby Router Protocol (HSRP) to provide routing redundancy for routing IP traffic without being dependent on the availability of any single router.

You can also use a version of HSRP in Layer 2 mode to configure a redundant command switch to take over cluster management if the cluster command switch fails.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring HSRP

### HSRP Overview

HSRP is Cisco's standard method of providing high network availability by providing first-hop redundancy for IP hosts on an IEEE 802 LAN configured with a default gateway IP address. HSRP routes IP traffic without relying on the availability of any single router. It enables a set of router interfaces to work together to present the appearance of a single virtual router or default gateway to the hosts on a LAN. When HSRP is configured on a network or segment, it provides a virtual Media Access Control (MAC) address and an IP address that is shared among a group of configured routers. HSRP allows two or more HSRP-configured routers to use the MAC address and IP network address of a virtual router. The virtual router does not exist; it represents the common target for routers that are configured to provide backup to each other. One of the routers is selected to be the active router and another to be the standby router, which assumes control of the group MAC address and IP address should the designated active router fail.

---

**Note** Routers in an HSRP group can be any router interface that supports HSRP, including routed ports and switch virtual interfaces (SVIs).

---

HSRP provides high network availability by providing redundancy for IP traffic from hosts on networks. In a group of router interfaces, the active router is the router of choice for routing packets; the standby router is the router that takes over the routing duties when an active router fails or when preset conditions are met.

HSRP is useful for hosts that do not support a router discovery protocol and cannot switch to a new router when their selected router reloads or loses power. When HSRP is configured on a network segment, it provides a virtual MAC address and an IP address that is shared among router interfaces in a group of router interfaces running HSRP. The router selected by the protocol to be the active router receives and routes packets destined for the group's MAC address. For  $n$  routers running HSRP, there are  $n + 1$  IP and MAC addresses assigned.

HSRP detects when the designated active router fails, and a selected standby router assumes control of the Hot Standby group's MAC and IP addresses. A new standby router is also selected at that time. Devices running HSRP send and receive multicast UDP-based hello packets to detect router failure and to designate active and standby routers. When HSRP is configured on an interface, Internet Control Message Protocol (ICMP) redirect messages are automatically enabled for the interface.

You can configure multiple Hot Standby groups among switches and switch stacks that are operating in Layer 3 to make more use of the redundant routers. To do so, specify a group number for each Hot Standby command group you configure for an interface. For example, you might configure an interface on switch 1 as an active router and one on switch 2 as a standby router and also configure another interface on switch 2 as an active router with another interface on switch 1 as its standby router.

The following figure shows a segment of a network configured for HSRP. Each router is configured with the MAC address and IP network address of the virtual router. Instead of configuring hosts on the network with the IP address of Router A, you configure them with the IP address of the virtual router as their default router. When Host C sends packets to Host B, it sends them to the MAC address of the virtual router. If for any reason, Router A stops transferring packets, Router B responds to the virtual IP address and virtual MAC address and becomes the active router, assuming the active router duties. Host C continues to use the IP address of the virtual router to address packets destined for Host B, which Router B now receives and sends to Host B. Until Router A resumes operation, HSRP allows Router B to provide uninterrupted service to users on Host C's segment that need to communicate with users on Host B's segment and also continues to perform its normal function of handling packets between the Host A segment and Host B.

Figure 13: Typical HSRP Configuration

You can configure multiple Hot Standby groups among switches and switch stacks that are operating in Layer 3 to make more use of the redundant routers. To do so, specify a group number for each Hot Standby command group you configure for an interface. For example, you might configure an interface on switch 1 as an active router and one on switch 2 as a standby router and also configure another interface on switch 2 as an active router with another interface on switch 1 as its standby router.

## HSRP Versions

Cisco IOS XE Release 3.3SE and later support these Hot Standby Router Protocol (HSRP) versions:

The switch supports these HSRP versions:

- HSRPv1- Version 1 of the HSRP, the default version of HSRP. It has these features:
  - The HSRP group number can be from 0 to 255.
  - HSRPv1 uses the multicast address 224.0.0.2 to send hello packets, which can conflict with Cisco Group Management Protocol (CGMP) leave processing. You cannot enable HSRPv1 and CGMP at the same time; they are mutually exclusive.
- HSRPv2- Version 2 of the HSRP has these features:
  - HSRPv2 uses the multicast address 224.0.0.102 to send hello packets. HSRPv2 and CGMP leave processing are no longer mutually exclusive, and both can be enabled at the same time.
  - HSRPv2 has a different packet format than HSRPv1.

A switch running HSRPv1 cannot identify the physical router that sent a hello packet because the source MAC address of the router is the virtual MAC address.

HSRPv2 has a different packet format than HSRPv1. A HSRPv2 packet uses the type-length-value (TLV) format and has a 6-byte identifier field with the MAC address of the physical router that sent the packet.

If an interface running HSRPv1 gets an HSRPv2 packet, the type field is ignored.

## Multiple HSRP

The switch supports Multiple HSRP (MHSRP), an extension of HSRP that allows load sharing between two or more HSRP groups. You can configure MHSRP to achieve load-balancing and to use two or more standby groups (and paths) from a host network to a server network.

In the figure below, half the clients are configured for Router A, and half the clients are configured for Router B. Together, the configuration for Routers A and B establishes two HSRP groups. For group 1, Router A is the default active router because it has the assigned highest priority, and Router B is the standby router. For group 2, Router B is the default active router because it has the assigned highest priority, and Router A is the standby router. During normal operation, the two routers share the IP traffic load. When either router becomes unavailable, the other router becomes active and assumes the packet-transfer functions of the router that is unavailable.

**Note** For MHSRP, you need to enter the **standby preempt** interface configuration command on the HSRP interfaces so that if a router fails and then comes back up, preemption restores load sharing.

**Figure 14: MHSRP Load Sharing**

## SSO HSRP

SSO HSRP alters the behavior of HSRP when a device with redundant Route Processors (RPs) is configured for stateful switchover (SSO) redundancy mode. When an RP is active and the other RP is standby, SSO enables the standby RP to take over if the active RP fails.

With this functionality, HSRP SSO information is synchronized to the standby RP, allowing traffic that is sent using the HSRP virtual IP address to be continuously forwarded during a switchover without a loss of data or a path change. Additionally, if both RPs fail on the active HSRP device, then the standby HSRP device takes over as the active HSRP device.

The feature is enabled by default when the redundancy mode of operation is set to SSO.

## HSRP and Switch Stacks

HSRP hello messages are generated by the stack master. If an HSRP-active stack master fails, a flap in the HSRP active state might occur. This is because HSRP hello messages are not generated while a new stack master is elected and initialized, and the standby router might become active after the stack master fails.

## Configuring HSRP for IPv6

Switches running the IP Services and IP Base feature set support the Hot Standby Router Protocol (HSRP) for IPv6. HSRP provides routing redundancy for routing IPv6 traffic not dependent on the availability of any single router. IPv6 hosts learn of available routers through IPv6 neighbor discovery router advertisement messages. These messages are multicast periodically or are solicited by hosts.

An HSRP IPv6 group has a virtual MAC address that is derived from the HSRP group number and a virtual IPv6 link-local address that is, by default, derived from the HSRP virtual MAC address.

Periodic messages are sent for the HSRP virtual IPv6 link-local address when the HSRP group is active. These messages stop after a final one is sent when the group leaves the active state.

**Note** When configuring HSRP for IPv6, you must enable HSRP version 2 (HSRPv2) on the interface.

## How to Configure HSRP

### Default HSRP Configuration

*Table 27: Default HSRP Configuration*

Feature	Default Setting
HSRP version	Version 1
HSRP groups	None configured
Standby group number	0
Standby MAC address	System assigned as: 0000.0c07.acXX, where XX is the HSRP group number
Standby priority	100
Standby delay	0 (no delay)
Standby track interface priority	10
Standby hello time	3 seconds
Standby holdtime	10 seconds

### HSRP Configuration Guidelines

- HSRPv2 and HSRPv1 are mutually exclusive. HSRPv2 is not interoperable with HSRPv1 on an interface and the reverse.

- In the procedures, the specified interface must be one of these Layer 3 interfaces:
  - Routed port: A physical port configured as a Layer 3 port by entering the **no switchport** command in interface configuration mode.
  - SVI: A VLAN interface created by using the **interface vlan** *vlan\_id* in global configuration mode, and by default a Layer 3 interface.
  - Etherchannel port channel in Layer 3 mode: A port-channel logical interface created by using the **interface port-channel** *port-channel-number* in global configuration mode, and binding the Ethernet interface into the channel group.
- All Layer 3 interfaces must have IP addresses assigned to them.
- If you change the HSRP version on an interface, each HSRP group resets because it now has a new virtual MAC address.
- Examples of valid and invalid group numbers:
  - If you configure groups with the numbers 2, 150, and 225, you cannot configure another group with the number 3850. It is not in the range of 0 to 255.
  - If you configure groups with the numbers 520, 600, and 700, you cannot configure another group with the number 900. It is not in the range of 512 to 767.

## Enabling HSRP

The **standby ip** interface configuration command activates HSRP on the configured interface. If an IP address is specified, that address is used as the designated address for the Hot Standby group. If no IP address is specified, the address is learned through the standby function. You must configure at least one Layer 3 port on the LAN with the designated address. Configuring an IP address always overrides another designated address currently in use.

When the **standby ip** command is enabled on an interface and proxy ARP is enabled, if the interface's Hot Standby state is active, proxy ARP requests are answered using the Hot Standby group MAC address. If the interface is in a different state, proxy ARP responses are suppressed.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch(config)# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Switch(config)# <b>interface</b> <b>gigabitethernet1/0/1</b>	Enters interface configuration mode, and enter the Layer 3 interface on which you want to enable HSRP.
<b>Step 3</b>	<b>standby version</b> { 1   2 } <b>Example:</b> Switch(config-if)# <b>standby version 1</b>	(Optional) Configures the HSRP version on the interface. <ul style="list-style-type: none"> <li>• 1- Selects HSRPv1.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• 2- Selects HSRPv2.</li> </ul> <p>If you do not enter this command or do not specify a keyword, the interface runs the default HSRP version, HSRP v1.</p>
<b>Step 4</b>	<p><b>standby</b> [<i>group-number</i>] <b>ip</b> [<i>ip-address</i>] [<b>secondary</b>]</p> <p><b>Example:</b></p> <pre>Switch(config-if)# standby 1 ip</pre>	<p>Creates (or enable) the HSRP group using its number and virtual IP address.</p> <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>- The group number on the interface for which HSRP is being enabled. The range is 0 to 255; the default is 0. If there is only one HSRP group, you do not need to enter a group number.</li> <li>• (Optional on all but one interface) <i>ip-address</i>- The virtual IP address of the hot standby router interface. You must enter the virtual IP address for at least one of the interfaces; it can be learned on the other interfaces.</li> <li>• (Optional) <b>secondary</b>- The IP address is a secondary hot standby router interface. If neither router is designated as a secondary or standby router and no priorities are set, the primary IP addresses are compared and the higher IP address is the active router, with the next highest as the standby router.</li> </ul>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode
<b>Step 6</b>	<p><b>show standby</b> [<i>interface-id</i>] [<i>group</i>]</p> <p><b>Example:</b></p> <pre>Switch # show standby</pre>	Verifies the configuration of the standby groups.
<b>Step 7</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring HSRP Priority

The **standby priority**, **standby preempt**, and **standby track** interface configuration commands are all used to set characteristics for finding active and standby routers and behavior regarding when a new active router takes over.

When configuring HSRP priority, follow these guidelines:

- Assigning a priority allows you to select the active and standby routers. If preemption is enabled, the router with the highest priority becomes the active router. If priorities are equal, the current active router does not change.
- The highest number (1 to 255) represents the highest priority (most likely to become the active router).
- When setting the priority, preempt, or both, you must specify at least one keyword (**priority**, **preempt**, or both)
- The priority of the device can change dynamically if an interface is configured with the **standby track** command and another interface on the router goes down.
- The **standby track** interface configuration command ties the router hot standby priority to the availability of its interfaces and is useful for tracking interfaces that are not configured for HSRP. When a tracked interface fails, the hot standby priority on the device on which tracking has been configured decreases by 10. If an interface is not tracked, its state changes do not affect the hot standby priority of the configured device. For each interface configured for hot standby, you can configure a separate list of interfaces to be tracked
- The **standby track interface-priority** interface configuration command specifies how much to decrement the hot standby priority when a tracked interface goes down. When the interface comes back up, the priority is incremented by the same amount.
- When multiple tracked interfaces are down and *interface-priority* values have been configured, the configured priority decrements are cumulative. If tracked interfaces that were not configured with priority values fail, the default decrement is 10, and it is noncumulative.
- When routing is first enabled for the interface, it does not have a complete routing table. If it is configured to preempt, it becomes the active router, even though it is unable to provide adequate routing services. To solve this problem, configure a delay time to allow the router to update its routing table.

Beginning in privileged EXEC mode, use one or more of these steps to configure HSRP priority characteristics on an interface:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch # <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface interface-id</b>  <b>Example:</b> Switch(config)# <b>interface</b> <b>gigabitethernet1/0/1</b>	Enters interface configuration mode, and enter the HSRP interface on which you want to set priority.
<b>Step 3</b>	<b>standby [group-number] prioritypriority</b>  <b>Example:</b>	Sets a <b>priority</b> value used in choosing the active router. The range is 1 to 255; the default priority is 100. The highest number represents the highest priority.

	Command or Action	Purpose
	Switch(config-if)# <b>standby 120 priority 50</b>	<ul style="list-style-type: none"> <li>• (Optional) group-number—The group number to which the command applies.</li> </ul> <p>Use the <b>no</b> form of the command to restore the default values.</p>
<b>Step 4</b>	<b>standby</b> [ <i>group-number</i> ] <b>preempt</b> [ <b>delay</b> [ <i>minimumseconds</i> ] [ <i>reloadseconds</i> ] [ <i>syncseconds</i> ] ]  <b>Example:</b> Switch(config-if)# <b>standby 1 preempt delay 300</b>	<p>Configures the router to <b>preempt</b>, which means that when the local router has a higher priority than the active router, it becomes the active router.</p> <ul style="list-style-type: none"> <li>• (Optional) group-number—The group number to which the command applies.</li> <li>• (Optional) <b>delay minimum</b>—Set to cause the local router to postpone taking over the active role for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> <li>• (Optional) <b>delay reload</b>—Set to cause the local router to postpone taking over the active role after a reload for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over after a reload).</li> <li>• (Optional) <b>delay sync</b>—Set to cause the local router to postpone taking over the active role so that IP redundancy clients can reply (either with an ok or wait reply) for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> </ul> <p>Use the <b>no</b> form of the command to restore the default values.</p>
<b>Step 5</b>	<b>standby</b> [ <i>group-number</i> ] <b>track</b> <i>type number</i> [ <i>interface-priority</i> ]  <b>Example:</b> Switch(config-if)# <b>standby track interface gigabitethernet1/1/1</b>	<p>Configures an interface to track other interfaces so that if one of the other interfaces goes down, the device's Hot Standby priority is lowered.</p> <ul style="list-style-type: none"> <li>• (Optional) group-number- The group number to which the command applies.</li> <li>• type- Enter the interface type (combined with interface number) that is tracked.</li> <li>• number- Enter the interface number (combined with interface type) that is tracked.</li> <li>• (Optional) interface-priority- Enter the amount by which the hot standby priority for the router is decremented or</li> </ul>

	Command or Action	Purpose
		incremented when the interface goes down or comes back up. The default value is 10.
<b>Step 6</b>	<b>end</b> <b>Example:</b>  Switch(config-if) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show running-config</b>	Verifies the configuration of the standby groups.
<b>Step 8</b>	<b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring MHSRP

To enable MHSRP and load-balancing, you configure two routers as active routers for their groups, with virtual routers as standby routers as shown in the *MHSRP Load Sharing* figure in the Multiple HSRP section. You need to enter the **standby preempt** interface configuration command on each HSRP interface so that if a router fails and comes back up, the preemption occurs and restores load-balancing.

Router A is configured as the active router for group 1, and Router B is configured as the active router for group 2. The HSRP interface for Router A has an IP address of 10.0.0.1 with a group 1 standby priority of 110 (the default is 100). The HSRP interface for Router B has an IP address of 10.0.0.2 with a group 2 standby priority of 110.

Group 1 uses a virtual IP address of 10.0.0.3 and group 2 uses a virtual IP address of 10.0.0.4.

### Configuring Router A

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch # <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface type number</b> <b>Example:</b> Switch (config)# <b>interface</b> <b>gigabitethernet1/0/1</b>	Configures an interface type and enters interface configuration mode.
<b>Step 3</b>	<b>no switchport</b> <b>Example:</b> Switch (config)# <b>no switchport</b>	Switches an interface that is in Layer 2 mode into Layer 3 mode for Layer 3 configuration.
<b>Step 4</b>	<b>ip address ip-address mask</b> <b>Example:</b>	Specifies an IP address for an interface.

	Command or Action	Purpose
	Switch (config-if)# 10.0.0.1 255.255.255.0	
<b>Step 5</b>	<p><b>standby</b> [<i>group-number</i>] <b>ip</b> [<i>ip-address</i> [<i>secondary</i>]]</p> <p><b>Example:</b></p> <pre>Switch (config-if)# standby 1 ip 10.0.0.3</pre>	<p>Creates the HSRP group using its number and virtual IP address.</p> <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>- The group number on the interface for which HSRP is being enabled. The range is 0 to 255; the default is 0. If there is only one HSRP group, you do not need to enter a group number.</li> <li>• (Optional on all but one interface) <i>ip-address</i>- The virtual IP address of the hot standby router interface. You must enter the virtual IP address for at least one of the interfaces; it can be learned on the other interfaces.</li> <li>• (Optional) <b>secondary</b>- The IP address is a secondary hot standby router interface. If neither router is designated as a secondary or standby router and no priorities are set, the primary IP addresses are compared and the higher IP address is the active router, with the next highest as the standby router.</li> </ul>
<b>Step 6</b>	<p><b>standby</b> [<i>group-number</i>] <b>priority</b> <i>priority</i></p> <p><b>Example:</b></p> <pre>Switch(config-if)# standby 1 priority 110</pre>	<p>Sets a <b>priority</b> value used in choosing the active router. The range is 1 to 255; the default priority is 100. The highest number represents the highest priority.</p> <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>—The group number to which the command applies.</li> </ul> <p>Use the <b>no</b> form of the command to restore the default values.</p>
<b>Step 7</b>	<p><b>standby</b> [<i>group-number</i>] <b>preempt</b> [<b>delay</b> [<i>minimum seconds</i>] [<b>reload</b> <i>seconds</i>] [<b>sync</b> <i>seconds</i>]]</p> <p><b>Example:</b></p> <pre>Switch(config-if)# standby 1 preempt delay 300</pre>	<p>Configures the router to <b>preempt</b>, which means that when the local router has a higher priority than the active router, it becomes the active router.</p> <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>-The group number to which the command applies.</li> <li>• (Optional) <b>delay minimum</b>—Set to cause the local router to postpone taking over the active role for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• (Optional) <b>delay reload</b>—Set to cause the local router to postpone taking over the active role after a reload for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over after a reload).</li> <li>• (Optional) <b>delay sync</b>—Set to cause the local router to postpone taking over the active role so that IP redundancy clients can reply (either with an ok or wait reply) for the number of seconds shown. <b>Step 8</b>	<p><b>standby</b> [<i>group-number</i>] <b>ip</b> [<i>ip-address</i> [<i>secondary</i>]]</p> <p><b>Example:</b></p> <pre>Switch (config-if)# standby 2 ip 10.0.0.4</pre>	<p>Creates the HSRP group using its number and virtual IP address.</p> <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>- The group number on the interface for which HSRP is being enabled. The range is 0 to 255; the default is 0. If there is only one HSRP group, you do not need to enter a group number.</li> <li>• (Optional on all but one interface) <i>ip-address</i>- The virtual IP address of the hot standby router interface. You must enter the virtual IP address for at least one of the interfaces; it can be learned on the other interfaces.</li> <li>• (Optional) <b>secondary</b>- The IP address is a secondary hot standby router interface. If neither router is designated as a secondary or standby router and no priorities are set, the primary IP addresses are compared and the higher IP address is the active router, with the next highest as the standby router.</li> </ul>
<b>Step 9</b>	<p><b>standby</b> [<i>group-number</i>] <b>preempt</b> [<b>delay</b> [<i>minimum seconds</i>] [<b>reload</b> <i>seconds</i>] [<b>sync</b> <i>seconds</i>]]</p> <p><b>Example:</b></p> <pre>Switch(config-if)# standby 2 preempt delay 300</pre>	<p>Configures the router to <b>preempt</b>, which means that when the local router has a higher priority than the active router, it becomes the active router.</p> <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>-The group number to which the command applies.</li> <li>• (Optional) <b>delay minimum</b>—Set to cause the local router to postpone taking over</li> </ul>

	Command or Action	Purpose
		<p>the active role for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</p> <ul style="list-style-type: none"> <li>• (Optional) <b>delay reload</b>—Set to cause the local router to postpone taking over the active role after a reload for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over after a reload).</li> <li>• (Optional) <b>delay sync</b>—Set to cause the local router to postpone taking over the active role so that IP redundancy clients can reply (either with an ok or wait reply) for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> </ul> <p>Use the <b>no</b> form of the command to restore the default values.</p>
<b>Step 10</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 11</b>	<p><b>show running-config</b></p>	Verifies the configuration of the standby groups.
<b>Step 12</b>	<p><b>copy running-config startup-config</b></p>	(Optional) Saves your entries in the configuration file.

## Configuring Router B

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch # configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>interface <i>type number</i></b></p> <p><b>Example:</b></p> <pre>Switch (config)# interface gigabitethernet1/0/1</pre>	Configures an interface type and enters interface configuration mode.
<b>Step 3</b>	<p><b>no switchport</b></p> <p><b>Example:</b></p>	Switches an interface that is in Layer 2 mode into Layer 3 mode for Layer 3 configuration.

	Command or Action	Purpose
	Switch (config)# <b>no switchport</b>	
<b>Step 4</b>	<b>ip address</b> <i>ip-address mask</i> <b>Example:</b> Switch (config-if)# <b>10.0.0.2</b> <b>255.255.255.0</b>	Specifies an IP address for an interface.
<b>Step 5</b>	<b>standby</b> [ <i>group-number</i> ] <b>ip</b> [ <i>ip-address</i> [ <i>secondary</i> ]] <b>Example:</b> Switch (config-if)# <b>standby 1 ip</b> <b>10.0.0.3</b>	Creates the HSRP group using its number and virtual IP address. <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>- The group number on the interface for which HSRP is being enabled. The range is 0 to 255; the default is 0. If there is only one HSRP group, you do not need to enter a group number.</li> <li>• (Optional on all but one interface) <i>ip-address</i>- The virtual IP address of the hot standby router interface. You must enter the virtual IP address for at least one of the interfaces; it can be learned on the other interfaces.</li> <li>• (Optional) <b>secondary</b>- The IP address is a secondary hot standby router interface. If neither router is designated as a secondary or standby router and no priorities are set, the primary IP addresses are compared and the higher IP address is the active router, with the next highest as the standby router.</li> </ul>
<b>Step 6</b>	<b>standby</b> [ <i>group-number</i> ] <b>priority</b> <i>priority</i> <b>Example:</b> Switch (config-if)# <b>standby 1 priority</b> <b>110</b>	Sets a <b>priority</b> value used in choosing the active router. The range is 1 to 255; the default priority is 100. The highest number represents the highest priority. <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>—The group number to which the command applies.</li> </ul> Use the <b>no</b> form of the command to restore the default values.
<b>Step 7</b>	<b>standby</b> [ <i>group-number</i> ] <b>preempt</b> [ <i>delay</i> [ <i>minimum seconds</i> ] [ <i>reload seconds</i> ] [ <i>sync seconds</i> ]] <b>Example:</b> Switch (config-if)# <b>standby 1 preempt</b> <b>delay 300</b>	Configures the router to <b>preempt</b> , which means that when the local router has a higher priority than the active router, it becomes the active router. <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>-The group number to which the command applies.</li> <li>• (Optional) <b>delay minimum</b>—Set to cause the local router to postpone taking over the active role for the number of seconds</li> </ul>

	Command or Action	Purpose
		<p>shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</p> <ul style="list-style-type: none"> <li>• (Optional) <b>delay reload</b>—Set to cause the local router to postpone taking over the active role after a reload for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over after a reload).</li> <li>• (Optional) <b>delay sync</b>—Set to cause the local router to postpone taking over the active role so that IP redundancy clients can reply (either with an ok or wait reply) for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> </ul> <p>Use the <b>no</b> form of the command to restore the default values.</p>
<b>Step 8</b>	<p><b>standby</b> [<i>group-number</i>] <b>ip</b> [<i>ip-address</i> [<i>secondary</i>]]</p> <p><b>Example:</b></p> <pre>Switch (config-if)# standby 2 ip 10.0.0.4</pre>	<p>Creates the HSRP group using its number and virtual IP address.</p> <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>- The group number on the interface for which HSRP is being enabled. The range is 0 to 255; the default is 0. If there is only one HSRP group, you do not need to enter a group number.</li> <li>• (Optional on all but one interface) <i>ip-address</i>- The virtual IP address of the hot standby router interface. You must enter the virtual IP address for at least one of the interfaces; it can be learned on the other interfaces.</li> <li>• (Optional) <b>secondary</b>- The IP address is a secondary hot standby router interface. If neither router is designated as a secondary or standby router and no priorities are set, the primary IP addresses are compared and the higher IP address is the active router, with the next highest as the standby router.</li> </ul>
<b>Step 9</b>	<p><b>standby</b> [<i>group-number</i>] <b>preempt</b> [<b>delay</b> [<i>minimum seconds</i>] [<b>reload</b> <i>seconds</i>] [<b>sync</b> <i>seconds</i>]]</p>	<p>Configures the router to <b>preempt</b>, which means that when the local router has a higher priority than the active router, it becomes the active router.</p>

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Switch(config-if)# standby 2 preempt delay 300</pre>	<ul style="list-style-type: none"> <li>• (Optional) <b>group-number</b>—The group number to which the command applies.</li> <li>• (Optional) <b>delay minimum</b>—Set to cause the local router to postpone taking over the active role for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> <li>• (Optional) <b>delay reload</b>—Set to cause the local router to postpone taking over the active role after a reload for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over after a reload).</li> <li>• (Optional) <b>delay sync</b>—Set to cause the local router to postpone taking over the active role so that IP redundancy clients can reply (either with an ok or wait reply) for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> </ul> <p>Use the <b>no</b> form of the command to restore the default values.</p>
<b>Step 10</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 11</b>	<b>show running-config</b>	Verifies the configuration of the standby groups.
<b>Step 12</b>	<b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring HSRP Authentication and Timers

You can optionally configure an HSRP authentication string or change the hello-time interval and holdtime.

When configuring these attributes, follow these guidelines:

- The authentication string is sent unencrypted in all HSRP messages. You must configure the same authentication string on all routers and access servers on a cable to ensure interoperability. Authentication mismatch prevents a device from learning the designated Hot Standby IP address and timer values from other routers configured with HSRP.
- Routers or access servers on which standby timer values are not configured can learn timer values from the active or standby router. The timers configured on an active router always override any other timer settings.
- All routers in a Hot Standby group should use the same timer values. Normally, the *holdtime* is greater than or equal to 3 times the *hellotime*.

Beginning in privileged EXEC mode, use one or more of these steps to configure HSRP authentication and timers on an interface:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch # <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b>  <b>Example:</b> Switch(config) # <b>interface gigabitethernet1/0/1</b>	Enters interface configuration mode, and enter the HSRP interface on which you want to set priority.
<b>Step 3</b>	<b>standby [<i>group-number</i>] authentication <i>string</i></b>  <b>Example:</b> Switch(config-if) # <b>standby 1 authentication word</b>	(Optional) <b>authentication <i>string</i></b> —Enter a string to be carried in all HSRP messages. The authentication string can be up to eight characters in length; the default string is <b>cisco</b> .  (Optional) <b>group-number</b> —The group number to which the command applies.
<b>Step 4</b>	<b>standby [<i>group-number</i>] timers <i>hellotime holdtime</i></b>  <b>Example:</b> Switch(config-if) # <b>standby 1 timers 5 15</b>	(Optional) Configure the time between hello packets and the time before other routers declare the active router to be down. <ul style="list-style-type: none"> <li>• <b>group-number</b>—The group number to which the command applies.</li> <li>• <b>hellotime</b> —Set to cause the local router to postpone taking over the active role for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> <li>• <b>holdtime</b>—Set to cause the local router to postpone taking over the active role after a reload for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over after a reload).</li> </ul>
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Switch(config-if) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b>	Verifies the configuration of the standby groups.
<b>Step 7</b>	<b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Enabling HSRP Support for ICMP Redirect Messages

ICMP redirect messages are automatically enabled on interfaces configured with HSRP. ICMP is a network layer Internet protocol that provides message packets to report errors and other information relevant to IP processing. ICMP provides diagnostic functions, such as sending and directing error packets to the host. This feature filters outgoing ICMP redirect messages through HSRP, in which the next hop IP address might be changed to an HSRP virtual IP address. For more information, see the Cisco IOS IP Configuration Guide, Release 12.4.

## Configuring HSRP Groups and Clustering

When a device is participating in an HSRP standby routing and clustering is enabled, you can use the same standby group for command switch redundancy and HSRP redundancy. Use the **cluster standby-group** *HSRP-group-name* [**routing-redundancy**] global configuration command to enable the same HSRP standby group to be used for command switch and routing redundancy. If you create a cluster with the same HSRP standby group name without entering the **routing-redundancy** keyword, HSRP standby routing is disabled for the group.

## Verifying HSRP

### Verifying HSRP Configurations

From privileged EXEC mode, use this command to display HSRP settings:

```
show standby [interface-id [group]] [brief] [detail]
```

You can display HSRP information for the whole switch, for a specific interface, for an HSRP group, or for an HSRP group on an interface. You can also specify whether to display a concise overview of HSRP information or detailed HSRP information. The default display is **detail**. If there are a large number of HSRP groups, using the **show standby** command without qualifiers can result in an unwieldy display.

#### Example

```
Switch #show standby
VLAN1 - Group 1
Local state is Standby, priority 105, may preempt
Hello time 3 holdtime 10
Next hello sent in 00:00:02.182
Hot standby IP address is 172.20.128.3 configured
Active router is 172.20.128.1 expires in 00:00:09
Standby router is local
Standby virtual mac address is 0000.0c07.ac01
Name is bbb

VLAN1 - Group 100
Local state is Standby, priority 105, may preempt
Hello time 3 holdtime 10
Next hello sent in 00:00:02.262
Hot standby IP address is 172.20.138.51 configured
Active router is 172.20.128.1 expires in 00:00:09
Active router is local
Standby router is unknown expired
Standby virtual mac address is 0000.0c07.ac64
Name is test
```

## Configuration Examples for Configuring HSRP

### Enabling HSRP: Example

This example shows how to activate HSRP for group 1 on an interface. The IP address used by the hot standby group is learned by using HSRP.

**Note** This procedure is the minimum number of steps required to enable HSRP. Other configurations are optional.

```
Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
Switch(config-if) # standby 1 ip
Switch(config-if) # end
Switch # show standby
```

### Configuring HSRP Priority: Example

This example activates a port, sets an IP address and a priority of 120 (higher than the default value), and waits for 300 seconds (5 minutes) before attempting to become the active router:

```
Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
Switch(config-if) # standby ip 172.20.128.3
Switch(config-if) # standby priority 120 preempt delay 300
Switch(config-if) # end
Switch # show standby
```

### Configuring MHSRP: Example

This example shows how to enable the MHSRP configuration shown in the figure *MHSRP Load Sharing*

#### Router A Configuration

```
Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
Switch(config-if) # ip address 10.0.0.1 255.255.255.0
Switch(config-if) # standby ip 10.0.0.3
Switch(config-if) # standby 1 priority 110
Switch(config-if) # standby 1 preempt
Switch(config-if) # standby 2 ip 10.0.0.4
Switch(config-if) # standby 2 preempt
Switch(config-if) # end
```

#### Router B Configuration

```
Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
```

```
Switch(config-if) # ip address 10.0.0.2 255.255.255.0
Switch(config-if) # standby ip 10.0.0.3
Switch(config-if) # standby 1 preempt
Switch(config-if) # standby 2 ip 10.0.0.4
Switch(config-if) # standby 1 priority 110
Switch(config-if) # standby 2 preempt
Switch(config-if) # end
```

## Configuring HSRP Authentication and Timer: Example

This example shows how to configure word as the authentication string required to allow Hot Standby routers in group 1 to interoperate:

```
Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
Switch(config-if) # standby 1 authentication word
Switch(config-if) # end
```

This example shows how to set the timers on standby group 1 with the time between hello packets at 5 seconds and the time after which a router is considered down to be 15 seconds:

```
Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
Switch(config-if) # standby 1 ip
Switch(config-if) # standby 1 timers 5 15
Switch(config-if) # end
```

## Configuring HSRP Groups and Clustering: Example

This example shows how to bind standby group my\_hsrp to the cluster and enable the same HSRP group to be used for command switch redundancy and router redundancy. The command can only be executed on the cluster command switch. If the standby group name or number does not exist, or if the switch is a cluster member switch, an error message appears.

```
Switch # configure terminal
Switch(config) # cluster standby-group my_hsrp routing-redundancy
Switch(config-if) # end
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for STP

- An attempt to configure a switch as the root switch fails if the value necessary to be the root switch is less than 1.
- If your network consists of switches that support and do not support the extended system ID, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches running older software.
- The root switch for each spanning-tree instance should be a backbone or distribution switch. Do not configure an access switch as the spanning-tree primary root.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

# Information About Spanning Tree Protocol

## Spanning Tree Protocol

Spanning Tree Protocol (STP) is a Layer 2 link management protocol that provides path redundancy while preventing loops in the network. For a Layer 2 Ethernet network to function properly, only one active path can exist between any two stations. Multiple active paths among end stations cause loops in the network. If a loop exists in the network, end stations might receive duplicate messages. Switches might also learn end-station MAC addresses on multiple Layer 2 interfaces. These conditions result in an unstable network. Spanning-tree operation is transparent to end stations, which cannot detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.

The STP uses a spanning-tree algorithm to select one switch of a redundantly connected network as the root of the spanning tree. The algorithm calculates the best loop-free path through a switched Layer 2 network by assigning a role to each port based on the role of the port in the active topology:

- Root—A forwarding port elected for the spanning-tree topology
- Designated—A forwarding port elected for every switched LAN segment
- Alternate—A blocked port providing an alternate path to the root bridge in the spanning tree
- Backup—A blocked port in a loopback configuration

The switch that has *all* of its ports as the designated role or as the backup role is the root switch. The switch that has at least *one* of its ports in the designated role is called the designated switch.

Spanning tree forces redundant data paths into a standby (blocked) state. If a network segment in the spanning tree fails and a redundant path exists, the spanning-tree algorithm recalculates the spanning-tree topology and activates the standby path. Switches send and receive spanning-tree frames, called bridge protocol data units (BPDUs), at regular intervals. The switches do not forward these frames but use them to construct a loop-free path. BPDUs contain information about the sending switch and its ports, including switch and MAC addresses, switch priority, port priority, and path cost. Spanning tree uses this information to elect the root switch and root port for the switched network and the root port and designated port for each switched segment.

When two ports on a switch are part of a loop, the spanning-tree and path cost settings control which port is put in the forwarding state and which is put in the blocking state. The spanning-tree port priority value represents the location of a port in the network topology and how well it is located to pass traffic. The path cost value represents the media speed.

---

**Note**

By default, the switch sends keepalive messages (to ensure the connection is up) only on interfaces that do not have small form-factor pluggable (SFP) modules. You can change the default for an interface by entering the **[no] keepalive** interface configuration command with no keywords.

---

## Spanning-Tree Topology and BPDUs

The stable, active spanning-tree topology of a switched network is controlled by these elements:

- The unique bridge ID (switch priority and MAC address) associated with each VLAN on each switch. In a switch stack, all switches use the same bridge ID for a given spanning-tree instance.
- The spanning-tree path cost to the root switch.
- The port identifier (port priority and MAC address) associated with each Layer 2 interface.

When the switches in a network are powered up, each functions as the root switch. Each switch sends a configuration BPDU through all of its ports. The BPDUs communicate and compute the spanning-tree topology. Each configuration BPDU contains this information:

- The unique bridge ID of the switch that the sending switch identifies as the root switch
- The spanning-tree path cost to the root
- The bridge ID of the sending switch
- Message age
- The identifier of the sending interface
- Values for the hello, forward delay, and max-age protocol timers

When a switch receives a configuration BPDU that contains *superior* information (lower bridge ID, lower path cost, and so forth), it stores the information for that port. If this BPDU is received on the root port of the switch, the switch also forwards it with an updated message to all attached LANs for which it is the designated switch.

If a switch receives a configuration BPDU that contains *inferior* information to that currently stored for that port, it discards the BPDU. If the switch is a designated switch for the LAN from which the inferior BPDU was received, it sends that LAN a BPDU containing the up-to-date information stored for that port. In this way, inferior information is discarded, and superior information is propagated on the network.

A BPDU exchange results in these actions:

- One switch in the network is elected as the root switch (the logical center of the spanning-tree topology in a switched network). See the figure following the bullets.

For each VLAN, the switch with the highest switch priority (the lowest numerical priority value) is elected as the root switch. If all switches are configured with the default priority (32768), the switch with the lowest MAC address in the VLAN becomes the root switch. The switch priority value occupies the most significant bits of the bridge ID, as shown in the following figure.

- A root port is selected for each switch (except the root switch). This port provides the best path (lowest cost) when the switch forwards packets to the root switch.

When selecting the root port on a switch stack, spanning tree follows this sequence:

- Selects the lowest root bridge ID
- Selects the lowest path cost to the root switch
- Selects the lowest designated bridge ID
- Selects the lowest designated path cost

- Selects the lowest port ID
- Only one outgoing port on the stack root switch is selected as the root port. The remaining switches in the stack become its designated switches (Switch 2 and Switch 3) as shown in the following figure.
- The shortest distance to the root switch is calculated for each switch based on the path cost.
- A designated switch for each LAN segment is selected. The designated switch incurs the lowest path cost when forwarding packets from that LAN to the root switch. The port through which the designated switch is attached to the LAN is called the designated port.

**Figure 15: Spanning-Tree Port States in a Switch Stack**

One stack member is elected as the stack root switch. The stack root switch contains the outgoing root port

All paths that are not needed to reach the root switch from anywhere in the switched network are placed in the spanning-tree blocking mode.

[Restrictions for STP](#), on page 321

## Bridge ID, Device Priority, and Extended System ID

The IEEE 802.1D standard requires that each switch has a unique bridge identifier (bridge ID), which controls the selection of the root switch. Because each VLAN is considered as a different *logical bridge* with PVST+ and Rapid PVST+, the same switch must have a different bridge ID for each configured VLAN. Each VLAN on the switch has a unique 8-byte bridge ID. The 2 most-significant bytes are used for the switch priority, and the remaining 6 bytes are derived from the switch MAC address.

The switch supports the IEEE 802.1t spanning-tree extensions, and some of the bits previously used for the switch priority are now used as the VLAN identifier. The result is that fewer MAC addresses are reserved for the switch, and a larger range of VLAN IDs can be supported, all while maintaining the uniqueness of the bridge ID.

The 2 bytes previously used for the switch priority are reallocated into a 4-bit priority value and a 12-bit extended system ID value equal to the VLAN ID.

**Table 29: Device Priority Value and Extended System ID**

Priority Value				Extended System ID (Set Equal to the VLAN ID)											
Bit 16	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1
32768	16384	8192	4096	2048	1024	512	256	128	64	32	16	8	4	2	1

Spanning tree uses the extended system ID, the switch priority, and the allocated spanning-tree MAC address to make the bridge ID unique for each VLAN. Because the switch stack appears as a single switch to the rest of the network, all switches in the stack use the same bridge ID for a given spanning tree. If the stack master fails, the stack members recalculate their bridge IDs of all running spanning trees based on the new MAC address of the new stack master.

Support for the extended system ID affects how you manually configure the root switch, the secondary root switch, and the switch priority of a VLAN. For example, when you change the switch priority value, you change the probability that the switch will be elected as the root switch. Configuring a higher value decreases the probability; a lower value increases the probability.

If any root switch for the specified VLAN has a switch priority lower than 24576, the switch sets its own priority for the specified VLAN to 4096 less than the lowest switch priority. 4096 is the value of the least-significant bit of a 4-bit switch priority value as shown in the table.

## Port Priority Versus Path Cost

If a loop occurs, spanning tree uses port priority when selecting an interface to put into the forwarding state. You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

The spanning-tree path cost default value is derived from the media speed of an interface. If a loop occurs, spanning tree uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

If your switch is a member of a switch stack, you must assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last instead of adjusting its port priority. For details, see Related Topics.

## Spanning-Tree Interface States

Propagation delays can occur when protocol information passes through a switched LAN. As a result, topology changes can take place at different times and at different places in a switched network. When an interface transitions directly from nonparticipation in the spanning-tree topology to the forwarding state, it can create temporary data loops. Interfaces must wait for new topology information to propagate through the switched LAN before starting to forward frames. They must allow the frame lifetime to expire for forwarded frames that have used the old topology.

Each Layer 2 interface on a switch using spanning tree exists in one of these states:

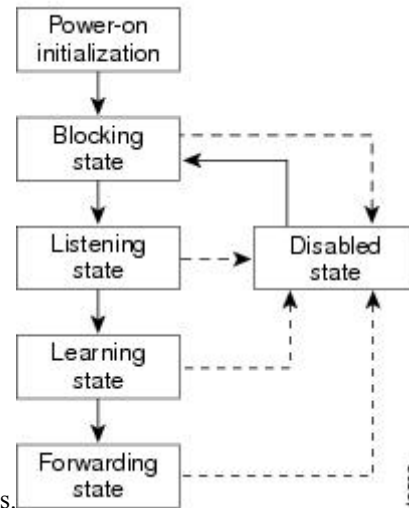

- **Blocking**—The interface does not participate in frame forwarding.
- **Listening**—The first transitional state after the blocking state when the spanning tree decides that the interface should participate in frame forwarding.
- **Learning**—The interface prepares to participate in frame forwarding.
- **Forwarding**—The interface forwards frames.
- **Disabled**—The interface is not participating in spanning tree because of a shutdown port, no link on the port, or no spanning-tree instance running on the port.

An interface moves through these states:

- From initialization to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled

Figure 16: Spanning-Tree Interface States

An interface moves through the states.

When you power up the switch, spanning tree is enabled by default, and every interface in the switch, VLAN, or network goes through the blocking state and the transitory states of listening and learning. Spanning tree stabilizes each interface at the forwarding or blocking state.

When the spanning-tree algorithm places a Layer 2 interface in the forwarding state, this process occurs:

1. The interface is in the listening state while spanning tree waits for protocol information to move the interface to the blocking state.
2. While spanning tree waits for the forward-delay timer to expire, it moves the interface to the learning state and resets the forward-delay timer.
3. In the learning state, the interface continues to block frame forwarding as the switch learns end-station location information for the forwarding database.
4. When the forward-delay timer expires, spanning tree moves the interface to the forwarding state, where both learning and frame forwarding are enabled.

## Blocking State

A Layer 2 interface in the blocking state does not participate in frame forwarding. After initialization, a BPDU is sent to each switch interface. A switch initially functions as the root until it exchanges BPDUs with other switches. This exchange establishes which switch in the network is the root or root switch. If there is only one switch in the network, no exchange occurs, the forward-delay timer expires, and the interface moves to the listening state. An interface always enters the blocking state after switch initialization.

An interface in the blocking state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Receives BPDUs

## Listening State

The listening state is the first state a Layer 2 interface enters after the blocking state. The interface enters this state when the spanning tree decides that the interface should participate in frame forwarding.

An interface in the listening state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Receives BPDUs

## Learning State

A Layer 2 interface in the learning state prepares to participate in frame forwarding. The interface enters the learning state from the listening state.

An interface in the learning state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Learns addresses
- Receives BPDUs

## Forwarding State

A Layer 2 interface in the forwarding state forwards frames. The interface enters the forwarding state from the learning state.

An interface in the forwarding state performs these functions:

- Receives and forwards frames received on the interface
- Forwards frames switched from another interface
- Learns addresses
- Receives BPDUs

## Disabled State

A Layer 2 interface in the disabled state does not participate in frame forwarding or in the spanning tree. An interface in the disabled state is nonoperational.

A disabled interface performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Does not receive BPDUs

## How a Switch or Port Becomes the Root Switch or Root Port

If all switches in a network are enabled with default spanning-tree settings, the switch with the lowest MAC address becomes the root switch.

**Figure 17: Spanning-Tree Topology**

Switch A is elected as the root switch because the switch priority of all the switches is set to the default (32768) and Switch A has the lowest MAC address. However, because of traffic patterns, number of forwarding interfaces, or link types, Switch A might not be the ideal root switch. By increasing the priority (lowering the numerical value) of the ideal switch so that it becomes the root switch, you force a spanning-tree recalculation

to form a new topology with the ideal switch as the root. RP = Root Port  
DP = Designated Port

When the spanning-tree topology is calculated based on default parameters, the path between source and destination end stations in a switched network might not be ideal. For instance, connecting higher-speed links to an interface that has a higher number than the root port can cause a root-port change. The goal is to make the fastest link the root port.

For example, assume that one port on Switch B is a Gigabit Ethernet link and that another port on Switch B (a 10/100 link) is the root port. Network traffic might be more efficient over the Gigabit Ethernet link. By changing the spanning-tree port priority on the Gigabit Ethernet port to a higher priority (lower numerical value) than the root port, the Gigabit Ethernet port becomes the new root port.

## Spanning Tree and Redundant Connectivity

**Figure 18: Spanning Tree and Redundant Connectivity**

You can create a redundant backbone with spanning tree by connecting two switch interfaces to another device or to two different devices. Spanning tree automatically disables one interface but enables it if the other one fails. If one link is high-speed and the other is low-speed, the low-speed link is always disabled. If the speeds

are the same, the port priority and port ID are added together, and spanning tree disables the link with the

highest value.

You can also create redundant links between switches by using EtherChannel groups.

## Spanning-Tree Address Management

IEEE 802.1D specifies 17 multicast addresses, ranging from 0x00180C2000000 to 0x0180C2000010, to be used by different bridge protocols. These addresses are static addresses that cannot be removed.

Regardless of the spanning-tree state, each switch in the stack receives but does not forward packets destined for addresses between 0x0180C2000000 and 0x0180C200000F.

If spanning tree is enabled, the CPU on the switch or on each switch in the stack receives packets destined for 0x0180C2000000 and 0x0180C2000010. If spanning tree is disabled, the switch or each switch in the stack forwards those packets as unknown multicast addresses.

## Accelerated Aging to Retain Connectivity

The default for aging dynamic addresses is 5 minutes, the default setting of the **mac address-table aging-time** global configuration command. However, a spanning-tree reconfiguration can cause many station locations to change. Because these stations could be unreachable for 5 minutes or more during a reconfiguration, the address-aging time is accelerated so that station addresses can be dropped from the address table and then relearned. The accelerated aging is the same as the forward-delay parameter value (**spanning-tree vlan *vlan-id* forward-time seconds** global configuration command) when the spanning tree reconfigures.

Because each VLAN is a separate spanning-tree instance, the switch accelerates aging on a per-VLAN basis. A spanning-tree reconfiguration on one VLAN can cause the dynamic addresses learned on that VLAN to be subject to accelerated aging. Dynamic addresses on other VLANs can be unaffected and remain subject to the aging interval entered for the switch.

[Restrictions for STP](#), on page 321

## Spanning-Tree Modes and Protocols

The switch supports these spanning-tree modes and protocols:

- **PVST+**—This spanning-tree mode is based on the IEEE 802.1D standard and Cisco proprietary extensions. The PVST+ runs on each VLAN on the switch up to the maximum supported, ensuring that each has a loop-free path through the network.

The PVST+ provides Layer 2 load-balancing for the VLAN on which it runs. You can create different logical topologies by using the VLANs on your network to ensure that all of your links are used but that no one link is oversubscribed. Each instance of PVST+ on a VLAN has a single root switch. This root switch propagates the spanning-tree information associated with that VLAN to all other switches in the network. Because each switch has the same information about the network, this process ensures that the network topology is maintained.

- **Rapid PVST+**—This spanning-tree mode is the same as PVST+ except that it uses a rapid convergence based on the IEEE 802.1w standard. Beginning from 15.2(4)E release, the STP default mode is Rapid PVST+. To provide rapid convergence, the Rapid PVST+ immediately deletes dynamically learned MAC address entries on a per-port basis upon receiving a topology change. By contrast, PVST+ uses a short aging time for dynamically learned MAC address entries.

Rapid PVST+ uses the same configuration as PVST+ (except where noted), and the switch needs only minimal extra configuration. The benefit of Rapid PVST+ is that you can migrate a large PVST+ install base to Rapid PVST+ without having to learn the complexities of the Multiple Spanning Tree Protocol (MSTP) configuration and without having to re-provision your network. In Rapid PVST+ mode, each VLAN runs its own spanning-tree instance up to the maximum supported.

- **MSTP**—This spanning-tree mode is based on the IEEE 802.1s standard. You can map multiple VLANs to the same spanning-tree instance, which reduces the number of spanning-tree instances required to support a large number of VLANs. The MSTP runs on top of the RSTP (based on IEEE 802.1w), which provides for rapid convergence of the spanning tree by eliminating the forward delay and by quickly transitioning root ports and designated ports to the forwarding state. In a switch stack, the cross-stack rapid transition (CSRT) feature performs the same function as RSTP. You cannot run MSTP without RSTP or CSRT.

#### Related Topics

[Changing the Spanning-Tree Mode \(CLI\)](#), on page 334

## Supported Spanning-Tree Instances

In PVST+ or Rapid PVST+ mode, the switch or switch stack supports up to 128 spanning-tree instances.

In MSTP mode, the switch or switch stack supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.

[Default Spanning-Tree Configuration](#), on page 333

[Default MSTP Configuration](#), on page 365

## Spanning-Tree Interoperability and Backward Compatibility

In a mixed MSTP and PVST+ network, the common spanning-tree (CST) root must be inside the MST backbone, and a PVST+ switch cannot connect to multiple MST regions.

When a network contains switches running Rapid PVST+ and switches running PVST+, we recommend that the Rapid PVST+ switches and PVST+ switches be configured for different spanning-tree instances. In the

Rapid PVST+ spanning-tree instances, the root switch must be a Rapid PVST+ switch. In the PVST+ instances, the root switch must be a PVST+ switch. The PVST+ switches should be at the edge of the network.

All stack members run the same version of spanning tree (all PVST+, all Rapid PVST+, or all MSTP).

**Table 30: PVST+, MSTP, and Rapid-PVST+ Interoperability and Compatibility**

	PVST+	MSTP	Rapid PVST+
PVST+	Yes	Yes (with restrictions)	Yes (reverts to PVST+)
MSTP	Yes (with restrictions)	Yes	Yes (reverts to PVST+)
Rapid PVST+	Yes (reverts to PVST+)	Yes (reverts to PVST+)	Yes

## STP and IEEE 802.1Q Trunks

The IEEE 802.1Q standard for VLAN trunks imposes some limitations on the spanning-tree strategy for a network. The standard requires only one spanning-tree instance for *all* VLANs allowed on the trunks. However, in a network of Cisco switches connected through IEEE 802.1Q trunks, the switches maintain one spanning-tree instance for *each* VLAN allowed on the trunks.

When you connect a Cisco switch to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco switch uses PVST+ to provide spanning-tree interoperability. If Rapid PVST+ is enabled, the switch uses it instead of PVST+. The switch combines the spanning-tree instance of the IEEE 802.1Q VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q switch.

However, all PVST+ or Rapid PVST+ information is maintained by Cisco switches separated by a cloud of non-Cisco IEEE 802.1Q switches. The non-Cisco IEEE 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.

Rapid PVST+ is automatically enabled on IEEE 802.1Q trunks, and no user configuration is required. The external spanning-tree behavior on access ports and Inter-Switch Link (ISL) trunk ports is not affected by PVST+.

## Spanning Tree and Switch Stacks

When the switch stack is operating in PVST+ or Rapid PVST+ mode:

- A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID for a given spanning tree. The bridge ID is derived from the MAC address of the active switch.
- When a new switch joins the stack, it sets its bridge ID to the active switch bridge ID. If the newly added switch has the lowest ID and if the root path cost is the same among all stack members, the newly added switch becomes the stack root.
- When a stack member leaves the stack, spanning-tree reconvergence occurs within the stack (and possibly outside the stack). The remaining stack member with the lowest stack port ID becomes the stack root.

- If a neighboring switch external to the switch stack fails or is powered down, normal spanning-tree processing occurs. Spanning-tree reconvergence might occur as a result of losing a switch in the active topology.
- If a new switch external to the switch stack is added to the network, normal spanning-tree processing occurs. Spanning-tree reconvergence might occur as a result of adding a switch in the network.

## Default Spanning-Tree Configuration

*Table 31: Default Spanning-Tree Configuration*

Feature	Default Setting
Enable state	Enabled on VLAN 1.
Spanning-tree mode	Rapid PVST+ ( PVST+ and MSTP are disabled.)
Switch priority	32768
Spanning-tree port priority (configurable on a per-interface basis)	128
Spanning-tree port cost (configurable on a per-interface basis)	1000 Mb/s: 4 100 Mb/s: 19 10 Mb/s: 100
Spanning-tree VLAN port priority (configurable on a per-VLAN basis)	128
Spanning-tree VLAN port cost (configurable on a per-VLAN basis)	1000 Mb/s: 4 100 Mb/s: 19 10 Mb/s: 100
Spanning-tree timers	Hello time: 2 seconds Forward-delay time: 15 seconds Maximum-aging time: 20 seconds Transmit hold count: 6 BPDUs

**Note** Beginning in Cisco IOS Release 15.2(4)E, the default STP mode is Rapid PVST+.

# How to Configure Spanning-Tree Features

## Changing the Spanning-Tree Mode (CLI)

The switch supports three spanning-tree modes: per-VLAN spanning tree plus (PVST+), Rapid PVST+, or multiple spanning tree protocol (MSTP). By default, the switch runs the Rapid PVST+ protocol.

If you want to enable a mode that is different from the default mode, this procedure is required.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree mode {pvst   mst   rapid-pvst}</b> <b>Example:</b> <pre>Switch(config)# spanning-tree mode pvst</pre>	Configures a spanning-tree mode. All stack members run the same version of spanning tree. <ul style="list-style-type: none"> <li>• Select <b>pvst</b> to enable PVST+.</li> <li>• Select <b>mst</b> to enable MSTP.</li> <li>• Select <b>rapid-pvst</b> to enable rapid PVST+.</li> </ul>
<b>Step 4</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config)# interface GigabitEthernet1/0/1</pre>	Specifies an interface to configure, and enters interface configuration mode. Valid interfaces include physical ports, VLANs, and port channels. The VLAN ID range is 1 to 4094. The port-channel range is 1 to 48.
<b>Step 5</b>	<b>spanning-tree link-type point-to-point</b> <b>Example:</b> <pre>Switch(config-if)# spanning-tree link-type point-to-point</pre>	Specifies that the link type for this port is point-to-point.  If you connect this port (local port) to a remote port through a point-to-point link and the local port becomes a designated port, the switch negotiates with the remote port and rapidly changes the local port to the forwarding state.

	Command or Action	Purpose
<b>Step 6</b>	<b>end</b> <b>Example:</b>  Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>clear spanning-tree detected-protocols</b> <b>Example:</b>  Switch# <b>clear spanning-tree detected-protocols</b>	If any port on the switch is connected to a port on a legacy IEEE 802.1D switch, this command restarts the protocol migration process on the entire switch.  This step is optional if the designated switch detects that this switch is running rapid PVST+.

**Related Topics**

[Spanning-Tree Modes and Protocols](#), on page 330

## Disabling Spanning Tree (CLI)

Spanning tree is enabled by default on VLAN 1 and on all newly created VLANs up to the spanning-tree limit. Disable spanning tree only if you are sure there are no loops in the network topology.

**Caution**

When spanning tree is disabled and loops are present in the topology, excessive traffic and indefinite packet duplication can drastically reduce network performance.

This procedure is optional.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>no spanning-tree vlan <i>vlan-id</i></b> <b>Example:</b>  Switch(config)# <b>no spanning-tree vlan 300</b>	For <i>vlan-id</i> , the range is 1 to 4094.

	Command or Action	Purpose
<b>Step 4</b>	<b>end</b>  <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.

**Related Topics**

[Supported Spanning-Tree Instances](#), on page 331

[Default Spanning-Tree Configuration](#), on page 333

## Configuring the Root Switch (CLI)

To configure a switch as the root for the specified VLAN, use the **spanning-tree vlan *vlan-id* root** global configuration command to modify the switch priority from the default value (32768) to a significantly lower value. When you enter this command, the software checks the switch priority of the root switches for each VLAN. Because of the extended system ID support, the switch sets its own priority for the specified VLAN to 24576 if this value will cause this switch to become the root for the specified VLAN.

Use the **diameter** keyword to specify the Layer 2 network diameter (that is, the maximum number of switch hops between any two end stations in the Layer 2 network). When you specify the network diameter, the switch automatically sets an optimal hello time, forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the **hello** keyword to override the automatically calculated hello time.

This procedure is optional.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree vlan <i>vlan-id</i> root primary</b> <b>[diameter <i>net-diameter</i>]</b>  <b>Example:</b>  Switch(config)# <b>spanning-tree vlan 20-24</b> <b>root primary diameter 4</b>	Configures a switch to become the root for the specified VLAN. <ul style="list-style-type: none"> <li>For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>(Optional) For <b>diameter</b> <i>net-diameter</i>, specify the maximum number of switches between any two end stations. The range is 2 to 7.</li> </ul>
<b>Step 4</b>	<b>end</b>  <b>Example:</b>  Switch(config) # <b>end</b>	Returns to privileged EXEC mode.

### What to do next

After configuring the switch as the root switch, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time through the **spanning-tree vlan** *vlan-id* **hello-time**, **spanning-tree vlan** *vlan-id* **forward-time**, and the **spanning-tree vlan** *vlan-id* **max-age** global configuration commands.

## Configuring a Secondary Root Device (CLI)

When you configure a switch as the secondary root, the switch priority is modified from the default value (32768) to 28672. With this priority, the switch is likely to become the root switch for the specified VLAN if the primary root switch fails. This is assuming that the other network switches use the default switch priority of 32768, and therefore, are unlikely to become the root switch.

You can execute this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello-time values that you used when you configured the primary root switch with the **spanning-tree vlan** *vlan-id* **root primary** global configuration command.

This procedure is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Switch# <code>configure terminal</code>	
<b>Step 3</b>	<p><b>spanning-tree vlan <i>vlan-id</i> root secondary</b>  <b>[<i>diameter net-diameter</i>]</b></p> <p><b>Example:</b></p> <pre>Switch(config)# spanning-tree vlan 20-24 root secondary diameter 4</pre>	<p>Configures a switch to become the secondary root for the specified VLAN.</p> <ul style="list-style-type: none"> <li>For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>(Optional) For <b>diameter <i>net-diameter</i></b>, specify the maximum number of switches between any two end stations. The range is 2 to 7.</li> </ul> <p>Use the same network diameter value that you used when configuring the primary root switch.</p>
<b>Step 4</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

## Configuring Port Priority (CLI)

**Note** If your switch is a member of a switch stack, you must use the **spanning-tree [vlan *vlan-id*] cost *cost*** interface configuration command instead of the **spanning-tree [vlan *vlan-id*] port-priority *priority*** interface configuration command to select an interface to put in the forwarding state. Assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last.

This procedure is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p>	Enters the global configuration mode.

	Command or Action	Purpose
	Switch# <code>configure terminal</code>	
<b>Step 3</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Switch(config)# <b>interface</b> <b>gigabitethernet1/0/2</b>	Specifies an interface to configure, and enters interface configuration mode.  Valid interfaces include physical ports and port-channel logical interfaces ( <b>port-channel</b> <i>port-channel-number</i> ).
<b>Step 4</b>	<b>spanning-tree port-priority</b> <i>priority</i> <b>Example:</b> Switch(config-if)# <b>spanning-tree</b> <b>port-priority 0</b>	Configures the port priority for an interface.  For <i>priority</i> , the range is 0 to 240, in increments of 16; the default is 128. Valid values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected. The lower the number, the higher the priority.
<b>Step 5</b>	<b>spanning-tree vlan</b> <i>vlan-id</i> <b>port-priority</b> <i>priority</i> <b>Example:</b> Switch(config-if)# <b>spanning-tree vlan</b> <b>20-25 port-priority 0</b>	Configures the port priority for a VLAN. <ul style="list-style-type: none"> <li>For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>For <i>priority</i>, the range is 0 to 240, in increments of 16; the default is 128. Valid values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected. The lower the number, the higher the priority.</li> </ul>
<b>Step 6</b>	<b>end</b> <b>Example:</b> Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.

**Related Topics**

[How a Switch or Port Becomes the Root Switch or Root Port](#), on page 329

## Configuring Path Cost (CLI)

This procedure is optional.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config)# interface gigabitethernet1/0/1</pre>	Specifies an interface to configure, and enters interface configuration mode. Valid interfaces include physical ports and port-channel logical interfaces ( <b>port-channel</b> <i>port-channel-number</i> ).
<b>Step 4</b>	<b>spanning-tree cost <i>cost</i></b> <b>Example:</b> <pre>Switch(config-if)# spanning-tree cost 250</pre>	<p>Configures the cost for an interface.</p> <p>If a loop occurs, spanning tree uses the path cost when selecting an interface to place into the forwarding state. A lower path cost represents higher-speed transmission.</p> <p>For <i>cost</i>, the range is 1 to 200000000; the default value is derived from the media speed of the interface.</p>
<b>Step 5</b>	<b>spanning-tree vlan <i>vlan-id</i> cost <i>cost</i></b> <b>Example:</b> <pre>Switch(config-if)# spanning-tree vlan 10,12-15,20 cost 300</pre>	<p>Configures the cost for a VLAN.</p> <p>If a loop occurs, spanning tree uses the path cost when selecting an interface to place into the forwarding state. A lower path cost represents higher-speed transmission.</p> <ul style="list-style-type: none"> <li>For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>For <i>cost</i>, the range is 1 to 200000000; the default value is derived from the media speed of the interface.</li> </ul>
<b>Step 6</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.

The **show spanning-tree interface *interface-id*** privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the **show running-config** privileged EXEC command to confirm the configuration.

## Configuring the Device Priority of a VLAN (CLI)

You can configure the switch priority and make it more likely that a standalone switch or a switch in the stack will be chosen as the root switch.

**Note** Exercise care when using this command. For most situations, we recommend that you use the **spanning-tree vlan *vlan-id* root primary** and the **spanning-tree vlan *vlan-id* root secondary** global configuration commands to modify the switch priority.

This procedure is optional.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree vlan <i>vlan-id</i> priority <i>priority</i></b> <b>Example:</b> Switch(config)# <b>spanning-tree vlan 20 priority 8192</b>	Configures the switch priority of a VLAN. <ul style="list-style-type: none"> <li>For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>For <i>priority</i>, the range is 0 to 61440 in increments of 4096; the default is 32768. The lower the number, the more likely the switch will be chosen as the root switch.</li> </ul> Valid priority values are 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152,

	Command or Action	Purpose
		53248, 57344, and 61440. All other values are rejected.
<b>Step 4</b>	<b>end</b>  <b>Example:</b>  Switch(config-if) # <b>end</b>	Returns to privileged EXEC mode.

## Configuring the Hello Time (CLI)

The hello time is the time interval between configuration messages generated and sent by the root switch. This procedure is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>spanning-tree vlan <i>vlan-id</i> hello-time <i>seconds</i></b>  <b>Example:</b>  Switch(config)# <b>spanning-tree vlan 20-24 hello-time 3</b>	Configures the hello time of a VLAN. The hello time is the time interval between configuration messages generated and sent by the root switch. These messages mean that the switch is alive. <ul style="list-style-type: none"> <li>• For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>• For <i>seconds</i>, the range is 1 to 10; the default is 2.</li> </ul>
<b>Step 3</b>	<b>end</b>  <b>Example:</b>  Switch(config-if) # <b>end</b>	Returns to privileged EXEC mode.

## Configuring the Forwarding-Delay Time for a VLAN (CLI)

This procedure is optional.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree vlan <i>vlan-id</i> forward-time <i>seconds</i></b> <b>Example:</b> Switch(config)# <b>spanning-tree vlan 20,25 forward-time 18</b>	Configures the forward time of a VLAN. The forwarding delay is the number of seconds an interface waits before changing from its spanning-tree learning and listening states to the forwarding state. <ul style="list-style-type: none"> <li>• For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>• For <i>seconds</i>, the range is 4 to 30; the default is 15.</li> </ul>
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.

**Configuring the Maximum-Aging Time for a VLAN (CLI)**

This procedure is optional.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree vlan <i>vlan-id</i> max-age <i>seconds</i></b> <b>Example:</b> Switch(config)# <b>spanning-tree vlan 20 max-age 30</b>	Configures the maximum-aging time of a VLAN. The maximum-aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration. <ul style="list-style-type: none"> <li>• For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>• For <i>seconds</i>, the range is 6 to 40; the default is 20.</li> </ul>
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring the Transmit Hold-Count (CLI)

You can configure the BPDU burst size by changing the transmit hold count value.

**Note** Changing this parameter to a higher value can have a significant impact on CPU utilization, especially in Rapid PVST+ mode. Lowering this value can slow down convergence in certain scenarios. We recommend that you maintain the default setting.

This procedure is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree transmit hold-count <i>value</i></b> <b>Example:</b> Switch(config)# <code>spanning-tree transmit hold-count 6</code>	Configures the number of BPDUs that can be sent before pausing for 1 second. For <i>value</i> , the range is 1 to 20; the default is 6.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode.

## Monitoring Spanning-Tree Status

Table 32: Commands for Displaying Spanning-Tree Status

<b>show spanning-tree active</b>	Displays spanning-tree information on active interfaces only.
<b>show spanning-tree detail</b>	Displays a detailed summary of interface information.
<b>show spanning-tree vlan <i>vlan-id</i></b>	Displays spanning-tree information for the specified VLAN.
<b>show spanning-tree interface <i>interface-id</i></b>	Displays spanning-tree information for the specified interface.
<b>show spanning-tree interface <i>interface-id</i> portfast</b>	Displays spanning-tree portfast information for the specified interface.
<b>show spanning-tree summary [totals]</b>	Displays a summary of interface states or displays the total lines of the STP state section.

To clear spanning-tree counters, use the **clear spanning-tree [interface *interface-id*]** privileged EXEC command.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for MSTP

- For two or more switches to be in the same multiple spanning tree (MST) region, they must have the same VLAN-to-instance map, the same configuration revision number, and the same name.
- For two or more stacked switches to be in the same MST region, they must have the same VLAN-to-instance map, the same configuration revision number, and the same name.
- For load-balancing across redundant paths in the network to work, all VLAN-to-instance mapping assignments must match; otherwise, all traffic flows on a single link. You can achieve load-balancing across a switch stack by manually configuring the path cost.
- For load-balancing between a per-VLAN spanning tree plus (PVST+) and an MST cloud or between a rapid-PVST+ and an MST cloud to work, all MST boundary ports must be forwarding. MST boundary ports are forwarding when the internal spanning tree (IST) master of the MST cloud is the root of the common spanning tree (CST). If the MST cloud consists of multiple MST regions, one of the MST regions must contain the CST root, and all of the other MST regions must have a better path to the root.

contained within the MST cloud than a path through the PVST+ or rapid-PVST+ cloud. You might have to manually configure the switches in the clouds.

## Restrictions for MSTP

- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.
- The switch stack supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.
- PVST+, Rapid PVST+, and MSTP are supported, but only one version can be active at any time. (For example, all VLANs run PVST+, all VLANs run Rapid PVST+, or all VLANs run MSTP.)
- VLAN Trunking Protocol (VTP) propagation of the MST configuration is not supported. However, you can manually configure the MST configuration (region name, revision number, and VLAN-to-instance mapping) on each switch within the MST region by using the command-line interface (CLI) or through the Simple Network Management Protocol (SNMP) support.
- Partitioning the network into a large number of regions is not recommended. However, if this situation is unavoidable, we recommend that you partition the switched LAN into smaller LANs interconnected by routers or non-Layer 2 devices.
- A region can have one member or multiple members with the same MST configuration; each member must be capable of processing rapid spanning tree protocol (RSTP) Bridge Protocol Data Units (BPDUs). There is no limit to the number of MST regions in a network, but each region can only support up to 65 spanning-tree instances. You can assign a VLAN to only one spanning-tree instance at a time.
- After configuring a switch as the root switch, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time through the **spanning-tree mst hello-time**, **spanning-tree mst forward-time**, and the **spanning-tree mst max-age** global configuration commands.

**Table 33: PVST+, MSTP, and Rapid PVST+ Interoperability and Compatibility**

	PVST+	MSTP	Rapid PVST+
PVST+	Yes	Yes (with restrictions)	Yes (reverts to PVST+)
MSTP	Yes (with restrictions)	Yes	Yes (reverts to PVST+)
Rapid PVST+	Yes (reverts to PVST+)	Yes (reverts to PVST+)	Yes

# Information About MSTP

## MSTP Configuration

MSTP, which uses RSTP for rapid convergence, enables multiple VLANs to be grouped into and mapped to the same spanning-tree instance, reducing the number of spanning-tree instances needed to support a large number of VLANs. The MSTP provides for multiple forwarding paths for data traffic, enables load balancing, and reduces the number of spanning-tree instances required to support a large number of VLANs. It improves the fault tolerance of the network because a failure in one instance (forwarding path) does not affect other instances (forwarding paths).

**Note** The multiple spanning-tree (MST) implementation is based on the IEEE 802.1s standard.

The most common initial deployment of MSTP is in the backbone and distribution layers of a Layer 2 switched network. This deployment provides the highly available network required in a service-provider environment.

When the switch is in the MST mode, the RSTP, which is based on IEEE 802.1w, is automatically enabled. The RSTP provides rapid convergence of the spanning tree through explicit handshaking that eliminates the IEEE 802.1D forwarding delay and quickly transitions root ports and designated ports to the forwarding state.

Both MSTP and RSTP improve the spanning-tree operation and maintain backward compatibility with equipment that is based on the (original) IEEE 802.1D spanning tree, with existing Cisco-proprietary Multiple Instance STP (MISTP), and with existing Cisco PVST+ and rapid per-VLAN spanning-tree plus (Rapid PVST+).

A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same switch ID.

## MSTP Configuration Guidelines

- When you enable MST by using the **spanning-tree mode mst** global configuration command, RSTP is automatically enabled.
- For configuration guidelines about UplinkFast, BackboneFast, and cross-stack UplinkFast, see the relevant sections in the Related Topics section.
- When the switch is in MST mode, it uses the long path-cost calculation method (32 bits) to compute the path cost values. With the long path-cost calculation method, the following path cost values are supported:

Speed	Path Cost Value
10 Mb/s	2,000,000
100 Mb/s	200,000
1 Gb/s	20,000
10 Gb/s	2,000

Speed	Path Cost Value
100 Gb/s	200

## Root Switch

The switch maintains a spanning-tree instance for the group of VLANs mapped to it. A switch ID, consisting of the switch priority and the switch MAC address, is associated with each instance. For a group of VLANs, the switch with the lowest switch ID becomes the root switch.

When you configure a switch as the root, you modify the switch priority from the default value (32768) to a significantly lower value so that the switch becomes the root switch for the specified spanning-tree instance. When you enter this command, the switch checks the switch priorities of the root switches. Because of the extended system ID support, the switch sets its own priority for the specified instance to 24576 if this value will cause this switches to become the root for the specified spanning-tree instance.

If any root switch for the specified instance has a switch priority lower than 24576, the switch sets its own priority to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value. For more information, select "Bridge ID, Switch Priority, and Extended System ID" link in Related Topics.

If your network consists of switches that support and do not support the extended system ID, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches running older software.

The root switch for each spanning-tree instance should be a backbone or distribution switch. Do not configure an access switch as the spanning-tree primary root.

Use the **diameter** keyword, which is available only for MST instance 0, to specify the Layer 2 network diameter (that is, the maximum number of switch hops between any two end stations in the Layer 2 network). When you specify the network diameter, the switch automatically sets an optimal hello time, forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the **hello** keyword to override the automatically calculated hello time.

## Multiple Spanning-Tree Regions

For switches to participate in multiple spanning-tree (MST) instances, you must consistently configure the switches with the same MST configuration information. A collection of interconnected switches that have the same MST configuration comprises an MST region.

The MST configuration controls to which MST region each switch belongs. The configuration includes the name of the region, the revision number, and the MST VLAN-to-instance assignment map. You configure the switch for a region by specifying the MST region configuration on it. You can map VLANs to an MST instance, specify the region name, and set the revision number. For instructions and an example, select the "Specifying the MST Region Configuration and Enabling MSTP" link in Related Topics.

A region can have one or multiple members with the same MST configuration. Each member must be capable of processing RSTP bridge protocol data units (BPDUs). There is no limit to the number of MST regions in a network, but each region can support up to 65 spanning-tree instances. Instances can be identified by any number in the range from 0 to 4094. You can assign a VLAN to only one spanning-tree instance at a time.

## IST, CIST, and CST

Unlike PVST+ and Rapid PVST+ in which all the spanning-tree instances are independent, the MSTP establishes and maintains two types of spanning trees:

- An internal spanning tree (IST), which is the spanning tree that runs in an MST region.

Within each MST region, the MSTP maintains multiple spanning-tree instances. Instance 0 is a special instance for a region, known as the internal spanning tree (IST). All other MST instances are numbered from 1 to 4094.

The IST is the only spanning-tree instance that sends and receives BPDUs. All of the other spanning-tree instance information is contained in M-records, which are encapsulated within MSTP BPDUs. Because the MSTP BPDUs carry information for all instances, the number of BPDUs that need to be processed to support multiple spanning-tree instances is significantly reduced.

All MST instances within the same region share the same protocol timers, but each MST instance has its own topology parameters, such as root switch ID, root path cost, and so forth. By default, all VLANs are assigned to the IST.

An MST instance is local to the region; for example, MST instance 1 in region A is independent of MST instance 1 in region B, even if regions A and B are interconnected.

- A common and internal spanning tree (CIST), which is a collection of the ISTs in each MST region, and the common spanning tree (CST) that interconnects the MST regions and single spanning trees.

The spanning tree computed in a region appears as a subtree in the CST that encompasses the entire switched domain. The CIST is formed by the spanning-tree algorithm running among switches that support the IEEE 802.1w, IEEE 802.1s, and IEEE 802.1D standards. The CIST inside an MST region is the same as the CST outside a region.

## Operations Within an MST Region

The IST connects all the MSTP switches in a region. When the IST converges, the root of the IST becomes the CIST regional root (called the *IST master* before the implementation of the IEEE 802.1s standard). It is the switch within the region with the lowest switch ID and path cost to the CIST root. The CIST regional root is also the CIST root if there is only one region in the network. If the CIST root is outside the region, one of the MSTP switches at the boundary of the region is selected as the CIST regional root.

When an MSTP switch initializes, it sends BPDUs claiming itself as the root of the CIST and the CIST regional root, with both of the path costs to the CIST root and to the CIST regional root set to zero. The switch also initializes all of its MST instances and claims to be the root for all of them. If the switch receives superior MST root information (lower switch ID, lower path cost, and so forth) than currently stored for the port, it relinquishes its claim as the CIST regional root.

During initialization, a region might have many subregions, each with its own CIST regional root. As switches receive superior IST information, they leave their old subregions and join the new subregion that contains the true CIST regional root. All subregions shrink except for the one that contains the true CIST regional root.

For correct operation, all switches in the MST region must agree on the same CIST regional root. Therefore, any two switches in the region only synchronize their port roles for an MST instance if they converge to a common CIST regional root.

### Related Topics

[Illustration of MST Regions](#), on page 355

## Operations Between MST Regions

If there are multiple regions or legacy IEEE 802.1D switches within the network, MSTP establishes and maintains the CST, which includes all MST regions and all legacy STP switches in the network. The MST instances combine with the IST at the boundary of the region to become the CST.

The IST connects all the MSTP switches in the region and appears as a subtree in the CIST that encompasses the entire switched domain. The root of the subtree is the CIST regional root. The MST region appears as a virtual switch to adjacent STP switches and MST regions.

Only the CST instance sends and receives BPDUs, and MST instances add their spanning-tree information into the BPDUs to interact with neighboring switches and compute the final spanning-tree topology. Because of this, the spanning-tree parameters related to BPDU transmission (for example, hello time, forward time, max-age, and max-hops) are configured only on the CST instance but affect all MST instances. Parameters related to the spanning-tree topology (for example, switch priority, port VLAN cost, and port VLAN priority) can be configured on both the CST instance and the MST instance.

MSTP switches use Version 3 RSTP BPDUs or IEEE 802.1D STP BPDUs to communicate with legacy IEEE 802.1D switches. MSTP switches use MSTP BPDUs to communicate with MSTP switches.

## IEEE 802.1s Terminology

Some MST naming conventions used in Cisco's prestandard implementation have been changed to identify some *internal* or *regional* parameters. These parameters are significant only within an MST region, as opposed to external parameters that are relevant to the whole network. Because the CIST is the only spanning-tree instance that spans the whole network, only the CIST parameters require the external rather than the internal or regional qualifiers.

- The CIST root is the root switch for the unique instance that spans the whole network, the CIST.
- The CIST external root path cost is the cost to the CIST root. This cost is left unchanged within an MST region. Remember that an MST region looks like a single switch for the CIST. The CIST external root path cost is the root path cost calculated between these virtual switches and switches that do not belong to any region.
- The CIST regional root was called the IST master in the prestandard implementation. If the CIST root is in the region, the CIST regional root is the CIST root. Otherwise, the CIST regional root is the closest switch to the CIST root in the region. The CIST regional root acts as a root switch for the IST.
- The CIST internal root path cost is the cost to the CIST regional root in a region. This cost is only relevant to the IST, instance 0.

**Table 34: Prestandard and Standard Terminology**

IEEE Standard	Cisco Prestandard	Cisco Standard
CIST regional root	IST master	CIST regional root
CIST internal root path cost	IST master path cost	CIST internal path cost
CIST external root path cost	Root path cost	Root path cost
MSTI regional root	Instance root	Instance root
MSTI internal root path cost	Root path cost	Root path cost

## Illustration of MST Regions

This figure displays three MST regions and a legacy IEEE 802.1D switch (D). The CIST regional root for region 1 (A) is also the CIST root. The CIST regional root for region 2 (B) and the CIST regional root for region 3 (C) are the roots for their respective subtrees within the CIST. The RSTP runs in all regions.

Figure 19: MST Regions, CIST Masters, and CST Root

[Operations Within an MST Region](#), on page 354

[Operations Between MST Regions](#), on page 354

## Hop Count

The IST and MST instances do not use the message-age and maximum-age information in the configuration BPDU to compute the spanning-tree topology. Instead, they use the path cost to the root and a hop-count mechanism similar to the IP time-to-live (TTL) mechanism.

By using the **spanning-tree mst max-hops** global configuration command, you can configure the maximum hops inside the region and apply it to the IST and all MST instances in that region. The hop count achieves the same result as the message-age information (triggers a reconfiguration). The root switch of the instance always sends a BPDU (or M-record) with a cost of 0 and the hop count set to the maximum value. When a switch receives this BPDU, it decrements the received remaining hop count by one and propagates this value as the remaining hop count in the BPDUs it generates. When the count reaches zero, the switch discards the BPDU and ages the information held for the port.

The message-age and maximum-age information in the RSTP portion of the BPDU remain the same throughout the region, and the same values are propagated by the region designated ports at the boundary.

## Boundary Ports

In the Cisco prestandard implementation, a boundary port connects an MST region to a single spanning-tree region running RSTP, to a single spanning-tree region running PVST+ or rapid PVST+, or to another MST region with a different MST configuration. A boundary port also connects to a LAN, the designated switch of which is either a single spanning-tree switch or a switch with a different MST configuration.

There is no definition of a boundary port in the IEEE 802.1s standard. The IEEE 802.1Q-2002 standard identifies two kinds of messages that a port can receive:

- internal (coming from the same region)
- external (coming from another region)

When a message is internal, the CIST part is received by the CIST, and each MST instance receives its respective M-record.

When a message is external, it is received only by the CIST. If the CIST role is root or alternate, or if the external BPDU is a topology change, it could have an impact on the MST instances.

An MST region includes both switches and LANs. A segment belongs to the region of its designated port. Therefore, a port in a different region than the designated port for a segment is a boundary port. This definition allows two ports internal to a region to share a segment with a port belonging to a different region, creating the possibility of a port receiving both internal and external messages.

The primary change from the Cisco prestandard implementation is that a designated port is not defined as boundary, unless it is running in an STP-compatible mode.

---

**Note** If there is a legacy STP switch on the segment, messages are always considered external.

---

The other change from the Cisco prestandard implementation is that the CIST regional root switch ID field is now inserted where an RSTP or legacy IEEE 802.1Q switch has the sender switch ID. The whole region performs like a single virtual switch by sending a consistent sender switch ID to neighboring switches. In this example, switch C would receive a BPDU with the same consistent sender switch ID of root, whether or not A or B is designated for the segment.

## IEEE 802.1s Implementation

The Cisco implementation of the IEEE MST standard includes features required to meet the standard, as well as some of the desirable prestandard functionality that is not yet incorporated into the published standard.

### Port Role Naming Change

The boundary role is no longer in the final MST standard, but this boundary concept is maintained in Cisco's implementation. However, an MST instance port at a boundary of the region might not follow the state of the corresponding CIST port. Two boundary roles currently exist:

- The boundary port is the root port of the CIST regional root—When the CIST instance port is proposed and is in sync, it can send back an agreement and move to the forwarding state only after all the corresponding MSTI ports are in sync (and thus forwarding). The MSTI ports now have a special *master* role.

- The boundary port is not the root port of the CIST regional root—The MSTI ports follow the state and role of the CIST port. The standard provides less information, and it might be difficult to understand why an MSTI port can be alternately blocking when it receives no BPDUs (MRecords). In this case, although the boundary role no longer exists, the **show** commands identify a port as boundary in the *type* column of the output.

## Interoperation Between Legacy and Standard Switches

Because automatic detection of prestandard switches can fail, you can use an interface configuration command to identify prestandard ports. A region cannot be formed between a standard and a prestandard switch, but they can interoperate by using the CIST. Only the capability of load-balancing over different instances is lost in that particular case. The CLI displays different flags depending on the port configuration when a port receives prestandard BPDUs. A syslog message also appears the first time a switch receives a prestandard BPDU on a port that has not been configured for prestandard BPDU transmission.

**Figure 20: Standard and Prestandard Switch Interoperation**

Assume that A is a standard switch and B a prestandard switch, both configured to be in the same region. A is the root switch for the CIST, and B has a root port (BX) on segment X and an alternate port (BY) on segment Y. If segment Y flaps, and the port on BY becomes the alternate before sending out a single prestandard BPDU, AY cannot detect that a prestandard switch is connected to Y and continues to send standard BPDUs. The port BY is fixed in a boundary, and no load balancing is possible between A and B. The same problem exists on segment X, but B might transmit topology

**Note** We recommend that you minimize the interaction between standard and prestandard MST implementations.

## Detecting Unidirectional Link Failure

This feature is not yet present in the IEEE MST standard, but it is included in this Cisco IOS release. The software checks the consistency of the port role and state in the received BPDUs to detect unidirectional link failures that could cause bridging loops.

When a designated port detects a conflict, it keeps its role, but reverts to the discarding state because disrupting connectivity in case of inconsistency is preferable to opening a bridging loop.

**Figure 21: Detecting Unidirectional Link Failure**

This figure illustrates a unidirectional link failure that typically creates a bridging loop. Switch A is the root switch, and its BPDUs are lost on the link leading to switch B. RSTP and MSTP BPDUs include the role and state of the sending port. With this information, switch A can detect that switch B does not react to the superior BPDUs it sends and that switch B is the designated, not root switch. As a result, switch A blocks (or keeps

blocking) its port, which prevents the bridging loop.

## MSTP and Switch Stacks

A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID for a given spanning tree. The bridge ID is derived from the MAC address of the active switch.

If a switch that does not support MSTP is added to a switch stack that does support MSTP or the reverse, the switch is put into a version mismatch state. If possible, the switch is automatically upgraded or downgraded to the same version of software that is running on the switch stack.

## Interoperability with IEEE 802.1D STP

A switch running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D switches. If this switch receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDUs on that port. An MSTP switch also can detect that a port is at the boundary of a region when it receives a legacy BPDU, an MSTP BPDU (Version 3) associated with a different region, or an RSTP BPDU (Version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot detect whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch might also continue to assign a boundary role to a port when the switch to which this switch is connected has joined the region. To restart the protocol migration process (force the renegotiation with neighboring switches), use the **clear spanning-tree detected-protocols** privileged EXEC command.

If all the legacy switches on the link are RSTP switches, they can process MSTP BPDUs as if they are RSTP BPDUs. Therefore, MSTP switches send either a Version 0 configuration and TCN BPDUs or Version 3 MSTP BPDUs on a boundary port. A boundary port connects to a LAN, the designated switch of which is either a single spanning-tree switch or a switch with a different MST configuration.

## RSTP Overview

The RSTP takes advantage of point-to-point wiring and provides rapid convergence of the spanning tree. Reconfiguration of the spanning tree can occur in less than 1 second (in contrast to 50 seconds with the default settings in the IEEE 802.1D spanning tree).

## Port Roles and the Active Topology

The RSTP provides rapid convergence of the spanning tree by assigning port roles and by learning the active topology. The RSTP builds upon the IEEE 802.1D STP to select the switch with the highest switch priority (lowest numerical priority value) as the root switch. The RSTP then assigns one of these port roles to individual ports:

- Root port—Provides the best path (lowest cost) when the switch forwards packets to the root switch.
- Designated port—Connects to the designated switch, which incurs the lowest path cost when forwarding packets from that LAN to the root switch. The port through which the designated switch is attached to the LAN is called the designated port.
- Alternate port—Offers an alternate path toward the root switch to that provided by the current root port.
- Backup port—Acts as a backup for the path provided by a designated port toward the leaves of the spanning tree. A backup port can exist only when two ports are connected in a loopback by a point-to-point link or when a switch has two or more connections to a shared LAN segment.
- Disabled port—Has no role within the operation of the spanning tree.

A port with the root or a designated port role is included in the active topology. A port with the alternate or backup port role is excluded from the active topology.

In a stable topology with consistent port roles throughout the network, the RSTP ensures that every root port and designated port immediately transition to the forwarding state while all alternate and backup ports are always in the discarding state (equivalent to blocking in IEEE 802.1D). The port state controls the operation of the forwarding and learning processes.

**Table 35: Port State Comparison**

Operational Status	STP Port State (IEEE 802.1D)	RSTP Port State	Is Port Included in the Active Topology?
Enabled	Blocking	Discarding	No
Enabled	Listening	Discarding	No
Enabled	Learning	Learning	Yes
Enabled	Forwarding	Forwarding	Yes
Disabled	Disabled	Discarding	No

To be consistent with Cisco STP implementations, this guide defines the port state as *blocking* instead of *discarding*. Designated ports start in the listening state.

## Rapid Convergence

The RSTP provides for rapid recovery of connectivity following the failure of a switch, a switch port, or a LAN. It provides rapid convergence for edge ports, new root ports, and ports connected through point-to-point links as follows:

- Edge ports—If you configure a port as an edge port on an RSTP switch by using the **spanning-tree portfast** interface configuration command, the edge port immediately transitions to the forwarding state.

An edge port is the same as a Port Fast-enabled port, and you should enable it only on ports that connect to a single end station.

- Root ports—If the RSTP selects a new root port, it blocks the old root port and immediately transitions the new root port to the forwarding state.
- Point-to-point links—If you connect a port to another port through a point-to-point link and the local port becomes a designated port, it negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology.

**Figure 22: Proposal and Agreement Handshaking for Rapid Convergence**

Switch A is connected to Switch B through a point-to-point link, and all of the ports are in the blocking state. Assume that the priority of Switch A is a smaller numerical value than the priority of Switch B. Switch A sends a proposal message (a configuration BPDU with the proposal flag set) to Switch B, proposing itself as the designated switch.

After receiving the proposal message, Switch B selects as its new root port the port from which the proposal message was received, forces all nonedge ports to the blocking state, and sends an agreement message (a BPDU with the agreement flag set) through its new root port.

After receiving Switch B's agreement message, Switch A also immediately transitions its designated port to the forwarding state. No loops in the network are formed because Switch B blocked all of its nonedge ports and because there is a point-to-point link between Switches A and B.

When Switch C is connected to Switch B, a similar set of handshaking messages are exchanged. Switch C selects the port connected to Switch B as its root port, and both ends immediately transition to the forwarding state. With each iteration of this handshaking process, one more switch joins the active topology. As the network converges, this proposal-agreement handshaking progresses from the root toward the leaves of the spanning tree.

In a switch stack, the cross-stack rapid transition (CSRT) feature ensures that a stack member receives acknowledgments from all stack members during the proposal-agreement handshaking before moving the port to the forwarding state. CSRT is automatically enabled when the switch is in MST mode.

The switch learns the link type from the port duplex mode: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. You can override the default setting that is controlled by the duplex setting by using the **spanning-tree link-type** interface configuration command.

## Synchronization of Port Roles

When the switch receives a proposal message on one of its ports and that port is selected as the new root port, the RSTP forces all other ports to synchronize with the new root information.

The switch is synchronized with superior root information received on the root port if all other ports are synchronized. An individual port on the switch is synchronized if

- That port is in the blocking state.
- It is an edge port (a port configured to be at the edge of the network).

If a designated port is in the forwarding state and is not configured as an edge port, it transitions to the blocking state when the RSTP forces it to synchronize with new root information. In general, when the RSTP forces a port to synchronize with root information and the port does not satisfy any of the above conditions, its port state is set to blocking.

### *Figure 23: Sequence of Events During Rapid Convergence*

After ensuring that all of the ports are synchronized, the switch sends an agreement message to the designated switch corresponding to its root port. When the switches connected by a point-to-point link are in agreement

about their port roles, the RSTP immediately transitions the port states to forwarding.

## Bridge Protocol Data Unit Format and Processing

The RSTP BPDUs format is the same as the IEEE 802.1D BPDUs format except that the protocol version is set to 2. A new 1-byte Version 1 Length field is set to zero, which means that no version 1 protocol information is present.

**Table 36: RSTP BPDUs Flags**

Bit	Function
0	Topology change (TC)
1	Proposal
2–3:	Port role:
00	Unknown
01	Alternate port
10	Root port
11	Designated port
4	Learning
5	Forwarding
6	Agreement
7	Topology change acknowledgement (TCA)

The sending switch sets the proposal flag in the RSTP BPDUs to propose itself as the designated switch on that LAN. The port role in the proposal message is always set to the designated port.

The sending switch sets the agreement flag in the RSTP BPDU to accept the previous proposal. The port role in the agreement message is always set to the root port.

The RSTP does not have a separate topology change notification (TCN) BPDU. It uses the topology change (TC) flag to show the topology changes. However, for interoperability with IEEE 802.1D switches, the RSTP switch processes and generates TCN BPDUs.

The learning and forwarding flags are set according to the state of the sending port.

### Processing Superior BPDU Information

If a port receives superior root information (lower switch ID, lower path cost, and so forth) than currently stored for the port, the RSTP triggers a reconfiguration. If the port is proposed and is selected as the new root port, RSTP forces all the other ports to synchronize.

If the BPDU received is an RSTP BPDU with the proposal flag set, the switch sends an agreement message after all of the other ports are synchronized. If the BPDU is an IEEE 802.1D BPDU, the switch does not set the proposal flag and starts the forward-delay timer for the port. The new root port requires twice the forward-delay time to transition to the forwarding state.

If the superior information received on the port causes the port to become a backup or alternate port, RSTP sets the port to the blocking state but does not send the agreement message. The designated port continues sending BPDUs with the proposal flag set until the forward-delay timer expires, at which time the port transitions to the forwarding state.

### Processing Inferior BPDU Information

If a designated port receives an inferior BPDU (such as a higher switch ID or a higher path cost than currently stored for the port) with a designated port role, it immediately replies with its own information.

## Topology Changes

This section describes the differences between the RSTP and the IEEE 802.1D in handling spanning-tree topology changes.

- **Detection**—Unlike IEEE 802.1D in which *any* transition between the blocking and the forwarding state causes a topology change, *only* transitions from the blocking to the forwarding state cause a topology change with RSTP (only an increase in connectivity is considered a topology change). State changes on an edge port do not cause a topology change. When an RSTP switch detects a topology change, it deletes the learned information on all of its nonedge ports except on those from which it received the TC notification.
- **Notification**—Unlike IEEE 802.1D, which uses TCN BPDUs, the RSTP does not use them. However, for IEEE 802.1D interoperability, an RSTP switch processes and generates TCN BPDUs.
- **Acknowledgement**—When an RSTP switch receives a TCN message on a designated port from an IEEE 802.1D switch, it replies with an IEEE 802.1D configuration BPDU with the TCA bit set. However, if the TC-while timer (the same as the topology-change timer in IEEE 802.1D) is active on a root port connected to an IEEE 802.1D switch and a configuration BPDU with the TCA bit set is received, the TC-while timer is reset.

This behavior is only required to support IEEE 802.1D switches. The RSTP BPDUs never have the TCA bit set.

- **Propagation**—When an RSTP switch receives a TC message from another switch through a designated or root port, it propagates the change to all of its nonedge, designated ports and to the root port (excluding

the port on which it is received). The switch starts the TC-while timer for all such ports and flushes the information learned on them.

- Protocol migration—For backward compatibility with IEEE 802.1D switches, RSTP selectively sends IEEE 802.1D configuration BPDUs and TCN BPDUs on a per-port basis.

When a port is initialized, the migrate-delay timer is started (specifies the minimum time during which RSTP BPDUs are sent), and RSTP BPDUs are sent. While this timer is active, the switch processes all BPDUs received on that port and ignores the protocol type.

If the switch receives an IEEE 802.1D BPDU after the port migration-delay timer has expired, it assumes that it is connected to an IEEE 802.1D switch and starts using only IEEE 802.1D BPDUs. However, if the RSTP switch is using IEEE 802.1D BPDUs on a port and receives an RSTP BPDU after the timer has expired, it restarts the timer and starts using RSTP BPDUs on that port.

## Protocol Migration Process

A switch running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D switches. If this switch receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDUs on that port. An MSTP switch also can detect that a port is at the boundary of a region when it receives a legacy BPDU, an MST BPDU (Version 3) associated with a different region, or an RST BPDU (Version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot detect whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch also might continue to assign a boundary role to a port when the switch to which it is connected has joined the region.

## Default MSTP Configuration

*Table 37: Default MSTP Configuration*

Feature	Default Setting
Spanning-tree mode	MSTP
Switch priority (configurable on a per-CIST port basis)	32768
Spanning-tree port priority (configurable on a per-CIST port basis)	128

Feature	Default Setting
Spanning-tree port cost (configurable on a per-CIST port basis)	1000 Mb/s: 20000 100 Mb/s: 20000 10 Mb/s: 20000 1000 Mb/s: 20000 100 Mb/s: 20000 10 Mb/s: 20000
Hello time	3 seconds
Forward-delay time	20 seconds
Maximum-aging time	20 seconds
Maximum hop count	20 hops

[Specifying the MST Region Configuration and Enabling MSTP \(CLI\)](#), on page 366

## How to Configure MSTP Features

### Specifying the MST Region Configuration and Enabling MSTP (CLI)

For two or more switches to be in the same MST region, they must have the same VLAN-to-instance mapping, the same configuration revision number, and the same name.

A region can have one member or multiple members with the same MST configuration; each member must be capable of processing RSTP BPDUs. There is no limit to the number of MST regions in a network, but each region can only support up to 65 spanning-tree instances. You can assign a VLAN to only one spanning-tree instance at a time.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Switch# <b>configure terminal</b>	
<b>Step 3</b>	<b>spanning-tree mst configuration</b> <b>Example:</b> Switch(config)# <b>spanning-tree mst configuration</b>	Enters MST configuration mode.
<b>Step 4</b>	<b>instance <i>instance-id</i> vlan <i>vlan-range</i></b> <b>Example:</b> Switch(config-mst)# <b>instance 1 vlan 10-20</b>	Maps VLANs to an MST instance. <ul style="list-style-type: none"> <li>• For <i>instance-id</i>, the range is 0 to 4094.</li> <li>• For <b>vlan <i>vlan-range</i></b>, the range is 1 to 4094.</li> </ul> When you map VLANs to an MST instance, the mapping is incremental, and the VLANs specified in the command are added to or removed from the VLANs that were previously mapped. <p>To specify a VLAN range, use a hyphen; for example, <b>instance 1 vlan 1-63</b> maps VLANs 1 through 63 to MST instance 1.</p> <p>To specify a VLAN series, use a comma; for example, <b>instance 1 vlan 10, 20, 30</b> maps VLANs 10, 20, and 30 to MST instance 1.</p>
<b>Step 5</b>	<b>name <i>name</i></b> <b>Example:</b> Switch(config-mst)# <b>name region1</b>	Specifies the configuration name. The <i>name</i> string has a maximum length of 32 characters and is case sensitive.
<b>Step 6</b>	<b>revision <i>version</i></b> <b>Example:</b> Switch(config-mst)# <b>revision 1</b>	Specifies the configuration revision number. The range is 0 to 65535.
<b>Step 7</b>	<b>show pending</b> <b>Example:</b> Switch(config-mst)# <b>show pending</b>	Verifies your configuration by displaying the pending configuration.
<b>Step 8</b>	<b>exit</b> <b>Example:</b> Switch(config-mst)# <b>exit</b>	Applies all changes, and returns to global configuration mode.

	Command or Action	Purpose
<b>Step 9</b>	<b>spanning-tree mode mst</b> <b>Example:</b> <pre>Switch(config)# spanning-tree mode mst</pre>	Enables MSTP. RSTP is also enabled.  Changing spanning-tree modes can disrupt traffic because all spanning-tree instances are stopped for the previous mode and restarted in the new mode.  You cannot run both MSTP and PVST+ or both MSTP and Rapid PVST+ at the same time.
<b>Step 10</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

## Configuring the Root Switch (CLI)

This procedure is optional.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID. Step 2 in the example uses 0 as the instance ID because that was the instance ID set up by the instructions listed under Related Topics.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree mst <i>instance-id</i> root primary</b> <b>Example:</b> Switch(config)# <b>spanning-tree mst 0 root primary</b>	Configures a switch as the root switch. <ul style="list-style-type: none"> <li>For <i>instance-id</i>, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.</li> </ul>
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.

[Bridge ID, Device Priority, and Extended System ID](#), on page 324

[Configuring a Secondary Root Switch \(CLI\)](#), on page 369

## Configuring a Secondary Root Switch (CLI)

When you configure a switch with the extended system ID support as the secondary root, the switch priority is modified from the default value (32768) to 28672. The switch is then likely to become the root switch for the specified instance if the primary root switch fails. This is assuming that the other network switches use the default switch priority of 32768 and therefore are unlikely to become the root switch.

You can execute this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello-time values that you used when you configured the primary root switch with the **spanning-tree mst *instance-id* root primary** global configuration command.

This procedure is optional.

### Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID. This example uses 0 as the instance ID because that was the instance ID set up by the instructions listed under Related Topics.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree mst <i>instance-id</i> root secondary</b> <b>Example:</b> Switch(config)# <b>spanning-tree mst 0 root secondary</b>	Configures a switch as the secondary root switch. <ul style="list-style-type: none"> <li>• For <i>instance-id</i>, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.</li> </ul>
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.

### Related Topics

[Configuring the Root Switch \(CLI\)](#), on page 368

## Configuring Port Priority (CLI)

If a loop occurs, the MSTP uses the port priority when selecting an interface to put into the forwarding state. You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

**Note** If the switch is a member of a switch stack, you must use the **spanning-tree mst [instance-id] cost cost** interface configuration command instead of the **spanning-tree mst [instance-id] port-priority priority** interface configuration command to select a port to put in the forwarding state. Assign lower cost values to ports that you want selected first and higher cost values to ports that you want selected last. For more information, see the path costs topic listed under Related Topics.

This procedure is optional.

### Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet1/0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config)# interface GigabitEthernet1/0/1</pre>	Specifies an interface to configure, and enters interface configuration mode.
<b>Step 4</b>	<b>spanning-tree mst <i>instance-id</i> port-priority <i>priority</i></b> <b>Example:</b>	Configures port priority. <ul style="list-style-type: none"> <li>For <i>instance-id</i>, you can specify a single instance, a range of instances separated by</li> </ul>

	Command or Action	Purpose
	<pre>Switch(config-if) # spanning-tree mst 0 port-priority 64</pre>	<p>a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.</p> <ul style="list-style-type: none"> <li>For <i>priority</i>, the range is 0 to 240 in increments of 16. The default is 128. The lower the number, the higher the priority.</li> </ul> <p>The priority values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if) # end</pre>	Returns to privileged EXEC mode.

The **show spanning-tree mst interface *interface-id*** privileged EXEC command displays information only if the port is in a link-up operative state. Otherwise, you can use the **show running-config interface** privileged EXEC command to confirm the configuration.

#### Related Topics

[Specifying the MST Region Configuration and Enabling MSTP \(CLI\)](#), on page 366

[Configuring Path Cost \(CLI\)](#), on page 372

## Configuring Path Cost (CLI)

The MSTP path cost default value is derived from the media speed of an interface. If a loop occurs, the MSTP uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

This procedure is optional.

#### Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet1/0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Switch> <b>enable</b>	
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <b>interface</b> <b>gigabitethernet1/0/1</b>	Specifies an interface to configure, and enters interface configuration mode. Valid interfaces include physical ports and port-channel logical interfaces. The port-channel range is 1 to 48.
<b>Step 4</b>	<b>spanning-tree mst <i>instance-id</i> cost <i>cost</i></b> <b>Example:</b> Switch(config-if)# <b>spanning-tree mst 0</b> <b>cost 17031970</b>	Configures the cost.  If a loop occurs, the MSTP uses the path cost when selecting an interface to place into the forwarding state. A lower path cost represents higher-speed transmission.  <ul style="list-style-type: none"> <li>• For <i>instance-id</i>, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.</li> <li>• For <i>cost</i>, the range is 1 to 200000000; the default value is derived from the media speed of the interface.</li> </ul>
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.

The **show spanning-tree mst interface *interface-id*** privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the **show running-config** privileged EXEC command to confirm the configuration.

## Configuring the Switch Priority (CLI)

Changing the priority of a switch makes it more likely to be chosen as the root switch whether it is a standalone switch or a switch in the stack.

**Note** Exercise care when using this command. For normal network configurations, we recommend that you use the **spanning-tree mst *instance-id* root primary** and the **spanning-tree mst *instance-id* root secondary** global configuration commands to specify a switch as the root or secondary root switch. You should modify the switch priority only in circumstances where these commands do not work.

This procedure is optional.

### Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID used. This example uses 0 as the instance ID because that was the instance ID set up by the instructions listed under Related Topics.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree mst <i>instance-id</i> priority <i>priority</i></b> <b>Example:</b> Switch(config)# <b>spanning-tree mst 0            priority 4096</b>	Configures the switch priority. <ul style="list-style-type: none"> <li>For <i>instance-id</i>, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.</li> <li>For <i>priority</i>, the range is 0 to 61440 in increments of 4096; the default is 32768. The lower the number, the more likely the switch will be chosen as the root switch.</li> </ul> Priority values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. These are the only acceptable values.
<b>Step 4</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Switch(config-if) # <b>end</b>

## Configuring the Hello Time (CLI)

The hello time is the time interval between configuration messages generated and sent by the root switch.

This procedure is optional.

### Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree mst hello-time seconds</b> <b>Example:</b> Switch(config) # <b>spanning-tree mst hello-time 4</b>	Configures the hello time for all MST instances. The hello time is the time interval between configuration messages generated and sent by the root switch. These messages indicate that the switch is alive.  For <i>seconds</i> , the range is 1 to 10; the default is 3.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config) # <b>end</b>	Returns to privileged EXEC mode.

### Related Topics

[Specifying the MST Region Configuration and Enabling MSTP \(CLI\)](#), on page 366

## Configuring the Forwarding-Delay Time (CLI)

### Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree mst forward-time <i>seconds</i></b> <b>Example:</b> Switch(config)# <b>spanning-tree mst forward-time 25</b>	Configures the forward time for all MST instances. The forwarding delay is the number of seconds a port waits before changing from its spanning-tree learning and listening states to the forwarding state.  For <i>seconds</i> , the range is 4 to 30; the default is 20.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring the Maximum-Aging Time (CLI)

### Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree mst max-age <i>seconds</i></b> <b>Example:</b> <pre>Switch(config)# spanning-tree mst max-age 40</pre>	Configures the maximum-aging time for all MST instances. The maximum-aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration.  For <i>seconds</i> , the range is 6 to 40; the default is 20.
<b>Step 4</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

**Related Topics**

[Specifying the MST Region Configuration and Enabling MSTP \(CLI\)](#), on page 366

## Configuring the Maximum-Hop Count (CLI)

This procedure is optional.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree mst max-hops <i>hop-count</i></b> <b>Example:</b> Switch(config)# <code>spanning-tree mst max-hops 25</code>	Specifies the number of hops in a region before the BPDU is discarded, and the information held for a port is aged.  For <i>hop-count</i> , the range is 1 to 255; the default is 20.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode.

**Related Topics**

[Specifying the MST Region Configuration and Enabling MSTP \(CLI\)](#), on page 366

## Specifying the Link Type to Ensure Rapid Transitions (CLI)

If you connect a port to another port through a point-to-point link and the local port becomes a designated port, the RSTP negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology.

By default, the link type is controlled from the duplex mode of the interface: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. If you have a half-duplex link physically connected point-to-point to a single port on a remote switch running MSTP, you can override the default setting of the link type and enable rapid transitions to the forwarding state.

This procedure is optional.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet1/0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Switch> <b>enable</b>	
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <b>interface</b> <b>GigabitEthernet1/0/1</b>	Specifies an interface to configure, and enters interface configuration mode. Valid interfaces include physical ports, VLANs, and port-channel logical interfaces. The VLAN ID range is 1 to 4094. The port-channel range is 1 to 48.
<b>Step 4</b>	<b>spanning-tree link-type point-to-point</b> <b>Example:</b> Switch(config-if)# <b>spanning-tree</b> <b>link-type point-to-point</b>	Specifies that the link type of a port is point-to-point.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.

**Related Topics**

[Specifying the MST Region Configuration and Enabling MSTP \(CLI\)](#), on page 366

## Designating the Neighbor Type (CLI)

A topology could contain both prestandard and IEEE 802.1s standard compliant devices. By default, ports can automatically detect prestandard devices, but they can still receive both standard and prestandard BPDUs. When there is a mismatch between a device and its neighbor, only the CIST runs on the interface.

You can choose to set a port to send only prestandard BPDUs. The prestandard flag appears in all the **show** commands, even if the port is in STP compatibility mode.

This procedure is optional.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <b>interface</b> <b>GigabitEthernet1/0/1</b>	Specifies an interface to configure, and enters interface configuration mode. Valid interfaces include physical ports.
<b>Step 4</b>	<b>spanning-tree mst pre-standard</b> <b>Example:</b> Switch(config-if)# <b>spanning-tree mst</b> <b>pre-standard</b>	Specifies that the port can send only prestandard BPDUs.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.

**Related Topics**

[Specifying the MST Region Configuration and Enabling MSTP \(CLI\)](#), on page 366

## Restarting the Protocol Migration Process (CLI)

This procedure restarts the protocol migration process and forces renegotiation with neighboring switches. It reverts the switch to MST mode. It is needed when the switch no longer receives IEEE 802.1D BPDUs after it has been receiving them.

Follow these steps to restart the protocol migration process (force the renegotiation with neighboring switches) on the switch.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

If you want to use the interface version of the command, you must also know the MST interface used. This example uses GigabitEthernet1/0/1 as the interface because that was the interface set up by the instructions listed under Related Topics.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	Enter one of the following commands: <ul style="list-style-type: none"> <li>• <b>clear spanning-tree detected-protocols</b></li> <li>• <b>clear spanning-tree detected-protocols interface <i>interface-id</i></b></li> </ul> <b>Example:</b> Switch# <b>clear spanning-tree detected-protocols</b> OR Switch# <b>clear spanning-tree detected-protocols interface GigabitEthernet1/0/1</b>	The switch reverts to the MSTP mode, and the protocol migration process restarts.

### What to do next

This procedure may need to be repeated if the switch receives more legacy IEEE 802.1D configuration BPDUs (BPDUs with the protocol version set to 0).

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restriction for Optional Spanning-Tree Features

- PortFast minimizes the time that interfaces must wait for spanning tree to converge, so it is effective only when used on interfaces connected to end stations. If you enable PortFast on an interface connecting to another switch, you risk creating a spanning-tree loop.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

### Related Topics

[PortFast, on page 384](#)

# Information About Optional Spanning-Tree Features

## PortFast

PortFast immediately brings an interface configured as an access or trunk port to the forwarding state from a blocking state, bypassing the listening and learning states.

**Figure 24: PortFast-Enabled Interfaces**

You can use PortFast on interfaces connected to a single workstation or server to allow those devices to immediately connect to the network, rather than waiting for the spanning tree to

converge. Interfaces connected to a single workstation or server should not receive bridge protocol data units (BPDUs). An interface with PortFast enabled goes through the normal cycle of spanning-tree status changes when the switch is restarted.

You can enable this feature by enabling it on either the interface or on all nontrunking ports.

### Related Topics

[Enabling PortFast \(CLI\)](#), on page 394

[Restriction for Optional Spanning-Tree Features](#), on page 383

## BPDU Guard

The Bridge Protocol Data Unit (BPDU) guard feature can be globally enabled on the switch or can be enabled per port, but the feature operates with some differences.

When you enable BPDU guard at the global level on PortFast edge-enabled ports, spanning tree shuts down ports that are in a PortFast edge-operational state if any BPDU is received on them. In a valid configuration, PortFast edge-enabled ports do not receive BPDUs. Receiving a BPDU on a Port Fast edge-enabled port means an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the port in the error-disabled state. When this happens, the switch shuts down the entire port on which the violation occurred.

When you enable BPDU guard at the interface level on any port without also enabling the PortFast edge feature, and the port receives a BPDU, it is put in the error-disabled state.

The BPDU guard feature provides a secure response to invalid configurations because you must manually put the interface back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

**Related Topics**

[Enabling BPDU Guard \(CLI\)](#), on page 395

## BPDU Filtering

The BPDU filtering feature can be globally enabled on the switch or can be enabled per interface, but the feature operates with some differences.

Enabling BPDU filtering on PortFast edge-enabled interfaces at the global level keeps those interfaces that are in a PortFast edge-operational state from sending or receiving BPDUs. The interfaces still send a few BPDUs at link-up before the switch begins to filter outbound BPDUs. You should globally enable BPDU filtering on a switch so that hosts connected to these interfaces do not receive BPDUs. If a BPDU is received on a PortFast edge-enabled interface, the interface loses its PortFast edge-operational status, and BPDU filtering is disabled.

Enabling BPDU filtering on an interface without also enabling the PortFast edge feature keeps the interface from sending or receiving BPDUs.

**Caution**

Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

You can enable the BPDU filtering feature for the entire switch or for an interface.

**Related Topics**

[Enabling BPDU Filtering \(CLI\)](#), on page 396

## UplinkFast

*Figure 25: Switches in a Hierarchical Network*

Switches in hierarchical networks can be grouped into backbone switches, distribution switches, and access switches. This complex network has distribution switches and access switches that each have at least one

redundant link that spanning tree blocks to prevent

loops.

If a switch loses connectivity, it begins using the alternate paths as soon as the spanning tree selects a new root port. You can accelerate the choice of a new root port when a link or switch fails or when the spanning tree reconfigures itself by enabling UplinkFast. The root port transitions to the forwarding state immediately without going through the listening and learning states, as it would with the normal spanning-tree procedures.

When the spanning tree reconfigures the new root port, other interfaces flood the network with multicast packets, one for each address that was learned on the interface. You can limit these bursts of multicast traffic by reducing the max-update-rate parameter (the default for this parameter is 150 packets per second). However, if you enter zero, station-learning frames are not generated, so the spanning-tree topology converges more slowly after a loss of connectivity.

#### Note

UplinkFast is most useful in wiring-closet switches at the access or edge of the network. It is not appropriate for backbone devices. This feature might not be useful for other types of applications.

UplinkFast provides fast convergence after a direct link failure and achieves load-balancing between redundant Layer 2 links using uplink groups. An uplink group is a set of Layer 2 interfaces (per VLAN), only one of which is forwarding at any given time. Specifically, an uplink group consists of the root port (which is forwarding) and a set of blocked ports, except for self-looping ports. The uplink group provides an alternate path in case the currently forwarding link fails.

**Figure 26: UplinkFast Example Before Direct Link Failure**

This topology has no link failures. Switch A, the root switch, is connected directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that is connected directly to Switch B is in

a blocking state.

**Figure 27: UplinkFast Example After Direct Link Failure**

If Switch C detects a link failure on the currently active link L2 on the root port (a direct link failure), UplinkFast unblocks the blocked interface on Switch C and transitions it to the forwarding state without going through the listening and learning states. This change takes approximately 1 to

5 seconds.

[Enabling UplinkFast for Use with Redundant Links \(CLI\)](#), on page 398

[Events That Cause Fast Convergence](#), on page 389

## Cross-Stack UplinkFast

Cross-Stack UplinkFast (CSUF) provides a fast spanning-tree transition (fast convergence in less than 1 second under normal network conditions) across a switch stack. During the fast transition, an alternate redundant link on the switch stack is placed in the forwarding state without causing temporary spanning-tree loops or loss of connectivity to the backbone. With this feature, you can have a redundant and resilient network in some configurations. CSUF is automatically enabled when you enable the UplinkFast feature.

CSUF might not provide a fast transition all the time; in these cases, the normal spanning-tree transition occurs, completing in 30 to 40 seconds. For more information, see [Related Topics](#).

**Related Topics**

[Enabling UplinkFast for Use with Redundant Links \(CLI\)](#), on page 398

[Events That Cause Fast Convergence](#), on page 389

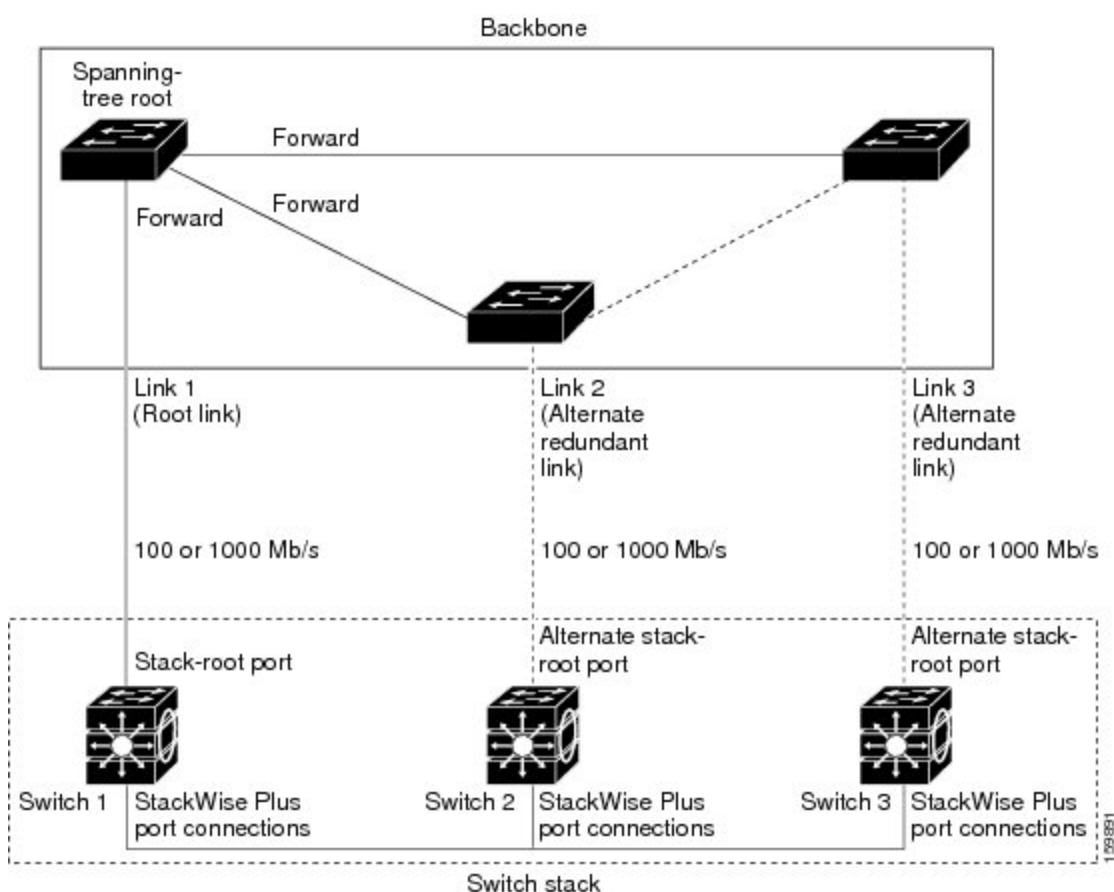

**How Cross-Stack UplinkFast Works**

Cross-Stack UplinkFast (CSUF) ensures that one link in the stack is elected as the path to the root.

**Figure 28: Cross-Stack UplinkFast Topology**

The stack-root port on Switch 1 provides the path to the root of the spanning tree. The alternate stack-root ports on Switches 2 and 3 can provide an alternate path to the spanning-tree root if the current stack-root switch fails or if its link to the spanning-tree root fails.

Link 1, the root link, is in the spanning-tree forwarding state. Links 2 and 3 are alternate redundant links that are in the spanning-tree blocking state. If Switch 1 fails, if its stack-root port fails, or if Link 1 fails, CSUF selects either the alternate stack-root port on Switch 2 or Switch 3 and puts it into the forwarding state in less than 1 second.

When certain link loss or spanning-tree events occur (described in the following topic), the Fast Uplink Transition Protocol uses the neighbor list to send fast-transition requests to stack members.

The switch sending the fast-transition request needs to do a fast transition to the forwarding state of a port that it has chosen as the root port, and it must obtain an acknowledgment from each stack switch before performing the fast transition.

Each switch in the stack decides if the sending switch is a better choice than itself to be the stack root of this spanning-tree instance by comparing the root, cost, and bridge ID. If the sending switch is the best choice as the stack root, each switch in the stack returns an acknowledgment; otherwise, it sends a fast-transition request. The sending switch then has not received acknowledgments from all stack switches.

When acknowledgments are received from all stack switches, the Fast Uplink Transition Protocol on the sending switch immediately transitions its alternate stack-root port to the forwarding state. If acknowledgments from all stack switches are not obtained by the sending switch, the normal spanning-tree transitions (blocking, listening, learning, and forwarding) take place, and the spanning-tree topology converges at its normal rate ( $2 * \text{forward-delay time} + \text{max-age time}$ ).

The Fast Uplink Transition Protocol is implemented on a per-VLAN basis and affects only one spanning-tree instance at a time.

### Related Topics

[Enabling UplinkFast for Use with Redundant Links \(CLI\)](#), on page 398

[Events That Cause Fast Convergence](#), on page 389

## Events That Cause Fast Convergence

Depending on the network event or failure, the CSUF fast convergence might or might not occur.

Fast convergence (less than 1 second under normal network conditions) occurs under these circumstances:

- The stack-root port link fails.

If two switches in the stack have alternate paths to the root, only one of the switches performs the fast transition.

- The failed link, which connects the stack root to the spanning-tree root, recovers.
- A network reconfiguration causes a new stack-root switch to be selected.
- A network reconfiguration causes a new port on the current stack-root switch to be chosen as the stack-root port.

---

**Note** The fast transition might not occur if multiple events occur simultaneously. For example, if a stack member is powered off, and at the same time, the link connecting the stack root to the spanning-tree root comes back up, the normal spanning-tree convergence occurs.

---

Normal spanning-tree convergence (30 to 40 seconds) occurs under these conditions:

- The stack-root switch is powered off, or the software failed.
- The stack-root switch, which was powered off or failed, is powered on.
- A new switch, which might become the stack root, is added to the stack.

[How Cross-Stack UplinkFast Works](#), on page 388

## BackboneFast

BackboneFast detects indirect failures in the core of the backbone. BackboneFast is a complementary technology to the UplinkFast feature, which responds to failures on links directly connected to access switches.

BackboneFast optimizes the maximum-age timer, which controls the amount of time the switch stores protocol information received on an interface. When a switch receives an inferior BPDU from the designated port of another switch, the BPDU is a signal that the other switch might have lost its path to the root, and BackboneFast tries to find an alternate path to the root.

BackboneFast starts when a root port or blocked interface on a switch receives inferior BPDUs from its designated switch. An inferior BPDU identifies a switch that declares itself as both the root bridge and the designated switch. When a switch receives an inferior BPDU, it means that a link to which the switch is not directly connected (an indirect link) has failed (that is, the designated switch has lost its connection to the root switch). Under spanning-tree rules, the switch ignores inferior BPDUs for the maximum aging time (default is 20 seconds).

The switch tries to find if it has an alternate path to the root switch. If the inferior BPDU arrives on a blocked interface, the root port and other blocked interfaces on the switch become alternate paths to the root switch. (Self-looped ports are not considered alternate paths to the root switch.) If the inferior BPDU arrives on the root port, all blocked interfaces become alternate paths to the root switch. If the inferior BPDU arrives on the root port and there are no blocked interfaces, the switch assumes that it has lost connectivity to the root switch, causes the maximum aging time on the root port to expire, and becomes the root switch according to normal spanning-tree rules.

If the switch has alternate paths to the root switch, it uses these alternate paths to send a root link query (RLQ) request. The switch sends the RLQ request on all alternate paths to learn if any stack member has an alternate root to the root switch and waits for an RLQ reply from other switches in the network and in the stack. The switch sends the RLQ request on all alternate paths and waits for an RLQ reply from other switches in the network.

When a stack member receives an RLQ reply from a nonstack member on a blocked interface and the reply is destined for another nonstacked switch, it forwards the reply packet, regardless of the spanning-tree interface state.

When a stack member receives an RLQ reply from a nonstack member and the response is destined for the stack, the stack member forwards the reply so that all the other stack members receive it.

If the switch discovers that it still has an alternate path to the root, it expires the maximum aging time on the interface that received the inferior BPDU. If all the alternate paths to the root switch indicate that the switch has lost connectivity to the root switch, the switch expires the maximum aging time on the interface that received the RLQ reply. If one or more alternate paths can still connect to the root switch, the switch makes all interfaces on which it received an inferior BPDU its designated ports and moves them from the blocking state (if they were in the blocking state), through the listening and learning states, and into the forwarding state.

**Figure 29: BackboneFast Example Before Indirect Link Failure**

This is an example topology with no link failures. Switch A, the root switch, connects directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that connects directly to Switch B

B is in the blocking state.

**Figure 30: BackboneFast Example After Indirect Link Failure**

If link L1 fails, Switch C cannot detect this failure because it is not connected directly to link L1. However, because Switch B is directly connected to the root switch over L1, it detects the failure, elects itself the root, and begins sending BPDUs to Switch C, identifying itself as the root. When Switch C receives the inferior BPDUs from Switch B, Switch C assumes that an indirect failure has occurred. At that point, BackboneFast allows the blocked interface on Switch C to move immediately to the listening state without waiting for the maximum aging time for the interface to expire. BackboneFast then transitions the Layer 2 interface on Switch C to the forwarding state, providing a path from Switch B to Switch A. The root-switch election takes approximately 30 seconds, twice the Forward Delay time if the default Forward Delay time of 15 seconds is set. BackboneFast reconfigures the topology to account for the failure of link

L1.

**Figure 31: Adding a Switch in a Shared-Medium Topology**

If a new switch is introduced into a shared-medium topology, BackboneFast is not activated because the inferior BPDUs did not come from the recognized designated switch (Switch B). The new switch begins sending inferior BPDUs that indicate it is the root switch. However, the other switches ignore these inferior

BPDUs, and the new switch learns that Switch B is the designated switch to Switch A, the root

switch.

## EtherChannel Guard

You can use EtherChannel guard to detect an EtherChannel misconfiguration between the switch and a connected device. A misconfiguration can occur if the switch interfaces are configured in an EtherChannel, but the interfaces on the other device are not. A misconfiguration can also occur if the channel parameters are not the same at both ends of the EtherChannel.

If the switch detects a misconfiguration on the other device, EtherChannel guard places the switch interfaces in the error-disabled state, and displays an error message.

### Related Topics

[Enabling EtherChannel Guard \(CLI\)](#), on page 401

## Root Guard

*Figure 32: Root Guard in a Service-Provider Network*

The Layer 2 network of a service provider (SP) can include many connections to switches that are not owned by the SP. In such a topology, the spanning tree can reconfigure itself and select a customer switch as the root switch. You can avoid this situation by enabling root guard on SP switch interfaces that connect to switches in your customer's network. If spanning-tree calculations cause an interface in the customer network to be selected as the root port, root guard then places the interface in the root-inconsistent (blocked) state to prevent the customer's switch from becoming the root switch or being in the path to the root.

If a switch outside the SP network becomes the root switch, the interface is blocked (root-inconsistent state), and spanning tree selects a new root switch. The customer's switch does not become the root switch and is not in the path to the root.

If the switch is operating in multiple spanning-tree (MST) mode, root guard forces the interface to be a designated port. If a boundary port is blocked in an internal spanning-tree (IST) instance because of root guard, the interface also is blocked in all MST instances. A boundary port is an interface that connects to a LAN, the designated switch of which is either an IEEE 802.1D switch or a switch with a different MST region configuration.

Root guard enabled on an interface applies to all the VLANs to which the interface belongs. VLANs can be grouped and mapped to an MST instance.

#### Caution

Misuse of the root guard feature can cause a loss of connectivity.

#### Related Topics

[Enabling Root Guard \(CLI\)](#), on page 402

## Loop Guard

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is enabled on the entire switched network. Loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

When the switch is operating in PVST+ or rapid-PVST+ mode, loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

When the switch is operating in MST mode, BPDUs are not sent on nonboundary ports only if the interface is blocked by loop guard in all MST instances. On a boundary port, loop guard blocks the interface in all MST instances.

**Related Topics**

[Enabling Loop Guard \(CLI\)](#), on page 403

# How to Configure Optional Spanning-Tree Features

## Enabling PortFast (CLI)

An interface with the PortFast feature enabled is moved directly to the spanning-tree forwarding state without waiting for the standard forward-time delay.

If you enable the voice VLAN feature, the PortFast feature is automatically enabled. When you disable voice VLAN, the PortFast feature is not automatically disabled.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

**Caution**

Use PortFast only when connecting a single end station to an access or trunk port. Enabling this feature on an interface connected to a switch or hub could prevent spanning tree from detecting and disabling loops in your network, which could cause broadcast storms and address-learning problems.

This procedure is optional.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config)# interface gigabitethernet1/0/2</pre>	Specifies an interface to configure, and enters interface configuration mode.
<b>Step 4</b>	<b>spanning-tree portfast [trunk]</b> <b>Example:</b> <pre>Switch(config-if)# spanning-tree portfast</pre>	Enables PortFast on an access port connected to a single workstation or server. By specifying the <b>trunk</b> keyword, you can enable PortFast on a trunk port.

	Command or Action	Purpose
	<code>trunk</code>	<p><b>Note</b> To enable PortFast on trunk ports, you must use the <b>spanning-tree portfast trunk</b> interface configuration command. The <b>spanning-tree portfast</b> command will not work on trunk ports.</p> <p>Make sure that there are no loops in the network between the trunk port and the workstation or server before you enable PortFast on a trunk port.</p> <p>By default, PortFast is disabled on all interfaces.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.

### What to do next

You can use the **spanning-tree portfast default** global configuration command to globally enable the PortFast feature on all nontrunking ports.

### Related Topics

[PortFast](#), on page 384

[Restriction for Optional Spanning-Tree Features](#), on page 383

## Enabling BPDU Guard (CLI)

You can enable the BPDU guard feature if your switch is running PVST+, Rapid PVST+, or MSTP.

### Caution

Configure PortFast edge only on ports that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.

This procedure is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree portfast edge bpduguard default</b> <b>Example:</b>  Switch(config)# <b>spanning-tree portfast edge bpduguard default</b>	Globally enables BPDU guard. By default, BPDU guard is disabled.
<b>Step 4</b>	<b>interface <i>interface-id</i></b> <b>Example:</b>  Switch(config)# <b>interface gigabitethernet1/0/2</b>	Specifies the interface connected to an end station, and enters interface configuration mode.
<b>Step 5</b>	<b>spanning-tree portfast edge</b> <b>Example:</b>  Switch(config-if)# <b>spanning-tree portfast edge</b>	Enables the PortFast edge feature.
<b>Step 6</b>	<b>end</b> <b>Example:</b>  Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.

**What to do next**

To prevent the port from shutting down, you can use the **errdisable detect cause bpduguard shutdown vlan** global configuration command to shut down just the offending VLAN on the port where the violation occurred.

You also can use the **spanning-tree bpduguard enable** interface configuration command to enable BPDU guard on any port without also enabling the PortFast edge feature. When the port receives a BPDU, it is put it in the error-disabled state.

**Related Topics**

[BPDU Guard](#), on page 384

**Enabling BPDU Filtering (CLI)**

You can also use the **spanning-tree bpduguard enable** interface configuration command to enable BPDU filtering on any interface without also enabling the PortFast edge feature. This command prevents the interface from sending or receiving BPDUs.

**Caution** Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

You can enable the BPDU filtering feature if your switch is running PVST+, Rapid PVST+, or MSTP.

**Caution** Configure PortFast edge only on interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.

This procedure is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree portfast edge bpdufilter default</b> <b>Example:</b> Switch(config)# <b>spanning-tree portfast edge bpdufilter default</b>	Globally enables BPDU filtering. By default, BPDU filtering is disabled.
<b>Step 4</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <b>interface gigabitethernet1/0/2</b>	Specifies the interface connected to an end station, and enters interface configuration mode.
<b>Step 5</b>	<b>spanning-tree portfast edge</b> <b>Example:</b> Switch(config-if)# <b>spanning-tree portfast edge</b>	Enables the PortFast edge feature on the specified interface.
<b>Step 6</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Switch(config-if) # <b>end</b>	

**Related Topics**

[BPDU Filtering](#), on page 385

## Enabling UplinkFast for Use with Redundant Links (CLI)

**Note** When you enable UplinkFast, it affects all VLANs on the switch or switch stack. You cannot configure UplinkFast on an individual VLAN.

You can configure the UplinkFast or the Cross-Stack UplinkFast (CSUF) feature for Rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

This procedure is optional. Follow these steps to enable UplinkFast and CSUF.

**Before you begin**

UplinkFast cannot be enabled on VLANs that have been configured with a switch priority. To enable UplinkFast on a VLAN with switch priority configured, first restore the switch priority on the VLAN to the default value using the **no spanning-tree vlan *vlan-id* priority** global configuration command.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree uplinkfast [max-update-rate <i>pkts-per-second</i>]</b> <b>Example:</b> Switch(config)# <b>spanning-tree uplinkfast max-update-rate 200</b>	Enables UplinkFast. (Optional) For <i>pkts-per-second</i> , the range is 0 to 32000 packets per second; the default is 150. If you set the rate to 0, station-learning frames are not generated, and the spanning-tree topology converges more slowly after a loss of connectivity.

	Command or Action	Purpose
		When you enter this command, CSUF also is enabled on all nonstack port interfaces.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config) # <b>end</b>	Returns to privileged EXEC mode.

When UplinkFast is enabled, the switch priority of all VLANs is set to 49152. If you change the path cost to a value less than 3000 and you enable UplinkFast or UplinkFast is already enabled, the path cost of all interfaces and VLAN trunks is increased by 3000 (if you change the path cost to 3000 or above, the path cost is not altered). The changes to the switch priority and the path cost reduce the chance that a switch will become the root switch.

When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.

When you enable the UplinkFast feature using these instructions, CSUF is automatically globally enabled on nonstack port interfaces.

#### Related Topics

[Cross-Stack UplinkFast](#), on page 387

[How Cross-Stack UplinkFast Works](#), on page 388

[Events That Cause Fast Convergence](#), on page 389

## Disabling UplinkFast (CLI)

This procedure is optional.

Follow these steps to disable UplinkFast and Cross-Stack UplinkFast (CSUF).

#### Before you begin

UplinkFast must be enabled.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Switch# <code>configure terminal</code>	
<b>Step 3</b>	<b>no spanning-tree uplinkfast</b> <b>Example:</b> Switch(config)# <code>no spanning-tree uplinkfast</code>	Disables UplinkFast and CSUF on the switch and all of its VLANs.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode.

When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.

When you disable the UplinkFast feature using these instructions, CSUF is automatically globally disabled on nonstack port interfaces.

## Enabling BackboneFast (CLI)

You can enable BackboneFast to detect indirect link failures and to start the spanning-tree reconfiguration sooner.

You can configure the BackboneFast feature for Rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

This procedure is optional. Follow these steps to enable BackboneFast on the switch.

### Before you begin

If you use BackboneFast, you must enable it on all switches in the network. BackboneFast is not supported on Token Ring VLANs. This feature is supported for use with third-party switches.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>spanning-tree backbonefast</b> <b>Example:</b> <pre>Switch(config)# spanning-tree backbonefast</pre>	Enables BackboneFast.
<b>Step 4</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

**Related Topics**

[BackboneFast](#), on page 390

## Enabling EtherChannel Guard (CLI)

You can enable EtherChannel guard to detect an EtherChannel misconfiguration if your switch is running PVST+, Rapid PVST+, or MSTP.

This procedure is optional.

Follow these steps to enable EtherChannel Guard on the switch.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>spanning-tree etherchannel guard misconfig</b> <b>Example:</b> <pre>Switch(config)# spanning-tree etherchannel guard misconfig</pre>	Enables EtherChannel guard.
<b>Step 4</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Switch(config)# <b>end</b>	

### What to do next

You can use the **show interfaces status err-disabled** privileged EXEC command to show which switch ports are disabled because of an EtherChannel misconfiguration. On the remote device, you can enter the **show etherchannel summary** privileged EXEC command to verify the EtherChannel configuration.

After the configuration is corrected, enter the **shutdown** and **no shutdown** interface configuration commands on the port-channel interfaces that were misconfigured.

### Related Topics

[EtherChannel Guard](#), on page 392

## Enabling Root Guard (CLI)

Root guard enabled on an interface applies to all the VLANs to which the interface belongs. Do not enable the root guard on interfaces to be used by the UplinkFast feature. With UplinkFast, the backup interfaces (in the blocked state) replace the root port in the case of a failure. However, if root guard is also enabled, all the backup interfaces used by the UplinkFast feature are placed in the root-inconsistent state (blocked) and are prevented from reaching the forwarding state.

**Note** You cannot enable both root guard and loop guard at the same time.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

This procedure is optional.

Follow these steps to enable root guard on the switch.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> <pre>Switch(config)# <b>interface</b> <b>gigabitethernet1/0/2</b></pre>	Specifies an interface to configure, and enters interface configuration mode.
<b>Step 4</b>	<b>spanning-tree guard root</b> <b>Example:</b> <pre>Switch(config-if)# <b>spanning-tree guard</b> <b>root</b></pre>	Enables root guard on the interface.  By default, root guard is disabled on all interfaces.
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if)# <b>end</b></pre>	Returns to privileged EXEC mode.

**Related Topics**

[Root Guard](#), on page 392

## Enabling Loop Guard (CLI)

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is configured on the entire switched network. Loop guard operates only on interfaces that are considered point-to-point by the spanning tree.

**Note** You cannot enable both loop guard and root guard at the same time.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

This procedure is optional. Follow these steps to enable loop guard on the switch.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	Enter one of the following commands: <ul style="list-style-type: none"> <li>• <b>show spanning-tree active</b></li> <li>• <b>show spanning-tree mst</b></li> </ul> <b>Example:</b> <pre>Switch# <b>show spanning-tree active</b></pre> or <pre>Switch# <b>show spanning-tree mst</b></pre>	Verifies which interfaces are alternate or root ports.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 3</b>	<b>spanning-tree loopguard default</b> <b>Example:</b> Switch(config)# <code>spanning-tree loopguard default</code>	Enables loop guard. By default, loop guard is disabled.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode.

**Related Topics**

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for EtherChannels

The following are restrictions for EtherChannels:

- All ports in an EtherChannel must be assigned to the same VLAN or they must be configured as trunk ports.
- Layer 3 EtherChannels are not supported if running the LAN Base license feature set.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

# Information About EtherChannels

## EtherChannel Overview

EtherChannel provides fault-tolerant high-speed links between switches, routers, and servers. You can use the EtherChannel to increase the bandwidth between the wiring closets and the data center, and you can deploy it anywhere in the network where bottlenecks are likely to occur. EtherChannel provides automatic recovery for the loss of a link by redistributing the load across the remaining links. If a link fails, EtherChannel redirects traffic from the failed link to the remaining links in the channel without intervention.

An EtherChannel consists of individual Ethernet links bundled into a single logical link.

**Figure 33: Typical EtherChannel Configuration**

The EtherChannel provides full-duplex bandwidth up to 8 Gb/s (Gigabit EtherChannel) or 80 Gb/s (10-Gigabit EtherChannel) between your switch and another switch or host.

Each EtherChannel can consist of up to eight compatibly configured Ethernet ports.

The number of EtherChannels is limited to 128.

The LAN Base feature set supports up to 24 EtherChannels.

All ports in each EtherChannel must be configured as either Layer 2 or Layer 3 ports. The EtherChannel Layer 3 ports are made up of routed ports. Routed ports are physical ports configured to be in Layer 3 mode by using the **no switchport** interface configuration command. For more information, see the Configuring Interface Characteristics chapter.

- [EtherChannel Configuration Guidelines](#), on page 421
- [Default EtherChannel Configuration](#), on page 420
- [Layer 2 EtherChannel Configuration Guidelines](#), on page 422

## EtherChannel Modes

You can configure an EtherChannel in one of these modes: Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or On. Configure both ends of the EtherChannel in the same mode:

- When you configure one end of an EtherChannel in either PAgP or LACP mode, the system negotiates with the other end of the channel to determine which ports should become active. If the remote port cannot negotiate an EtherChannel, the local port is put into an independent state and continues to carry data traffic as would any other single link. The port configuration does not change, but the port does not participate in the EtherChannel.
- When you configure an EtherChannel in the **on** mode, no negotiations take place. The switch forces all compatible ports to become active in the EtherChannel. The other end of the channel (on the other switch) must also be configured in the **on** mode; otherwise, packet loss can occur.

### Related Topics

[EtherChannel Configuration Guidelines](#), on page 421

[Default EtherChannel Configuration](#), on page 420

[Layer 2 EtherChannel Configuration Guidelines](#), on page 422

## EtherChannel on Switches

You can create an EtherChannel on a switch, on a single switch in the stack, or on multiple switches in the stack (known as cross-stack EtherChannel).

**Figure 34: Single-Switch EtherChannel**

Figure 35: Cross-Stack EtherChannel

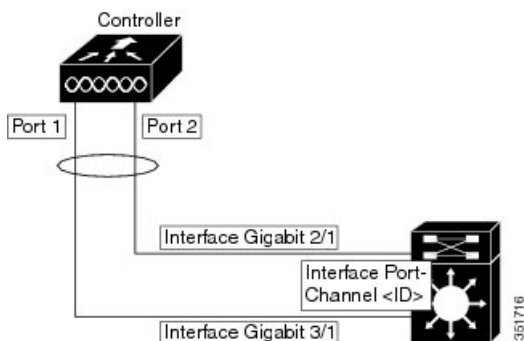

Figure 36: Single Controller EtherChannel

This figure shows the recommended cross-stack EtherChannel configuration with three active links and three standby links.

Figure 37: Cross-Stack EtherChannel

- [EtherChannel Configuration Guidelines](#), on page 421

[Default EtherChannel Configuration](#), on page 420

[Layer 2 EtherChannel Configuration Guidelines](#), on page 422

## EtherChannel Link Failover

If a link within an EtherChannel fails, traffic previously carried over that failed link moves to the remaining links within the EtherChannel. If traps are enabled on the switch, a trap is sent for a failure that identifies the switch, the EtherChannel, and the failed link. Inbound broadcast and multicast packets on one link in an EtherChannel are blocked from returning on any other link of the EtherChannel.

### Related Topics

## Channel Groups and Port-Channel Interfaces

An EtherChannel comprises a channel group and a port-channel interface. The channel group binds physical ports to the port-channel interface. Configuration changes applied to the port-channel interface apply to all the physical ports bound together in the channel group.

**Figure 38: Relationship of Physical Ports, Channel Group and Port-Channel Interface**

The **channel-group** command binds the physical port and the port-channel interface together. Each EtherChannel has a port-channel logical interface numbered from 1 to 128. This port-channel interface number corresponds to the one specified with the **channel-group** interface configuration command.

- With Layer 2 ports, use the **channel-group** interface configuration command to dynamically create the port-channel interface.

You also can use the **interface port-channel** *port-channel-number* global configuration command to manually create the port-channel interface, but then you must use the **channel-group** *channel-group-number* command to bind the logical interface to a physical port. The *channel-group-number* can be the same as the *port-channel-number*; or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

- With Layer 3 ports, you should manually create the logical interface by using the **interface port-channel** global configuration command followed by the **no switchport** interface configuration command. You then manually assign an interface to the EtherChannel by using the **channel-group** interface configuration command.
- With Layer 3 ports, use the **no switchport** interface command to configure the interface as a Layer 3 interface, and then use the **channel-group** interface configuration command to dynamically create the port-channel interface.

## Port Aggregation Protocol

The Port Aggregation Protocol (PAgP) is a Cisco-proprietary protocol that can be run only on Cisco switches and on those switches licensed by vendors to support PAgP. PAgP facilitates the automatic creation of EtherChannels by exchanging PAgP packets between Ethernet ports.

By using PAgP, the switch or switch stack learns the identity of partners capable of supporting PAgP and the capabilities of each port. It then dynamically groups similarly configured ports (on a single switch in the stack) into a single logical link (channel or aggregate port). Similarly configured ports are grouped based on hardware, administrative, and port parameter constraints. For example, PAgP groups the ports with the same speed, duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, PAgP adds the group to the spanning tree as a single switch port.

## PAgP Modes

PAgP modes specify whether a port can send PAgP packets, which start PAgP negotiations, or only respond to PAgP packets received.

*Table 39: EtherChannel PAgP Modes*

Mode	Description
<b>auto</b>	Places a port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. This setting minimizes the transmission of PAgP packets.
<b>desirable</b>	Places a port into an active negotiating state, in which the port starts negotiations with other ports by sending PAgP packets. This mode is supported when the EtherChannel members are from different switches in the switch stack (cross-stack EtherChannel).

Switch ports exchange PAgP packets only with partner ports configured in the **auto** or **desirable** modes. Ports configured in the **on** mode do not exchange PAgP packets.

Both the **auto** and **desirable** modes enable ports to negotiate with partner ports to form an EtherChannel based on criteria such as port speed. and for Layer 2 EtherChannels, based on trunk state and VLAN numbers.

Ports can form an EtherChannel when they are in different PAgP modes as long as the modes are compatible. For example:

- A port in the **desirable** mode can form an EtherChannel with another port that is in the **desirable** or **auto** mode.
- A port in the **auto** mode can form an EtherChannel with another port in the **desirable** mode.

A port in the **auto** mode cannot form an EtherChannel with another port that is also in the **auto** mode because neither port starts PAgP negotiation.

- [Configuring the Physical Interfaces \(CLI\)](#)

## Silent Mode

If your switch is connected to a partner that is PAgP-capable, you can configure the switch port for nonsilent operation by using the **non-silent** keyword. If you do not specify **non-silent** with the **auto** or **desirable** mode, silent mode is assumed.

Use the silent mode when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. An example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port connected to a silent partner prevents that switch port from ever becoming operational. However, the silent setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.

## PAgP Learn Method and Priority

Network devices are classified as PAgP physical learners or aggregate-port learners. A device is a physical learner if it learns addresses by physical ports and directs transmissions based on that knowledge. A device is an aggregate-port learner if it learns addresses by aggregate (logical) ports. The learn method must be configured the same at both ends of the link.

When a device and its partner are both aggregate-port learners, they learn the address on the logical port-channel. The device sends packets to the source by using any of the ports in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives.

PAgP cannot automatically detect when the partner device is a physical learner and when the local device is an aggregate-port learner. Therefore, you must manually set the learning method on the local device to learn

addresses by physical ports. You also must set the load-distribution method to source-based distribution, so that any given source MAC address is always sent on the same physical port.

You also can configure a single port within the group for all transmissions and use other ports for hot-standby. The unused ports in the group can be swapped into operation in just a few seconds if the selected single port loses hardware-signal detection. You can configure which port is always selected for packet transmission by changing its priority with the **pagp port-priority** interface configuration command. The higher the priority, the more likely that the port will be selected.

**Note** The switch supports address learning only on aggregate ports even though the **physical-port** keyword is provided in the CLI. The **pagp learn-method** command and the **pagp port-priority** command have no effect on the switch hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.

When the link partner of the switch is a physical learner, we recommend that you configure the switch as a physical-port learner by using the **pagp learn-method physical-port** interface configuration command. Set the load-distribution method based on the source MAC address by using the **port-channel load-balance src-mac** global configuration command. The switch then sends packets to the physical learner using the same port in the EtherChannel from which it learned the source address. Only use the **pagp learn-method** command in this situation.

## PAgP Interaction with Other Features

The Dynamic Trunking Protocol (DTP) and the Cisco Discovery Protocol (CDP) send and receive packets over the physical ports in the EtherChannel. Trunk ports send and receive PAgP protocol data units (PDUs) on the lowest numbered VLAN.

In Layer 2 EtherChannels, the first port in the channel that comes up provides its MAC address to the EtherChannel. If this port is removed from the bundle, one of the remaining ports in the bundle provides its MAC address to the EtherChannel. For Layer 3 EtherChannels, the MAC address is allocated by the active switch as soon as the interface is created (through the **interface port-channel** global configuration command).

PAgP sends and receives PAgP PDUs only from ports that are up and have PAgP enabled for the auto or desirable mode.

## Link Aggregation Control Protocol

The LACP is defined in IEEE 802.3ad and enables Cisco switches to manage Ethernet channels between switches that conform to the IEEE 802.3ad protocol. LACP facilitates the automatic creation of EtherChannels by exchanging LACP packets between Ethernet ports.

By using LACP, the switch or switch stack learns the identity of partners capable of supporting LACP and the capabilities of each port. It then dynamically groups similarly configured ports into a single logical link (channel or aggregate port). Similarly configured ports are grouped based on hardware, administrative, and

port parameter constraints. For example, LACP groups the ports with the same speed, duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, LACP adds the group to the spanning tree as a single switch port.

The independent mode behavior of ports in a port channel is changed. With CSCtn96950, by default, standalone mode is enabled. When no response is received from an LACP peer, ports in the port channel are moved to suspended state.

## LACP Modes

LACP modes specify whether a port can send LACP packets or only receive LACP packets.

**Table 40: EtherChannel LACP Modes**

Mode	Description
<b>active</b>	Places a port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.
<b>passive</b>	Places a port into a passive negotiating state in which the port responds to LACP packets that it receives, but does not start LACP packet negotiation. This setting minimizes the transmission of LACP packets.

Both the **active** and **passive LACP** modes enable ports to negotiate with partner ports to an EtherChannel based on criteria such as port speed, and for Layer 2 EtherChannels, based on trunk state and VLAN numbers.

Ports can form an EtherChannel when they are in different LACP modes as long as the modes are compatible. For example:

- A port in the **active** mode can form an EtherChannel with another port that is in the **active** or **passive** mode.
- A port in the **passive** mode cannot form an EtherChannel with another port that is also in the **passive** mode because neither port starts LACP negotiation.

## LACP and Link Redundancy

LACP port-channel operation, bandwidth availability, and link redundancy can be further refined with the LACP port-channel min-links and the LACP max-bundle features.

The LACP port-channel min-links feature:

- Configures the minimum number of ports that must be linked up and bundled in the LACP port channel.
- Prevents a low-bandwidth LACP port channel from becoming active.
- Causes an LACP port channel to become inactive if there are too few active members ports to supply the required minimum bandwidth.

The LACP max-bundle feature:

- Defines an upper limit on the number of bundled ports in an LACP port channel.
- Allows hot-standby ports with fewer bundled ports. For example, in an LACP port channel with five ports, you can specify a max-bundle of three, and the two remaining ports are designated as hot-standby ports.

## LACP Interaction with Other Features

The DTP and the CDP send and receive packets over the physical ports in the EtherChannel. Trunk ports send and receive LACP PDUs on the lowest numbered VLAN.

In Layer 2 EtherChannels, the first port in the channel that comes up provides its MAC address to the EtherChannel. If this port is removed from the bundle, one of the remaining ports in the bundle provides its MAC address to the EtherChannel. For Layer 3 EtherChannels, the MAC address is allocated by the active switch as soon as the interface is created through the **interface port-channel** global configuration command.

LACP sends and receives LACP PDUs only from ports that are up and have LACP enabled for the active or passive mode.

## EtherChannel On Mode

EtherChannel **on** mode can be used to manually configure an EtherChannel. The **on** mode forces a port to join an EtherChannel without negotiations. The **on** mode can be useful if the remote device does not support PAgP or LACP. In the **on** mode, a usable EtherChannel exists only when the switches at both ends of the link are configured in the **on** mode.

Ports that are configured in the **on** mode in the same channel group must have compatible port characteristics, such as speed and duplex. Ports that are not compatible are suspended, even though they are configured in the **on** mode.

#### Caution

You should use care when using the **on** mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

## Load-Balancing and Forwarding Methods

EtherChannel balances the traffic load across the links in a channel by reducing part of the binary pattern formed from the addresses in the frame to a numerical value that selects one of the links in the channel. You can specify one of several different load-balancing modes, including load distribution based on MAC addresses, IP addresses, source addresses, destination addresses, or both source and destination addresses. The selected mode applies to all EtherChannels configured on the switch.

**Note** Layer 3 Equal-cost multi path (ECMP) load balancing is based on source IP address, destination IP address, source port, destination port, and layer 4 protocol. Fragmented packets will be treated on two different links based on the algorithm calculated using these parameters. Any changes in one of these parameters will result in load balancing.

You configure the load-balancing and forwarding method by using the **port-channel load-balance** and the **port-channel load-balance extended** global configuration commands.

[Layer 3 EtherChannel Configuration Guidelines](#), on page 423

## MAC Address Forwarding

With source-MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the source-MAC address of the incoming packet. Therefore, to provide load-balancing, packets from different hosts use different ports in the channel, but packets from the same host use the same port in the channel.

With destination-MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the destination host's MAC address of the incoming packet. Therefore, packets to the same destination are forwarded over the same port, and packets to a different destination are sent on a different port in the channel.

With source-and-destination MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on both the source and destination MAC addresses. This forwarding method, a combination source-MAC and destination-MAC address forwarding methods of load distribution, can be used if it is not clear whether source-MAC or destination-MAC address forwarding is better suited on a particular switch. With source-and-destination MAC-address forwarding, packets sent from host A to host B, host A to host C, and host C to host B could all use different ports in the channel.

#### Related Topics

[Layer 2 EtherChannel Configuration Guidelines](#), on page 422

[Default EtherChannel Configuration](#), on page 420

[Layer 3 EtherChannel Configuration Guidelines](#), on page 423

## IP Address Forwarding

With source-IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on the source-IP address of the incoming packet. To provide load balancing, packets from different IP addresses use different ports in the channel, and packets from the same IP address use the same port in the channel.

With destination-IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on the destination-IP address of the incoming packet. To provide load balancing, packets from the same IP source address sent to different IP destination addresses could be sent on different ports in the channel.

Packets sent from different source IP addresses to the same destination IP address are always sent on the same port in the channel.

With source-and-destination IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on both the source and destination IP addresses of the incoming packet. This forwarding method, a combination of source-IP and destination-IP address-based forwarding, can be used if it is not clear whether source-IP or destination-IP address-based forwarding is better suited on a particular switch. In this method, packets sent from the IP address A to IP address B, from IP address A to IP address C, and from IP address C to IP address B could all use different ports in the channel.

## Load-Balancing Advantages

Different load-balancing methods have different advantages, and the choice of a particular load-balancing method should be based on the position of the switch in the network and the kind of traffic that needs to be load-distributed.

**Figure 39: Load Distribution and Forwarding Methods**

In the following figure, an EtherChannel of four workstations communicates with a router. Because the router is a single MAC-address device, source-based forwarding on the switch EtherChannel ensures that the switch uses all available bandwidth to the router. The router is configured for destination-based forwarding because the large number of workstations ensures that the traffic is evenly distributed from the router EtherChannel.

10-1239

**Figure 40: Load Distribution and Forwarding**

In the figure below the controller does source MAC-based forwarding over the EtherChannel links and evenly distributes the traffic over multiple links of the EtherChannel.

Use the option that provides the greatest variety in your configuration. For example, if the traffic on a channel is going only to a single MAC address, using the destination-MAC address always chooses the same link in the channel. Using source addresses or IP addresses might result in better load-balancing.

## EtherChannel and Switch Stacks

If a stack member that has ports participating in an EtherChannel fails or leaves the stack, the active switch removes the failed stack member switch ports from the EtherChannel. The remaining ports of the EtherChannel, if any, continue to provide connectivity.

When a switch is added to an existing stack, the new switch receives the running configuration from the active switch and updates itself with the EtherChannel-related stack configuration. The stack member also receives the operational information (the list of ports that are up and are members of a channel).

When two stacks merge that have EtherChannels configured between them, self-looped ports result. Spanning tree detects this condition and acts accordingly. Any PAgP or LACP configuration on a winning switch stack is not affected, but the PAgP or LACP configuration on the losing switch stack is lost after the stack reboots.

### Switch Stack and PAgP

With PAgP, if the active switch fails or leaves the stack, the standby switch becomes the new active switch. A spanning-tree reconvergence is not triggered unless there is a change in the EtherChannel bandwidth. The new active switch synchronizes the configuration of the stack members to that of the active switch. The PAgP

configuration is not affected after an active switch change unless the EtherChannel has ports residing on the old active switch.

## Switch Stacks and LACP

With LACP, the system ID uses the stack MAC address from the active switch. When an active switch fails or leaves the stack and the standby switch becomes the new active switch change, the LACP system ID is unchanged. By default, the LACP configuration is not affected after the active switch changes.

## Default EtherChannel Configuration

The default EtherChannel configuration is described in this table.

**Table 41: Default EtherChannel Configuration**

Feature	Default Setting
Channel groups	None assigned.
Port-channel logical interface	None defined.
PAgP mode	No default.
PAgP learn method	Aggregate-port learning on all ports.
PAgP priority	128 on all ports.
LACP mode	No default.
LACP learn method	Aggregate-port learning on all ports.
LACP port priority	32768 on all ports.
LACP system priority	32768.
LACP system ID	LACP system priority and the switch or stack MAC address.
Load-balancing	Load distribution on the switch is based on the source-MAC address of the incoming packet.

## EtherChannel Configuration Guidelines

If improperly configured, some EtherChannel ports are automatically disabled to avoid network loops and other problems. Follow these guidelines to avoid configuration problems:

- Do not try to configure more than 128 EtherChannels on the switch or switch stack.
- Configure a PAgP EtherChannel with up to eight Ethernet ports of the same type.
- Configure a LACP EtherChannel with up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.
- Configure all ports in an EtherChannel to operate at the same speeds and duplex modes.
- Enable all ports in an EtherChannel. A port in an EtherChannel that is disabled by using the **shutdown** interface configuration command is treated as a link failure, and its traffic is transferred to one of the remaining ports in the EtherChannel.
- When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, you must also make the changes to all ports in the group:
  - Allowed-VLAN list
  - Spanning-tree path cost for each VLAN
  - Spanning-tree port priority for each VLAN
  - Spanning-tree Port Fast setting
- Do not configure a port to be a member of more than one EtherChannel group.
- Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch or on different switches in the stack. Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.
- Do not configure a secure port as part of an EtherChannel or the reverse.
- Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x on an EtherChannel port, an error message appears, and IEEE 802.1x is not enabled.

- If EtherChannels are configured on switch interfaces, remove the EtherChannel configuration from the interfaces before globally enabling IEEE 802.1x on a switch by using the **dot1x system-auth-control** global configuration command.
- If cross-stack EtherChannel is configured and the switch stack partitions, loops and forwarding issues can occur.

## Layer 2 EtherChannel Configuration Guidelines

When configuring Layer 2 EtherChannels, follow these guidelines:

- Assign all ports in the EtherChannel to the same VLAN, or configure them as trunks. Ports with different native VLANs cannot form an EtherChannel.
- An EtherChannel supports the same allowed range of VLANs on all the ports in a trunking Layer 2 EtherChannel. If the allowed range of VLANs is not the same, the ports do not form an EtherChannel even when PAgP is set to the **auto** or **desirable** mode.
- Ports with different spanning-tree path costs can form an EtherChannel if they are otherwise compatibly configured. Setting different spanning-tree path costs does not, by itself, make ports incompatible for the formation of an EtherChannel.

## Auto-LAG

The auto-LAG feature provides the ability to auto create EtherChannels on ports connected to a switch. By default, auto-LAG is disabled globally and is enabled on all port interfaces. The auto-LAG applies to a switch only when it is enabled globally.

On enabling auto-LAG globally, the following scenarios are possible:

- All port interfaces participate in creation of auto EtherChannels provided the partner port interfaces have EtherChannel configured on them. For more information, see the *"The supported auto-LAG configurations between the actor and partner devices"* table below.
- Ports that are already part of manual EtherChannels cannot participate in creation of auto EtherChannels.
- When auto-LAG is disabled on a port interface that is already a part of an auto created EtherChannel, the port interface will unbundle from the auto EtherChannel.

The following table shows the supported auto-LAG configurations between the actor and partner devices:

Table 42: The supported auto-LAG configurations between the actor and partner devices

Actor/Partner	Active	Passive	Auto
Active	Yes	Yes	Yes
Passive	Yes	No	Yes
Auto	Yes	Yes	Yes

On disabling auto-LAG globally, all auto created Etherchannels become manual EtherChannels.

You cannot add any configurations in an existing auto created EtherChannel. To add, you should first convert it into a manual EtherChannel by executing the **port-channel<channel-number>persistent**.

---

**Note** Auto-LAG uses the LACP protocol to create auto EtherChannel. Only one EtherChannel can be automatically created with the unique partner devices.

---

- [Configuring Auto-LAG on a Port Interface](#), on page 440
- [Configuring Persistence with Auto-LAG](#), on page 441
- [Auto-LAG Configuration Guidelines](#), on page 424

## Auto-LAG Configuration Guidelines

Follow these guidelines when configuring the auto-LAG feature.

- When auto-LAG is enabled globally and on the port interface, and if you do not want the port interface to become a member of the auto EtherChannel, disable the auto-LAG on the port interface.
- A port interface will not bundle to an auto EtherChannel when it is already a member of a manual EtherChannel. To allow it to bundle with the auto EtherChannel, first unbundle the manual EtherChannel on the port interface.
- When auto-LAG is enabled and auto EtherChannel is created, you can create multiple EtherChannels manually with the same partner device. But by default, the port tries to create auto EtherChannel with the partner device.
- The auto-LAG is supported only on Layer 2 EtherChannel. It is not supported on Layer 3 interface and Layer 3 EtherChannel.
- The auto-LAG is supported on cross-stack EtherChannel.

# How to Configure EtherChannels

After you configure an EtherChannel, configuration changes applied to the port-channel interface apply to all the physical ports assigned to the port-channel interface, and configuration changes applied to the physical port affect only the port where you apply the configuration.

## Configuring Layer 2 EtherChannels (CLI)

You configure Layer 2 EtherChannels by assigning ports to a channel group with the **channel-group** interface configuration command. This command automatically creates the port-channel logical interface.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <b>interface gigabitethernet2/0/1</b>	Specifies a physical port, and enters interface configuration mode.  Valid interfaces are physical ports.  For a PAgP EtherChannel, you can configure up to eight ports of the same type and speed for the same group.  For a LACP EtherChannel, you can configure up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.
<b>Step 3</b>	<b>switchport mode {access   trunk}</b> <b>Example:</b> Switch(config-if)# <b>switchport mode access</b>	Assigns all ports as static-access ports in the same VLAN, or configure them as trunks.  If you configure the port as a static-access port, assign it to only one VLAN. The range is 1 to 4094.
<b>Step 4</b>	<b>switchport access vlan <i>vlan-id</i></b> <b>Example:</b> Switch(config-if)# <b>switchport access vlan 22</b>	(Optional) If you configure the port as a static-access port, assign it to only one VLAN. The range is 1 to 4094.

	Command or Action	Purpose
<b>Step 5</b>	<p><b>channel-group</b> <i>channel-group-number</i> <b>mode</b> {<b>auto</b> [<b>non-silent</b>]   <b>desirable</b> [<b>non-silent</b>]   <b>on</b> }   { <b>active</b>   <b>passive</b> }</p> <p><b>Example:</b></p> <pre>Switch(config-if) # channel-group 5 mode auto</pre>	<p>Assigns the port to a channel group, and specifies the PAgP or the LACP mode.</p> <p>For <i>channel-group-number</i>, the range is 1 to 128.</p> <p>For <b>mode</b>, select one of these keywords:</p> <ul style="list-style-type: none"> <li>• <b>auto</b> —Enables PAgP only if a PAgP device is detected. It places the port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. This keyword is not supported when EtherChannel members are from different switches in the switch stack.</li> <li>• <b>desirable</b> —Unconditionally enables PAgP. It places the port into an active negotiating state, in which the port starts negotiations with other ports by sending PAgP packets. This keyword is not supported when EtherChannel members are from different switches in the switch stack.</li> <li>• <b>on</b> —Forces the port to channel without PAgP or LACP. In the <b>on</b> mode, an EtherChannel exists only when a port group in the <b>on</b> mode is connected to another port group in the <b>on</b> mode.</li> <li>• <b>non-silent</b> —(Optional) If your switch is connected to a partner that is PAgP-capable, configures the switch port for nonsilent operation when the port is in the <b>auto</b> or <b>desirable</b> mode. If you do not specify <b>non-silent</b>, silent is assumed. The silent setting is for connections to file servers or packet analyzers. This setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.</li> <li>• <b>active</b> —Enables LACP only if a LACP device is detected. It places the port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.</li> <li>• <b>passive</b> —Enables LACP on the port and places it into a passive negotiating state in which the port responds to LACP packets</li> </ul>

	Command or Action	Purpose
		that it receives, but does not start LACP packet negotiation.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Switch(config-if) # <b>end</b>	Returns to privileged EXEC mode.

## Configuring Layer 3 EtherChannels (CLI)

Follow these steps to assign an Ethernet port to a Layer 3 EtherChannel. This procedure is required.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Switch(config)# <b>interface</b> gigabitethernet	Specifies a physical port, and enters interface configuration mode.  Valid interfaces include physical ports.

	Command or Action	Purpose
	1/0/2	<p>For a PAgP EtherChannel, you can configure up to eight ports of the same type and speed for the same group.</p> <p>For a LACP EtherChannel, you can configure up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.</p>
<b>Step 4</b>	<p><b>no ip address</b></p> <p><b>Example:</b></p> <pre>Switch(config-if) # no ip address</pre>	Ensures that there is no IP address assigned to the physical port.
<b>Step 5</b>	<p><b>no switchport</b></p> <p><b>Example:</b></p> <pre>Switch(config-if) # no switchport</pre>	Puts the port into Layer 3 mode.
<b>Step 6</b>	<p><b>channel-group</b> <i>channel-group-number</i> <b>mode</b>  { <b>auto</b> [ <b>non-silent</b> ]   <b>desirable</b> [ <b>non-silent</b> ]   <b>on</b> }   { <b>active</b>   <b>passive</b> }</p> <p><b>Example:</b></p> <pre>Switch(config-if) # channel-group 5 mode auto</pre>	<p>Assigns the port to a channel group, and specifies the PAgP or the LACP mode.</p> <p>For <b>mode</b>, select one of these keywords:</p> <ul style="list-style-type: none"> <li>• <b>auto</b>—Enables PAgP only if a PAgP device is detected. It places the port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. This keyword is not supported when EtherChannel members are from different switches in the switch stack.</li> <li>• <b>desirable</b>—Unconditionally enables PAgP. It places the port into an active negotiating state, in which the port starts negotiations with other ports by sending PAgP packets. This keyword is not supported when EtherChannel members are from different switches in the switch stack.</li> <li>• <b>on</b>—Forces the port to channel without PAgP or LACP. In the <b>on</b> mode, an EtherChannel exists only when a port group in the <b>on</b> mode is connected to another port group in the <b>on</b> mode.</li> <li>• <b>non-silent</b>—(Optional) If your switch is connected to a partner that is PAgP</li> </ul>

	Command or Action	Purpose
		<p>capable, configures the switch port for nonsilent operation when the port is in the <b>auto</b> or <b>desirable</b> mode. If you do not specify <b>non-silent</b>, silent is assumed. The silent setting is for connections to file servers or packet analyzers. This setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.</p> <ul style="list-style-type: none"> <li>• <b>active</b>—Enables LACP only if a LACP device is detected. It places the port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.</li> <li>• <b>passive</b>—Enables LACP on the port and places it into a passive negotiating state in which the port responds to LACP packets that it receives, but does not start LACP packet negotiation.</li> </ul>
<b>Step 7</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.

## Configuring EtherChannel Load-Balancing (CLI)

You can configure EtherChannel load-balancing to use one of several different forwarding methods.

This task is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>port-channel load-balance</b> { <b>dst-ip</b>   <b>dst-mac</b>   <b>dst-mixed-ip-port</b>   <b>dst-port</b>   <b>extended</b> [<b>dst-ip</b>   <b>dst-mac</b>   <b>dst-port</b>   <b>ipv6-label</b>   <b>I3-proto</b>   <b>src-ip</b>   <b>src-mac</b>   <b>src-port</b> ]  </p>	<p>Configures an EtherChannel load-balancing method.</p> <p>The default is <b>src-mac</b>.</p> <p>Select one of these load-distribution methods:</p>

	Command or Action	Purpose
	<p><b>src-dst-ip   src-dst-mac src-dst-mixed-ip-port src-dst-portsrc-ip   src-mac   src-mixed-ip-port   src-port}</b></p> <p><b>Example:</b></p> <pre>Switch(config)# port-channel load-balance src-mac</pre>	<ul style="list-style-type: none"> <li>• <b>dst-ip</b>—Specifies destination-host IP address.</li> <li>• <b>dst-mac</b>—Specifies the destination-host MAC address of the incoming packet.</li> <li>• <b>dst-mixed-ip-port</b>—Specifies the host IP address and TCP/UDP port.</li> <li>• <b>dst-port</b>—Specifies the destination TCP/UDP port.</li> <li>• <b>extended</b>—Specifies extended load balance methods--combinations of source and destination methods beyond those available with the standard command.</li> <li>• <b>ipv6-label</b>—Specifies the IPv6 flow label.</li> <li>• <b>l3-proto</b>—Specifies the Layer 3 protocol.</li> <li>• <b>src-dst-ip</b>—Specifies the source and destination host IP address.</li> <li>• <b>src-dst-mac</b>—Specifies the source and destination host MAC address.</li> <li>• <b>src-dst-mixed-ip-port</b>—Specifies the source and destination host IP address and TCP/UDP port.</li> <li>• <b>src-dst-port</b>—Specifies the source and destination TCP/UDP port.</li> <li>• <b>src-ip</b>—Specifies the source host IP address.</li> <li>• <b>src-mac</b>—Specifies the source MAC address of the incoming packet.</li> <li>• <b>src-mixed-ip-port</b>—Specifies the source host IP address and TCP/UDP port.</li> <li>• <b>src-port</b>—Specifies the source TCP/UDP port.</li> </ul>
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

## Configuring EtherChannel Extended Load-Balancing (CLI)

Configure EtherChannel extended load-balancing when you want to use a combination of load-balancing methods.

This task is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>port-channel load-balance extended [ dst-ip   dst-mac dst-port   ipv6-label   l3-proto   src-ip   src-mac   src-port ]</b>  <b>Example:</b> Switch(config)# <b>port-channel load-balance extended dst-ip dst-mac src-ip</b>	Configures an EtherChannel extended load-balancing method.  The default is <b>src-mac</b> .  Select one of these load-distribution methods: <ul style="list-style-type: none"> <li>• <b>dst-ip</b>—Specifies destination-host IP address.</li> <li>• <b>dst-mac</b>—Specifies the destination-host MAC address of the incoming packet.</li> <li>• <b>dst-port</b>—Specifies the destination TCP/UDP port.</li> <li>• <b>ipv6-label</b>—Specifies the IPv6 flow label.</li> <li>• <b>l3-proto</b>—Specifies the Layer 3 protocol.</li> <li>• <b>src-ip</b>—Specifies the source host IP address.</li> <li>• <b>src-mac</b>—Specifies the source MAC address of the incoming packet.</li> <li>• <b>src-port</b>—Specifies the source TCP/UDP port.</li> </ul>

	Command or Action	Purpose
<b>Step 3</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

## Configuring the PAgP Learn Method and Priority (CLI)

This task is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config)# interface gigabitethernet 1/0/2</pre>	Specifies the port for transmission, and enters interface configuration mode.
<b>Step 3</b>	<b>pagp learn-method physical-port</b> <b>Example:</b> <pre>Switch(config-if)# pagp learn-method physical port</pre>	<p>Selects the PAgP learning method.</p> <p>By default, <b>aggregation-port learning</b> is selected, which means the switch sends packets to the source by using any of the ports in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives.</p> <p>Selects <b>physical-port</b> to connect with another switch that is a physical learner. Make sure to configure the <b>port-channel load-balance</b> global configuration command to <b>src-mac</b>.</p> <p>The learning method must be configured the same at both ends of the link.</p>
<b>Step 4</b>	<b>pagp port-priority <i>priority</i></b> <b>Example:</b> <pre>Switch(config-if)# pagp port-priority 200</pre>	<p>Assigns a priority so that the selected port is chosen for packet transmission.</p> <p>For <i>priority</i>, the range is 0 to 255. The default is 128. The higher the priority, the more likely that the port will be used for PAgP transmission.</p>

	Command or Action	Purpose
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.

## Configuring LACP Hot-Standby Ports

When LACP is enabled, the software, by default, tries to configure the maximum number of LACP-compatible ports in a channel, up to a maximum of 16 ports. Only eight LACP links can be active at one time; the remaining eight links are placed in hot-standby mode. If one of the active links becomes inactive, a link that is in the hot-standby mode becomes active in its place.

You can override the default behavior by specifying the maximum number of active ports in a channel, in which case, the remaining ports become hot-standby ports. For example, if you specify a maximum of five ports in a channel, up to 11 ports become hot-standby ports.

If you configure more than eight links for an EtherChannel group, the software automatically decides which of the hot-standby ports to make active based on the LACP priority. To every link between systems that operate LACP, the software assigns a unique priority made up of these elements (in priority order):

- LACP system priority
- System ID (the switch MAC address)
- LACP port priority
- Port number

In priority comparisons, numerically lower values have higher priority. The priority decides which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

Determining which ports are active and which are hot standby is a two-step procedure. First the system with a numerically lower system priority and system ID is placed in charge of the decision. Next, that system decides which ports are active and which are hot standby, based on its values for port priority and port number. The port priority and port number values for the other system are not used.

You can change the default values of the LACP system priority and the LACP port priority to affect how the software selects active and standby links.

## Configuring the LACP Max Bundle Feature (CLI)

When you specify the maximum number of bundled LACP ports allowed in a port channel, the remaining ports in the port channel are designated as hot-standby ports.

Beginning in privileged EXEC mode, follow these steps to configure the maximum number of LACP ports in a port channel. This procedure is optional.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface port-channel</b> <i>channel-number</i> <b>Example:</b> Switch(config)# <b>interface port-channel</b> <b>2</b>	Enters interface configuration mode for a port channel.  The range is 1 to 128.
<b>Step 3</b>	<b>lACP max-bundle</b> <i>max-bundle-number</i> <b>Example:</b> Switch(config-if)# <b>lACP max-bundle</b> <b>3</b>	Specifies the maximum number of LACP ports in the port-channel bundle.  The range is 1 to 8.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring LACP Port-Channel Standalone Disable

To disable the standalone EtherChannel member port state on a port channel, perform this task on the port channel interface:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface port-channel <i>channel-group</i></b> <b>Example:</b>  Switch(config)# <b>interface port-channel <i>channel-group</i></b>	Selects a port channel interface to configure.
<b>Step 3</b>	<b>port-channel standalone-disable</b> <b>Example:</b>  Switch(config-if)# <b>port-channel standalone-disable</b>	Disables the standalone mode on the port-channel interface.
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Switch(config-if)# <b>end</b>	Exits configuration mode.
<b>Step 5</b>	<b>show etherchannel</b> <b>Example:</b>  Switch# <b>show etherchannel <i>channel-group</i></b> <b>port-channel</b> Switch# <b>show etherchannel <i>channel-group</i></b> <b>detail</b>	Verifies the configuration.

**Related Topics**

[Configuring LACP Hot-Standby Ports: Example](#), on page 444

**Configuring the LACP Port Channel Min-Links Feature (CLI)**

You can specify the minimum number of active ports that must be in the link-up state and bundled in an EtherChannel for the port channel interface to transition to the link-up state. Using EtherChannel min-links, you can prevent low-bandwidth LACP EtherChannels from becoming active. Port channel min-links also cause LACP EtherChannels to become inactive if they have too few active member ports to supply the required minimum bandwidth.

To configure the minimum number of links that are required for a port channel. Perform the following tasks.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Switch> <b>enable</b>	
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface port-channel</b> <i>channel-number</i> <b>Example:</b> Switch(config)# <b>interface port-channel</b> <b>2</b>	Enters interface configuration mode for a port-channel.  For <i>channel-number</i> , the range is 1 to 63.
<b>Step 4</b>	<b>port-channel min-links</b> <i>min-links-number</i> <b>Example:</b> Switch(config-if)# <b>port-channel min-links</b> <b>3</b>	Specifies the minimum number of member ports that must be in the link-up state and bundled in the EtherChannel for the port channel interface to transition to the link-up state.  For <i>min-links-number</i> , the range is 2 to 8.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.

**Related Topics**

[LACP and Link Redundancy](#), on page 415

[Configuring LACP Hot-Standby Ports: Example](#), on page 444

**Configuring the LACP System Priority (CLI)**

You can configure the system priority for all the EtherChannels that are enabled for LACP by using the **lacp system-priority** global configuration command. You cannot configure a system priority for each LACP-configured channel. By changing this value from the default, you can affect how the software selects active and standby links.

You can use the **show etherchannel summary** privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag).

Follow these steps to configure the LACP system priority. This procedure is optional.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>lacp system-priority <i>priority</i></b> <b>Example:</b>  Switch(config)# <b>lacp system-priority</b> <b>32000</b>	Configures the LACP system priority.  The range is 1 to 65535. The default is 32768.  The lower the value, the higher the system priority.
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.

**Related Topics**

- [EtherChannel Configuration Guidelines](#), on page 421
- [Default EtherChannel Configuration](#), on page 420
- [Layer 2 EtherChannel Configuration Guidelines](#), on page 422
- [Monitoring EtherChannel, PAGP, and LACP Status](#), on page 441

**Configuring the LACP Port Priority (CLI)**

By default, all ports use the same port priority. If the local system has a lower value for the system priority and the system ID than the remote system, you can affect which of the hot-standby links become active first by changing the port priority of LACP EtherChannel ports to a lower value than the default. The hot-standby ports that have lower port numbers become active in the channel first. You can use the **show etherchannel summary** privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag).

**Note** If LACP is not able to aggregate all the ports that are compatible (for example, the remote system might have more restrictive hardware limitations), all the ports that cannot be actively included in the EtherChannel are put in the hot-standby state and are used only if one of the channeled ports fails.

Follow these steps to configure the LACP port priority. This procedure is optional.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Switch(config)# <b>interface gigabitethernet</b> <b>1/0/2</b>	Specifies the port to be configured, and enters interface configuration mode.
<b>Step 4</b>	<b>lacp port-priority</b> <i>priority</i> <b>Example:</b> Switch(config-if)# <b>lacp port-priority</b> <b>32000</b>	Configures the LACP port priority. The range is 1 to 65535. The default is 32768. The lower the value, the more likely that the port will be used for LACP transmission.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config-if)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring Auto-LAG Globally

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>[no] port-channel auto</b> <b>Example:</b> Switch(config)# <b>port-channel auto</b>	Enables the auto-LAG feature on a switch globally. Use the no form of this command to disable the auto-LAG feature on the switch globally.  <b>Note</b> By default, the auto-LAG feature is enabled on the port.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show etherchannel auto</b> <b>Example:</b> Switch# <b>show etherchannel auto</b>	Displays that EtherChannel is created automatically.

## Monitoring EtherChannel, PAgP, and LACP Status

You can display EtherChannel, PAgP, and LACP status using the commands listed in this table.

*Table 43: Commands for Monitoring EtherChannel, PAgP, and LACP Status*

Command	Description
<b>clear lacp</b> { <i>channel-group-number</i> <b>counters</b>   <b>counters</b> }	Clears LACP channel-group information and traffic counters.
<b>clear pagp</b> { <i>channel-group-number</i> <b>counters</b>   <b>counters</b> }	Clears PAgP channel-group information and traffic counters.

Command	Description
<b>show etherchannel</b> [ <i>channel-group-number</i> { <b>detail</b>   <b>load-balance</b>   <b>port</b>   <b>port-channel</b>   <b>protocol</b>   <b>summary</b> } ] [ <b>detail</b>   <b>load-balance</b>   <b>port</b>   <b>port-channel</b>   <b>protocol</b>   <b>auto</b>   <b>summary</b> ]	Displays EtherChannel information in a brief, detailed, and one-line summary form. Also displays the load-balance or frame-distribution scheme, port, port-channel, protocol, and Auto-LAG information.
<b>show pagp</b> [ <i>channel-group-number</i> ] { <b>counters</b>   <b>internal</b>   <b>neighbor</b> }	Displays PAgP information such as traffic information, the internal PAgP configuration, and neighbor information.
<b>show pagp</b> [ <i>channel-group-number</i> ] <b>dual-active</b>	Displays the dual-active detection status.
<b>show lacp</b> [ <i>channel-group-number</i> ] { <b>counters</b>   <b>internal</b>   <b>neighbor</b>   <b>sys-id</b> }	Displays LACP information such as traffic information, the internal LACP configuration, and neighbor information.
<b>show running-config</b>	Verifies your configuration entries.
<b>show etherchannel load-balance</b>	Displays the load balance or frame distribution scheme among ports in the port channel.

## Configuration Examples for Configuring EtherChannels

### Configuring Layer 2 EtherChannels: Examples

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two ports as static-access ports in VLAN 10 to channel 5 with the PAgP mode **desirable**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode desirable non-silent
Switch(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two ports as static-access ports in VLAN 10 to channel 5 with the LACP mode **active**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range)# switchport mode access
```

```
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

This example shows how to configure a cross-stack EtherChannel. It uses LACP passive mode and assigns two ports on stack member 1 and one port on stack member 2 as static-access ports in VLAN 10 to channel 5:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/4 -5
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode passive
Switch(config-if-range)# exit
Switch(config)# interface gigabitethernet3/0/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 10
Switch(config-if)# channel-group 5 mode passive
Switch(config-if)# exit
```

PoE or LACP negotiation errors may occur if you configure two ports from switch to the access point (AP). This scenario can be avoided if the port channel configuration is on the switch side. For more details, see the following example:

```
interface Port-channel1
  switchport access vlan 20
  switchport mode access
  switchport nonegotiate
  no port-channel standalone-disable <---this one
  spanning-tree portfast
```

**Note** If the port reports LACP errors on port flap, you should include the following command as well: **no errdisable detect cause pagp-flap**

## Configuring Layer 3 EtherChannels: Examples

This example shows how to configure a Layer 3 EtherChannel. It assigns two ports to channel 5 with the LACP mode active:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range)# no ip address
Switch(config-if-range)# no switchport
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

This example shows how to configure a cross-stack Layer 3 EtherChannel. It assigns two ports on stack member 2 and one port on stack member 3 to channel 7 using LACP active mode:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/4 -5
Switch(config-if-range)# no ip address
Switch(config-if-range)# no switchport
Switch(config-if-range)# channel-group 7 mode active
Switch(config-if-range)# exit
Switch(config)# interface gigabitethernet3/0/3
Switch(config-if)# no ip address
Switch(config-if)# no switchport
Switch(config-if)# channel-group 7 mode active
Switch(config-if)# exit
```

## Configuring LACP Hot-Standby Ports: Example

This example shows how to configure an Etherchannel (port channel 2) that will be active when there are at least three active ports, will comprise up to seven active ports and the remaining ports (up to nine) as hot-standby ports :

```
Switch# configure terminal
Switch(config)# interface port-channel 2
Switch(config-if)# port-channel min-links 3
Switch(config-if)# lacp max-bundle 7
```

This example shows how to disable the standalone EtherChannel member port state on port channel 42:

```
Switch(config)# interface port-channel channel-group
Switch(config-if)# port-channel standalone-disable
```

This example shows how to verify the configuration:

```
Switch# show etherchannel 42 port-channel | include Standalone
Standalone Disable = enabled
Switch# show etherchannel 42 detail | include Standalone
Standalone Disable = enabled
```

## Configuring Auto LAG: Examples

This example shows how to configure Auto-LAG on a switch

```
switch> enable
switch# configure terminal
switch (config)# port-channel auto
switch (config-if)# end
switch# show etherchannel auto
```

The following example shows the summary of EtherChannel that was created automatically.

```

switch# show etherchannel auto
Flags: D - down          P - bundled in port-channel
       I - stand-alone  s - suspended
       H - Hot-standby (LACP only)
       R - Layer3       S - Layer2
       U - in use       f - failed to allocate aggregator
       M - not in use, minimum links not met
       u - unsuitable for bundling
       w - waiting to be aggregated
       d - default port
       A - formed by Auto LAG

Number of channel-groups in use: 1
Number of aggregators:          1

```

Group	Port-channel	Protocol	Ports
1	Pol(SUA)	LACP	Gi1/0/45(P) Gi2/0/21(P) Gi3/0/21(P)

The following example shows the summary of auto EtherChannel after executing the **port-channel 1 persistent** command.

```

switch# port-channel 1 persistent

switch# show etherchannel summary
Switch# show etherchannel summary
Flags: D - down          P - bundled in port-channel
       I - stand-alone  s - suspended
       H - Hot-standby (LACP only)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for Configuring Flex Links and MAC Address-Table Move Update

- Flex Links are supported only on Layer 2 ports and port channels.
- You can configure up to 16 backup links.
- You can configure only one Flex Links backup link for any active link, and it must be a different interface from the active interface.

- An interface can belong to only one Flex Links pair. An interface can be a backup link for only one active link. An active link cannot belong to another Flex Links pair.
- Neither of the links can be a port that belongs to an EtherChannel. However, you can configure two port channels (EtherChannel logical interfaces) as Flex Links, and you can configure a port channel and a physical interface as Flex Links, with either the port channel or the physical interface as the active link.
- A backup link does not have to be the same type (Gigabit Ethernet or port channel) as the active link. However, you should configure both Flex Links with similar characteristics so that there are no loops or changes in behavior if the standby link begins to forward traffic.
- STP is disabled on Flex Links ports. A Flex Links port does not participate in STP, even if the VLANs present on the port are configured for STP. When STP is not enabled, be sure that there are no loops in the configured topology.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

# Information About Flex Links and MAC Address-Table Move Update

## Flex Links

Flex Links are a pair of a Layer 2 interfaces (switch ports or port channels) where one interface is configured to act as a backup to the other. The feature provides an alternative solution to the Spanning Tree Protocol (STP). Users can disable STP and still retain basic link redundancy. Flex Links are typically configured in service provider or enterprise networks where customers do not want to run STP on the switch. If the switch is running STP, Flex Links are not necessary because STP already provides link-level redundancy or backup.

You configure Flex Links on one Layer 2 interface (the active link) by assigning another Layer 2 interface as the Flex Links or backup link. On switches, the Flex Links can be on the same switch or on another switch in the stack. When one of the links is up and forwarding traffic, the other link is in standby mode, ready to begin forwarding traffic if the other link shuts down. At any given time, only one of the interfaces is in the linkup state and forwarding traffic. If the primary link shuts down, the standby link starts forwarding traffic. When the active link comes back up, it goes into standby mode and does not forward traffic. STP is disabled on Flex Links interfaces.

#### Related Topics

[Configuring a Preemption Scheme for a Pair of Flex Links \(CLI\)](#), on page 457

[Configuring Flex Links \(CLI\)](#), on page 456

[Configuring Flex Links: Examples](#), on page 462

## Flex Links Configuration

In the following figure, ports 1 and 2 on switch A are connected to uplink switches B and C. Because they are configured as Flex Links, only one of the interfaces is forwarding traffic; the other is in standby mode. If port 1 is the active link, it begins forwarding traffic between port 1 and switch B; the link between port 2 (the backup link) and switch C is not forwarding traffic. If port 1 goes down, port 2 comes up and starts forwarding traffic to switch C. When port 1 comes back up, it goes into standby mode and does not forward traffic; port 2 continues forwarding traffic.

You can also configure a preemption function, specifying the preferred port for forwarding traffic. For example, you can configure the Flex Links pair with preemption mode. In the scenario shown, when port 1 comes back up and has more bandwidth than port 2, port 1 begins forwarding traffic after 60 seconds. Port 2 becomes the standby port. You do this by entering the **switchport backup interface preemption mode bandwidth** and **switchport backup interface preemption delay** interface configuration commands.

**Figure 41: Flex Links Configuration Example**

**Figure 42: Flex Links Configuration Example**

If a primary (forwarding) link goes down, a trap notifies the network management stations. If the standby link goes down, a trap notifies the users.

Flex Links are supported only on Layer 2 ports and port channels, not on VLANs or on Layer 3 ports.

[Configuring Flex Links \(CLI\)](#), on page 456

## VLAN Flex Links Load Balancing and Support

VLAN Flex Links load balancing allows users to configure a Flex Links pair so that both ports simultaneously forward the traffic for some mutually exclusive VLANs. For example, if Flex Links ports are configured for 1 to 100 VLANs, the traffic of the first 50 VLANs can be forwarded on one port and the rest on the other

port. If one of the ports fail, the other active port forwards all the traffic. When the failed port comes back up, it resumes forwarding traffic in the preferred VLANs. In addition to providing the redundancy, this Flex Links pair can be used for load balancing. Flex Links VLAN load balancing does not impose any restrictions on uplink switches.

**Figure 43: VLAN Flex Links Load-Balancing Configuration Example**

The following figure displays a VLAN Flex Links load-balancing configuration.

**Figure 44: VLAN Flex Links Load-Balancing Configuration Example**

## Multicast Fast Convergence with Flex Links Failover

Multicast fast convergence reduces the multicast traffic convergence time after a Flex Links failure. Multicast fast convergence is implemented by a combination of learning the backup link as an mrouter port, generating IGMP reports, and leaking IGMP reports.

### Related Topics

[Configuring Multicast Fast Convergence with Flex Links Failover: Examples](#), on page 465

### Learning the Other Flex Links Port as the mrouter Port

In a typical multicast network, there is a querier for each VLAN. A switch deployed at the edge of a network has one of its Flex Links ports receiving queries. Flex Links ports are also always forwarding at any given time.

A port that receives queries is added as an mrouter port on the switch. An mrouter port is part of all the multicast groups learned by the switch. After a changeover, queries are received by the other Flex Links port. The other Flex Links port is then learned as the mrouter port. After changeover, multicast traffic then flows through the other Flex Links port. To achieve faster convergence of traffic, both Flex Links ports are learned as mrouter ports whenever either Flex Links port is learned as the mrouter port. Both Flex Links ports are always part of multicast groups.

Although both Flex Links ports are part of the groups in normal operation mode, all traffic on the backup port is blocked. The normal multicast data flow is not affected by the addition of the backup port as an mrouter

port. When the changeover happens, the backup port is unblocked, allowing the traffic to flow. In this case, the upstream multicast data flows as soon as the backup port is unblocked.

## Generating IGMP Reports

When the backup link comes up after the changeover, the upstream new distribution switch does not start forwarding multicast data, because the port on the upstream router, which is connected to the blocked Flex Links port, is not part of any multicast group. The reports for the multicast groups were not forwarded by the downstream switch because the backup link is blocked. The data does not flow on this port, until it learns the multicast groups, which occurs only after it receives reports.

The reports are sent by hosts when a general query is received, and a general query is sent within 60 seconds in normal scenarios. When the backup link starts forwarding, to achieve faster convergence of multicast data, the downstream switch immediately sends proxy reports for all the learned groups on this port without waiting for a general query.

## Leaking IGMP Reports

To achieve multicast traffic convergence with minimal loss, a redundant data path must be set up before the Flex Links active link goes down. This can be achieved by leaking only IGMP report packets on the Flex Links backup link. These leaked IGMP report messages are processed by upstream distribution routers, so multicast data traffic gets forwarded to the backup interface. Because all incoming traffic on the backup interface is dropped at the ingress of the access switch, no duplicate multicast traffic is received by the host. When the Flex Links active link fails, the access switch starts accepting traffic from the backup link immediately. The only disadvantage of this scheme is that it consumes bandwidth on the link between the distribution switches and on the backup link between the distribution and access switches. This feature is disabled by default and can be configured by using the **switchport backup interface *interface-id* multicast fast-convergence** command.

When this feature has been enabled at changeover, the switch does not generate the proxy reports on the backup port, which became the forwarding port.

## MAC Address-Table Move Update

The MAC address-table move update feature allows the switch to provide rapid bidirectional convergence when a primary (forwarding) link goes down and the standby link begins forwarding traffic.

### *Figure 45: MAC Address-Table Move Update Example*

In the following figure, switch A is an access switch, and ports 1 and 2 on switch A are connected to uplink switches B and D through a Flex Links pair. Port 1 is forwarding traffic, and port 2 is in the backup state. Traffic from the PC to the server is forwarded from port 1 to port 3. The MAC address of the PC has been

learned on port 3 of switch C. Traffic from the server to the PC is forwarded from port 3 to port 1.

If the MAC address-table move update feature is not configured and port 1 goes down, port 2 starts forwarding traffic. However, for a short time, switch C keeps forwarding traffic from the server to the PC through port 3, and the PC does not get the traffic because port 1 is down. If switch C removes the MAC address of the PC on port 3 and relearns it on port 4, traffic can then be forwarded from the server to the PC through port 2.

If the MAC address-table move update feature is configured and enabled on the switches, and port 1 goes down, port 2 starts forwarding traffic from the PC to the server. The switch sends a MAC address-table move update packet from port 2. Switch C gets this packet on port 4 and immediately learns the MAC address of the PC on port 4, which reduces the reconvergence time.

You can configure the access switch, switch A, to *send* MAC address-table move update messages. You can also configure the uplink switches B, C, and D to *get* and process the MAC address-table move update messages. When switch C gets a MAC address-table move update message from switch A, switch C learns the MAC address of the PC on port 4. Switch C updates the MAC address table, including the forwarding table entry for the PC.

Switch A does not need to wait for the MAC address-table update. The switch detects a failure on port 1 and immediately starts forwarding server traffic from port 2, the new forwarding port. This change occurs in less than 100 milliseconds (ms). The PC is directly connected to switch A, and the connection status does not change. Switch A does not need to update the PC entry in the MAC address table.

**Figure 46: MAC Address-Table Move Update Example**

In the following figure, the controller and switches B and C form the Flexlink through a Flex Links pair. Port 3 is forwarding traffic, and port 4 is in the backup state. Switch A is an access switch, and ports 1 and 2 on switch A are connected to uplink switches B and C. The MAC addresses of the wireless clients have been learnt on port 1 of the switch A.

In the above figure, three wireless clients connect to an access point and communicate to the controller. The PC connected to switch A communicates with the wireless clients through the data path from port 3 to port 1. If the MAC address-table move update feature is not configured on the controller and port 3 goes down, port 4 starts forwarding traffic. However, for a short time the wireless clients will not be able to pass any traffic to the PC as port 3 is down.

If the MAC address-table move update feature is configured and enabled on the controller, and port 3 goes down, the controller sends a MAC address-table move update packet (MMU) from port 4. This MMU packet carries all the MAC addresses of the wireless clients. Switch C gets this packet on port 4 and immediately learns the MAC addresses of the wireless clients, which reduces the reconvergence time. The PC transmits data to the wireless clients using the path from port 2 to port 4. Switch C also bridges the same MMU packet in the VLAN so that all the switches in the network will update the MAC address table to ensure that the next packet to any wireless client towards controller comes on the right path. The controller learns only the MAC addresses of the wireless clients.

## Configuration Examples for Flex Links

### Configuring Flex Links: Examples

This example shows how to verify the configuration after you configure an interface with a backup interface:

```
Switch# show interface switchport backup

Switch Backup Interface Pairs:
Active Interface Backup Interface State
-----
GigabitEthernet1/0/1 GigabitEthernet1/0/2 Active Up/Backup Standby
```

This example shows how to verify the configuration after you configure the preemption mode as forced for a backup interface pair:

```
Switch# show interface switchport backup detail

Switch Backup Interface Pairs:

Active Interface Backup Interface State
-----
GigabitEthernet1/0/211 GigabitEthernet1/0/2 Active Up/Backup Standby
Interface Pair : Gi1/0/1, Gi1/0/2
Preemption Mode : forced
Preemption Delay : 50 seconds
Bandwidth : 100000 Kbit (Gi1/0/1), 100000 Kbit (Gi1/0/2)
Mac Address Move Update Vlan : auto
```

**Related Topics**

## Configuring VLAN Load Balancing on Flex Links: Examples

In the following example, VLANs 1 to 50, 60, and 100 to 120 are configured on the switch:

```
Switch(config)# interface gigabitethernet 2/0/6
Switch(config-if)# switchport backup interface gigabitethernet 2/0/8 prefer vlan 60,100-120
```

When both interfaces are up, Gi2/0/8 forwards traffic for VLANs 60 and 100 to 120 and Gi2/0/6 forwards traffic for VLANs 1 to 50.

```
Switch# show interfaces switchport backup
```

```
Switch Backup Interface Pairs:
```

Active Interface	Backup Interface	State
GigabitEthernet2/0/6	GigabitEthernet2/0/8	Active Up/Backup Standby

```
Vlans Preferred on Active Interface: 1-50
```

```
Vlans Preferred on Backup Interface: 60, 100-120
```

When a Flex Links interface goes down (LINK\_DOWN), VLANs preferred on this interface are moved to the peer interface of the Flex Links pair. In this example, if interface Gi2/0/6 goes down, Gi2/0/8 carries all VLANs of the Flex Links pair.

```
Switch# show interfaces switchport backup
```

```
Switch Backup Interface Pairs:
```

Active Interface	Backup Interface	State
GigabitEthernet2/0/6	GigabitEthernet2/0/8	Active Down/Backup Up

```
Vlans Preferred on Active Interface: 1-50
```

```
Vlans Preferred on Backup Interface: 60, 100-120
```

When a Flex Links interface comes up, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface Gi2/0/6 comes up, VLANs preferred on this interface are blocked on the peer interface Gi2/0/8 and forwarded on Gi2/0/6.

```
Switch# show interfaces switchport backup
```

```
Switch Backup Interface Pairs:
```

Active Interface	Backup Interface	State
------------------	------------------	-------

```

-----
GigabitEthernet2/0/6    GigabitEthernet2/0/8    Active Up/Backup Standby

Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120

Switch# show interfaces switchport backup detail

Switch Backup Interface Pairs:

Active Interface          Backup Interface          State
-----
FastEthernet1/0/3        FastEthernet1/0/4        Active Down/Backup Up

Vlans Preferred on Active Interface: 1-2,5-4094
Vlans Preferred on Backup Interface: 3-4
Preemption Mode : off
Bandwidth : 10000 Kbit (Fa1/0/3), 100000 Kbit (Fa1/0/4)
Mac Address Move Update Vlan : auto

```

## Configuring the MAC Address-Table Move Update: Examples

This example shows how to verify the configuration after you configure an access switch to send MAC address-table move updates:

```

Switch# show mac address-table move update

Switch-ID : 010b.4630.1780
Dst mac-address : 0180.c200.0010
Vlans/Macs supported : 1023/8320
Default/Current settings: Rcv Off/On, Xmt Off/On
Max packets per min : Rcv 40, Xmt 60
Rcv packet count : 5
Rcv conforming packet count : 5
Rcv invalid packet count : 0
Rcv packet count this min : 0
Rcv threshold exceed count : 0
Rcv last sequence# this min : 0
Rcv last interface : Po2
Rcv last src-mac-address : 000b.462d.c502
Rcv last switch-ID : 0403.fd6a.8700
Xmt packet count : 0
Xmt packet count this min : 0
Xmt threshold exceed count : 0
Xmt pak buf unavail cnt : 0
Xmt last interface : None

```

## Configuring Multicast Fast Convergence with Flex Links Failover: Examples

These are configuration examples for learning the other Flex Links port as the mrouter port when Flex Links is configured on GigabitEthernet1/0/11 and GigabitEthernet1/0/12, and output for the **show interfaces switchport backup** command:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface GigabitEthernet1/0/11
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport backup interface GigabitEthernet1/0/12
Switch(config-if)# exit
Switch(config)# interface GigabitEthernet1/0/12
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# end
Switch# show interfaces switchport backup detail
Switch Backup Interface Pairs:
Active Interface Backup Interface State
GigabitEthernet1/0/11 GigabitEthernet1/0/12 Active Up/Backup Standby
Preemption Mode : off
Multicast Fast Convergence : Off
Bandwidth : 100000 Kbit (Gi1/0/11), 100000 Kbit (Gi1/0/12)
Mac Address Move Update Vlan : auto
```

This output shows a querier for VLANs 1 and 401, with their queries reaching the switch through GigabitEthernet1/0/11:

```
Switch# show ip igmp snooping querier
```

Vlan	IP Address	IGMP Version	Port
1	1.1.1.1	v2	Gi1/0/11
401	41.41.41.1	v2	Gi1/0/11

This example is output for the **show ip igmp snooping mrouter** command for VLANs 1 and 401:

```
Switch# show ip igmp snooping mrouter
```

Vlan	ports
1	Gi1/0/11(dynamic), Gi1/0/12(dynamic)
401	Gi1/0/11(dynamic), Gi1/0/12(dynamic)

Similarly, both Flex Links ports are part of learned groups. In this example, GigabitEthernet2/0/11 is a receiver/host in VLAN 1, which is interested in two multicast groups:

```
Switch# show ip igmp snooping groups
```

Vlan	Group	Type	Version	Port List
1	228.1.5.1	igmp	v2	Gi1/0/11, Gi1/0/12, Gi2/0/11

```
1 228.1.5.2 igmp v2 Gi1/0/11, Gi1/0/12, Gi2/0/11
```

When a host responds to the general query, the switch forwards this report on all the mrouter ports. In this example, when a host sends a report for the group 228.1.5.1, it is forwarded only on GigabitEthernet1/0/11, because the backup port GigabitEthernet1/0/12 is blocked. When the active link, GigabitEthernet1/0/11, goes down, the backup port, GigabitEthernet1/0/12, begins forwarding.

As soon as this port starts forwarding, the switch sends proxy reports for the groups 228.1.5.1 and 228.1.5.2 on behalf of the host. The upstream router learns the groups and starts forwarding multicast data. This is the default behavior of Flex Links. This behavior changes when the user configures fast convergence using the **switchport backup interface gigabitEthernet 1/0/12 multicast fast-convergence** command. This example shows turning on this feature:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitEthernet 1/0/11
Switch(config-if)# switchport backup interface gigabitEthernet 1/0/12 multicast
fast-convergence
Switch(config-if)# exit
Switch# show interfaces switchport backup detail

Switch Backup Interface Pairs:
Active      Interface      Backup Interface State
-----
GigabitEthernet1/0/11 GigabitEthernet1/0/12 Active Up/Backup Standby
Preemption Mode : off
Multicast Fast Convergence : On
Bandwidth : 100000 Kbit (Gi1/0/11), 100000 Kbit (Gi1/0/12)
Mac Address Move Update Vlan : auto
```

This output shows a querier for VLAN 1 and 401 with their queries reaching the switch through GigabitEthernet1/0/11:

```
Switch# show ip igmp snooping querier

Vlan      IP Address      IGMP Version      Port
-----
1         1.1.1.1         v2                 Gi1/0/11
401      41.41.41.1     v2                 Gi1/0/11
```

This is output for the **show ip igmp snooping mrouter** command for VLAN 1 and 401:

```
Switch# show ip igmp snooping mrouter

Vlan      ports
----      -
1         Gi1/0/11(dynamic), Gi1/0/12(dynamic)
401      Gi1/0/11(dynamic), Gi1/0/12(dynamic)
```

Similarly, both the Flex Links ports are a part of the learned groups. In this example, GigabitEthernet2/0/11 is a receiver/host in VLAN 1, which is interested in two multicast groups:

```
Switch# show ip igmp snooping groups

Vlan  Group  Type  Version  Port List
-----
```

```

1 228.1.5.1 igmp v2 Gi1/0/11, Gi1/0/12, Gi2/0/11
1 228.1.5.2 igmp v2 Gi1/0/11, Gi1/0/12, Gi2/0/11

```

Whenever a host responds to the general query, the switch forwards this report on all the mrouter ports. When you turn on this feature through the command-line port, and when a report is forwarded by the switch on GigabitEthernet1/0/11, it is also leaked to the backup port GigabitEthernet1/0/12. The upstream router learns the groups and starts forwarding multicast data, which is dropped at the ingress because GigabitEthernet1/0/12 is blocked. When the active link, GigabitEthernet1/0/11, goes down, the backup port, GigabitEthernet1/0/12, begins forwarding. You do not need to send any proxy reports as the multicast data is already being forwarded by the upstream router. By leaking reports to the backup port, a redundant multicast path has been set up, and the time taken for the multicast traffic convergence is very minimal.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for Configuring UDLD

The following are restrictions for configuring UniDirectional Link Detection (UDLD):

- A UDLD-capable port cannot detect a unidirectional link if it is connected to a UDLD-incapable port of another switch.
- When configuring the mode (normal or aggressive), make sure that the same mode is configured on both sides of the link.
- You can configure UDLD in interface configuration mode and the configuration is accepted by the device; however, this configuration is not displayed in the running configuration, nor is it saved.

### Caution

Loop guard works only on point-to-point links. We recommend that each end of the link has a directly connected device that is running STP.

# Information About UDLD

UniDirectional Link Detection (UDLD) is a Layer 2 protocol that enables devices connected through fiber-optic or twisted-pair Ethernet cables to monitor the physical configuration of the cables and detect when a unidirectional link exists. All connected devices must support UDLD for the protocol to successfully identify and disable unidirectional links. When UDLD detects a unidirectional link, it disables the affected port and alerts you. Unidirectional links can cause a variety of problems, including spanning-tree topology loops.

## Modes of Operation

UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD can detect unidirectional links due to misconnected ports on fiber-optic connections. In aggressive mode, UDLD can also detect unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and to misconnected ports on fiber-optic links.

In normal and aggressive modes, UDLD works with the Layer 1 mechanisms to learn the physical status of a link. At Layer 1, autonegotiation takes care of physical signaling and fault detection. UDLD performs tasks that autonegotiation cannot perform, such as detecting the identities of neighbors and shutting down misconnected ports. When you enable both autonegotiation and UDLD, the Layer 1 and Layer 2 detections work together to prevent physical and logical unidirectional connections and the malfunctioning of other protocols.

A unidirectional link occurs whenever traffic sent by a local device is received by its neighbor but traffic from the neighbor is not received by the local device.

### Normal Mode

In normal mode, UDLD detects a unidirectional link when fiber strands in a fiber-optic port are misconnected and the Layer 1 mechanisms do not detect this misconnection. If the ports are connected correctly but the traffic is one way, UDLD does not detect the unidirectional link because the Layer 1 mechanism, which is supposed to detect this condition, does not do so. In this case, the logical link is considered undetermined, and UDLD does not disable the port.

When UDLD is in normal mode, if one of the fiber strands in a pair is disconnected, as long as autonegotiation is active, the link does not stay up because the Layer 1 mechanisms detects a physical problem with the link. In this case, UDLD does not take any action and the logical link is considered undetermined.

#### Related Topics

[Enabling UDLD Globally \(CLI\)](#), on page 472

[Enabling UDLD on an Interface \(CLI\)](#), on page 474

### Aggressive Mode

In aggressive mode, UDLD detects a unidirectional link by using the previous detection methods. UDLD in aggressive mode can also detect a unidirectional link on a point-to-point link on which no failure between the two devices is allowed. It can also detect a unidirectional link when one of these problems exists:

- On fiber-optic or twisted-pair links, one of the ports cannot send or receive traffic.
- On fiber-optic or twisted-pair links, one of the ports is down while the other is up.
- One of the fiber strands in the cable is disconnected.

In these cases, UDLD disables the affected port.

In a point-to-point link, UDLD hello packets can be considered as a heart beat whose presence guarantees the health of the link. Conversely, the loss of the heart beat means that the link must be shut down if it is not possible to reestablish a bidirectional link.

If both fiber strands in a cable are working normally from a Layer 1 perspective, UDLD in aggressive mode detects whether those fiber strands are connected correctly and whether traffic is flowing bidirectionally between the correct neighbors. This check cannot be performed by autonegotiation because autonegotiation operates at Layer 1.

[Enabling UDLD Globally \(CLI\)](#), on page 472

[Enabling UDLD on an Interface \(CLI\)](#), on page 474

## Methods to Detect Unidirectional Links

UDLD operates by using two methods:

- Neighbor database maintenance
- Event-driven detection and echoing

#### Related Topics

[Enabling UDLD Globally \(CLI\)](#), on page 472

[Enabling UDLD on an Interface \(CLI\)](#), on page 474

## Neighbor Database Maintenance

UDLD learns about other UDLD-capable neighbors by periodically sending a hello packet (also called an advertisement or probe) on every active port to keep each device informed about its neighbors.

When the switch receives a hello message, it caches the information until the age time (hold time or time-to-live) expires. If the switch receives a new hello message before an older cache entry ages, the switch replaces the older entry with the new one.

Whenever a port is disabled and UDLD is running, whenever UDLD is disabled on a port, or whenever the switch is reset, UDLD clears all existing cache entries for the ports affected by the configuration change. UDLD sends at least one message to inform the neighbors to flush the part of their caches affected by the status change. The message is intended to keep the caches synchronized.

## Event-Driven Detection and Echoing

UDLD relies on echoing as its detection operation. Whenever a UDLD device learns about a new neighbor or receives a resynchronization request from an out-of-sync neighbor, it restarts the detection window on its side of the connection and sends echo messages in reply. Because this behavior is the same on all UDLD neighbors, the sender of the echoes expects to receive an echo in reply.

If the detection window ends and no valid reply message is received, the link might shut down, depending on the UDLD mode. When UDLD is in normal mode, the link might be considered undetermined and might not be shut down. When UDLD is in aggressive mode, the link is considered unidirectional, and the port is disabled.

#### Related Topics

[Enabling UDLD Globally \(CLI\)](#), on page 472

[Enabling UDLD on an Interface \(CLI\)](#), on page 474

## UDLD Reset Options

If an interface becomes disabled by UDLD, you can use one of the following options to reset UDLD:

- The **udld reset** interface configuration command.
- The **shutdown** interface configuration command followed by the **no shutdown** interface configuration command restarts the disabled port.
- The **no udld {aggressive | enable}** global configuration command followed by the **udld {aggressive | enable}** global configuration command reenables the disabled ports.
- The **no udld port** interface configuration command followed by the **udld port [aggressive]** interface configuration command reenables the disabled fiber-optic port.
- The **errdisable recovery cause udld** global configuration command enables the timer to automatically recover from the UDLD error-disabled state, and the **errdisable recovery interval interval** global configuration command specifies the time to recover from the UDLD error-disabled state.

## How to Configure UDLD

### Enabling UDLD Globally (CLI)

Follow these steps to enable UDLD in the aggressive or normal mode and to set the configurable message timer on all fiber-optic ports on the switch.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>udld {aggressive   enable   message time message-timer-interval}</b> <b>Example:</b> <pre>Switch(config)# udld enable message time 10</pre>	<p>Specifies the UDLD mode of operation:</p> <ul style="list-style-type: none"> <li>• <b>aggressive</b>—Enables UDLD in aggressive mode on all fiber-optic ports.</li> <li>• <b>enable</b>—Enables UDLD in normal mode on all fiber-optic ports on the switch. UDLD is disabled by default. An individual interface configuration overrides the setting of the <b>udld enable</b> global configuration command.</li> <li>• <b>message time message-timer-interval</b>—Configures the period of time between UDLD probe messages on ports that are in the advertisement phase and are detected to be bidirectional. The range is from 1 to 90 seconds; the default value is 15.</li> </ul> <p><b>Note</b> This command affects fiber-optic ports only. Use the <b>udld</b> interface configuration command to enable UDLD on other port types.</p> <p>Use the <b>no</b> form of this command, to disable UDLD.</p>
<b>Step 3</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring the Switch for Access Point Discovery

---

**Caution** You should connect APs directly to the Cisco Catalyst 3850 switch ports to use its wireless functionality.

---

- Ensure that the Control and Provisioning of Wireless Access Points (CAPWAP) UDP ports 5246 and 5247 (similar to the Lightweight Access Point Protocol (LWAPP) UDP ports 12222 and 12223) are enabled and are not blocked by an intermediate device that could prevent an access point from joining the switch.
- If access control lists (ACLs) are in the control path between the switch and its access points, you must open new protocol ports to prevent access points from being stranded.

- If an access point is in the UP state and its IP address changes, the access point tears down the existing CAPWAP tunnel and rejoins the switch.
- Access points must be discovered by a switch before they can become an active part of the network. The lightweight access points support the following switch discovery processes:
  - Layer 3 CAPWAP discovery—You can enable this feature on different subnets from the access point. This feature uses IP addresses and UDP packets rather than the MAC addresses used by Layer 2 discovery.
  - Locally stored switch IP address discovery—If the access point was previously associated to a switch, the IP addresses of the primary, secondary, and tertiary switches are stored in the access point's nonvolatile memory. This process of storing switch IP addresses on an access point for later deployment is called *priming the access point*.
  - DHCP server discovery—This feature uses DHCP option 43 to provide switch IP addresses to the access points. Cisco switches support a DHCP server option that is typically used for this capability.
  - DNS discovery—The access point can discover switches through your domain name server (DNS). You must configure your DNS to return switch IP addresses in response to CISCO-CAPWAP-CONTROLLER.*localdomain*, where *localdomain* is the access point domain name. When an access point receives an IP address and DNS information from a DHCP server, it contacts the DNS to resolve CISCO-CAPWAP-CONTROLLER.*localdomain*. When the DNS sends a list of switch IP addresses, the access point sends discovery requests to the switches.

## Restrictions for Configuring the Switch for Access Point Discovery

- Ensure that the switches are configured with the correct date and time. If the date and time configured on the switch precedes the creation and installation date of certificates on the access points, the access point fails to join the switch.
- During the discovery process, access points that are supported by the Cisco switch, such as the 1140, 1260, 3500, 1040, 1600, 2600, or 3600 query only for Cisco switches.
- Do not configure same VLAN for both wireless management and wireless clients.

## Information About Configuring the Switch for Access Point Discovery

In a CAPWAP environment, a lightweight access point discovers a switch by using CAPWAP discovery mechanisms and then sends a CAPWAP join request to the switch. The switch sends a CAPWAP join response to the access point that allows the access point to join the switch. When the access point joins the switch, the switch manages its configuration, firmware, control transactions, and data transactions.

## Access Point Communication Protocols

Cisco lightweight access points use the IETF standard CAPWAP to communicate with the switch and other lightweight access points on the network.

CAPWAP, which is based on LWAPP, is a standard, interoperable protocol that enables a switch to manage a collection of wireless access points. CAPWAP is implemented in switch for these reasons:

- To provide an upgrade path from Cisco products that use LWAPP to next-generation Cisco products that use CAPWAP
- To manage RFID readers and similar devices
- To enable switches to interoperate with third-party access points in the future

## Viewing Access Point Join Information

Join statistics for an access point that sends a CAPWAP discovery request to the switch at least once are maintained on the switch even if the access point is rebooted or disconnected. These statistics are removed only when the switch is rebooted or when you choose to clear the statistics.

## Troubleshooting the Access Point Join Process

Access points can fail to join a switch for many reasons such as a RADIUS authorization is pending, self-signed certificates are not enabled on the switch, the access point and switch's regulatory domains do not match, and so on.

You can configure the access points to send all CAPWAP-related errors to a syslog server. You do not need to enable any debug commands on the switch because all of the CAPWAP error messages can be viewed from the syslog server itself.

The state of the access point is not maintained on the switch until it receives a CAPWAP join request from the access point, so it can be difficult to determine why the CAPWAP discovery request from a certain access point was rejected. In order to troubleshoot such joining issues without enabling CAPWAP debug commands on the switch, the switch collects information for all access points that send a discovery message to this switch and maintains information for any access points that have successfully joined this switch.

The switch collects all join-related information for each access point that sends a CAPWAP discovery request to the switch. Collection begins when the first discovery message is received from the access point and ends when the last configuration payload is sent from the switch to the access point.

When the switch is maintaining join-related information for the maximum number of access points, it does not collect information for any more access points.

You can also configure a DHCP server to return a syslog server IP address to the access point using option 7 on the server. The access point then starts sending all syslog messages to this IP address.

You can configure the syslog server IP address through the access point CLI, if the access point is not connected to the switch by entering the **capwap ap log-server *syslog\_server\_IP\_address*** command.

When the access point joins a switch for the first time, the switch pushes the global syslog server IP address (the default is 255.255.255.255) to the access point. After that, the access point sends all syslog messages to this IP address, until it is overridden by one of the following scenarios:

- The access point is still connected to the same switch, and you changed the global syslog server IP address configuration on the switch by using the **ap syslog host** *Syslog\_Server\_IP\_Address* command. In this case, the switch pushes the new global syslog server IP address to the access point.
- The access point is still connected to the same switch, and you configured a specific syslog server IP address for the access point on the switch by using the **ap name** *Cisco\_AP* **syslog host** *Syslog\_Host\_IP\_Address* command. In this case, the switch pushes the new specific syslog server IP address to the access point.
- The access point gets disconnected from the switch, and you configured the syslog server IP address from the access point CLI by using the **capwap ap log-server** *syslog\_server\_IP\_address* command. This command works only if the access point is not connected to any switch.
- The access point gets disconnected from the switch and joins another switch. In this case, the new switch pushes its global syslog server IP address to the access point.

Whenever a new syslog server IP address overrides the existing syslog server IP address, the old address is erased from persistent storage, and the new address is stored in its place. The access point also starts sending all syslog messages to the new IP address, if the access point can reach the syslog server IP address.

## How to Configure Access Point Discovery

### Configuring the Syslog Server for Access Points (GUI)

#### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points > All APs**.
- The **All APs** page is displayed showing a list of access points that are associated with the switch and their current settings.
- Step 2** From the **Show** drop-down list, choose **Quick Filter**.
- The filter options (text boxes) appear in each of the column header in the table.
- Step 3** Enter a keyword in the corresponding text boxes to specify the filter criteria based on which you want to search, and click the **Filter** icon.
- 

### Configuring the Syslog Server for Access Points (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>show ap config global</b>  <b>Example:</b> Switch# show ap config global	Displays the global syslog server settings for all access points that join the switch.

	Command or Action	Purpose
<b>Step 2</b>	<b>show ap name <i>Cisco_AP</i> config general</b> <b>Example:</b> Switch# show ap name AP03 config general	Displays the syslog server settings for a specific access point.

## Monitoring Access Point Join Information (CLI)

**Note** The procedure to perform this task using the switch GUI is not currently available.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>show ap join stats summary</b> <b>Example:</b> Switch# show ap join stats summary	Displays the MAC addresses of all the access points that are joined to the switch or that have tried to join.
<b>Step 3</b>	<b>show ap mac-address <i>mac_address</i> join stats summary</b> <b>Example:</b> Switch# show ap mac-address 000.2000.0400 join stats summary	Displays all the statistics for the AP including the last join error detail.
<b>Step 4</b>	<b>show ap mac-address <i>mac_address</i> join stats detailed</b> <b>Example:</b> Switch# show ap mac-address 000.2000.0400 join stats detailed	Displays all join-related statistics collected for a specific access point.
<b>Step 5</b>	<b>clear ap join statistics</b> <b>Example:</b> Switch# clear ap join statistics	Clears the join statistics for all access points. <b>Note</b> To clear the join statistics that correspond to specific access points, enter the <b>clear ap mac-address <i>mac_address</i> join statistics</b> command.

### Related Topics

[Displaying the MAC Addresses of all Access Points: Example](#), on page 484

[DHCP Option 43 for Lightweight Cisco Aironet Access Points Configuration Example](#), on page 486

## Searching for Access Point Radios (GUI)

### Procedure

---

- Step 1** Choose **Monitor > Wireless > Access Points** and click **802.11a/n/ac Statistics** or **802.11b/g/n Statistics**.  
The 802.11 Radio pages are displayed. These pages show all of the 802.11a/n/ac or 802.11b/g/n access point radios that are associated with the switch and their current settings.
- Note** In a Cisco converged access environment, the 802.11a/n/ac and 802.11b/g/n radios should not be differentiated based on their Base Radio MAC addresses, because they might have the same addresses. Instead, the radios should be differentiated based on their physical addresses.
- Step 2** From the **Show** drop-down list, choose **Quick Filter**.  
The filter options (text boxes) appear in each of the column header in the table.
- Step 3** Enter a keyword in the corresponding text boxes to specify the filter criteria based on which you want to search, and click the **Filter** icon.
- 

## Monitoring the Interface Details (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Wireless > Access Points > All APs**.  
The **All APs** page is displayed showing a list of access points that are associated with the switch.
- Step 2** Click the access point name.  
The **AP > Edit** page is displayed.
- Step 3** Click the **Interface** tab.  
The interface details are displayed.
- 

## Configuration Examples for Configuring the Switch for Access Point Discovery

### Displaying the MAC Addresses of all Access Points: Example

This example shows how to display MAC addresses of all the access points that are joined to the switch:

```
Switch# show ap join stats summary
Number of APs..... 4

Base Mac          EthernetMac      AP Name IP Address    Status
-----
00:0b:85:57:bc:c0 00:0b:85:57:bc:c0 AP1130 10.10.163.217  Joined
00:1c:0f:81:db:80 00:1c:63:23:ac:a0 AP1140 10.10.163.216  Not joined
00:1c:0f:81:fc:20 00:1b:d5:9f:7d:b2 AP1     10.10.163.215  Joined
00:21:1b:ea:36:60 00:0c:d4:8a:6b:c1 AP2     10.10.163.214  Not joined
```

This example shows how to display the last join error details for a specific access point:

```
Switch# show ap mac-address 000.2000.0400 join stats summary
Is the AP currently connected to controller..... Yes
Time at which the AP joined this
controller last time..... Aug 21 12:50:36.061
Type of error
that occurred last..... AP got or has been disconnected
Reason for error
that occurred last..... The AP has been reset by the controller
Time at which the last join error occurred..... Aug 21 12:50:34.374
```

This example shows how to display all join-related statistics collected for a specific access point:

```
Switch# show ap mac-address 000.2000.0400 join stats detailed
Discovery phase statistics
- Discovery requests received..... 2
- Successful discovery responses sent..... 2
- Unsuccessful discovery request processing..... 0
- Reason for last unsuccessful discovery attempt.... Not applicable
- Time at last successful discovery attempt..... Aug 21 12:50:23.335
- Time at last unsuccessful discovery attempt..... Not applicable

Join phase statistics
- Join requests received..... 1
- Successful join responses sent..... 1
- Unsuccessful join request processing..... 1
- Reason for last unsuccessful join attempt..... RADIUS authorization
is pending
for the AP
- Time at last successful join attempt..... Aug 21 12:50:34.481
- Time at last unsuccessful join attempt..... Aug 21 12:50:34.374

Configuration phase statistics
- Configuration requests received..... 1
- Successful configuration responses sent..... 1
- Unsuccessful configuration request processing..... 0
- Reason for last unsuccessful configuration attempt.. Not applicable
- Time at last successful configuration attempt..... Aug 21 12:50:34.374
- Time at last unsuccessful configuration attempt..... Not applicable

Last AP message decryption failure details
- Reason for last message decryption failure..... Not applicable

Last AP disconnect details
- Reason for last AP connection failure..... The AP has been reset by
the controller

Last join error summary
- Type of error that occurred last..... AP got or has been
disconnected
- Reason for error that occurred last..... The AP has been reset
by the controller
- Time at which the last join error occurred..... Aug 21 12:50:34.374
```

# DHCP Option 43 for Lightweight Cisco Aironet Access Points Configuration Example

For more information about the AP join process, see *DHCP OPTION 43 for Lightweight Cisco Aironet Access Points Configuration Example*.

## Configuring AP Pass Through

### Information About AP Pass Through

AP pass through allows all the access points connected to Cisco Catalyst 3850 Series Switches and Cisco Catalyst 3650 Series Switches to join another controller on the network.

Prior to this release, all access points connected Cisco Catalyst 3850 Series Switches and Cisco Catalyst 3650 Series Switches would be terminated on the switch when the wireless management vlan is turned on. Unsupported access points connected to the switch were unable join a controller on a different vlan. AP pass through allows the connected AP to join another wireless controller on the network by assigning different vlan.

The advantages of AP pass through are:

- Allows partial deployment of Cisco New Generation Wireless Controllers where some APs are connected to Cisco Catalyst 3850 Series Switches and Cisco Catalyst 3650 Series Switches but other APs continue to join other controllers on the network.
- The APs that are not supported on the Cisco Catalyst 3850 Series Switches and Cisco Catalyst 3650 Series Switches are allowed to join other controllers on the network.
- The wireless LAN controller is used to provide access to both wired and wireless guests. AP Pass through allows the AP to pass through Cisco Catalyst 3850 Series Switches and Cisco Catalyst 3650 Series Switches to join any other controller when wired guest accessing is turned on.

### Configuring AP Pass Through

All access points on VLANs other than the one with supported access points will be put into the AP pass-through mode and will not terminate on theSwitch.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless management interface vlan</b> <i>vlan_id</i>  <b>Example:</b>	Configures the ports that are connected to the supported access points with the wireless management VLAN

	Command or Action	Purpose
	Switch(config)# wireless management interface vlan10	
<b>Step 3</b>	<b>interface GigabitEthernet1/0/1</b>  <b>Example:</b> Switch(config)# interface TenGigabitEthernet1/0/1	Sets the 10-Gigbit Ethernet interface.  The command prompt changes from (config)# to (config-if)#.
<b>Step 4</b>	<b>description Supported AP switchport access <i>vlan_id</i></b>  <b>Example:</b> Switch(config-if)# switchport access vlan10	Specifies the VLAN for which this access port will carry traffic
<b>Step 5</b>	<b>description Unsupported AP switchport access <i>vlan_id</i></b>  <b>Example:</b> Switch(config-if)# switchport access vlan20	Configures the ports that are connected to the unsupported access points with a vlan other than the wireless management VLAN.

## CHAPTER 29

# Configuring Data Encryption

- [Finding Feature Information, on page 489](#)
- [Prerequisites for Configuring Data Encryption, on page 489](#)
- [Restrictions for Configuring Data Encryption, on page 489](#)
- [Information About Data Encryption, on page 490](#)
- [How to Configure Data Encryption, on page 490](#)
- [Configuration Examples for Configuring Data Encryption, on page 491](#)

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring Data Encryption

- Cisco 1260, 3500, 3600, 801, 1140, 1310, and 1520 series access points support Datagram Transport Layer Security (DTLS) data encryption.
- You can use the switch to enable or disable DTLS data encryption for a specific access point or for all access points.
- Non-Russian customers who use the Cisco switch do not need a data DTLS license.

## Restrictions for Configuring Data Encryption

- Encryption limits throughput at both the switch and the access point, and maximum throughput is desired for most enterprise networks.
- If your switch does not have a data DTLS license and if the access point associated with the switch has DTLS enabled, the data path will be unencrypted.

- In images that do not have a DTLS license, the DTLS commands are not available.

## Information About Data Encryption

The switch enables you to encrypt Control and Provisioning of Wireless Access Points (CAPWAP) control packets (and optionally, CAPWAP data packets) that are sent between the access point and the switch using DTLS. DTLS is a standards-track Internet Engineering Task Force (IETF) protocol based on TLS. CAPWAP control packets are management packets exchanged between a switch and an access point while CAPWAP data packets encapsulate forwarded wireless frames. CAPWAP control and data packets are sent over separate UDP ports: 5246 (control) and 5247 (data). If an access point does not support DTLS data encryption, DTLS is enabled only for the control plane, and a DTLS session for the data plane is not established.

## How to Configure Data Encryption

### Configuring Data Encryption (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap link-encryption</b> <b>Example:</b> Switch(config)# <code>ap link-encryption</code>	Enables data encryption for all access points or a specific access point by entering this command. The default value is disabled.  Changing the data encryption mode requires the access points to rejoin the switch.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 4</b>	<b>show ap link-encryption</b> <b>Example:</b> Switch# <code>show ap link-encryption</code>	Displays the encryption state of all access points or a specific access point. This command also shows authentication errors, which track the number of integrity check failures and replay errors. Relay errors help in tracking the number of times the access point receives the same packet.
<b>Step 5</b>	<b>show wireless dtls connections</b> <b>Example:</b>	Displays a summary of all active DTLS connections.

	Command or Action	Purpose
	Switch# show wireless dtls connections	<b>Note</b> If you experience any problems with DTLS data encryption, enter the <b>debug dtls ap {all   event   trace}</b> command to debug all DTLS messages, events, or traces.

**Related Topics**

[Displaying Data Encryption States for all Access Points: Examples](#), on page 491

## Configuring Data Encryption (GUI)

**Procedure**

**Step 1** Choose **Configuration > Wireless > Access Points > All APs**.

The All APs page is displayed.

**Step 2** Click the name of the access point for which you want to enable data encryption.

The **AP > Edit** page is displayed.

**Step 3** Click the **Advanced** tab.

**Step 4** Select or unselect the **Data Encryption** check box.

**Note** Changing the data encryption mode requires the access points to reassociate with the switch.

**Step 5** Click **Apply**.

**Step 6** Click **Save Configuration**.

## Configuration Examples for Configuring Data Encryption

### Displaying Data Encryption States for all Access Points: Examples

This example shows how to display the encryption state of all access points or a specific access point. This command also shows authentication errors, which track the number of integrity check failures and replay errors. Relay errors help in tracking the number of times the access point receives the same packet:

```
Switch# show ap link-encryption
      Encryption  Dnstream  Upstream  Last
AP Name          State      Count     Count    Update
-----
3602a            Enabled    0         0        Never
```

This example shows how to display a summary of all active DTLS connections:

```
Switch# show wireless dtls connections
AP Name      Local Port  Peer IP      Peer Port    Ciphersuite
-----
3602a        Capwap_Ctrl 10.10.21.213 46075        TLS_RSA_WITH_AES_128_CBC_SHA
3602a        Capwap_Data 10.10.21.213 46075        TLS_RSA_WITH_AES_128_CBC_SHA
```

## CHAPTER 30

# Configuring Retransmission Interval and Retry Count

---

- [Finding Feature Information, on page 493](#)
- [Prerequisites for Configuring the Access Point Retransmission Interval and Retry Count, on page 493](#)
- [Information About Retransmission Interval and Retry Count, on page 494](#)

- [Viewing CAPWAP Maximum Transmission Unit Information \(GUI\), on page 496](#)
- [Configuration Examples for Configuring Access Point Retransmission Interval and Retry Count, on page 497](#)

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring the Access Point Retransmission Interval and Retry Count

- You can configure the retransmission intervals and retry count both at a global and a specific access point level. A global configuration applies these configuration parameters to all the access points. Alternatively, when you configure the retransmission level and retry count at a specific access point level, the values are applied to that particular access point. The access point specific configuration has a higher precedence than the global configuration.

# Information About Retransmission Interval and Retry Count

The switch and the access points exchange packets using the Control and Provisioning of Wireless Access Points (CAPWAP) reliable transport protocol. For each request, a response is defined. This response is used to acknowledge the receipt of the request message. Response messages are not explicitly acknowledged; therefore, if a response message is not received, the original request message is retransmitted after the retransmit interval. If the request is not acknowledged after a maximum number of retransmissions, the session is closed and the access points reassociate with another switch.

## How to Configure Access Point Retransmission Interval and Retry Count

### Configuring the Access Point Retransmission Interval and Retry Count (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Switch# <b>enable</b>	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>ap capwap retransmit interval</b> <i>interval_time</i>  <b>Example:</b> Switch(config)# ap capwap retransmit interval 2	Configures the control packet retransmit interval for all access points globally.  <b>Note</b> The range for the interval parameter is from 2 to 5.
<b>Step 4</b>	<b>ap capwap retransmit count</b> <i>count_value</i>  <b>Example:</b> Switch(config)# ap capwap retransmit count 3	Configures the control packet retry count for all access points globally.  <b>Note</b> The range for the count is from 3 to 8.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 6</b>	<b>ap name</b> <i>Cisco_AP</i> <b>capwap retransmit interval</b> <i>interval_time</i>	Configures the control packet retransmit interval for the individual access point that you specify.

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Switch# ap name AP02 capwap retransmit interval 2</pre>	<p><b>Note</b> The range for the interval is from 2 to 5.</p> <p><b>Note</b> You must be in privileged EXEC mode to use the <b>ap name</b> commands.</p>
<b>Step 7</b>	<p><b>ap name</b> <i>Cisco_AP</i> <b>capwap retransmit count</b> <i>count_value</i></p> <p><b>Example:</b></p> <pre>Switch# ap name AP02 capwap retransmit count 3</pre>	<p>Configures the control packet retry count for the individual access point that you specify.</p> <p><b>Note</b> The range for the retry count is from 3 to 8.</p>
<b>Step 8</b>	<p><b>show ap capwap retransmit</b></p> <p><b>Example:</b></p> <pre>Switch# show ap capwap retransmit</pre>	Displays the CAPWAP retransmit details.

## Configuring the Access Point Retransmission Interval and Retry Count (GUI)

### Procedure

- Global configuration applicable to all APs:
  - a) Choose **Configuration > Wireless > Access Points > Global AP Configuration**.  
The **Global Configuration** page is displayed.
  - b) In the **AP Retransmit Config Parameters** area, enter the values for the following parameters:
    - **AP Retransmit Count**—Number of times you want the access point to retransmit the request to the switch. The valid range is between 3 and 8.
    - **AP Retransmit Interval**—Duration between the retransmission of requests. The valid range is between 2 and 5.
  - c) Click **Apply**.
  - d) Click **Save Configuration**.
- Configuration that is applicable to a specific AP:
  - a) Choose **Configuration > Wireless > Access Points > All APs**.  
The **All APs** page is displayed with a list of access points.
  - b) Click the access point name.  
The **AP > Edit** page is displayed.
  - c) Click the **Advanced** tab.
  - d) In the **AP Retransmit Config Parameters** area, enter the values for the following **AP Retransmit Count** and **AP Retransmit Interval** parameters:

- **AP Retransmit Count**—Number of times you want the access point to retransmit the request to the switch. The valid range is between 3 and 8.
- **AP Retransmit Interval**—Duration between the retransmission of requests. The valid range is between 2 and 5.

- Click **Apply**.
- Click **Save Configuration**.

## Viewing CAPWAP Maximum Transmission Unit Information (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>show ap name Cisco_AP config general</b>  <b>Example:</b> Switch# show ap name Maria-1250 config general   include MTU	Displays the maximum transmission unit (MTU) for the CAPWAP path on the switch. The MTU specifies the maximum size of any packet (in bytes) in a transmission.

### Related Topics

[Viewing the CAPWAP Retransmission Details: Example](#), on page 497

[Viewing Maximum Transmission Unit Information: Example](#), on page 497

## Viewing CAPWAP Maximum Transmission Unit Information (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points > All APs**.  
The **All APs** page is displayed.
  - Step 2** Click the AP name.  
The **AP > Edit** page is displayed.
  - Step 3** Click the **Advanced** tab.

The CAPWAP MTU field shows the CAPWAP maximum retransmission unit information.

---

## Configuration Examples for Configuring Access Point Retransmission Interval and Retry Count

### Viewing the CAPWAP Retransmission Details: Example

Enter the following command:

```
Switch# show ap capwap retransmit
Global control packet retransmit interval : 3
Global control packet retransmit count : 5
```

AP Name	Retransmit Interval	Retransmit Count
-----	-----	-----
3602a	5	3

### Viewing Maximum Transmission Unit Information: Example

This example shows how to view the maximum transmission unit (MTU) for the CAPWAP path on the switch. The MTU specifies the maximum size of any packet (in bytes) in a transmission:

```
Switch# show ap name cisco-ap-name config general | include MTU
CAPWAP Path MTU..... 1500
```

## CHAPTER 31

# Configuring Adaptive Wireless Intrusion Prevention System

---

- [Prerequisites for Configuring wIPS, on page 499](#)
- [How to Configure wIPS on Access Points, on page 500](#)
- [Monitoring wIPS Information, on page 502](#)
- [Configuration Examples for Configuring wIPS on Access Points, on page 502](#)

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring wIPS

- The regular local mode access point has been extended with a subset of Wireless Intrusion Prevention System (wIPS) capabilities. This feature enables you to deploy your access points to provide protection without needing a separate overlay network.

# How to Configure wIPS on Access Points

## Configuring wIPS on an Access Point (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>ap name <i>Cisco_AP</i> mode local</b> <b>Example:</b> <pre>Switch# ap name AP01 mode local</pre>	Configures an access point for monitor mode.  A message appears that indicates that changing the AP's mode causes the access point to reboot. This message also displays a prompt that enables you to specify whether or not you want to continue with changing the AP mode. Enter <b>y</b> at the prompt to continue.
<b>Step 2</b>	<b>ap name <i>Cisco_AP</i> dot11 5ghz shutdown</b> <b>Example:</b> <pre>Switch# ap name AP01 dot11 5ghz shutdown</pre>	Disables the 802.11a radio on the access point.
<b>Step 3</b>	<b>ap name <i>Cisco_AP</i> dot11 24ghz shutdown</b> <b>Example:</b> <pre>Switch# ap name AP02 dot11 24ghz shutdown</pre>	Disables the 802.11b radio on the access point.
<b>Step 4</b>	<b>ap name <i>Cisco_AP</i> mode monitor submode wips</b> <b>Example:</b> <pre>Switch# ap name AP01 mode monitor submode wips</pre>	Configures the wIPS submode on the access point.  <b>Note</b> To disable wIPS on the access point, enter the <b>ap name <i>Cisco_AP</i> modemonitor submode none</b> command.
<b>Step 5</b>	<b>ap name <i>Cisco_AP</i> monitor-mode wips-optimized</b> <b>Example:</b> <pre>Switch# ap name AP01 monitor-mode wips-optimized</pre>	Enables wIPS optimized channel scanning for the access point.  The access point scans each channel for 250 milliseconds. It derives the list of channels to be scanned from the monitor configuration. You can choose the following options: <ul style="list-style-type: none"> <li>• <b>All</b>—All channels supported by the access point's radio.</li> <li>• <b>Country</b>—Only the channels supported by the access point's country of operation.</li> <li>• <b>DCA</b>—Only the channel set used by the dynamic channel assignment (DCA)</li> </ul>

	Command or Action	Purpose
		algorithm, which by default includes all of the nonoverlapping channels allowed in the access point's country of operation.
<b>Step 6</b>	<b>show ap dot11 24ghz monitor</b> <b>Example:</b> <pre>Switch# show ap dot11 24ghz monitor</pre>	Displays the monitor configuration channel set. <b>Note</b> The 802.11b Monitor Channels value in the output of the command indicates the monitor configuration channel set.
<b>Step 7</b>	<b>ap name Cisco_AP no dot11 5ghz shutdown</b> <b>Example:</b> <pre>Switch# ap name AP01 no dot11 5ghz shutdown</pre>	Enables the 802.11a radio on the access point.
<b>Step 8</b>	<b>ap name Cisco_AP no dot11 24ghz shutdown</b> <b>Example:</b> <pre>Switch# ap name AP01 no dot11 24ghz shutdown</pre>	Enables the 802.11b radio on the access point.

## Configuring WIPS on an Access Point (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points > All APs**  
The **All APs** page is displayed.
- Step 2** Click the access point name.  
The **AP > Edit** page is displayed.
- Step 3** From the **AP Mode** drop-down list, choose one of the following options to configure the AP mode parameters:
- **Local**
  - **Monitor**
- Step 4** From the **AP Sub Mode** drop-down list, choose **WIPS**.
- Step 5** Click **Apply**.
- Step 6** Click **Save Configuration**.
-

# Monitoring wIPS Information

**Note** The procedure to perform this task using the switch GUI is not currently available.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>show ap name <i>Cisco_AP</i> config general</b> <b>Example:</b> Switch# show ap name AP01 config general	Displays information on the wIPS submode on the access point.
<b>Step 2</b>	<b>show ap monitor-mode summary</b> <b>Example:</b> Switch# show ap monitor-mode summary	Displays the wIPS optimized channel scanning configuration on the access point.
<b>Step 3</b>	<b>show wireless wps wips summary</b> <b>Example:</b> Switch# show wireless wps wips summary	Displays the wIPS configuration forwarded by NCS or Prime to the switch.
<b>Step 4</b>	<b>show wireless wps wips statistics</b> <b>Example:</b> Switch# show wireless wps wips statistics	Displays the current state of wIPS operation on the switch.
<b>Step 5</b>	<b>clear wireless wps statistics</b> <b>Example:</b> Switch# clear wireless wps statistics	Clears the wIPS statistics on the switch.

# Configuration Examples for Configuring wIPS on Access Points

## Displaying the Monitor Configuration Channel Set: Example

This example shows how to display the monitor configuration channel set:

```
Switch# show ap dot11 24ghz monitor
Default 802.11b AP monitoring
802.11b Monitor Mode..... enable
802.11b Monitor Channels..... Country channels
802.11b AP Coverage Interval..... 180 seconds
```

```
802.11b AP Load Interval..... 60 seconds
802.11b AP Noise Interval..... 180 seconds
802.11b AP Signal Strength Interval..... 60 seconds
```

## Displaying wIPS Information: Examples

This example shows how to display information on the wIPS submode on the access point:

```
Switch# show ap name AP01 config general
Cisco AP Identifier..... 3
Cisco AP Name..... AP1131:46f2.98ac
...
AP Mode ..... Monitor
Public Safety ..... Disabled Disabled
AP SubMode ..... WIPS
```

This example shows how to display the wIPS optimized channel scanning configuration on the access point:

```
Switch# show ap monitor-mode summary
AP Name      Ethernet MAC   Status   Scanning
              Channel
              List
-----
AP1131:4f2.9a 00:16:4:f2:9:a WIPS     1, 6, NA, NA
```

This example shows how to display the wIPS configuration forwarded by WCS to the switch:

```
Switch# show wireless wps wips summary
Policy Name..... Default
Policy Version..... 3
```

This example shows how to display the current state of wIPS operation on the switch:

```
Switch# show wireless wps wips statistics
Policy Assignment Requests..... 1
Policy Assignment Responses..... 1
Policy Update Requests..... 0
Policy Update Responses..... 0
Policy Delete Requests..... 0
Policy Delete Responses..... 0
Alarm Updates..... 13572
Device Updates..... 8376
Device Update Requests..... 0
Device Update Responses..... 0
Forensic Updates..... 1001
Invalid WIPS Payloads..... 0
Invalid Messages Received..... 0
CAPWAP Enqueue Failed..... 0
NMSP Enqueue Failed..... 0
NMSP Transmitted Packets..... 22950
NMSP Transmit Packets Dropped..... 0
NMSP Largest Packet..... 1377
```

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring Authentication for Access Points

- You can set a global username, password, and enable password for all access points that are currently joined to the switch and any that join in the future inherit as they join the switch. If desired, you can override the global credentials and assign a unique username, password, and enable password for a specific access point.
- After an access point joins the switch, the access point enables console port security, and you are prompted for your username and password whenever you log into the access point's console port. When you log in, you are in nonprivileged mode, and you must enter the enable password in order to use the privileged mode.
- The global credentials that you configure on the switch are retained across switch and access point reboots. They are overwritten only if the access point joins a new switch that is configured with a global username and password. If the new switch is not configured with global credentials, the access point retains the global username and password configured for the first switch.
- You must track the credentials used by the access points. Otherwise, you might not be able to log into an access point's console port. If you need to return the access points to the default *Cisco/Cisco* username

and password, you must clear the switch's configuration and the access point's configuration to return them to factory-default settings. To reset the default access point configuration, enter the **ap name Cisco AP mgmtuser username Cisco password Cisco** command. Entering the command does not clear the static IP address of the access point. Once the access point rejoins a switch, it adopts the default *Cisco/Cisco* username and password.

- You can configure global authentication settings for all access points that are currently joined to the switch and any that join in the future. If desired, you can override the global authentication settings and assign unique authentication settings for a specific access point.
- This feature is supported on the following hardware:
  - All Cisco switches that support authentication.
  - Cisco Aironet 1140, 1260, 1310, 1520, 1600, 2600, 3500, and 3600 access points

## Restrictions for Configuring Authentication for Access Points

- The switch name in the AP configuration is case sensitive. Therefore, make sure to configure the exact system name on the AP configuration. Failure to do this results in the AP fallback not working.

## Information about Configuring Authentication for Access Points

Cisco IOS access points are shipped from the factory with *Cisco* as the default enable password. This password allows users to log into the nonprivileged mode and enter the **show** and **debug** commands that pose a security threat to your network. You must change the default enable password to prevent unauthorized access and to enable users to enter configuration commands from the access point's console port.

You can configure 802.1X authentication between a lightweight access point and a Cisco switch. The access point acts as an 802.1X supplicant and is authenticated by the switch where it uses EAP-FAST with anonymous PAC provisioning.

## How to Configure Authentication for Access Points

### Configuring Global Credentials for Access Points (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Switch# enable	Enters privileged EXEC mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>ap mgmtuser username user_name password 0 password secret 0 secret_value</b> <b>Example:</b> Switch(config)# ap mgmtuser apusr1 password appass 0 secret 0 appass1	Configures the global username and password and enables the password for all access points that are currently joined to the switch and any access points that join the switch in the future. In the command, the parameter 0 specifies that an unencrypted password will follow and 8 specifies that an AES encrypted password will follow.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 5</b>	<b>ap name Cisco_AP mgmtuser username user_name password password secret secret</b> <b>Example:</b> Switch(config)# ap name TSIM_AP-2 mgmtuser apusr1 password appass secret secret	<p>Overrides the global credentials for a specific access point and assigns a unique username and password and enables password to this access point.</p> <p>The credentials that you enter in this command are retained across switch and access point reboots and if the access point joins a new switch.</p> <p><b>Note</b> If you want to force this access point to use the switch's global credentials, enter the <b>ap name Cisco_AP no mgmtuser</b> command. The following message appears after you execute this command: "AP reverted to global username configuration."</p>
<b>Step 6</b>	<b>show ap summary</b> <b>Example:</b> Switch# show ap summary	Displays a summary of all connected Cisco APs.
<b>Step 7</b>	<b>show ap name Cisco_AP config general</b> <b>Example:</b> Switch# show ap name AP02 config general	<p>Displays the global credentials configuration for a specific access point.</p> <p><b>Note</b> If this access point is configured for global credentials, the AP User Mode text boxes shows "Automatic." If the global credentials have been overwritten for this access point, the AP User Mode text box shows "Customized."</p>

## Configuring Global Credentials for Access Points (GUI)

### Procedure

---

**Step 1** Choose **Configuration > Wireless > Access Points > Global AP Configuration**.

The **Global Configuration** page is displayed.

**Step 2** In the **Login Credentials** area, enter the following parameters:

- **User Name**
- **Password**
- **Confirm Password**
- **Secret Password**
- **Confirm Secret Password**

The password should contain characters from at least three of the following classes: lowercase letters, uppercase letters, digits, and special characters. No character in the password can be repeated more than three times consecutively. The password should not contain the management username or the reverse of the username. The password should not contain words like Cisco, oscic, admin, nimda or any variant obtained by changing the capitalization of letters by substituting l, |, or ! or substituting 0 for o or substituting \$ for s.

**Step 3** Click **Apply**.

The global username and password are applied to all the access points that are associated with the switches

**Step 4** Click **Save Configuration**.

**Step 5** (Optional) You can override the global credentials for a specific access point and assign a unique username and password by following these steps:

a) Choose **Configuration > Wireless > Access Points > All APs**.

The **All APs** page is displayed.

b) Click the name of an access point.

The **AP > Edit** page is displayed.

c) Click the **Credentials** tab.

d) In the **Login Credentials** area, select the **Over-ride Global Credentials** check box.

e) Enter the values for the following parameters:

- **Username**
- **Password**
- **Enable Password**

f) Click **Apply**.

g) Click **Save Configuration**.

---

## Configuring Authentication for Access Points (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# <b>enable</b>	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>ap dot1x username <i>user_name_value</i> password 0 <i>password_value</i></b> <b>Example:</b> Switch(config)# ap dot1x username AP3 password 0 password	Configures the global authentication username and password for all access points that are currently joined to the switch and any access points that join the switch in the future. This command contains the following keywords and arguments: <ul style="list-style-type: none"> <li>• <b>username</b>—Specifies an 802.1X username for all access points.</li> <li>• <i>user-id</i>—Username.</li> <li>• <b>password</b>—Specifies an 802.1X password for all access points.</li> <li>• <b>0</b>—Specifies an unencrypted password.</li> <li>• <b>8</b>—Specifies an AES encrypted password.</li> <li>• <i>passwd</i>—Password.</li> </ul> <p><b>Note</b> You must enter a strong password for the password parameter. Strong passwords are at least eight characters long, contain a combination of uppercase and lowercase letters, numbers, and symbols, and are not a word in any language.</p>
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 5</b>	<b>ap name <i>Cisco_AP</i> dot1x-user username <i>username_value</i> password <i>password_value</i></b> <b>Example:</b>	Overrides the global authentication settings and assigns a unique username and password to a specific access point. This command

	Command or Action	Purpose
	<pre>Switch# ap name AP03 dot1x-user username apuser1 password appass</pre>	<p>contains the following keywords and arguments:</p> <ul style="list-style-type: none"> <li>• <b>username</b>—Specifies to add a username.</li> <li>• <i>user-id</i>—Username.</li> <li>• <b>password</b>—Specifies to add a password.</li> <li>• <b>0</b>—Specifies an unencrypted password.</li> <li>• <b>8</b>—Specifies an AES encrypted password.</li> <li>• <i>passwd</i>—Password.</li> </ul> <p><b>Note</b> You must enter a strong password for the password parameter. See the note in Step 2 for the characteristics of strong passwords.</p> <p>The authentication settings that you enter in this command are retained across switch and access point reboots and whenever the access point joins a new switch.</p>
<b>Step 6</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 7</b>	<p><b>no ap dot1x username <i>user_name_value</i></b> <b>password 0 <i>password_value</i></b></p> <p><b>Example:</b></p> <pre>Switch(config)# no ap dot1x username dotlxusr password 0 dotlxpass</pre>	<p>Disables 802.1X authentication for all access points or for a specific access point.</p> <p>The following message appears after you execute this command: “AP reverted to global username configuration.”</p> <p><b>Note</b> You can disable 802.1X authentication for a specific access point only if global 802.1X authentication is not enabled. If global 802.1X authentication is enabled, you can disable 802.1X for all access points only.</p>
<b>Step 8</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 9</b>	<p><b>show ap summary</b></p> <p><b>Example:</b></p>	Displays the authentication settings for all access points that join the switch.

	Command or Action	Purpose
	Switch# show ap summary	<b>Note</b> If global authentication settings are not configured, the Global AP Dot1x User Name text box shows “Not Configured.”
<b>Step 10</b>	<b>show ap name Cisco_AP config general</b> <b>Example:</b> Switch# show ap name AP02 config general	Displays the authentication settings for a specific access point. <b>Note</b> If this access point is configured for global authentication, the AP Dot1x User Mode text boxes shows “Automatic.” If the global authentication settings have been overwritten for this access point, the AP Dot1x User Mode text box shows “Customized.”

**Related Topics**

## Configuring Authentication for Access Points (GUI)

**Procedure**

- 
- Step 1** Choose **Configuration > Wireless > Access Points > Global AP Configuration**.  
The **Global Configuration** page is displayed.
- Step 2** In the **802.1x Supplicant Credentials** area, select the **Credentials Required** check box.
- Step 3** Enter the username and password details.
- Note** You must enter a strong password in these text boxes. Strong passwords have the following characteristics:
- They are at least eight characters long
  - They contain a combination of uppercase and lowercase letters, numbers, and symbols
  - They are not a word in any language
- Step 4** Click **Apply**.
- Step 5** Click **Save Configuration**.
- Step 6** (Optional) You can override the global configuration and assign a unique username and password to a specific access point by following these steps:
- a) Choose **Configuration > Wireless > Access Points > All APs**.  
The **All APs** page is displayed.

- Step 7** Click the name of an access point.  
The **AP > Edit** is displayed.
- Step 8** Click the **Credentials** tab.
- Step 9** In the **802.1x Supplicant Credentials** area, select the **Over-ride Global Credentials** check box.
- Step 10** Enter the username and password details.
- Step 11** Click **Apply**.
- Step 12** Click **Save Configuration**.

## Configuring the Switch for Authentication (CLI)

**Note** The procedure to perform this task using the switch GUI is not currently available.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>dot1x system-auth-control</b> <b>Example:</b> Switch(config)# dot1x system-auth-control	Enables system authentication control.
<b>Step 4</b>	<b>aaa new-model</b> <b>Example:</b> Switch(config)# aaa new-model	Enables new access control commands and functions.
<b>Step 5</b>	<b>aaa authentication dot1x default group radius</b> <b>Example:</b> Switch(config)# aaa authentication dot1x default group radius	Sets the default authentications lists for IEEE 802.1X by using all the radius hosts in a server group.

	Command or Action	Purpose
<b>Step 6</b>	<b>radius-server host <i>host_ip_adress</i> acct-port <i>port_number</i> auth-port <i>port_number</i> key 0 unencrypted_server_key</b>  <b>Example:</b> Switch(config)# radius-server host 10.1.1.1 acct-port 1813 auth-port 6225 key 0 encryptkey	Sets a clear text encryption key for the RADIUS authentication server.
<b>Step 7</b>	<b>interface TenGigabitEthernet1/0/1</b>  <b>Example:</b> Switch(config)# interface TenGigabitEthernet1/0/1	Sets the 10-Gigabit Ethernet interface.  The command prompt changes from Controller(config)# to Controller(config-if)#.
<b>Step 8</b>	<b>switch mode access</b>  <b>Example:</b> Switch(config-if)# switch mode access	Sets the unconditional trunking mode access to the interface.
<b>Step 9</b>	<b>dot1x pae authenticator</b>  <b>Example:</b> Switch(config-if)# dot1x pae authenticator	Sets the 802.1X interface PAE type as the authenticator.
<b>Step 10</b>	<b>end</b>  <b>Example:</b> Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Configuration Examples for Configuring Authentication for Access Points

## Displaying the Authentication Settings for Access Points: Examples

This example shows how to display the authentication settings for all access points that join the switch:

```
Switch# show ap summary
Number of APs..... 1
Global AP User Name..... globalap
Global AP Dot1x User Name..... globalDot1x
```

This example shows how to display the authentication settings for a specific access point:

```
Switch# show ap name AP02 config dot11 24ghz general
Cisco AP Identifier..... 0
```

```
Cisco AP Name..... TSIM_AP2
...
AP Dot1x User Mode..... AUTOMATIC
AP Dot1x User Name..... globalDot1x
```

- [Recovering the Access Point Using the TFTP Recovery Procedure, on page 524](#)
- [Configuration Examples for Converting Autonomous Access Points to Lightweight Mode, on page 524](#)

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Converting Autonomous Access Points to Lightweight Mode

- Access points that are converted to lightweight mode do not support Wireless Domain Services (WDS). Converted access points communicate only with Cisco wireless LAN switches and cannot communicate with WDS devices. However, the switch provides functionality that is equivalent to WDS when the access point associates to it.

- All Cisco lightweight access points support 16 Basic Service Set Identifiers (BSSIDs) per radio and a total of 16 wireless LANs per access point. When a converted access point associates to a switch, only wireless LANs with IDs 1 through 16 are pushed to the access point unless the access point is a member of an access point group.
- Access points that are converted to lightweight mode must get an IP address and discover the switch using DHCP, DNS, or IP subnet broadcast.

## Information About Autonomous Access Points Converted to Lightweight Mode

You can convert autonomous Cisco Aironet access points to lightweight mode. When you upgrade the access points to lightweight mode, the access point communicates with the switch and receives a configuration and software image from the switch.

### Reverting from Lightweight Mode to Autonomous Mode

After you convert an autonomous access point to lightweight mode, you can convert the access point from a lightweight unit back to an autonomous unit by loading a Cisco IOS release that supports autonomous mode (Cisco IOS Release 12.3(7)JA or earlier releases). If the access point is associated with a switch, you can use the switch to load the Cisco IOS release. If the access point is not associated to a switch, you can load the Cisco IOS release using TFTP. In either method, the access point must be able to access a TFTP server that contains the Cisco IOS release to be loaded.

### Using DHCP Option 43 and DHCP Option 60

Cisco Aironet access points use the type-length-value (TLV) format for DHCP option 43. You must program the DHCP servers to return the option based on the access point's DHCP Vendor Class Identifier (VCI) string (DHCP option 60).

See the product documentation for your DHCP server for instructions on configuring DHCP option 43. The *Upgrading Autonomous Cisco Aironet Access Points to Lightweight Mode* document contains example steps for configuring option 43 on a DHCP server.

If the access point is ordered with the Service Provider Option - AIR-OPT60-DHCP selected, the VCI string for that access point will be different than those strings listed in the previous table. The VCI string has the following suffix: ServiceProvider. For example, a 1260 with this option returns this VCI string: Cisco AP c1260-ServiceProvider.

---

**Note** The switch IP address that you obtain from the DHCP server should be a unicast IP address. Do not configure the switch IP address as a multicast address when configuring DHCP option 43.

---

## How Converted Access Points Send Crash Information to the Switch

When a converted access point unexpectedly reboots, the access point stores a crash file on its local flash memory at the time of the crash. After the unit reboots, it sends the reason for the reboot to the switch. If the unit rebooted because of a crash, the switch pulls up the crash file using existing CAPWAP messages and stores it in the switch flash memory. The crash information copy is removed from the access point flash memory when the switch pulls it from the access point.

## Uploading Memory Core Dumps from Converted Access Points

By default, access points converted to lightweight mode do not send memory core dumps to the switch. This section provides instructions to upload access point core dumps using the switch GUI or CLI.

## Displaying MAC Addresses for Converted Access Points

There are some differences in the way that controllers display the MAC addresses of converted access points on information pages in the controller GUI:

- On the AP Summary page, the controller lists the Ethernet MAC addresses of converted access points.
- On the AP Detail page, the controller lists the BSS MAC addresses and Ethernet MAC addresses of converted access points.
- On the Radio Summary page, the switch lists converted access points by the radio MAC address.

## Configuring a Static IP Address for a Lightweight Access Point

If you want to specify an IP address for an access point rather than having one assigned automatically by a DHCP server, you can use the controller GUI or CLI to configure a static IP address for the access point. Static IP addresses are generally used only for deployments with a limited number of APs.

An access point cannot discover the switch using domain name system (DNS) resolution if a static IP address is configured for the access point, unless you specify a DNS server and the domain to which the access point belongs. You can configure these parameters using either the switch CLI or the GUI.

---

**Note** If you configure an access point to use a static IP address that is not on the same subnet on which the access point's previous DHCP address was, the access point falls back to a DHCP address after the access point reboots. If the access point falls back to a DHCP address, enter the **show ap config general Cisco\_AP** CLI command to show that the access point is using a fallback IP address. However, the GUI shows both the static IP address and the DHCP address, but it does not identify the DHCP address as a fallback address.

---

# How to Convert a Lightweight Access Point Back to an Autonomous Access Point

## Converting a Lightweight Access Point Back to an Autonomous Access Point (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap name Cisco_AP tftp-downgrade            tftp_server_ip_address            tftp_server_image_filename</b> <b>Example:</b> Switch# ap name AP02 tftp-downgrade 10.0.0.1 tsrvname	Converts the lightweight access point back to autonomous mode.  <b>Note</b> After entering this command, you must wait until the access point reboots and then reconfigure the access point using the CLI or GUI.

## Converting a Lightweight Access Point Back to an Autonomous Access Point (Using the Mode Button and a TFTP Server)

### Procedure

- 
- Step 1** Configure the PC on which your TFTP server software runs with a static IP address in the range of 10.0.0.2 to 10.0.0.30.
- Step 2** Make sure that the PC contains the access point image file (such as *c1140-k9w7-tar.123-7.JA.tar* for a 1140 series access point) in the TFTP server folder and that the TFTP server is activated.
- Step 3** Rename the access point image file in the TFTP server folder to **c1140-k9w7-tar.default** for a 1140 series access point.
- Step 4** Connect the PC to the access point using a Category 5 (CAT5) Ethernet cable.
- Step 5** Disconnect power from the access point.
- Step 6** Press and hold the **MODE** button while you reconnect power to the access point.
- Note** The **MODE** button on the access point must be enabled.
- Step 7** Hold the **MODE** button until the status LED turns red (approximately 20 to 30 seconds), and release the **MODE** button.

- Step 8** Wait until the access point reboots as indicated by all LEDs turning green followed by the Status LED blinking green.
- Step 9** After the access point reboots, reconfigure the access point using the GUI or the CLI.

## Authorizing Access Points (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# <b>enable</b>	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>ap auth-list ap-policy authorize-ap</b> <b>Example:</b> Switch(config)# ap auth-list ap-policy authorize-ap	Configures an access point authorization policy.
<b>Step 4</b>	<b>username user_name mac aaa attribute list list_name</b> <b>Example:</b> Switch(config)# username aaa.bbb.ccc mac aaa attribute list attrlist	Configures the MAC address of an access point locally.
<b>Step 5</b>	<b>aaa new-model</b> <b>Example:</b> Switch(config)# aaa new-model	Enables new access control commands and functions.
<b>Step 6</b>	<b>aaa authorization credential-download auth_list local</b> <b>Example:</b> Switch(config)# aaa authorization credential-download auth_download local	Downloads EAP credentials from the local server.
<b>Step 7</b>	<b>aaa attribute list list</b> <b>Example:</b> Switch(config)# aaa attribute list alist	Configures AAA attribute list definitions.

	Command or Action	Purpose
<b>Step 8</b>	<b>aaa session-id common</b> <b>Example:</b> Switch(config)# aaa session-id common	Configures the AAA common session ID.
<b>Step 9</b>	<b>aaa local authentication default authorization default</b> <b>Example:</b> Switch(config)# aaa local authentication default authorization default	Configures the local authentication method list.
<b>Step 10</b>	<b>show ap name Cisco_AP config general</b> <b>Example:</b> Switch(config)# show ap name AP01 config general	Displays the configuration information that corresponds to a specific access point.

## Authorizing Access Points (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > AAA > AP Policy**.  
The **AP Policy** page is displayed.
- Step 2** In the Policy Configuration area, enable or disable the following parameters:
- **Authorize LSC APs against Auth-List**
  - **AP with Self-Signed Certificate**
  - **Authorize MIC APs against AAA**
  - **AP with Manufacturing Installed Certificate**
- Step 3** Click **Apply**.
- Step 4** Click **Save Configuration**.
- 

## Disabling the Reset Button on Converted Access Points (CLI)

You can enable or disable the Reset button on access points that are converted to lightweight mode. The Reset button is labeled MODE on the outside of the access point.

**Note** The procedure to perform this task using the controller GUI is not currently available.

---

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>no ap reset-button</b> <b>Example:</b> Switch(config)# no ap reset-button	Disables the Reset buttons on all converted access points that are associated to the switch.  <b>Note</b> To enable the Reset buttons on all converted access points that are associated to the switch, enter the <b>ap reset-button</b> command.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 5</b>	<b>ap name Cisco_AP reset-button</b> <b>Example:</b> Switch# ap name AP02 reset-button	Enables the Reset button on the converted access point that you specify.

## Monitoring the AP Crash Log Information

**Note** The procedure to perform this task using the switch GUI is not currently available.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>show ap crash-file</b> <b>Example:</b> Switch# show ap crash-file	Verifies whether the crash file is downloaded to the switch.

# How to Configure a Static IP Address on an Access Point

## Configuring a Static IP Address on an Access Point (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap name Cisco_AP static-ip ip-address static_ap_address netmask static_ip_netmask gateway static_ip_gateway</b>  <b>Example:</b> Switch# ap name AP03 static-ip ip-address 9.9.9.16 netmask 255.255.0.0 gateway 9.9.9.2	Configures a static IP address on the access point. This command contains the following keywords and arguments: <ul style="list-style-type: none"> <li>• <b>ip-address</b>— Specifies the Cisco access point static IP address.</li> <li>• <b>ip-address</b>— Cisco access point static IP address.</li> <li>• <b>netmask</b>— Specifies the Cisco access point static IP netmask.</li> <li>• <b>netmask</b>— Cisco access point static IP netmask.</li> <li>• <b>gateway</b>— Specifies the Cisco access point gateway.</li> <li>• <b>gateway</b>— IP address of the Cisco access point gateway.</li> </ul> <p>The access point reboots and rejoins the switch, and the static IP address that you specify is pushed to the access point. After the static IP address has been sent to the access point, you can configure the DNS server IP address and domain name. You must perform Steps 3 and 4 after the access points reboot.</p>
<b>Step 3</b>	<b>enable</b>  <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 4</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 5</b>	<b>ap static-ip name-server</b> <i>nameserver_ip_address</i>  <b>Example:</b> Switch(config)# ap static-ip name-server  10.10.10.205	Configures a DNS server so that a specific access point or all access points can discover the switch using DNS resolution.  <b>Note</b> To undo the DNS server configuration, enter the <b>no ap static-ip name-server nameserver_ip_address</b> command.
<b>Step 6</b>	<b>ap static-ip domain</b> <i>static_ip_domain</i>  <b>Example:</b> Switch(config)# ap static-ip domain domain1	Configures the domain to which a specific access point or all access points belong.  <b>Note</b> To undo the domain name configuration, enter the <b>no ap static-ip domain static_ip_domain</b> command.
<b>Step 7</b>	<b>end</b>  <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 8</b>	<b>show ap name</b> <i>Cisco_AP</i> <b>config general</b>  <b>Example:</b> Switch# show ap name AP03 config general	Displays the IP address configuration for the access point.

## Configuring a Static IP Address on an Access Point (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points > All APs**.  
The **All APs** page is displayed.
- Step 2** Click the name of the access point.  
The **AP > Edit** page is displayed.
- Step 3** In the **General** tab, in the **IP Config** area, select the **Static IP** check box if you want to assign a static IP address to the access point.
- Step 4** Enter the following details:
- **Static IP**
  - **Netmask**
  - **Gateway**
- Step 5** Click **Apply**.

The access point reboots and rejoins the switch, and the static IP address that you specified is sent to the access point.

- Step 6** After the static IP address has been sent to the access point, configure the **DNS IP Address** and **Domain Name**.
- Step 7** Click **Apply**.
- Step 8** Click **Save Configuration**.

## Recovering the Access Point Using the TFTP Recovery Procedure

### Procedure

- Step 1** Download the required recovery image from Cisco.com (ap3g2-k9w8-tar.152-2.JA.tar) and install it in the root directory of your TFTP server.
- Step 2** Connect the TFTP server to the same subnet as the target access point and power-cycle the access point. The access point boots from the TFTP image and then joins the switch to download the oversized access point image and complete the upgrade procedure.
- Step 3** After the access point has been recovered, you can remove the TFTP server.

## Configuration Examples for Converting Autonomous Access Points to Lightweight Mode

### Displaying the IP Address Configuration for Access Points: Example

This example shows how to display the IP address configuration for the access point:

```
Switch# show ap name AP03 dot11 24ghz config general
Cisco AP Identifier..... 4
Cisco AP Name..... AP6
IP Address Configuration..... Static IP assigned
IP Address..... 10.10.10.118
IP NetMask..... 255.255.255.0
Gateway IP Addr..... 10.10.10.1
Domain..... Domain1
Name Server..... 10.10.10.205
...
```

## Displaying Access Point Crash File Information: Example

This example shows how to display access point crash file information. Using this command, you can verify whether the file is downloaded to the switch:

```
Switch# show ap crash-file
Local Core Files:
lrاد_AP1130.rdump0 (156)
```

The number in parentheses indicates the size of the file. The size should be greater than zero if a core dump file is available.

## CHAPTER 34

# Using Cisco Workgroup Bridges

- [Finding Feature Information, on page 527](#)
- [Information About Cisco Workgroup Bridges and non-Cisco Workgroup bridges, on page 527](#)
- [Monitoring the Status of Workgroup Bridges, on page 528](#)
- [Debugging WGB Issues \(CLI\), on page 528](#)
- [Configuration Examples for Configuring Workgroup Bridges, on page 529](#)

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Cisco Workgroup Bridges and non-Cisco Workgroup bridges

A WGB is a mode that can be configured on an autonomous Cisco IOS access point to provide wireless connectivity to a lightweight access point on behalf of clients that are connected by Ethernet to the WGB access point. A WGB connects a wired network over a single wireless segment by learning the MAC addresses of its wired clients on the Ethernet interface and reporting them to the lightweight access point using Internet Access Point Protocol (IAPP) messaging. The WGB provides wireless access connectivity to wired clients by establishing a single wireless connection to the lightweight access point.

When a Cisco WGB is used, the WGB informs the access points of all the clients that it is associated with. The switch is aware of the clients that are associated with the access point. When non-Cisco WGBs are used, the switch has no information about the IP address of the clients on the wired segment behind the WGB. Without this information, the switch drops the following types of messages:

- ARP REQ from the distribution system for the WGB client.
- ARP RPLY from the WGB client.
- DHCP REQ from the WGB client.

- DHCP RPLY for the WGB client.

## Monitoring the Status of Workgroup Bridges

**Note** The procedure to perform this task using the switch GUI is not currently available.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>show wireless wgb summary</b> <b>Example:</b> Switch# show wireless wgb summary	Displays the WGBs on your network.
<b>Step 3</b>	<b>show wireless wgb mac-address wgb_mac_address detail</b> <b>Example:</b> Switch# show wireless wgb mac-address 00:0d:ed:dd:25:82 detail	Displays the details of any wired clients that are connected to a particular WGB.

## Debugging WGB Issues (CLI)

**Note** The procedure to perform this task using the switch GUI is not currently available.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>debug iapp all</b> <b>Example:</b> Switch# debug iapp all	Enables debugging for IAPP messages.

	Command or Action	Purpose
<b>Step 3</b>	<b>debug iapp error</b> <b>Example:</b> Switch# debug iapp error	Enables debugging for IAPP error events.
<b>Step 4</b>	<b>debug iapp packet</b> <b>Example:</b> Switch# debug iapp packet	Enables debugging for IAPP packets.
<b>Step 5</b>	<b>debug mobility handoff [switch switch_number]</b> <b>Example:</b> Switch# debug mobility handoff	Enables debugging for any roaming issues.
<b>Step 6</b>	<b>debug dhcp</b> <b>Example:</b> Switch# debug dhcp	Debug an IP assignment issue when DHCP is used.
<b>Step 7</b>	<b>debug dot11 mobile</b> <b>Example:</b> Switch# debug dot11 mobile	Enables dot11/mobile debugging. Debug an IP assignment issue when static IP is used.
<b>Step 8</b>	<b>debug dot11 state</b> <b>Example:</b> Switch# debug dot11 state	Enables dot11/state debugging. Debug an IP assignment issue when static IP is used.

# Configuration Examples for Configuring Workgroup Bridges

## WGB Configuration: Example

This example shows how to configure a WGB access point using static WEP with a 40-bit WEP key:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# dot11 ssid WGB_with_static_WEP
Switch(config-ssid)# authentication open
Switch(config-ssid)# guest-mode
Switch(config-ssid)# exit
Switch(config)# interface dot11Radio 0
Switch(config)# station-role workgroup-bridge
Switch(config-if)# ency mode wep 40
Switch(config-if)# ency key 1 size 40 0 1234567890
Switch(config-if)# ssid WGB_with_static_WEP
Switch(config-if)# end
```

Verify that the WGB is associated to an access point by entering this command on the WGB:

**show dot11 association**

Information similar to the following appears:

```
Switch# show dot11 associations
802.11 Client Stations on Dot11Radio0:
SSID [FCVTESTING] :
MAC Address      IP address      Device      Name      Parent      State
000b.8581.6aee  10.11.12.1     WGB-client  map1     -           Assoc
ap#
```

## CHAPTER 35

# Configuring Probe Request Forwarding

---

- [Finding Feature Information, on page 531](#)
- [Information About Configuring Probe Request Forwarding, on page 531](#)
- [How to Configure Probe Request Forwarding \(CLI\), on page 531](#)

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring Probe Request Forwarding

Probe requests are 802.11 management frames that are sent by clients to request information about the capabilities of Service Set Identifiers (SSIDs). By default, access points forward acknowledged probe requests to the switch for processing. Acknowledged probe requests are probe requests for SSIDs that are supported by the access point. If desired, you can configure access points to forward both acknowledged and unacknowledged probe requests to the switch. The switch can use the information from unacknowledged probe requests to improve the location accuracy.

## How to Configure Probe Request Forwarding (CLI)

---

**Note** The procedure to perform this task using the switch GUI is not currently available.

---

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless probe filter</b> <b>Example:</b> Switch(config)# <code>wireless probe filter</code>	Enables or disables the filtering of probe requests forwarded from an access point to the switch.  <b>Note</b> If you enable probe filtering, the default filter setting, the access point forwards only acknowledged probe requests to the switch. If you disable probe filtering, the access point forwards both acknowledged and unacknowledged probe requests to the switch.
<b>Step 3</b>	<b>wireless probe filter <i>num_probes interval</i></b> <b>Example:</b> Switch(config)# <code>wireless probe filter 5 5</code>	Limits the number of probe requests sent to the switch per client per access point radio in a given interval. You must specify the following arguments with this command: <ul style="list-style-type: none"> <li>• <i>num_probes</i>—Number of probe requests forwarded to the switch per client per access point radio in a given interval. The range is from 1 to 100.</li> <li>• <i>interval</i>—Probe limit interval in milliseconds. The range is from 100 to 10000.</li> </ul>
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 5</b>	<b>show wireless probe</b> <b>Example:</b> Switch# <code>show wireless probe</code>	Displays the advanced probe request configuration.

## CHAPTER 36

# Optimizing RFID Tracking

- [Finding Feature Information](#), on page 533
- [Optimizing RFID Tracking on Access Points](#), on page 533
- [How to Optimize RFID Tracking on Access Points](#), on page 533
- [Configuration Examples for Optimizing RFID Tracking](#), on page 534

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Optimizing RFID Tracking on Access Points

To optimize the monitoring and location calculation of RFID tags, you can enable tracking optimization on up to four channels within the 2.4-GHz band of an 802.11b/g access point radio. This feature allows you to scan only the channels on which tags are usually programmed to operate (such as channels 1, 6, and 11).

## How to Optimize RFID Tracking on Access Points

### Optimizing RFID Tracking on Access Points (CLI)

#### Procedure

	Command or Action	Purpose
Step 1	<pre>ap name <i>Cisco_AP</i> mode monitor submode none</pre> <p>Example:</p>	Specifies the monitor submode for the access point as none.

	Command or Action	Purpose
	Switch# ap name 3602a mode monitor submode none	<b>Note</b> A warning message indicates that changing the access point's mode will cause the access point to reboot and prompts you to specify whether you want to continue by entering <b>Y</b> .  After you enter <b>Y</b> , the access point reboots.
<b>Step 2</b>	<b>ap name Cisco_AP dot11 24ghz shutdown</b> <b>Example:</b> Switch# ap name AP01 dot11 24ghz shutdown	Disables the access point radio.
<b>Step 3</b>	<b>ap name Cisco_AP monitor-mode tracking-opt</b> <b>Example:</b> Switch# ap name TSIM_AP1 monitor-mode tracking-opt	Configures the access point to scan only the Dynamic Channel Assignment (DCA) channels supported by its country of operation.  <b>Note</b> To disable tracking optimization for an access point, enter the <b>ap name Cisco_AP monitor-mode tracking-opt no-optimization</b> command.
<b>Step 4</b>	<b>ap name Cisco_AP monitor-mode dot11b {fast-channel [first_channel second_channel third_channel fourth_channel]}</b> <b>Example:</b> Switch# ap name AP01 monitor-mode dot11b  fast-channel 1 2 3 4	Chooses up to four specific 802.11b channels to be scanned by the access point.  <b>Note</b> In the United States, you can assign any value from 1 to 11 (inclusive) to the channel variable. Other countries support additional channels. You must assign at least one channel.
<b>Step 5</b>	<b>ap name Cisco_AP no dot11 24ghz shutdown</b> <b>Example:</b> Switch# ap name AP01 no dot11 24ghz shutdown	Enables the access point radio.
<b>Step 6</b>	<b>show ap monitor-mode summary</b> <b>Example:</b> Switch# show ap monitor-mode summary	Displays all the access points in monitor mode.

## Configuration Examples for Optimizing RFID Tracking

### Displaying all the Access Points in Monitor Mode: Example

This example shows how to display all the access points in monitor mode:

```
Switch# show ap monitor-mode summary

AP Name          Ethernet MAC    Status    Scanning
                Channel
                List
-----
AP1131:4f2.9a 00:16:4:f2:9:a Tracking 1,6,NA,NA
```

## CHAPTER 37

# Configuring Country Codes

---

- [Finding Feature Information, on page 537](#)
- [Prerequisites for Configuring Country Codes, on page 537](#)
- [Information About Configuring Country Codes, on page 538](#)
- [How to Configure Country Codes \(CLI\), on page 538](#)
- [Configuration Examples for Configuring Country Codes, on page 540](#)

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring Country Codes

- Generally, you configure one country code per switch; you configure one code that matches the physical location of the switch and its access points. You can configure up to 20 country codes per switch. This multiple-country support enables you to manage access points in various countries from a single switch.
- When the multiple-country feature is used, all switches that are going to join the same RF group must be configured with the same set of countries, configured in the same order.
- Access points are capable of using all the available legal frequencies. However, access points are assigned to the frequencies that are supported in their relevant domains.
- The country list configured on the RF group leader determines which channels the members would operate on. This list is independent of which countries have been configured on the RF group members.
- For switches in the Japan regulatory domain, you must have had one or more Japan country codes (JP, J2, or J3) configured on your switch at the time you last booted your switch.
- For switches in the Japan regulatory domain, you must have at least one access point with a -J regulatory domain joined to your switch.

## Information About Configuring Country Codes

Controllers and access points are designed for use in many countries with varying regulatory requirements. The radios within the access points are assigned to a specific regulatory domain at the factory (such as -E for Europe), but the country code enables you to specify a particular country of operation (such as FR for France or ES for Spain). Configuring a country code ensures that each radio's broadcast frequency bands, interfaces, channels, and transmit power levels are compliant with country-specific regulations.

### Information About Japanese Country Codes

Country codes define the channels that can be used legally in each country. These country codes are available for Japan:

- JP—Allows only -J radios to join the controller
- J2—Allows only -P radios to join the controller
- J3—Uses the -U frequencies but allows -U, -P and -Q (other than 1550/1600/2600/3600) radios to join the WLC
- J4—Allows 2.4G JPQU and 5G PQU to join the controller.

**Note** The 1550, 1600, 2600, and 3600 APs require J4.

See the *Channels and Maximum Power Settings for Cisco Aironet Lightweight Access Points* document for the list of channels and power levels supported by access points in the Japanese regulatory domains.

## How to Configure Country Codes (CLI)

**Note** The procedure to perform this task using the switch GUI is not currently available.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>show wireless country supported</b>  <b>Example:</b> Switch# show wireless country supported	Displays a list of all available country codes.

	Command or Action	Purpose
<b>Step 3</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 4</b>	<b>ap dot11 24ghz shutdown</b> <b>Example:</b> Switch(config)# <code>ap dot11 5ghz shutdown</code>	Disables the 802.11a network.
<b>Step 5</b>	<b>ap dot11 5ghz shutdown</b> <b>Example:</b> Switch(config)# <code>ap dot11 24ghz shutdown</code>	Disables the 802.11b/g network.
<b>Step 6</b>	<b>ap country <i>country_code</i></b> <b>Example:</b> Switch(config)# <code>ap country IN</code>	Assigns access points to a specific country.  <b>Note</b> Make sure that the country code you choose is compatible with the regulatory domain of at least one of the access point's radios.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 8</b>	<b>show wireless country channels</b> <b>Example:</b> Switch# <code>show wireless country channels</code>	Displays the list of available channels for the country codes configured on your switch.  <b>Note</b> Perform Steps 9 through 17 only if you have configured multiple country codes in Step 6.
<b>Step 9</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 10</b>	<b>no ap dot11 5ghz shutdown</b> <b>Example:</b> Switch(config)# <code>no ap dot11 5ghz shutdown</code>	Enables the 802.11a network.
<b>Step 11</b>	<b>no ap dot11 24ghz shutdown</b> <b>Example:</b> Switch(config)# <code>no ap dot11 24ghz shutdown</code>	Enables the 802.11b/g network.

	Command or Action	Purpose
<b>Step 12</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 13</b>	<b>ap name Cisco_AP shutdown</b> <b>Example:</b> Switch# ap name AP02 shutdown	Disables the access point. <b>Note</b> Ensure that you disable only the access point for which you are configuring country codes.
<b>Step 14</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 15</b>	<b>ap country country_code</b> <b>Example:</b> Switch# ap country IN	Assigns an access point to a specific country. <b>Note</b> Ensure that the country code that you choose is compatible with the regulatory domain of at least one of the access point's radios. <b>Note</b> If you enabled the networks and disabled some access points and then enter the <b>ap country country_code</b> command, the specified country code is configured on only the disabled access points. All other access points are ignored.
<b>Step 16</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 17</b>	<b>ap name Cisco_AP no shutdown</b> <b>Example:</b> Switch# ap name AP02 no shutdown	Enables the access point.

## Configuration Examples for Configuring Country Codes

### Displaying Channel List for Country Codes: Example

This example shows how to display the list of available channels for the country codes configured on your switch:

```
Switch# show wireless country channels
```

```

Configured Country.....: US - United States
KEY: * = Channel is legal in this country and may be configured manually.
A = Channel is the Auto-RF default in this country.
. = Channel is not legal in this country.
C = Channel has been configured for use by Auto-RF.
x = Channel is available to be configured for use by Auto-RF.
(-,-) = (indoor, outdoor) regulatory domain allowed by this country.

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring Link Latency

- The switch displays the current round-trip time as well as a running minimum and maximum round-trip time. The minimum and maximum times continue to run as long as the switch is up or can be cleared and allowed to restart.
- You can configure link latency for a specific access point using the switch GUI or CLI or for all access points joined to the switch using the CLI.

## Restrictions for Configuring Link Latency

- Link latency calculates the Control and Provisioning of Wireless Access Points (CAPWAP) response time between the access point and the switch. It does not measure network latency or ping responses.

# Information About Configuring Link Latency

You can configure link latency on the switch to measure the link between an access point and the switch. You can use this feature with all access points that are joined to the switch where the link can be a slow or unreliable WAN connection.

## TCP MSS

If the client's maximum segment size (MSS) in a Transmission Control Protocol (TCP) three-way handshake is greater than the maximum transmission unit can handle, the client might experience reduced throughput and the fragmentation of packets. To avoid this problem, you can specify the MSS for all access points that are joined to the switch or for a specific access point.

When you enable this feature, the access point selects the MSS for TCP packets to and from wireless clients in its data path. If the MSS of these packets is greater than the value that you configured or greater than the default value for the CAPWAP tunnel, the access point changes the MSS to the new configured value.

## Link Tests

A link test is used to determine the quality of the radio link between two devices. Two types of link-test packets are transmitted during a link test: request and response. Any radio receiving a link-test request packet fills in the appropriate text boxes and echoes the packet back to the sender with the response type set.

The radio link quality in the client-to-access point direction can differ from that in the access point-to-client direction due to the asymmetrical distribution of the transmit power and receive sensitivity on both sides. Two types of link tests can be performed: a ping test and a CCX link test.

With the *ping link test*, the controller can test link quality only in the client-to-access point direction. The RF parameters of the ping reply packets received by the access point are polled by the controller to determine the client-to-access point link quality.

With the *CCX link test*, the switch can also test the link quality in the access point-to-client direction. The switch issues link-test requests to the client, and the client records the RF parameters (received signal strength indicator [RSSI], signal-to-noise ratio [SNR], and so on) of the received request packet in the response packet. Both the link-test requestor and responder roles are implemented on the access point and switch. Not only can the access point or switch initiate a link test to a CCX v4 or v5 client, but a CCX v4 or v5 client can initiate a link test to the access point or switch.

The switch shows the link-quality metrics for CCX link tests in both directions (out—the access point to the client; in—the client to the access point):

- Signal strength in the form of RSSI (minimum, maximum, and average)
- Signal quality in the form of SNR (minimum, maximum, and average)
- Total number of packets that are retried
- Maximum retry count for a single packet
- Number of lost packets
- Data rate of a successfully transmitted packet

The controller shows this metric regardless of direction:

- Link test request/reply round-trip time (minimum, maximum, and average)

The controller software supports CCX versions 1 through 5. CCX support is enabled automatically for every WLAN on the controller and cannot be disabled. The controller stores the CCX version of the client in its client database and uses it to limit the features for this client. If a client does not support CCXv4 or v5, the controller performs a ping link test on the client. If a client supports CCXv4 or v5, the controller performs a CCX link test on the client. If a client times out during a CCX link test, the controller switches to the ping link test automatically.

## How to Configure Link Latency

### Configuring Link Latency (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ap link-latency</b> <b>Example:</b> Switch(config)# ap link-latency	Enables link latency for all access points that are currently associated with the switch.  <b>Note</b> To disable link latency for all the access points that are associated with the switch, use the <b>no ap link-latency</b> command.  <b>Note</b> These commands enable or disable link latency only for access points that are currently joined to the switch. You have to enable or disable link latency for the access points that join in the future.

	Command or Action	Purpose
		<p><b>Note</b> To enable or disable link latency for specific access points that are associated with the switch, enter the following commands in Privileged EXEC mode:</p> <ul style="list-style-type: none"> <li>• <b>ap name <i>Cisco_AP</i> link-latency</b>—Enables link latency.</li> <li>• <b>ap name <i>Cisco_AP</i> no link-latency</b>—Disables link latency.</li> </ul>
<b>Step 4</b>	<p><b>ap tcp-adjust-mss size <i>size</i></b></p> <p><b>Example:</b></p> <pre>Switch(config)# ap tcp-adjust-mss size 537</pre>	Configures TCP MSS adjust size for all access points. The range is from 536 to 1363.
<b>Step 5</b>	<p><b>show ap name <i>Cisco_AP</i> config general</b></p> <p><b>Example:</b></p> <pre>Switch(config)# show ap name AP02 config general</pre>	<p>Displays the general configuration details of the access point. These configuration details contain the link latency results that correspond to the access point that you specify in the command.</p> <p>The output of this command contains the following link latency results:</p> <ul style="list-style-type: none"> <li>• <b>Current Delay</b>—The current round-trip time (in milliseconds) of CAPWAP heartbeat packets from the access point to the switch and back.</li> <li>• <b>Maximum Delay</b>—Since the time that link latency has been enabled or reset, the maximum round-trip time (in milliseconds) of CAPWAP heartbeat packets from the access point to the switch and back.</li> <li>• <b>Minimum Delay</b>—Since the time that link latency has been enabled or reset, the minimum round-trip time (in milliseconds) of CAPWAP heartbeat packets from the access point to the switch and back.</li> </ul>
<b>Step 6</b>	<p><b>ap name <i>Cisco_AP</i> link-latency [reset]</b></p> <p><b>Example:</b></p> <pre>Switch(config)# ap name AP02 link-latency reset</pre>	Clears the current, minimum, and maximum link latency statistics on the switch for a specific access point.

	Command or Action	Purpose
<b>Step 7</b>	<b>show ap name <i>Cisco_AP</i> config general</b> <b>Example:</b> <pre>Switch(config)# show ap name AP02 config general</pre>	Displays the general configuration details of the access point. Use this command to see the result of the reset operation.

## Configuring Link Latency (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points > All APs**.  
The **All APs** page appears with a list of access points.
- Step 2** Click the name of the access point.  
The **AP > Edit** page appears.
- Step 3** Click the **Advanced** tab.
- Step 4** In the **Link Latency** area, select or unselect the **Enable Link Latency** check box.
- Note** You can select the **Enable Link Latency** check box to enable link latency for this access point or unselect it to prevent the access point from sending the round-trip time to the switch after every echo response is received. The default state is unselected.
- Step 5** Click **Apply**.
- Step 6** When a message box appears that indicates that AP Parameters are modified successfully, click **OK**.
- Step 7** When the **All APs** page is displayed, click the access point that you have modified earlier.  
The **AP > Edit** page appears.
- Step 8** Click the **Advanced** tab.  
In the **Link Latency** area, the following link latency and data latency results are displayed:
- **Current(mSec)**—The current round-trip time (in milliseconds) of CAPWAP heartbeat packets or data packets from the access point to the switch and back.
  - **Minimum(mSec)**—Since the time that link latency has been enabled or reset, the minimum round-trip time (in milliseconds) of CAPWAP heartbeat packets or data packets from the access point to the switch and back.
  - **Maximum(mSec)**—Since the time that link latency has been enabled or reset, the maximum round-trip time (in milliseconds) of CAPWAP heartbeat packets or data packets from the access point to the switch and back.
- Step 9** Click **Reset Link Latency** to clear the current, minimum, and maximum link latency and data latency statistics on the switch for this access point.

**Note** After the page refreshes and the **All APs** page is displayed again, click the **Advanced** tab. The updated statistics appear in the **Minimum** and **Maximum** text boxes.

## How to Configure TCP MSS

### Configuring TCP MSS (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap tcp-adjust-mss size size_value</b> <b>Example:</b> Switch(config)# <code>ap tcp-adjust-mss size 537</code>	Enables the TCP MSS on the particular access point that you specify.  <b>Note</b> To enable TCP MSS on all the access points that are associated with the switch, enter the <b>ap tcp-adjust-mss size size_value</b> command, where the size parameter is from 536 to 1363 bytes. The default value varies for different clients.
<b>Step 3</b>	<b>reload</b> <b>Example:</b> Switch# <code>reload</code>	Reboots the switch in order for your change to take effect.
<b>Step 4</b>	<b>show ap tcp-adjust-mss</b> <b>Example:</b> Switch# <code>show ap tcp-adjust-mss</code>	Displays the current TCP MSS setting for all the access points that are associated with the switch.  <b>Note</b> To display the TCP MSS settings that correspond to a specific access point, enter the <b>show ap name Cisco_AP tcp-adjust-mss</b> command.

## Configuring TCP MSS (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points > Global AP Configuration**.  
The **Global Configuration** page is displayed.
- Step 2** In the **TCP MSS** area, select the **Global TCP Adjust MSS** check box and set the MSS for all access points that are associated with the switch. The valid range is from 536 to 1363 bytes.
- Step 3** Click **Apply**.
- Step 4** Click **Save Configuration**.
- 

## Performing a Link Test (CLI)

**Note** The procedure to perform this task using the switch GUI is not currently available.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>test wireless linktest <i>mac_address</i></b>  <b>Example:</b> Switch# test wireless linktest 00:0d:88:c5:8a:d1	Runs a link test.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>wireless linktest frame-size <i>frame_size</i></b>  <b>Example:</b> Switch(config)# wireless linktest frame-size 41	Configures the link test frame size for each packet.
<b>Step 4</b>	<b>wireless linktest number-of-frames <i>number_of_frames</i></b>  <b>Example:</b> Switch(config)# wireless linktest number-of-frames 50	Configures the number of frames to send for the link test.

	Command or Action	Purpose
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuration Examples for Configuring Link Latency

### Running a Link Test: Example

This example shows how to run a link test:

```
Switch# test wireless linktest 6470.0227.ca55
Switch# show wireless linktest statistic

Link Test to 64700227CA55 with 500 frame-size.
Client MAC Address           : 6470.0227.ca55
AP Mac Address               : 44e4.d901.19c0
Link Test Packets Sent       : 20
Link Test Packets Received   : 20
Link Test Pkts Lost(Total/AP->Clnt/Clnt->AP) : 0/0/0
Link Test Pkts round trip time (min/max/avg) : 9ms/31ms/14ms
RSSI at AP (min/max/average) : -53dBm/-51dBm/-52dBm
RSSI at Client (min/max/average) : -48dBm/-40dBm/-44dBm
```

### Displaying Link Latency Information: Example

This example shows how to display general configuration details of the access point. These configuration details contain the link latency results that correspond to the access point that you specify in the command.

```
Switch# show ap name AP01 config general

Cisco AP Name           : AP01
Cisco AP Identifier     : 55
Country Code           : US - United States
Regulatory Domain Allowed by Country : 802.11bg:-A 802.11a:-A
AP Country Code        : US - United States
AP Regulatory Domain    : Unconfigured
Switch Port Number     : Tel1/0/1
MAC Address             : 0000.2000.03f0
IP Address Configuration : Static IP assigned
IP Address             : 9.9.9.16
IP Netmask              : 255.255.0.0
Gateway IP Address      : 9.9.9.2
Fallback IP Address Being Used : 9.9.9.16
Domain                  : Cisco

AP TCP MSS Size                           : 536

```

## Displaying TCP MSS Settings: Example

This example shows how to display the current TCP MSS setting for all the access points that are associated with the switch:

```
Switch# show ap tcp-adjust-mss
```

AP Name	TCP State	MSS Size
AP01	Disabled	6146
AP02	Disabled	536
AP03	Disabled	6146
AP04	Disabled	6146
AP05	Disabled	6146

## CHAPTER 39

# Configuring Power over Ethernet

- [Finding Feature Information, on page 553](#)
- [Information About Configuring Power over Ethernet, on page 553](#)
- [How to Configure Power over Ethernet, on page 553](#)
- [Configuration Examples for Configuring Power over Ethernet, on page 556](#)

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring Power over Ethernet

When an access point that has been converted to lightweight mode (such as an AP1262) access point is powered by a power injector that is connected to a Cisco pre-Intelligent Power Management (pre-IPM) switch, you must configure Power over Ethernet (PoE), which is also known as *inline power*.

## How to Configure Power over Ethernet

### Configuring Power over Ethernet (CLI)

#### Procedure

	Command or Action	Purpose
Step 1	<b>ap name</b> <i>Cisco_AP</i> <b>power injector installed</b>  <b>Example:</b>	Enables the PoE power injector state. The access point remembers that a power injector is connected to this particular switch port. If you relocate the access point, you must reenter

	Command or Action	Purpose
	Switch# ap name AP02 power injector installed	this command after the presence of a new power injector is verified.  <b>Note</b> Enter this command if your network contains any older Cisco 6-W switches that could be accidentally overloaded if connected directly to a 12-W access point. Make sure that the Cisco Discovery Protocol (CDP) is enabled before entering this command. Otherwise, this command will fail.
<b>Step 2</b>	<b>ap name Cisco_AP power injector override</b>  <b>Example:</b> Switch# ap name AP02 power injector override	Removes the safety checks and allows the access point to be connected to any switch port. You can use this command if your network does not contain any older Cisco 6-W switches that could be overloaded if connected directly to a 12-W access point. The access point assumes that a power injector is always connected. If you relocate the access point, it continues to assume that a power injector is present.
<b>Step 3</b>	<b>ap name Cisco_AP power injector switch-mac-address switch_mac_address</b>  <b>Example:</b> Switch# ap name AP02 power injector switch-mac-address 10a.2d.5c.3d	Sets the MAC address of the switch port that has a power injector.  <b>Note</b> Enter this command if you know the MAC address of the connected switch port and do not want to automatically detect it using the installed option.
<b>Step 4</b>	<b>show ap name Cisco_AP config general</b>  <b>Example:</b> Switch# show ap name AP02 config general	Displays common information that includes the PoE settings for a specific access point.  <b>Note</b> The Power Type/Mode text box shows “degraded mode” if the access point is not operating at full power.

## Configuring Power over Ethernet (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points > All APs**.  
The **All APs** page appears with a list of access points that are associated with the switch.
- Step 2** Click the name of the access point.

The **AP > Edit** page appears.

**Step 3** Click the **Advanced** tab.

**Step 4** In the **Power Over Ethernet Settings** area, select the **Pre-Standard 802.3af Switches** check box.

Select this check box if the access point is being powered by a high-power 802.3af Cisco switch. This switch provides more than the traditional 6 Watts of power but does not support the intelligent power management (IPM) feature.

**Note** Unselect the **Pre-standard 802.3af Switches** check box if power is being provided by a power injector. This is the default value.

**Step 5** Select the **Power Injector State** check box.

Select this check box if the attached switch does not support IPM and a power injector is being used. If the attached switch supports IPM, you do not need to select this check box.

The **Power Injector Selection** drop-down list is displayed that contains parameters that enable you to protect your switch port from an accidental overload if the power injector is inadvertently bypassed.

**Step 6** From the **Power Injector Selection** drop-down list, choose an option to specify the desired level of protection.

You can choose any one of the following three options:

- **Installed**—Examines and remembers the MAC address of the currently connected switch port and assumes that a power injector is connected. Choose this option if your network contains older Cisco 6-Watt switches and you want to avoid possible overloads by forcing a double-check of any relocated access points.

If you want to configure the switch MAC address, enter the MAC address in the **Injector Switch MAC Address** text box. If you want the access point to find the switch MAC address, leave the **Injector Switch MAC Address** text box blank.

**Note** Each time that an access point is relocated, the MAC address of the new switch port fails to match the remembered MAC address, and the access point remains in low-power mode. You must then physically verify the existence of a power injector and reselect this option to cause the new MAC address to be remembered.

- **Override**—Allows the access point to operate in high-power mode without first verifying a matching MAC address. You can use this option if your network does not contain any older Cisco 6-W switches that could be overloaded if connected directly to a 12-W access point. The advantage of this option is that if you relocate the access point, it continues to operate in high-power mode without any further configuration. The disadvantage of this option is that if the access point is connected directly to a 6-W switch, an overload occurs.

**Step 7** Click **Apply**.

**Step 8** Click **Save Configuration**.

---

### What to do next

Manually reset the access point in order for the change to take effect.

# Configuration Examples for Configuring Power over Ethernet

## Displaying Power over Ethernet Information: Example

This example shows how to display common information that includes the PoE settings for a specific access point:

```
Switch# show ap name AP01 config general

Cisco AP Identifier..... 1
Cisco AP Name..... AP1
...
PoE Pre-Standard Switch..... Enabled
PoE Power Injector MAC Addr..... Disabled
Power Type/Mode..... PoE/Low Power (degraded mode)
...
```

### Mobility

- [Information About Mobility, on page 559](#)
- [Mobility Network Elements, on page 565](#)
- [Mobility Control Protocols, on page 569](#)
- [Configuring Mobility, on page 577](#)

## CHAPTER 40

# Information About Mobility

- [Overview, on page 559](#)
- [Wired and Wireless Mobility, on page 560](#)
- [Features of Mobility, on page 560](#)
- [Sticky Anchoring for Low Latency Roaming, on page 562](#)
- [Bridge Domain ID and L2/L3 Roaming, on page 562](#)
- [Link Down Behavior, on page 562](#)
- [Platform Specific Scale Requirement for the Mobility Controller, on page 563](#)

## Overview

The switch delivers more services at access layer other than merely providing increased speeds and feeds. Wireless services is now integrated with the switch, which ensures that the access layer switch terminates the wireless users data plane, thereby delivering on the promise of Cisco's unified architecture. Unification implies that mobility services are provided to both wireless and wired stations.

The switch provides seamless roaming, which requires transparency of the network configuration and deployment options to the client.

From the end user's perspective, any mobility event must not change its IP address, its default router or DHCP server. This means that as stations roam, they must be able to

- Send an ARP to their default router, or
- Transmit a DHCP request to the server that had previously assigned their address.

From the infrastructure's perspective, as mobility events occur, the station's traffic must follow its current point of attachment, which can either be a mobility agent (MA) or mobility controller (MC). This must be true regardless of whether the station has moved to a network that is configured for a different subnet. The period from which the station is not receiving traffic following its mobility event must be as short as possible, even below 40 ms whenever possible, which includes any authentication procedures that are required.

From the infrastructure's perspective, the mobility management solution must have four main components, and all of these functions must be performed within the constraints of roaming:

- **Initial Association**—This function is used to identify the user's new point of attachment in the network.
- **Context Transfer**—This function is used to transfer state information associated with the station. This ensures that the station's static and real-time policies, including security and application ACLs, and services, remain the same across handoffs.

- Handoff—This function is used to signal that the station's point of attachment has changed, and control of the station should be relinquished by the previous access switch.
- Data Plane—This function is typically tied to the handoff process, and ensures that the station's traffic continues to be delivered and received from the station without any noticeable performance degradation.

**Caution**

If you have configured virtual routing and forwarding (VRF) on wireless management interface VLAN, the mobility feature may not work expected.

**Note**

You must enable PIM, IP ROUTING and IP MULTICAST Routing for wireless mobility multicast to work.

## Wired and Wireless Mobility

One of the key features of the Converged access solution (applicable to both the Cisco Catalyst 3850 Switch and Cisco WLC 5700 Series Controller) is its ability to provide a device with an IP address and maintain its session persistence, across mobility events from ethernet connections to wireless and vice-versa. This feature allows users to remain on an ethernet network when possible, and make use of the freedom of mobility associated with wireless when necessary.

This feature leverages support from both the client and the infrastructure and uses the two factor authentication-device and user. The device authentication credentials is cached in the mobility controller (MC). When a device transitions across link layers, the device credentials is validated, and if a match is found, the MC ensures that the same IP address is assigned to the new interface.

## Features of Mobility

- Mobility Controller (MC)—The controller provides mobility management services for inter-peer group roaming events. The MC provides a central point of contact for management and policy based control protocols, such as RADIUS. This eliminates the need for the infrastructure servers to maintain a user's location as it transitions throughout the network. The MC sends the configuration to all the mobility agents under its sub-domain of their mobility configuration, peer group membership and list of members. A sub-domain is synonymous to the MC that forms it. Each sub-domain consists of an MC and zero or more access switches that have AP's associated to them.
- Mobility Agents (MA)— A mobility agent is either an access switch that has a wireless module running on it or an MC with an internal MA running on it. A mobility agent is the wireless component that maintains client mobility state machine for a mobile client that is connected via an AP to the device that the MA is running on.
- Mobility Sub Domain— It is an autonomous portion of the mobility domain network. A mobility sub-domain comprises of a single mobility controller and its associated mobility agents (MAs).

---

**Note** Even when more than one mobility controller is present, only one MC can be active at any given time.

---

A mobility sub-domain is the set of devices managed by the active mobility controller. A mobility sub-domain comprises of a set of mobility agents and associated access points.

- **Mobility Group**— A collection of mobility controllers (MCs) across which fast roaming is supported. The concept of mobility group is the same as a collection of buildings in a campus across which frequent roaming is expected.
- **Mobility Domain**— A collection of mobility sub-domains across which mobility is supported. The term mobility domain may be the same as a campus network.
- **Mobility Oracle (MO)**—The mobility oracle acts as the point of contact for mobility events that occur across mobility sub-domains. It also maintains a local database of each station in the entire mobility domain, their home and current sub-domain. A mobility domain includes one or more mobility oracle, though only one would be active at any given time.
- **Mobility Tunnel Endpoint (MTE)**— The mobility tunnel endpoint (MTE) provides data plane services for mobile devices through the use of tunneling. This minimizes the impact of roaming events on the network by keeping the user's point of presence on the network a constant.
- **Point of Attachment**— A station's point of attachment is where its data path is initially processed upon entry in the network. This could either be the access switch that is currently providing it service, or the wireless LAN controller.
- **Point of Presence**— A station's point of presence is the place in the network where the station is being advertised. For instance, if an access switch is advertising reachability to the station via a routing protocol, the interface on which the route is being advertised is considered the station's point of presence.
- **Switch Peer Group (SPG)**— A peer group is a statically created list of neighboring access switches between which fast mobility services is provided. A peer group limits the scope of interactions between switches during handoffs to only those that are geographically proximate.
- **Station**—A user's device that connects to and requests service from the network. The device may have a wired, wireless or both interfaces.
- **Switch in the same SPG**—A peer switch that is part of the peer group of the local switch.
- **Switch outside the SPG**—A peer access switch that is not part of the local switch's peer group.
- **Foreign Mobility Controller**— The mobility controller providing mobility management service for the station in a foreign mobility sub-domain. The foreign mobility controller acts as a liaison between access switches in the foreign sub-domain and the mobility controller in the home domain.
- **Foreign Mobility Sub-Domain**— The mobility sub-domain, controlled by a mobility controller, supporting a station which is anchored in another mobility sub-domain
- **Foreign Switch**— The access switch in the foreign mobility sub-domain currently providing service to the station.
- **Anchor Mobility Controller**— The mobility controller providing a single point of control and mobility management service for stations in their home mobility sub-domain.

- Anchor Mobility Sub-Domain— The mobility sub-domain, controlled by a mobility controller, for a station where its IP address was assigned.
- Anchor Switch— The switch in the home mobility sub-domain that last provided service to a station.

## Sticky Anchoring for Low Latency Roaming

Sticky Anchoring ensures low roaming latency from the client's point of presence is maintained at the switch where the client initially joins the network. It is expensive to apply client policies at a switch for a roaming client. There can be considerable delay as it involves contacting the AAA server for downloadable ACLs which is not acceptable for restoring time sensitive client traffic.

To manage this delay, when the client roams between APs connected to different switches, irrespective of whether it is an intra sub-domain roam or inter sub-domain roam, the client traffic is always tunneled to the switch where the client first associates. The client is anchored at its first point of attachment for its lifetime in the network.

This behavior is enabled by default. You can also disable this behavior to allow the client anchoring only for inter-subnet roams. This configuration is per WLAN config and is available under the WLAN config mode. The customer can configure different SSIDs for time sensitive and non time sensitive applications.

## Bridge Domain ID and L2/L3 Roaming

Bridge domain ID provides the mobility nodes with information to decide on specific roam type, either as L2 or L3 roam. It also allows the network administrators to reuse the VLAN IDs across network distribution. When the VLAN IDs do not have the associated subnet configurations, they may require additional parameter to use in conjunction with VLAN ID. The network administrator ensures that the given VLAN under the same bridge domain ID are associated with the unique subnet. The mobility nodes will first check for the bridge domain ID for the given node and the VLAN ID associated with the client to identify the roam type. The bridge domain ID and the VLAN ID must be same to treat a roam as L2 roam.

The bridge domain ID is configured for each SPG when creating a SPG and later on the MC. The bridge domain ID could be same for more than one SPG and all the MAs under the SPG will share the same bridge domain ID. This information is pushed to the MAs as part of the configuration download when MA comes up initially. If the bridge domain ID is modified when the system is up, it will be pushed to all the MAs in the modified SPG and will take immediate effect for the future roams.

## Link Down Behavior

This section provides information about data synchronization between MA-MC and MC-MO when MC or MO faces downtime in absence of redundancy manager. When Keepalive is configured between MA-MC or MC-MO the clients database is synchronized between the MO and the MCs and the MC and its MAs respectively.

## Platform Specific Scale Requirement for the Mobility Controller

The Mobility Controller (MC) role is supported on a number of different platforms like, the Cisco WLC 5700 Series, CUWN and Catalyst 3850 Switches. The scale requirements on these three platforms are summarized in the table below:

Scalability	Catalyst 3850 as MC	Catalyst 3650 as MC	Cisco WLC 5700 as MC	CUWN 5508 as MC	WiSM2 as MC
Max number of MC in Mobility Domain	8	8	72	72	72
Max number of MC in Mobility Group	8	8	24	24	24
Max number of MAs in Sub-domain (per MC)	16	16	350	350	350
Max number of SPGs in Sub-domain (per MC)	8	8	24	24	24
Max number of MAs in a SPG	16	16	64	64	64

## CHAPTER 41

# Mobility Network Elements

- [Mobility Agent, on page 565](#)
- [Mobility Controller, on page 566](#)
- [Mobility Oracle, on page 567](#)
- [Guest Controller, on page 567](#)

## Mobility Agent

A Mobility Controller resides on the switch. It is both, control path and data path entity and is responsible for:

- Handling the mobility events on the switch
- Configuring the datapath elements on the switch for mobility, and
- Communicating with the mobility controller

As MA, the switch performs the datapath functions by terminating the CAPWAP tunnels that encapsulate 802.11 traffic sourced by wireless stations.

This allows the switch to apply features to wired and wireless traffic in a uniform fashion. As far as switch is concerned, 802.11 is just another access medium.

The MA performs the following functions:

- Support the mobility protocol – The MA is responsible for responding in a timely manner, ensuring the switch is capable of achieving its roaming budget.
- Point of presence – If the wireless subnets are not available at the MC, the MA assumes the point of presence if the wireless client VLAN is not available at the new point of attachment and tunnel the client traffic accordingly.
- ARP Server – When the network is configured in a layer 2 mode, the MA is responsible for advertising reachability for the stations connected to it. If tunneling is employed, the ARP request is transmitted on behalf of the station through the tunnel, which the point of presence (anchor switch) would bridge onto its uplink interface.
- Proxy IGMP – The MA on the switch is responsible for subscribing to multicast groups on behalf of a station after a roaming event has occurred. This information is passed as part of the context to the new switch. This ensures the multicast flows follow the user as it roams.
- Routing – When the switch is connected to a layer 3 access network, the MA is responsible for injecting routes for the stations that are associated with it for which tunneling is not provided.

- 802.1X Authenticator – The authenticator function is included in the MA, and handles both wired and wireless stations.
- Secure PMK Sharing – When a station successfully authenticates to the network, the MA forwards the PMK to the MC. The MC is responsible for flooding the PMK to all the MAs under its sub-domain and to the peer MCs in the mobility group.

The MA also performs the following datapath functions:

- Mobility tunnel – If tunneling is used, the MA encapsulates and decapsulates packets from the mobility tunnel to the MC, and to other MA in the peer group, if the access switches are serving as points of presence. The MA supports the tunneling of client data traffic between the point of attachment and the point of attachment. The packet format used for other switches is CAPWAP with an 802.3 payload. The MA also supports reassembly and fragmentation for mobility tunnels.
- Encryption – The mobility control traffic between the mobility nodes is DTLS encrypted. The MA also encrypts the CAPWAP control and data (optional) at the point of attachment.
- CAPWAP – The switch supports the CAPWAP control and data planes. The switch forwarding logic is responsible for terminating the CAPWAP tunnels with 802.11 as well as 802.3 payloads. Since support for large frames (greater than 1500bytes) is not universally available, the switch supports CAPWAP fragmentation and reassembly.

---

**Note** Mobility tunnel path via an L3 interface on the 4500 or the L3 interface on the uplink port is not supported. It is not possible to have an L3 wireless management interface. Even if the tunnel comes up, packet forwarding is not possible as it is not supported. 4510 drops DHCP packets from wireless clients if SSID is anchored to a different Cisco WLC.

---

## Mobility Controller

The main function of mobility controller is to coordinate the client roaming beyond a switch peer group. The other features of the mobility controller are:

- Station Database—The Mobility Controller maintains a database of all the clients that are connected within the local mobility sub-domain.
- Mobility Protocol—The MC supports the mobility protocol which ensures the target roaming point responds in a timely manner and achieves the 150ms roaming budget
- Interface to Mobility Oracle—The Mobility Controller acts as a gateway between the switch and the Mobility Oracle. When the Mobility Controller does not find a match in its local database, it suggests a match for a wireless client entry (in its database) and forwards the request to the Mobility Oracle, which manages the Mobility Domain.

---

**Note** Mobility Oracle function can be enabled on an MC only if it is supported by the platform.

---

- ARP Server—When tunneling is employed for a station, its point of presence on the network is the Mobility Tunnel Endpoint (MTE). The Mobility Controller responds to any ARP requests received for the stations it is responsible for.
- Routing—When the Mobility Controller is connected to a layer three network, the Mobility Controller is responsible for injecting routes for the stations it supports into the network.
- Configures MTE—The Mobility Controller is the control point for the switch for all mobility management related requests. When a change in a station's point of attachment occurs, the Mobility Controller is responsible for configuring the forwarding policy on the MTE.
- NTP Server—The Mobility Controller acts as an NTP server to the switch and supports all the nodes to have their clocks synchronized with it.

---

**Note** The Cisco 5700 series WLC and other controller platforms that have the Mobility Controller function enabled by default should not be added to a switch peer group (SPG).

---

## Mobility Oracle

The Mobility Oracle coordinates the client roams beyond the subdomain on a need basis and consists of the following features:

- Station Database—The Mobility Oracle maintains a database of all stations that are serviced within the mobility domain. This database is populated during the Mobility Oracle's interactions with all the Mobility Controllers, in all of the mobility sub-domains it supports.
- Interface to Mobility Controller—When the Mobility Oracle receives a request from a Mobility Controller, it performs a station lookup, and forwards, whenever needed, the request to the proper Mobility Controller.
- NTP Server—The Mobility Oracle acts as an NTP server to the Mobility Controllers and synchronizes all the **switch** clocks within the mobility domain.

## Guest Controller

The guest access feature provides guest access to wireless clients. The guest tunnels use the same format as the mobility tunnels. Using the guest access feature, there is no need to configure guest VLANs on the access switch. Traffic from the wired and wireless clients terminates on Guest Controller. Since the guest VLAN is not present on the access switch, the traffic is tunneled to the MTE over the existing mobility tunnel, and then via a guest tunnel to the Guest Controller.

The advantage of this approach is that all guest traffic passes through the MTE before it is tunneled to the Guest Controller. The Guest Controller only needs to support tunnels between itself and all the MTEs.

The disadvantage is that the traffic from the guest client is tunneled twice - once to the MTE and then again to the Guest Controller.

Clients cannot roam to Guest Controllers because roaming is not supported on Guest Controllers. This restriction is applicable only for the IOS-XE guest anchor, and not for AireOS.

## CHAPTER 42

# Mobility Control Protocols

---

- [About Mobility Control Protocols, on page 569](#)
- [Initial Association and Roaming, on page 569](#)
- [Initial Association, on page 570](#)
- [Intra Switch Handoff, on page 571](#)
- [Intra Switch Peer Group Handoff, on page 571](#)
- [Inter Switch Peer Group Handoff, on page 572](#)
- [Inter Sub Domain Handoff, on page 573](#)
- [Inter Mobility Group Handoff, on page 575](#)

## About Mobility Control Protocols

The mobility control protocol is used regardless of whether tunneled or routed. The mobility control protocol is used for mobility events between the MO, MC and MA.

The mobility architecture uses both,

- Distributed approach, using the direct communication with the switches in their respective SPG, as well as
- Centralized approach, using the MC and MO.

The goal is to reduce the overhead on the centralized MC, while limiting the interactions between switches to help scale the overall system.

## Initial Association and Roaming

The following scenarios are applicable to the mobility management protocol:

- Initial Association
- Intra Switch Roam
- Intra Switch Peer Group Roam
- Inter Switch Peer Group Roam
- Inter Sub-Domain Roam
- Inter Group Roam

# Initial Association

The illustration below explains the initial association process followed by the switch:

Figure 47: Initial Association

1. When a station initially associates with a mobility agent, the MA performs a lookup to determine whether keying information for key caching is locally available in the MA. If no keying information is available, which is the case when the station first appears in the network, the switch prompts the device to authenticate itself to generate the Pairwise Master Key (PMK). The PMK is generated on the client and the RADIUS server side, and the RADIUS server forwards the PMK to the authenticator, the MA.
2. The MA sends the PMK to the MC.
3. After receiving the PMK from the MA, the MC transmits the PMK to all the MAs in its sub-domain, and to all the other MCs in its mobility group.

4. The mobility group is a single key domain. This ensures that 802.11r compliant stations recognize the key domain, and attempts to utilize the fast transition procedures defined in 802.11r.

---

**Note** The 802.11r protocol defines a key domain, which is a collection of access points that share keying information.

---

5. (Refer to step 2B in the illustration). Since the station is new to the mobility sub-domain, as indicated by the fact that the PMK is not in the MA local key cache, the MA transmits a mobile announce message to the MC.
6. The MC checks if the client exists in its database. As the client cannot be found, the MC in turn forwards it to the MO, if available.
7. (Refer to step 5 in the illustration). As the station is new to the network, the MO returns a negative response (NACK), which is forwarded by the MC to the switch. If the Mobility Oracle is not available then the MC is responsible for not responding to the Mobile Announce.

---

**Note** In new mobility if there are many peers, the IOS controller will not react on a NACK message from the AirOS peer and sends two more probes. NACK is ignored if the client is not present it just drops it, in such a scenario AIREOS sends the NACK. So NACK from mobility controller is not processed.

---

8. The MA on the switch informs the MC about the station's new point of attachment via the Handoff Complete message.
9. The MA then informs the other MAs in its switch peer group (SPG) about the station's new point of attachment via the Handoff Notification message. It is necessary to transmit this notification to the MAs in its SPG to allow local handoff without interacting with the MC. The Handoff Notification message sent to MAs in SPG need not carry all the information in Handoff Complete message sent to the MC.
10. (Refer to step 7B in the illustration). The MC updates its database and forwards the Handoff Complete message to the Mobility Oracle. This ensures that the Mobility Oracle's database is updated to record the station's current home mobility sub-domain.

To eliminate race conditions that could occur with devices moving quickly across switch, regardless of whether they are within a mobility sub-domain or not, the messages between MA and MC/MO are time synchronized. This would allow the MC and MO to properly process requests, if they are received out of order.

The Handoff Notification sent to MAs in the SPG are not acknowledged.

## Intra Switch Handoff

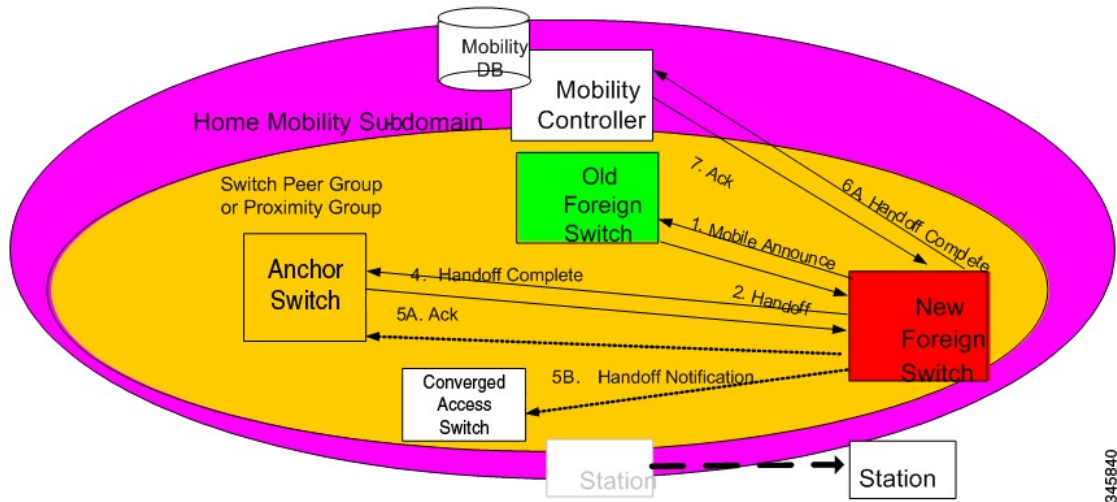

Mobility events within an MA are completely transparent to the SPG and the MC. When a station moves across APs on the same MA and attempts to perform a fast handoff, the PMK is present on the MA. The MA will complete the fast handoff without invoking any additional signal.

## Intra Switch Peer Group Handoff

The switch peer group (SPG) is a group of MAs between which users may roam, and expect fast roaming services. Allowing the MA to handoff directly within a SPG reduces the overhead on the MC as it requires fewer messages to be exchanged.

After the initial association is complete the station moves to another MA belonging to its SPG. In an intra switch peer group roam, the initial association, the stations PMK was forwarded to all MAs in the mobility sub-domain.

**Figure 48: Intra Switch Peer Group Handoff**

The following process explains the intra switch peer group handoff:

1. In the initial association example, the Handoff Notification message is sent to all MAs in its SPG to know the station's current point of attachment.
2. The new MA sends a unicast Mobile Announce message to the previous MA to which the client is associated.
3. After the handoff completion, the new MA transmits a Handoff Complete message to the MC.
4. The new switch sends a Handoff Notification to all MA in its own SPG to inform them about the clients new point of presence.

## Inter Switch Peer Group Handoff

The Intra SPG roams do not cover all possible scenarios and there can be cases where it is possible for mobility events to occur between two MAs that are not in the same SPG.

When a MA does not have any information about a station's current point of attachment, because of the Handoff Notification message getting lost in the network, or because of the the station roaming to an MA that is not in the new SPG, the MA consults the MC. The MC provides information about the clients point of presence within the mobility sub-domain. This eliminates the need to consult all other MCs within the mobility sub-domain.

Figure 49: Inter Switch Peer Group Handoff

345841

The image above illustrates an example of a mobility event that occurs across MAs that are not in the same SPG, but within the same mobility sub-domain.

**Note** The MA color matches the circle representing its SPG.

1. The new MA will have the PMK for the station, which was forwarded to each MA in the mobility sub-domain upon client initial authentication.
2. Since the MA had not been previously notified of the station's presence on a neighboring MA inside a different SPG transmits the mobile announce to the sub-domain's MC.
3. (Refer to step 2 in the illustration) On receiving the mobile announce message, the MC performs a lookup in its database, and forwards the request to the MA that was previously providing service to the station. This information is known to the MC through a previously received Handoff Complete message sent in a reliable fashion from the old MA.
4. (Refer to step 3 in the illustration) The old MA, shown in green above, transmits a Handoff message directly to the new MA.
5. The old MA needs to notify other MAs within its SPG of the fact that the station has left the group using a Station Left message. This ensures that if the station were to come back to one of the MA, they would be aware of the fact that the station is no longer being serviced by the old MA.
6. Once the handoff is complete, the new MA transmits the Handoff Complete message in a reliable fashion to the MC.
7. The new MA then transmits the Handoff Notification to the other MAs within its SPG.

## Inter Sub Domain Handoff

A sub-domain is an ensemble formed by a mobility controller and the mobility agents it directly manages. An inter sub-domain mobility event implies communication between two mobility controllers. These 2 mobility controllers can be configured with the same mobility group value and recognize each other. They will appear in each other's mobility list, or they can be configured with different mobility group values, and still recognize each other.

When the roaming event occurs across sub-domains between MCs in the same mobility group, the 802.11r key domain advertised by the new APs are the same. Additionally, the client PMK is also transmitted to all MCs upon the client's initial authentication. The new MC does not need to force the client to reauthenticate, and the new MC also knows which previous MC was managing the wireless client mobility.

Figure 50: Inter Sub Domain Handoff

345842

The following steps are involved in the inter sub domain handoff, when mobility controllers belong to the same mobility group:

1. When a client's PMK was sent by the initial MA to all the MCs in the mobility group, the new MA already had already received the client PMK from its MC, and re-authentication is not required.
2. The new MA was not notified previously of the station's presence on a neighboring MA inside a different SPG it transmits the mobile announce to the sub-domain's MC.
3. On receiving the mobile announce message, the MC forwards the mobile announce to the MO, which performs a lookup in its database, and forwards the request to the MC that was previously providing service to the station.
4. The previous MC, in turn, forwards the request to the MA that was previously providing service to the station.
5. The old MA, shown in yellow color above, transmits a Handoff message directly to the new MA.
6. The old MA must notify the other MAs within its SPG of the fact that the station has left the SPG using a Station Left message. This ensures that if the station comes back to one of the MA, the MA is aware of the fact that the station is no longer serviced by the old MA.
7. Once the handoff is complete, the new MA transmits the Handoff Complete message in a reliable fashion to the new Mobility Controller.
8. The new MA then transmits the Handoff Notification to all other MAs.
9. The new MC then transmits the Handoff Complete to the old MC.

## Inter Mobility Group Handoff

A mobility group is formed by MCs sharing the same mobility group name, and knowing each other.

Since the roaming event occurs across mobility groups, the 802.11r key domain advertised by the new APs differ. This forces the client to re-authenticate. They are propagated only within a mobility group, and roaming across mobility groups requires the stations to re-authenticate when they cross mobility group boundaries. When the authentication is complete, the PMK that is generated is pushed to the MAs and MCs within the same mobility group. The stations cache the PMK from the previous sub-domain because each PMK is associated to a given sub-domain (802.11y key domain). This ensures that you do not have to re-authenticate when the PMK roams back to the previous sub-domain within the pmk cache timeout interval. The remaining procedure follows the inter-sub-domain handoff steps, except that these steps relate to inter mobility group roaming.

# CHAPTER 43

## Configuring Mobility

- [Configuring Mobility Controller, on page 577](#)
- [Configuring Mobility Agent, on page 585](#)

### Configuring Mobility Controller

### Configuring Converged Access Controllers

#### Creating Peer Groups, Peer Group Member, and Bridge Domain ID (CLI)

##### Before you begin

- On the mobility agent, you can only configure the IP address of the mobility controller.
- On the mobility controller, you can define the peer group and the IP address of each peer group member.

##### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless mobility controller</b> <b>Example:</b> Switch(config)# <b>wireless mobility controller</b>	Enables the mobility controller functionality on the device. This command is applicable only to the switch. The controller is by default a mobility controller.
<b>Step 2</b>	<b>wireless mobility controller peer-group SPG1</b> <b>Example:</b> Switch(config)# <b>wireless mobility controller peer-group SPG1</b>	Creates a peer group named SPG1.

	Command or Action	Purpose
<b>Step 3</b>	<b>wireless mobility controller peer-group</b> <i>SPG1</i> <b>member ip</b> <i>member-ip-addr</i> <b>public-ip</b> <i>public-ip-addr</i>  <b>Example:</b> <pre>Switch(config)# wireless mobility controller peer-group SPG1 member ip 10.10.20.2 public-ip 10.10.20.2</pre>	Adds a mobility agent to the peer group.  <b>Note</b> The 10.10.20.2 is the mobility agent's direct IP address. When NAT is used, use the optional public IP address to enter the mobility agent's NATed address. When NAT is not used, the public IP address is not used and the device displays the mobility agent's direct IP address.
<b>Step 4</b>	<b>wireless mobility controller peer-group</b> <i>SPG1</i> <b>member ip</b> <i>member-ip-addr</i> <b>public-ip</b> <i>public-ip-addr</i>  <b>Example:</b> <pre>Switch(config)# wireless mobility controller peer-group SPG1 member ip 10.10.20.6 public-ip 10.10.20.6</pre>	Adds another member to the peer group SPG1.
<b>Step 5</b>	<b>wireless mobility controller peer-group</b> <i>SPG2</i>  <b>Example:</b> <pre>Switch(config)# wireless mobility controller peer-group SPG2</pre>	Creates another peer group SPG2.
<b>Step 6</b>	<b>wireless mobility controller peer-group</b> <i>SPG2</i> <b>member ip</b> <i>member-ip-addr</i> <b>public-ip</b> <i>public-ip-addr</i>  <b>Example:</b> <pre>Switch(config)# wireless mobility controller peer-group SPG2 member ip 10.10.10.20 public-ip 10.10.10.20</pre>	Adds a member to peer group SPG2.
<b>Step 7</b>	<b>wireless mobility controller peer-group</b> <i>SPG1</i> <b>bridge-domain-id</b> <i>id</i>  <b>Example:</b> <pre>Switch(config)# wireless mobility controller peer-group SPG1 bridge-domain-id 54</pre>	(Optional) Adds a bridge domain to SPG1 used for defining the subnet-VLAN mapping with other SPGs.

### Example

This example shows how to create peer group and add members to it:

```
Switch(config)# wireless mobility controller
Switch(config)# wireless mobility controller peer-group SPG1
Switch(config)# wireless mobility controller peer-group SPG1
Switch(config)# wireless mobility controller peer-group SPG1 member ip 10.10.20.2 public-ip
```

```

10.10.20.2
Switch(config)# wireless mobility controller peer-group SPG1 member ip 10.10.20.6 public-ip
10.10.20.6
Switch(config)# wireless mobility controller peer-group SPG2
Switch(config)# wireless mobility controller peer-group SPG2 member ip 10.10.10.20 public-ip
10.10.10.20
Switch(config)# wireless mobility controller peer-group SPG1 bridge-domain-id 54

```

## Creating Peer Groups, Peer Group Member, and Bridge Domain ID (GUI)

### Before you begin

- Ensure that the device is in mobility controller state.
- On the mobility agent, you can only configure the IP address of the mobility controller.
- On the mobility controller, you can define the peer group and the IP address of each peer group member.

### Procedure

- 
- Step 1** Choose **Controller > Mobility Management > Switch Peer Group**.  
The **Mobility Switch Peer Groups** page is displayed.
- Step 2** Click **New**.
- Step 3** Enter the following details:
- Switch Peer Group Name**
  - Bridge Domain ID**
  - Multicast IP Address**
- Step 4** Click **Apply**.
- Step 5** Click **Save Configuration**.
- 

## Configuring Local Mobility Group (CLI)

Configuration for wireless mobility groups and mobility group members where the mobility group is a group of MCs.

### Before you begin

MCs can belong only to one mobility group, and can know MCs in several mobility groups.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless mobility group name</b> <i>group-name</i>  <b>Example:</b> Switch(config)# wireless mobility group name Mygroup	Creates a mobility group named <b>Mygroup</b> .

	Command or Action	Purpose
<b>Step 2</b>	<b>wireless mobility group member ip</b> <i>member-ip-addr public-ip public-ip-addr</i>  <b>Example:</b> <pre>Switch(config)# wireless mobility group member ip 10.10.34.10 public-ip 10.10.34.28</pre>	Adds a mobility controller to the <b>Mygroup</b> mobility group.  <b>Note</b> When NAT is used, use the optional public IP address to enter the NATed IP address of the mobility controller.
<b>Step 3</b>	<b>wireless mobility group keepalive interval</b> <i>time-in-seconds</i>  <b>Example:</b> <pre>Switch(config)# wireless mobility group keepalive interval 5</pre>	Configures the interval between two keepalives sent to a mobility member.
<b>Step 4</b>	<b>wireless mobility group keepalive count</b> <i>count</i>  <b>Example:</b> <pre>Switch(config)# wireless mobility group keepalive count 3</pre>	Configures the keep alive retries before a member status is termed DOWN.

### Example

```
Switch(config)# wireless mobility group name Mygroup
Switch(config)# wireless mobility group member ip 10.10.34.10 public-ip 10.10.34.28
Switch(config)# wireless mobility group keepalive interval 5
Switch(config)# wireless mobility group keepalive count 3
```

## Configuring Local Mobility Group (GUI)

### Before you begin

Mobility controllers can belong to only one mobility group and can know mobility controllers in several mobility groups.

### Procedure

- 
- Step 1** Choose **Controller > Mobility Management > Mobility Global Config**.  
The **Mobility Controller Configuration** page is displayed.
- Step 2** Enter the following details:
- Mobility Group Name**
  - Mobility Keepalive Interval**
  - Mobility Keepalive Count**
  - Multicast IP Address** if you want to enable multicast mode to send mobile announce messages to the mobility members.

**Note** If you do not enable multicast IP address, the device uses unicast mode to send mobile announce messages.

- Step 3** Click **Apply**.  
**Step 4** Click **Save Configuration**.

## Adding a Peer Mobility Group (CLI)

### Before you begin

MCs belong to only one group, and can know MCs in several groups.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless mobility group member ip</b> <i>member-ip-addr</i> <b>public-ip</b> <i>public-ip-addr</i> <b>group</b> <i>group-name</i>  <b>Example:</b> Switch(config)# <b>wireless mobility group</b> <b>member ip</b> 10.10.10.24 <b>public-ip</b> 10.10.10.25 <b>group</b> Group2	Adds the member as a peer MC in a different group than the <b>Mygroup</b> .

## Adding a Peer Mobility Group (GUI)

### Before you begin

Mobility controllers belong to only one group, and can know several mobility groups.

### Procedure

- Step 1** Choose **Controller > Mobility Management > Mobility Peer**.  
 The **Mobility Peer** page is displayed.
- Step 2** Click **New**.
- Step 3** Enter the following details:
- Mobility Member IP**
  - Mobility Member Public IP**
  - Mobility Member Group Name**
  - Multicast IP Address**
- Step 4** Click **Apply**.
- Step 5** Click **Save Configuration**.

## Configuring Optional Parameters for Roaming Behavior

Use this configuration to disable the sticky anchor. This command can also be used, if required, between all MA's and MC's where roaming is expected for the target SSID.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wlan open21</b> <b>Example:</b> Switch(config)# wlan open20	Configures a WLAN.
<b>Step 2</b>	<b>no mobility anchor sticky</b> <b>Example:</b> Switch(config-wlan)# no mobility anchor sticky	Disables the default sticky mobility anchor.

### Example

```
Switch(config)# wlan open20
Switch(config-wlan)# no mobility anchor sticky
```

## Pointing the Mobility Controller to a Mobility Oracle (CLI)

### Before you begin

You can configure a mobility oracle on a known mobility controller.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless mobility group member ip</b> <i>member-ip-addr group group-name</i> <b>Example:</b> Switch(config)# wireless mobility group member ip 10.10.10.10 group Group3	Creates and adds a MC to a mobility group.
<b>Step 2</b>	<b>wireless mobility oracle ip</b> <i>oracle-ip-addr</i> <b>Example:</b> Switch(config)# wireless mobility oracle ip 10.10.10.10	Configures the mobility controller as mobility oracle.

**Example**

```
Switch(config)# wireless mobility group member ip 10.10.10.10 group Group3
Switch(config)# wireless mobility oracle ip 10.10.10.10
```

**Pointing the Mobility Controller to a Mobility Oracle (GUI)****Before you begin**

You can configure a mobility oracle on a known mobility controller.

**Procedure**

- 
- Step 1** Choose **Controller > Mobility Management > Mobility Global Config**.  
The **Mobility Controller Configuration** page is displayed.
- Step 2** Enter the **Mobility Oracle IP Address**.  
**Note** To make the mobility controller itself a mobility oracle, select the **Mobility Oracle Enabled** check box.
- Step 3** Click **Apply**.
- Step 4** Click **Save Configuration**.
- 

**Configuring Guest Controller**

A guest controller is used when the client traffic is tunneled to a guest anchor controller in the demilitarized zone (DMZ). The guest client goes through a web authentication process. The web authentication process is optional, and the guest is allowed to pass traffic without authentication too.

Enable the WLAN on the mobility agent on which the guest client connects with the mobility anchor address of the guest controller.

On the guest controller WLAN, which can be Cisco 5500 Series WLC, Cisco WiSM2, or Cisco 5700 Series WLC, configure the IP address of the mobility anchor as its own IP address. This allows the traffic to be tunneled to the guest controller from the mobility agent.

**Note** With Cisco 5700 Series WLC as the guest anchor controller and Cisco 5500 Series WLC or Cisco WiSM2 as export foreign controller, the guest user role per user is not supported on the Cisco 5700 Series WLC.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<code>wlan wlan-id</code> <b>Example:</b>	Creates a WLAN for the client.

	Command or Action	Purpose
	Switch(config)# wlan Mywlan1	
<b>Step 2</b>	<b>mobility anchor</b> <i>guest-anchor-ip-addr</i> <b>Example:</b> Switch(config-wlan)# <b>mobility anchor</b> 10.10.10.2	Enables the guest anchors (GA) IP address on the MA. <b>Note</b> To enable guest anchor on the mobility controller, you need not enter the IP address. Enter the <b>mobility anchor</b> command in the WLAN configuration mode to enable GA on the mobility controller.
<b>Step 3</b>	<b>client vlan</b> <i>vlan-name</i> <b>Example:</b> Switch(config-wlan)# <b>client vlan</b> gc_ga_vlan1	Assigns a VLAN to the client's WLAN.
<b>Step 4</b>	<b>security open</b> <b>Example:</b> Switch(config-wlan)# <b>security open</b>	Assigns a security type to the WLAN.

### Example

```
Switch(config)# wlan Mywlan1
Switch(config-wlan)# mobility anchor 10.10.10.2
Switch(config-wlan)# client vlan gc_ga_vlan1
Switch(config-wlan)# security open
```

## Configuring Guest Anchor

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wlan</b> Mywlan1 <b>Example:</b> Switch(config)# wlan Mywlan1	Creates a wlan for the client.
<b>Step 2</b>	<b>mobility anchor</b> <b>&lt;guest-anchors-own-ip-address&gt;</b> <b>Example:</b> Switch(config-wlan)# mobility anchor 10.10.10.2	Enables the guest anchors IP address on the guest anchor (GA). The GA assigns its own address on itself.
<b>Step 3</b>	<b>client vlan</b> <vlan-name> <b>Example:</b>	Assigns a vlan to the clients wlan.

	Command or Action	Purpose
	Switch(config-wlan)# client vlan gc_ga_vlan1	
<b>Step 4</b>	<b>security open</b>  <b>Example:</b> Switch(config-wlan)# security open	Assigns a security type to the wlan.

### Example

```
Switch(config)# wlan Mywlan1
Switch(config-wlan)# mobility anchor 10.10.10.2
Switch(config-wlan)# client vlan gc_ga_vlan1
Switch(config-wlan)# security open
```

## Configuring Mobility Agent

### Configuring Mobility Agent by Pointing to Mobility Controller (CLI)

#### Before you begin

- By default, the switches are configured as mobility agents.
- Your network must have at least one mobility controller and the network connectivity with the mobility controller must be operational.
- You cannot configure mobility from the mobility agent. On the mobility agent, you can configure only the IP address of the mobility controller to download the SPG configuration.
- On the mobility agent, you can either configure the mobility controller address to point to an external mobility agent, or enable the mobility controller function.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless management interface vlan 21</b>  <b>Example:</b> Switch (config)# wireless management interface vlan 21	Enables the wireless functionality on the device and activates the mobility agent function. This ensures the APs have a place to terminate the CAPWAP tunnel.

**Example**

This example shows how to add a mobility agent into the mobility group by pointing it to a mobility controller:

```
Switch(config)# wireless management interface vlan 21
```

## Configuring Mobility Agent by Pointing to Mobility Controller (GUI)

**Before you begin**

- By default, the switches are configured as mobility agents.
- Your network must have at least one mobility controller and the network connectivity with the mobility controller must be operational.
- You cannot configure mobility from the mobility agent. On the mobility agent, you can configure only the IP address of the mobility controller to download the SPG configuration.
- On the mobility agent, you can either configure the mobility controller address to point to an external mobility agent, or enable the mobility controller function.

**Procedure**

- 
- Step 1** Choose **Configuration > Controller > Mobility Management > Mobility Global Config**.  
The **Mobility Controller Configuration** page is displayed.
- Step 2** From the **Mobility Role** drop-down list, choose **Mobility Agent**.
- Step 3** In the **Mobility Controller IP Address**, enter the IP address of the mobility controller.
- Step 4** Click **Apply**.
- Step 5** Click **Save Configuration**.
- Step 6** Reboot the device.
- 

## Configuring the Mobility Controller for the Mobility Agent (CLI)

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless mobility controller</b>  <b>Example:</b> <pre>Switch (config)# wireless mobility controller</pre> Mobility role changed to Mobility Controller. Please save config and reboot the whole	Enables the mobility function on the switch.  <b>Note</b> After you enter this command, save the configuration and reboot the switch for the mobility controller function to take effect.

	Command or Action	Purpose
	stack.	
<b>Step 2</b>	<b>wireless mobility controller ip <i>ip-addr</i></b> <b>Example:</b> <pre>Switch (config)# wireless mobility controller ip 10.10.21.3</pre>	Specifies the mobility controller to which the mobility agent relates.  <b>Note</b> If a mobility agent is configured and the mobility controller exists on a different device, configure the SPG on the mobility controller to ensure the mobility agent functions properly.

**What to do next**

After you add a mobility controller role to the mobility agent, you can configure optional parameters on the mobility agent.

## Adding a Mobility Controller Role to the Mobility Agent

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless mobility controller ip 10.10.21.3</b> <b>Example:</b> <pre>Switch(config)# wireless mobility controller ip 10.10.21.3</pre>	Converts the mobility agent to a mobility controller.

**Example**

This example shows how to add the mobility controller role to a mobility agent:

```
Switch(config)# wireless mobility controller ip 10.10.21.3
Mobility role changed to Mobility Controller.
Please save config and reboot the whole stack.
```

## Configuring Optional Parameters on a Mobility Agent (CLI)

This section shows how to configure load-balancing on a switch.

- By default, the load-balancing is enabled and it cannot be disabled.
- The switch supports a maximum of 2000 clients and the default threshold value is fifty percent of client max load.
- When the switch reaches its threshold, it redistributes the new clients load to other mobility agents in the same SPG, if their client load is lower.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>wireless mobility load-balance threshold</b> <i>threshold-value</i>  <b>Example:</b> <pre>Switch(config)# wireless mobility load-balance threshold 150</pre>	Configures the threshold that triggers load-balancing.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring the Configuration Engine

- Obtain the name of the configuration engine instance to which you are connecting.
- Because the CNS uses both the event bus and the configuration server to provide configurations to devices, you must define both ConfigID and Device ID for each configured switch.
- All switches configured with the **cns config partial** global configuration command must access the event bus. The DeviceID, as originated on the switch, must match the DeviceID of the corresponding switch definition in the Cisco Configuration Engine. You must know the hostname of the event bus to which you are connecting.

### Related Topics

- [Cisco Networking Services IDs and Device Hostnames, on page 594](#)
- [DeviceID, on page 594](#)

## Restrictions for Configuring the Configuration Engine

- Within the scope of a single instance of the configuration server, no two configured switches can share the same value for ConfigID.
- Within the scope of a single instance of the event bus, no two configured switches can share the same value for DeviceID.

[Cisco Networking Services IDs and Device Hostnames](#), on page 594

## Information About Configuring the Configuration Engine

### Cisco Configuration Engine Software

The Cisco Configuration Engine is network management utility software that acts as a configuration service for automating the deployment and management of network devices and services. Each Cisco Configuration Engine manages a group of Cisco devices (switches and routers) and the services that they deliver, storing their configurations and delivering them as needed. The Cisco Configuration Engine automates initial configurations and configuration updates by generating device-specific configuration changes, sending them to the device, executing the configuration change, and logging the results.

The Cisco Configuration Engine supports standalone and server modes and has these Cisco Networking Services (CNS) components:

- Configuration service:
  - Web server
  - File manager
  - Namespace mapping server
- Event service (event gateway)
- Data service directory (data models and schema)

In standalone mode, the Cisco Configuration Engine supports an embedded directory service. In this mode, no external directory or other data store is required. In server mode, the Cisco Configuration Engine supports the use of a user-defined external directory.

Figure 51: Cisco Configuration Engine Architectural Overview

## Configuration Service

The Configuration Service is the core component of the Cisco Configuration Engine. It consists of a Configuration Server that works with Cisco IOS CNS agents on the switch. The Configuration Service delivers device and service configurations to the switch for initial configuration and mass reconfiguration by logical groups. Switches receive their initial configuration from the Configuration Service when they start up on the network for the first time.

The Configuration Service uses the CNS Event Service to send and receive configuration change events and to send success and failure notifications.

The Configuration Server is a web server that uses configuration templates and the device-specific configuration information stored in the embedded (standalone mode) or remote (server mode) directory.

Configuration templates are text files containing static configuration information in the form of CLI commands. In the templates, variables are specified by using Lightweight Directory Access Protocol (LDAP) URLs that reference the device-specific configuration information stored in a directory.

The Cisco IOS agent can perform a syntax check on received configuration files and publish events to show the success or failure of the syntax check. The configuration agent can either apply configurations immediately or delay the application until receipt of a synchronization event from the configuration server.

## Event Service

The Cisco Configuration Engine uses the Event Service for receipt and generation of configuration events. The Event Service consists of an event agent and an event gateway. The event agent is on the switch and facilitates the communication between the switch and the event gateway on the Cisco Configuration Engine.

The Event Service is a highly capable publish-and-subscribe communication method. The Event Service uses subject-based addressing to send messages to their destinations. Subject-based addressing conventions define a simple, uniform namespace for messages and their destinations.

**Related Topics**

[Enabling the CNS Event Agent](#), on page 598

## NameSpace Mapper

The Cisco Configuration Engine includes the NameSpace Mapper (NSM) that provides a lookup service for managing logical groups of devices based on application, device or group ID, and event.

Cisco IOS devices recognize only event subject-names that match those configured in Cisco IOS software; for example, `cisco.cns.config.load`. You can use the namespace mapping service to designate events by using any desired naming convention. When you have populated your data store with your subject names, NSM changes your event subject-name strings to those known by Cisco IOS.

For a subscriber, when given a unique device ID and event, the namespace mapping service returns a set of events to which to subscribe. Similarly, for a publisher, when given a unique group ID, device ID, and event, the mapping service returns a set of events on which to publish.

## Cisco Networking Services IDs and Device Hostnames

The Cisco Configuration Engine assumes that a unique identifier is associated with each configured switch. This unique identifier can take on multiple synonyms, where each synonym is unique within a particular namespace. The event service uses namespace content for subject-based addressing of messages.

The Cisco Configuration Engine intersects two namespaces, one for the event bus and the other for the configuration server. Within the scope of the configuration server namespace, the term *ConfigID* is the unique identifier for a device. Within the scope of the event bus namespace, the term *DeviceID* is the CNS unique identifier for a device.

**Related Topics**

[Prerequisites for Configuring the Configuration Engine](#), on page 591

[Restrictions for Configuring the Configuration Engine](#), on page 592

## ConfigID

Each configured switch has a unique ConfigID, which serves as the key into the Cisco Configuration Engine directory for the corresponding set of switch CLI attributes. The ConfigID defined on the switch must match the ConfigID for the corresponding switch definition on the Cisco Configuration Engine.

The ConfigID is fixed at startup time and cannot be changed until the device restarts, even if the switch hostname is reconfigured.

## DeviceID

Each configured switch participating on the event bus has a unique DeviceID, which is analogous to the switch source address so that the switch can be targeted as a specific destination on the bus.

The origin of the DeviceID is defined by the Cisco IOS hostname of the switch. However, the DeviceID variable and its usage reside within the event gateway adjacent to the switch.

The logical Cisco IOS termination point on the event bus is embedded in the event gateway, which in turn functions as a proxy on behalf of the switch. The event gateway represents the switch and its corresponding DeviceID to the event bus.

The switch declares its hostname to the event gateway immediately after the successful connection to the event gateway. The event gateway couples the DeviceID value to the Cisco IOS hostname each time this connection is established. The event gateway retains this DeviceID value for the duration of its connection to the switch.

#### Related Topics

[Prerequisites for Configuring the Configuration Engine](#), on page 591

## Hostname and DeviceID

The DeviceID is fixed at the time of the connection to the event gateway and does not change even when the switch hostname is reconfigured.

When changing the switch hostname on the switch, the only way to refresh the DeviceID is to break the connection between the switch and the event gateway. For instructions on refreshing DeviceIDs, see "Related Topics."

When the connection is reestablished, the switch sends its modified hostname to the event gateway. The event gateway redefines the DeviceID to the new value.

#### Caution

When using the Cisco Configuration Engine user interface, you must first set the DeviceID field to the hostname value that the switch acquires *after*, not *before*, and you must reinitialize the configuration for your Cisco IOS CNS agent. Otherwise, subsequent partial configuration command operations may malfunction.

#### Related Topics

[Refreshing DeviceIDs](#), on page 606

## Hostname, DeviceID, and ConfigID

In standalone mode, when a hostname value is set for a switch, the configuration server uses the hostname as the DeviceID when an event is sent on hostname. If the hostname has not been set, the event is sent on the `cn=<value>` of the device.

In server mode, the hostname is not used. In this mode, the unique DeviceID attribute is always used for sending an event on the bus. If this attribute is not set, you cannot update the switch.

These and other associated attributes (tag value pairs) are set when you run **Setup** on the Cisco Configuration Engine.

## Cisco IOS CNS Agents

The CNS event agent feature allows the switch to publish and subscribe to events on the event bus and works with the Cisco IOS CNS agent. These agents, embedded in the switch Cisco IOS software, allow the switch to be connected and automatically configured.

#### Related Topics

[Enabling the Cisco IOS CNS Agent](#), on page 599

## Initial Configuration

When the switch first comes up, it attempts to get an IP address by broadcasting a Dynamic Host Configuration Protocol (DHCP) request on the network. Assuming there is no DHCP server on the subnet, the distribution

switch acts as a DHCP relay agent and forwards the request to the DHCP server. Upon receiving the request, the DHCP server assigns an IP address to the new switch and includes the Trivial File Transfer Protocol (TFTP) server Internet Protocol (IP) address, the path to the bootstrap configuration file, and the default gateway IP address in a unicast reply to the DHCP relay agent. The DHCP relay agent forwards the reply to the switch.

The switch automatically configures the assigned IP address on interface VLAN 1 (the default) and downloads the bootstrap configuration file from the TFTP server. Upon successful download of the bootstrap configuration file, the switch loads the file in its running configuration.

The Cisco IOS CNS agents initiate communication with the Configuration Engine by using the appropriate ConfigID and EventID. The Configuration Engine maps the Config ID to a template and downloads the full configuration file to the switch.

The following figure shows a sample network configuration for retrieving the initial bootstrap configuration file by using DHCP-based autoconfiguration.

**Figure 52: Initial Configuration**

#### Related Topics

[Enabling an Initial Configuration for Cisco IOS CNS Agent](#), on page 601

[Monitoring CNS Configurations](#), on page 609

## Incremental (Partial) Configuration

After the network is running, new services can be added by using the Cisco IOS CNS agent. Incremental (partial) configurations can be sent to the switch. The actual configuration can be sent as an event payload by way of the event gateway (push operation) or as a signal event that triggers the switch to initiate a pull operation.

The switch can check the syntax of the configuration before applying it. If the syntax is correct, the switch applies the incremental configuration and publishes an event that signals success to the configuration server. If the switch does not apply the incremental configuration, it publishes an event showing an error status. When the switch has applied the incremental configuration, it can write it to nonvolatile random-access memory (NVRAM) or wait until signaled to do so.

#### Related Topics

[Enabling a Partial Configuration for Cisco IOS CNS Agent](#), on page 607

[Monitoring CNS Configurations](#), on page 609

## Synchronized Configuration

When the switch receives a configuration, it can defer application of the configuration upon receipt of a write-signal event. The write-signal event tells the switch not to save the updated configuration into its NVRAM. The switch uses the updated configuration as its running configuration. This ensures that the switch configuration is synchronized with other network activities before saving the configuration in NVRAM for use at the next reboot.

## Automated CNS Configuration

To enable automated CNS configuration of the switch, you must first complete the prerequisites listed in this topic. When you complete them, power on the switch. At the **setup** prompt, do nothing; the switch begins the initial configuration. When the full configuration file is loaded on your switch, you do not need to do anything else.

For more information on what happens during initial configuration, see "Related Topics."

**Table 45: Prerequisites for Enabling Automatic Configuration**

Device	Required Configuration
Access switch	Factory default (no configuration file)
Distribution switch	<ul style="list-style-type: none"> <li>• IP helper address</li> <li>• Enable DHCP relay agent<sup>3</sup></li> <li>• IP routing (if used as default gateway)</li> </ul>
DHCP server	<ul style="list-style-type: none"> <li>• IP address assignment</li> <li>• TFTP server IP address</li> <li>• Path to bootstrap configuration file on the TFTP server</li> <li>• Default gateway IP address</li> </ul>
TFTP server	<ul style="list-style-type: none"> <li>• A bootstrap configuration file that includes the CNS configuration commands that enable the switch to communicate with the Configuration Engine</li> <li>• The switch configured to use either the switch MAC address or the serial number (instead of the default hostname) to generate the ConfigID and EventID</li> <li>• The CNS event agent configured to push the configuration file to the switch</li> </ul>
CNS Configuration Engine	One or more templates for each type of device, with the ConfigID of the device mapped to the template.

<sup>3</sup> A DHCP Relay is needed only when the DHCP Server is on a different subnet from the client.

# How to Configure the Configuration Engine

## Enabling the CNS Event Agent

**Note** You must enable the CNS event agent on the switch before you enable the CNS configuration agent.

Follow these steps to enable the CNS event agent on the switch.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>cns event</b> <i>{hostname   ip-address}</i> <i>[port-number]</i> [ <b>keepalive</b> <i>seconds</i> <i>retry-count</i> ] [ <b>failover-time</b> <i>seconds</i> ] <i>[reconnect-time time]</i>   <b>backup</b> <b>Example:</b> Switch(config)# <b>cns event</b> 10.180.1.27 <b>keepalive</b> 120 10	Enables the event agent, and enters the gateway parameters. <ul style="list-style-type: none"> <li>• For <i>{hostname   ip-address}</i>, enter either the hostname or the IP address of the event gateway.</li> <li>• (Optional) For <i>port number</i>, enter the port number for the event gateway. The default port number is 11011.</li> <li>• (Optional) For <b>keepalive</b> <i>seconds</i>, enter how often the switch sends keepalive messages. For <i>retry-count</i>, enter the number of unanswered keepalive messages that the switch sends before the connection is terminated. The default for each is 0.</li> <li>• (Optional) For <b>failover-time</b> <i>seconds</i>, enter how long the switch waits for the primary gateway route after the route to the backup gateway is established.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• (Optional) For <b>reconnect-time</b> <i>time</i>, enter the maximum time interval that the switch waits before trying to reconnect to the event gateway.</li> <li>• (Optional) Enter <b>backup</b> to show that this is the backup gateway. (If omitted, this is the primary gateway.)</li> </ul> <p><b>Note</b> Though visible in the command-line help string, the <b>encrypt</b> and the <b>clock-timeout</b> <i>time</i> keywords are not supported.</p>
<b>Step 4</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

**What to do next**

To verify information about the event agent, use the **show cns event connections** command in privileged EXEC mode.

To disable the CNS event agent, use the **no cns event** { *ip-address* | *hostname* } global configuration command.

**Related Topics**

[Event Service](#), on page 593

## Enabling the Cisco IOS CNS Agent

Follow these steps to enable the Cisco IOS CNS agent on the switch.

**Before you begin**

You must enable the CNS event agent on the switch before you enable this agent.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>cns config initial</b> <i>{hostname   ip-address}</i> <i>[port-number]</i> <b>Example:</b> <pre>Switch(config)# cns config initial 10.180.1.27 10</pre>	<p>Enables the Cisco IOS CNS agent, and enters the configuration server parameters.</p> <ul style="list-style-type: none"> <li>• For <i>{hostname   ip-address}</i>, enter either the hostname or the IP address of the configuration server.</li> <li>• (Optional) For <i>port number</i>, enter the port number for the configuration server.</li> </ul> <p>This command enables the Cisco IOS CNS agent and initiates an initial configuration on the switch.</p>
<b>Step 4</b>	<b>cns config partial</b> <i>{hostname   ip-address}</i> <i>[port-number]</i> <b>Example:</b> <pre>Switch(config)# cns config partial 10.180.1.27 10</pre>	<p>Enables the Cisco IOS CNS agent, and enters the configuration server parameters.</p> <ul style="list-style-type: none"> <li>• For <i>{hostname   ip-address}</i>, enter either the hostname or the IP address of the configuration server.</li> <li>• (Optional) For <i>port number</i>, enter the port number for the configuration server.</li> </ul> <p>Enables the Cisco IOS CNS agent and initiates a partial configuration on the switch.</p>
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b> <pre>Switch# show running-config</pre>	Verifies your entries.

	Command or Action	Purpose
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.
<b>Step 8</b>	Start the Cisco IOS CNS agent on the switch.	

**What to do next**

You can now use the Cisco Configuration Engine to remotely send incremental configurations to the switch.

**Related Topics**

[Cisco IOS CNS Agents](#), on page 595

## Enabling an Initial Configuration for Cisco IOS CNS Agent

Follow these steps to enable the CNS configuration agent and initiate an initial configuration on the switch.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>cns template connect <i>name</i></b> <b>Example:</b> <pre>Switch(config)# cns template connect template-dhcp</pre>	Enters CNS template connect configuration mode, and specifies the name of the CNS connect template.
<b>Step 4</b>	<b>cli <i>config-text</i></b> <b>Example:</b> <pre>Switch(config-tmpl-conn)# cli ip address dhcp</pre>	Enters a command line for the CNS connect template. Repeat this step for each command line in the template.

	Command or Action	Purpose
<b>Step 5</b>	Repeat Steps 3 to 4 to configure another CNS connect template.	
<b>Step 6</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config)# exit</pre>	Returns to global configuration mode.
<b>Step 7</b>	<b>cns connect name [retries number] [retry-interval seconds] [sleep seconds] [timeout seconds]</b> <b>Example:</b> <pre>Switch(config)# cns connect dhcp</pre>	<p>Enters CNS connect configuration mode, specifies the name of the CNS connect profile, and defines the profile parameters. The switch uses the CNS connect profile to connect to the Configuration Engine.</p> <ul style="list-style-type: none"> <li>• Enter the <i>name</i> of the CNS connect profile.</li> <li>• (Optional) For <b>retries number</b>, enter the number of connection retries. The range is 1 to 30. The default is 3.</li> <li>• (Optional) For <b>retry-interval seconds</b>, enter the interval between successive connection attempts to the Configuration Engine. The range is 1 to 40 seconds. The default is 10 seconds.</li> <li>• (Optional) For <b>sleep seconds</b>, enter the amount of time before which the first connection attempt occurs. The range is 0 to 250 seconds. The default is 0.</li> <li>• (Optional) For <b>timeout seconds</b>, enter the amount of time after which the connection attempts end. The range is 10 to 2000 seconds. The default is 120.</li> </ul>
<b>Step 8</b>	<b>discover {controller controller-type   dlci [subinterface subinterface-number]   interface [interface-type]   line line-type}</b> <b>Example:</b> <pre>Switch(config-cns-conn)# discover interface gigabitethernet</pre>	<p>Specifies the interface parameters in the CNS connect profile.</p> <ul style="list-style-type: none"> <li>• For <b>controller controller-type</b>, enter the controller type.</li> <li>• For <b>dlci</b>, enter the active data-link connection identifiers (DLCIs).</li> </ul> <p>(Optional) For <b>subinterface subinterface-number</b>, specify the point-to-point subinterface number that is used to search for active DLCIs.</p> <ul style="list-style-type: none"> <li>• For <b>interface [interface-type]</b>, enter the type of interface.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>For <b>line</b> <i>line-type</i>, enter the line type.</li> </ul>
<b>Step 9</b>	<b>template</b> <i>name</i> [... <i>name</i> ] <b>Example:</b> <pre>Switch(config-cns-conn) # <b>template</b> <b>template-dhcp</b></pre>	Specifies the list of CNS connect templates in the CNS connect profile to be applied to the switch configuration. You can specify more than one template.
<b>Step 10</b>	Repeat Steps 8 to 9 to specify more interface parameters and CNS connect templates in the CNS connect profile.	
<b>Step 11</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-cns-conn) # <b>exit</b></pre>	Returns to global configuration mode.
<b>Step 12</b>	<b>hostname</b> <i>name</i> <b>Example:</b> <pre>Switch(config) # <b>hostname</b> device1</pre>	Enters the hostname for the switch.
<b>Step 13</b>	<b>ip route</b> <i>network-number</i> <b>Example:</b> <pre>RemoteSwitch(config) # <b>ip route</b> 172.28.129.22 255.255.255.255 11.11.11.1</pre>	(Optional) Establishes a static route to the Configuration Engine whose IP address is <i>network-number</i> .
<b>Step 14</b>	<b>cns id</b> <i>interface num</i> { <b>dns-reverse</b>   <b>ipaddress</b>   <b>mac-address</b> } [ <b>event</b> ] [ <b>image</b> ] <b>Example:</b> <pre>RemoteSwitch(config) # <b>cns id</b> GigabitEthernet1/0/1 <b>ipaddress</b></pre>	(Optional) Sets the unique EventID or ConfigID used by the Configuration Engine. If you enter this command, do not enter the <b>cns id</b> { <b>hardware-serial</b>   <b>hostname</b>   <b>string string</b>   <b>udi</b> } [ <b>event</b> ] [ <b>image</b> ] command. <ul style="list-style-type: none"> <li>For <i>interface num</i>, enter the type of interface. For example, ethernet, group-async, loopback, or virtual-template. This setting specifies from which interface the IP or MAC address should be retrieved to define the unique ID.</li> <li>For {<b>dns-reverse</b>   <b>ipaddress</b>   <b>mac-address</b>}, enter <b>dns-reverse</b> to retrieve the hostname and assign it as the unique ID, enter <b>ipaddress</b> to use the IP address, or enter <b>mac-address</b> to use the MAC address as the unique ID.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• (Optional) Enter <b>event</b> to set the ID to be the event-id value used to identify the switch.</li> <li>• (Optional) Enter <b>image</b> to set the ID to be the image-id value used to identify the switch.</li> </ul> <p><b>Note</b> If both the <b>event</b> and <b>image</b> keywords are omitted, the image-id value is used to identify the switch.</p>
<b>Step 15</b>	<p><b>cns id</b> { <b>hardware-serial</b>   <b>hostname</b>   <b>string string</b>   <b>udi</b> } [ <b>event</b> ] [ <b>image</b> ]</p> <p><b>Example:</b></p> <pre>RemoteSwitch(config)# <b>cns id hostname</b></pre>	<p>(Optional) Sets the unique EventID or ConfigID used by the Configuration Engine. If you enter this command, do not enter the <b>cns id interface num</b> { <b>dns-reverse</b>   <b>ipaddress</b>   <b>mac-address</b> } [ <b>event</b> ] [ <b>image</b> ] command.</p> <ul style="list-style-type: none"> <li>• For { <b>hardware-serial</b>   <b>hostname</b>   <b>string string</b>   <b>udi</b> }, enter <b>hardware-serial</b> to set the switch serial number as the unique ID, enter <b>hostname</b> (the default) to select the switch hostname as the unique ID, enter an arbitrary text string for <b>string string</b> as the unique ID, or enter <b>udi</b> to set the unique device identifier (UDI) as the unique ID.</li> </ul>
<b>Step 16</b>	<p><b>cns config initial</b> { <i>hostname</i>   <i>ip-address</i> } [ <i>port-number</i> ] [ <b>event</b> ] [ <b>no-persist</b> ] [ <b>page page</b> ] [ <i>source ip-address</i> ] [ <b>syntax-check</b> ]</p> <p><b>Example:</b></p> <pre>RemoteSwitch(config)# <b>cns config initial</b> <b>10.1.1.1 no-persist</b></pre>	<p>Enables the Cisco IOS agent, and initiates an initial configuration.</p> <ul style="list-style-type: none"> <li>• For { <i>hostname</i>   <i>ip-address</i> }, enter the hostname or the IP address of the configuration server.</li> <li>• (Optional) For <i>port-number</i>, enter the port number of the configuration server. The default port number is 80.</li> <li>• (Optional) Enable <b>event</b> for configuration success, failure, or warning messages when the configuration is finished.</li> <li>• (Optional) Enable <b>no-persist</b> to suppress the automatic writing to NVRAM of the configuration pulled as a result of entering the <b>cns config initial</b> global configuration command. If the <b>no-persist</b> keyword is not entered, using the <b>cns config initial</b> command causes the resultant</li> </ul>

	Command or Action	Purpose
		<p>configuration to be automatically written to NVRAM.</p> <ul style="list-style-type: none"> <li>• (Optional) For <b>page page</b>, enter the web page of the initial configuration. The default is /Config/config/asp.</li> <li>• (Optional) Enter <b>source ip-address</b> to use for source IP address.</li> <li>• (Optional) Enable <b>syntax-check</b> to check the syntax when this parameter is entered.</li> </ul> <p><b>Note</b> Though visible in the command-line help string, the <b>encrypt</b>, <b>status url</b>, and <b>inventory</b> keywords are not supported.</p>
<b>Step 17</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 18</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 19</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

### What to do next

To verify information about the configuration agent, use the **show cns config connections** command in privileged EXEC mode.

To disable the CNS Cisco IOS agent, use the **no cns config initial** { *ip-address* | *hostname* } global configuration command.

## Refreshing DeviceIDs

Follow these steps to refresh a DeviceID when changing the hostname on the switch.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>show cns config connections</b> <b>Example:</b> Switch# <b>show cns config connections</b>	Displays whether the CNS event agent is connecting to the gateway, connected, or active, and the gateway used by the event agent, its IP address and port number.
<b>Step 3</b>	Make sure that the CNS event agent is properly connected to the event gateway.	Examine the output of <b>show cns config connections</b> for the following: <ul style="list-style-type: none"> <li>• Connection is active.</li> <li>• Connection is using the currently configured switch hostname. The DeviceID will be refreshed to correspond to the new hostname configuration using these instructions.</li> </ul>
<b>Step 4</b>	<b>show cns event connections</b> <b>Example:</b> Switch# <b>show cns event connections</b>	Displays the event connection information for your switch.
<b>Step 5</b>	Record from the output of Step 4 the information for the currently connected connection listed below. You will be using the IP address and port number in subsequent steps of these instructions.	
<b>Step 6</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 7</b>	<b>no cns event ip-address port-number</b> <b>Example:</b> Switch(config)# <b>no cns event</b> <b>172.28.129.22 2012</b>	Specifies the IP address and port number that you recorded in Step 5 in this command.  This command breaks the connection between the switch and the event gateway. It is

	Command or Action	Purpose
		necessary to first break, then reestablish, this connection to refresh the DeviceID.
<b>Step 8</b>	<b>cns event ip-address port-number</b> <b>Example:</b> Switch(config)# <b>cns event 172.28.129.22</b> <b>2012</b>	Specifies the IP address and port number that you recorded in Step 5 in this command. This command reestablishes the connection between the switch and the event gateway.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 10</b>	Make sure that you have reestablished the connection between the switch and the event connection by examining the output from <b>show cns event connections</b> .	
<b>Step 11</b>	<b>show running-config</b> <b>Example:</b> Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 12</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config</b> <b>startup-config</b>	(Optional) Saves your entries in the configuration file.

## Enabling a Partial Configuration for Cisco IOS CNS Agent

Follow these steps to enable the Cisco IOS CNS agent and to initiate a partial configuration on the switch.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>cns config partial</b> { <i>ip-address</i>   <i>hostname</i> } [ <i>port-number</i> ] [ <i>source ip-address</i> ] <b>Example:</b> <pre>Switch(config)# cns config partial 172.28.129.22 2013</pre>	Enables the configuration agent, and initiates a partial configuration. <ul style="list-style-type: none"> <li>• For {<i>ip-address</i>   <i>hostname</i>}, enter the IP address or the hostname of the configuration server.</li> <li>• (Optional) For <i>port-number</i>, enter the port number of the configuration server. The default port number is 80.</li> <li>• (Optional) Enter <b>source ip-address</b> to use for the source IP address.</li> </ul> <p><b>Note</b> Though visible in the command-line help string, the <b>encrypt</b> keyword is not supported.</p>
<b>Step 4</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

### What to do next

To verify information about the configuration agent, use either the **show cns config stats** or the **show cns config outstanding** command in privileged EXEC mode.

To disable the Cisco IOS agent, use the **no cns config partial** { *ip-address* | *hostname* } global configuration command. To cancel a partial configuration, use the **cns config cancel** global configuration command.

## Monitoring CNS Configurations

*Table 46: CNS show Commands*

Command	Purpose
<b>show cns config connections</b>  Switch# <code>show cns config connections</code>	Displays the status of the CNS Cisco IOS CNS agent connections.
<b>show cns config outstanding</b>  Switch# <code>show cns config outstanding</code>	Displays information about incremental (partial) CNS configurations that have started but are not yet completed.
<b>show cns config stats</b>  Switch# <code>show cns config stats</code>	Displays statistics about the Cisco IOS CNS agent.
<b>show cns event connections</b>  Switch# <code>show cns event connections</code>	Displays the status of the CNS event agent connections.
<b>show cns event gateway</b>  Switch# <code>show cns event gateway</code>	Displays the event gateway information for your switch.
<b>show cns event stats</b>  Switch# <code>show cns event stats</code>	Displays statistics about the CNS event agent.
<b>show cns event subject</b>  Switch# <code>show cns event subject</code>	Displays a list of event agent subjects that are subscribed to by applications.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About CDP

### CDP Overview

CDP is a device discovery protocol that runs over Layer 2 (the data-link layer) on all Cisco-manufactured devices (routers, bridges, access servers, controllers, and switches) and allows network management applications to discover Cisco devices that are neighbors of already known devices. With CDP, network management applications can learn the device type and the Simple Network Management Protocol (SNMP) agent address of neighboring devices running lower-layer, transparent protocols. This feature enables applications to send SNMP queries to neighboring devices.

CDP runs on all media that support Subnetwork Access Protocol (SNAP). Because CDP runs over the data-link layer only, two systems that support different network-layer protocols can learn about each other.

Each CDP-configured device sends periodic messages to a multicast address, advertising at least one address at which it can receive SNMP messages. The advertisements also contain time-to-live, or holdtime information,

which is the length of time a receiving device holds CDP information before discarding it. Each device also listens to the messages sent by other devices to learn about neighboring devices.

On the switch, CDP enables Network Assistant to display a graphical view of the network. The switch uses CDP to find cluster candidates and maintain information about cluster members and other devices up to three cluster-enabled devices away from the command switch by default.

#### Related Topics

[Configuring CDP Characteristics](#), on page 614

[Monitoring and Maintaining CDP](#), on page 621

## CDP and Stacks

A switch stack appears as a single switch in the network. Therefore, CDP discovers the switch stack, not the individual stack members. The switch stack sends CDP messages to neighboring network devices when there are changes to the switch stack membership, such as stack members being added or removed.

## Default CDP Configuration

This table shows the default CDP configuration.

Feature	Default Setting
CDP global state	Enabled
CDP interface state	Enabled
CDP timer (packet update frequency)	60 seconds
CDP holdtime (before discarding)	180 seconds
CDP Version-2 advertisements	Enabled

#### Related Topics

## How to Configure CDP

### Configuring CDP Characteristics

You can configure these CDP characteristics:

- Frequency of CDP updates
- Amount of time to hold the information before discarding it
- Whether or not to send Version-2 advertisements

**Note** Steps 3 through 5 are all optional and can be performed in any order.

Follow these steps to configure the CDP characteristics.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>cdp timer <i>seconds</i></b> <b>Example:</b> Switch(config)# <b>cdp timer 20</b>	(Optional) Sets the transmission frequency of CDP updates in seconds. The range is 5 to 254; the default is 60 seconds.
<b>Step 4</b>	<b>cdp holdtime <i>seconds</i></b> <b>Example:</b> Switch(config)# <b>cdp holdtime 60</b>	(Optional) Specifies the amount of time a receiving device should hold the information sent by your device before discarding it. The range is 10 to 255 seconds; the default is 180 seconds.
<b>Step 5</b>	<b>cdp advertise-v2</b> <b>Example:</b> Switch(config)# <b>cdp advertise-v2</b>	(Optional) Configures CDP to send Version-2 advertisements. This is the default state.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show running-config</b> <b>Example:</b> Switch# <b>show running-config</b>	Verifies your entries.

	Command or Action	Purpose
<b>Step 8</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

**What to do next**

Use the **no** form of the CDP commands to return to the default settings.

**Related Topics**

## Disabling CDP

CDP is enabled by default.

**Note** Switch clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange CDP messages. Disabling CDP can interrupt cluster discovery and device connectivity.

Follow these steps to disable the CDP device discovery capability.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>no cdp run</b> <b>Example:</b> <pre>Switch(config)# no cdp run</pre>	Disables CDP.
<b>Step 4</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Switch(config)# <b>end</b>	
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b> Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

**What to do next**

You must reenable CDP to use it.

**Related Topics**

[Enabling CDP](#), on page 617

[Default CDP Configuration](#), on page 614

## Enabling CDP

CDP is enabled by default.

**Note** Switch clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange CDP messages. Disabling CDP can interrupt cluster discovery and device connectivity.

Follow these steps to enable CDP when it has been disabled.

**Before you begin**

CDP must be disabled, or it cannot be enabled.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>cdp run</b> <b>Example:</b>  Switch(config)# <code>cdp run</code>	Enables CDP if it has been disabled.
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Switch(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b>  Switch# <code>show running-config</code>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

**What to do next**

Use the **show run all** command to show that CDP has been enabled. If you enter only **show run**, the enabling of CDP may not be displayed.

**Related Topics**

[Disabling CDP](#), on page 616

## Disabling CDP on an Interface

CDP is enabled by default on all supported interfaces to send and to receive CDP information.

**Note** Switch clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange CDP messages. Disabling CDP can interrupt cluster discovery and device connectivity.

Follow these steps to disable CDP on a port.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <b>interface</b> <b>gigabitethernet1/0/1</b>	Specifies the interface on which you are disabling CDP, and enters interface configuration mode.
<b>Step 4</b>	<b>no cdp enable</b> <b>Example:</b> Switch(config-if)# <b>no cdp enable</b>	Disables CDP on the interface specified in Step 3.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b> Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config</b> <b>startup-config</b>	(Optional) Saves your entries in the configuration file.

## Related Topics

## Enabling CDP on an Interface

CDP is enabled by default on all supported interfaces to send and to receive CDP information.

**Note** Switch clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange CDP messages. Disabling CDP can interrupt cluster discovery and device connectivity.

Follow these steps to enable CDP on a port on which it has been disabled.

### Before you begin

CDP must be disabled on the port that you are trying to CDP enable on, or it cannot be enabled.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b>  Switch(config)# <b>interface gigabitethernet1/0/1</b>	Specifies the interface on which you are enabling CDP, and enters interface configuration mode.
<b>Step 4</b>	<b>cdp enable</b> <b>Example:</b>  Switch(config-if)# <b>cdp enable</b>	Enables CDP on a disabled interface.
<b>Step 5</b>	<b>end</b> <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b>  Switch# <b>show running-config</b>	Verifies your entries.

	Command or Action	Purpose
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Monitoring and Maintaining CDP

*Table 47: Commands for Displaying CDP Information*

Command	Description
<b>clear cdp counters</b>	Resets the traffic counters to zero.
<b>clear cdp table</b>	Deletes the CDP table of information about neighbors.
<b>show cdp</b>	Displays global information, such as frequency of transmissions and the holdtime for packets being sent.
<b>show cdp entry</b> <i>entry-name</i> [version] [protocol]	<p>Displays information about a specific neighbor.</p> <p>You can enter an asterisk (*) to display all CDP neighbors, or you can enter the name of the neighbor about which you want information.</p> <p>You can also limit the display to information about the protocols enabled on the specified neighbor or information about the version of software running on the device.</p>
<b>show cdp interface</b> [ <i>interface-id</i> ]	<p>Displays information about interfaces where CDP is enabled.</p> <p>You can limit the display to the interface about which you want information.</p>
<b>show cdp neighbors</b> [ <i>interface-id</i> ] [ <i>detail</i> ]	<p>Displays information about neighbors, including device type, interface type and number, holdtime settings, capabilities, platform, and port ID.</p> <p>You can limit the display to neighbors of a specific interface or expand the display to provide more detailed information.</p>
<b>show cdp traffic</b>	Displays CDP counters, including the number of packets sent and received and checksum errors.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for SNMP

### Supported SNMP Versions

This software release supports the following SNMP versions:

- SNMPv1—The Simple Network Management Protocol, a Full Internet Standard, defined in RFC 1157.
- SNMPv2C replaces the Party-based Administrative and Security Framework of SNMPv2Classic with the community-string-based Administrative Framework of SNMPv2C while retaining the bulk retrieval and improved error handling of SNMPv2Classic. It has these features:

- SNMPv2—Version 2 of the Simple Network Management Protocol, a Draft Internet Standard, defined in RFCs 1902 through 1907.
- SNMPv2C—The community-string-based Administrative Framework for SNMPv2, an Experimental Internet Protocol defined in RFC 1901.
- SNMPv3—Version 3 of the SNMP is an interoperable standards-based protocol defined in RFCs 2273 to 2275. SNMPv3 provides secure access to devices by authenticating and encrypting packets over the network and includes these security features:
  - Message integrity—Ensures that a packet was not tampered with in transit.
  - Authentication—Determines that the message is from a valid source.
  - Encryption—Mixes the contents of a package to prevent it from being read by an unauthorized source.

**Note** To select encryption, enter the **priv** keyword.

Both SNMPv1 and SNMPv2C use a community-based form of security. The community of managers able to access the agent's MIB is defined by an IP address access control list and password.

SNMPv2C includes a bulk retrieval function and more detailed error message reporting to management stations. The bulk retrieval function retrieves tables and large quantities of information, minimizing the number of round-trips required. The SNMPv2C improved error-handling includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes in SNMPv2C report the error type.

SNMPv3 provides for both security models and security levels. A security model is an authentication strategy set up for a user and the group within which the user resides. A security level is the permitted level of security within a security model. A combination of the security level and the security model determine which security method is used when handling an SNMP packet. Available security models are SNMPv1, SNMPv2C, and SNMPv3.

The following table identifies characteristics and compares different combinations of security models and levels:

**Table 48: SNMP Security Models and Levels**

Model	Level	Authentication	Encryption	Result
SNMPv1	noAuthNoPriv	Community string	No	Uses a community string match for authentication.
SNMPv2C	noAuthNoPriv	Community string	No	Uses a community string match for authentication.
SNMPv3	noAuthNoPriv	Username	No	Uses a username match for authentication.

Model	Level	Authentication	Encryption	Result
SNMPv3	authNoPriv	Message Digest 5 (MD5) or Secure Hash Algorithm (SHA)	No	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms.
SNMPv3	authPriv	MD5 or SHA	Data Encryption Standard (DES) or Advanced Encryption Standard (AES)	<p>Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms.</p> <p>Allows specifying the User-based Security Model (USM) with these encryption algorithms:</p> <ul style="list-style-type: none"> <li>• DES 56-bit encryption in addition to authentication based on the CBC-DES (DES-56) standard.</li> <li>• 3DES 168-bit encryption</li> <li>• AES 128-bit, 192-bit, or 256-bit encryption</li> </ul>

You must configure the SNMP agent to use the SNMP version supported by the management station. Because an agent can communicate with multiple managers, you can configure the software to support communications using SNMPv1, SNMPv2C, or SNMPv3.

## Restrictions for SNMP

### Version Restrictions

- SNMPv1 does not support informs.

# Information About SNMP

## SNMP Overview

SNMP is an application-layer protocol that provides a message format for communication between managers and agents. The SNMP system consists of an SNMP manager, an SNMP agent, and a management information base (MIB). The SNMP manager can be part of a network management system (NMS) such as Cisco Prime Infrastructure. The agent and MIB reside on the switch. To configure SNMP on the switch, you define the relationship between the manager and the agent.

The SNMP agent contains MIB variables whose values the SNMP manager can request or change. A manager can get a value from an agent or store a value into the agent. The agent gathers data from the MIB, the repository for information about device parameters and network data. The agent can also respond to a manager's requests to get or set data.

An agent can send unsolicited traps to the manager. Traps are messages alerting the SNMP manager to a condition on the network. Traps can mean improper user authentication, restarts, link status (up or down), MAC address tracking, closing of a TCP connection, loss of connection to a neighbor, or other significant events.

## SNMP Manager Functions

The SNMP manager uses information in the MIB to perform the operations described in the following table:

**Table 49: SNMP Operations**

Operation	Description
get-request	Retrieves a value from a specific variable.
get-next-request	Retrieves a value from a variable within a table. <sup>4</sup>
get-bulk-request <sup>5</sup>	Retrieves large blocks of data, such as multiple rows in a table, that would otherwise require the transmission of many small blocks of data.
get-response	Replies to a get-request, get-next-request, and set-request sent by an NMS.
set-request	Stores a value in a specific variable.
trap	An unsolicited message sent by an SNMP agent to an SNMP manager when some event has occurred.

<sup>4</sup> With this operation, an SNMP manager does not need to know the exact variable name. A sequential search is performed to find the needed variable from within a table.

<sup>5</sup> The get-bulk command only works with SNMPv2 or later.

## SNMP Agent Functions

The SNMP agent responds to SNMP manager requests as follows:

- Get a MIB variable—The SNMP agent begins this function in response to a request from the NMS. The agent retrieves the value of the requested MIB variable and responds to the NMS with that value.

- Set a MIB variable—The SNMP agent begins this function in response to a message from the NMS. The SNMP agent changes the value of the MIB variable to the value requested by the NMS.

The SNMP agent also sends unsolicited trap messages to notify an NMS that a significant event has occurred on the agent. Examples of trap conditions include, but are not limited to, when a port or module goes up or down, when spanning-tree topology changes occur, and when authentication failures occur.

#### Related Topics

[Disabling the SNMP Agent](#), on page 632

[Monitoring SNMP Status](#), on page 648

## SNMP Community Strings

SNMP community strings authenticate access to MIB objects and function as embedded passwords. In order for the NMS to access the switch, the community string definitions on the NMS must match at least one of the three community string definitions on the switch.

A community string can have one of the following attributes:

- Read-only (RO)—Gives all objects in the MIB except the community strings read access to authorized management stations, but does not allow write access.
- Read-write (RW)—Gives all objects in the MIB read and write access to authorized management stations, but does not allow access to the community strings.
- When a cluster is created, the command switch manages the exchange of messages among member switches and the SNMP application. The Network Assistant software appends the member switch number (@esN, where N is the switch number) to the first configured RW and RO community strings on the command switch and propagates them to the member switches.

#### Related Topics

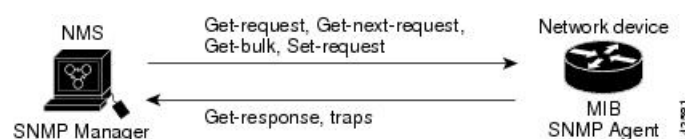

[Configuring Community Strings](#), on page 633

## SNMP MIB Variables Access

An example of an NMS is the Cisco Prime Infrastructure network management software. Cisco Prime Infrastructure 2.0 software uses the switch MIB variables to set device variables and to poll devices on the network for specific information. The results of a poll can be displayed as a graph and analyzed to troubleshoot internetworking problems, increase network performance, verify the configuration of devices, monitor traffic loads, and more.

As shown in the figure, the SNMP agent gathers data from the MIB. The agent can send traps, or notification of certain events, to the SNMP manager, which receives and processes the traps. Traps alert the SNMP manager to a condition on the network such as improper user authentication, restarts, link status (up or down), MAC address tracking, and so forth. The SNMP agent also responds to MIB-related queries sent by the SNMP manager in *get-request*, *get-next-request*, and *set-request* format.

**Figure 53: SNMP Network**

## SNMP Notifications

SNMP allows the switch to send notifications to SNMP managers when particular events occur. SNMP notifications can be sent as traps or inform requests. In command syntax, unless there is an option in the command to select either traps or informs, the keyword traps refers to either traps or informs, or both. Use the **snmp-server host** command to specify whether to send SNMP notifications as traps or informs.

**Note** SNMPv1 does not support informs.

Traps are unreliable because the receiver does not send an acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. When an SNMP manager receives an inform request, it acknowledges the message with an SNMP response protocol data unit (PDU). If the sender does not receive a response, the inform request can be sent again. Because they can be resent, informs are more likely than traps to reach their intended destination.

The characteristics that make informs more reliable than traps also consume more resources in the switch and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request is held in memory until a response is received or the request times out. Traps are sent only once, but an inform might be resent or retried several times. The retries increase traffic and contribute to a higher overhead on the network. Therefore, traps and informs require a trade-off between reliability and resources. If it is important that the SNMP manager receive every notification, use inform requests. If traffic on the network or memory in the switch is a concern and notification is not required, use traps.

[Monitoring SNMP Status](#), on page 648

## SNMP ifIndex MIB Object Values

In an NMS, the IF-MIB generates and assigns an interface index (ifIndex) object value that is a unique number greater than zero to identify a physical or a logical interface. When the switch reboots or the switch software is upgraded, the switch uses this same value for the interface. For example, if the switch assigns a port 2 an ifIndex value of 10003, this value is the same after the switch reboots.

The switch uses one of the values in the following table to assign an ifIndex value to an interface:

**Table 50: ifIndex Values**

Interface Type	ifIndex Range
SVI <sup>6</sup>	1–4999
EtherChannel	5000–5012
Loopback	5013–5077
Tunnel	5078–5142
Physical (such as Gigabit Ethernet or SFP <sup>7</sup> -module interfaces)	10000–14500
Null	14501

<sup>6</sup> SVI = switch virtual interface

<sup>7</sup> SFP = small form-factor pluggable

## Default SNMP Configuration

Feature	Default Setting
SNMP agent	Disabled <sup>8</sup> .
SNMP trap receiver	None configured.
SNMP traps	None enabled except the trap for TCP connections (tty).
SNMP version	If no version keyword is present, the default is Version 1.
SNMPv3 authentication	If no keyword is entered, the default is the <b>noauth</b> (noAuthNoPriv) security level.
SNMP notification type	If no type is specified, all notifications are sent.

<sup>8</sup> This is the default when the switch starts and the startup configuration does not have any **snmp-server** global configuration commands.

## SNMP Configuration Guidelines

If the switch starts and the switch startup configuration has at least one **snmp-server** global configuration command, the SNMP agent is enabled.

An SNMP *group* is a table that maps SNMP users to SNMP views. An SNMP *user* is a member of an SNMP group. An SNMP *host* is the recipient of an SNMP trap operation. An SNMP *engine ID* is a name for the local or remote SNMP engine.

When configuring SNMP, follow these guidelines:

- When configuring an SNMP group, do not specify a notify view. The **snmp-server host** global configuration command auto-generates a notify view for the user and then adds it to the group associated with that user. Modifying the group's notify view affects all users associated with that group.
- To configure a remote user, specify the IP address or port number for the remote SNMP agent of the device where the user resides.
- Before you configure remote users for a particular agent, configure the SNMP engine ID, using the **snmp-server engineID** global configuration command with the **remote** option. The remote agent's SNMP engine ID and user password are used to compute the authentication and privacy digests. If you do not configure the remote engine ID first, the configuration command fails.
- When configuring SNMP informs, you need to configure the SNMP engine ID for the remote agent in the SNMP database before you can send proxy requests or informs to it.
- If a local user is not associated with a remote host, the switch does not send informs for the **auth** (authNoPriv) and the **priv** (authPriv) authentication levels.
- Changing the value of the SNMP engine ID has significant results. A user's password (entered on the command line) is converted to an MD5 or SHA security digest based on the password and the local engine ID. The command-line password is then destroyed, as required by RFC 2274. Because of this deletion, if the value of the engine ID changes, the security digests of SNMPv3 users become invalid, and you need to reconfigure SNMP users by using the **snmp-server user username** global configuration

command. Similar restrictions require the reconfiguration of community strings when the engine ID changes.

# How to Configure SNMP

## Disabling the SNMP Agent

The **no snmp-server** global configuration command disables all running versions (Version 1, Version 2C, and Version 3) of the SNMP agent on the device. You reenables all versions of the SNMP agent by the first **snmp-server** global configuration command that you enter. There is no Cisco IOS command specifically designated for enabling SNMP.

Follow these steps to disable the SNMP agent.

#### Before you begin

The SNMP Agent must be enabled before it can be disabled. The SNMP agent is enabled by the first **snmp-server** global configuration command entered on the device.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>no snmp-server</b> <b>Example:</b> Switch(config)# <b>no snmp-server</b>	Disables the SNMP agent operation.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b> Switch# <code>show running-config</code>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

**Related Topics**

[SNMP Agent Functions](#), on page 628

[Monitoring SNMP Status](#), on page 648

## Configuring Community Strings

You use the SNMP community string to define the relationship between the SNMP manager and the agent. The community string acts like a password to permit access to the agent on the switch. Optionally, you can specify one or more of these characteristics associated with the string:

- An access list of IP addresses of the SNMP managers that are permitted to use the community string to gain access to the agent
- A MIB view, which defines the subset of all MIB objects accessible to the given community
- Read and write or read-only permission for the MIB objects accessible to the community

Follow these steps to configure a community string on the switch.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<p><b>snmp-server community</b> <i>string</i> [<b>view</b> <i>view-name</i>] [<b>ro</b>   <b>rw</b>] [<i>access-list-number</i>]</p> <p><b>Example:</b></p> <pre>Switch(config)# snmp-server community comaccess ro 4</pre>	<p>Configures the community string.</p> <p><b>Note</b> The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.</p> <ul style="list-style-type: none"> <li>For <i>string</i>, specify a string that acts like a password and permits access to the SNMP protocol. You can configure one or more community strings of any length.</li> <li>(Optional) For <b>view</b>, specify the view record accessible to the community.</li> <li>(Optional) Specify either read-only (<b>ro</b>) if you want authorized management stations to retrieve MIB objects, or specify read-write (<b>rw</b>) if you want authorized management stations to retrieve and modify MIB objects. By default, the community string permits read-only access to all objects.</li> <li>(Optional) For <i>access-list-number</i>, enter an IP standard access list numbered from 1 to 99 and 1300 to 1999.</li> </ul>
<b>Step 4</b>	<p><b>access-list</b> <i>access-list-number</i> {<b>deny</b>   <b>permit</b>} <i>source</i> [<i>source-wildcard</i>]</p> <p><b>Example:</b></p> <pre>Switch(config)# access-list 4 deny any</pre>	<p>(Optional) If you specified an IP standard access list number in Step 3, then create the list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> <li>For <i>access-list-number</i>, enter the access list number specified in Step 3.</li> <li>The <b>deny</b> keyword denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>For <i>source</i>, enter the IP address of the SNMP managers that are permitted to use the community string to gain access to the agent.</li> <li>(Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul>

	Command or Action	Purpose
		Recall that the access list is always terminated by an implicit deny statement for everything.
<b>Step 5</b>	<b>end</b> <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b>  Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

**What to do next**

To disable access for an SNMP community, set the community string for that community to the null string (do not enter a value for the community string).

To remove a specific community string, use the **no snmp-server** community string global configuration command.

You can specify an identification name (engine ID) for the local or remote SNMP server engine on the switch. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

**Related Topics**

[SNMP Community Strings](#), on page 629

## Configuring SNMP Groups and Users

You can specify an identification name (engine ID) for the local or remote SNMP server engine on the switch. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

Follow these steps to configure SNMP groups and users on the switch.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Switch> <b>enable</b>	
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>snmp-server engineID</b> { <b>local</b> <i>engineid-string</i>   <b>remote</b> <i>ip-address</i> [ <b>udp-port</b> <i>port-number</i> ] <i>engineid-string</i> } <b>Example:</b> Switch(config)# <b>snmp-server engineID local 1234</b>	Configures a name for either the local or remote copy of SNMP. <ul style="list-style-type: none"> <li>The <i>engineid-string</i> is a 24-character ID string with the name of the copy of SNMP. You need not specify the entire 24-character engine ID if it has trailing zeros. Specify only the portion of the engine ID up to the point where only zeros remain in the value. The Step Example configures an engine ID of 123400000000000000000000.</li> <li>If you select <b>remote</b>, specify the <i>ip-address</i> of the device that contains the remote copy of SNMP and the optional User Datagram Protocol (UDP) port on the remote device. The default is 162.</li> </ul>
<b>Step 4</b>	<b>snmp-server group</b> <i>group-name</i> { <b>v1</b>   <b>v2c</b>   <b>v3</b> { <b>auth</b>   <b>noauth</b>   <b>priv</b> } } [ <b>read</b> <i>readview</i> ] [ <b>write</b> <i>writeview</i> ] [ <b>notify</b> <i>notifyview</i> ] [ <b>access</b> <i>access-list</i> ] <b>Example:</b> Switch(config)# <b>snmp-server group public v2c access lmnop</b>	Configures a new SNMP group on the remote device. For <i>group-name</i> , specify the name of the group. Specify one of the following security models: <ul style="list-style-type: none"> <li><b>v1</b> is the least secure of the possible security models.</li> <li><b>v2c</b> is the second least secure model. It allows transmission of informs and integers twice the normal width.</li> <li><b>v3</b>, the most secure, requires you to select one of the following authentication levels: <ul style="list-style-type: none"> <li><b>auth</b>—Enables the Message Digest 5 (MD5) and the Secure Hash Algorithm (SHA) packet authentication.</li> <li><b>noauth</b>—Enables the noAuthNoPriv security level. This is the default if no keyword is specified.</li> </ul> </li> </ul>

	Command or Action	Purpose
		<p><b>priv</b>—Enables Data Encryption Standard (DES) packet encryption (also called privacy).</p> <p>(Optional) Enter <b>read</b> <i>readview</i> with a string (not to exceed 64 characters) that is the name of the view in which you can only view the contents of the agent.</p> <p>(Optional) Enter <b>write</b> <i>writeview</i> with a string (not to exceed 64 characters) that is the name of the view in which you enter data and configure the contents of the agent.</p> <p>(Optional) Enter <b>notify</b> <i>notifyview</i> with a string (not to exceed 64 characters) that is the name of the view in which you specify a notify, inform, or trap.</p> <p>(Optional) Enter <b>access</b> <i>access-list</i> with a string (not to exceed 64 characters) that is the name of the access list.</p>
<b>Step 5</b>	<p><b>snmp-server user</b> <i>username group-name</i> { <b>remote</b> <i>host</i> [ <b>udp-port</b> <i>port</i> ] } { <b>v1</b> [ <b>access</b> <i>access-list</i> ]   <b>v2c</b> [ <b>access</b> <i>access-list</i> ]   <b>v3</b> [ <b>encrypted</b> ] [ <b>access</b> <i>access-list</i> ] [ <b>auth</b> { <b>md5</b>   <b>sha</b> } <i>auth-password</i> ] } [ <b>priv</b> { <b>des</b>   <b>3des</b>   <b>aes</b> { <b>128</b>   <b>192</b>   <b>256</b> } } <i>priv-password</i> ]</p> <p><b>Example:</b></p> <pre>Switch(config)# snmp-server user Pat public v2c</pre>	<p>Adds a new user for an SNMP group.</p> <p>The <i>username</i> is the name of the user on the host that connects to the agent.</p> <p>The <i>group-name</i> is the name of the group to which the user is associated.</p> <p>Enter <b>remote</b> to specify a remote SNMP entity to which the user belongs and the hostname or IP address of that entity with the optional UDP port number. The default is 162.</p> <p>Enter the SNMP version number (<b>v1</b>, <b>v2c</b>, or <b>v3</b>). If you enter <b>v3</b>, you have these additional options:</p> <ul style="list-style-type: none"> <li>• <b>encrypted</b> specifies that the password appears in encrypted format. This keyword is available only when the <b>v3</b> keyword is specified.</li> <li>• <b>auth</b> is an authentication level setting session that can be either the HMAC-MD5-96 (<b>md5</b>) or the HMAC-SHA-96 (<b>sha</b>) authentication level and requires a password string <i>auth-password</i> (not to exceed 64 characters).</li> </ul>

	Command or Action	Purpose
		<p>If you enter <b>v3</b> you can also configure a private (<b>priv</b>) encryption algorithm and password string <i>priv-password</i> using the following keywords (not to exceed 64 characters):</p> <ul style="list-style-type: none"> <li>• <b>priv</b> specifies the User-based Security Model (USM).</li> <li>• <b>des</b> specifies the use of the 56-bit DES algorithm.</li> <li>• <b>3des</b> specifies the use of the 168-bit DES algorithm.</li> <li>• <b>aes</b> specifies the use of the DES algorithm. You must select either 128-bit, 192-bit, or 256-bit encryption.</li> </ul> <p>(Optional) Enter <b>access</b> <i>access-list</i> with a string (not to exceed 64 characters) that is the name of the access list.</p>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 7</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 8</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring SNMP Notifications

A trap manager is a management station that receives and processes traps. Traps are system alerts that the switch generates when certain events occur. By default, no trap manager is defined, and no traps are sent. Switches running this Cisco IOS release can have an unlimited number of trap managers.

**Note** Many commands use the word **traps** in the command syntax. Unless there is an option in the command to select either traps or informs, the keyword **traps** refers to traps, informs, or both. Use the **snmp-server host** global configuration command to specify whether to send SNMP notifications as traps or informs.

You can use the **snmp-server host** global configuration command for a specific host to receive the notification types listed in the following table. You can enable any or all of these traps and configure a trap manager to receive them.

**Table 51: Device Notification Types**

Notification Type Keyword	Description
<b>bridge</b>	Generates STP bridge MIB traps.
<b>cluster</b>	Generates a trap when the cluster configuration changes.
<b>config</b>	Generates a trap for SNMP configuration changes.
<b>copy-config</b>	Generates a trap for SNMP copy configuration changes.
<b>cpu threshold</b>	Allow CPU-related traps.
<b>entity</b>	Generates a trap for SNMP entity changes.
<b>envmon</b>	Generates environmental monitor traps. You can enable any or all of these environmental traps: fan, shutdown, status, supply, temperature.
<b>flash</b>	Generates SNMP FLASH notifications. In a switch stack, you can optionally enable notification for flash insertion or removal, which would cause a trap to be issued whenever a switch in the stack is removed or inserted (physical removal, power cycle, or reload).
<b>fru-ctrl</b>	Generates entity field-replaceable unit (FRU) control traps. In the switch stack, this trap refers to the insertion or removal of a switch in the stack.
<b>hsrp</b>	Generates a trap for Hot Standby Router Protocol (HSRP) changes.
<b>ipmulticast</b>	Generates a trap for IP multicast routing changes.
<b>mac-notification</b>	Generates a trap for MAC address notifications.
<b>ospf</b>	Generates a trap for Open Shortest Path First (OSPF) changes. You can enable any or all of these traps: Cisco specific, errors, link-state advertisement, rate limit, retransmit, and state changes.
<b>pim</b>	Generates a trap for Protocol-Independent Multicast (PIM) changes. You can enable any or all of these traps: invalid PIM messages, neighbor changes, and rendezvous point (RP)-mapping changes.

Notification Type Keyword	Description
<b>port-security</b>	<p>Generates SNMP port security traps. You can also set a maximum trap rate per second. The range is from 0 to 1000; the default is 0, which means that there is no rate limit.</p> <p><b>Note</b> When you configure a trap by using the notification type <b>port-security</b>, configure the port security trap first, and then configure the port security trap rate:</p> <ol style="list-style-type: none"> <li><b>snmp-server enable traps port-security</b></li> <li><b>snmp-server enable traps port-security trap-rate rate</b></li> </ol>
<b>snmp</b>	Generates a trap for SNMP-type notifications for authentication, cold start, warm start, link up or link down.
<b>storm-control</b>	Generates a trap for SNMP storm-control. You can also set a maximum trap rate per minute. The range is from 0 to 1000; the default is 0 (no limit is imposed; a trap is sent at every occurrence).
<b>stpx</b>	Generates SNMP STP Extended MIB traps.
<b>syslog</b>	Generates SNMP syslog traps.
<b>tty</b>	Generates a trap for TCP connections. This trap is enabled by default.
<b>vlan-membership</b>	Generates a trap for SNMP VLAN membership changes.
<b>vlancreate</b>	Generates SNMP VLAN created traps.
<b>vlandelete</b>	Generates SNMP VLAN deleted traps.
<b>vtp</b>	Generates a trap for VLAN Trunking Protocol (VTP) changes.

Follow these steps to configure the switch to send traps or informs to a host.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<p><b>snmp-server engineID remote ip-address engineid-string</b></p> <p><b>Example:</b></p>	Specifies the engine ID for the remote host.

	Command or Action	Purpose
	<pre>Switch(config)# snmp-server engineID remote 192.180.1.27 00000063000100a1c0b4011b</pre>	
<b>Step 4</b>	<p><b>snmp-server user</b> <i>username group-name</i> { <b>remote</b> <i>host</i> [ <b>udp-port</b> <i>port</i> ] } { <b>v1</b> [ <b>access</b> <i>access-list</i> ]   <b>v2c</b> [ <b>access</b> <i>access-list</i> ]   <b>v3</b> [ <b>encrypted</b> ] [ <b>access</b> <i>access-list</i> ] [ <b>auth</b> { <b>md5</b>   <b>sha</b> } <i>auth-password</i> ] }</p> <p><b>Example:</b></p> <pre>Switch(config)# snmp-server user Pat public v2c</pre>	<p>Configures an SNMP user to be associated with the remote host created in Step 3.</p> <p><b>Note</b> You cannot configure a remote user for an address without first configuring the engine ID for the remote host. Otherwise, you receive an error message, and the command is not executed.</p>
<b>Step 5</b>	<p><b>snmp-server group</b> <i>group-name</i> { <b>v1</b>   <b>v2c</b>   <b>v3</b> { <b>auth</b>   <b>noauth</b>   <b>priv</b> } } [ <b>read</b> <i>readview</i> ] [ <b>write</b> <i>writeview</i> ] [ <b>notify</b> <i>notifyview</i> ] [ <b>access</b> <i>access-list</i> ]</p> <p><b>Example:</b></p> <pre>Switch(config)# snmp-server group public v2c access lmnop</pre>	<p>Configures an SNMP group.</p>
<b>Step 6</b>	<p><b>snmp-server host</b> <i>host-addr</i> [ <b>informs</b>   <b>traps</b> ] [ <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> { <b>auth</b>   <b>noauth</b>   <b>priv</b> } } ] <i>community-string</i> [ <i>notification-type</i> ]</p> <p><b>Example:</b></p> <pre>Switch(config)# snmp-server host 203.0.113.1 comaccess snmp</pre>	<p>Specifies the recipient of an SNMP trap operation.</p> <p>For <i>host-addr</i>, specify the name or Internet address of the host (the targeted recipient).</p> <p>(Optional) Specify <b>traps</b> (the default) to send SNMP traps to the host.</p> <p>(Optional) Specify <b>informs</b> to send SNMP informs to the host.</p> <p>(Optional) Specify the SNMP <b>version</b> (<b>1</b>, <b>2c</b>, or <b>3</b>). SNMPv1 does not support informs.</p> <p>(Optional) For Version 3, select authentication level <b>auth</b>, <b>noauth</b>, or <b>priv</b>.</p> <p><b>Note</b> The <b>priv</b> keyword is available only when the cryptographic software image is installed.</p> <p>For <i>community-string</i>, when <b>version 1</b> or <b>version 2c</b> is specified, enter the password-like community string sent with the notification operation. When <b>version 3</b> is specified, enter the SNMPv3 username.</p> <p>The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.</p>

	Command or Action	Purpose
		(Optional) For <i>notification-type</i> , use the keywords listed in the table above. If no type is specified, all notifications are sent.
<b>Step 7</b>	<b>snmp-server enable traps <i>notification-types</i></b> <b>Example:</b> <pre>Switch(config)# snmp-server enable traps snmp</pre>	<p>Enables the switch to send traps or informs and specifies the type of notifications to be sent. For a list of notification types, see the table above, or enter <b>snmp-server enable traps ?</b></p> <p>To enable multiple types of traps, you must enter a separate <b>snmp-server enable traps</b> command for each trap type.</p> <p><b>Note</b> When you configure a trap by using the notification type <b>port-security</b>, configure the port security trap first, and then configure the port security trap rate:</p> <ol style="list-style-type: none"> <li>a. <b>snmp-server enable traps port-security</b></li> <li>b. <b>snmp-server enable traps port-security trap-rate <i>rate</i></b></li> </ol>
<b>Step 8</b>	<b>snmp-server trap-source <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config)# snmp-server trap-source gigabitethernet 1/0/1</pre>	(Optional) Specifies the source interface, which provides the IP address for the trap message. This command also sets the source IP address for informs.
<b>Step 9</b>	<b>snmp-server queue-length <i>length</i></b> <b>Example:</b> <pre>Switch(config)# snmp-server queue-length 20</pre>	(Optional) Establishes the message queue length for each trap host. The range is 1 to 5000; the default is 10.
<b>Step 10</b>	<b>snmp-server trap-timeout <i>seconds</i></b> <b>Example:</b> <pre>Switch(config)# snmp-server trap-timeout 60</pre>	(Optional) Defines how often to resend trap messages. The range is 1 to 1000; the default is 30 seconds.
<b>Step 11</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 12</b>	<b>show running-config</b> <b>Example:</b>	Verifies your entries.

	Command or Action	Purpose
	Switch# <code>show running-config</code>	
<b>Step 13</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

### What to do next

The **snmp-server host** command specifies which hosts receive the notifications. The **snmp-server enable traps** command globally enables the method for the specified notification (for traps and informs). To enable a host to receive an inform, you must configure an **snmp-server host informs** command for the host and globally enable informs by using the **snmp-server enable traps** command.

To remove the specified host from receiving traps, use the **no snmp-server host** *host* global configuration command. The **no snmp-server host** command with no keywords disables traps, but not informs, to the host. To disable informs, use the **no snmp-server host informs** global configuration command. To disable a specific trap type, use the **no snmp-server enable traps** *notification-types* global configuration command.

## Setting the Agent Contact and Location Information

Follow these steps to set the system contact and location of the SNMP agent so that these descriptions can be accessed through the configuration file.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>snmp-server contact</b> <i>text</i> <b>Example:</b>	Sets the system contact string.

	Command or Action	Purpose
	<code>Switch(config)# snmp-server contact Dial System Operator at beeper 21555</code>	
<b>Step 4</b>	<b>snmp-server location</b> <i>text</i> <b>Example:</b> <code>Switch(config)# snmp-server location Building 3/Room 222</code>	Sets the system location string.
<b>Step 5</b>	<b>end</b> <b>Example:</b> <code>Switch(config)# end</code>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b> <code>Switch# show running-config</code>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> <code>Switch# copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Limiting TFTP Servers Used Through SNMP

Follow these steps to limit the TFTP servers used for saving and loading configuration files through SNMP to the servers specified in an access list.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <code>Switch&gt; enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <code>Switch# configure terminal</code>	Enters the global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<p><b>snmp-server tftp-server-list</b> <i>access-list-number</i></p> <p><b>Example:</b></p> <pre>Switch(config)# snmp-server tftp-server-list 44</pre>	<p>Limits the TFTP servers used for configuration file copies through SNMP to the servers in the access list.</p> <p>For <i>access-list-number</i>, enter an IP standard access list numbered from 1 to 99 and 1300 to 1999.</p>
<b>Step 4</b>	<p><b>access-list</b> <i>access-list-number</i> {<b>deny</b>   <b>permit</b>} <i>source</i> [<i>source-wildcard</i>]</p> <p><b>Example:</b></p> <pre>Switch(config)# access-list 44 permit 10.1.1.2</pre>	<p>Creates a standard access list, repeating the command as many times as necessary.</p> <p>For <i>access-list-number</i>, enter the access list number specified in Step 3.</p> <p>The <b>deny</b> keyword denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</p> <p>For <i>source</i>, enter the IP address of the TFTP servers that can access the switch.</p> <p>(Optional) For <i>source-wildcard</i>, enter the wildcard bits, in dotted decimal notation, to be applied to the source. Place ones in the bit positions that you want to ignore.</p> <p>The access list is always terminated by an implicit deny statement for everything.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>
<b>Step 6</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>	<p>Verifies your entries.</p>
<b>Step 7</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p>

## Configuring Trap Flags for SNMP

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>trapflags ap { interfaceup   register}</b> <b>Example:</b> Switch(config)# <code>trapflags ap interfaceup</code>	Enables sending AP-related traps. Use the <b>no</b> form of the command to disable the trap flags. <ul style="list-style-type: none"> <li>• <b>interfaceup</b>– Enables trap when a Cisco AP interface (A or B) comes up.</li> <li>• <b>register</b>– Enables trap when a Cisco AP registers with a Cisco switch.</li> </ul>
<b>Step 3</b>	<b>trapflags client {dot11   excluded}</b> <b>Example:</b> Switch(config)# <code>trapflags client excluded</code>	Enables sending client-related dot11 traps. Use the <b>no</b> form of the command to disable the trap flags. <ul style="list-style-type: none"> <li>• <b>dot11</b>– Enables Dot11 traps for clients.</li> <li>• <b>excluded</b>– Enables excluded traps for clients.</li> </ul>
<b>Step 4</b>	<b>trapflags dot11-security {ids-sig-attack   wep-decrypt-error}</b> <b>Example:</b> Switch(config)# <code>trapflags dot11-security wep-decrypt-error</code>	Enables sending 802.11 security-related traps. Use the <b>no</b> form of the command to disable the trap flags. <ul style="list-style-type: none"> <li>• <b>ids-sig-attack</b>– Enables IDS signature attack traps.</li> <li>• <b>wep-decrypt-error</b>– Enables traps for WEP decrypt error for clients.</li> </ul>
<b>Step 5</b>	<b>trapflags mesh</b> <b>Example:</b> Switch(config)# <code>trapflags mesh</code>	Enables trap for the mesh. Use the <b>no</b> form of the command to disable the trap flags.
<b>Step 6</b>	<b>trapflags rogueap</b> <b>Example:</b> Switch(config)# <code>trapflags rogueap</code>	Enables trap for rogue AP detection. Use the <b>no</b> form of the command to disable the trap flags.

	Command or Action	Purpose
<b>Step 7</b>	<b>trapflags rrm-params {channels   tx-power}</b> <b>Example:</b> <pre>Switch(config)# trapflags rrm-params tx-power</pre>	Enables sending RRM-parameter update-related traps. Use the <b>no</b> form of the command to disable the trap flags. <ul style="list-style-type: none"> <li>• <b>channels</b>– Enables trap when RF Manager automatically changes a channel number for the Cisco AP interface.</li> <li>• <b>tx-power</b>– Enables the trap when RF Manager automatically changes Tx-Power level for the Cisco AP interface.</li> </ul>
<b>Step 8</b>	<b>trapflags rrm-profile {coverage   interference   load   noise}</b> <b>Example:</b> <pre>Switch(config)# trapflags rrm-profile interference</pre>	Enables sending RRM-profile-related traps. Use the <b>no</b> form of the command to disable the trap flags. <ul style="list-style-type: none"> <li>• <b>coverage</b>– Enables the trap when the coverage profile maintained by RF Manager fails.</li> <li>• <b>interference</b>– Enables the trap when the interference profile maintained by RF Manager fails.</li> <li>• <b>load</b>– Enables trap when the load profile maintained by RF Manager fails.</li> <li>• <b>noise</b>– Enables trap when the noise profile maintained by RF Manager fails.</li> </ul>
<b>Step 9</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

## Enabling SNMP Wireless Trap Notification

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<b>snmp-server enable traps wireless [AP   RRM   bsn80211SecurityTrap  </b>	Enables SNMP wireless trap notification.

	Command or Action	Purpose
	<b>bsnAPPParamUpdate</b>   <b>bsnAPPProfile</b>   <b>bsnAccessPoint</b>   <b>bsnMobileStation</b>   <b>bsnRogue</b>   <b>client</b>   <b>mfp</b>   <b>rogue</b> ] <b>Example:</b> <pre>Switch(config)# snmp-server enable traps wireless AP</pre>	<ul style="list-style-type: none"> <li>• <b>AP</b>– Enables access point traps.</li> <li>• <b>RRM</b>– Enables RRM traps.</li> <li>• <b>bsn80211SecurityTrap</b>– Enables the security-related trap.</li> <li>• <b>bsnAPPParamUpdate</b>– Enables the trap for AP parameters that get updated.</li> <li>• <b>bsnAPPProfile</b>– Enables BSN AP profile traps.</li> <li>• <b>bsnAccessPoint</b>– Enables BSN access point traps.</li> <li>• <b>bsnMobileStation</b>– Controls wireless client traps.</li> <li>• <b>bsnRogue</b>– Enables BSN rogue-related traps.</li> <li>• <b>client</b>– Enables client traps.</li> <li>• <b>mfp</b>– Enables MFP traps.</li> <li>• <b>rogue</b>– Enables rogue-related traps.</li> </ul>
<b>Step 3</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

## Monitoring SNMP Status

To display SNMP input and output statistics, including the number of illegal community string entries, errors, and requested variables, use the **show snmp** privileged EXEC command. You also can use the other privileged EXEC commands listed in the table to display SNMP information.

*Table 52: Commands for Displaying SNMP Information*

Command	Purpose
<b>show snmp</b>	Displays SNMP statistics.
	Displays information on the local SNMP engine and all remote engines that have been configured on the device.
<b>show snmp group</b>	Displays information on each SNMP group on the network.

Command	Purpose
<b>show snmp pending</b>	Displays information on pending SNMP requests.
<b>show snmp sessions</b>	Displays information on the current SNMP sessions.
<b>show snmp user</b>	Displays information on each SNMP user name in the SNMP users table.  <b>Note</b> You must use this command to display SNMPv3 configuration information for <b>auth</b>   <b>noauth</b>   <b>priv</b> mode. This information is not displayed in the <b>show running-config</b> output.

## SNMP Examples

This example shows how to enable all versions of SNMP. The configuration permits any SNMP manager to access all objects with read-only permissions using the community string *public*. This configuration does not cause the switch to send any traps.

```
Switch(config)# snmp-server community public
```

This example shows how to permit any SNMP manager to access all objects with read-only permission using the community string *public*. The switch also sends VTP traps to the hosts 192.180.1.111 and 192.180.1.33 using SNMPv1 and to the host 192.180.1.27 using SNMPv2C. The community string *public* is sent with the traps.

```
Switch(config)# snmp-server community public
Switch(config)# snmp-server enable traps vtp
Switch(config)# snmp-server host 192.180.1.27 version 2c public
Switch(config)# snmp-server host 192.180.1.111 version 1 public
Switch(config)# snmp-server host 192.180.1.33 public
```

This example shows how to allow read-only access for all objects to members of access list 4 that use the *comaccess* community string. No other SNMP managers have access to any objects. SNMP Authentication Failure traps are sent by SNMPv2C to the host *cisco.com* using the community string *public*.

```
Switch(config)# snmp-server community comaccess ro 4
Switch(config)# snmp-server enable traps snmp authentication
Switch(config)# snmp-server host cisco.com version 2c public
```

This example shows how to send Entity MIB traps to the host *cisco.com*. The community string is restricted. The first line enables the switch to send Entity MIB traps in addition to any traps previously enabled. The second line specifies the destination of these traps and overwrites any previous **snmp-server** host commands for the host *cisco.com*.

```
Switch(config)# snmp-server enable traps entity
Switch(config)# snmp-server host cisco.com restricted entity
```

This example shows how to enable the switch to send all traps to the host *myhost.cisco.com* using the community string *public*:

```
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com public
```

This example shows how to associate a user with a remote host and to send **auth** (authNoPriv) authentication-level informs when the user enters global configuration mode:

```
Switch(config)# snmp-server engineID remote 192.180.1.27 00000063000100a1c0b4011b
Switch(config)# snmp-server group authgroup v3 auth
Switch(config)# snmp-server user authuser authgroup remote 192.180.1.27 v3 auth md5 mypassword
Switch(config)# snmp-server user authuser authgroup v3 auth md5 mypassword
Switch(config)# snmp-server host 192.180.1.27 informs version 3 auth authuser config
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server inform retries 0
```

## CHAPTER 47

# Configuring Service Level Agreements

This chapter describes how to use Cisco IOS IP Service Level Agreements (SLAs) on the switch.

Unless otherwise noted, the term *switch* refers to a standalone switch or a switch stack.

- [Finding Feature Information, on page 653](#)
- [Restrictions on SLAs, on page 653](#)
- [Information About SLAs, on page 654](#)
- [How to Configure IP SLAs Operations, on page 659](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions on SLAs

This section lists the restrictions on SLAs.

The following are restrictions on IP SLAs network performance measurement:

- The switch does not support VoIP service levels using the gatekeeper registration delay operations measurements.
- Only a Cisco IOS device can be a source for a destination IP SLAs responder.
- You cannot configure the IP SLAs responder on non-Cisco devices and Cisco IOS IP SLAs can send operational packets only to services native to those devices.

# Information About SLAs

## Cisco IOS IP Service Level Agreements (SLAs)

Cisco IOS IP SLAs send data across the network to measure performance between multiple network locations or across multiple network paths. They simulate network data and IP services and collect network performance information in real time. Cisco IOS IP SLAs generate and analyze traffic either between Cisco IOS devices or from a Cisco IOS device to a remote IP device such as a network application server. Measurements provided by the various Cisco IOS IP SLA operations can be used for troubleshooting, for problem analysis, and for designing network topologies.

Depending on the specific Cisco IOS IP SLA operations, various network performance statistics are monitored within the Cisco device and stored in both command-line interface (CLI) and Simple Network Management Protocol (SNMP) MIBs. IP SLA packets have configurable IP and application layer options such as source and destination IP address, User Datagram Protocol (UDP)/TCP port numbers, a type of service (ToS) byte (including Differentiated Services Code Point [DSCP] and IP Prefix bits), Virtual Private Network (VPN) routing/forwarding instance (VRF), and URL web address.

Because Cisco IP SLAs are Layer 2 transport independent, you can configure end-to-end operations over disparate networks to best reflect the metrics that an end user is likely to experience. IP SLAs support the use of Cisco Mediatrace and Cisco Performance Monitor to collect and analyze the following performance metrics:

- Delay (both round-trip and one-way)
- Jitter (directional)
- Packet loss (directional)
- Packet sequencing (packet ordering)
- Path (per hop)
- Connectivity (directional)
- Server or website download time

Additionally, the switch also supports Cisco Medianet to enable intelligent services in the network infrastructure for a wide variety of video applications. Cisco Medianet supports the auto-provisioning of endpoints offering video conferencing services and of IP Surveillance cameras through Auto Smartports.

Cisco Mediatrace and Cisco Performance Monitor can be used on switches running the IP Base image or the IP Services image.

Because Cisco IOS IP SLAs is SNMP-accessible, it can also be used by performance-monitoring applications like Cisco Prime Internetwork Performance Monitor (IPM) and other third-party Cisco partner performance management products.

Using IP SLAs can provide the following benefits:

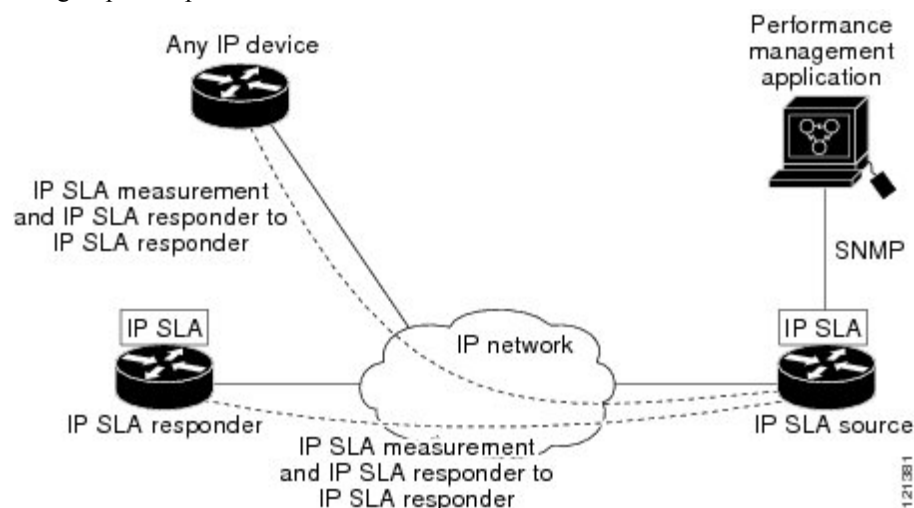

- Service-level agreement monitoring, measurement, and verification.
- Network performance monitoring
  - Measurement of jitter, latency, or packet loss in the network.
  - Continuous, reliable, and predictable measurements.
- IP service network health assessment to verify that the existing QoS is sufficient for new IP services.
- Edge-to-edge network availability monitoring for proactive verification and connectivity testing of network resources (for example, shows the network availability of an NFS server used to store business critical data from a remote site).
- Network operation troubleshooting by providing consistent, reliable measurement that immediately identifies problems and saves troubleshooting time.
- Multiprotocol Label Switching (MPLS) performance monitoring and network verification (if the switch supports MPLS).

## Network Performance Measurement with Cisco IOS IP SLAs

You can use IP SLAs to monitor the performance between any area in the network—core, distribution, and edge—without deploying a physical probe. It uses generated traffic to measure network performance between two networking devices.

**Figure 54: Cisco IOS IP SLAs Operation**

The following figure shows how IP SLAs begin when the source device sends a generated packet to the destination device. After the destination device receives the packet, depending on the type of IP SLAs operation, it responds with time-stamp information for the source to make the calculation on performance metrics. An IP SLAs operation performs a network measurement from the source device to a destination in the network using a specific protocol such as UDP.

## IP SLA Responder and IP SLA Control Protocol

The IP SLA responder is a component embedded in the destination Cisco device that allows the system to anticipate and respond to IP SLA request packets. The responder provides accurate measurements without the need for dedicated probes. The responder uses the Cisco IOS IP SLA Control Protocol to provide a mechanism through which it can be notified on which port it should listen and respond.

**Note** The IP SLA responder can be a Cisco IOS Layer 2, responder-configurable switch. The responder does not need to support full IP SLA functionality.

The following figure shows where the Cisco IOS IP SLA responder fits in the IP network. The responder listens on a specific port for control protocol messages sent by an IP SLA operation. Upon receipt of the control message, it enables the specified UDP or TCP port for the specified duration. During this time, the responder accepts the requests and responds to them. It disables the port after it responds to the IP SLA packet, or when the specified time expires. MD5 authentication for control messages is available for added security.

*Figure 55: Cisco IOS IP SLAs Operation*

You do not need to enable the responder on the destination device for all IP SLA operations. For example, a responder is not required for services that are already provided by the destination router (such as Telnet or HTTP).

## Response Time Computation for IP SLAs

Switches, controllers, and routers can take tens of milliseconds to process incoming packets due to other high priority processes. This delay affects the response times because the test-packet reply might be in a queue while waiting to be processed. In this situation, the response times would not accurately represent true network delays. IP SLAs minimize these processing delays on the source device as well as on the target device (if the responder is being used) to determine true round-trip times. IP SLA test packets use time stamping to minimize the processing delays.

When the IP SLA responder is enabled, it allows the target device to take time stamps when the packet arrives on the interface at interrupt level and again just as it is leaving, eliminating the processing time. This time stamping is made with a granularity of sub-milliseconds (ms).

**Figure 56: Cisco IOS IP SLA Responder Time Stamping**

The following figure demonstrates how the responder works. Four time stamps are taken to make the calculation for round-trip time. At the target router, with the responder functionality enabled, time stamp 2 (TS2) is subtracted from time stamp 3 (TS3) to produce the time spent processing the test packet as represented by delta. This delta value is then subtracted from the overall round-trip time. Notice that the same principle is applied by IP SLAs on the source router where the incoming time stamp 4 (TS4) is also taken at the interrupt

level to allow for greater accuracy.  $RTT$  (Round-trip time) =  $T4$  (Time stamp 4) -  $T1$  (Time stamp 1) -  $\Delta$

An additional benefit of the two time stamps at the target device is the ability to track one-way delay, jitter, and directional packet loss. Because much network behavior is asynchronous, it is critical to have these statistics. However, to capture one-way delay measurements, you must configure both the source router and target router with Network Time Protocol (NTP) so that the source and target are synchronized to the same clock source. One-way jitter measurements do not require clock synchronization.

## IP SLAs Operation Scheduling

When you configure an IP SLAs operation, you must schedule the operation to begin capturing statistics and collecting error information. You can schedule an operation to start immediately or to start at a certain month, day, and hour. You can use the *pending* option to set the operation to start at a later time. The pending option is an internal state of the operation that is visible through SNMP. The pending state is also used when an operation is a reaction (threshold) operation waiting to be triggered. You can schedule a single IP SLAs operation or a group of operations at one time.

You can schedule several IP SLAs operations by using a single command through the Cisco IOS CLI or the CISCO RTTMON-MIB. Scheduling the operations to run at evenly distributed times allows you to control the amount of IP SLAs monitoring traffic. This distribution of IP SLA operations helps minimize the CPU utilization and thus improves network scalability.

For more details about the IP SLA multi-operations scheduling functionality, see the “IP SLAs—Multiple Operation Scheduling” chapter of the *Cisco IOS IP SLAs Configuration Guide*.

## IP SLA Operation Threshold Monitoring

To support successful service level agreement monitoring, you must have mechanisms that notify you immediately of any possible violation. IP SLAs can send SNMP traps that are triggered by events such as the following:

- Connection loss
- Timeout
- Round-trip time threshold
- Average jitter threshold
- One-way packet loss

- One-way jitter
- One-way mean opinion score (MOS)
- One-way latency

An IP SLA threshold violation can also trigger another IP SLA operation for further analysis. For example, the frequency could be increased or an Internet Control Message Protocol (ICMP) path echo or ICMP path jitter operation could be initiated for troubleshooting.

### ICMP Echo

The ICMP echo operation measures the end-to-end response time between a Cisco device and any other device that uses IP. The response time is computed by measuring the time it takes to send an ICMP echo request message to a destination and receive an ICMP echo reply. Many customers use IP SLA ICMP-based operations, in-house ping testing, or ping-based dedicated probes to measure this response time. The IP SLA ICMP echo operation conforms to the same specifications as ICMP ping testing, and both methods result in the same response times.

## UDP Jitter

Jitter is a simple term that describes interpacket delay variance. When multiple packets are sent consecutively at an interval of 10 ms from source to destination, the destination should receive them 10 ms apart (if the network is behaving correctly). However, if there are delays in the network (such as queuing, arriving through alternate routes, and so on), the time interval between packet arrivals might be more or less than 10 ms. A positive jitter value indicates that the packets arrived more than 10 ms apart. A negative jitter value indicates that the packets arrived less than 10 ms apart. If the packets arrive 12 ms apart, the positive jitter is 2 ms; if the packets arrive 8 ms apart, the negative jitter is 2 ms. For delay-sensitive networks, positive jitter values are undesirable, and a jitter value of 0 is ideal.

In addition to monitoring jitter, the IP SLA UDP jitter operation can be used as a multipurpose data gathering operation. The packets generated by IP SLAs carry sequence information and time stamps from the source and operational target that include packet sending and receiving data. Based on this data, UDP jitter operations measure the following:

- Per-direction jitter (source to destination and destination to source)
- Per-direction packet-loss
- Per-direction delay (one-way delay)
- Round-trip delay (average round-trip time)

Because the paths for the sending and receiving of data can be different (asymmetric), you can use the per-direction data to more readily identify where congestion or other problems are occurring in the network.

The UDP jitter operation generates synthetic (simulated) UDP traffic and sends a number of UDP packets, each of a specified size, sent a specified number of milliseconds apart, from a source router to a target router, at a given frequency. By default, ten packet-frames, each with a payload size of 10 bytes are generated every 10 ms, and the operation is repeated every 60 seconds. You can configure each of these parameters to best simulate the IP service you want to provide.

To provide accurate one-way delay (latency) measurements, time synchronization (as provided by NTP) is required between the source and the target device. Time synchronization is not required for the one-way jitter and packet loss measurements. If the time is not synchronized between the source and target devices, one-way jitter and packet loss data is returned, but values of 0 are returned for the one-way delay measurements provided by the UDP jitter operation.

## How to Configure IP SLAs Operations

This section does not include configuration information for all available operations as the configuration information details are included in the *Cisco IOS IP SLAs Configuration Guide*. It does include several operations as examples, including configuring the responder, configuring a UDP jitter operation, which requires a responder, and configuring an ICMP echo operation, which does not require a responder. For details about configuring other operations, see the *Cisco IOS IP SLAs Configuration Guide*.

### Default Configuration

No IP SLAs operations are configured.

### Configuration Guidelines

For information on the IP SLA commands, see the *Cisco IOS IP SLAs Command Reference, Release 12.4T* command reference.

For detailed descriptions and configuration procedures, see the *Cisco IOS IP SLAs Configuration Guide, Release 12.4TL*.

Not all of the IP SLA commands or operations described in the referenced guide are supported on the switch. The switch supports IP service level analysis by using UDP jitter, UDP echo, HTTP, TCP connect, ICMP echo, ICMP path echo, ICMP path jitter, FTP, DNS, and DHCP, as well as multiple operation scheduling and proactive threshold monitoring. It does not support VoIP service levels using the gatekeeper registration delay operations measurements.

Before configuring any IP SLAs application, you can use the **show ip sla application** privileged EXEC command to verify that the operation type is supported on your software image. This is an example of the output from the command:

```
Switch# show ip sla application

      IP Service Level Agreements
Version: Round Trip Time MIB 2.2.0, Infrastructure Engine-III

Supported Operation Types:
      icmpEcho, path-echo, path-jitter, udpEcho, tcpConnect, http
      dns, udpJitter, dhcp, ftp, udpApp, wspApp

Supported Features:
      IPSLAs Event Publisher

IP SLAs low memory water mark: 33299323
Estimated system max number of entries: 24389
```

```

Estimated number of configurable operations: 24389
Number of Entries configured      : 0
Number of active Entries         : 0
Number of pending Entries        : 0
Number of inactive Entries       : 0
Time of last change in whole IP SLAs: *13:04:37.668 UTC Wed Dec 19 2012

```

## Configuring the IP SLA Responder

The IP SLA responder is available only on Cisco IOS software-based devices, including some Layer 2 switches that do not support full IP SLA functionality.

Follow these steps to configure the IP SLA responder on the target device (the operational target):

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip sla responder {tcp-connect   udp-echo}</b> <b>ipaddress ip-address port port-number</b> <b>Example:</b> Switch(config)# <b>ip sla responder udp-echo</b> <b>172.29.139.134 5000</b>	Configures the switch as an IP SLA responder. The keywords have these meanings: <ul style="list-style-type: none"> <li>• <b>tcp-connect</b>—Enables the responder for TCP connect operations.</li> <li>• <b>udp-echo</b>—Enables the responder for User Datagram Protocol (UDP) echo or jitter operations.</li> <li>• <b>ipaddress ip-address</b>—Enter the destination IP address.</li> <li>• <b>port port-number</b>—Enter the destination port number.</li> </ul> <p><b>Note</b> The IP address and port number must match those configured on the source device for the IP SLA operation.</p>

	Command or Action	Purpose
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b>  Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Implementing IP SLA Network Performance Measurement

Follow these steps to implement IP SLA network performance measurement on your switch:

### Before you begin

Use the **show ip sla application** privileged EXEC command to verify that the desired operation type is supported on your software image.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip sla operation-number</b> <b>Example:</b>	Creates an IP SLA operation, and enters IP SLA configuration mode.

	Command or Action	Purpose
	Switch(config)# ip sla 10	
<b>Step 4</b>	<p><b>udp-jitter</b> {<i>destination-ip-address</i>   <i>destination-hostname</i>} <i>destination-port</i> [<b>source-ip</b> {<i>ip-address</i>   <i>hostname</i>}] [<b>source-port</b> <i>port-number</i>] [<b>control</b> {<b>enable</b>   <b>disable</b>}] [<b>num-packets</b> <i>number-of-packets</i>] [<b>interval</b> <i>interpacket-interval</i>]</p> <p><b>Example:</b></p> <pre>Switch(config-ip-sla)# udp-jitter 172.29.139.134 5000</pre>	<p>Configures the IP SLA operation as the operation type of your choice (a UDP jitter operation is used in the example), and enters its configuration mode (UDP jitter configuration mode is used in the example).</p> <ul style="list-style-type: none"> <li>• <i>destination-ip-address</i>   <i>destination-hostname</i>—Specifies the destination IP address or hostname.</li> <li>• <i>destination-port</i>—Specifies the destination port number in the range from 1 to 65535.</li> <li>• (Optional) <b>source-ip</b> {<i>ip-address</i>   <i>hostname</i>}—Specifies the source IP address or hostname. When a source IP address or hostname is not specified, IP SLA chooses the IP address nearest to the destination</li> <li>• (Optional) <b>source-port</b> <i>port-number</i>—Specifies the source port number in the range from 1 to 65535. When a port number is not specified, IP SLA chooses an available port.</li> <li>• (Optional) <b>control</b>—Enables or disables sending of IP SLA control messages to the IP SLA responder. By default, IP SLA control messages are sent to the destination device to establish a connection with the IP SLA responder</li> <li>• (Optional) <b>num-packets</b> <i>number-of-packets</i>—Enters the number of packets to be generated. The range is 1 to 6000; the default is 10.</li> <li>• (Optional) <b>interval</b> <i>inter-packet-interval</i>—Enters the interval between sending packets in milliseconds. The range is 1 to 6000; the default value is 20 ms.</li> </ul>
<b>Step 5</b>	<p><b>frequency</b> <i>seconds</i></p> <p><b>Example:</b></p>	<p>(Optional) Configures options for the SLA operation. This example sets the rate at which a specified IP SLA operation repeats. The</p>

	Command or Action	Purpose
	Switch(config-ip-sla-jitter)# <b>frequency</b> 45	range is from 1 to 604800 seconds; the default is 60 seconds.
<b>Step 6</b>	<b>threshold</b> <i>milliseconds</i> <b>Example:</b> Switch(config-ip-sla-jitter)# <b>threshold</b> 200	(Optional) Configures threshold conditions. This example sets the threshold of the specified IP SLA operation to 200. The range is from 0 to 60000 milliseconds.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> Switch(config-ip-sla-jitter)# <b>exit</b>	Exits the SLA operation configuration mode (UDP jitter configuration mode in this example), and returns to global configuration mode.
<b>Step 8</b>	<b>ip sla schedule</b> <i>operation-number</i> [ <b>life</b> { <b>forever</b>   <i>seconds</i> }] [ <b>start-time</b> { <i>hh:mm</i> [: <i>ss</i> ] [ <i>month day</i>   <i>day month</i> ]   <b>pending</b>   <b>now</b>   <b>after</b> <i>hh:mm:ss</i> ] [ <b>ageout</b> <i>seconds</i> ] [ <b>recurring</b> ] <b>Example:</b> Switch(config)# <b>ip sla schedule</b> 10 <b>start-time now life forever</b>	Configures the scheduling parameters for an individual IP SLA operation. <ul style="list-style-type: none"> <li>• <i>operation-number</i>—Enter the RTR entry number.</li> <li>• (Optional) <b>life</b>—Sets the operation to run indefinitely (<b>forever</b>) or for a specific number of <i>seconds</i>. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour).</li> <li>• (Optional) <b>start-time</b>—Enters the time for the operation to begin collecting information:  To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. If no month is entered, the default is the current month.  Enter <b>pending</b> to select no information collection until a start time is selected.  Enter <b>now</b> to start the operation immediately.  Enter <b>after</b> <i>hh:mm:ss</i> to show that the operation should start after the entered time has elapsed.</li> <li>• (Optional) <b>ageout</b> <i>seconds</i>—Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is 0 to</li> </ul>

	Command or Action	Purpose
		2073600 seconds, the default is 0 seconds (never ages out).  • (Optional) <b>recurring</b> —Set the operation to automatically run every day.
<b>Step 9</b>	<b>end</b>  <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 10</b>	<b>show running-config</b>  <b>Example:</b>  Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 11</b>	<b>copy running-config startup-config</b>  <b>Example:</b>  Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

### UDP Jitter Configuration

This example shows how to configure a UDP jitter IP SLA operation:

```
Switch(config)# ip sla 10
Switch(config-ip-sla)# udp-jitter 172.29.139.134 5000
Switch(config-ip-sla-jitter)# frequency 30
Switch(config-ip-sla-jitter)# exit
Switch(config)# ip sla schedule 5 start-time now life forever
Switch(config)# end
Switch# show ip sla configuration 10
IP SLAs, Infrastructure Engine-II.
```

```
Entry number: 10
Owner:

## Analyzing IP Service Levels by Using the UDP Jitter Operation

Follow these steps to configure a UDP jitter operation on the source device:

### Before you begin

You must enable the IP SLA responder on the target device (the operational target) to configure a UDP jitter operation on the source device.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip sla operation-number</b> <b>Example:</b> Switch(config)# <b>ip sla 10</b>	Creates an IP SLA operation, and enters IP SLA configuration mode.
<b>Step 4</b>	<b>udp-jitter</b> <i>{destination-ip-address   destination-hostname}</i> <i>destination-port</i> [ <b>source-ip</b> <i>{ip-address   hostname}</i> ] [ <b>source-port</b> <i>port-number</i> ] [ <b>control</b> <i>{enable</i>	Configures the IP SLA operation as a UDP jitter operation, and enters UDP jitter configuration mode.

	Command or Action	Purpose
	<p>  <b>disable</b> } ] [ <b>num-packets</b> <i>number-of-packets</i> ]  [ <b>interval</b> <i>interpacket-interval</i> ]</p> <p><b>Example:</b></p> <pre>Switch(config-ip-sla) # <b>udp-jitter</b> 172.29.139.134 5000</pre>	<ul style="list-style-type: none"> <li>• <i>destination-ip-address</i>   <i>destination-hostname</i>—Specifies the destination IP address or hostname.</li> <li>• <i>destination-port</i>—Specifies the destination port number in the range from 1 to 65535.</li> <li>• (Optional) <b>source-ip</b> { <i>ip-address</i>   <i>hostname</i> }—Specifies the source IP address or hostname. When a source IP address or hostname is not specified, IP SLA chooses the IP address nearest to the destination.</li> <li>• (Optional) <b>source-port</b> <i>port-number</i>—Specifies the source port number in the range from 1 to 65535. When a port number is not specified, IP SLA chooses an available port.</li> <li>• (Optional) <b>control</b>—Enables or disables sending of IP SLA control messages to the IP SLA responder. By default, IP SLA control messages are sent to the destination device to establish a connection with the IP SLA responder.</li> <li>• (Optional) <b>num-packets</b> <i>number-of-packets</i>—Enters the number of packets to be generated. The range is 1 to 6000; the default is 10.</li> <li>• (Optional) <b>interval</b> <i>inter-packet-interval</i>—Enters the interval between sending packets in milliseconds. The range is 1 to 6000; the default value is 20 ms.</li> </ul>
<b>Step 5</b>	<p><b>frequency</b> <i>seconds</i></p> <p><b>Example:</b></p> <pre>Switch(config-ip-sla-jitter) # <b>frequency</b> 45</pre>	(Optional) Sets the rate at which a specified IP SLA operation repeats. The range is from 1 to 604800 seconds; the default is 60 seconds.
<b>Step 6</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-ip-sla-jitter) # <b>exit</b></pre>	Exits UDP jitter configuration mode, and returns to global configuration mode.

	Command or Action	Purpose
Step 7	<p><b>ip sla schedule</b> <i>operation-number</i> [<b>life</b> {<b>forever</b>   <i>seconds</i>}] [<b>start-time</b> {<i>hh:mm</i> [:<i>ss</i>] [<i>month day</i>   <i>day month</i>]   <b>pending</b>   <b>now</b>   <b>after</b> <i>hh:mm:ss</i>] [<b>ageout</b> <i>seconds</i>] [<b>recurring</b>]</p> <p><b>Example:</b></p> <pre>Switch(config)# ip sla schedule 10 start-time now life forever</pre>	<p>Configures the scheduling parameters for an individual IP SLA operation.</p> <ul style="list-style-type: none"> <li>• <i>operation-number</i>—Enter the RTR entry number.</li> <li>• (Optional) <b>life</b>—Sets the operation to run indefinitely (<b>forever</b>) or for a specific number of <i>seconds</i>. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour).</li> <li>• (Optional) <b>start-time</b>—Enters the time for the operation to begin collecting information: <ul style="list-style-type: none"> <li>To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. ## Analyzing IP Service Levels by Using the ICMP Echo Operation

Follow these steps to configure an ICMP echo operation on the source device:

### Before you begin

This operation does not require the IP SLA responder to be enabled.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip sla operation-number</b> <b>Example:</b> Switch(config)# <b>ip sla 10</b>	Creates an IP SLA operation and enters IP SLA configuration mode.
<b>Step 4</b>	<b>icmp-echo</b> { <i>destination-ip-address</i>   <i>destination-hostname</i> } [ <b>source-ip</b> { <i>ip-address</i>   <i>hostname</i> }   <b>source-interface</b> <i>interface-id</i> ] <b>Example:</b> Switch(config-ip-sla)# <b>icmp-echo 172.29.139.134</b>	Configures the IP SLA operation as an ICMP Echo operation and enters ICMP echo configuration mode. <ul style="list-style-type: none"> <li>• <i>destination-ip-address</i>   <i>destination-hostname</i>—Specifies the destination IP address or hostname.</li> <li>• (Optional) <b>source-ip</b> {<i>ip-address</i>   <i>hostname</i>}—Specifies the source IP address or hostname. When a source IP address or hostname is not specified, IP SLA chooses the IP address nearest to the destination.</li> <li>• (Optional) <b>source-interface</b> <i>interface-id</i>—Specifies the source interface for the operation.</li> </ul>

	Command or Action	Purpose
<b>Step 5</b>	<b>frequency</b> <i>seconds</i> <b>Example:</b> <pre>Switch(config-ip-sla-echo) # <b>frequency</b> 30</pre>	(Optional) Sets the rate at which a specified IP SLA operation repeats. The range is from 1 to 604800 seconds; the default is 60 seconds.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-ip-sla-echo) # <b>exit</b></pre>	Exits UDP echo configuration mode, and returns to global configuration mode.
<b>Step 7</b>	<b>ip sla schedule</b> <i>operation-number</i> [ <b>life</b> { <b>forever</b>   <i>seconds</i> }] [ <b>start-time</b> { <i>hh:mm</i> [: <i>ss</i> ] [ <i>month day</i>   <i>day month</i> ]   <b>pending</b>   <b>now</b>   <b>after</b> <i>hh:mm:ss</i> ] [ <b>ageout</b> <i>seconds</i> ] [ <b>recurring</b> ] <b>Example:</b> <pre>Switch(config)# <b>ip sla schedule</b> 5 <b>start-time now life forever</b></pre>	<p>Configures the scheduling parameters for an individual IP SLA operation.</p> <ul style="list-style-type: none"> <li>• <i>operation-number</i>—Enter the RTR entry number.</li> <li>• (Optional) <b>life</b>—Sets the operation to run indefinitely (<b>forever</b>) or for a specific number of <i>seconds</i>. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour)</li> <li>• (Optional) <b>start-time</b>—Enter the time for the operation to begin collecting information:  <p>To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. If no month is entered, the default is the current month.</p> <p>Enter <b>pending</b> to select no information collection until a start time is selected.</p> <p>Enter <b>now</b> to start the operation immediately.</p> <p>Enter <b>after</b> <i>hh:mm:ss</i> to indicate that the operation should start after the entered time has elapsed.</p> </li> <li>• (Optional) <b>ageout</b> <i>seconds</i>—Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is 0 to 2073600 seconds; the default is 0 seconds (never ages out).</li> <li>• (Optional) <b>recurring</b>—Sets the operation to automatically run every day.</li> </ul>

	Command or Action	Purpose
<b>Step 8</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 9</b>	<b>show running-config</b> <b>Example:</b> Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 10</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

### Configuring an ICMP Echo IP SLA Operation

This example shows how to configure an ICMP echo IP SLA operation:

```
Switch(config)# ip sla 12
Switch(config-ip-sla)# icmp-echo 172.29.139.134
Switch(config-ip-sla-echo)# frequency 30
Switch(config-ip-sla-echo)# exit
Switch(config)# ip sla schedule 5 start-time now life forever
Switch(config)# end
Switch# show ip sla configuration 22
IP SLAs, Infrastructure Engine-II.
```

```
Entry number: 12
Owner:
Tag:
Type of operation to perform: echo
Target address: 2.2.2.2
Source address: 0.0.0.0
Request size (ARR data portion): 28
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Verify data: No
Vrf Name:
Schedule:
  Operation frequency (seconds): 60
  Next Scheduled Start Time: Pending trigger
  Group Scheduled : FALSE
  Randomly Scheduled : FALSE
  Life (seconds): 3600
  Entry Ageout (seconds): never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): notInService
Threshold (milliseconds): 5000
Distribution Statistics:
```

```

Number of statistic hours kept: 2
Number of statistic distribution buckets kept: 1
Statistic distribution interval (milliseconds): 20
History Statistics:

## Monitoring IP SLA Operations

The following table describes the commands used to display IP SLA operation configurations and results:

**Table 53: Monitoring IP SLA Operations**

<b>show ip sla application</b>	Displays global information about Cisco IOS IP SLAs.
<b>show ip sla authentication</b>	Displays IP SLA authentication information.
<b>show ip sla configuration</b> [ <i>entry-number</i> ]	Displays configuration values including all defaults for all IP SLA operations or a specific operation.
<b>show ip sla enhanced-history</b> { <b>collection-statistics</b>   <b>distribution statistics</b> } [ <i>entry-number</i> ]	Displays enhanced history statistics for collected history buckets or distribution statistics for all IP SLA operations or a specific operation.
<b>show ip sla ethernet-monitor configuration</b> [ <i>entry-number</i> ]	Displays IP SLA automatic Ethernet configuration.
<b>show ip sla group schedule</b> [ <i>schedule-entry-number</i> ]	Displays IP SLA group scheduling configuration and details.
<b>show ip sla history</b> [ <i>entry-number</i>   <b>full</b>   <b>tabular</b> ]	Displays history collected for all IP SLA operations.
<b>show ip sla mpls-lsp-monitor</b> { <b>collection-statistics</b>   <b>configuration</b>   <b>ldp operational-state</b>   <b>scan-queue</b>   <b>summary</b> [ <i>entry-number</i> ]   <b>neighbors</b> }	Displays MPLS label switched path (LSP) Health Monitor operations.
<b>show ip sla reaction-configuration</b> [ <i>entry-number</i> ]	Displays the configured proactive threshold monitoring settings for all IP SLA operations or a specific operation.
<b>show ip sla reaction-trigger</b> [ <i>entry-number</i> ]	Displays the reaction trigger information for all IP SLA operations or a specific operation.
<b>show ip sla responder</b>	Displays information about the IP SLA responder.
<b>show ip sla statistics</b> [ <i>entry-number</i>   <b>aggregated</b>   <b>details</b> ]	Displays current or aggregated operational status and statistics.

# Monitoring IP SLA Operation Examples

The following example shows all IP SLAs by application:

```
Switch# show ip sla application

      IP Service Level Agreements
Version: Round Trip Time MIB 2.2.0, Infrastructure Engine-III

Supported Operation Types:
      icmpEcho, path-echo, path-jitter, udpEcho, tcpConnect, http
      dns, udpJitter, dhcp, ftp, udpApp, wspApp

Supported Features:
      IPSLAs Event Publisher

IP SLAs low memory water mark: 33299323
Estimated system max number of entries: 24389

Estimated number of configurable operations: 24389
Number of Entries configured      : 0
Number of active Entries          : 0
Number of pending Entries         : 0
Number of inactive Entries        : 0
Time of last change in whole IP SLAs: *13:04:37.668 UTC Wed Dec 19 2012
```

The following example shows all IP SLA distribution statistics:

```
Switch# show ip sla enhanced-history distribution-statistics

Point by point Enhanced History
Entry   = Entry Number
Int     = Aggregation Interval
BucI    = Bucket Index
StartT  = Aggregation Start Time
Pth     = Path index
Hop     = Hop in path index
Comps   = Operations completed
OvrTh   = Operations completed over thresholds
SumCmp  = Sum of RTT (milliseconds)
SumCmp2L = Sum of RTT squared low 32 bits (milliseconds)
SumCmp2H = Sum of RTT squared high 32 bits (milliseconds)
TMax    = RTT maximum (milliseconds)
TMin    = RTT minimum (milliseconds)

Entry Int BucI StartT      Pth Hop Comps OvrTh SumCmp      SumCmp2L  SumCmp2H  T
Max   TMin

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for Configuring Local Policies

- The policy map attributes supported on the switch are QoS, VLAN, session timeout, and ACL.
- Apple iPhone 6s will get classified as "workstation" after HTTP profiling.

## Information About Configuring Local Policies

Local policies can profile devices based on HTTP and DHCP to identify the end devices on the network. Users can configure device-based policies and enforce the policies per user or per device policy on the network.

Local policies allow profiling of mobile devices and basic onboarding of the profiled devices to a specific VLAN. They also assign ACL and QoS or configure session timeouts.

You can configure local policies as two separate components:

- Defining policy attributes as service templates specific to clients joining the network and applying policy match criteria.
- Applying match criteria to the policy.

The following policy match attributes are used for configuring local policies:

- Device—Defines the type of device. Windows-based computer, Smart phone, Apple devices such as iPad and iPhone.
- Username—Defines the username of the user.
- User role—Defines the user type or the user group the user belongs to, such as a student or employee.
- MAC—Defines the mac-address of the end point.
- MAC OUI—Defines the mac-address OUI.

Once the switch has a match corresponding to these parameters per end point, the policy can be added. Policy enforcement allows basic device on-boarding of mobile devices based on the following session attributes:

- VLAN
- QoS
- ACL
- Session timeout

You can configure these policies and enforce end points with specified policies. The wireless clients are profiled based on MAC OUI, DHCP, and HTTP user agent (valid Internet is required for successful HTTP profiling). The switch uses these attributes and predefined classification profiles to identify devices.

### Replacing Default Profile Text File

If a new device is not classified, contact the Cisco support team with the device MAC address. The Cisco support team will provide a new **dc\_default\_profile.txt** file with the MAC address included in the file. You need to replace the **dc\_default\_profile.txt** file with the earlier file. Follow these steps to change the **dc\_default\_profile.txt** file:

1. Stop device classifier by entering this command:  
`switch(config)# no device classifier`
2. Copy the file by entering this command:

```
switch# device classifier profile location filepath
```

3. Start the device classifier by entering this command:

```
switch(config)# device classifier
```

#### Disabling session monitor on trunk ports

On uplink trunk ports, you should not create any session monitoring. By default, session monitoring is enabled. You should disable session monitoring.

1. Enter into global configuration mode by entering this command:

```
switch# configure terminal
```

2. Enter into interface configuration mode by entering this command:

```
switch(config)# interface interface-id
```

3. Disable session monitoring by entering this command:

```
switch(config-if)# no access-session monitor
```

# How to Configure Local Policies

## Configuring Local Policies (CLI)

To configure local policies, complete these procedures:

1. Create a service template.
2. Create an interface template.
3. Create a parameter map.
4. Create a policy map.
5. Apply a local policy on a WLAN.

## Creating a Service Template (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>service-template <i>service-template-name</i></b>  <b>Example:</b> Switch(config)# <b>service-template</b> <b>cisco-phone-template</b> Switch(config-service-template)#	Enters service template configuration mode.
<b>Step 3</b>	<b>access-group <i>acl_list</i></b>  <b>Example:</b> Switch(config-service-template)# <b>access-group foo-acl</b>	Specifies the access list to be applied.
<b>Step 4</b>	<b>vlan <i>vlan_id</i></b>  <b>Example:</b> Switch(config-service-template)# <b>vlan</b> <b>100</b>	Specifies VLAN ID. You can specify a value from 1 to 4094.
<b>Step 5</b>	<b>absolute-timer <i>seconds</i></b>  <b>Example:</b> Switch(config-service-template)# <b>absolute-timer 20</b>	Specifies session timeout value for service template. You can specify a value from 1 to 65535.
<b>Step 6</b>	<b>service-policy qos {input   output}</b>  <b>Example:</b> Switch(config-service-template)# <b>service-policy qos input foo-qos</b>	Configures QoS policies for the client.
<b>Step 7</b>	<b>end</b>  <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Creating an Interface Template (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>template <i>interface-template-name</i></b> <b>Example:</b> Switch(config)# <b>template</b> <b>cisco-phone-template</b> Switch(config-template)#	Enters interface template configuration mode.
<b>Step 3</b>	<b>switchport mode access</b> <b>Example:</b> Switch(config-template)# <b>switchport mode</b> <b>access</b>	Sets the interface as a nontrunking nontagged single-VLAN Ethernet interface. An access port can carry traffic in one VLAN only. By default, an access port carries traffic for VLAN1.
<b>Step 4</b>	<b>switchport voice vlan <i>vlan_id</i></b> <b>Example:</b> Switch(config-template)# <b>switchport voice</b> <b>vlan 20</b>	Specifies to forward all voice traffic through the specified VLAN. You can specify a value from 1 to 4094.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Creating a Parameter Map (CLI)

Parameter map is preferred to use than class map.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Switch# <code>configure terminal</code>	
<b>Step 2</b>	<p><code>parameter-map type subscriber attribute-to-service <i>parameter-map-name</i></code></p> <p><b>Example:</b></p> <pre>Switch(config)# parameter-map type subscriber attribute-to-service Aironet-Policy-para</pre>	Specifies the parameter map type and name.
<b>Step 3</b>	<p><code>map-index map { device-type   mac-address   oui   user-role   username } { eq   not-eq   regex <i>filter-name</i> }</code></p> <p><b>Example:</b></p> <pre>Switch(config-parameter-map-filter)# 10 map device-type eq "WindowsXP-Workstation"</pre>	Specifies parameter map attribute filter criteria.
<b>Step 4</b>	<p><code>service-template <i>service-template-name</i></code></p> <p><b>Example:</b></p> <pre>Switch(config-parameter-map-filter-submode)# service-template cisco-phone-template Switch(config-parameter-map-filter-submode)#</pre>	Enters service template configuration mode.
<b>Step 5</b>	<p><code>interface-template <i>interface-template-name</i></code></p> <p><b>Example:</b></p> <pre>Switch(config-parameter-map-filter-submode)# interface-template cisco-phone-template Switch(config-parameter-map-filter-submode)#</pre>	Enters service template configuration mode.
<b>Step 6</b>	<p><code>end</code></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Local Policies (GUI)

To configure local policies, complete these procedures:

1. Create a service template.
2. Create a policy map.
3. Apply a local policy that you have created to a WLAN.

### Creating a Service Template (GUI)

#### Procedure

---

- Step 1** Choose **Configuration > Security > Local Policies > Service Template** to open the **Service Template** page.
- Step 2** Create a new template as follows:
- a) Click **New** to open the **Service Template > New** page.
  - b) In the Service Template name text box, enter the new service template name.
  - c) In the VLAN ID text box, enter the VLAN identifier that has to be associated with the policy. The value ranges from 1 to 4094.
  - d) In the Session timeout text box, enter the maximum amount of time, in seconds, after which a client is forced to reauthenticate. The value ranges from 1 to 65535 seconds.
  - e) From the Access control list drop-down list, choose the access control list to be mapped to the policy.
  - f) From the Ingress QoS drop-down list, choose the ingress QoS policy to be applied.
  - g) From the Egress QoS drop-down list, choose the egress QoS policy to be applied.
  - h) Click **Apply** to save the configuration.
- Step 3** Edit a service template as follows:
- a) From the **Service Template** page, click the service template to open the **Service Template > Edit** page.
  - b) In the VLAN ID text box, enter the VLAN identifier that has to be associated with the policy. The value ranges from 1 to 4094.
  - c) In the Session timeout text box, enter the maximum amount of time, in seconds, after which a client is forced to reauthenticate. The value ranges from 1 to 65535 seconds.
  - d) From the Access control list drop-down list, choose the access control list to be mapped to the policy.
  - e) From the Ingress QoS drop-down list, choose the ingress QoS policy to be applied.
  - f) From the Egress QoS drop-down list, choose the egress QoS policy to be applied.
  - g) Click **Apply** to save the configuration.
- Step 4** Remove a service template as follows:
- a) From the **Service Template** page, select the service template.
  - b) Click **Remove**.
  - c) Click **Apply** to save the configuration.

---

#### Related Topics

- [Monitoring Local Policies](#), on page 688
- [Examples: Local Policies Configuration](#), on page 689

## Creating a Policy Map (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Security > Local Policies > Policy Map** to open the **Policy Map** page.
- Step 2** Create a new policy map as follows:
- Click **New** to open the **Policy Map > New** page.
  - In the Policy Map name text box, enter the new policy map name.
  - Click **Add** to open the Match Criteria area.
  - From the Device Type drop-down list, choose the device type. The match criteria for the device type can be eq, not-eq, or regex with respect to the device type you are choosing.
  - From the User Role drop-down list, select the match criteria as eq, not-eq, or regex and enter the user type or user group of the user, for example, student, teacher, and so on.
  - From the Service Template drop-down list, choose the service template to be mapped to the policy.
  - Click **Add**. The match criteria is added to the Match Criteria Lists.
  - In the Match Criteria Lists area, click **Add** to add the match criteria to the policy.
  - Click **Apply** to save the configuration.
- Step 3** Edit a policy map as follows:
- In the **Policy Map** page, select the policy map that you want to edit, and click **Edit** to open the **Policy Map > Edit** page.
  - In the Match Criteria area, choose the device type from the Device Type drop-down list. The match criteria for the device type can be eq, not-eq, or regex with respect to the device type you are choosing.
  - In the Match Criteria area, choose the user role from the User Role drop-down list. Select the match criteria as eq, not-eq, or regex and enter the user type or user group of the user.
  - From the Service Template drop-down list, choose the service template to be mapped to the policy.
  - Click **Ok** to save the configuration or **Cancel** to discard the configuration.
  - Click **Add** to add more match criteria based on device type, user role, and service template to the policy.
  - In the Match Criteria Lists area, select the match criteria and click **Move to** to move the match criteria with respect to a value entered in the row text box.
  - Select the match criteria and click **Move up** to move the match criteria up in the list.
  - Select the match criteria and click **Move down** to move the match criteria down in the list.
  - Select the match criteria and click **Remove** to remove the match criteria from the policy map list.
  - Click **Apply** to save the configuration.
- Step 4** Remove a policy map as follows:
- From the **Policy Map** page, select the policy map.
  - Click **Remove**.
  - Click **Apply** to save the configuration.

---

## Applying Local Policies to WLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > WLAN** to open the **WLANs** page.
  - Step 2** Click the corresponding WLAN profile. The **WLANs > Edit** page is displayed.
  - Step 3** Click the **Policy-Mapping** tab.
  - Step 4** Check the **Device Classification** check box to enable classification based on device type.
  - Step 5** From the Local Subscriber Policy drop-down list, choose the policy that has to be applied for the WLAN.
  - Step 6** Select **Local HTTP Profiling** to enable profiling on devices based on HTTP (optional).
  - Step 7** Select **Radius HTTP Profiling** to enable profiling on devices based on RADIUS (optional).
  - Step 8** Click **Apply** to save the configuration.
-

## Monitoring Local Policies

The following commands can be used to monitor local policies configured on the switch.

*Table 54: Monitoring Local Policies Command*

Command	Purpose
<b>show access-session</b>	Displays the summary of access session with authorization status, method and domain for each client or MAC address displayed.
<b>show access-session cache</b>	Displays the latest classification for the client.
<b>show device classifier attached detail</b>	Displays the latest classification for the client based on parameters such as Mac, DHCP, or HTTP.
<b>show access-session mac mac-address details</b>	<p>Displays the policy mapped, service template used, and attributes for the client.</p> <p><b>Note</b> If the <b>show access-session detail</b> command output is not displaying session timeout details, you should enable client profiling with session timeout in client access session and then run the <b>show access-session mac mac-address details</b> command to see the session timeout details.</p>

<p><b>show access-session mac</b> <i>mac-address policy</i></p>	<p>Displays the policy mapped, service template used, and attributes for the client.</p> <p>In addition, you can view the <b>Resultant Policy</b> that displays the following information:</p> <ul style="list-style-type: none"> <li>• The final attributes applied to the session when the session has locally configured attributes.</li> <li>• Attributes applied from the server.</li> </ul>

## Examples: Local Policies Configuration

This example shows how to create service template:

```
Switch(config)# service-template test3
Switch(config-service-template)# access-group josephacl
Switch(config-service-template)# vlan 137
Switch(config-service-template)# absolute-timer 500
Switch(config-service-template)# service-policy qos input qosingress
Switch(config-service-template)# end
```

This example shows how to create parameter map:

```
Switch(config)# parameter-map type subscriber attribute-to-service apple-tsim-param
Switch(config-parameter-map)# 1 map device-type eq "Apple-Device"
Switch(config-parameter-map)# 1 service-template test1
Switch(config-parameter-map)# 2 map device-type eq "Apple-Ipad"
Switch(config-parameter-map)# 1 service-template test2
Switch(config-parameter-map)# 3 map device-type eq "Android"
Switch(config-parameter-map)# 1 service-template test3
Switch(config-parameter-map)# end
```

### Note

At the end of each configuration command line, enter CTRL Z to execute the command and proceed to the next line.

This example shows how to create interface template:

```
Switch# configure terminal
Switch(config)# template cisco-phone-template
Switch(config-template)# switchport mode access
Switch(config-template)# switchport voice vlan 20
Switch(config-template)# end
```

This example shows how to create parameter map:

```
Switch# configure terminal
Switch(config)# parameter-map type subscriber attribute-to-service param-wired
Switch(config-parameter-map-filter)# 10 map device-type regex Cisco-IP-Phone
Switch(config-parameter-map-filter-submode)# 10 interface-template cisco-phone-template
Switch(config-parameter-map)# end
```

This example shows how to create policy map:

```
Switch(config)# policy-map type control subscriber apple-tsim
Switch(config-policy-map)# event identity-update match-all
Switch(config-policy-map)# 1 class always do-until-failure
Switch(config-policy-map)# 1 map attribute-to-service table apple-tsim-param
Switch(config-policy-map)# end
```

This example shows how to apply policy to a device on a WLAN:

```
Switch(config)# wlan wlan1
Switch(config-wlan)# client vlan VLAN0054
Switch(config-wlan)# profiling local http
Switch(config-wlan)# service-policy type control subscriber apple-tsim
Switch(config-wlan)# no shutdown
Switch# end
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for SPAN and RSPAN

### SPAN

- You can limit SPAN traffic to specific VLANs by using the **filter vlan** keyword. If a trunk port is being monitored, only traffic on the VLANs specified with this keyword is monitored. By default, all VLANs are monitored on a trunk port.

### RSPAN

- We recommend that you configure an RSPAN VLAN before you configure an RSPAN source or a destination session.

# Restrictions for SPAN and RSPAN

## SPAN

The restrictions for SPAN are as follows:

- On each switch, you can configure 66 sessions. A maximum of 7 source sessions can be configured and the remaining sessions can be configured as RSPAN destination sessions. A source session is either a local SPAN session or an RSPAN source session.
- For SPAN sources, you can monitor traffic for a single port or VLAN or a series or range of ports or VLANs for each session. You cannot mix source ports and source VLANs within a single SPAN session.
- The destination port cannot be a source port; a source port cannot be a destination port.
- You cannot have two SPAN sessions using the same destination port.
- When you configure a switch port as a SPAN destination port, it is no longer a normal switch port; only monitored traffic passes through the SPAN destination port.
- Entering SPAN configuration commands does not remove previously configured SPAN parameters. You must enter the **no monitor session** *{session\_number | all | local | remote}* global configuration command to delete configured SPAN parameters.
- For local SPAN, outgoing packets through the SPAN destination port carry the original encapsulation headers—untagged, ISL, or IEEE 802.1Q—if the **encapsulation replicate** keywords are specified. If the keywords are not specified, the packets are sent in native form.
- You can configure a disabled port to be a source or destination port, but the SPAN function does not start until the destination port and at least one source port or source VLAN are enabled.
- You cannot mix source VLANs and filter VLANs within a single SPAN session.

Traffic monitoring in a SPAN session has the following restrictions:

- Sources can be ports or VLANs, but you cannot mix source ports and source VLANs in the same session.
- Wireshark does not capture egress packets when egress span is active.
- You can run both a local SPAN and an RSPAN source session in the same switch or switch stack. The switch or switch stack supports a total of 66 source and RSPAN destination sessions.
- You can configure two separate SPAN or RSPAN source sessions with separate or overlapping sets of SPAN source ports and VLANs. Both switched and routed ports can be configured as SPAN sources and destinations.
- You can have multiple destination ports in a SPAN session, but no more than 64 destination ports per switch stack.
- SPAN sessions do not interfere with the normal operation of the switch. However, an oversubscribed SPAN destination, for example, a 10-Mb/s port monitoring a 100-Mb/s port, can result in dropped or lost packets.
- When SPAN or RSPAN is enabled, each packet being monitored is sent twice, once as normal traffic and once as a monitored packet. Monitoring a large number of ports or VLANs could potentially generate large amounts of network traffic.

- You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.
- The switch does not support a combination of local SPAN and RSPAN in a single session.
  - An RSPAN source session cannot have a local destination port.
  - An RSPAN destination session cannot have a local source port.
  - An RSPAN destination session and an RSPAN source session that are using the same RSPAN VLAN cannot run on the same switch or switch stack.

## RSPAN

The restrictions for RSPAN are as follows:

- RSPAN does not support BPDU packet monitoring or other Layer 2 switch protocols.
- The RSPAN VLAN is configured only on trunk ports and not on access ports. To avoid unwanted traffic in RSPAN VLANs, make sure that the VLAN remote-span feature is supported in all the participating switches.
- RSPAN VLANs are included as sources for port-based RSPAN sessions when source trunk ports have active RSPAN VLANs. RSPAN VLANs can also be sources in SPAN sessions. However, since the switch does not monitor spanned traffic, it does not support egress spanning of packets on any RSPAN VLAN identified as the destination of an RSPAN source session on the switch.
- 
- If you enable VTP and VTP pruning, RSPAN traffic is pruned in the trunks to prevent the unwanted flooding of RSPAN traffic across the network for VLAN IDs that are lower than 1005.
- To use RSPAN, the switch must be running the LAN Base image.

# Information About SPAN and RSPAN

## SPAN and RSPAN

You can analyze network traffic passing through ports or VLANs by using SPAN or RSPAN to send a copy of the traffic to another port on the switch or on another switch that has been connected to a network analyzer or other monitoring or security device. SPAN copies (or mirrors) traffic received or sent (or both) on source ports or source VLANs to a destination port for analysis. SPAN does not affect the switching of network traffic on the source ports or VLANs. You must dedicate the destination port for SPAN use. Except for traffic that is required for the SPAN or RSPAN session, destination ports do not receive or forward traffic.

Only traffic that enters or leaves source ports or traffic that enters or leaves source VLANs can be monitored by using SPAN; traffic routed to a source VLAN cannot be monitored. For example, if incoming traffic is being monitored, traffic that gets routed from another VLAN to the source VLAN cannot be monitored; however, traffic that is received on the source VLAN and routed to another VLAN can be monitored.

You can use the SPAN or RSPAN destination port to inject traffic from a network security device. For example, if you connect a Cisco Intrusion Detection System (IDS) sensor appliance to a destination port, the IDS device can send TCP reset packets to close down the TCP session of a suspected attacker.

## Local SPAN

Local SPAN supports a SPAN session entirely within one switch; all source ports or source VLANs and destination ports are in the same switch or switch stack. Local SPAN copies traffic from one or more source ports in any VLAN or from one or more VLANs to a destination port for analysis.

**Figure 57: Example of Local SPAN Configuration on a Single Device**

All traffic on port 5 (the source port) is mirrored to port 10 (the destination port). A network analyzer on port 10 receives all network traffic from port 5 without being physically attached to port

**Figure 58: Example of Local SPAN Configuration on a Device Stack**

This is an example of a local SPAN in a switch stack, where the source and destination ports reside on different stack members.

### Related Topics

[Creating a Local SPAN Session and Configuring Incoming Traffic](#), on page 709

[Example: Configuring Local SPAN](#), on page 729

## Remote SPAN

RSPAN supports source ports, source VLANs, and destination ports on different switches (or different switch stacks), enabling remote monitoring of multiple switches across your network.

**Figure 59: Example of RSPAN Configuration**

The figure below shows source ports on Switch A and Switch B. The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating switches. The RSPAN traffic from the source ports or VLANs is copied into the RSPAN VLAN and forwarded over trunk ports carrying the RSPAN VLAN to a destination session monitoring the RSPAN VLAN. Each RSPAN source switch must have either ports or VLANs as RSPAN sources. The destination is always a physical port,

as shown on Switch C in the figure.

## SPAN and RSPAN Concepts and Terminology

- [SPAN Sessions](#)

- [Monitored Traffic](#)
- [Source Ports](#)
- [Source VLANs](#)
- [VLAN Filtering](#)
- [Destination Port](#)
- [RSPAN VLAN](#)

## SPAN Sessions

SPAN sessions (local or remote) allow you to monitor traffic on one or more ports, or one or more VLANs, and send the monitored traffic to one or more destination ports.

A local SPAN session is an association of a destination port with source ports or source VLANs, all on a single network device. Local SPAN does not have separate source and destination sessions. Local SPAN sessions gather a set of ingress and egress packets specified by the user and form them into a stream of SPAN data, which is directed to the destination port.

RSPAN consists of at least one RSPAN source session, an RSPAN VLAN, and at least one RSPAN destination session. You separately configure RSPAN source sessions and RSPAN destination sessions on different network devices. To configure an RSPAN source session on a device, you associate a set of source ports or source VLANs with an RSPAN VLAN. The output of this session is the stream of SPAN packets that are sent to the RSPAN VLAN. To configure an RSPAN destination session on another device, you associate the destination port with the RSPAN VLAN. The destination session collects all RSPAN VLAN traffic and sends it out the RSPAN destination port.

An RSPAN source session is very similar to a local SPAN session, except for where the packet stream is directed. In an RSPAN source session, SPAN packets are relabeled with the RSPAN VLAN ID and directed over normal trunk ports to the destination switch.

An RSPAN destination session takes all packets received on the RSPAN VLAN, strips off the VLAN tagging, and presents them on the destination port. The session presents a copy of all RSPAN VLAN packets (except Layer 2 control packets) to the user for analysis.

A single RSPAN session with multiple source and destination ports can be in the same session but more than one source session with the source being the same remote vlan is not allowed.

Traffic monitoring in a SPAN session has these restrictions:

- Sources can be ports or VLANs, but you cannot mix source ports and source VLANs in the same session.
- You can run both a local SPAN and an RSPAN source session in the same switch or switch stack. The switch or switch stack supports a total of 66 source and RSPAN destination sessions.
- You can configure two separate SPAN or RSPAN source sessions with separate or overlapping sets of SPAN source ports and VLANs. Both switched and routed ports can be configured as SPAN sources and destinations.
- You can have multiple destination ports in a SPAN session, but no more than 64 destination ports per switch stack.
- SPAN sessions do not interfere with the normal operation of the switch. However, an oversubscribed SPAN destination, for example, a 10-Mb/s port monitoring a 100-Mb/s port, can result in dropped or lost packets.

- When SPAN or RSPAN is enabled, each packet being monitored is sent twice, once as normal traffic and once as a monitored packet. Therefore monitoring a large number of ports or VLANs could potentially generate large amounts of network traffic.
- You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.
- The switch does not support a combination of local SPAN and RSPAN in a single session.
  - An RSPAN source session cannot have a local destination port.
  - An RSPAN destination session cannot have a local source port.
  - An RSPAN destination session and an RSPAN source session that are using the same RSPAN VLAN cannot run on the same switch or switch stack.

### Related Topics

[Creating a Local SPAN Session](#), on page 706

[Creating a Local SPAN Session and Configuring Incoming Traffic](#), on page 709

[Example: Configuring Local SPAN](#), on page 729

## Monitored Traffic

SPAN sessions can monitor these traffic types:

- Receive (Rx) SPAN—Receive (or ingress) SPAN monitors as much as possible all of the packets received by the source interface or VLAN before any modification or processing is performed by the switch. A copy of each packet received by the source is sent to the destination port for that SPAN session.

Packets that are modified because of routing or Quality of Service (QoS)—for example, modified Differentiated Services Code Point (DSCP)—are copied before modification.

Features that can cause a packet to be dropped during receive processing have no effect on ingress SPAN; the destination port receives a copy of the packet even if the actual incoming packet is dropped. These features include IP standard and extended input Access Control Lists (ACLs), ingress QoS policing, VLAN ACLs, and egress QoS policing.

- Transmit (Tx) SPAN—Transmit (or egress) SPAN monitors as much as possible all of the packets sent by the source interface after all modification and processing is performed by the switch. A copy of each packet sent by the source is sent to the destination port for that SPAN session. The copy is provided after the packet is modified.

Packets that are modified because of routing (for example, with modified time-to-live (TTL), MAC address, or QoS values) are duplicated (with the modifications) at the destination port.

Features that can cause a packet to be dropped during transmit processing also affect the duplicated copy for SPAN. These features include IP standard and extended output ACLs and egress QoS policing.

- Both—In a SPAN session, you can also monitor a port or VLAN for both received and sent packets. This is the default.

The default configuration for local SPAN session ports is to send all packets untagged. However, when you enter the **encapsulation replicate** keywords while configuring a destination port, these changes occur:

- Packets are sent on the destination port with the same encapsulation (untagged or IEEE 802.1Q) that they had on the source port.

- Packets of all types, including BPDU and Layer 2 protocol packets, are monitored.

Therefore, a local SPAN session with encapsulation replicate enabled can have a mixture of untagged and IEEE 802.1Q tagged packets appear on the destination port.

Switch congestion can cause packets to be dropped at ingress source ports, egress source ports, or SPAN destination ports. In general, these characteristics are independent of one another. For example:

- A packet might be forwarded normally but dropped from monitoring due to an oversubscribed SPAN destination port.
- An ingress packet might be dropped from normal forwarding, but still appear on the SPAN destination port.
- An egress packet dropped because of switch congestion is also dropped from egress SPAN.

In some SPAN configurations, multiple copies of the same source packet are sent to the SPAN destination port. For example, a bidirectional (both Rx and Tx) SPAN session is configured for the Rx monitor on port A and Tx monitor on port B. If a packet enters the switch through port A and is switched to port B, both incoming and outgoing packets are sent to the destination port. Both packets are the same unless a Layer 3 rewrite occurs, in which case the packets are different because of the packet modification.

## Source Ports

A source port (also called a monitored port) is a switched or routed port that you monitor for network traffic analysis. In a local SPAN session or RSPAN source session, you can monitor source ports or VLANs for traffic in one or both directions. The switch supports any number of source ports (up to the maximum number of available ports on the switch) and any number of source VLANs (up to the maximum number of VLANs supported). However, the switch supports a maximum of (local or RSPAN) with source ports or VLANs. You cannot mix ports and VLANs in a single session.

A source port has these characteristics:

- It can be monitored in multiple SPAN sessions.
- Each source port can be configured with a direction (ingress, egress, or both) to monitor.
- It can be any port type (for example, EtherChannel, Gigabit Ethernet, and so forth).
- For EtherChannel sources, you can monitor traffic for the entire EtherChannel or individually on a physical port as it participates in the port channel.
- It can be an access port, trunk port, routed port, or voice VLAN port.
- It cannot be a destination port.
- Source ports can be in the same or different VLANs.
- You can monitor multiple source ports in a single session.

## Source VLANs

VLAN-based SPAN (VSPAN) is the monitoring of the network traffic in one or more VLANs. The SPAN or RSPAN source interface in VSPAN is a VLAN ID, and traffic is monitored on all the ports for that VLAN.

VSPAN has these characteristics:

- All active ports in the source VLAN are included as source ports and can be monitored in either or both directions.
- On a given port, only traffic on the monitored VLAN is sent to the destination port.
- If a destination port belongs to a source VLAN, it is excluded from the source list and is not monitored.
- If ports are added to or removed from the source VLANs, the traffic on the source VLAN received by those ports is added to or removed from the sources being monitored.
- You cannot use filter VLANs in the same session with VLAN sources.
- You can monitor only Ethernet VLANs.

## VLAN Filtering

When you monitor a trunk port as a source port, by default, all VLANs active on the trunk are monitored. You can limit SPAN traffic monitoring on trunk source ports to specific VLANs by using VLAN filtering.

- VLAN filtering applies only to trunk ports or to voice VLAN ports.
- VLAN filtering applies only to port-based sessions and is not allowed in sessions with VLAN sources.
- When a VLAN filter list is specified, only those VLANs in the list are monitored on trunk ports or on voice VLAN access ports.
- SPAN traffic coming from other port types is not affected by VLAN filtering; that is, all VLANs are allowed on other ports.
- VLAN filtering affects only traffic forwarded to the destination SPAN port and does not affect the switching of normal traffic.

## Destination Port

Each local SPAN session or RSPAN destination session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source ports or VLANs and sends the SPAN packets to the user, usually a network analyzer.

A destination port has these characteristics:

- For a local SPAN session, the destination port must reside on the same switch or switch stack as the source port. For an RSPAN session, it is located on the switch containing the RSPAN destination session. There is no destination port on a switch or switch stack running only an RSPAN source session.
- When a port is configured as a SPAN destination port, the configuration overwrites the original port configuration. When the SPAN destination configuration is removed, the port reverts to its previous configuration. If a configuration change is made to the port while it is acting as a SPAN destination port, the change does not take effect until the SPAN destination configuration had been removed.

---

**Note** When QoS is configured on the SPAN destination port, QoS takes effect immediately.

---

- If the port was in an EtherChannel group, it is removed from the group while it is a destination port. If it was a routed port, it is no longer a routed port.

- It can be any Ethernet physical port.
- It cannot be a secure port.
- It cannot be a source port.
- It can be an EtherChannel group (**ON** mode only).
- It cannot be a VLAN.
- It can participate in only one SPAN session at a time (a destination port in one SPAN session cannot be a destination port for a second SPAN session).
- When it is active, incoming traffic is disabled. The port does not transmit any traffic except that required for the SPAN session. Incoming traffic is never learned or forwarded on a destination port.
- If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.
- It does not participate in any of the Layer 2 protocols (STP, VTP, CDP, DTP, PagP).
- A destination port that belongs to a source VLAN of any SPAN session is excluded from the source list and is not monitored.
- The maximum number of destination ports in a switch or switch stack is 64.

Local SPAN and RSPAN destination ports function differently with VLAN tagging and encapsulation:

- For local SPAN, if the **encapsulation replicate** keywords are specified for the destination port, these packets appear with the original encapsulation (untagged, ISL, or IEEE 802.1Q). If these keywords are not specified, packets appear in the untagged format. Therefore, the output of a local SPAN session with **encapsulation replicate** enabled can contain a mixture of untagged, ISL, or IEEE 802.1Q-tagged packets.
- For RSPAN, the original VLAN ID is lost because it is overwritten by the RSPAN VLAN identification. Therefore, all packets appear on the destination port as untagged.

## RSPAN VLAN

The RSPAN VLAN carries SPAN traffic between RSPAN source and destination sessions. RSPAN VLAN has these special characteristics:

- All traffic in the RSPAN VLAN is always flooded.
- No MAC address learning occurs on the RSPAN VLAN.
- RSPAN VLAN traffic only flows on trunk ports.
- RSPAN VLANs must be configured in VLAN configuration mode by using the **remote-span** VLAN configuration mode command.
- STP can run on RSPAN VLAN trunks but not on SPAN destination ports.
- An RSPAN VLAN cannot be a private-VLAN primary or secondary VLAN.

For VLANs 1 to 1005 that are visible to VLAN Trunking Protocol (VTP), the VLAN ID and its associated RSPAN characteristic are propagated by VTP. If you assign an RSPAN VLAN ID in the extended VLAN range (1006 to 4094), you must manually configure all intermediate switches.

It is normal to have multiple RSPAN VLANs in a network at the same time with each RSPAN VLAN defining a network-wide RSPAN session. That is, multiple RSPAN source sessions anywhere in the network can contribute packets to the RSPAN session. It is also possible to have multiple RSPAN destination sessions throughout the network, monitoring the same RSPAN VLAN and presenting traffic to the user. The RSPAN VLAN ID separates the sessions.

## SPAN and RSPAN Interaction with Other Features

SPAN interacts with these features:

- **Routing**—SPAN does not monitor routed traffic. VSPAN only monitors traffic that enters or exits the switch, not traffic that is routed between VLANs. For example, if a VLAN is being Rx-monitored and the switch routes traffic from another VLAN to the monitored VLAN, that traffic is not monitored and not received on the SPAN destination port.
- **STP**—A destination port does not participate in STP while its SPAN or RSPAN session is active. The destination port can participate in STP after the SPAN or RSPAN session is disabled. On a source port, SPAN does not affect the STP status. STP can be active on trunk ports carrying an RSPAN VLAN.
- **CDP**—A SPAN destination port does not participate in CDP while the SPAN session is active. After the SPAN session is disabled, the port again participates in CDP.  
Due to limitation in the ASIC, CDP packets are not dropped in RSPAN configured VLAN.
- **VTP**—You can use VTP to prune an RSPAN VLAN between switches.
- **VLAN and trunking**—You can modify VLAN membership or trunk settings for source or destination ports at any time. However, changes in VLAN membership or trunk settings for a destination port do not take effect until you remove the SPAN destination configuration. Changes in VLAN membership or trunk settings for a source port immediately take effect, and the respective SPAN sessions automatically adjust accordingly.
- **EtherChannel**—You can configure an EtherChannel group as a source port or a SPAN destination port. When a group is configured as a SPAN source, the entire group is monitored.

If a physical port is added to a monitored EtherChannel group, the new port is added to the SPAN source port list. If a port is removed from a monitored EtherChannel group, it is automatically removed from the source port list.

A physical port that belongs to an EtherChannel group can be configured as a SPAN source port and still be a part of the EtherChannel. In this case, data from the physical port is monitored as it participates in the EtherChannel. However, if a physical port that belongs to an EtherChannel group is configured as a SPAN destination, it is removed from the group. After the port is removed from the SPAN session, it rejoins the EtherChannel group. Ports removed from an EtherChannel group remain members of the group, but they are in the inactive or suspended state.

If a physical port that belongs to an EtherChannel group is a destination port and the EtherChannel group is a source, the port is removed from the EtherChannel group and from the list of monitored ports.

- Multicast traffic can be monitored. For egress and ingress port monitoring, only a single unedited packet is sent to the SPAN destination port. It does not reflect the number of times the multicast packet is sent.
- A private-VLAN port cannot be a SPAN destination port.
- A secure port cannot be a SPAN destination port.

For SPAN sessions, do not enable port security on ports with monitored egress when ingress forwarding is enabled on the destination port. For RSPAN source sessions, do not enable port security on any ports with monitored egress.

- An IEEE 802.1x port can be a SPAN source port. You can enable IEEE 802.1x on a port that is a SPAN destination port; however, IEEE 802.1x is disabled until the port is removed as a SPAN destination.

For SPAN sessions, do not enable IEEE 802.1x on ports with monitored egress when ingress forwarding is enabled on the destination port. For RSPAN source sessions, do not enable IEEE 802.1x on any ports that are egress monitored.

## SPAN and RSPAN and Device Stacks

Because the stack of switches represents one logical switch, local SPAN source ports and destination ports can be in different switches in the stack. Therefore, the addition or deletion of switches in the stack can affect a local SPAN session, as well as an RSPAN source or destination session. An active session can become inactive when a switch is removed from the stack or an inactive session can become active when a switch is added to the stack.

## Flow-Based SPAN

You can control the type of network traffic to be monitored in SPAN or RSPAN sessions by using flow-based SPAN (FSPAN) or flow-based RSPAN (FRSPAN), which apply access control lists (ACLs) to the monitored traffic on the source ports. The FSPAN ACLs can be configured to filter IPv4, IPv6, and non-IP monitored traffic.

You apply an ACL to a SPAN session through the interface. It is applied to all the traffic that is monitored on all interfaces in the SPAN session. The packets that are permitted by this ACL are copied to the SPAN destination port. No other packets are copied to the SPAN destination port.

The original traffic continues to be forwarded, and any port, VLAN, and router ACLs attached are applied. The FSPAN ACL does not have any effect on the forwarding decisions. Similarly, the port, VLAN, and router ACLs do not have any effect on the traffic monitoring. If a security input ACL denies a packet and it is not forwarded, the packet is still copied to the SPAN destination ports if the FSPAN ACL permits it. But if the security output ACL denies a packet and it is not sent, it is not copied to the SPAN destination ports. However, if the security output ACL permits the packet to go out, it is only copied to the SPAN destination ports if the FSPAN ACL permits it. This is also true for an RSPAN session.

You can attach three types of FSPAN ACLs to the SPAN session:

- IPv4 FSPAN ACL— Filters only IPv4 packets.
- IPv6 FSPAN ACL— Filters only IPv6 packets.
- MAC FSPAN ACL— Filters only non-IP packets.

If a VLAN-based FSPAN session configured on a stack cannot fit in the hardware memory on one or more switches, it is treated as unloaded on those switches, and traffic meant for the FSPAN ACL and sourcing on

that switch is not copied to the SPAN destination ports. The FSPAN ACL continues to be correctly applied, and traffic is copied to the SPAN destination ports on the switches where the FSPAN ACL fits in the hardware memory.

When an empty FSPAN ACL is attached, some hardware functions copy all traffic to the SPAN destination ports for that ACL. If sufficient hardware resources are not available, even an empty FSPAN ACL can be unloaded.

IPv4 and MAC FSPAN ACLs are supported on all feature sets. IPv6 FSPAN ACLs are supported only in the advanced IP Services feature set.

## Default SPAN and RSPAN Configuration

*Table 55: Default SPAN and RSPAN Configuration*

Feature	Default Setting
SPAN state (SPAN and RSPAN)	Disabled.
Source port traffic to monitor	Both received and sent traffic ( <b>both</b> ).
Encapsulation type (destination port)	Native form (untagged packets).
Ingress forwarding (destination port)	Disabled.
VLAN filtering	On a trunk interface used as a source port, all VLANs are monitored.
RSPAN VLANs	None configured.

## Configuration Guidelines

### SPAN Configuration Guidelines

- To remove a source or destination port or VLAN from the SPAN session, use the **no monitor session session\_number source {interface interface-id | vlan vlan-id}** global configuration command or the **no monitor session session\_number destination interface interface-id** global configuration command. For destination interfaces, the **encapsulation** options are ignored with the **no** form of the command.
- To monitor all VLANs on the trunk port, use the **no monitor session session\_number filter** global configuration command.

## RSPAN Configuration Guidelines

- All the SPAN configuration guidelines apply to RSPAN.
- As RSPAN VLANs have special properties, you should reserve a few VLANs across your network for use as RSPAN VLANs; do not assign access ports to these VLANs.
- You can apply an output ACL to RSPAN traffic to selectively filter or monitor specific packets. Specify these ACLs on the RSPAN VLAN in the RSPAN source switches.
- For RSPAN configuration, you can distribute the source ports and the destination ports across multiple switches in your network.
- Access ports (including voice VLAN ports) on the RSPAN VLAN are put in the inactive state.
- You can configure any VLAN as an RSPAN VLAN as long as these conditions are met:
  - The same RSPAN VLAN is used for an RSPAN session in all the switches.
  - All participating switches support RSPAN.

## FSPAN and FRSPAN Configuration Guidelines

- When at least one FSPAN ACL is attached, FSPAN is enabled.
- When you attach at least one FSPAN ACL that is not empty to a SPAN session, and you have not attached one or more of the other FSPAN ACLs (for instance, you have attached an IPv4 ACL that is not empty, and have not attached IPv6 and MAC ACLs), FSPAN blocks the traffic that would have been filtered by the unattached ACLs. Therefore, this traffic is not monitored.

# How to Configure SPAN and RSPAN

## Creating a Local SPAN Session

Follow these steps to create a SPAN session and specify the source (monitored) ports or VLANs and the destination (monitoring) ports.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>no monitor session</b> { <i>session_number</i>   <b>all</b>   <b>local</b>   <b>remote</b> } <b>Example:</b> <pre>Switch(config)# no monitor session all</pre>	Removes any existing SPAN configuration for the session. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• <b>all</b>—Removes all SPAN sessions.</li> <li>• <b>local</b>—Removes all local sessions.</li> <li>• <b>remote</b>—Removes all remote SPAN sessions.</li> </ul>
<b>Step 4</b>	<b>monitor session</b> <i>session_number</i> <b>source</b> { <b>interface</b> <i>interface-id</i>   <b>vlan</b> <i>vlan-id</i> } [,   -] [ <b>both</b>   <b>rx</b>   <b>tx</b> ] <b>Example:</b> <pre>Switch(config)# monitor session 1 source interface gigabitethernet1/0/1</pre>	Specifies the SPAN session and the source port (monitored port). <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• For <i>interface-id</i>, specify the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (<b>port-channel</b> <i>port-channel-number</i>). Valid port-channel numbers are 1 to 48.</li> <li>• For <i>vlan-id</i>, specify the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN).</li> </ul> <p><b>Note</b> A single session can include multiple sources (ports or VLANs) defined in a series of commands, but you cannot combine source ports and source VLANs in one session.</p> <ul style="list-style-type: none"> <li>• (Optional) [,   -] Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• (Optional) <b>both</b>   <b>rx</b>   <b>tx</b>—Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both sent and received traffic.</li> <li>• <b>both</b>—Monitors both received and sent traffic.</li> <li>• <b>rx</b>—Monitors received traffic.</li> <li>• <b>tx</b>—Monitors sent traffic.</li> </ul> <p><b>Note</b> You can use the <b>monitor session</b> <i>session_number</i> <b>source</b> command multiple times to configure multiple source ports.</p>
<b>Step 5</b>	<p><b>monitor session</b> <i>session_number</i> <b>destination</b> {<b>interface</b> <i>interface-id</i> [,   -] [<b>encapsulation</b> <i>replicate</i>]}</p> <p><b>Example:</b></p> <pre>Switch(config)# monitor session 1 destination interface gigabitethernet1/0/2 encapsulation replicate</pre>	<p>Specifies the SPAN session and the destination port (monitoring port). The port LED changes to amber when the configuration changes take effect. The LED returns to its original state(green) only after removing the SPAN destination configuration.</p> <p><b>Note</b> For local SPAN, you must use the same session number for the source and destination interfaces.</p> <ul style="list-style-type: none"> <li>• For <i>session_number</i>, specify the session number entered in step 4.</li> <li>• For <i>interface-id</i>, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.</li> <li>• (Optional) [,   -] Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</li> </ul> <p>(Optional) <b>encapsulation replicate</b> specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).</p>

	Command or Action	Purpose
		<b>Note</b> You can use <b>monitor session session_number destination</b> command multiple times to configure multiple destination ports.
<b>Step 6</b>	<b>end</b> <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show running-config</b> <b>Example:</b>  Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 8</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Creating a Local SPAN Session and Configuring Incoming Traffic

Follow these steps to create a SPAN session, to specify the source ports or VLANs and the destination ports, and to enable incoming traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance).

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Switch# <code>configure terminal</code>	
<b>Step 3</b>	<p><b>no monitor session</b> <i>{session_number   all   local   remote}</i></p> <p><b>Example:</b></p> <pre>Switch(config)# no monitor session all</pre>	<p>Removes any existing SPAN configuration for the session.</p> <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• <b>all</b>—Removes all SPAN sessions.</li> <li>• <b>local</b>—Removes all local sessions.</li> <li>• <b>remote</b>—Removes all remote SPAN sessions.</li> </ul>
<b>Step 4</b>	<p><b>monitor session</b> <i>session_number</i> <b>source</b> <i>{interface interface-id   vlan vlan-id}</i> [,   -] <i>[both   rx   tx]</i></p> <p><b>Example:</b></p> <pre>Switch(config)# monitor session 2 source gigabitethernet1/0/1 rx</pre>	<p>Specifies the SPAN session and the source port (monitored port).</p>
<b>Step 5</b>	<p><b>monitor session</b> <i>session_number</i> <b>destination</b> <i>{interface interface-id [,   -] [encapsulation replicate] [ingress {dot1q vlan vlan-id   untagged vlan vlan-id   vlan vlan-id}]}</i></p> <p><b>Example:</b></p> <pre>Switch(config)# monitor session 2 destination interface gigabitethernet1/0/2 encapsulation replicate ingress dot1q vlan 6</pre>	<p>Specifies the SPAN session, the destination port, the packet encapsulation, and the ingress VLAN and encapsulation.</p> <ul style="list-style-type: none"> <li>• For <i>session_number</i>, specify the session number entered in Step 4.</li> <li>• For <i>interface-id</i>, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.</li> <li>• (Optional) [,   -]—Specifies a series or range of interfaces. Enter a space before and after the comma or hyphen.</li> <li>• (Optional) <b>encapsulation replicate</b> specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).</li> <li>• <b>ingress</b> enables forwarding of incoming traffic on the destination port and to specify the encapsulation type: <ul style="list-style-type: none"> <li>• <b>dot1q vlan vlan-id</b>—Accepts incoming packets with IEEE 802.1Q</li> </ul> </li> </ul>

	Command or Action	Purpose
		encapsulation with the specified VLAN as the default VLAN.  • <b>untagged vlan <i>vlan-id</i> or vlan <i>vlan-id</i></b> —Accepts incoming packets with untagged encapsulation type with the specified VLAN as the default VLAN.
<b>Step 6</b>	<b>end</b> <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show running-config</b> <b>Example:</b>  Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 8</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Specifying VLANs to Filter

Follow these steps to limit SPAN source traffic to specific VLANs.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>no monitor session</b> { <i>session_number</i>   <b>all</b>   <b>local</b>   <b>remote</b> } <b>Example:</b> <pre>Switch(config)# no monitor session all</pre>	Removes any existing SPAN configuration for the session. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• <b>all</b>—Removes all SPAN sessions.</li> <li>• <b>local</b>—Removes all local sessions.</li> <li>• <b>remote</b>—Removes all remote SPAN sessions.</li> </ul>
<b>Step 4</b>	<b>monitor session</b> <i>session_number</i> <b>source interface</b> <i>interface-id</i> <b>Example:</b> <pre>Switch(config)# monitor session 2 source interface gigabitethernet1/0/2 rx</pre>	Specifies the characteristics of the source port (monitored port) and SPAN session. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• For <i>interface-id</i>, specify the source port to monitor. The interface specified must already be configured as a trunk port.</li> </ul>
<b>Step 5</b>	<b>monitor session</b> <i>session_number</i> <b>filter vlan</b> <i>vlan-id</i> [,   -] <b>Example:</b> <pre>Switch(config)# monitor session 2 filter vlan 1 - 5 , 9</pre>	Limits the SPAN source traffic to specific VLANs. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, enter the session number specified in Step 4.</li> <li>• For <i>vlan-id</i>, the range is 1 to 4094.</li> <li>• (Optional) Use a comma (,) to specify a series of VLANs, or use a hyphen (-) to specify a range of VLANs. Enter a space before and after the comma; enter a space before and after the hyphen.</li> </ul>
<b>Step 6</b>	<b>monitor session</b> <i>session_number</i> <b>destination</b> { <b>interface</b> <i>interface-id</i> [,   -] [ <b>encapsulation replicate</b> ] } <b>Example:</b> <pre>Switch(config)# monitor session 2 destination interface gigabitethernet1/0/1</pre>	Specifies the SPAN session and the destination port (monitoring port). <ul style="list-style-type: none"> <li>• For <i>session_number</i>, specify the session number entered in Step 4.</li> <li>• For <i>interface-id</i>, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• (Optional) [, -] Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</li> <li>• (Optional) <b>encapsulation replicate</b> specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).</li> </ul>
<b>Step 7</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 8</b>	<b>show running-config</b> <b>Example:</b> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 9</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring a VLAN as an RSPAN VLAN

Follow these steps to create a new VLAN, then configure it to be the RSPAN VLAN for the RSPAN session.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Switch# <code>configure terminal</code>	
<b>Step 3</b>	<b>vlan <i>vlan-id</i></b> <b>Example:</b> Switch(config)# <code>vlan 100</code>	Enters a VLAN ID to create a VLAN, or enters the VLAN ID of an existing VLAN, and enters VLAN configuration mode. The range is 2 to 1001 and 1006 to 4094.  The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 through 1005 (reserved for Token Ring and FDDI VLANs).
<b>Step 4</b>	<b>remote-span</b> <b>Example:</b> Switch(config-vlan)# <code>remote-span</code>	Configures the VLAN as an RSPAN VLAN.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config-vlan)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b> Switch# <code>show running-config</code>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

### What to do next

You must create the RSPAN VLAN in all switches that will participate in RSPAN. If the RSPAN VLAN-ID is in the normal range (lower than 1005) and VTP is enabled in the network, you can create the RSPAN VLAN in one switch, and VTP propagates it to the other switches in the VTP domain. For extended-range VLANs (greater than 1005), you must configure RSPAN VLAN on both source and destination switches and any intermediate switches.

Use VTP pruning to get an efficient flow of RSPAN traffic, or manually delete the RSPAN VLAN from all trunks that do not need to carry the RSPAN traffic.

To remove the remote SPAN characteristic from a VLAN and convert it back to a normal VLAN, use the **no remote-span** VLAN configuration command.

To remove a source port or VLAN from the SPAN session, use the **no monitor session** *session\_number* **source** {**interface** *interface-id* | **vlan** *vlan-id*} global configuration command. To remove the RSPAN VLAN from the session, use the **no monitor session** *session\_number* **destination remote vlan** *vlan-id*.

## Creating an RSPAN Source Session

Follow these steps to create and start an RSPAN source session and to specify the monitored source and the destination RSPAN VLAN.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>no monitor session</b> { <i>session_number</i>   <b>all</b>   <b>local</b>   <b>remote</b> } <b>Example:</b> <pre>Switch(config)# no monitor session 1</pre>	Removes any existing SPAN configuration for the session. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• <b>all</b>—Removes all SPAN sessions.</li> <li>• <b>local</b>—Removes all local sessions.</li> <li>• <b>remote</b>—Removes all remote SPAN sessions.</li> </ul>
<b>Step 4</b>	<b>monitor session</b> <i>session_number</i> <b>source</b> { <b>interface</b> <i>interface-id</i>   <b>vlan</b> <i>vlan-id</i> } [,   -] [ <b>both</b>   <b>rx</b>   <b>tx</b> ] <b>Example:</b> <pre>Switch(config)# monitor session 1 source interface gigabitethernet1/0/1 tx</pre>	Specifies the RSPAN session and the source port (monitored port). <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• Enter a source port or source VLAN for the RSPAN session: <ul style="list-style-type: none"> <li>• For <i>interface-id</i>, specifies the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (<b>port-channel</b> <i>port-channel-number</i>). Valid port-channel numbers are 1 to 48.</li> </ul> </li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>For <i>vlan-id</i>, specifies the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN).  A single session can include multiple sources (ports or VLANs), defined in a series of commands, but you cannot combine source ports and source VLANs in one session.</li> <li>(Optional) [, -]—Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</li> <li>(Optional) <b>both</b>   <b>rx</b>   <b>tx</b>—Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both sent and received traffic. <ul style="list-style-type: none"> <li><b>both</b>—Monitors both received and sent traffic.</li> <li><b>rx</b>—Monitors received traffic.</li> <li><b>tx</b>—Monitors sent traffic.</li> </ul> </li> </ul>
<b>Step 5</b>	<b>monitor session</b> <i>session_number</i> <b>destination</b> <b>remote vlan</b> <i>vlan-id</i>  <b>Example:</b>  <pre>Switch(config)# monitor session 1 destination remote vlan 100</pre>	Specifies the RSPAN session, the destination RSPAN VLAN, and the destination-port group. <ul style="list-style-type: none"> <li>For <i>session_number</i>, enter the number defined in Step 4.</li> <li>For <i>vlan-id</i>, specify the source RSPAN VLAN to monitor.</li> </ul>
<b>Step 6</b>	<b>end</b>  <b>Example:</b>  <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show running-config</b>  <b>Example:</b>  <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 8</b>	<b>copy running-config startup-config</b>  <b>Example:</b>	(Optional) Saves your entries in the configuration file.

	Command or Action	Purpose
	Switch# <code>copy running-config startup-config</code>

<b>Step 6</b>	<p><b>monitor session <i>session_number</i> destination remote vlan <i>vlan-id</i></b></p> <p><b>Example:</b></p> <pre>Switch(config)# monitor session 2 destination remote vlan 902</pre>	<p>Specifies the RSPAN session and the destination remote VLAN (RSPAN VLAN).</p> <ul style="list-style-type: none"> <li>• For <i>session_number</i>, enter the session number specified in Step 4.</li> <li>• For <i>vlan-id</i>, specify the RSPAN VLAN to carry the monitored traffic to the destination port.</li> </ul>
<b>Step 7</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>
<b>Step 8</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>	<p>Verifies your entries.</p>
<b>Step 9</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p>

## Creating an RSPAN Destination Session

You configure an RSPAN destination session on a different switch or switch stack; that is, not the switch or switch stack on which the source session was configured.

Follow these steps to define the RSPAN VLAN on that switch, to create an RSPAN destination session, and to specify the source RSPAN VLAN and the destination port.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>vlan <i>vlan-id</i></b> <b>Example:</b> Switch(config)# <b>vlan 901</b>	Specifies the VLAN ID of the RSPAN VLAN created from the source switch, and enters VLAN configuration mode.  If both switches are participating in VTP and the RSPAN VLAN ID is from 2 to 1005, Steps 3 through 5 are not required because the RSPAN VLAN ID is propagated through the VTP network.
<b>Step 4</b>	<b>remote-span</b> <b>Example:</b> Switch(config-vlan)# <b>remote-span</b>	Identifies the VLAN as the RSPAN VLAN.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Switch(config-vlan)# <b>exit</b>	Returns to global configuration mode.
<b>Step 6</b>	<b>no monitor session {<i>session_number</i>   all   local   remote}</b> <b>Example:</b> Switch(config)# <b>no monitor session 1</b>	Removes any existing SPAN configuration for the session. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• <b>all</b>—Removes all SPAN sessions.</li> <li>• <b>local</b>—Removes all local sessions.</li> <li>• <b>remote</b>—Removes all remote SPAN sessions.</li> </ul>
<b>Step 7</b>	<b>monitor session <i>session_number</i> source remote vlan <i>vlan-id</i></b> <b>Example:</b>	Specifies the RSPAN session and the source RSPAN VLAN. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> </ul>

	Command or Action	Purpose
	<pre>Switch(config)# monitor session 1 source remote vlan 901</pre>	<ul style="list-style-type: none"> <li>For <i>vlan-id</i>, specify the source RSPAN VLAN to monitor.</li> </ul>
<b>Step 8</b>	<p><b>monitor session</b> <i>session_number</i> <b>destination interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Switch(config)# monitor session 1 destination interface gigabitethernet2/0/1</pre>	<p>Specifies the RSPAN session and the destination interface.</p> <ul style="list-style-type: none"> <li>For <i>session_number</i>, enter the number defined in Step 7.</li> <li>In an RSPAN destination session, you must use the same session number for the source RSPAN VLAN and the destination port.</li> <li>For <i>interface-id</i>, specify the destination interface. The destination interface must be a physical interface.</li> <li>Though visible in the command-line help string, <b>encapsulation replicate</b> is not supported for RSPAN. The original VLAN ID is overwritten by the RSPAN VLAN ID, and all packets appear on the destination port as untagged.</li> </ul>
<b>Step 9</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 10</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 11</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Creating an RSPAN Destination Session and Configuring Incoming Traffic

Follow these steps to create an RSPAN destination session, to specify the source RSPAN VLAN and the destination port, and to enable incoming traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance).

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>no monitor session</b> <i>{session_number   all   local   remote}</i> <b>Example:</b> <pre>Switch(config)# no monitor session 2</pre>	Removes any existing SPAN configuration for the session. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• <b>all</b>—Removes all SPAN sessions.</li> <li>• <b>local</b>—Removes all local sessions.</li> <li>• <b>remote</b>—Removes all remote SPAN sessions.</li> </ul>
<b>Step 4</b>	<b>monitor session</b> <i>session_number</i> <b>source</b> <b>remote vlan</b> <i>vlan-id</i> <b>Example:</b> <pre>Switch(config)# monitor session 2 source remote vlan 901</pre>	Specifies the RSPAN session and the source RSPAN VLAN. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• For <i>vlan-id</i>, specify the source RSPAN VLAN to monitor.</li> </ul>
<b>Step 5</b>	<b>monitor session</b> <i>session_number</i> <b>destination</b> <b>{interface</b> <i>interface-id</i> <b>[,   -] [ingress {dot1q</b> <b>vlan</b> <i>vlan-id</i> <b>  untagged vlan</b> <i>vlan-id</i> <b>  vlan</b> <i>vlan-id</i> <b>}]}</b> <b>Example:</b> <pre>Switch(config)# monitor session 2 destination interface gigabitethernet1/0/2 ingress vlan 6</pre>	Specifies the SPAN session, the destination port, the packet encapsulation, and the incoming VLAN and encapsulation. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, enter the number defined in Step 5.</li> </ul> In an RSPAN destination session, you must use the same session number for the source RSPAN VLAN and the destination port.

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• For <i>interface-id</i>, specify the destination interface. The destination interface must be a physical interface.</li> <li>• Though visible in the command-line help string, <b>encapsulation replicate</b> is not supported for RSPAN. The original VLAN ID is overwritten by the RSPAN VLAN ID, and all packets appear on the destination port as untagged.</li> <li>• (Optional) [, -] Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</li> <li>• Enter <b>ingress</b> with additional keywords to enable forwarding of incoming traffic on the destination port and to specify the encapsulation type: <ul style="list-style-type: none"> <li>• <b>dot1q vlan <i>vlan-id</i></b>—Forwards incoming packets with IEEE 802.1Q encapsulation with the specified VLAN as the default VLAN.</li> <li>• <b>untagged vlan <i>vlan-id</i> or vlan <i>vlan-id</i></b>—Forwards incoming packets with untagged encapsulation type with the specified VLAN as the default VLAN.</li> </ul> </li> </ul>
<b>Step 6</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show running-config</b> <b>Example:</b> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 8</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring an FSPAN Session

Follow these steps to create a SPAN session, specify the source (monitored) ports or VLANs and the destination (monitoring) ports, and configure FSPAN for the session.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>no monitor session</b> { <i>session_number</i>   <b>all</b>   <b>local</b>   <b>remote</b> } <b>Example:</b> <pre>Switch(config)# no monitor session 2</pre>	Removes any existing SPAN configuration for the session. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• <b>all</b>—Removes all SPAN sessions.</li> <li>• <b>local</b>—Removes all local sessions.</li> <li>• <b>remote</b>—Removes all remote SPAN sessions.</li> </ul>
<b>Step 4</b>	<b>monitor session</b> <i>session_number</i> <b>source</b> { <b>interface</b> <i>interface-id</i>   <b>vlan</b> <i>vlan-id</i> } [,   -] [ <b>both</b>   <b>rx</b>   <b>tx</b> ] <b>Example:</b> <pre>Switch(config)# monitor session 2 source interface gigabitethernet1/0/1</pre>	Specifies the SPAN session and the source port (monitored port). <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• For <i>interface-id</i>, specifies the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (<b>port-channel</b> <i>port-channel-number</i>). Valid port-channel numbers are 1 to 48.</li> <li>• For <i>vlan-id</i>, specify the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN).</li> </ul>

	Command or Action	Purpose
		<p><b>Note</b> A single session can include multiple sources (ports or VLANs) defined in a series of commands, but you cannot combine source ports and source VLANs in one session.</p> <ul style="list-style-type: none"> <li>• (Optional) [,   -]—Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</li> <li>• (Optional) [<b>both</b>   <b>rx</b>   <b>tx</b>]—Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the SPAN monitors both sent and received traffic. <ul style="list-style-type: none"> <li>• <b>both</b>—Monitors both sent and received traffic. This is the default.</li> <li>• <b>rx</b>—Monitors received traffic.</li> <li>• <b>tx</b>—Monitors sent traffic.</li> </ul> </li> </ul> <p><b>Note</b> You can use the <b>monitor session session_number source</b> command multiple times to configure multiple source ports.</p>
<b>Step 5</b>	<p><b>monitor session session_number destination {interface interface-id [,   -] [encapsulation replicate]}</b></p> <p><b>Example:</b></p> <pre>Switch(config)# monitor session 2 destination interface gigabitethernet1/0/2 encapsulation replicate</pre>	<p>Specifies the SPAN session and the destination port (monitoring port).</p> <ul style="list-style-type: none"> <li>• For <i>session_number</i>, specify the session number entered in Step 4.</li> <li>• For <b>destination</b>, specify the following parameters: <ul style="list-style-type: none"> <li>• For <i>interface-id</i>, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.</li> <li>• (Optional) [,   -] Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</li> <li>• (Optional) <b>encapsulation replicate</b> specifies that the destination interface</li> </ul> </li> </ul>

	Command or Action	Purpose
		<p>replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).</p> <p><b>Note</b> For local SPAN, you must use the same session number for the source and destination interfaces.</p> <p>You can use <b>monitor session <i>session_number</i> destination</b> command multiple times to configure multiple destination ports.</p>
<b>Step 6</b>	<p><b>monitor session <i>session_number</i> filter {ip   ipv6   mac} access-group {<i>access-list-number</i>   <i>name</i>}</b></p> <p><b>Example:</b></p> <pre>Switch(config)# monitor session 2 filter ipv6 access-group 4</pre>	<p>Specifies the SPAN session, the types of packets to filter, and the ACLs to use in an FSPAN session.</p> <ul style="list-style-type: none"> <li>For <i>session_number</i>, specify the session number entered in Step 4.</li> <li>For <i>access-list-number</i>, specify the ACL number that you want to use to filter traffic.</li> <li>For <i>name</i>, specify the ACL name that you want to use to filter traffic.</li> </ul>
<b>Step 7</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 8</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 9</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring an FRSPAN Session

Follow these steps to start an RSPAN source session, specify the monitored source and the destination RSPAN VLAN, and configure FRSPAN for the session.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>no monitor session</b> { <i>session_number</i>   <b>all</b>   <b>local</b>   <b>remote</b> } <b>Example:</b> <pre>Switch(config)# no monitor session 2</pre>	Removes any existing SPAN configuration for the session. <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• <b>all</b>—Removes all SPAN sessions.</li> <li>• <b>local</b>—Removes all local sessions.</li> <li>• <b>remote</b>—Removes all remote SPAN sessions.</li> </ul>
<b>Step 4</b>	<b>monitor session</b> <i>session_number</i> <b>source</b> { <b>interface</b> <i>interface-id</i>   <b>vlan</b> <i>vlan-id</i> } [,   -] [ <b>both</b>   <b>rx</b>   <b>tx</b> ] <b>Example:</b> <pre>Switch(config)# monitor session 2 source interface gigabitethernet1/0/1</pre>	Specifies the SPAN session and the source port (monitored port). <ul style="list-style-type: none"> <li>• For <i>session_number</i>, the range is 1 to 66.</li> <li>• For <i>interface-id</i>, specifies the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (<b>port-channel</b> <i>port-channel-number</i>). Valid port-channel numbers are 1 to 48.</li> <li>• For <i>vlan-id</i>, specify the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN).</li> </ul> <p><b>Note</b> A single session can include multiple sources (ports or VLANs) defined in a series of commands, but you cannot combine source ports and source VLANs in one session.</p>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• (Optional) [,   -]—Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</li> <li>• (Optional) [<b>both</b>   <b>rx</b>   <b>tx</b>]—Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the SPAN monitors both sent and received traffic.</li> <li>• <b>both</b>—Monitors both sent and received traffic. This is the default.</li> <li>• <b>rx</b>—Monitors received traffic.</li> <li>• <b>tx</b>—Monitors sent traffic.</li> </ul> <p><b>Note</b> You can use the <b>monitor session session_number source</b> command multiple times to configure multiple source ports.</p>
<b>Step 5</b>	<p><b>monitor session</b> <i>session_number</i> <b>destination remote vlan</b> <i>vlan-id</i></p> <p><b>Example:</b></p> <pre>Switch(config)# monitor session 2 destination remote vlan 5</pre>	<p>Specifies the RSPAN session and the destination RSPAN VLAN.</p> <ul style="list-style-type: none"> <li>• For <i>session_number</i>, enter the number defined in Step 4.</li> <li>• For <i>vlan-id</i>, specify the destination RSPAN VLAN to monitor.</li> </ul>
<b>Step 6</b>	<p><b>vlan</b> <i>vlan-id</i></p> <p><b>Example:</b></p> <pre>Switch(config)# vlan 10</pre>	<p>Enters the VLAN configuration mode. For <i>vlan-id</i>, specify the source RSPAN VLAN to monitor.</p>
<b>Step 7</b>	<p><b>remote-span</b></p> <p><b>Example:</b></p> <pre>Switch(config-vlan)# remote-span</pre>	<p>Specifies that the VLAN you specified in Step 5 is part of the RSPAN VLAN.</p>
<b>Step 8</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-vlan)# exit</pre>	<p>Returns to global configuration mode.</p>
<b>Step 9</b>	<p><b>monitor session</b> <i>session_number</i> <b>filter</b> {<i>ip</i>   <i>ipv6</i>   <i>mac</i>} <b>access-group</b> {<i>access-list-number</i>   <i>name</i>}</p>	<p>Specifies the RSPAN session, the types of packets to filter, and the ACLs to use in an FRSPAN session.</p>

	Command or Action	Purpose
	<b>Example:</b>  <pre>Switch(config)# monitor session 2 filter ip access-group 7</pre>	<ul style="list-style-type: none"> <li>• For <i>session_number</i>, specify the session number entered in Step 4.</li> <li>• For <i>access-list-number</i>, specify the ACL number that you want to use to filter traffic.</li> <li>• For <i>name</i>, specify the ACL name that you want to use to filter traffic.</li> </ul>
<b>Step 10</b>	<b>end</b>  <b>Example:</b>  <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 11</b>	<b>show running-config</b>  <b>Example:</b>  <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 12</b>	<b>copy running-config startup-config</b>  <b>Example:</b>  <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Monitoring SPAN and RSPAN Operations

The following table describes the command used to display SPAN and RSPAN operations configuration and results to monitor operations:

*Table 56: Monitoring SPAN and RSPAN Operations*

Command	Purpose
<b>show monitor</b>	Displays the current SPAN, RSPAN, FSPAN, or FRSPAN configuration.

# SPAN and RSPAN Configuration Examples

## Example: Configuring Local SPAN

This example shows how to set up SPAN session 1 for monitoring source port traffic to a destination port. First, any existing SPAN configuration for session 1 is deleted, and then bidirectional traffic is mirrored from source Gigabit Ethernet port 1 to destination Gigabit Ethernet port 2, retaining the encapsulation method.

```
Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 1
Switch(config)# monitor session 1 source interface gigabitethernet1/0/1
Switch(config)# monitor session 1 destination interface gigabitethernet1/0/2
encapsulation replicate
Switch(config)# end
```

This example shows how to remove port 1 as a SPAN source for SPAN session 1:

```
Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 1 source interface gigabitethernet1/0/1
Switch(config)# end
```

This example shows how to disable received traffic monitoring on port 1, which was configured for bidirectional monitoring:

```
Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 1 source interface gigabitethernet1/0/1 rx
```

The monitoring of traffic received on port 1 is disabled, but traffic sent from this port continues to be monitored.

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor received traffic on all ports belonging to VLANs 1 through 3, and send it to destination Gigabit Ethernet port 2. The configuration is then modified to also monitor all traffic on all ports belonging to VLAN 10.

```
Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source vlan 1 - 3 rx
Switch(config)# monitor session 2 destination interface gigabitethernet1/0/2
Switch(config)# monitor session 2 source vlan 10
Switch(config)# end
```

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor received traffic on Gigabit Ethernet source port 1, and send it to destination Gigabit Ethernet port 2 with the same egress encapsulation type as the source port, and to enable ingress forwarding with IEEE 802.1Q encapsulation and VLAN 6 as the default ingress VLAN:

```
Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source gigabitethernet1/0/1 rx
```

```
Switch(config)# monitor session 2 destination interface gigabitethernet1/0/2 encapsulation
  replicate ingress dot1q vlan 6
Switch(config)# end
```

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor traffic received on Gigabit Ethernet trunk port 2, and send traffic for only VLANs 1 through 5 and VLAN 9 to destination Gigabit Ethernet port 1:

```
Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source interface gigabitethernet1/0/2 rx
Switch(config)# monitor session 2 filter vlan 1 - 5 , 9
Switch(config)# monitor session 2 destination interface gigabitethernet1/0/1
Switch(config)# end
```

### Related Topics

[Local SPAN](#), on page 696

[SPAN Sessions](#), on page 698

[SPAN Configuration Guidelines](#), on page 705

## Examples: Creating an RSPAN VLAN

This example shows how to create the RSPAN VLAN 901:

```
Switch> enable
Switch# configure terminal
Switch(config)# vlan 901
Switch(config-vlan)# remote span
Switch(config-vlan)# end
```

This example shows how to remove any existing RSPAN configuration for session 1, configure RSPAN session 1 to monitor multiple source interfaces, and configure the destination as RSPAN VLAN 901:

```
Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 1
Switch(config)# monitor session 1 source interface gigabitethernet1/0/1 tx
Switch(config)# monitor session 1 source interface gigabitethernet1/0/2 rx
Switch(config)# monitor session 1 source interface port-channel 2
Switch(config)# monitor session 1 destination remote vlan 901
Switch(config)# end
```

This example shows how to remove any existing configuration on RSPAN session 2, configure RSPAN session 2 to monitor traffic received on trunk port 2, and send traffic for only VLANs 1 through 5 and 9 to destination RSPAN VLAN 902:

```
Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source interface gigabitethernet1/0/2 rx
Switch(config)# monitor session 2 filter vlan 1 - 5 , 9
Switch(config)# monitor session 2 destination remote vlan 902
Switch(config)# end
```

This example shows how to configure VLAN 901 as the source remote VLAN and port 1 as the destination interface:

```
Switch> enable
Switch# configure terminal
Switch(config)# monitor session 1 source remote vlan 901
Switch(config)# monitor session 1 destination interface gigabitethernet2/0/1
Switch(config)# end
```

This example shows how to configure VLAN 901 as the source remote VLAN in RSPAN session 2, to configure Gigabit Ethernet source port 2 as the destination interface, and to enable forwarding of incoming traffic on the interface with VLAN 6 as the default receiving VLAN:

```
Switch> enable
Switch# configure terminal
Switch(config)# monitor session 2 source remote vlan 901
Switch(config)# monitor session 2 destination interface gigabitethernet1/0/2 ingress vlan 6
Switch(config)# end
```

- [Monitoring Wireshark, on page 762](#)
- [Configuration Examples for Wireshark, on page 762](#)
- [Additional References, on page 779](#)
- [Feature History and Information for WireShark, on page 780](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Wireshark

- Wireshark is supported on Supervisor Engine 7-E, Supervisor Engine 7L-E, Catalyst 3850, Catalyst 3650, Wireless LAN Controller 5700 Series, Catalyst 4500X-16, and Catalyst 4500X-32.

## Restrictions for Wireshark

- Starting in Cisco IOS Release XE 3.3.0(SE), global packet capture on Wireshark is not supported.
- Capture filters are not supported.

- The CLI for configuring Wireshark requires that the feature be executed only from EXEC mode. Actions that usually occur in configuration submode (such as defining capture points), are handled at the EXEC mode instead. All key commands are not NVGEN'd and are not synchronized to the standby supervisor in NSF and SSO scenarios.
- Packets captured in the output direction of an interface might not reflect the changes made by switch rewrite (includes TTL, VLAN tag, CoS, checksum, MAC addresses, DSCP, precedent, UP, etc.).
- Limiting circular file storage by file size is not supported.

### Wireless Packet Capture

- The only form of wireless capture is a CAPWAP tunnel capture.
- When capturing CAPWAP tunnels, no other interface types can be used as attachment points on the same capture point.
- Capturing multiple CAPWAP tunnels is supported.
- Core filters are not applied and should be omitted when capturing a CAPWAP tunnel.
- To capture a CAPWAP data tunnel, each CAPWAP tunnel is mapped to a physical port and an appropriate ACL will be applied to filter the traffic.
- To capture a CAPWAP non-data tunnel, the switch is set to capture traffic on all ports and apply an appropriate ACL to filter the traffic.
- To capture a CAPWAP tunnel, no matter what kind, the controller will be told to capture the traffic on all physical ports and apply an appropriate ACL to filter the traffic.

### Configuration Limitations

- Starting from Cisco IOS release 16.1, as many as 8 capture points can be defined, but only one can be active at a time. You must stop one before you can start the other.
- You cannot use VRFs, management ports, and private VLANs as attachment points.
- Only one ACL (IPv4, IPv6 or MAC) is allowed in a Wireshark class map.
- Wireshark cannot capture packets on a destination SPAN port.
- Wireshark stops capturing packets when one of the attachment points (interfaces) attached to a capture point stops working. For example, if the device that is associated with an attachment point is unplugged from the switch. To resume capturing packets, restart manually.
- CPU-injected packets are considered control plane packets and are not captured on an interface egress capture.
- MAC ACL is only used for non-IP packets such as ARP. It will not be supported on a Layer 3 port or SVI.
- IPv6-based ACLs are not supported in VACL.
- Layer 2 EtherChannels are not supported. Individual members like GigabitEthernet 1 and GigabitEthernet 2 are supported on Layer 3 EtherChannels.

- ACL logging and Wireshark are incompatible. After Wireshark is activated, it takes priority. All traffic, including traffic captured by ACL logging on ports, will be redirected to Wireshark. We recommend that you deactivate ACL logging before you start Wireshark. Otherwise, Wireshark traffic is contaminated by ACL logging traffic.
- Wireshark does not capture packets dropped by floodblock.
- If you capture both PACL and RACL on the same port, only one copy is sent to the CPU. If you capture a DTLS-encrypted CAPWAP interface, two copies are sent to Wireshark, one encrypted and the other decrypted. The same behavior will occur if we capture a Layer 2 interface carrying DTLS-encrypted CAPWAP traffic. The core filter is based on the outer CAPWAP header.
- Control plane packets are not rate limited and do not impact performance. Use filters to limit control plane packet capture.

## Information About Wireshark

### Wireshark Overview

Wireshark is a packet analyzer program, formerly known as Ethereal, that supports multiple protocols and presents information in a text-based user interface.

The ability to capture and analyze traffic provides data on network activity. Prior to Cisco IOS Release XE 3.3.0(SE), only two features addressed this need: SPAN and debug platform packet. Both have limitations. SPAN is ideal for capturing packets, but can only deliver them by forwarding them to some specified local or remote destination; it provides no local display or analysis support.

So the need exists for a traffic capture and analysis mechanism that is applicable to both hardware and software forwarded traffic and that provides strong packet capture, display, and analysis support, preferably using a well known interface.

Wireshark dumps packets to a file using a well known format called .pcap, and is applied or enabled on individual interfaces. You specify an interface in EXEC mode along with the filter and other parameters. The Wireshark application is applied only when you enter a **start** command, and is removed only when Wireshark stops capturing packets either automatically or manually.

---

**Note** The current version of Wireshark installed on the switch is 1.10.8.

---

### Capture Points

A capture point is the central policy definition of the Wireshark feature. The capture point describes all of the characteristics associated with a given instance of Wireshark: which packets to capture, where to capture them from, what to do with the captured packets, and when to stop. Capture points can be modified after creation, and do not become active until explicitly activated with a **start** command. This process is termed activating the capture point or starting the capture point. Capture points are identified by name and can also be manually or automatically deactivated or stopped.

Multiple capture points can be defined, but only one can be active at a time. You need to stop one before you can start the other.

In case of stacked systems, the capture point is activated on the active member. A switchover will terminate any active packet capture session and it will have to be restarted.

## Attachment Points

An attachment point is a point in the logical packet process path associated with a capture point. An attachment point is an attribute of the capture point. Packets that impact an attachment point are tested against capture point filters; packets that match are copied and sent to the associated Wireshark instance of the capture point. A specific capture point can be associated with multiple attachment points, with limits on mixing attachment points of different types. Some restrictions apply when you specify attachment points of different types. Attachment points are directional (input or output or both) with the exception of the Layer 2 VLAN attachment point, which is always bidirectional.

In case of stacked systems, the attachment points on all stack members are valid. EPC captures the packets from all the defined attachment points. However these packets are processed only on the active member.

# Filters

Filters are attributes of a capture point that identify and limit the subset of traffic traveling through the attachment point of a capture point, which is copied and passed to Wireshark. To be displayed by Wireshark, a packet must pass through an attachment point, as well as all of the filters associated with the capture point.

A capture point has the following types of filters:

- Core system filter—The core system filter is applied by hardware, and its match criteria is limited by hardware. This filter determines whether hardware-forwarded traffic is copied to software for Wireshark purposes.
- Display filter—The display filter is applied by Wireshark. Packets that fail the display filter are not displayed.

## Core System Filter

You can specify core system filter match criteria by using the class map or ACL, or explicitly by using the CLI.

**Note** When specifying CAPWAP as an attachment point, the core system filter is not used.

In some installations, you need to obtain authorization to modify the switch configuration, which can lead to extended delays if the approval process is lengthy. This can limit the ability of network administrators to monitor and analyze traffic. To address this situation, Wireshark supports explicit specification of core system filter match criteria from the EXEC mode CLI. The disadvantage is that the match criteria that you can specify is a limited subset of what class map supports, such as MAC, IP source and destination addresses, ether-type, IP protocol, and TCP/UDP source and destination ports.

If you prefer to use configuration mode, you can define ACLs or have class maps refer capture points to them. Explicit and ACL-based match criteria are used internally to construct class maps and policy maps.

Note The ACL and class map configuration are part of the system and not aspects of the Wireshark feature.

## Display Filter

With the display filter, you can direct Wireshark to further narrow the set of packets to display when decoding and displaying from a .pcap file.

## Related Topics

[Additional References](#), on page 779

# Actions

Wireshark can be invoked on live traffic or on a previously existing .pcap file. When invoked on live traffic, it can perform four types of actions on packets that pass its display filters:

- Captures to buffer in memory to decode and analyze and store
- Stores to a .pcap file
- Decodes and displays

- Stores and displays

When invoked on a .pcap file only, only the decode and display action is applicable.

## Storage of Captured Packets to Buffer in Memory

Packets can be stored in the capture buffer in memory for subsequent decode, analysis, or storage to a .pcap file.

The capture buffer can be in linear or circular mode. In linear mode, new packets are discarded when the buffer is full. In circular mode, if the buffer is full, the oldest packets are discarded to accommodate the new packets. Although the buffer can also be cleared when needed, this mode is mainly used for debugging network traffic. However, it is not possible to only clear the contents of the buffer alone without deleting it. Stop the current captures and restart the capture again for this to take effect.

---

**Note** If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss.

---

## Storage of Captured Packets to a .pcap File

---

**Note** When WireShark is used on switches in a stack, packet captures can be stored only on flash or USB flash devices connected to the active switch.

For example, if flash1 is connected to the active switch, and flash2 is connected to the secondary switch, only flash1 can be used to store packet captures.

Attempts to store packet captures on devices other than flash or USB flash devices connected to the active switch will probably result in errors.

---

Wireshark can store captured packets to a .pcap file. The capture file can be located on the following storage devices:

- Switch on-board flash storage (flash:)
- USB drive (usbflash0:)

---

**Note** Attempts to store packet captures on unsupported devices or devices not connected to the active switch will probably result in errors.

---

When configuring a Wireshark capture point, you can associate a filename. When the capture point is activated, Wireshark creates a file with the specified name and writes packets to it. If the file already exists at the time of creation of the capture point, Wireshark queries you as to whether the file can be overwritten. If the file already exists at the time of activating the capture point, Wireshark will overwrite the existing file. Only one capture point may be associated with a given filename.

If the destination of the Wireshark writing process is full, Wireshark fails with partial data in the file. You must ensure that there is sufficient space in the file system before you start the capture session. With Cisco IOS Release IOS XE 3.3.0(SE), the file system full status is not detected for some storage devices.

You can reduce the required storage space by retaining only a segment, instead of the entire packet. Typically, you do not require details beyond the first 64 or 128 bytes. The default behavior is to store the entire packet.

To avoid possible packet drops when processing and writing to the file system, Wireshark can optionally use a memory buffer to temporarily hold packets as they arrive. Memory buffer size can be specified when the capture point is associated with a .pcap file.

## Packet Decoding and Display

Wireshark can decode and display packets to the console. This functionality is possible for capture points applied to live traffic and for capture points applied to a previously existing .pcap file.

---

**Note** Decoding and displaying packets may be CPU intensive.

---

Wireshark can decode and display packet details for a wide variety of packet formats. The details are displayed by entering the **monitor capture name start** command with one of the following keyword options, which place you into a display and decode mode:

- **brief**—Displays one line per packet (the default).
- **detailed**—Decodes and displays all the fields of all the packets whose protocols are supported. Detailed modes require more CPU than the other two modes.
- **(hexadecimal) dump**—Displays one line per packet as a hexadecimal dump of the packet data and the printable characters of each packet.

When you enter the **capture** command with the decode and display option, the Wireshark output is returned to Cisco IOS and displayed on the console unchanged.

### Live Traffic Display

Wireshark receives copies of packets from the core system. Wireshark applies its display filters to discard uninteresting packets, and then decodes and displays the remaining packets.

### .pcap File Display

Wireshark can decode and display packets from a previously stored .pcap file and direct the display filter to selectively displayed packets.

## Packet Storage and Display

Functionally, this mode is a combination of the previous two modes. Wireshark stores packets in the specified .pcap file and decodes and displays them to the console. Only the core filters are applicable here.

## Wireshark Capture Point Activation and Deactivation

After a Wireshark capture point has been defined with its attachment points, filters, actions, and other options, it must be activated. Until the capture point is activated, it does not actually capture packets.

Before a capture point is activated, some functional checks are performed. A capture point cannot be activated if it has neither a core system filter nor attachment points defined. Attempting to activate a capture point that does not meet these requirements generates an error.\*

---

**Note** \*When performing a wireless capture with a CAPWAP tunneling interface, the core system filter is not required and cannot be used.

---

The display filters are specified as needed.

After Wireshark capture points are activated, they can be deactivated in multiple ways. A capture point that is storing only packets to a .pcap file can be halted manually or configured with time or packet limits, after which the capture point halts automatically.

When a Wireshark capture point is activated, a fixed rate policer is applied automatically in the hardware so that the CPU is not flooded with Wireshark-directed packets. The disadvantage of the rate policer is that you cannot capture contiguous packets beyond the established rate even if more resources are available.

The set packet capture rate is 1000 packets per sec (pps). The 1000 pps limit is applied to the sum of all attachment points. For example, if we have a capture session with 3 attachment points, the rates of all 3 attachment points added together is policed to 1000 pps.

---

**Note** Policer is not supported for control-plane packet capture. When activating control-plane capture points, you need to be extra cautious, so that it does not flood the CPU.

---

## Wireshark Features

This section describes how Wireshark features function in the switch environment:

- If port security and Wireshark are applied on an ingress capture, a packet that is dropped by port security will still be captured by Wireshark. If port security is applied on an ingress capture, and Wireshark is applied on an egress capture, a packet that is dropped by port security will not be captured by Wireshark.
- Packets dropped by Dynamic ARP Inspection (DAI) are not captured by Wireshark.
- If a port that is in STP blocked state is used as an attachment point and the core filter is matched, Wireshark will capture the packets that come into the port, even though the packets will be dropped by the switch.
- Classification-based security features—Packets that are dropped by input classification-based security features (such as ACLs and IPSG) are not caught by Wireshark capture points that are connected to attachment points at the same layer. In contrast, packets that are dropped by output classification-based security features are caught by Wireshark capture points that are connected to attachment points at the same layer. The logical model is that the Wireshark attachment point occurs after the security feature lookup on the input side, and symmetrically before the security feature lookup on the output side.

On ingress, a packet goes through a Layer 2 port, a VLAN, and a Layer 3 port/SVI. On egress, the packet goes through a Layer 3 port/SVI, a VLAN, and a Layer 2 port. If the attachment point is before the point where the packet is dropped, Wireshark will capture the packet. Otherwise, Wireshark will not capture the packet. For example, Wireshark capture policies connected to Layer 2 attachment points in the input direction capture packets dropped by Layer 3 classification-based security features. Symmetrically, Wireshark capture policies attached to Layer 3 attachment points in the output direction capture packets dropped by Layer 2 classification-based security features.

- Routed ports and switch virtual interfaces (SVIs)—Wireshark cannot capture the output of an SVI because the packets that go out of an SVI's output are generated by CPU. To capture these packets, include the control plane as an attachment point.
- VLANs—Starting with Cisco IOS Release 16.1, when a VLAN is used as a Wireshark attachment point, packet capture is supported on L2 and L3 in both input and output directions.
- Redirection features—In the input direction, features traffic redirected by Layer 3 (such as PBR and WCCP) are logically later than Layer 3 Wireshark attachment points. Wireshark captures these packets even though they might later be redirected out another Layer 3 interface. Symmetrically, output features redirected by Layer 3 (such as egress WCCP) are logically prior to Layer 3 Wireshark attachment points, and Wireshark will not capture them.
- SPAN—Wireshark cannot capture packets on interface configured as a SPAN destination.
- SPAN—Wireshark is able to capture packets on interfaces configured as a SPAN source in the ingress direction, and may be available for egress direction too.
- You can capture packets from a maximum of 1000 VLANs at a time, if no ACLs are applied. If ACLs are applied, the hardware will have less space for Wireshark to use. As a result, the maximum number of VLANs than can be used for packet capture at a time will be lower. Using more than 1000 VLANs tunnels at a time or extensive ACLs might have unpredictable results. For example, mobility may go down.

---

**Note** Capturing an excessive number of attachment points at the same time is strongly discouraged because it may cause excessive CPU utilization and unpredictable hardware behavior.

---

### Wireless Packet Capture in Wireshark

- Wireless traffic is encapsulated inside CAPWAP packets. However, capturing only a particular wireless client's traffic inside a CAPWAP tunnel is not supported when using the CAPWAP tunnel as an attachment point. To capture only a particular wireless client's traffic, use the client VLAN as an attachment point and formulate the core filter accordingly.
- Limited decoding of inner wireless traffic is supported. Decoding of inner wireless packets inside encrypted CAPWAP tunnels is not supported.
- No other interface type can be used with the CAPWAP tunneling interface on the same capture point. A CAPWAP tunneling interface and a Level 2 port cannot be attachment points on the same capture point.
- You cannot specify a core filter when capturing packets for Wireshark via the CAPWAP tunnel. However, you can use the Wireshark display filters for filtering wireless client traffic against a specific wireless client.

- You can capture packets from a maximum of 135 CAPWAP tunnels at a time if no ACLs are applied. If ACLs are applied, the hardware memory will have less space for Wireshark to use. As a result, the maximum number of CAPWAP tunnels that can be used for packet capture at a time will be lower. Using more than 135 CAPWAP tunnels at a time or using extensive ACLs might have unpredictable results. For example, mobility may go down.

---

**Note** Capturing an excessive number of attachment points at the same time is strongly discouraged because it may cause excessive CPU utilization and unpredictable hardware behavior.

---

## Guidelines for Wireshark

- During Wireshark packet capture, hardware forwarding happens concurrently.
- Before starting a Wireshark capture process, ensure that CPU usage is moderate and that sufficient memory (at least 200 MB) is available.
- If you plan to store packets to a storage file, ensure that sufficient space is available before beginning a Wireshark capture process.
- The CPU usage during Wireshark capture depends on how many packets match the specified conditions and on the intended actions for the matched packets (store, decode and display, or both).
- Where possible, keep the capture to the minimum (limit by packets, duration) to avoid high CPU usage and other undesirable conditions.
- Because packet forwarding typically occurs in hardware, packets are not copied to the CPU for software processing. For Wireshark packet capture, packets are copied and delivered to the CPU, which causes an increase in CPU usage.

To avoid high CPU usage, do the following:

- Attach only relevant ports.
  - Use a class map, and secondarily, an access list to express match conditions. If neither is viable, use an explicit, in-line filter.
  - Adhere closely to the filter rules. Restrict the traffic type (such as, IPv4 only) with a restrictive, rather than relaxed ACL, which elicits unwanted traffic.
- Always limit packet capture to either a shorter duration or a smaller packet number. The parameters of the capture command enable you to specify the following:
    - Capture duration
    - Number of packets captured
    - File size
    - Packet segment size
  - Run a capture session without limits if you know that very little traffic matches the core filter.

- You might experience high CPU (or memory) usage if:
  - You leave a capture session enabled and unattended for a long period of time, resulting in unanticipated bursts of traffic.
  - You launch a capture session with ring files or capture buffer and leave it unattended for a long time, resulting in performance or system health issues.
- During a capture session, watch for high CPU usage and memory consumption due to Wireshark that may impact switch performance or health. If these situations arise, stop the Wireshark session immediately.
- Avoid decoding and displaying packets from a .pcap file for a large file. Instead, transfer the .pcap file to a PC and run Wireshark on the PC.
- You can define up to eight Wireshark instances. An active **show** command that decodes and displays packets from a .pcap file or capture buffer counts as one instance. However, only one of the instances can be active.
- Whenever an ACL that is associated with a running capture is modified, you must restart the capture for the ACL modifications to take effect. If you do not restart the capture, it will continue to use the original ACL as if it had not been modified.
- To avoid packet loss, consider the following:
  - Use store-only (when you do not specify the display option) while capturing live packets rather than decode and display, which is an CPU-intensive operation (especially in detailed mode).
  - If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss.
  - If you use the default buffer size and see that you are losing packets, you can increase the buffer size to avoid losing packets.
  - Writing to flash disk is a CPU-intensive operation, so if the capture rate is insufficient, you may want to use a buffer capture.
  - The Wireshark capture session always operates in streaming mode at the rate of 1000 pps.
- The streaming capture mode rate is 1000 pps.
- If you want to decode and display live packets in the console window, ensure that the Wireshark session is bounded by a short capture duration.

**Warning**

A Wireshark session with either a longer duration limit or no capture duration (using a terminal with no auto-more support using the **term len 0** command) may make the console or terminal unusable.

- When using Wireshark to capture live traffic that leads to high CPU, usage, consider applying a QoS policy temporarily to limit the actual traffic until the capture process concludes.
- All Wireshark-related commands are in EXEC mode; no configuration commands exist for Wireshark. If you need to use access list or class-map in the Wireshark CLI, you must define an access list and class map with configuration commands.

- No specific order applies when defining a capture point; you can define capture point parameters in any order, provided that CLI allows this. The Wireshark CLI allows as many parameters as possible on a single line. This limits the number of commands required to define a capture point.
- All parameters except attachment points take a single value. Generally, you can replace the value with a new one by reentering the command. After user confirmation, the system accepts the new value and overrides the older one. A **no** form of the command is unnecessary to provide a new value, but it is necessary to remove a parameter.
- Wireshark allows you to specify one or more attachment points. To add more than one attachment point, reenter the command with the new attachment point. To remove an attachment point, use the **no** form of the command. You can specify an interface range as an attachment point. For example, enter **monitor capture mycap interface GigabitEthernet1/0/1 in** where interface GigabitEthernet1/0/1 is an attachment point.

If you also need to attach interface GigabitEthernet1/0/2, specify it in another line as follows:

**monitor capture mycap interface GigabitEthernet1/0/2 in**

- You cannot make changes to a capture point when the capture is active.
- The action you want to perform determines which parameters are mandatory. The Wireshark CLI allows you to specify or modify any parameter prior to entering the **start** command. When you enter the **start** command, Wireshark will start only after determining that all mandatory parameters have been provided.
- If the file already exists at the time of creation of the capture point, Wireshark queries you as to whether the file can be overwritten. If the file already exists at the time of activating the capture point, Wireshark will overwrite the existing file.
- The core filter can be an explicit filter, access list, or class map. Specifying a newer filter of these types replaces the existing one.

---

**Note** A core filter is required except when using a CAPWAP tunnel interface as a capture point attachment point.

---

- You can terminate a Wireshark session with an explicit **stop** command or by entering **q** in automore mode. The session could terminate itself automatically when a stop condition such as duration or packet capture limit is met, or if an internal error occurs, or resource is full (specifically if disk is full in file mode).
- Dropped packets will not be shown at the end of the capture. However, only the count of dropped, oversized packets will be displayed.

## Default Wireshark Configuration

The table below shows the default Wireshark configuration.

Feature	Default Setting
Duration	No limit
Packets	No limit

Feature	Default Setting
Packet-length	No limit (full packet)
File size	No limit
Ring file storage	No
Buffer storage mode	Linear

## How to Configure Wireshark

To configure Wireshark, perform these basic steps.

1. Define a capture point.
2. (Optional) Add or modify the capture point's parameters.
3. Activate or deactivate a capture point.
4. Delete the capture point when you are no longer using it.

## Defining a Capture Point

The example in this procedure defines a very simple capture point. If you choose, you can define a capture point and all of its parameters with one instance of the **monitor capture** command.

**Note** You must define an attachment point, direction of capture, and core filter to have a functional capture point.

An exception to needing to define a core filter is when you are defining a wireless capture point using a CAPWAP tunneling interface. In this case, you do not define your core filter. It cannot be used.

Follow these steps to define a capture point.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<p><b>show capwap summary</b></p> <p><b>Example:</b></p> <pre>Switch# show capwap summary</pre>	<p>Displays the CAPWAP tunnels available as attachment points for a wireless capture.</p> <p><b>Note</b> Use this command only if you are using a CAPWAP tunnel as an attachment point to perform a wireless capture. See the CAPWAP example in the examples section.</p>
<b>Step 3</b>	<p><b>monitor capture</b> <i>{capture-name}</i> <b>{interface interface-type interface-id   control-plane}</b> <b>{in   out   both}</b></p> <p><b>Example:</b></p> <pre>Switch# monitor capture mycap interface GigabitEthernet1/0/1 in</pre>	<p>Defines the capture point, specifies the attachment point with which the capture point is associated, and specifies the direction of the capture.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• <i>capture-name</i>—Specifies the name of the capture point to be defined (mycap is used in the example). Capture Name should be less than or equal to 8 characters. Only alphanumeric characters and underscore ( ) is permitted</li> <li>• (Optional) <b>interface interface-type interface-id</b>—Specifies the attachment point with which the capture point is associated (GigabitEthernet1/0/1 is used in the example).</li> </ul> <p><b>Note</b> Optionally, you can define multiple attachment points and all of the parameters for this capture point with this one command instance. These parameters are discussed in the instructions for modifying capture point parameters. Range support is also available both for adding and removing attachment points.</p> <p>Use one of the following for <i>interface-type</i>:</p>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>GigabitEthernet</b>—Specifies the attachment point as GigabitEthernet.</li> <li>• <b>vlan</b>—Specifies the attachment point as a VLAN. <ul style="list-style-type: none"> <li><b>Note</b> Only ingress capture (in) is allowed when using this interface as an attachment point.</li> </ul> </li> <li>• <b>capwap</b>—Specifies the attachment point as a CAPWAP tunnel. <ul style="list-style-type: none"> <li><b>Note</b> When using this interface as an attachment point, a core filter cannot be used.</li> </ul> </li> <li>• (Optional) <b>control-plane</b>—Specifies the control plane as an attachment point.</li> <li>• <b>in   out   both</b>—Specifies the direction of capture.</li> </ul>
<b>Step 4</b>	<p><b>monitor capture</b> <i>{capture-name}</i> [<b>match</b> {<b>any</b>   <b>ipv4 any any</b>   <b>ipv6</b>} <b>any any</b>}]</p> <p><b>Example:</b></p> <pre>Switch# monitor capture mycap interface GigabitEthernet1/0/1 in match any</pre>	<p>Defines the core system filter.</p> <p><b>Note</b> When using the CAPWAP tunneling interface as an attachment point, do not perform this step because a core filter cannot be used.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• <i>capture-name</i>—Specifies the name of the capture point to be defined (mycap is used in the example).</li> <li>• <b>match</b>—Specifies a filter. The first filter defined is the core filter. <ul style="list-style-type: none"> <li><b>Note</b> A capture point cannot be activated if it has neither a core system filter nor attachment points defined. Attempting to activate a capture point that does not meet these requirements generates an error.</li> </ul> </li> <li>• <b>ipv4</b>—Specifies an IP version 4 filter.</li> <li>• <b>ipv6</b>—Specifies an IP version 6 filter.</li> </ul>

	Command or Action	Purpose
<b>Step 5</b>	<b>show monitor capture</b> { <i>capture-name</i> } [ <i>parameter</i> ]  <b>Example:</b> <pre>Switch# show monitor capture mycap parameter monitor capture mycap interface GigabitEthernet1/0/1 in monitor capture mycap match any</pre>	Displays the capture point parameters that you defined in Step 2 and confirms that you defined a capture point.
<b>Step 6</b>	<b>show running-config</b>  <b>Example:</b> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b>  <b>Example:</b> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

### Example

To define a capture point with a CAPWAP attachment point:

```
Switch# show capwap summary
```

```
CAPWAP Tunnels General Statistics:
```

```
Number of Capwap Data Tunnels      = 1
Number of Capwap Mobility Tunnels   = 0
Number of Capwap Multicast Tunnels  = 0
```

```
Name      APName                                     Type PhyPortIf Mode      McastIf
-----
Ca0       AP442b.03a9.6715                             data Gi3/0/6  unicast  -
```

```
Name      SrcIP          SrcPort DestIP          DstPort DtlsEn MTU   Xact
-----
Ca0       10.10.14.32   5247   10.10.14.2     38514   No    1449  0
```

```
Switch# monitor capture mycap interface capwap 0 both
Switch# monitor capture mycap file location flash:mycap.pcap
Switch# monitor capture mycap file buffer-size 1
Switch# monitor capture mycap start
```

```
*Aug 20 11:02:21.983: %BUFCAP-6-ENABLE: Capture Point mycap enabled.on
```

```
Switch# show monitor capture mycap parameter
monitor capture mycap interface capwap 0 in
monitor capture mycap interface capwap 0 out
monitor capture mycap file location flash:mycap.pcap buffer-size 1
Switch#
```

```
Switch# show monitor capture mycap
```

```

### What to do next

You can add additional attachment points, modify the parameters of your capture point, then activate it, or if you want to use your capture point just as it is, you can now activate it.

**Note** You cannot change a capture point's parameters using the methods presented in this topic.

If the user enters an incorrect capture name, or an invalid/non existing attachment point, the switch will show errors like "*Capture Name should be less than or equal to 8 characters. Only alphanumeric characters and underscore ( \_ ) is permitted*" and "*% Invalid input detected at '^' marker*" respectively.

## Adding or Modifying Capture Point Parameters

Although listed in sequence, the steps to specify values for the parameters can be executed in any order. You can also specify them in one, two, or several lines. Except for attachment points, which can be multiple, you can replace any value with a more recent value by redefining the same option. You will need to confirm interactively when certain parameters already specified are being modified.

Follow these steps to modify a capture point's parameters.

### Before you begin

A capture point must be defined before you can use these instructions.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	enable <b>Example:</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Switch> <b>enable</b>	
<b>Step 2</b>	<p><b>monitor capture</b> {<i>capture-name</i>} <b>match</b> {<b>any</b>   <b>mac</b> <i>mac-match-string</i>   <b>ipv4</b> {<b>any</b>   <b>host</b>   <b>protocol</b>}{<b>any</b>   <b>host</b>}   <b>ipv6</b> {<b>any</b>   <b>host</b>   <b>protocol</b>}{<b>any</b>   <b>host</b>}}</p> <p><b>Example:</b></p> <pre>Switch# monitor capture mycap match ipv4 any any</pre>	<p>Defines the core system filter (<b>ipv4 any any</b>), defined either explicitly, through ACL or through a class map.</p> <p><b>Note</b> If you are defining a wireless capture point using a CAPWAP tunneling interface, this command will have no effect, so it should not be used.</p>
<b>Step 3</b>	<p><b>monitor capture</b> {<i>capture-name</i>} <b>limit</b> { [<i>duration seconds</i>] [<i>packet-length size</i>] [<i>packets num</i>] }</p> <p><b>Example:</b></p> <pre>Switch# monitor capture mycap limit duration 60 packet-len 400</pre>	<p>Specifies the session limit in seconds (60), packets captured, or the packet segment length to be retained by Wireshark (400).</p>
<b>Step 4</b>	<p><b>monitor capture</b> {<i>capture-name</i>} <b>file</b> {<i>location filename</i>}</p> <p><b>Example:</b></p> <pre>Switch# monitor capture mycap file location flash:mycap.pcap</pre>	<p>Specifies the file association, if the capture point intends to capture packets rather than only display them.</p> <p><b>Note</b> If the file already exists, you have to confirm if it can be overwritten.</p> <p><b>Note</b> File option does not exist on LAN base license.</p>
<b>Step 5</b>	<p><b>monitor capture</b> {<i>capture-name</i>} <b>file</b> {<i>buffer-size size</i>}</p> <p><b>Example:</b></p> <pre>Switch# monitor capture mycap file buffer-size 100</pre>	<p>Specifies the size of the memory buffer used by Wireshark to handle traffic bursts.</p>
<b>Step 6</b>	<p><b>show monitor capture</b> {<i>capture-name</i>} [<i>parameter</i>]</p> <p><b>Example:</b></p> <pre>Switch# show monitor capture mycap parameter monitor capture mycap interface GigabitEthernet1/0/1 in monitor capture mycap match ipv4 any any monitor capture mycap limit duration 60 packet-len 400 monitor capture point mycap file location bootdisk:mycap.pcap monitor capture mycap file buffer-size 100</pre>	<p>Displays the capture point parameters that you defined previously.</p>

	Command or Action	Purpose
<b>Step 7</b>	<b>end</b>  <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.

## Examples

### Modifying Parameters

#### Associating or Disassociating a Capture File

```
Switch# monitor capture point mycap file location flash:mycap.pcap
Switch# no monitor capture mycap file
```

#### Specifying a Memory Buffer Size for Packet Burst Handling

```
Switch# monitor capture mycap buffer size 100
```

#### Defining an Explicit Core System Filter to Match Both IPv4 and IPv6

```
Switch# monitor capture mycap match any
```

### What to do next

if your capture point contains all of the parameters you want, activate it.

## Deleting Capture Point Parameters

Although listed in sequence, the steps to delete parameters can be executed in any order. You can also delete them in one, two, or several lines. Except for attachment points, which can be multiple, you can delete any parameter.

Follow these steps to delete a capture point's parameters.

### Before you begin

A capture point parameter must be defined before you can use these instructions to delete it.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>no monitor capture {capture-name} match</b> <b>Example:</b> <pre>Switch# no monitor capture mycap match</pre>	Deletes all filters defined on capture point (mycap).
<b>Step 3</b>	<b>no monitor capture {capture-name} limit [duration] [packet-length] [packets]</b> <b>Example:</b> <pre>Switch# no monitor capture mycap limit duration packet-len Switch# no monitor capture mycap limit</pre>	Deletes the session time limit and the packet segment length to be retained by Wireshark. It leaves other specified limits in place.  Deletes all limits on Wireshark.
<b>Step 4</b>	<b>no monitor capture {capture-name} file [location] [buffer-size]</b> <b>Example:</b> <pre>Switch# no monitor capture mycap file Switch# no monitor capture mycap file location</pre>	Deletes the file association. The capture point will no longer capture packets. It will only display them.  Deletes the file location association. The file location will no longer be associated with the capture point. However, other defined file association will be unaffected by this action.
<b>Step 5</b>	<b>show monitor capture {capture-name} [parameter]</b> <b>Example:</b> <pre>Switch# show monitor capture mycap parameter       monitor capture mycap interface GigabitEthernet1/0/1 in</pre>	Displays the capture point parameters that remain defined after your parameter deletion operations. This command can be run at any point in the procedure to see what parameters are associated with a capture point.
<b>Step 6</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

## What to do next

If your capture point contains all of the parameters you want, activate it.

**Note**

If the parameters are deleted when the capture point is active, the switch will show an error "*Capture is active*".

## Deleting a Capture Point

Follow these steps to delete a capture point.

**Before you begin**

A capture point must be defined before you can use these instructions to delete it. You have to stop the capture point before you can delete it.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>no monitor capture</b> { <i>capture-name</i> } <b>Example:</b> <pre>Switch# no monitor capture mycap</pre>	Deletes the specified capture point (mycap).
<b>Step 3</b>	<b>show monitor capture</b> { <i>capture-name</i> } [ <b>parameter</b> ] <b>Example:</b> <pre>Switch# show monitor capture mycap parameter   Capture mycap does not exist</pre>	Displays a message indicating that the specified capture point does not exist because it has been deleted.
<b>Step 4</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b>	Verifies your entries.

	Command or Action	Purpose
	Switch# <code>show running-config</code>	
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

### What to do next

You can define a new capture point with the same name as the one you deleted. These instructions are usually performed when one wants to start over with defining a capture point.

## Activating and Deactivating a Capture Point

Follow these steps to activate or deactivate a capture point.

### Before you begin

A capture point can be activated even if an attachment point and a core system filter have been defined and the associated filename already exists. In such an instance, the existing file will be overwritten.

A capture point with no associated filename can only be activated to display. When the filename is not specified, the packets are captured into the buffer. Live display (display during capture) is available in both file and buffer modes.

If no display filters are specified, packets are not displayed live, and all the packets captured by the core system filter are displayed. The default display mode is brief.

**Note** When using a CAPWAP tunneling interface as an attachment point, core filters are not used, so there is no requirement to define them in this case.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>monitor capture</b> { <i>capture-name</i> } <b>start</b> [ <b>display</b> [ <b>display-filter</b> <i>filter-string</i> ]] [ <b>brief</b>   <b>detailed</b>   <b>dump</b> ] <b>Example:</b> Switch# <b>monitor capture mycap start display display-filter "stp"</b>	Activates a capture point and filters the display, so only packets containing "stp" are displayed.
<b>Step 3</b>	<b>monitor capture</b> { <i>capture-name</i> } <b>stop</b> <b>Example:</b> Switch# <b>monitor capture name stop</b>	Deactivates a capture point.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b> Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

**What to do next**

While activating and deactivating a capture point, you could encounter a few errors. Here are examples of some of the possible errors.

## Missing attachment point on activation

```

## Clearing the Capture Point Buffer

Follow these steps to clear the buffer contents or save them to an external file for storage.

**Note** If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss. Do not try to clear buffer on an active capture point.

**Note** Clearing buffer on an active capture point is supported only on Lan Base as this only clears the content. On all other licenses, it deletes the buffer itself, hence cannot be run during active capture.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	enable <b>Example:</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Switch> <b>enable</b>	
<b>Step 2</b>	<b>monitor capture</b> { <i>capture-name</i> } [ <b>clear</b>   <b>export filename</b> ] <b>Example:</b> Switch# <b>monitor capture mycap clear</b>	Clear - Completely deletes the buffer. <b>Note</b> When the clear command is run, <ul style="list-style-type: none"> <li>• On Lan base - the command clears the buffer contents without deleting the buffer</li> <li>• On all other licenses - the command deletes the buffer itself.</li> </ul> Export - Saves the captured packets in the buffer as well as deletes the buffer.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 4</b>	<b>show running-config</b> <b>Example:</b> Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 5</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

### Examples: Capture Point Buffer Handling

#### Exporting Capture to a File

```
Switch# monitor capture mycap export flash:mycap.pcap
```

Storage configured as File for this capture

#### Clearing Capture Point Buffer

```
Switch# monitor capture mycap clear
```

Capture configured with file options

**What to do next**

**Note** If you try to clear the capture point buffer on licenses other than LAN Base, the switch will show an error "*Failed to clear capture buffer : Capture Buffer BUSY*".

# Monitoring Wireshark

The commands in this table are used to monitor Wireshark.

Command	Purpose
<code>show monitor capture [capture-name ]</code>	Displays the capture point state so that you can see what capture points are defined, what their attributes are, and whether they are active. When capture point name is specified, it displays specific capture point's details.
<code>show monitor capture [capture-name parameter]</code>	Displays the capture point parameters.
<code>show capwap summary</code>	Displays all the CAPWAP tunnels on the switch. Use this command to determine which CAPWAP tunnels are available to use for a wireless capture.

## Configuration Examples for Wireshark

### Example: Displaying a Brief Output from a .pcap File

You can display the output from a .pcap file by entering:

```
Switch# show monitor capture file flash:mycap.pcap brief
Starting the packet display ..... Press Ctrl + Shift + 6 to exit
```

```

 1 0.000000000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x002e,
seq=0/0, ttl=254
 2 0.000051000 10.10.10.1 -> 10.10.10.2 ICMP 114 Echo (ping) reply id=0x002e,
seq=0/0, ttl=255 (request in 1)
 3 0.000908000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x002e,
seq=1/256, ttl=254
 4 0.001782000 10.10.10.1 -> 10.10.10.2 ICMP 114 Echo (ping) reply id=0x002e,
seq=1/256, ttl=255 (request in 3)
 5 0.002961000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x002e,
seq=2/512, ttl=254
 6 0.003676000 10.10.10.1 -> 10.10.10.2 ICMP 114 Echo (ping) reply id=0x002e,
seq=2/512, ttl=255 (request in 5)
 7 0.004835000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x002e,
seq=3/768, ttl=254
 8 0.005579000 10.10.10.1 -> 10.10.10.2 ICMP 114 Echo (ping) reply id=0x002e,
seq=3/768, ttl=255 (request in 7)
 9 0.006850000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x002e,
seq=4/1024, ttl=254
10 0.007586000 10.10.10.1 -> 10.10.10.2 ICMP 114 Echo (ping) reply id=0x002e,
seq=4/1024, ttl=255 (request in 9)
11 0.008768000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x002e,
seq=5/1280, ttl=254
12 0.009497000 10.10.10.1 -> 10.10.10.2 ICMP 114 Echo (ping) reply id=0x002e,
seq=5/1280, ttl=255 (request in 11)
13 0.010695000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x002e,
seq=6/1536, ttl=254
14 0.011427000 10.10.10.1 -> 10.10.10.2 ICMP 114 Echo (ping) reply id=0x002e,

seq=10/2560, ttl=255 (request in 21)
23 0.020575000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x002e,
seq=11/2816, ttl=254
--Morex

```

## Example: Displaying Detailed Output from a .pcap File

You can display the detailed .pcap file output by entering:

```

Switch# show monitor capture file flash:mycap.pcap detailed
Starting the packet display ..... Press Ctrl + Shift + 6 to exit

```

```

Frame 1: 114 bytes on wire (912 bits), 114 bytes captured (912 bits) on interface 0
Interface id: 0
Encapsulation type: Ethernet (1)
Arrival Time: Nov 6, 2015 11:44:48.322497000 UTC
[Time shift for this packet: 0.000000000 seconds]

```

## Example: Displaying Detailed Output from a .pcap File

```

Epoch Time: 1446810288.322497000 seconds
[Time delta from previous captured frame: 0.000000000 seconds]
[Time delta from previous displayed frame: 0.000000000 seconds]
[Time since reference or first frame: 0.000000000 seconds]
Frame Number: 1
Frame Length: 114 bytes (912 bits)
Capture Length: 114 bytes (912 bits)

```

## Example: Simple Capture and Display

This example shows how to monitor traffic in the Layer 3 interface Gigabit Ethernet 1/0/1:

**Step 1:** Define a capture point to match on the relevant traffic by entering:

```
Switch# monitor capture mycap interface GigabitEthernet1/0/3 in
Switch# monitor capture mycap match ipv4 any any
Switch# monitor capture mycap limit duration 60 packets 50
Switch# monitor capture mycap buffer size 100
```

To avoid high CPU utilization, a low packet count and duration as limits has been set.

**Step 2:** Confirm that the capture point has been correctly defined by entering:

```
Switch# show monitor capture mycap parameter
      monitor capture mycap interface GigabitEthernet1/0/3 in
      monitor capture mycap match ipv4 any any
      monitor capture mycap buffer size 100
      monitor capture mycap limit packets 50 duration 60
```

```
Switch# show monitor capture mycap
Status Information for Capture mycap
Target Type:
  Interface: GigabitEthernet1/0/3, Direction: in
  Status : Inactive
Filter Details:
  IPv4
  Source IP: any
  Destination IP: any
  Protocol: any
Buffer Details:
  Buffer Type: LINEAR (default)
  Buffer Size (in MB): 100
File Details:
  File not associated
Limit Details:
  Number of Packets to capture: 50
  Packet Capture duration: 60
  Packet Size to capture: 0 (no limit)
  Packet sampling rate: 0 (no sampling)
```

**Step 3:** Start the capture process and display the results.

```
Switch# monitor capture mycap start display
Starting the packet display ..... Press Ctrl + Shift + 6 to exit

  1  0.000000  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0030, seq=0/0,
      ttl=254
  2  0.003682  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0030,
seq=1/256, ttl=254
  3  0.006586  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0030,
seq=2/512, ttl=254
  4  0.008941  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0030,
seq=3/768, ttl=254
  5  0.011138  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0030,
seq=4/1024, ttl=254
  6  0.014099  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0030,
seq=5/1280, ttl=254
  7  0.016868  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0030,
seq=6/1536, ttl=254
  8  0.019210  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0030,
```

```
seq=7/1792, ttl=254
 9 0.024785 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0030,
seq=8/2048, ttl=254
--More--
```

**Step 4:** Delete the capture point by entering:

```
Switch# no monitor capture mycap
```

**Note** A **stop** command is not required in this particular case since we have set a limit and the capture will automatically stop once that limit is reached.

For more information on syntax to be used for pcap statistics, refer the "*Additional References*" section.

## Example: Simple Capture and Store

This example shows how to capture packets to a filter:

**Step 1:** Define a capture point to match on the relevant traffic and associate it to a file by entering:

```
Switch# monitor capture mycap interface GigabitEthernet1/0/3 in
Switch# monitor capture mycap match ipv4 any any
Switch# monitor capture mycap limit duration 60 packets 50
Switch# monitor capture mycap file location flash:mycap.pcap
```

**Step 2:** Confirm that the capture point has been correctly defined by entering:

```
Switch# show monitor capture mycap parameter
monitor capture mycap interface GigabitEthernet1/0/3 in
monitor capture mycap match ipv4 any any
monitor capture mycap file location flash:mycap.pcap
monitor capture mycap limit packets 50 duration 60
```

```
Switch# show monitor capture mycap
```

```
Status Information for Capture mycap
Target Type:
Interface: GigabitEthernet1/0/3, Direction: in
Status : Inactive
Filter Details:
```

```
IPv4
  Source IP: any
  Destination IP: any
  Protocol: any
Buffer Details:
  Buffer Type: LINEAR (default)
File Details:
  Associated file name: flash:mycap.pcap
Limit Details:
  Number of Packets to capture: 50
  Packet Capture duration: 60
  Packet Size to capture: 0 (no limit)
  Packet sampling rate: 0 (no sampling)
```

**Step 3:** Launch packet capture by entering:

```
Switch# monitor capture mycap start
```

**Step 4:** Display extended capture statistics during runtime by entering:

```
Switch# show monitor capture mycap capture-statistics
Capture statistics collected at software:
  Capture duration - 15 seconds
  Packets received - 40
  Packets dropped - 0
  Packets oversized - 0
  Packets errored - 0
  Packets sent - 40
  Bytes received - 7280
  Bytes dropped - 0
  Bytes oversized - 0
  Bytes errored - 0
  Bytes sent - 4560
```

**Step 5:** After sufficient time has passed, stop the capture by entering:

```
Switch# monitor capture mycap stop
Capture statistics collected at software (Buffer & Wireshark):
  Capture duration - 20 seconds
  Packets received - 50
  Packets dropped - 0
  Packets oversized - 0
```

---

**Note** Alternatively, you could allow the capture operation stop automatically after the time has elapsed or the packet count has been met.

The mycap.pcap file now contains the captured packets.

---

**Step 6:** Display extended capture statistics after stop by entering:

```
Switch# show monitor capture mycap capture-statistics
Capture statistics collected at software:
  Capture duration - 20 seconds
  Packets received - 50
  Packets dropped - 0
  Packets oversized - 0
  Packets errored - 0
  Packets sent - 50
  Bytes received - 8190
```

```

Bytes dropped - 0
Bytes oversized - 0
Bytes errored - 0
Bytes sent - 5130

```

### Step 7: Display the packets by entering:

```

Switch# show monitor capture file flash:mycap.pcap
Starting the packet display ..... Press Ctrl + Shift + 6 to exit

  1 0.000000000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0031,

## Example: Using Buffer Capture

This example shows how to use buffer capture:

**Step 1:** Launch a capture session with the buffer capture option by entering:

```
Switch# monitor capture mycap interface GigabitEthernet1/0/3 in
Switch# monitor capture mycap match ipv4 any any
Switch# monitor capture mycap buffer circular size 1
Switch# monitor capture mycap start
```

**Step 2:** Determine whether the capture is active by entering:

```
Switch# show monitor capture mycap
Status Information for Capture mycap
Target Type:
  Interface: GigabitEthernet1/0/3, Direction: in
  Status : Active
Filter Details:
  IPv4
  Source IP: any
  Destination IP: any
  Protocol: any
Buffer Details:
  Buffer Type: CIRCULAR
  Buffer Size (in MB): 1
File Details:
  File not associated
Limit Details:
  Number of Packets to capture: 0 (no limit)
  Packet Capture duration: 0 (no limit)
  Packet Size to capture: 0 (no limit)
  Maximum number of packets to capture per second: 1000
  Packet sampling rate: 0 (no sampling)
```

**Step 3:** Display extended capture statistics during runtime by entering:

```
Switch# show monitor capture mycap capture-statistics
Capture statistics collected at software:
  Capture duration - 88 seconds
  Packets received - 1000
  Packets dropped - 0
  Packets oversized - 0
  Packets errored - 0
  Packets sent - 1000
  Bytes received - 182000
  Bytes dropped - 0
  Bytes oversized - 0
  Bytes errored - 0
  Bytes sent - 114000
```

**Step 4:** Stop the capture by entering:

```
Switch# monitor capture mycap stop
Capture statistics collected at software (Buffer):
  Capture duration - 2185 seconds
  Packets received - 51500
  Packets dropped - 0
  Packets oversized - 0
```

**Step 5:** Display extended capture statistics after stop by entering:

```
Switch# show monitor capture mycap capture-statistics
Capture statistics collected at software:
  Capture duration - 156 seconds
  Packets received - 2000
  Packets dropped - 0
  Packets oversized - 0
  Packets errored - 0
  Packets sent - 2000
  Bytes received - 364000
  Bytes dropped - 0
  Bytes oversized - 0
  Bytes errored - 0
  Bytes sent - 228000
```

### Step 6: Determine whether the capture is active by entering:

```
Switch# show monitor capture mycap
Status Information for Capture mycap
  Target Type:
    Interface: GigabitEthernet1/0/3, Direction: in
    Status : Inactive
  Filter Details:
    IPv4
    Source IP: any
    Destination IP: any
    Protocol: any
  Buffer Details:
    Buffer Type: CIRCULAR
    Buffer Size (in MB): 1
  File Details:
    File not associated
  Limit Details:
    Number of Packets to capture: 0 (no limit)
    Packet Capture duration: 0 (no limit)
    Packet Size to capture: 0 (no limit)
    Maximum number of packets to capture per second: 1000
    Packet sampling rate: 0 (no sampling)
```

### Step 7: Display the packets in the buffer by entering:

```
Switch# show monitor capture mycap buffer brief
Starting the packet display ..... Press Ctrl + Shift + 6 to exit

  1  0.000000  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0038,
seq=40057/31132, ttl=254
  2  0.000030  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0038,
seq=40058/31388, ttl=254
  3  0.000052  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0038,
seq=40059/31644, ttl=254
  4  0.000073  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0038,
seq=40060/31900, ttl=254
  5  0.000094  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0038,
seq=40061/32156, ttl=254

```

**Step 9:** Clear the buffer by entering:

```
Switch# monitor capture mycap clear
```

---

**Note** NOTE - Clearing the buffer deletes the buffer along with the contents.

---

---

**Note** If you require the buffer contents to be displayed, run the clear commands after show commands.

---

**Step 10:** Restart the traffic, wait for 10 seconds, then display the buffer contents by entering:

**Note** We cannot run show from buffer during an active capture. Capture should be stopped before running show from buffer. We can however run a show on a pcap file during an active capture in both file and buffer mode. In file mode, we can display the packets in the current capture session's pcap file as well when the capture is active.

```
Switch# monitor capture mycap start
Switch# show monitor capture mycap

Status Information for Capture mycap
Target Type:
  Interface: GigabitEthernet1/0/3, Direction: in
  Status : Active
Filter Details:
  IPv4
  Source IP: any
  Destination IP: any
  Protocol: any
Buffer Details:
  Buffer Type: CIRCULAR
  Buffer Size (in MB): 1
File Details:
  File not associated
Limit Details:
  Number of Packets to capture: 0 (no limit)
  Packet Capture duration: 0 (no limit)
  Packet Size to capture: 0 (no limit)
  Maximum number of packets to capture per second: 1000
  Packet sampling rate: 0 (no sampling)
```

**Step 11:** Stop the packet capture and display the buffer contents by entering:

```
Switch# monitor capture mycap stop
Capture statistics collected at software (Buffer):
Capture duration - 111 seconds
Packets received - 5000
Packets dropped - 0
Packets oversized - 0
```

**Step 12:** Determine whether the capture is active by entering:

```
Switch# show monitor capture mycap
Status Information for Capture mycap
Target Type:
  Interface: GigabitEthernet1/0/3, Direction: in
  Status : Inactive
Filter Details:
  IPv4
  Source IP: any
  Destination IP: any
  Protocol: any
Buffer Details:
  Buffer Type: CIRCULAR
  Buffer Size (in MB): 1

--More<
```

**Step 14:** Store the buffer contents to the mycap.pcap file in the internal flash: storage device by entering:

```
Switch# monitor capture mycap export flash:mycap.pcap
Exported Successfully
```

**Note** The current implementation of export is such that when the command is run, export is "started" but not complete when it returns the prompt to the user. So we have to wait for a message display on the console from Wireshark before it can run a display of packets in the file.

**Step 15:** Display capture packets from the file by entering:

```
Switch# show monitor capture file flash:mycap.pcap
Starting the packet display ..... Press Ctrl + Shift + 6 to exit

  1 0.000000000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0039,
seq=0/0, ttl=254
  2 0.000030000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0039,
seq=1/256, ttl=254
  3 0.000051000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0039,
seq=2/512, ttl=254
  4 0.000072000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0039,
seq=3/768, ttl=254
  5 0.000093000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0039,

## Example: Capture and Store in Lock-step Mode

This example captures live traffic and stores the packets in lock-step mode.

### Note

The capture rate might be slow for the first 15 seconds. If possible and necessary, start the traffic 15 seconds after the capture session starts.

**Step 1:** Define a capture point to match on the relevant traffic and associate it to a file by entering:

```

Switch# monitor capture mycap interface GigabitEthernet1/0/1 in
Switch# monitor capture mycap match ipv4 any any
Switch# monitor capture mycap limit duration 60 packets 100
Switch# monitor capture mycap file location flash:mycap.pcap buffer-size 64

```

**Step 2:** Confirm that the capture point has been correctly defined by entering:

```

Switch# show monitor capture mycap parameter
monitor capture mycap interface GigabitEthernet1/0/1 in
monitor capture mycap file location flash:mycap.pcap buffer-size 64
monitor capture mycap limit packets 100 duration 60

```

```

Switch# show monitor capture mycap

```

```

Status Information for Capture mycap
Target Type:
Interface: GigabitEthernet1/0/1, Direction: in
Status : Inactive
Filter Details:
Filter not attached
Buffer Details:
Buffer Type: LINEAR (default)
File Details:
Associated file name: flash:mycap.pcap

```

```

Size of buffer(in MB): 64
Limit Details:
Number of Packets to capture: 100
Packet Capture duration: 60
Packet Size to capture: 0 (no limit)
Packets per second: 0 (no limit)
Packet sampling rate: 0 (no sampling)

```

**Step 3: Launch packet capture by entering:**

```

Switch# monitor capture mycap start
A file by the same capture file name already exists, overwrite?[confirm]
Turning on lock-step mode

```

```

Switch#
*Oct 14 09:35:32.661: %BUFCAP-6-ENABLE: Capture Point mycap enabled.

```

**Step 4: Display the packets by entering:**

```

Switch# show monitor capture file flash:mycap.pcap
Starting the packet display ..... Press Ctrl + Shift + 6 to exit

0.000000  10.1.1.30 -> 20.1.1.2      UDP Source port: 20001  Destination port: 20002
1.000000  10.1.1.31 -> 20.1.1.2      UDP Source port: 20001  Destination port: 20002
2.000000  10.1.1.32 -> 20.1.1.2      UDP Source port: 20001  Destination port: 20002
3.000000  10.1.1.33 -> 20.1.1.2      UDP Source port: 20001  Destination port: 20002
4.000000  10.1.1.34 -> 20.1.1.2      UDP Source port: 20001  Destination port: 20002
5.000000  10.1.1.35 -> 20.1.1.2      UDP Source port: 20001  Destination port: 20002
6.000000  10.1.1.36 -> 20.1.1.2      UDP Source port: 20001  Destination port: 20002
7.000000  10.1.1.37 -> 20.1.1.2      UDP Source port: 20001  Destination port: 20002
8.000000  10.1.1.38 -> 20.1.1.2      UDP Source port: 20001  Destination port: 20002
9.000000  10.1.1.39 -> 20.1.1.2      UDP Source port: 20001  Destination port: 20002

```

**Step 5: Delete the capture point by entering:**

```

Switch# no monitor capture mycap

```

## Example: Simple Capture and Store of Packets in Egress Direction

This example shows how to capture packets to a filter:

**Step 1: Define a capture point to match on the relevant traffic and associate it to a file by entering:**

```

Switch# monitor capture mycap interface Gigabit 1/0/1 out match ipv4 any any
Switch# monitor capture mycap limit duration 60 packets 100
Switch# monitor capture mycap file location flash:mycap.pcap buffer-size 90

```

**Step 2:** Confirm that the capture point has been correctly defined by entering:

```
Switch# show monitor capture mycap parameter
  monitor capture mycap interface GigabitEthernet1/0/1 out
  monitor capture mycap match ipv4 any any
  monitor capture mycap file location flash:mycap.pcap buffer-size 90
  monitor capture mycap limit packets 100 duration 60
```

```
Switch# show monitor capture mycap
```

```
Status Information for Capture mycap
Target Type:
  Interface: GigabitEthernet1/0/1, Direction: out
  Status : Inactive
Filter Details:
  IPv4
  Source IP: any
  Destination IP: any
  Protocol: any
Buffer Details:
  Buffer Type: LINEAR (default)
File Details:
  Associated file name: flash:mycap.pcap
  Size of buffer(in MB): 90
Limit Details:
  Number of Packets to capture: 100
  Packet Capture duration: 60
  Packet Size to capture: 0 (no limit)
  Packets per second: 0 (no limit)
  Packet sampling rate: 0 (no sampling)
```

**Step 3:** Launch packet capture by entering:

```
Switch# monitor capture mycap start
A file by the same capture file name already exists, overwrite?[confirm]
Turning on lock-step mode
```

```
Switch#
*Oct 14 09:35:32.661: %BUFCAP-6-ENABLE: Capture Point mycap enabled.
```

**Note** Allow the capture operation stop automatically after the time has elapsed or the packet count has been met. When you see the following message in the output, will know that the capture operation has stopped:

```
*Oct 14 09:36:34.632: %BUFCAP-6-DISABLE_ASYNC: Capture Point mycap disabled. Reason : Wireshark Session Ended
```

The mycap.pcap file now contains the captured packets.

**Step 4:** Display the packets by entering:

```
Switch# show monitor capture file flash:mycap.pcap
Starting the packet display ..... Press Ctrl + Shift + 6 to exit

0.000000 10.1.1.30 -> 20.1.1.2      UDP Source port: 20001 Destination port: 20002
1.000000 10.1.1.31 -> 20.1.1.2      UDP Source port: 20001 Destination port: 20002
2.000000 10.1.1.32 -> 20.1.1.2      UDP Source port: 20001 Destination port: 20002
3.000000 10.1.1.33 -> 20.1.1.2      UDP Source port: 20001 Destination port: 20002
4.000000 10.1.1.34 -> 20.1.1.2      UDP Source port: 20001 Destination port: 20002
5.000000 10.1.1.35 -> 20.1.1.2      UDP Source port: 20001 Destination port: 20002
6.000000 10.1.1.36 -> 20.1.1.2      UDP Source port: 20001 Destination port: 20002
7.000000 10.1.1.37 -> 20.1.1.2      UDP Source port: 20001 Destination port: 20002
```

```

8.000000    10.1.1.38 -> 20.1.1.2    UDP Source port: 20001 Destination port: 20002
9.000000    10.1.1.39 -> 20.1.1.2    UDP Source port: 20001 Destination port: 20002

```

**Step 5:** Delete the capture point by entering:

```
Switch# no monitor capture mycap
```

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Prerequisites for QoS

Before configuring standard QoS, you must have a thorough understanding of these items:

- Standard QoS concepts.
- Wireless concepts and network topologies.
- Classic Cisco IOS QoS.

- Modular QoS CLI (MQC).
- Understanding of QoS implementation.
- The types of applications used and the traffic patterns on your network.
- Traffic characteristics and needs of your network. For example, is the traffic on your network bursty? Do you need to reserve bandwidth for voice and video streams?
- Bandwidth requirements and speed of the network.
- Location of congestion points in the network.

## QoS Components

QoS consists of the following key components:

- **Classification**— Classification is the process of distinguishing one type of traffic from another based upon ACLs, Differentiated Services Code Point (DSCP), Class of Service (CoS), and other factors.
- **Marking and mutation**— Marking is used on traffic to convey specific information to a downstream device in the network, or to carry information from one interface in a switch to another. When traffic is marked, QoS operations on that traffic can be applied. This can be accomplished directly using the **set** command or through a table map, which takes input values and translates them directly to values on output.
- **Shaping and policing**— Shaping is the process of imposing a maximum rate of traffic, while regulating the traffic rate in such a way that downstream devices are not subjected to congestion. Shaping in the most common form is used to limit the traffic sent from a physical or logical interface. Policing is used to impose a maximum rate on a traffic class. If the rate is exceeded, then a specific action is taken as soon as the event occurs.
- **Queuing** — Queuing is used to prevent traffic congestion. Traffic is sent to specific queues for servicing and scheduling based upon bandwidth allocation. Traffic is then scheduled or sent out through the port.
- **Bandwidth**—Bandwidth allocation determines the available capacity for traffic that is subject to QoS policies.
- **Trust**— Trust enables traffic to pass through the switch, and the DSCP, precedence, or CoS values coming in from the end points are retained in the absence of any explicit policy configuration.

## QoS Terminology

The following terms are used interchangeably in this QoS configuration guide:

- Upstream (direction towards the switch) is the same as ingress.
- Downstream (direction from the switch) is the same as egress.

---

**Note** Upstream is wireless to wired. Downstream is wired to wireless. Wireless to wireless has no specific term.

---

## Information About QoS

### QoS Overview

By configuring the quality of service (QoS), you can provide preferential treatment to specific types of traffic at the expense of other traffic types. Without QoS, the switch offers best-effort service to each packet, regardless of the packet contents or size. The switch sends the packets without any assurance of reliability, delay bounds, or throughput.

The following are specific features provided by QoS:

- Low latency
- Bandwidth guarantee
- Buffering capabilities and dropping disciplines
- Traffic policing
- Enables the changing of the attribute of the frame or packet header
- Relative services

### Modular QoS Command-Line Interface

With the switch, QoS features are enabled through the Modular QoS command-line interface (MQC). The MQC is a command-line interface (CLI) structure that allows you to create traffic policies and attach these policies to interfaces. A traffic policy contains a traffic class and one or more QoS features. A traffic class is used to classify traffic, while the QoS features in the traffic policy determine how to treat the classified traffic. One of the main goals of MQC is to provide a platform-independent interface for configuring QoS across Cisco platforms.

### Wireless QoS Overview

Wireless QoS can be configured on the following wireless targets:

- Wireless ports, including all physical ports to which an access point can be associated.
- Radio
- SSID (applicable on a per-radio, per-AP, and per-SSID)
- Client

From Cisco IOS XE Release 3E, marking and policing actions for ingress SSID and client policies are applied at the access point. The SSID and client ingress policies that you configure in the switch are moved to the access point. The access point performs policing and marking actions for each packet. However, the switch selects the QoS policies. Marking and policing of egress SSID and client policies are applied at the switch.

The following table displays how policies are supported for the wireless targets.

**Table 57: Wireless Targets Policies Support**

Wireless Target	Policies on Wireless Targets Supported	Policies Supported Egress Direction	Policies Supported Ingress Direction
Wireless port	Yes	Yes - user configurable	No
Radio	Yes	Yes - but not configurable by user	No
SSID	Yes	Yes - user configurable	Yes - user configurable
Client	Yes	Yes - user configurable	Yes - user configurable

**Note** Additional polices that are user configured include multidestination policers and VLANs.

Wireless QoS supports the following features:

- Queuing in the egress direction.
- Policing of wireless traffic
- Marking of wireless traffic.
- Shaping of wireless traffic in the egress direction.
- Approximate Fair Drop (AFD) in the egress direction.
- Mobility support for QoS.
- Compatibility with precious metal QoS policies available on Cisco Unified Wireless Controllers.
- Combination of CLI/Traffic Class (TCLAS) and CLI/snooping.
- Application control (can drop or mark the data traffic) by configuring an AVC QoS client policy.
- Drop action for ingress policies.
- QoS statistics for client and SSID targets in the ingress direction.
- QoS attribute for local profiling policy.
- Hierarchical policies.

## QoS and IPv6 for Wireless

The switch supports QoS for both IPv4 and IPv6 traffic, and client policies can now have IPv4 and IPv6 filters.

## Wired and Wireless Access Supported Features

The following table describes the supported features for both wired and wireless access.

**Table 58: Supported QoS Features for Wired and Wireless Access**

Feature	Wired	Wireless
Targets	<ul style="list-style-type: none"> <li>• Gigabit Ethernet</li> <li>• 10 Gigabit Ethernet</li> <li>• VLAN</li> </ul>	<ul style="list-style-type: none"> <li>• Wireless port (CAPWAP tunnel)</li> <li>• SSID</li> <li>• Client</li> <li>• Radio</li> <li>• CAPWAP multicast tunnel</li> </ul>
Configuration Sequence	QoS policy installed using the <b>service-policy</b> command.	<ul style="list-style-type: none"> <li>• When an access point joins the switch, the switch installs a policy on the port. The port policy has a child policy called <code>port_child_policy</code>.</li> <li>• A policy is installed on the radio which has a shaper configured to the radio rate. The default radio policy (which cannot be modified) is attached to the radio.</li> <li>• The default client policies take effect when a WMM client associates, and if admission control is enabled on the radio.</li> <li>• User can modify the <code>port_child_policy</code> to add more classes.</li> <li>• User can attach a user-defined policy at the SSID level.</li> <li>• User can attach a user-defined policy at the client level.</li> <li>• User can configure a port policy.</li> <li>• User can configure an SSID policy.</li> <li>• These policies can then be modified.</li> <li>• The default radio policy (which cannot be modified) is attached to the radio.</li> <li>• Optionally, the user can attach a client policy as required.</li> <li>• The default client policies take effect when a WMM client associates, and if admission control is enabled on the radio.</li> </ul>

Feature	Wired	Wireless
Number of queues permitted at port level	Up to 8 queues supported on a port.	Only four queues supported.
Classification mechanism	<ul style="list-style-type: none"> <li>• DSCP</li> <li>• IP precedence</li> <li>• CoS</li> <li>• QoS-group</li> <li>• ACL membership including: <ul style="list-style-type: none"> <li>• IPv4 ACLs</li> <li>• IPv6 ACLS</li> <li>• MAC ACLs</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Port level <ul style="list-style-type: none"> <li>• Ingress: QoS policies not supported on ingress in wireless ports.</li> <li>• Egress: Only DSCP based classification.</li> </ul> </li> <li>• SSID level <ul style="list-style-type: none"> <li>• Ingress: DSCP, UP</li> <li>• Egress: DSCP,COS, QoS group</li> </ul> </li> <li>• Client level <ul style="list-style-type: none"> <li>• Ingress: ACL, DSCP, UP</li> <li>• Egress: DSCP and COS</li> </ul> </li> </ul>

## Port Policies

The switch supports port-based policies. The port policies includes port shaper and a child policy (port\_child\_policy).

---

**Note** Port child policies only apply to wireless ports and not to wired ports on the switch. A wireless port is defined as a port to which APs join. A default port child policy is applied on the switch to the wireless ports at start up. The port shaper rate is limited to 1G

---

Port shaper specifies the traffic policy applicable between the device and the AP. This is the sum of the radio rates supported on the access point.

The child policy determines the mapping between packets and queues defined by the port-child policy. The child policy can be configured to include voice, video, class-default, and non-client-nrt classes where voice and video are based on DSCP value (which is the outer CAPWAP header DSCP value). The definition of class-default is known to the system as any value other than voice and video DSCP.

The DSCP value is assigned when the packet reaches the port. Before the packet arrives at the port, the SSID policies are applied on the packet. Port child policy also includes multicast percentage for a given port traffic. By default, the port child policy allocates up to 10 percent of the available rate.

## Port Policy Format

This section describes the behavior of the port policies on a switch. The ports on the switch do not distinguish between wired or wireless physical ports. Depending on the kind of device associated to the switch, the policies are applied. For example, when an access point is connected to a switch port, the switch detects it as a wireless device and applies the default hierarchical policy which is in the format of a parent-child policy. This policy is an hierarchical policy. The parent policy cannot be modified but the child policy (port-child policy) can be modified to suit the QoS configuration. The switch is pre configured with a default class map and a policy map.

Default class map:

```
Class Map match-any non-client-nrt-class
Match non-client-nrt
```

The above port policy processes all network traffic to the Q3 queue. You can view the class map by executing the **show class-map** command.

Default policy map:

```
Policy Map port_child_policy
  Class non-client-nrt-class
    bandwidth remaining ratio 10
```

**Note** The class map and policy map listed are system-defined policies and cannot be changed.

The following is the system-defined policy map available on the ports on which wireless devices are associated. The format consists of a parent policy and a service child policy (**port\_child\_policy**). To customize the policies to suite your network needs, you must configure the port child policy.

```
Policy-map policy_map_name
  Class class-default
    Shape average average_rate
    Service-policy port_child_policy
```

**Note** The parent policy is system generated and cannot be changed. You must configure the *port\_child\_policy* to suit the QoS requirements on your network.

Depending on the type of traffic in your network, you can configure the port child policy. For example, in a typical wireless network deployment, you can assign specific priorities to voice and video traffic. Here is an example:

```
Policy-map port_child_policy
  Class voice-policy-name (match dscp ef)
    Priority level 1
    Police (multicast-policer-name-voice) Multicast Policer
  Class video-policy-name (match dscp af41)
    Priority level 2
    Police (multicast-policer-name-video) Multicast Policer
  Class non-client-nrt-class traffic (match non-client-nrt)
    Bandwidth remaining ratio (brr-value-nrt-q2)
  Class class-default (NRT Data)
    Bandwidth remaining ratio (brr-value-q3)
```

In the above port child policy:

- *voice-policy-name*— Refers to the name of the class that specifies rules for the traffic for voice packets. Here the DSCP value is mapped to a value of 46 (represented by the keyword **ef**). The voice traffic is assigned the highest priority of 1.
- *video-policy-name*— Refers to the name of the class that specifies rules for the traffic for video packets. The DSCP value is mapped to a value of 34 (represented by the keyword **af41**).
- *multicast-policer-name-voice*— If you need to configure multicast voice traffic, you can configure policing for the voice class map.
- *multicast-policer-name-video*— If you need to configure multicast video traffic, you can configure policing for the video class map.

In the above sample configuration, all voice and video traffic is directed to the Q0 and Q1 queues, respectively. These queues maintain a strict priority. The packets in Q0 and Q1 are processed in that order. The bandwidth remaining ratios *brr-value-nrt-q2* and *brr-value-q3* are directed to the Q2 and Q3 respectively specified by

the class maps and *class-default* and *non-client-nrt*. The processing of packets on Q2 and Q3 are based on a weighted round-robin approach. For example, if the *brr-value-nrtq2* has a value of 90 and *brr-value-nrtq3* is 10, the packets in queue 2 and queue 3 are processed in the ratio of 9:1.

The Cisco 5700 Series Wireless Controller does not contain a default port policy. Physical port policies must be configured for voice and video to function. Because a Cisco 5700 Series Wireless Controller contains six 10-gigabit ports, the policy map must be configured on all ports.

**Note** The policy must be configured on all of the six physical ports on the controller even if LAG (Link Aggregation/Etherchannel) is configured.

The following basic port policy must be configured on the physical ports. You can add further classification if required:

```
Policy-map <port-policy-name>
  Class voice
    Priority level 1
  class video
    Priority level 2
```

## Radio Policies

The radio policies are system defined and are not user configurable. Radio wireless targets are only applicable in the egress direction.

Radio policies are applicable on a per-radio, per-access point basis. The rate limit on the radios is the practical limit of the AP radio rate. This value is equivalent to the sum of the radios supported by the access point.

The following radios are supported:

- 802.11 a/n
- 802.11 b/n
- 802.11 ac

#### Related Topics

- [Restrictions for QoS on Wireless Targets](#), on page 826
- [Supported QoS Features on Wireless Targets](#), on page 788

## SSID Policies

You can create QoS policies on SSID BSSID (Basic Service Set Identification) in both the ingress and egress directions. By default, there is no SSID policy. All traffic is transmitted as best effort because the wireless traffic is untrusted. You can configure an SSID policy based on the SSID name. The policy is applicable on a per BSSID.

The types of policies you can create on SSID include marking by using table maps (table-maps), shape rate, and RT1 (Real Time 1) and RT2 (Real Time 2) policies. If traffic is ingress, you usually configure a marking and policing policy on the SSID. If traffic is downstream, you can configure marking and queuing.

There should be a one-to-one mapping between the policies configured on a port and an SSID. For example, if you configure class voice and class video on the port, you can have a similar policy on the SSID.

The policy on the port is mandatory if you want to preserve the voice and video behavior priority at the port level. Queuing policy is applicable in a downstream direction. When packets arrive from the AP, you can only configure policing and rate limiting.

SSID priorities can be specified by configuring bandwidth remaining ratio. Queuing SSID policies are applied in the egress direction.

[Supported QoS Features on Wireless Targets](#), on page 788

[Examples: SSID Policy](#)

[Examples: Configuring Downstream SSID Policy](#), on page 891

## Client Policies

Client policies are applicable in the ingress and egress direction. The wireless control module of the switch applies the default client policies when admission control is enabled for WMM clients. When admission control is disabled, there is no default client policy. You can configure policing and marking policies on clients.

---

**Note** A client policy can have both IPv4 and IPv6 filters.

---

You can configure client policies in the following ways:

- Using AAA
- Using the Cisco IOS MQC CLI
  - You can use **service policy client** command in the WLAN configuration.
- Using the default configuration
- Using local policies (native profiling)

Use the **show wireless client mac address *mac\_address* service-policy** command to display the source of the client policy (for example, local profiling policy, AAA, or CLI). The precedence order of client policies is AAA > local policy > WLAN service client policy CLI > default configuration.

---

**Note** If you configured AAA by configuring the unified wireless controller procedure, and using the MQC QoS commands, the policy configuration performed through the MQC QoS commands takes precedence.

---

---

**Note** When applying client policies on a WLAN, you must disable the WLAN before modifying the client policy. SSID policies can be modified even if the WLAN is enabled.

---

The default client policy is enabled only on Wi-Fi Multimedia (WMM) clients that are admission control (ACM)-enabled.

### Policy Chaining

Every packet has a maximum of two applicable policies, first at the client target and second at the SSID target. The client policing action is applied to the packet before the marking action that is specified in the client policy. After the client policing and marking actions are applied to the packet, the SSID policy action is applied to the updated packet. If no custom policies are specified, the system trust configuration is applied to the packet. Egress trust is based on DSCP, and ingress trust is based on WLAN user priority.

## Hierarchical QoS

The switch supports hierarchical QoS (HQoS). HQoS allows you to perform:

- Hierarchical classification— Traffic classification is based upon other classes.
- Hierarchical policing—The process of having the policing configuration at multiple levels in a hierarchical policy.
- Hierarchical shaping—Shaping can also be configured at multiple levels in the hierarchy.

---

**Note** Hierarchical shaping is only supported for the port shaper, where for the parent you only have a configuration for the class default, and the only action for the class default is shaping.

---

### Related Topics

[Examples: Hierarchical Classification](#), on page 888

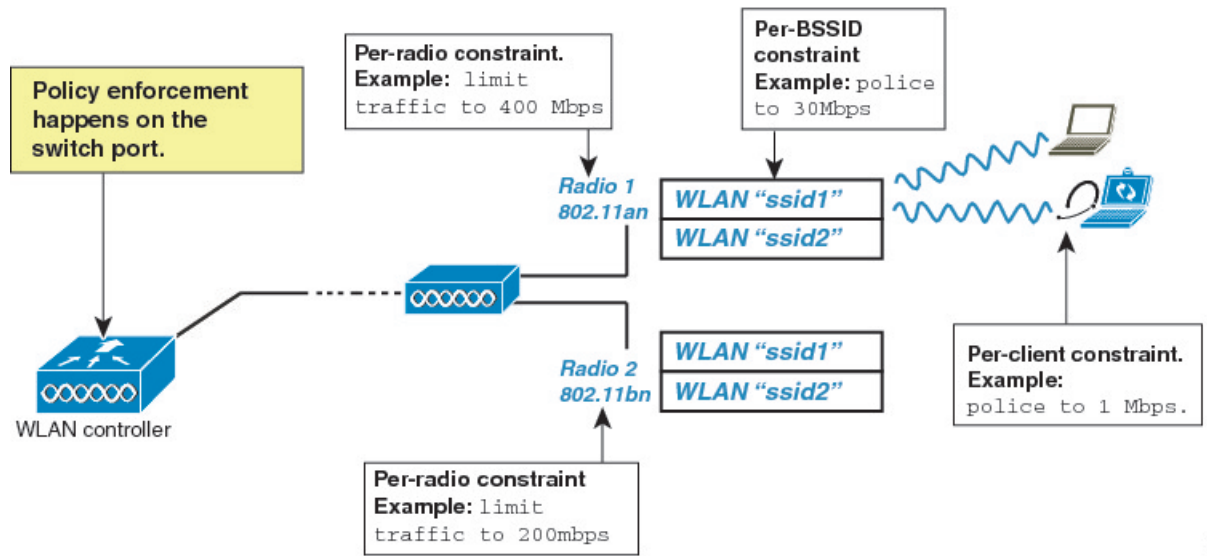

[Examples: Hierarchical Policy Configuration](#), on page 888

## Hierarchical Wireless QoS

The switch supports hierarchical QoS for wireless targets. Hierarchical QoS policies are applicable on port, radio, SSID, and client. QoS policies configured on the device (including marking, shaping, policing) can be applied across the targets. If the network contains non-realtime traffic, the non-realtime traffic is subject to approximate fair drop. Hierarchy refers to the process of application of the various QoS policies on the packets arriving to the device. You can configure policing in both the parent and child policies.

**Note** For hierarchical client and SSID policies, you only configure marking either in the parent or child policy.

352757

## Wireless Packet Format

Figure 60: Wireless Packet Path in the Egress Direction during First Pass

This figure displays the wireless packet flow and encapsulation used in hierarchical wireless QoS. The incoming packet enters the switch. The switch encapsulates this incoming packet and adds the 802.11e and CAPWAP headers.

## Hierarchical AFD

Approximate Fair Dropping (AFD) is a feature provided by the QoS infrastructure in Cisco IOS. For wireless targets, AFD can be configured on SSID (via shaping) and clients (via policing). AFD shaping rate is only applicable for downstream direction. Unicast real-time traffic is not subjected to AFD drops.

## QoS Implementation

Typically, networks operate on a best-effort delivery basis, which means that all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped.

When you configure the QoS feature, you can select specific network traffic, prioritize it according to its relative importance, and use congestion-management and congestion-avoidance techniques to provide preferential treatment. Implementing QoS in your network makes network performance more predictable and bandwidth utilization more effective.

The QoS implementation is based on the Differentiated Services (Diff-Serv) architecture, a standard from the Internet Engineering Task Force (IETF). This architecture specifies that each packet is classified upon entry into the network.

The classification is carried in the IP packet header, using 6 bits from the deprecated IP type of service (ToS) field to carry the classification (*class*) information. Classification can also be carried in the Layer 2 frame.

**Figure 61: QoS Classification Layers in Frames and Packets**

The special bits in the Layer 2 frame or a Layer 3 packet are shown in the following

Encapsulated Packet

Layer 2 ISL Frame

↑ 3 bits used for CoS

Layer 2 802.1Q and 802.1p Frame

↑ 3 bits used for CoS (user priority)

Layer 3 IPv4 Packet

↑ IP precedence or DSCP

Layer 3 IPv6 Packet

↑ IP precedence or DSCP

figure:

[Restrictions for QoS on Wireless Targets](#), on page 826

## Layer 2 Frame Prioritization Bits

Layer 2 Inter-Switch Link (ISL) frame headers have a 1-byte User field that carries an IEEE 802.1p class of service (CoS) value in the three least-significant bits. On ports configured as Layer 2 ISL trunks, all traffic is in ISL frames.

Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value in the three most-significant bits, which are called the User Priority bits. On ports configured as Layer 2 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN.

Other frame types cannot carry Layer 2 CoS values.

Layer 2 CoS values range from 0 for low priority to 7 for high priority.

## Layer 3 Packet Prioritization Bits

Layer 3 IP packets can carry either an IP precedence value or a Differentiated Services Code Point (DSCP) value. QoS supports the use of either value because DSCP values are backward-compatible with IP precedence values.

IP precedence values range from 0 to 7. DSCP values range from 0 to 63.

## End-to-End QoS Solution Using Classification

All switches and routers that access the Internet rely on the class information to provide the same forwarding treatment to packets with the same class information and different treatment to packets with different class information. The class information in the packet can be assigned by end hosts or by switches or routers along the way, based on a configured policy, detailed examination of the packet, or both. Detailed examination of the packet is expected to occur closer to the edge of the network, so that the core switches and routers are not overloaded with this task.

Switches and routers along the path can use the class information to limit the amount of resources allocated per traffic class. The behavior of an individual device when handling traffic in the Diff-Serv architecture is called per-hop behavior. If all devices along a path provide a consistent per-hop behavior, you can construct an end-to-end QoS solution.

Implementing QoS in your network can be a simple task or complex task and depends on the QoS features offered by your internetworking devices, the traffic types and patterns in your network, and the granularity of control that you need over incoming and outgoing traffic.

## Packet Classification

Packet classification is the process of identifying a packet as belonging to one of several classes in a defined policy, based on certain criteria. The Modular QoS CLI (MQC) is a policy-class based language. The policy class language is used to define the following:

- Class-map template with one or several match criteria
- Policy-map template with one or several classes associated to the policy map

The policy map template is then associated to one or several interfaces on the switch.

Packet classification is the process of identifying a packet as belonging to one of the classes defined in the policy map. The process of classification will exit when the packet being processed matches a specific filter in a class. This is referred to as first-match exit. If a packet matches multiple classes in a policy, irrespective of the order of classes in the policy map, it would still exit the classification process after matching the first class.

If a packet does not match any of the classes in the policy, it would be classified into the default class in the policy. Every policy map has a default class, which is a system-defined class to match packets that do not match any of the user-defined classes.

Packet classification can be categorized into the following types:

- Classification based on information that is propagated with the packet
- Classification based on information that is switch specific
- Hierarchical classification

## Classification Based on Information That is Propagated with the Packet

Classification that is based on information that is part of the packet and propagated either end-to-end or between hops, typically includes the following:

- Classification based on Layer 3 or 4 headers
- Classification based on Layer 2 information

### Classification Based on Layer 3 or Layer 4 Header

This is the most common deployment scenario. Numerous fields in the Layer 3 and Layer 4 headers can be used for packet classification.

At the most granular level, this classification methodology can be used to match an entire flow. For this deployment type, an access control list (ACLs) can be used. ACLs can also be used to match based on various subsets of the flow (for example, source IP address only, or destination IP address only, or a combination of both).

Classification can also be done based on the precedence or DSCP values in the IP header. The IP precedence field is used to indicate the relative priority with which a particular packet needs to be handled. It is made up of three bits in the IP header's type of service (ToS) byte.

The following table shows the different IP precedence bit values and their names.

**Note** IP precedence is not supported for wireless QoS.

**Table 60: IP Precedence Values and Names**

IP Precedence Value	IP Precedence Bits	IP Precedence Names
0	000	Routine
1	001	Priority
2	010	Immediate
3	011	Flash
4	100	Flash Override
5	101	Critical
6	110	Internetwork control
7	111	Network control

**Note** All routing control traffic in the network uses IP precedence value 6 by default. IP precedence value 7 also is reserved for network control traffic. Therefore, the use of IP precedence values 6 and 7 is not recommended for user traffic.

The DSCP field is made up of 6 bits in the IP header and is being standardized by the Internet Engineering Task Force (IETF) Differentiated Services Working Group. The original ToS byte contained the DSCP bits has been renamed the DSCP byte. The DSCP field is part of the IP header, similar to IP precedence. The

DSCP field is a super set of the IP precedence field. Therefore, the DSCP field is used and is set in ways similar to what was described with respect to IP precedence.

---

**Note** The DSCP field definition is backward-compatible with the IP precedence values.

---

### *Classification Based on Layer 2 Header*

A variety of methods can be used to perform classification based on the Layer 2 header information. The most common methods include the following:

- MAC address-based classification (only for access groups)—Classification is based upon the source MAC address (for policies in the input direction) and destination MAC address (for policies in the output direction).
- Class-of-Service—Classification is based on the 3 bits in the Layer 2 header based on the IEEE 802.1p standard. This usually maps to the ToS byte in the IP header.
- VLAN ID—Classification is based on the VLAN ID of the packet.

---

**Note** Some of these fields in the Layer 2 header can also be set using a policy.

---

### **Classification Based on Information that is Device Specific (QoS Groups)**

The switch also provides classification mechanisms that are available where classification is not based on information in the packet header or payload.

At times you might be required to aggregate traffic coming from multiple input interfaces into a specific class in the output interface. For example, multiple customer edge routers might be going into the same access switch on different interfaces. The service provider might want to police all the aggregate voice traffic going into the core to a specific rate. However, the voice traffic coming in from the different customers could have a different ToS settings. QoS group-based classification is a feature that is useful in these scenarios.

Policies configured on the input interfaces set the QoS group to a specific value, which can then be used to classify packets in the policy enabled on output interface.

The QoS group is a field in the packet data structure internal to the switch. It is important to note that a QoS group is an internal label to the switch and is not part of the packet header.

### **Hierarchical Classification**

The switch permits you to perform a classification based on other classes. Typically, this action may be required when there is a need to combine the classification mechanisms (that is, filters) from two or more classes into a single class map.

## **QoS Wired Model**

To implement QoS, the switch must perform the following tasks:

- Traffic classification—Distinguishes packets or flows from one another.

- Traffic marking and policing—Assigns a label to indicate the given quality of service as the packets move through the switch, and then make the packets comply with the configured resource usage limits.
- Queuing and scheduling—Provides different treatment in all situations where resource contention exists.
- Shaping—Ensures that traffic sent from the switch meets a specific traffic profile.

## Ingress Port Activity

The following activities occur at the ingress port of the switch:

- Classification—Classifying a distinct path for a packet by associating it with a QoS label. For example, the switch maps the CoS or DSCP in the packet to a QoS label to distinguish one type of traffic from another. The QoS label that is generated identifies all future QoS actions to be performed on this packet.
- Policing—Policing determines whether a packet is in or out of profile by comparing the rate of the incoming traffic to the configured policer. The policer limits the bandwidth consumed by a flow of traffic. The result is passed to the marker.
- Marking—Marking evaluates the policer and configuration information for the action to be taken when a packet is out of profile and determines what to do with the packet (pass through a packet without modification, mark down the QoS label in the packet, or drop the packet).

---

**Note** Applying polices on the wireless ingress port is not supported on the switch.

---

## Egress Port Activity

The following activities occur at the egress port of the switch:

- Policing—Policing determines whether a packet is in or out of profile by comparing the rate of the incoming traffic to the configured policer. The policer limits the bandwidth consumed by a flow of traffic. The result is passed to the marker.
- Marking—Marking evaluates the policer and configuration information for the action to be taken when a packet is out of profile and determines what to do with the packet (pass through a packet without modification, mark down the QoS label in the packet, or drop the packet).
- Queueing—Queueing evaluates the QoS packet label and the corresponding DSCP or CoS value before selecting which of the egress queues to use. Because congestion can occur when multiple ingress ports simultaneously send data to an egress port, Weighted Tail Drop (WTD) differentiates traffic classes and subjects the packets to different thresholds based on the QoS label. If the threshold is exceeded, the packet is dropped.

## Classification

Classification is the process of distinguishing one kind of traffic from another by examining the fields in the packet. Classification is enabled only if QoS is enabled on the switch. By default, QoS is enabled on the switch.

During classification, the switch performs a lookup and assigns a QoS label to the packet. The QoS label identifies all QoS actions to be performed on the packet and from which queue the packet is sent.

## Access Control Lists

You can use IP standard, IP extended, or Layer 2 MAC ACLs to define a group of packets with the same characteristics (class). You can also classify IP traffic based on IPv6 ACLs.

In the QoS context, the permit and deny actions in the access control entries (ACEs) have different meanings from security ACLs:

- If a match with a permit action is encountered (first-match principle), the specified QoS-related action is taken.
- If a match with a deny action is encountered, the ACL being processed is skipped, and the next ACL is processed.

---

**Note** Deny action is supported in Cisco IOS Release 3.7.4E and later releases.

---

- If no match with a permit action is encountered and all the ACEs have been examined, no QoS processing occurs on the packet, and the switch offers best-effort service to the packet.
- If multiple ACLs are configured on a port, the lookup stops after the packet matches the first ACL with a permit action, and QoS processing begins.

---

**Note** When creating an access list, note that by default the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.

---

After a traffic class has been defined with the ACL, you can attach a policy to it. A policy might contain multiple classes with actions specified for each one of them. A policy might include commands to classify the class as a particular aggregate (for example, assign a DSCP) or rate-limit the class. This policy is then attached to a particular port on which it becomes effective.

You implement IP ACLs to classify IP traffic by using the **access-list** global configuration command; you implement Layer 2 MAC ACLs to classify non-IP traffic by using the **mac access-list extended** global configuration command.

## Class Maps

A class map is a mechanism that you use to name a specific traffic flow (or class) and isolate it from all other traffic. The class map defines the criteria used to match against a specific traffic flow to further classify it. The criteria can include matching the access group defined by the ACL or matching a specific list of DSCP or IP precedence values. If you have more than one type of traffic that you want to classify, you can create another class map and use a different name. After a packet is matched against the class-map criteria, you further classify it through the use of a policy map.

You create a class map by using the **class-map** global configuration command or the **class** policy-map configuration command. You should use the **class-map** command when the map is shared among many ports. When you enter the **class-map** command, the switch enters the class-map configuration mode. In this mode, you define the match criterion for the traffic by using the **match** class-map configuration command.

You can create a default class by using the **class class-default** policy-map configuration command. The default class is system-defined and cannot be configured. Unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as default traffic.

#### Related Topics

[Creating a Traffic Class \(CLI\)](#), on page 828

[Examples: Classification by Access Control Lists](#), on page 886

## Policy Maps

A policy map specifies which traffic class to act on. Actions can include the following:

- Setting a specific DSCP or IP precedence value in the traffic class
- Setting a CoS value in the traffic class
- Setting a QoS group
- Setting a wireless LAN (WLAN) value in the traffic class
- Specifying the traffic bandwidth limitations and the action to take when the traffic is out of profile

Before a policy map can be effective, you must attach it to a port.

You create and name a policy map using the **policy-map** global configuration command. When you enter this command, the switch enters the policy-map configuration mode. In this mode, you specify the actions to take on a specific traffic class by using the **class** or **set** policy-map configuration and policy-map class configuration commands.

The policy map can also be configured using the **police** and **bandwidth** policy-map class configuration commands, which define the policer, the bandwidth limitations of the traffic, and the action to take if the limits are exceeded. In addition, the policy-map can further be configured using the **priority** policy-map class configuration command, to schedule priority for the class or the queueing policy-map class configuration commands, **queue-buffers** and **queue-limit**.

To enable the policy map, you attach it to a port by using the **service-policy** interface configuration command.

### Policy Map on Physical Port

You can configure a nonhierarchical policy map on a physical port that specifies which traffic class to act on. Actions can include setting a specific DSCP or IP precedence value in the traffic class, specifying the traffic bandwidth limitations for each matched traffic class (policer), and taking action when the traffic is out of profile (marking).

A policy map also has these characteristics:

- A policy map can contain multiple class statements, each with different match criteria and policers.
- A policy map can contain a predefined default traffic class explicitly placed at the end of the map.

When you configure a default traffic class by using the **class class-default** policy-map configuration command, unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as the default traffic class (**class-default**).

- A separate policy-map class can exist for each type of traffic received through a port.

#### Related Topics

[Attaching a Traffic Policy to an Interface \(CLI\)](#), on page 844

### Policy Map on VLANs

The switch supports a VLAN QoS feature that allows the user to perform QoS treatment at the VLAN level (classification and QoS actions) using the incoming frame's VLAN information. In VLAN-based QoS, a service policy is applied to an SVI interface. All physical interfaces belonging to a VLAN policy map then need to be programmed to refer to the VLAN-based policy maps instead of the port-based policy map.

Although the policy map is applied to the VLAN SVI, any policing (rate-limiting) action can only be performed on a per-port basis. You cannot configure the policer to take account of the sum of traffic from a number of physical ports. Each port needs to have a separate policer governing the traffic coming into that port.

[Examples: Policer VLAN Configuration](#), on page 898

### Wireless QoS Multicast

You can configure multicast policing rate at the port level.

There are two modes of a multicast configuration in the Cisco 5700 Series Wireless Controller:

- multicast-unicast mode—Multicast traffic is copied as unicast traffic to the APs. QoS on multicast traffic when multicast-unicast mode is not supported on the Cisco 5700 Series Wireless Controller.
- multicast-multicast mode—The controller sends the traffic to the multicast group. The APs in the multicast group then receive the multicast traffic.

[Examples: Wireless QoS Policy Classified by Voice, Video, and Multicast Traffic](#), on page 890

## Policing

After a packet is classified and has a DSCP-based, CoS-based, or QoS-group label assigned to it, the policing and marking process can begin.

Policing involves creating a policer that specifies the bandwidth limits for the traffic. Packets that exceed the limits are *out of profile* or *nonconforming*. Each policer decides on a packet-by-packet basis whether the packet is in or out of profile and specifies the actions on the packet. These actions, carried out by the marker, include passing through the packet without modification, dropping the packet, or modifying (marking down) the assigned DSCP or CoS value of the packet and allowing the packet to pass through.

To avoid out-of-order packets, both conform and nonconforming traffic typically exit the same queue.

#### Note

All traffic, regardless of whether it is bridged or routed, is subjected to a policer, if one is configured. As a result, bridged packets might be dropped or might have their DSCP or CoS fields modified when they are policed and marked.

You can only configure policing on a physical port.

After you configure the policy map and policing actions, attach the policy to an ingress port or SVI by using the **service-policy** interface configuration command.

[Configuring Police \(CLI\)](#), on page 867

[Examples: Policing Action Configuration](#), on page 897

## Token-Bucket Algorithm

Policing uses a token-bucket algorithm. As each frame is received by the switch, a token is added to the bucket. The bucket has a hole in it and leaks at a rate that you specify as the average traffic rate in bits per second. Each time a token is added to the bucket, the switch verifies that there is enough room in the bucket. If there is not enough room, the packet is marked as nonconforming, and the specified policer action is taken (dropped or marked down).

How quickly the bucket fills is a function of the bucket depth (burst-byte), the rate at which the tokens are removed (rate-bps), and the duration of the burst above the average rate. The size of the bucket imposes an upper limit on the burst length and limits the number of frames that can be transmitted back-to-back. If the burst is short, the bucket does not overflow, and no action is taken against the traffic flow. However, if a burst is long and at a higher rate, the bucket overflows, and the policing actions are taken against the frames in that burst.

You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the burst-byte option of the **police** policy-map class configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the rate option of the **police** policy-map class configuration command.

## Marking

Marking is used to convey specific information to a downstream device in the network, or to carry information from one interface in a switch to another.

Marking can be used to set certain field/bits in the packet headers, or marking can also be used to set certain fields in the packet structure that is internal to the switch. Additionally, the marking feature can be used to define mapping between fields. The following marking methods are available for QoS:

- Packet header
- Device (switch) specific information
- Table maps

## Packet Header Marking

Marking on fields in the packet header can be classified into two general categories:

- IPv4/v6 header bit marking

- Layer 2 header bit marking

The marking feature at the IP level is used to set the precedence or the DSCP in the IP header to a specific value to get a specific per-hop behavior at the downstream device (switch or router), or it can also be used to aggregate traffic from different input interfaces into a single class in the output interface. The functionality is currently supported on both the IPv4 and IPv6 headers.

Marking in the Layer 2 headers is typically used to influence dropping behavior in the downstream devices (switch or router). It works in tandem with the match on the Layer 2 headers. The bits in the Layer 2 header that can be set using a policy map are class of service.

## Switch Specific Information Marking

This form of marking includes marking of fields in the packet data structure that are not part of the packets header, so that the marking can be used later in the data path. This is not propagated between the switches. Marking of QoS-group falls into this category. This form of marking is only supported in policies that are enabled on the input interfaces. The corresponding matching mechanism can be enabled on the output interfaces on the same switch and an appropriate QoS action can be applied.

## Table Map Marking

Table map marking enables the mapping and conversion from one field to another using a conversion table. This conversion table is called a table map.

Depending upon the table map attached to an interface, CoS, DSCP, and UP values (UP specific to wireless packets) of the packet are rewritten. The switch allows configuring both ingress table map policies and egress table map policies.

### Note

The switch stack supports a total of 14 table maps. Only one table map is supported per wired port, per direction.

As an example, a table map can be used to map the Layer 2 CoS setting to a precedence value in Layer 3. This feature enables combining multiple **set** commands into a single table, which indicates the method to perform the mapping. This table can be referenced in multiple policies, or multiple times in the same policy.

The following table shows the currently supported forms of mapping:

**Table 61: Packet-Marking Types Used for Establishing a To-From Relationship**

The To Packet-Marking Type	The From Packet-Marking Type
Precedence	CoS
Precedence	QoS Group
DSCP	CoS
DSCP	QoS Group
CoS	Precedence
CoS	DSCP

The To Packet-Marking Type	The From Packet-Marking Type
QoS Group	Precedence
QoS Group	DSCP

A table map-based policy supports the following capabilities:

- Mutation—You can have a table map that maps from one DSCP value set to another DSCP value set, and this can be attached to an egress port.
- Rewrite—Packets coming in are rewritten depending upon the configured table map.
- Mapping—Table map based policies can be used instead of set policies.

The following steps are required for table map marking:

1. Define the table map—Use the **table-map** global configuration command to map the values. The table does not know of the policies or classes within which it will be used. The default command in the table map is used to indicate the value to be copied into the to field when there is no matching from field.
2. Define the policy map—You must define the policy map where the table map will be used.
3. Associate the policy to an interface.

**Note** A table map policy on an input port changes the trust setting of that port to the from type of qos-marking.

[Examples: Table Map Marking Configuration](#), on page 900

## Traffic Conditioning

To support QoS in a network, traffic entering the service provider network needs to be policed on the network boundary routers to ensure that the traffic rate stays within the service limit. Even if a few routers at the network boundary start sending more traffic than what the network core is provisioned to handle, the increased traffic load leads to network congestion. The degraded performance in the network makes it difficult to deliver QoS for all the network traffic.

Traffic policing functions (using the police feature) and shaping functions (using the traffic shaping feature) manage the traffic rate, but differ in how they treat traffic when tokens are exhausted. The concept of tokens comes from the token bucket scheme, a traffic metering function.

**Note** When running QoS tests on network traffic, you may see different results for the shaper and policing data. Network traffic data from shaping provides more accurate results.

This table compares the policing and shaping functions.

**Table 62: Comparison Between Policing and Shaping Functions**

<b>Policing Function</b>	<b>Shaping Function</b>
Sends conforming traffic up to the line rate and allows bursts.	Smooths traffic and sends it out at a constant rate.
When tokens are exhausted, action is taken immediately.	When tokens are exhausted, it buffers packets and sends them out later, when tokens are available. A class with shaping has a queue associated with it which will be used to buffer the packets.
Policing has multiple units of configuration – in bits per second, packets per second and cells per second.	Shaping has only one unit of configuration - in bits per second.
Policing has multiple possible actions associated with an event, marking and dropping being example of such actions.	Shaping does not have the provision to mark packets that do not meet the profile.
Works for both input and output traffic.	Implemented for output traffic only.
Transmission Control Protocol (TCP) detects the line at line speed but adapts to the configured rate when a packet drop occurs by lowering its window size.	TCP can detect that it has a lower speed line and adapt its retransmission timer accordingly. This results in less scope of retransmissions and is TCP-friendly.

## Policing

The QoS policing feature is used to impose a maximum rate on a traffic class. The QoS policing feature can also be used with the priority feature to restrict priority traffic. If the rate is exceeded, then a specific action is taken as soon as the event occurs. The rate (committed information rate [CIR] and peak information rate [PIR] ) and the burst parameters (conformed burst size [  $B_c$  ] and extended burst size [  $B_e$  ] ) are all configured in bytes per second.

The following policing forms or policers are supported for QoS:

- Single-rate two-color policing
- Dual-rate three-color policing

**Note** Single-rate three-color policing is not supported.

### Single-Rate Two-Color Policing

Single-rate two-color policer is the mode in which you configure only a CIR and a  $B_c$ .

The  $B_c$  is an optional parameter, and if it is not specified it is computed by default. In this mode, when an incoming packet has enough tokens available, the packet is considered to be conforming. If at the time of packet arrival, enough tokens are not available within the bounds of  $B_c$ , the packet is considered to have exceeded the configured rate.

---

**Note** For information about the token-bucket algorithm, see [Token-Bucket Algorithm, on page 805](#).

---

#### Related Topics

[Configuring Police \(CLI\), on page 867](#)

[Examples: Single-Rate Two-Color Policing Configuration, on page 899](#)

### Dual-Rate Three-Color Policing

With the dual rate policer, the switch supports only color-blind mode. In this mode, you configure a committed information rate (CIR) and a peak information rate (PIR). As the name suggests, there are two token buckets in this case, one for the peak rate, and one for the conformed rate.

---

**Note** For information about the token-bucket algorithm, see [Token-Bucket Algorithm, on page 805](#).

---

In the color-blind mode, the incoming packet is first checked against the peak rate bucket. If there are not enough tokens available, the packet is said to violate the rate. If there are enough tokens available, then the tokens in the conformed rate buckets are checked to determine if there are enough tokens available. The tokens in the peak rate bucket are decremented by the size of the packet. If it does not have enough tokens available, the packet is said to have exceeded the configured rate. If there are enough tokens available, then the packet is said to conform, and the tokens in both the buckets are decremented by the size of the packet.

The rate at which tokens are replenished depends on the packet arrival. Assume that a packet comes in at time T1 and the next one comes in at time T2. The time interval between T1 and T2 determines the number of tokens that need to be added to the token bucket. This is calculated as:

Time interval between packets (T2-T1) \* CIR/8 bytes

[Examples: Dual-Rate Three-Color Policing Configuration, on page 899](#)

## Shaping

Shaping is the process of imposing a maximum rate of traffic, while regulating the traffic rate in such a way that the downstream switches and routers are not subjected to congestion. Shaping in the most common form is used to limit the traffic sent from a physical or logical interface.

Shaping has a buffer associated with it that ensures that packets which do not have enough tokens are buffered as opposed to being immediately dropped. The number of buffers available to the subset of traffic being shaped is limited and is computed based on a variety of factors. The number of buffers available can also be tuned using specific QoS commands. Packets are buffered as buffers are available, beyond which they are dropped.

### Class-Based Traffic Shaping

The switch uses class-based traffic shaping. This shaping feature is enabled on a class in a policy that is associated to an interface. A class that has shaping configured is allocated a number of buffers to hold the packets that do not have tokens. The buffered packets are sent out from the class using FIFO. In the most common form of usage, class-based shaping is used to impose a maximum rate for an physical interface or logical interface as a whole. The following shaping forms are supported in a class:

- Average rate shaping
- Hierarchical shaping

Shaping is implemented using a token bucket. The values of CIR,  $B_c$  and  $B_e$  determine the rate at which the packets are sent out and the rate at which the tokens are replenished.

---

**Note** For information about the token-bucket algorithm, see [Token-Bucket Algorithm, on page 805](#).

---

### Average Rate Shaping

You use the **shape average** policy-map class command to configure average rate shaping.

This command configures a maximum bandwidth for a particular class. The queue bandwidth is restricted to this value even though the port has more bandwidth available. The switch supports configuring shape average by either a percentage or by a target bit rate value.

#### Related Topics

- [Configuring Shaping \(CLI\), on page 876](#)
- [Examples: Average Rate Shaping Configuration, on page 895](#)

### Hierarchical Shaping

Shaping can also be configured at multiple levels in a hierarchy. This is accomplished by creating a parent policy with shaping configured, and then attaching child policies with additional shaping configurations to the parent policy.

There are two supported types of hierarchical shaping:

- Port shaper
- User-configured shaping

The port shaper uses the class default and the only action permitted in the parent is shaping. The queueing action is in the child with the port shaper. With the user configured shaping, you cannot have queueing action in the child.

#### Related Topics

- [Configuring Shaping \(CLI\), on page 876](#)

## Queueing and Scheduling

The switch uses both queueing and scheduling to help prevent traffic congestion. The switch supports the following queueing and scheduling features:

- Bandwidth
- Weighted Tail Drop
- Priority queues
- Queue buffers

## Bandwidth

The switch supports the following bandwidth configurations:

- Bandwidth percent
- Bandwidth remaining ratio

### Related Topics

[Configuring Bandwidth \(CLI\)](#), on page 865

## Bandwidth Percent

You can use the **bandwidth percent** policy-map class command to allocate a minimum bandwidth to a particular class. The total sum cannot exceed 100 percent and in case the total sum is less than 100 percent, then the rest of the bandwidth is divided equally among all bandwidth queues.

---

**Note** A queue can oversubscribe bandwidth in case the other queues do not utilize the entire port bandwidth.

---

You cannot mix bandwidth types on a policy map. For example, you cannot configure bandwidth in a single policy map using both a bandwidth percent and in kilobits per second.

## Bandwidth Remaining Ratio

You use the **bandwidth remaining ratio** policy-map class command to create a ratio for sharing unused bandwidth in specified queues. Any unused bandwidth will be used by these specific queues in the ratio that is specified by the configuration. Use this command when the **priority** command is also used for certain queues in the policy.

When you assign ratios, the queues will be assigned certain weights which are inline with these ratios.

You can specify ratios using a range from 0 to 100. For example, you can configure a bandwidth remaining ratio of 2 on one class, and another queue with a bandwidth remaining ratio of 4 on another class. The bandwidth remaining ratio of 4 will be scheduled twice as often as the bandwidth remaining ratio of 2.

The total bandwidth ratio allocation for the policy can exceed 100. For example, you can configure a queue with a bandwidth remaining ratio of 50, and another queue with a bandwidth remaining ratio of 100.

## Weighted Tail Drop

The switch egress queues use an enhanced version of the tail-drop congestion-avoidance mechanism called weighted tail drop (WTD). WTD is implemented on queues to manage the queue lengths and to provide drop precedences for different traffic classifications.

As a frame is enqueued to a particular queue, WTD uses the frame's assigned QoS label to subject it to different thresholds. If the threshold is exceeded for that QoS label (the space available in the destination queue is less than the size of the frame), the switch drops the frame.

Each queue has three configurable threshold values. The QoS label determines which of the three threshold values is subjected to the frame.

### *Figure 62: WTD and Queue Operation*

The following figure shows an example of WTD operating on a queue whose size is 1000 frames. Three drop percentages are configured: 40 percent (400 frames), 60 percent (600 frames), and 100 percent (1000 frames).

These percentages indicate that up to 400 frames can be queued at the 40-percent threshold, up to 600 frames at the 60-percent threshold, and up to 1000 frames at the 100-percent

threshold.

In the example, CoS value 6 has a greater importance than the other CoS values, and is assigned to the 100-percent drop threshold (queue-full state). CoS values 4 is assigned to the 60-percent threshold, and CoS values 3 is assigned to the 40-percent threshold. All of these threshold values are assigned using the **queue-limit cos** command.

Assuming the queue is already filled with 600 frames, and a new frame arrives. It contains CoS value 4 and is subjected to the 60-percent threshold. If this frame is added to the queue, the threshold will be exceeded, so the switch drops it.

[Configuring Queue Limits \(CLI\)](#), on page 874

[Examples: Queue-limit Configuration](#), on page 896

## Weighted Tail Drop Default Values

The following are the Weighted Tail Drop (WTD) default values and the rules for configuring WTD threshold values.

- If you configure less than three queue-limit percentages for WTD, then WTD default values are assigned to these thresholds.

The following are the WTD threshold default values:

**Table 63: WTD Threshold Default Values**

Threshold	Default Value Percentage
0	80
1	90
2	400

- If 3 different WTD thresholds are configured, then the queues are programmed as configured.
- If 2 WTD thresholds are configured, then the maximum value percentage will be 400.
- If a WTD single threshold is configured as x, then the maximum value percentage will be 400.
  - If the value of x is less than 90, then threshold1=90 and threshold 0= x.
  - If the value of x equals 90, then threshold1=90, threshold 0=80.
  - If the value x is greater than 90, then threshold1=x, threshold 0=80.

## Priority Queues

Each port supports eight egress queues, of which two can be given a priority.

You use the **priority level** policy class-map command to configure the priority for two classes. One of the classes has to be configured with a priority queue level 1, and the other class has to be configured with a priority queue level 2. Packets on these two queues are subjected to less latency with respect to other queues.

**Note** You can configure a priority only with a level.

Only one strict priority or a priority with levels is allowed in one policy map. Multiple priorities with the same priority levels without kbps/percent are allowed in a policy map only if all of them are configured with police.

### Related Topics

[Configuring Priority \(CLI\)](#), on page 869

## Queue Buffer

Each 1-gigabit port on the switch is allocated 168 buffers for a wireless port and 300 buffers for a wired port. Each 10-gigabit port is allocated 1800 buffers. At boot time, when there is no policy map enabled on the wired port, there are two queues created by default. Wired ports can have a maximum of 8 queues configured using MQC-based policies. The following table shows which packets go into which one of the queues:

**Table 64: DSCP, Precedence, and CoS - Queue Threshold Mapping Table**

DSCP, Precedence or CoS	Queue	Threshold
Control Packets	0	2
Rest of Packets	1	2

**Note** You can guarantee the availability of buffers, set drop thresholds, and configure the maximum memory allocation for a queue. You use the **queue-buffers** policy-map class command to configure the queue buffers. You use the **queue-limit** policy-map class command to configure the maximum thresholds.

There are two types of buffer allocations: hard buffers, which are explicitly reserved for the queue, and soft buffers, which are available for other ports when unused by a given port.

For the wireless port default, Queue 0 will be given 40 percent of the buffers that are available for the interface as hard buffers, that is 67 buffers are allocated for Queue 0 in the context of 1-gigabit ports. The soft maximum for this queue is set to 268 (calculated as  $67 * 400/100$ ) for 1-gigabit ports, where 400 is the default maximum threshold that is configured for any queue.

For the wired port default, Queue 0 will be given 40 percent of the buffers that are available for the interface as hard buffers, that is 120 buffers are allocated for Queue 0 in the context of 1-gigabit ports, and 720 buffers in the context of 10-gigabit ports. The soft maximum for this queue is set to 480 (calculated as  $120 * 400/100$ ) for 1-gigabit ports and 2880 for 10-gigabit ports, where 400 is the default maximum threshold that is configured for any queue.

Queue 1 does not have any hard buffers allocated. The default soft buffer limit is set to 400 (which is the maximum threshold). The threshold would determine the maximum number of soft buffers that can be borrowed from the common pool.

## Queue Buffer Allocation

The buffer allocation to any queue can be tuned using the **queue-buffers ratio** policy-map class configuration command.

### Related Topics

[Configuring Queue Buffers \(CLI\)](#), on page 872

[Examples: Queue Buffers Configuration](#), on page 897

## Dynamic Threshold and Scaling

Traditionally, reserved buffers are statically allocated for each queue. No matter whether the queue is active or not, its buffers are held up by the queue. In addition, as the number of queues increases, the portion of the reserved buffers allocated for each queue can become smaller and smaller. Eventually, a situation may occur where there are not enough reserved buffers to support a jumbo frame for all queues.

The switch supports Dynamic Thresholding and Scaling (DTS), which is a feature that provides a fair and efficient allocation of buffer resources. When congestion occurs, this DTS mechanism provides an elastic buffer allocation for the incoming data based on the occupancy of the global/port resources. Conceptually, DTS scales down the queue buffer allocation gradually as the resources are used up to leave room for other queues, and vice versa. This flexible method allows the buffers to be more efficiently and fairly utilized.

As mentioned in the previous sections, there are two limits configured on a queue—a hard limit and a soft limit.

Hard limits are not part of DTS. These buffers are available only for that queue. The sum of the hard limits should be less than the globally set up hard maximum limit. The global hard limit configured for egress queuing is currently set to 5705. In the default scenario when there are no MQC policies configured, the 24 1-gigabit ports would take up  $24 * 67 = 1608$ , and the 4 10-gigabit ports would take up  $4 * 720 = 2880$ , for a total of 4488 buffers, allowing room for more hard buffers to be allocated based upon the configuration.

Soft limit buffers participate in the DTS process. Additionally, some of the soft buffer allocations can exceed the global soft limit allocation. The global soft limit allocation for egress queuing is currently set to 7607. The sum of the hard and soft limits add up to 13312, which in turn translates to 3.4 MB. Because the sum of the soft buffer allocations can exceed the global limit, it allows a specific queue to use a large number of buffers when the system is lightly loaded. The DTS process dynamically adjusts the per-queue allocation as the system becomes more heavily loaded.

## Queuing in Wireless

Queuing in the wireless component is performed based on the port policy and is applicable only in the downstream direction. The wireless module supports the following four queues:

- **Voice**—This is a strict priority queue. Represented by Q0, this queue processes control traffic and multicast or unicast voice traffic. All control traffic (such as CAPWAP packets) is processed through the voice queue. The QoS module uses a different threshold within the voice queue to process control and voice packets to ensure that control packets get higher priority over other non-control packets.
- **Video**—This is a strict priority queue. Represented by Q1, this queue processes multicast or unicast video traffic.
- **Data NRT**—Represented by Q2, this queue processes all non-real-time unicast traffic.

- Multicast NRT—Represented by Q3, this queue processes Multicast NRT traffic. Any traffic that does not match the traffic in Q0, Q1, or Q2 is processed through Q3.

**Note** By default, the queues Q0 and Q1 are not enabled.

**Note** A weighted round-robin policy is applied for traffic in the queues Q2 and Q3.

For upstream direction only one queue is available. Port and radio policies are applicable only in the downstream direction.

**Note** The wired ports support eight queues.

## Trust Behavior

### Trust Behavior for Wired and Wireless Ports

For wired or wireless ports that are connected to the switch (end points such as IP phones, laptops, cameras, telepresence units, or other devices), their DSCP, precedence, or CoS values coming in from these end points are trusted by the switch and therefore are retained in the absence of any explicit policy configuration.

This trust behavior is applicable to both upstream and downstream QoS.

The packets are enqueued to the appropriate queue per the default initial configuration. No priority queuing at the switch is done by default. This is true for unicast and multicast packets.

In scenarios where the incoming packet type differs from the outgoing packet type, the trust behavior and the queuing behavior are explained in the following table. Note that the default trust mode for a port is DSCP based. The trust mode ‘falls back’ to CoS if the incoming packet is a pure Layer 2 packet. You can also change the trust setting from DSCP to CoS. This setting change is accomplished by using an MQC policy that has a class default with a 'set cos cos table default default-cos' action, where default-cos is the name of the table map created (which only performs a default copy).

**Table 65: Trust and Queuing Behavior**

Incoming Packet	Outgoing Packet	Trust Behavior	Queuing Behavior
Layer 3	Layer 3	Preserve DSCP/Precedence	Based on DSCP
Layer 2	Layer 2	Not applicable	Based on CoS
Tagged	Tagged	Preserve DSCP and CoS	Based on DSCP (trust DSCP takes precedence)
Layer 3	Tagged	Preserve DSCP, CoS is set to 0	Based on DSCP

The Cisco IOS XE 3.2 Release supported different trust defaults for wired and wireless ports. The trust default for wired ports was the same as for this software release. For wireless ports, the default system behavior was non-trust, which meant that when the switch came up, all markings for the wireless ports were defaulted to zero and no traffic received priority treatment. For compatibility with an existing wired switch, all traffic went to the best-effort queue by default. The access point performed priority queuing by default. In the downstream direction, the access point maintained voice, video, best-effort, and background queues for queuing. The access selected the queuing strategy based on the 11e tag information. By default, the access point treated all wireless packets as best effort.

The default trust behavior in the case of wireless ports could be changed by using the **qos wireless default untrust** command.

**Note** If you upgrade from Cisco IOS XE 3.2 SE Release to a later release, the default behavior of the wireless traffic is still untrusted. In this situation, you can use the **no qos wireless-default untrust** command to enable trust behavior for wireless traffic. However, if you install Cisco IOS XE 3.3 SE or a later release on the switch, the default QoS behavior for wireless traffic is trust. Starting with Cisco IOS XE 3.3 SE Release and later, the packet markings are preserved in both egress and ingress directions for new installations (not upgrades) for wireless traffic.

## Port Security on a Trusted Boundary for Cisco IP Phones

In a typical network, you connect a Cisco IP Phone to a switch port and cascade devices that generate data packets from the back of the telephone. The Cisco IP Phone guarantees the voice quality through a shared data link by marking the CoS level of the voice packets as high priority (CoS = 5) and by marking the data packets as low priority (CoS = 0). Traffic sent from the telephone to the switch is typically marked with a tag that uses the 802.1Q header. The header contains the VLAN information and the class of service (CoS) 3-bit field, which is the priority of the packet.

For most Cisco IP Phone configurations, the traffic sent from the telephone to the switch should be trusted to ensure that voice traffic is properly prioritized over other types of traffic in the network. By using the **trust device** interface configuration command, you configure the switch port to which the telephone is connected to trust the traffic received on that port.

**Note** The **trust device device\_type** command available in interface configuration mode is a stand-alone command on the switch. When using this command in an AutoQoS configuration, if the connected peer device is not a corresponding device (defined as a device matching your trust policy), both CoS and DSCP values are set to "0" and any input policy will not take effect. If the connected peer device is a corresponding device, input policy will take effect.

With the trusted setting, you also can use the trusted boundary feature to prevent misuse of a high-priority queue if a user bypasses the telephone and connects the PC directly to the switch. Without trusted boundary, the CoS labels generated by the PC are trusted by the switch (because of the trusted CoS setting). By contrast, trusted boundary uses CDP to detect the presence of a Cisco IP Phone (such as the Cisco IP Phone 7910, 7935, 7940, and 7960) on a switch port. If the telephone is not detected, the trusted boundary feature disables

the trusted setting on the switch port and prevents misuse of a high-priority queue. Note that the trusted boundary feature is not effective if the PC and Cisco IP Phone are connected to a hub that is connected to the switch.

## Wireless QoS Mobility

Wireless QoS mobility enables you to configure QoS policies so that the network provides the same service anywhere in the network. A wireless client can roam from one location to another and as a result the client can get associated to different access points associated with a different switch. Wireless client roaming can be classified into two types:

- Intra-switch roaming
- Inter-switch roaming

---

**Note** The client policies must be available on all of the switches in the mobility group. The same SSID and port policy must be applied to all switches in the mobility group so that the clients get consistent treatment.

---

## Inter-Switch Roaming

When a client roams from one location to another, the client can get associated to access points either associated to the same switch (anchor switch) or a different switch (foreign switch). Inter-switch roaming refers to the scenario where the client gets associated to an access point that is not associated to the same device before the client roamed. The host device is now foreign to the device to which the client was initially anchored.

In the case of inter-switch roaming, the client QoS policy is always executed on the foreign controller. When a client roams from anchor switch to foreign switch, the QoS policy is uninstalled on the anchor switch and installed on the foreign switch. In the mobility handoff message, the anchor device passes the name of the policy to the foreign switch. The foreign switch should have a policy with the same name configured for the QoS policy to be applied correctly.

In the case of inter-switch roaming, all of the QoS policies are moved from the anchor device to the foreign device. While the QoS policies are in transition from the anchor device to the foreign device, the traffic on the foreign device is provided the default treatment. This is comparable to a new policy installation on the client target.

---

**Note** If the foreign device is not configured with the user-defined physical port policy, the default port policy is applicable to all traffic is routed through the NRT queue, except the control traffic which goes through RT1 queue. The network administrator must configure the same physical port policy on both the anchor and foreign devices symmetrically.

---

During inter-switch roaming, client and SSID policy statistics are collected only for the duration that the client is associated with the foreign switch. Cumulative statistics for the whole roaming (anchor switch and foreign switch) are not collected.

## Intra-Switch Roaming

With intra-switch roaming, the client gets associated to an access point that is associated to the same switch before the client roamed, but this association to the device occurs through a different access point.

---

**Note** QoS policies remain intact in the case of intra-switch roaming.

---

## Precious Metal Policies for Wireless QoS

Wireless QoS is backward compatible with the precious metal policies offered by the unified wireless controller platforms. The precious metal policies are system-defined policies that are available on the controller.

The following policies are available:

- Platinum—Used for VoIP clients.
- Gold—Used for video clients.
- Silver—Used for traffic that can be considered best-effort.
- Bronze—Used for NRT traffic.

These policies (also known as profiles) can be applied to a WLAN based on the traffic. We recommend the configuration using the Cisco IOS MQC configuration. The policies are available in the system based on the precious metal policy required. You can configure precious metal policies only for SSID ingress and egress policies.

Based on the policies applied, the 802.1p, 802.11e (WMM), and DSCP fields in the packets are affected. These values are preconfigured and installed when the switch is booted.

---

**Note** Unlike the precious metal policies that were applicable in the Cisco Unified Wireless controllers, the attributes rt-average-rate, nrt-average-rate, and peak rates are not applicable for the precious metal policies configured on this switch platform.

---

---

**Note** The 802.1p protocol priority is applicable on the Cisco 5700 Series Wireless Controller.

---

### Related Topics

[Configuring Precious Metal Policies \(CLI\)](#), on page 878

## Standard QoS Default Settings

### Default Wired QoS Configuration

There are two queues configured by default on each wired interface on the switch. All control traffic traverses and is processed through queue 0. All other traffic traverses and is processed through queue 1.

## DSCP Maps

### Default CoS-to-DSCP Map

You use the CoS-to-DSCP map to map CoS values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic. The following table shows the default CoS-to-DSCP map. If these values are not appropriate for your network, you need to modify them.

**Table 66: Default CoS-to-DSCP Map**

CoS Value	DSCP Value
0	0
1	8
2	16
3	24
4	32
5	40
6	48
7	56

### Default IP-Precedence-to-DSCP Map

You use the IP-precedence-to-DSCP map to map IP precedence values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic. The following table shows the default IP-precedence-to-DSCP map. If these values are not appropriate for your network, you need to modify them.

**Table 67: Default IP-Precedence-to-DSCP Map**

IP Precedence Value	DSCP Value
0	0
1	8
2	16
3	24
4	32
5	40
6	48
7	56

### Default DSCP-to-CoS Map

You use the DSCP-to-CoS map to generate a CoS value, which is used to select one of the four egress queues. The following table shows the default DSCP-to-CoS map. If these values are not appropriate for your network, you need to modify them.

**Table 68: Default DSCP-to-CoS Map**

DSCP Value	CoS Value
0–7	0
8–15	1
16–23	2
24–31	3
32–39	4
40–47	5
48–55	6
56–63	7

## Default Wireless QoS Configuration

The ports on the switch do not distinguish between wired or wireless physical ports. Depending on the kind of device associated to the switch, the policies are applied. For example, when an access point is connected to a switch port, the switch detects it as a wireless device and applies the default hierarchical policy which is in the format of a parent-child policy. This policy is an hierarchical policy. The parent policy cannot be modified but the child policy (port-child policy) can be modified to suite the QoS configuration. The switch is preconfigured with a default class map and a policy map.

## Configuring Auto QoS for Wireless

### Information About Auto QoS for Wireless

Auto QoS for Wireless feature, introduced in Cisco IOS XE Release 3.7.0, is supported on the following platforms:

- Cisco 5760 Wireless Controller
- Catalyst 3850 Series Switches
- Catalyst 3650 Series Switches
- Cisco Catalyst 4500E Supervisor Engine 8-E

The following pre-defined global configuration templates/profiles are available:

- Enterprise
- Voice

- Guest

You can customize these templates to suit your needs. Auto QoS for Wireless can be configured using both CLI and GUI. Auto QoS for Wireless can be applied on a per-WLAN basis.

Precedence applicable:

1. AAA QoS
2. Native Profile QoS
3. Auto QoS/CLI-based QoS

### Policy Names

P1	AutoQos-4.0-wlan-ET-Client-Input-Policy
P2	AutoQos-4.0-wlan-ET-SSID-Output-Policy
P3	platinum-up (Auto generated system policy at boot-up)
P4	platinum (Auto generated system policy at boot-up)
P5	AutoQos-4.0-wlan-GT-SSID-Input-Policy
P6	AutoQos-4.0-wlan-GT-SSID-Output-Policy
P7	port_child_policy
P8	AutoQos-4.0-wlan-Port-Output-Policy
P9	Capwap-SRND4-Queuing-Policy

### List of Targets

- Client
- BSSID
- Radio
- AP Port (Catalyst 3850 Switch)
- Uplink Port (Catalyst 3850 Switch)
- Cisco 5760 WLC physical port
- Catalyst 4500E Supervisor Engine 8-E Front Panel Ports

**Auto QoS for Wireless - Wireless QoS Matrix**

Template	Client		BSSID		Radio	AP Port (Catalyst 3850 Switch)		Uplink Port (Catalyst 3850 Switch)		Cisco 5760 WLC physical port		Catalyst 4500E Supervisor Engine 8-E Front Panel Ports	
	Ingress	Egress	Ingress	Egress		Ingress	Egress	Ingress	Egress	Ingress	Egress	Ingress	Egress
Enterprise	P1	N/A	N/A	P2	N/A	N/A	P7	N/A	N/A	N/A	P8	N/A	P9
Voice	N/A	N/A	P3	P4	N/A	N/A	P7	N/A	N/A	N/A	P8	N/A	P9
Guest	N/A	N/A	P5	P6	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	P9

**Guidelines for Auto QoS for Wireless**

- The Catalyst 3850 Switch uplink ports should not be configured along with Auto QoS for Wireless. This should be managed using Wired Auto QoS
- The Catalyst 3850 Switch AP Port Policy (port\_child\_policy) and Cisco 5760 WLC physical ports should be automatically configured for Enterprise and Voice templates.
- AP Control traffic must go through the P0 queue (should be given highest priority among all traffic).
- All the Auto QoS policies for Wireless applied through the GUI have the prefix 'AutoQos-4.0'. This enables you to recognize the policies that are applied through templates.
- On the CLI, it is not possible to create a policy name that starts with 'AutoQos-4.0' because this is reserved for policies generated through templates.

**Configuring Auto QoS for Wireless (GUI)****Procedure**

- 
- Step 1** Choose **Configuration > Wireless > WLAN**.
- Step 2** Click the WLAN ID.
- Step 3** Click the QoS tab.
- Step 4** In the **Auto QoS** section, choose the policy from the drop-down list.
- Note** By default, the Auto QoS policy applied for a WLAN is 'None'.
- Step 5** Save the configuration.
- 

**Configuring Auto QoS for Wireless (CLI)**

```
Switch(config-wlan)# auto qos {enterprise | guest | voice}
```

## Guidelines for QoS Policies

Follow these guidelines to prevent clients from getting excluded due to malformed QoS policies:

- When a new QoS policy is added to the switch, a QoS policy with the same name should be added to other switch within the same roam or mobility domain.
- When a switch is loaded with a software image of a later release, the new policy formats are supported. If you have upgraded the software image from an earlier release to a later release, you should save the configuration separately. When an earlier release image is loaded, some QoS policies might show as not supported, and you should restore those QoS policies to supported policy formats.

## Restrictions for QoS on Wired Targets

A target is an entity where a policy is applied. You can apply a policy to either a wired or wireless target. A wired target can be either a port or VLAN. A wireless target can be either a port, radio, SSID, or client. Only port, SSID, and client policies are user configurable. Radio policies are not user configurable. Wireless QoS policies for port, radio, SSID, and client are applied in the downstream direction, and for upstream only SSID and client targets are supported. Downstream indicates that traffic is flowing from the switch to the wireless client. Upstream indicates that traffic is flowing from wireless client to the switch.

The following are restrictions for applying QoS features on the switch for the wired target:

- A maximum of 8 queuing classes are supported on the switch port for the wired target.
- A maximum of 63 policers are supported per policy on the wired port for the wired target.
- No more than two levels are supported in a QoS hierarchy.
- In a hierarchical policy, overlapping actions between parent and child are not allowed, except when a policy has the port shaper in the parent and queuing features in the child policy.
- A QoS policy cannot be attached to any EtherChannel interface.
- Policing in both the parent and child is not supported in a QoS hierarchy.
- Marking in both the parent and child is not supported in a QoS hierarchy.
- A mixture of queue limit and queue buffer in the same policy is not supported.

---

**Note** The queue-limit percent is not supported on the switch because the **queue-buffer** command handles this functionality. Queue limit is only supported with the DSCP and CoS extensions.

---

- With shaping, there is an IPG overhead of 20Bytes for every packet that is accounted internally in the hardware. Shaping accuracy will be effected by this, specially for packets of small size.
- The classification sequence for all wired queuing-based policies should be the same across all wired upstream ports (10-Gigabit Ethernet), and the same for all downstream wired ports (1-Gigabit Ethernet).
- Empty classes are not supported.

- Class-maps with empty actions are not supported. If there are two policies with the same order of class-maps and if there are class-maps with no action in one of the policies, there may be traffic drops. As a workaround, allocate minimal bandwidth for all the classes in PRIORITY\_QUEUE.
- A maximum of 256 classes are supported per policy on the wired port for the wired target.
- The actions under a policer within a policy map have the following restrictions:
  - The conform action must be transmit.
  - The exceed/violate action for markdown type can only be cos2cos, prec2prec, dscp2dscp.
  - The markdown types must be the same within a policy.
- A port-level input marking policy takes precedence over an SVI policy; however, if no port policy is configured, the SVI policy takes precedence. For a port policy to take precedence, define a port-level policy; so that the SVI policy is overwritten.
- Classification counters have the following specific restrictions:
  - Classification counters count packets instead of bytes.
  - Filter-based classification counters are not supported
  - Only QoS configurations with marking or policing trigger the classification counter.
  - The classification counter is not port based. This means that the classification counter aggregates all packets belonging to the same class of the same policy which attach to different interfaces.
  - As long as there is policing or marking action in the policy, the class-default will have classification counters.
  - When there are multiple match statements in a class, then the classification counter only shows the traffic counter for one of the match statements.
- Table maps have the following specific restrictions:
  - Only one table map for policing exceeding the markdown and one table map for policing violating the markdown per direction per target is supported.
  - Table maps must be configured under the class-default; table maps are unsupported for a user-defined class.
- Hierarchical policies are required for the following:
  - Port-shapers
  - Aggregate policers
  - PV policy
  - Parent shaping and child marking/policing
- For ports with wired targets, these are the only supported hierarchical policies:
  - Police chaining in the same policy is unsupported, except for wireless client.
  - Hierarchical queueing is unsupported in the same policy (port shaper is the exception).

- In a parent class, all filters must have the same type. The child filter type must match the parent filter type with the following exceptions:
  - If the parent class is configured to match IP, then the child class can be configured to match the ACL.
  - If the parent class is configured to match CoS, then the child class can be configured to match the ACL.
- The **trust device** *device\_type* command available in interface configuration mode is a stand-alone command on the switch. When using this command in an AutoQoS configuration, if the connected peer device is not a corresponding device (defined as a device matching your trust policy), both CoS and DSCP values are set to "0" and any input policy will not take effect. If the connected peer device is a corresponding device, input policy will take effect.

The following are restrictions for applying QoS features on the VLAN to the wired target:

- For a flat or nonhierarchical policy, only marking or a table map is supported.

The following are restrictions and considerations for applying QoS features on EtherChannel and channel member interfaces:

- QoS is not supported on an EtherChannel interface.
- QoS is supported on EtherChannel member interfaces in both ingress and egression directions. All EtherChannel members must have the same QoS policy applied. If the QoS policy is not the same, each individual policy on the different link acts independently.
- On attaching a service policy to channel members, the following warning message appears to remind the user to make sure the same policy is attached to all ports in the EtherChannel: ' Warning: add service policy will cause inconsistency with port xxx in ether channel xxx. '.
- Auto QoS is not supported on EtherChannel members.

---

**Note** On attaching a service policy to an EtherChannel, the following message appears on the console: ' Warning: add service policy will cause inconsistency with port xxx in ether channel xxx. '. This warning message should be expected. This warning message is a reminder to attach the same policy to other ports in the same EtherChannel. The same message will be seen during boot up. This message does not mean there is a discrepancy between the EtherChannel member ports.

---

# Restrictions for QoS on Wireless Targets

## General Restrictions

A target is an entity where a policy is applied. You can apply a policy to either a wired or wireless target. A wired target can be either a port or VLAN. A wireless target can be either a port, radio, SSID, or client. Only port, SSID, and client policies are user configurable. Radio policies are not user configurable. Wireless QoS policies for port, radio, SSID, and client are applied in the downstream direction, and for upstream only SSID and client targets are supported. Downstream indicates that traffic is flowing from the switch to the wireless client. Upstream indicates that traffic is flowing from wireless client to the switch.

- Only port, SSID, and client (using AAA and Cisco IOS command-line interface) policies are user-configurable. Radio policies are set by the wireless control module and are not user-configurable.
- Port and radio policies are applicable only in the egress direction.
- SSID and client targets can be configured only with marking and policing policies.
- One policy per target per direction is supported.
- For the egress class-default SSID policy, you must configure the queue buffer ratio as 0 after you configure the average shape rate.
- Class maps in a policy map can have different types of filters. However, only one marking action (either table map, or set dscp, or set cos) is supported in a map in egress direction.
- For hierarchical client and SSID ingress policies, you cannot configure marking in both the parent and child policies. You can only configure marking either in the parent or child policy.
- You cannot configure multiple set actions in the same class.
- For both SSID and client ingress policies, supported set actions are only for DSCP, and CoS values.
- You cannot delete a group of WLANs or QoS policy.

## Wireless QoS Restrictions on Ports

The following are restrictions for applying QoS features on a wireless port target:

- All wireless ports have similar parent policy with one class-default and one action shape under class-default. Shape rates are dependent on the 802.11a/b/g/ac bands.
- You can create a maximum of four classes in a child policy by modifying the `port_child_policy`.
- If there are four classes in the `port_child_policy` at the port level, one must be a non-client-nrt class and one must be class-default.
- No two classes can have the same priority level. Only priority level 1 (for voice traffic and control traffic) and 2 (for video) are supported.
- Priority is not supported in the multicast NRT class (non-client-nrt class) and `class-default`.
- If four classes are configured, two of them have to be priority classes. If only three classes are configured, at least one of them should be a priority class. If three classes are configured and there is no non-client-nrt class, both priority levels must be present.
- Only match DSCP is supported.
- The port policy applied by the wireless control module cannot be removed using the CLI.

- Both priority rate and police CIR (using MQC) in the same class is unsupported.
- Queue limit (which is used to configure Weighted Tail Drop) is unsupported.

### Wireless QoS Restrictions on SSID

The following are restrictions for applying QoS features on SSID:

- One table map is supported at the ingress policy.
- Table maps are supported for the parent class-default only. Up to two table maps are supported in the egress direction and three table-maps can be configured when a QoS group is involved.

---

**Note** Table-maps are not supported at the client targets.

---

- If a wireless port has a default policy with only two queues (one for multicast-NRT, one for class-default), the policy at SSID level cannot have voice and video class in the egress direction.
- Policing without priority is not supported in the egress direction.
- Priority configuration at the SSID level is used only to configure the RT1 and RT2 policers (AFD for policer). Priority configuration does not include the shape rate. Therefore, priority is restricted for SSID policies without police.
- If **set** is not enabled in class-default, the classification at the SSID for voice or video must be a subset of the classification for the voice or video class at the port level.
- The mapping in the DSCP2DSCP and COS2COS table should be based on the classification function for the voice and video classes in the port level policy.
- No action is allowed under the class-default of a child policy.
- For SSID ingress policies, only UP and DSCP filters (match criteria) are supported. ACL and protocol match criteria are not supported.
- For a flat policy (non hierarchical), in the ingress direction, the policy configuration must be a set (table map) or policing or both.

### Wireless QoS Restrictions on Clients

The following are restrictions for applying QoS policies on client targets:

- The default client policy is enabled only on WMM clients that are ACM-enabled.
- Queuing is not supported.
- Attaching, removing, or modifying client policies on a WLAN in the enabled state is not supported. You must shut down the WLAN to apply, remove, or modify a policy.
- Table-map configuration is not supported for client targets.
- Policing and set configured together in class-default is blocked in egress direction:

```
policy-map foo
class class-default
```

```

police X
set dscp Y

```

- Child policy is not supported under class-default if the parent policy contains other user-defined class maps in it.
- For flat egress client policy, policing in class-default and marking action in other classes are not supported.
- Only set marking actions are supported in the client policies.
- For client ingress policies, only ACL, UP, DSCP, and protocol filters (match criteria) are supported.
- All the filters in classes in a policy map for client policy must have the same attributes. Filters matching on protocol-specific attributes such as IPv4 or IPv6 addresses are considered as different attribute sets.
- For filters matching on ACLs, all ACEs (Access Control Entry) in the access list should have the same type and number of attributes.
- In client egress policies, all filters in the policy-map must match on the same marking attribute for filters matching on marking attributes. For example, If filter matches on DSCP, then all filters in the policy must match on DSCP.
- ACL matching on port ranges and subnet are only supported in ingress direction.

# How to Configure QoS

## Configuring Class, Policy, and Table Maps

### Creating a Traffic Class (CLI)

To create a traffic class containing match criteria, use the **class-map** command to specify the traffic class name, and then use the following **match** commands in class-map configuration mode, as needed.

#### Before you begin

All match commands specified in this configuration task are considered optional, but you must configure at least one match criterion for a class.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>class-map</b> { <i>class-map name</i>   <b>match-any</b> } <b>Example:</b> Switch(config)# <b>class-map test_1000</b> Switch(config-cmap)#	Enters class map configuration mode. <ul style="list-style-type: none"> <li>• Creates a class map to be used for matching packets to the class whose name you specify.</li> <li>• If you specify <b>match-any</b>, one of the match criteria must be met for traffic entering the traffic class to be classified as part of the traffic class. This is the default.</li> </ul>
<b>Step 3</b>	<b>match access-group</b> { <i>index number</i>   <i>name</i> } <b>Example:</b> Switch(config-cmap)# <b>match access-group 100</b> Switch(config-cmap)#	The following parameters are available for this command: <ul style="list-style-type: none"> <li>• access-group</li> <li>• class-map</li> <li>• cos</li> <li>• dscp</li> <li>• ip</li> <li>• non-client-nrt</li> <li>• precedence</li> <li>• qos-group</li> <li>• vlan</li> <li>• wlan user priority</li> </ul> (Optional) For this example, enter the access-group ID: <ul style="list-style-type: none"> <li>• Access list index (value from 1 to 2799)</li> <li>• Named access list</li> </ul>
<b>Step 4</b>	<b>match class-map</b> <i>class-map name</i> <b>Example:</b> Switch(config-cmap)# <b>match class-map test_2000</b>	(Optional) Matches to another class-map name.

	Command or Action	Purpose
	Switch (config-cmap) #	
<b>Step 5</b>	<b>match cos</b> <i>cos value</i> <b>Example:</b> Switch (config-cmap) # <b>match cos 2 3 4 5</b> Switch (config-cmap) #	(Optional) Matches IEEE 802.1Q or ISL class of service (user) priority values. <ul style="list-style-type: none"> <li>• Enters up to 4 CoS values separated by spaces (0 to 7).</li> </ul>
<b>Step 6</b>	<b>match dscp</b> <i>dscp value</i> <b>Example:</b> Switch (config-cmap) # <b>match dscp af11 af12</b> Switch (config-cmap) #	(Optional) Matches the DSCP values in IPv4 and IPv6 packets.
<b>Step 7</b>	<b>match ip</b> { <b>dscp</b> <i>dscp value</i>   <b>precedence</b> <i>precedence value</i> } <b>Example:</b> Switch (config-cmap) # <b>match ip dscp af11 af12</b> Switch (config-cmap) #	(Optional) Matches IP values including the following: <ul style="list-style-type: none"> <li>• <b>dscp</b>—Matches IP DSCP (DiffServ codepoints).</li> <li>• <b>precedence</b>—Matches IP precedence (0 to 7).</li> </ul> <p><b>Note</b> Since CPU generated packets are not marked at egress, the packet will not match the configured class-map.</p>
<b>Step 8</b>	<b>match non-client-nrt</b> <b>Example:</b> Switch (config-cmap) # <b>match non-client-nrt</b> Switch (config-cmap) #	(Optional) Matches non-client NRT (Non-Real-Time).
<b>Step 9</b>	<b>match qos-group</b> <i>qos group value</i> <b>Example:</b> Switch (config-cmap) # <b>match qos-group 10</b> Switch (config-cmap) #	(Optional) Matches QoS group value (from 0 to 31).
<b>Step 10</b>	<b>match vlan</b> <i>vlan value</i> <b>Example:</b> Switch (config-cmap) # <b>match vlan 210</b>	(Optional) Matches a VLAN ID (from 1 to 4095).

	Command or Action	Purpose
	<code>Switch(config-cmap)#</code>	
<b>Step 11</b>	<p><b>match wlan user-priority</b> <i>wlan value</i></p> <p><b>Example:</b></p> <pre>Switch(config-cmap)# match wlan user priority 7 Switch(config-cmap)#</pre>	(Optional) Matches 802.11e specific values. Enter the user priority 802.11e user priority (0 to 7).
<b>Step 12</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-cmap)# end</pre>	Saves the configuration changes.

**What to do next**

Configure the policy map.

**Related Topics**

[Class Maps](#), on page 802

[Examples: Classification by Access Control Lists](#), on page 886

**Creating a Traffic Policy (CLI)**

To create a traffic policy, use the **policy-map** global configuration command to specify the traffic policy name.

The traffic class is associated with the traffic policy when the **class** command is used. The **class** command must be entered after you enter the policy map configuration mode. After entering the **class** command, the switch is automatically in policy map class configuration mode, which is where the QoS policies for the traffic policy are defined.

The following policy map class-actions are supported:

- **admit**—Admits the request for Call Admission Control (CAC).
- **bandwidth**—Bandwidth configuration options.
- **exit**—Exits from the QoS class action configuration mode.
- **no**—Negates or sets default values for the command.
- **police**—Policer configuration options.
- **priority**—Strict scheduling priority configuration options for this class.
- **queue-buffers**—Queue buffer configuration options.
- **queue-limit**—Queue maximum threshold for Weighted Tail Drop (WTD) configuration options.
- **service-policy**—Configures the QoS service policy.

- **set**—Sets QoS values using the following options:
  - CoS values
  - DSCP values
  - Precedence values
  - QoS group values
  - WLAN values
- **shape**—Traffic-shaping configuration options.

### Before you begin

You should have first created a class map.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>policy-map</b> <i>policy-map name</i> <b>Example:</b> Switch(config)# <b>policy-map test_2000</b> Switch(config-pmap)#	Enters policy map configuration mode.  Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<b>Step 3</b>	<b>class</b> { <i>class-name</i>   <b>class-default</b> } <b>Example:</b> Switch(config-pmap)# <b>class test_1000</b> Switch(config-pmap-c)#	Specifies the name of the class whose policy you want to create or change.  You can also create a system default class for unclassified packets.
<b>Step 4</b>	<b>admit</b> <b>Example:</b> Switch(config-pmap-c)# <b>admit cac</b> <b>wmm-tspec</b> Switch(config-pmap-c)#	(Optional) Admits the request for Call Admission Control (CAC). For a more detailed example of this command and its usage, see <a href="#">Configuring Call Admission Control (CLI), on page 858</a> .  <b>Note</b> This command only configures CAC for wireless QoS.
<b>Step 5</b>	<b>bandwidth</b> { <b>kb/s</b> <i>kb/s value</i>   <b>percent</b> <i>percentage</i>   <b>remaining</b> { <i>percent</i>   <i>ratio</i> }}	(Optional) Sets the bandwidth using one of the following:

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Switch(config-pmap-c) # <b>bandwidth</b> 50 Switch(config-pmap-c) #</pre>	<ul style="list-style-type: none"> <li>• <b>kb/s</b>—Kilobits per second, enter a value between 20000 and 10000000 for Kb/s.</li> <li>• <b>percent</b>—Enter the percentage of the total bandwidth to be used for this policy map.</li> <li>• <b>remaining</b>—Enter the percentage ratio of the remaining bandwidth.</li> </ul> <p>For a more detailed example of this command and its usage, see <a href="#">Configuring Bandwidth (CLI)</a>, on page 865.</p>
<b>Step 6</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c) # <b>exit</b> Switch(config-pmap-c) #</pre>	(Optional) Exits from QoS class action configuration mode.
<b>Step 7</b>	<p><b>no</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c) # <b>no</b> Switch(config-pmap-c) #</pre>	(Optional) Negates the command.
<b>Step 8</b>	<p><b>police</b> {<i>target_bit_rate</i>   <b>cir</b>   <b>rate</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c) # <b>police</b> 100000 Switch(config-pmap-c) #</pre>	<p>(Optional) Configures the policer:</p> <ul style="list-style-type: none"> <li>• <i>target_bit_rate</i>—Enter the bit rate per second, enter a value between 8000 and 10000000000.</li> <li>• <b>cir</b>—Committed Information Rate</li> <li>• <b>rate</b>—Specify police rate, PCR for hierarchical policies or SCR for single-level ATM 4.0 policer policies.</li> </ul> <p>For a more detailed example of this command and its usage, see <a href="#">Configuring Police (CLI)</a>, on page 867.</p>
<b>Step 9</b>	<p><b>priority</b> {<i>kb/s</i>   <i>level level value</i>   <b>percent percentage value</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c) # <b>priority percent</b> 50 Switch(config-pmap-c) #</pre>	<p>(Optional) Sets the strict scheduling priority for this class. Command options include:</p> <ul style="list-style-type: none"> <li>• <i>kb/s</i>—Kilobits per second, enter a value between 1 and 2000000.</li> <li>• <b>level</b>—Establishes a multi-level priority queue. Enter a value (1 or 2).</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>percent</b>—Enter a percent of the total bandwidth for this priority.</li> </ul> <p>For a more detailed example of this command and its usage, see <a href="#">Configuring Priority (CLI)</a>, on page 869.</p>
<b>Step 10</b>	<b>queue-buffers ratio ratio limit</b> <b>Example:</b> <pre>Switch(config-pmap-c) # queue-buffers ratio 10 Switch(config-pmap-c) #</pre>	(Optional) Configures the queue buffer for the class. Enter the queue buffers ratio limit (0 to 100).  For a more detailed example of this command and its usage, see <a href="#">Configuring Queue Buffers (CLI)</a> , on page 872.
<b>Step 11</b>	<b>queue-limit {packets   cos   dscp   percent}</b> <b>Example:</b> <pre>Switch(config-pmap-c) # queue-limit cos 7 percent 50 Switch(config-pmap-c) #</pre>	(Optional) Specifies the queue maximum threshold for the tail drop: <ul style="list-style-type: none"> <li>• <b>packets</b>—Packets by default, enter a value between 1 to 2000000.</li> <li>• <b>cos</b>—Enter the parameters for each COS value.</li> <li>• <b>dscp</b>—Enter the parameters for each DSCP value.</li> <li>• <b>percent</b>—Enter the percentage for the threshold.</li> </ul> <p>For a more detailed example of this command and its usage, see <a href="#">Configuring Queue Limits (CLI)</a>, on page 874.</p>
<b>Step 12</b>	<b>service-policy policy-map name</b> <b>Example:</b> <pre>Switch(config-pmap-c) # service-policy test_2000 Switch(config-pmap-c) #</pre>	(Optional) Configures the QoS service policy.
<b>Step 13</b>	<b>set {cos   dscp   ip   precedence   qos-group   wlan}</b> <b>Example:</b> <pre>Switch(config-pmap-c) # set cos 7 Switch(config-pmap-c) #</pre>	(Optional) Sets the QoS values. Possible QoS configuration values include: <ul style="list-style-type: none"> <li>• <b>cos</b>—Sets the IEEE 802.1Q/ISL class of service/user priority.</li> <li>• <b>dscp</b>—Sets DSCP in IP(v4) and IPv6 packets.</li> <li>• <b>ip</b>—Sets IP specific values.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>precedence</b>—Sets precedence in IP(v4) and IPv6 packet.</li> <li>• <b>qos-group</b>—Sets the QoS Group.</li> <li>• <b>wlan</b>—Sets the WLAN user-priority.</li> </ul>
<b>Step 14</b>	<p><b>shape average</b> {<i>target_bit_rate</i>   <b>percent</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c) #shape average percent 50 Switch(config-pmap-c) #</pre>	<p>(Optional) Sets the traffic shaping. Command parameters include:</p> <ul style="list-style-type: none"> <li>• <i>target_bit_rate</i>—Target bit rate.</li> <li>• <b>percent</b>—Percentage of interface bandwidth for Committed Information Rate.</li> </ul> <p>For a more detailed example of this command and its usage, see <a href="#">Configuring Shaping (CLI)</a>, on page 876.</p>
<b>Step 15</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c) #end Switch(config-pmap-c) #</pre>	Saves the configuration changes.

**What to do next**

Configure the interface.

**Related Topics**

[Policy Maps](#), on page 803

**Configuring Client Policies (GUI)****Procedure**

- 
- Step 1** Choose **Configuration > Wireless**.
- Step 2** Expand the **QoS** node by clicking on the left pane and choose **QOS-Policy**.  
The **QOS-Policy** page is displayed.
- Step 3** Click **Add New** to create a new QoS Policy.  
The **Create QoS Policy** page is displayed.
- Step 4** Select **Client** from the **Policy Type** drop-down menu.
- Step 5** Select the direction into which the policy needs to be applied from the **Policy Direction** drop-down menu.  
The available options are:

- **Ingress**
- **Egress**

**Step 6** Specify a policy name in the **Policy Name** text box.

**Step 7** Provide a description to the policy in the **Description** text box.

**Step 8** (Optional) Configure the default voice or video configuration parameters by checking the **Enable Voice** or **Enable Video** checkbox.

The following options are available:

- **Trust**—Specify the classification type behavior on this policy. The options available are:
  - **DSCP**—Assigns a label to indicate the given quality of service. The range is from 0 to 63.
  - **User Priority**—This option is available when the **Policy Direction** is ingress. Enter the 802.11e user priority. The range is from 0 to 7.
  - **COS**—This option is available when the **Policy Direction** is egress. Matches IEEE 802.1Q class of service. The range is from 0 to 7.
- **Mark**—Specify the marking label for each packet. The following options are available:
  - **DSCP**—Assigns a label to indicate the given quality of service. The range is from 0 to 63.
  - **CoS**—Matches IEEE 802.1Q class of service. The range is from 0 to 7.
  - **User Priority**—Enter the 802.11e user priority. The range is from 0 to 7.
- **Police(kbps)**—Specify the policing rate in kbps.

**Note** The marking and policing options are optional.

**Step 9** Specify the **Class-default** parameters.

The following options are available:

- **Mark**—Specify the marking label for each packet. The following options are available:
  - **DSCP**—Assigns a label to indicate the given quality of service. The range is from 0 to 63.
  - **CoS**—Matches IEEE 802.1Q class of service. The range is from 0 to 7.
  - **User Priority**—Enter the 802.11e user priority. The range is from 0 to 7.
- **Police (kbps)**—This option is available when the **Policy Direction** is egress. This option Specify the policing rate in kbps.

**Note** You can choose either Mark or Police action for the class-default class when creating an egress client policy.

**Step 10** (Optional) To configure the AVC class map for a client policy, check the **Enable Application Recognition** check box

**Note** For an egress client policy, when you enable Application Recognition, the Voice, Video, and User Defined check boxes are disabled.

The following options are available:

- **Trust**—Specify a classification type for this policy.
  - **Protocol**—Allows you to choose the protocols and configure the marking and policing of the packets.
  - **Category**—Allows you to choose the category of the application. For example, browsing.

- **Subcategory**—Allows you to choose the subcategory of the application. For example, file-sharing.
- **Application-Group**—Allows you to choose the application group. For example, ftp-group.
- **Protocol Choice**—Choose the protocols, category, subcategory, or application group from the **Available Protocols** list into the **Assigned Protocols** to apply the marking and policing of the packets.
- **Mark**—Specify the marking label for each packet. The following options are available:
  - **DSCP**—Assigns a label to indicate the given quality of service. The range is from 0 to 63.
  - **CoS**—Matches IEEE 802.1Q class of service. The range is from 0 to 7.
  - **None**—Choose this option when you do not want to mark the packets.
- **Police (kbps)**—Specifies the policing rate in kbps. This option is available when the **Policy Direction** is egress.
- **Drop**—Drops the ingress packets that correspond to the chosen protocols.

**Step 11** (Optional) To configure user defined classes, check the **User Defined Classes** checkbox.

The following options are available:

- **Trust**—Specify the classification type behavior on this policy.
  - **DSCP**—Assigns a label to indicate the given quality of service. The range is from 0 to 63.
  - **User Priority**—This option is available when the **Policy Direction** is ingress. Enter the 802.11e user priority. The range is from 0 to 7.
  - **COS**—This option is available when the **Policy Direction** is egress. Matches IEEE 802.1Q class of service. The range is from 0 to 7.
- **Mark**—Specify the marking label for each packet. The following options are available:
  - **DSCP**—Assigns a label to indicate the given quality of service. The range is from 0 to 63.
  - **CoS**—Matches IEEE 802.1Q class of service. The range is from 0 to 7.
  - **User Priority**—Enter the 802.11e user priority. The range is from 0 to 7.
- **Police (kbps)**—This option is available when the **Policy Direction** is egress. This option specifies the policing rate in kbps.

**Note** You can add a maximum of five user-defined classes for each client policy.

**Step 12** Click **Add** to add the policy.

---

## Configuring Class-Based Packet Marking (CLI)

This procedure explains how to configure the following class-based packet marking features on your switch:

- CoS value
- DSCP value
- IP value
- Precedence value
- QoS group value
- WLAN value

**Before you begin**

You should have created a class map and a policy map before beginning this procedure.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy name</i></b> <b>Example:</b> Switch(config)# <b>policy-map policy1</b> Switch(config-pmap)#	Enters policy map configuration mode.  Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<b>Step 3</b>	<b>class <i>class name</i></b> <b>Example:</b> Switch(config-pmap)# <b>class class1</b> Switch(config-pmap-c)#	Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change.  Command options for policy class map configuration mode include the following: <ul style="list-style-type: none"> <li>• <b>admit</b>—Admits the request for Call Admission Control (CAC).</li> <li>• <b>bandwidth</b>—Bandwidth configuration options.</li> <li>• <b>exit</b>—Exits from the QoS class action configuration mode.</li> <li>• <b>no</b>—Negates or sets default values for the command.</li> <li>• <b>police</b>—Policer configuration options.</li> <li>• <b>priority</b>—Strict scheduling priority configuration options for this class.</li> <li>• <b>queue-buffers</b>—Queue buffer configuration options.</li> <li>• <b>queue-limit</b>—Queue maximum threshold for Weighted Tail Drop (WTD) configuration options.</li> <li>• <b>service-policy</b>—Configures the QoS service policy.</li> <li>• <b>set</b>—Sets QoS values using the following options:</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• CoS values</li> <li>• DSCP values</li> <li>• Precedence values</li> <li>• QoS group values</li> <li>• WLAN values</li> </ul> <ul style="list-style-type: none"> <li>• <b>shape</b>—Traffic-shaping configuration options.</li> </ul> <p><b>Note</b> This procedure describes the available configurations using <b>set</b> command options. The other command options (<b>admit</b>, <b>bandwidth</b>, etc.) are described in other sections of this guide. Although this task lists all of the possible <b>set</b> commands, only one <b>set</b> command is supported per class.</p>
<b>Step 4</b>	<p><b>set cos</b> {<i>cos value</i>   <b>cos table</b> <i>table-map name</i>   <b>dscp table</b> <i>table-map name</i>   <b>precedence table</b> <i>table-map name</i>   <b>qos-group table</b> <i>table-map name</i>   <b>wlan user-priority table</b> <i>table-map name</i>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap) # set cos 5 Switch(config-pmap) #</pre>	<p>(Optional) Sets the specific IEEE 802.1Q Layer 2 CoS value of an outgoing packet. Values are from 0 to 7.</p> <p>You can also set the following values using the <b>set cos</b> command:</p> <ul style="list-style-type: none"> <li>• <b>cos table</b>—Sets the CoS value based on a table map.</li> <li>• <b>dscp table</b>—Sets the code point value based on a table map.</li> <li>• <b>precedence table</b>—Sets the code point value based on a table map.</li> <li>• <b>qos-group table</b>—Sets the CoS value from QoS group based on a table map.</li> <li>• <b>wlan user-priority table</b>—Sets the CoS value from the WLAN user priority based on a table map.</li> </ul>
<b>Step 5</b>	<p><b>set dscp</b> {<i>dscp value</i>   <b>default</b>   <b>dscp table</b> <i>table-map name</i>   <b>ef</b>   <b>precedence table</b> <i>table-map name</i>   <b>qos-group table</b> <i>table-map name</i>   <b>wlan user-priority table</b> <i>table-map name</i>}</p> <p><b>Example:</b></p>	<p>(Optional) Sets the DSCP value.</p> <p>In addition to setting specific DSCP values, you can also set the following using the <b>set dscp</b> command:</p> <ul style="list-style-type: none"> <li>• <b>default</b>—Matches packets with default DSCP value (000000).</li> </ul>

	Command or Action	Purpose
	<pre>Switch(config-pmap) # set dscp af11 Switch(config-pmap) #</pre>	<ul style="list-style-type: none"> <li>• <b>dscp table</b>—Sets the packet DSCP value from DSCP based on a table map.</li> <li>• <b>ef</b>—Matches packets with EF DSCP value (101110).</li> <li>• <b>precedence table</b>—Sets the packet DSCP value from precedence based on a table map.</li> <li>• <b>qos-group table</b>—Sets the packet DSCP value from a QoS group based upon a table map.</li> <li>• <b>wlan user-priority table</b>—Sets the packet DSCP value based upon a WLAN user-priority based upon a table map.</li> </ul>
<b>Step 6</b>	<p><b>set ip {dscp   precedence}</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap) # set ip dscp c3 Switch(config-pmap) #</pre>	<p>(Optional) Sets IP specific values. These values are either IP DSCP or IP precedence values.</p> <p>You can set the following values using the <b>set ip dscp</b> command:</p> <ul style="list-style-type: none"> <li>• <i>dscp value</i>—Sets a specific DSCP value.</li> <li>• <b>default</b>—Matches packets with default DSCP value (000000).</li> <li>• <b>dscp table</b>—Sets the packet DSCP value from DSCP based on a table map.</li> <li>• <b>ef</b>—Matches packets with EF DSCP value (101110).</li> <li>• <b>precedence table</b>—Sets the packet DSCP value from precedence based on a table map.</li> <li>• <b>qos-group table</b>—Sets the packet DSCP value from a QoS group based upon a table map.</li> <li>• <b>wlan user-priority table</b>—Sets the packet DSCP value based upon a WLAN user-priority based upon a table map.</li> </ul> <p>You can set the following values using the <b>set ip precedence</b> command:</p> <ul style="list-style-type: none"> <li>• <i>precedence value</i>—Sets the precedence value (from 0 to 7) .</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>cos table</b>—Sets the packet precedence value from Layer 2 CoS based on a table map.</li> <li>• <b>dscp table</b>—Sets the packet precedence from DSCP value based on a table map.</li> <li>• <b>precedence table</b>—Sets the precedence value from precedence based on a table map</li> <li>• <b>qos-group table</b>—Sets the precedence value from a QoS group based upon a table map.</li> </ul>
<b>Step 7</b>	<p><b>set precedence</b> {<i>precedence value</i>   <b>cos table</b> <i>table-map name</i>   <b>dscp table</b> <i>table-map name</i>   <b>precedence table</b> <i>table-map name</i>   <b>qos-group table</b> <i>table-map name</i>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap) # set precedence 5 Switch(config-pmap) #</pre>	<p>(Optional) Sets precedence values in IPv4 and IPv6 packets.</p> <p>You can set the following values using the <b>set precedence</b> command:</p> <ul style="list-style-type: none"> <li>• <i>precedence value</i>—Sets the precedence value (from 0 to 7) .</li> <li>• <b>cos table</b>—Sets the packet precedence value from Layer 2 CoS on a table map.</li> <li>• <b>dscp table</b>—Sets the packet precedence from DSCP value on a table map.</li> <li>• <b>precedence table</b>—Sets the precedence value from precedence based on a table map.</li> <li>• <b>qos-group table</b>—Sets the precedence value from a QoS group based upon a table map.</li> </ul>
<b>Step 8</b>	<p><b>set qos-group</b> {<i>qos-group value</i>   <b>dscp table</b> <i>table-map name</i>   <b>precedence table</b> <i>table-map name</i>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap) # set qos-group 10 Switch(config-pmap) #</pre>	<p>(Optional) Sets QoS group values. You can set the following values using this command:</p> <ul style="list-style-type: none"> <li>• <i>qos-group value</i>—A number from 1 to 31.</li> <li>• <b>dscp table</b>—Sets the code point value from DSCP based on a table map.</li> <li>• <b>precedence table</b>—Sets the code point value from precedence based on a table map.</li> </ul>

	Command or Action	Purpose
<b>Step 9</b>	<p><b>set wlan user-priority</b> {<i>wlan user-priority value</i>   <b>cos table</b> <i>table-map name</i>   <b>dscp table</b> <i>table-map name</i>   <b>qos-group table</b> <i>table-map name</i>   <b>wlan table</b> <i>table-map name</i>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap)# set wlan user-priority 1 Switch(config-pmap)#</pre>	<p>(Optional) Sets the WLAN user priority value. You can set the following values using this command:</p> <ul style="list-style-type: none"> <li>• <i>wlan user-priority value</i>—A value between 0 to 7.</li> <li>• <b>cos table</b>—Sets the WLAN user priority value from CoS based on a table map.</li> <li>• <b>dscp table</b>—Sets the WLAN user priority value from DSCP based on a table map.</li> <li>• <b>qos-group table</b>—Sets the WLAN user priority value from QoS group based on a table map.</li> <li>• <b>wlan table</b>—Sets the WLAN user priority value from the WLAN user priority based on a table map.</li> </ul>
<b>Step 10</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap)# end Switch#</pre>	Saves configuration changes.
<b>Step 11</b>	<p><b>show policy-map</b></p> <p><b>Example:</b></p> <pre>Switch# show policy-map</pre>	(Optional) Displays policy configuration information for all classes configured for all service policies.

**What to do next**

Attach the traffic policy to an interface using the **service-policy** command.

**Configuring Class Maps for Voice and Video (CLI)**

To configure class maps for voice and video traffic, follow these steps:

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>class-map</b> <i>class-map-name</i> <b>Example:</b> Switch(config)# <b>class-map voice</b>	Creates a class map.
<b>Step 3</b>	<b>match dscp</b> <i>dscp-value-for-voice</i> <b>Example:</b> Switch(config-cmap)# <b>match dscp 46</b>	Matches the DSCP value in the IPv4 and IPv6 packets. Set this value to 46.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 5</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 6</b>	<b>class-map</b> <i>class-map-name</i> <b>Example:</b> Switch(config)# <b>class-map video</b>	Configures a class map.
<b>Step 7</b>	<b>match dscp</b> <i>dscp-value-for-video</i> <b>Example:</b> Switch(config-cmap)# <b>match dscp 34</b>	Matches the DSCP value in the IPv4 and IPv6 packets. Set this value to 34.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Attaching a Traffic Policy to an Interface (CLI)

After the traffic class and traffic policy are created, you must use the **service-policy** interface configuration command to attach a traffic policy to an interface, and to specify the direction in which the policy should be applied (either on packets coming into the interface or packets leaving the interface).

### Before you begin

A traffic class and traffic policy must be created before attaching a traffic policy to an interface.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Switch# <code>configure terminal</code>	
<b>Step 2</b>	<p><code>interface type</code></p> <p><b>Example:</b></p> <pre>Switch(config)# interface GigabitEthernet1/0/1 Switch(config-if)#</pre>	<p>Enters interface configuration mode and configures an interface.</p> <p>Command parameters for the interface configuration include:</p> <ul style="list-style-type: none"> <li>• <b>Auto Template</b>— Auto-template interface</li> <li>• <b>Capwap</b>—CAPWAP tunnel interface</li> <li>• <b>GigabitEthernet</b>—Gigabit Ethernet IEEE 802</li> <li>• <b>GroupVI</b>—Group virtual interface</li> <li>• <b>Internal Interface</b>— Internal interface</li> <li>• <b>Loopback</b>—Loopback interface</li> <li>• <b>Null</b>—Null interface</li> <li>• <b>Port-channel</b>—Ethernet Channel of interface</li> <li>• <b>TenGigabitEthernet</b>—10-Gigabit Ethernet</li> <li>• <b>Tunnel</b>—Tunnel interface</li> <li>• <b>Vlan</b>—Catalyst VLANs</li> <li>• <b>Range</b>—Interface range</li> </ul>
<b>Step 3</b>	<p><code>service-policy {input policy-map   output policy-map }</code></p> <p><b>Example:</b></p> <pre>Switch(config-if)# service-policy output policy_map_01 Switch(config-if)#</pre>	<p>Attaches a policy map to an input or output interface. This policy map is then used as the service policy for that interface.</p> <p>In this example, the traffic policy evaluates all traffic leaving that interface.</p>
<b>Step 4</b>	<p><code>end</code></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end Switch#</pre>	Saves configuration changes.
<b>Step 5</b>	<p><code>show policy map</code></p> <p><b>Example:</b></p>	(Optional) Displays statistics for the policy on the specified interface.

	Command or Action	Purpose
	Switch# <code>show policy map</code>	

### What to do next

Proceed to attach any other traffic policy to an interface, and to specify the direction in which the policy should be applied.

## Configuring SSID Policies (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless**.
- Step 2** Expand the **QoS** node by clicking on the left pane and choose **QOS-Policy**.  
The **Create QoS Policy** page is displayed.
- Step 3** Click **Add New** to create a new QoS Policy.  
The **QoS Policy** page is displayed.
- Step 4** Select **SSID** from the **Policy Type** drop-down menu.
- Step 5** Select the direction into which the policy needs to be applied from the **Policy Direction** drop-down list.

The available options are:

- **Ingress**
- **Egress**

**Note** Voice and video configurations are available only in the egress direction.

**Note** When creating an egress SSID policy for voice and video classes, if the **port\_child\_policy** is already configured with voice and video classes having priority level, the existing **port\_child\_policy** is used. If a **port\_child\_policy** does not exist with voice and video classes, the switch will create voice and video classes with priority levels 1 and 2 under **port\_child\_policy** for voice and video traffic.

- Step 6** Specify a policy name in the **Policy Name** text box.
- Step 7** Provide a description to the policy in the **Description** text box.
- Step 8** Select the trust parameter from the **Trust** drop-down list.

The following options are available:

- **DSCP**— Assigns a label to indicate the given quality of service as DSCP.
- **COS**—Matches IEEE 802.1Q class of service. This option is not available when the **Policy Direction** is ingress.

- **User Priority**—Enter the 802.11e user priority. This option is not available when the **Policy Direction** is egress.
- **None**—This option is available when the **Policy Direction** is egress. This option is available only for egress policies.

**Step 9**

If you chose **Egress** policy above, the following options are available:

- **Bandwidth**—Specifies the bandwidth rate. The following options are available:
  - **Rate**—Specifies the bandwidth in kbps. Enter a value in kbps in the **Value** field.
  - **Remaining Ratio**—Specifies the bandwidth in BRR (bandwidth remaining ratio). Enter the percentage in the **Percent** field.

**Note** If you choose the **Rate** option for the **Bandwidth** parameter, this value must be greater than the sum of the policing values for voice and video traffic.

- **Enable Voice**—Check the **Enable Voice** check box to enable voice traffic on this policy. Specify the following properties:
  - **Priority**—Sets the priority for this policy for strict scheduling. The priority level is set to 1.
  - **Police (kbps)**—Specifies the police rate in Kilobits per second.
  - **CAC**—Enables or disables CAC. If CAC is enabled, you must specify the following options:
    - **User priority**—This option is available when the **Policy Direction** is ingress. Enter the 802.11e user priority. The range is from 0 to 7. By default, a value of 6 is assigned.
    - **Rate(kbps)**
      - Note** The CAC rate must be less than the police rate.
- **Enable Video**—Check the **Enable Video** check box to enable video traffic on this policy. Specify the following properties:
  - **Priority**—Sets the priority for this policy for strict scheduling.
  - **Police (kbps)**—Specifies the police rate in kilobits per second.

**Step 10**

Click **Apply**.

**Applying an SSID or Client Policy on a WLAN (CLI)****Before you begin**

You must have a service-policy map configured before applying it on an SSID.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>profile-name</i></b> <b>Example:</b> Switch# <b>wlan test4</b>	Enters the WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.
<b>Step 3</b>	<b>service-policy [ input   output ] <i>policy-name</i></b> <b>Example:</b> Switch(config-wlan)# <b>service-policy input policy-map-ssid</b>	Applies the policy. The following options are available: <ul style="list-style-type: none"> <li>• <b>input</b>— Assigns the policy map to WLAN ingress traffic.</li> <li>• <b>output</b>— Assigns the policy map to WLAN egress traffic.</li> </ul>
<b>Step 4</b>	<b>service-policy client [ input   output ] <i>policy-name</i></b> <b>Example:</b> Switch(config-wlan)# <b>service-policy client input policy-map-client</b>	Applies the policy. The following options are available: <ul style="list-style-type: none"> <li>• <b>input</b>— Assigns the client policy for ingress direction on the WLAN.</li> <li>• <b>output</b>— Assigns the client policy for egress direction on the WLAN.</li> </ul>
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

**Classifying, Policing, and Marking Traffic on Physical Ports by Using Policy Maps (CLI)**

You can configure a nonhierarchical policy map on a physical port that specifies which traffic class to act on. Actions supported are remarking and policing.

**Before you begin**

You should have already decided upon the classification, policing, and marking of your network traffic by policy maps prior to beginning this procedure.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>class-map</b> { <i>class-map name</i>   <b>match-any</b> } <b>Example:</b> Switch(config)# <b>class-map ipclass1</b> Switch(config-cmap)# <b>exit</b> Switch(config)#	Enters class map configuration mode. <ul style="list-style-type: none"> <li>• Creates a class map to be used for matching packets to the class whose name you specify.</li> <li>• If you specify <b>match-any</b>, one of the match criteria must be met for traffic entering the traffic class to be classified as part of the traffic class. This is the default.</li> </ul>
<b>Step 3</b>	<b>match access-group</b> { <i>access list index</i>   <i>access list name</i> } <b>Example:</b> Switch(config-cmap)# <b>match access-group 1000</b> Switch(config-cmap)# <b>exit</b> Switch(config)#	Specifies the classification criteria to match to the class map. You can match on the following criteria: <ul style="list-style-type: none"> <li>• <b>access-group</b>—Matches to access group.</li> <li>• <b>class-map</b>—Matches to another class map.</li> <li>• <b>cos</b>—Matches to a CoS value.</li> <li>• <b>dscp</b>—Matches to a DSCP value.</li> <li>• <b>ip</b>—Matches to a specific IP value.</li> <li>• <b>non-client-nrt</b>—Matches non-client NRT.</li> <li>• <b>precedence</b>—Matches precedence in IPv4 and IPv6 packets.</li> <li>• <b>qos-group</b>—Matches to a QoS group.</li> <li>• <b>vlan</b>—Matches to a VLAN.</li> <li>• <b>wlan</b>—Matches to a wireless LAN.</li> </ul>
<b>Step 4</b>	<b>policy-map</b> <i>policy-map-name</i> <b>Example:</b> Switch(config)# <b>policy-map flowit</b> Switch(config-pmap)#	Creates a policy map by entering the policy map name, and enters policy-map configuration mode.  By default, no policy maps are defined.

	Command or Action	Purpose
<b>Step 5</b>	<p><b>class</b> {<i>class-map-name</i>   <b>class-default</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap)# class ipclass1 Switch(config-pmap-c)#</pre>	<p>Defines a traffic classification, and enter policy-map class configuration mode.</p> <p>By default, no policy map class-maps are defined.</p> <p>If a traffic class has already been defined by using the <b>class-map</b> global configuration command, specify its name for <i>class-map-name</i> in this command.</p> <p>A <b>class-default</b> traffic class is predefined and can be added to any policy. It is always placed at the end of a policy map. With an implied <b>match any</b> included in the <b>class-default</b> class, all packets that have not already matched the other traffic classes will match <b>class-default</b>.</p>
<b>Step 6</b>	<p><b>set</b> {<b>cos</b>   <b>dscp</b>   <b>ip</b>   <b>precedence</b>   <b>qos-group</b>   <b>wlan user-priority</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# set dscp 45 Switch(config-pmap-c)#</pre>	<p>(Optional) Sets the QoS values. Possible QoS configuration values include:</p> <ul style="list-style-type: none"> <li>• <b>cos</b>—Sets the IEEE 802.1Q/ISL class of service/user priority.</li> <li>• <b>dscp</b>—Sets DSCP in IP(v4) and IPv6 packets.</li> <li>• <b>ip</b>—Sets IP specific values.</li> <li>• <b>precedence</b>—Sets precedence in IP(v4) and IPv6 packet.</li> <li>• <b>qos-group</b>—Sets QoS group.</li> <li>• <b>wlan user-priority</b>—Sets WLAN user priority.</li> </ul> <p>In this example, the <b>set dscp</b> command classifies the IP traffic by setting a new DSCP value in the packet.</p>
<b>Step 7</b>	<p><b>police</b> {<i>target_bit_rate</i>   <b>cir</b>   <b>rate</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# police 100000 conform-action transmit exceed-action drop Switch(config-pmap-c)#</pre>	<p>(Optional) Configures the policer:</p> <ul style="list-style-type: none"> <li>• <i>target_bit_rate</i>—Specifies the bit rate per second, enter a value between 8000 and 10000000000.</li> <li>• <b>cir</b>—Committed Information Rate.</li> <li>• <b>rate</b>—Specifies the police rate, PCR for hierarchical policies, or SCR for single-level ATM 4.0 policer policies.</li> </ul>

	Command or Action	Purpose
		In this example, the <b>police</b> command adds a policer to the class where any traffic beyond the 100000 set target bit rate is dropped.
<b>Step 8</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-pmap-c) # exit</pre>	Returns to policy map configuration mode.
<b>Step 9</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-pmap) # exit</pre>	Returns to global configuration mode.
<b>Step 10</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config) # interface gigabitethernet 2/0/1</pre>	Specifies the port to attach to the policy map, and enters interface configuration mode.  Valid interfaces include physical ports.
<b>Step 11</b>	<b>service-policy input <i>policy-map-name</i></b> <b>Example:</b> <pre>Switch(config-if) # service-policy input flowit</pre>	Specifies the policy-map name, and applies it to an ingress port. Only one policy map per ingress port is supported.
<b>Step 12</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if) # end</pre>	Returns to privileged EXEC mode.
<b>Step 13</b>	<b>show policy-map [<i>policy-map-name</i> [class <i>class-map-name</i>]]</b> <b>Example:</b> <pre>Switch# show policy-map</pre>	(Optional) Verifies your entries.
<b>Step 14</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy-running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

**What to do next**

If applicable to your QoS configuration, configure classification, policing, and marking of traffic on SVIs by using policy maps.

**Classifying, Policing, and Marking Traffic on SVIs by Using Policy Maps (CLI)****Before you begin**

You should have already decided upon the classification, policing, and marking of your network traffic by using policy maps prior to beginning this procedure.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<b>class-map</b> { <i>class-map name</i>   <b>match-any</b> } <b>Example:</b> <pre>Switch(config)# class-map class_vlan100</pre>	Enters class map configuration mode. <ul style="list-style-type: none"> <li>• Creates a class map to be used for matching packets to the class whose name you specify.</li> <li>• If you specify <b>match-any</b>, one of the match criteria must be met for traffic entering the traffic class to be classified as part of the traffic class. This is the default.</li> </ul>
<b>Step 3</b>	<b>match vlan</b> <i>vlan number</i> <b>Example:</b> <pre>Switch(config-cmap)# match vlan 100 Switch(config-cmap)# exit Switch(config)#</pre>	Specifies the VLAN to match to the class map. <p><b>Note</b> The device installs the policy only if the lowest value in the VLAN range is configured on the device. For example, if the VLAN range is 100 to 200, VLAN with ID 100 must be configured on the device. If you have any of the other VLANs with ID starting from 101 to 200 configured on the device, the policy will not be installed on the device. This check is only performed when you install or reinstall a policy. You can delete all the VLANs after the policy is installed. The policy will continue to work.</p>

	Command or Action	Purpose
<b>Step 4</b>	<p><b>policy-map</b> <i>policy-map-name</i></p> <p><b>Example:</b></p> <pre>Switch(config)# <b>policy-map</b> <b>policy_vlan100</b> Switch(config-pmap)#</pre>	<p>Creates a policy map by entering the policy map name, and enters policy-map configuration mode.</p> <p>By default, no policy maps are defined.</p>
<b>Step 5</b>	<p><b>description</b> <i>description</i></p> <p><b>Example:</b></p> <pre>Switch(config-pmap)# <b>description</b> vlan 100</pre>	<p>(Optional) Enters a description of the policy map.</p>
<b>Step 6</b>	<p><b>class</b> {<i>class-map-name</i>   <b>class-default</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap)# <b>class</b> <b>class_vlan100</b> Switch(config-pmap-c)#</pre>	<p>Defines a traffic classification, and enters the policy-map class configuration mode.</p> <p>By default, no policy map class-maps are defined.</p> <p>If a traffic class has already been defined by using the <b>class-map</b> global configuration command, specify its name for <i>class-map-name</i> in this command.</p> <p>A <b>class-default</b> traffic class is predefined and can be added to any policy. It is always placed at the end of a policy map. With an implied <b>match any</b> included in the <b>class-default</b> class, all packets that have not already matched the other traffic classes will match <b>class-default</b>.</p>
<b>Step 7</b>	<p><b>set</b> {<b>cos</b>   <b>dscp</b>   <b>ip</b>   <b>precedence</b>   <b>qos-group</b>   <b>wlan user-priority</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# <b>set</b> <b>dscp</b> <b>af23</b> Switch(config-pmap-c)#</pre>	<p>(Optional) Sets the QoS values. Possible QoS configuration values include:</p> <ul style="list-style-type: none"> <li>• <b>cos</b>—Sets the IEEE 802.1Q/ISL class of service/user priority.</li> <li>• <b>dscp</b>—Sets DSCP in IP(v4) and IPv6 packets.</li> <li>• <b>ip</b>—Sets IP specific values.</li> <li>• <b>precedence</b>—Sets precedence in IP(v4) and IPv6 packet.</li> <li>• <b>qos-group</b>—Sets QoS group.</li> <li>• <b>wlan user-priority</b>—Sets WLAN user-priority.</li> </ul>

	Command or Action	Purpose
		In this example, the <b>set dscp</b> command classifies the IP traffic by matching the packets with a DSCP value of AF23 (010010).
<b>Step 8</b>	<p><b>police</b> {<i>target_bit_rate</i>   <b>cir</b>   <b>rate</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# police 200000 conform-action transmit exceed-action drop Switch(config-pmap-c)#</pre>	<p>(Optional) Configures the policer:</p> <ul style="list-style-type: none"> <li>• <i>target_bit_rate</i>—Specifies the bit rate per second. Enter a value between 8000 and 10000000000.</li> <li>• <b>cir</b>—Committed Information Rate.</li> <li>• <b>rate</b>—Specifies the police rate, PCR for hierarchical policies, or SCR for single-level ATM 4.0 policer policies.</li> </ul> <p>In this example, the <b>police</b> command adds a policer to the class where any traffic beyond the 200000 set target bit rate is dropped.</p>
<b>Step 9</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# exit</pre>	Returns to policy map configuration mode.
<b>Step 10</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap)# exit</pre>	Returns to global configuration mode.
<b>Step 11</b>	<p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/3</pre>	<p>Specifies the port to attach to the policy map, and enters interface configuration mode.</p> <p>Valid interfaces include physical ports.</p>
<b>Step 12</b>	<p><b>service-policy input</b> <i>policy-map-name</i></p> <p><b>Example:</b></p> <pre>Switch(config-if)# service-policy input policy_vlan100</pre>	Specifies the policy-map name, and applies it to an ingress port. Only one policy map per ingress port is supported.
<b>Step 13</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.

	Command or Action	Purpose
<b>Step 14</b>	<b>show policy-map</b> [ <i>policy-map-name</i> [ <b>class</b> <i>class-map-name</i> ]] <b>Example:</b> <pre>Switch# show policy-map</pre>	(Optional) Verifies your entries.
<b>Step 15</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Switch# copy-running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

**Configuring Table Maps (CLI)**

Table maps are a form of marking, and also enable the mapping and conversion of one field to another using a table. For example, a table map can be used to map and convert a Layer 2 CoS setting to a precedence value in Layer 3.

**Note** A table map can be referenced in multiple policies or multiple times in the same policy.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<b>table-map</b> <i>name</i> { <b>default</b> { <i>default value</i>   <b>copy</b>   <b>ignore</b> }   <b>exit</b>   <b>map</b> { <b>from</b> <i>from value</i> <b>to</b> <i>to value</i> }   <b>no</b> } <b>Example:</b> <pre>Switch(config)# table-map table01 Switch(config-tablemap)#</pre>	Creates a table map and enters the table map configuration mode. In table map configuration mode, you can perform the following tasks: <ul style="list-style-type: none"> <li>• <b>default</b>—Configures the table map default value, or sets the default behavior for a value not found in the table map to copy or ignore.</li> <li>• <b>exit</b>—Exits from the table map configuration mode.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>map</b>—Maps a <i>from</i> to a <i>to</i> value in the table map.</li> <li>• <b>no</b>—Negates or sets the default values of the command.</li> </ul>
<b>Step 3</b>	<p><b>map from value to value</b></p> <p><b>Example:</b></p> <pre>Switch(config-tablemap) # map from 0 to 2 Switch(config-tablemap) # map from 1 to 4 Switch(config-tablemap) # map from 24 to 3 Switch(config-tablemap) # map from 40 to 6 Switch(config-tablemap) # default 0 Switch(config-tablemap) #</pre>	<p>In this step, packets with DSCP values 0 are marked to the CoS value 2, DSCP value 1 to the CoS value 4, DSCP value 24 to the CoS value 3, DSCP value 40 to the CoS value 6 and all others to the CoS value 0.</p> <p><b>Note</b> The mapping from CoS values to DSCP values in this example is configured by using the <b>set</b> policy map class configuration command as described in a later step in this procedure.</p>
<b>Step 4</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-tablemap) # exit Switch(config) #</pre>	Returns to global configuration mode.
<b>Step 5</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config) exit Switch#</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<p><b>show table-map</b></p> <p><b>Example:</b></p> <pre>Switch# show table-map Table Map table01   from 0 to 2   from 1 to 4   from 24 to 3   from 40 to 6   default 0</pre>	Displays the table map configuration.
<b>Step 7</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal Switch(config) #</pre>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 8</b>	<b>policy-map</b> <b>Example:</b> <pre>Switch(config)# <b>policy-map table-policy</b> Switch(config-pmap)#</pre>	Configures the policy map for the table map.
<b>Step 9</b>	<b>class class-default</b> <b>Example:</b> <pre>Switch(config-pmap)# <b>class</b> <b>class-default</b> Switch(config-pmap-c)#</pre>	Matches the class to the system default.
<b>Step 10</b>	<b>set cos dscp table <i>table map name</i></b> <b>Example:</b> <pre>Switch(config-pmap-c)# <b>set cos dscp</b> <b>table table01</b> Switch(config-pmap-c)#</pre>	If this policy is applied on input port, that port will have trust DSCP enabled on that port and marking will take place depending upon the specified table map.
<b>Step 11</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-pmap-c)# <b>end</b> Switch#</pre>	Returns to privileged EXEC mode.

**What to do next**

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or polices to an interface using the **service-policy** command.

## Configuring Trust

### Configuring Trust Behavior for Wireless Traffic (CLI)

The Cisco IOS XE 3.2 Release supported different trust defaults for wired and wireless ports. The trust default for wired ports was the same as for this software release. For wireless ports, the default system behavior was non-trust, which meant that when the switch came up, all markings for the wireless ports were defaulted to zero and no traffic received priority treatment. For compatibility with an existing wired switch, all traffic went to the best-effort queue by default. The access point performed priority queuing by default. In the downstream direction, the access point maintained voice, video, best-effort, and background queues for queuing. The

access selected the queuing strategy based on the 11e tag information. By default, the access point treated all wireless packets as best effort.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>qos wireless-default-untrust</b> <b>Example:</b> Switch (config)# <code>qos wireless-default-untrust</code>	Configures the behavior of the switch to untrust wireless traffic. To configure the switch to trust wireless traffic by default, use the <b>no</b> form of the command.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring QoS Features and Functionality

### Configuring Call Admission Control (CLI)

This task explains how to configure class-based, unconditional packet marking features on your switch for Call Admission Control (CAC).

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>class-map <i>class name</i></b> <b>Example:</b> Switch (config)# <code>class-map voice</code> Switch (config-cmap)#	Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following: <ul style="list-style-type: none"> <li>• <i>word</i>—Class map name.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul>
<b>Step 3</b>	<b>match dscp</b> <i>dscp value</i> <b>Example:</b> <pre>Switch(config-cmap)# <b>match dscp 46</b></pre>	(Optional) Matches the DSCP values in IPv4 and IPv6 packets.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-cmap)# <b>exit</b> Switch(config)#</pre>	Returns to global configuration mode.
<b>Step 5</b>	<b>class-map</b> <i>class name</i> <b>Example:</b> <pre>Switch(config)# <b>class-map video</b> Switch(config-cmap)#</pre>	<p>Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following:</p> <ul style="list-style-type: none"> <li>• <i>word</i>—Class map name.</li> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul>
<b>Step 6</b>	<b>match dscp</b> <i>dscp value</i> <b>Example:</b> <pre>Switch(config-cmap)# <b>match dscp 34</b></pre>	(Optional) Matches the DSCP values in IPv4 and IPv6 packets.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-cmap)# <b>exit</b> Switch(config)#</pre>	Returns to global configuration mode.
<b>Step 8</b>	<b>table-map</b> <i>name</i> <b>Example:</b> <pre>Switch(config)# <b>table-map dscp2dscp</b> Switch(config-tablemap)#</pre>	Creates a table map and enters the table map configuration mode.

	Command or Action	Purpose
<b>Step 9</b>	<b>default copy</b> <b>Example:</b> <pre>Switch(config-tablemap) # default copy</pre>	Sets the default behavior for value not found in the table map to copy. <b>Note</b> This is the default option. You can also do a mapping of values for DSCP to DSCP.
<b>Step 10</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-tablemap) # exit Switch(config) #</pre>	Returns to global configuration mode.
<b>Step 11</b>	<b>table-map name</b> <b>Example:</b> <pre>Switch(config) # table-map dscp2up Switch(config-tablemap) #</pre>	Creates a new table map and enters the table map configuration mode.
<b>Step 12</b>	<b>default copy</b> <b>Example:</b> <pre>Switch(config-tablemap) # default copy</pre>	Sets the default behavior for value not found in the table map to copy. <b>Note</b> This is the default option. You can also do a mapping of values for DSCP to UP.
<b>Step 13</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-tablemap) # exit Switch(config) #</pre>	Returns to global configuration mode.
<b>Step 14</b>	<b>policy-map policy name</b> <b>Example:</b> <pre>Switch(config) # policy-map ssid_child_cac Switch(config-pmap) #</pre>	Enters policy map configuration mode. Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<b>Step 15</b>	<b>class class-map-name</b> <b>Example:</b> <pre>Switch(config-pmap) # class voice</pre>	Defines an interface-level traffic classification, and enters policy-map configuration mode.

	Command or Action	Purpose
Step 16	<p><b>priority level</b> <i>level_value</i></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c) # <b>priority level</b> 1</pre>	<p>The <b>priority</b> command assigns a strict scheduling priority for the class.</p> <p><b>Note</b> Priority level 1 is more important than priority level 2. Priority level 1 reserves bandwidth that is processed first for QoS, so its latency is very low. Both priority level 1 and 2 reserve bandwidth.</p>
Step 17	<p><b>police</b> [<i>target_bit_rate</i>   <b>cir</b>   <b>rate</b> ]</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c) # <b>police cir</b> 10m</pre>	<p>(Optional) Configures the policer:</p> <ul style="list-style-type: none"> <li>• <b>target_bit_rate</b>—Specifies the bit rate per second. Enter a value between 8000 and 10000000000.</li> <li>• <b>cir</b>—Committed Information Rate.</li> <li>• <b>rate</b>—Specifies the police rate, PCR for hierarchical policies, or SCR for single-level ATM 4.0 policer policies.</li> </ul>
Step 18	<p><b>admit cac wmm-tspec</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c) # <b>admit cac</b> <b>wmm-tspec</b> Switch(config-pmap-cac-wmm) #</pre>	<p>Configures call admission control for the policy map.</p> <p><b>Note</b> This command only configures CAC for wireless QoS.</p>
Step 19	<p><b>rate</b> <i>value</i></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-admit-cac-wmm) # <b>rate</b> 5000</pre>	<p>Configures the target bit rate (Kilo Bits per second). Enter a value from 8 to 10000000.</p>
Step 20	<p><b>wlan-up</b> <i>value</i></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-admit-cac-wmm) # <b>wlan-up</b> 6 7</pre>	<p>Configures the WLAN UP value. Enter a value from 0 to 7.</p>
Step 21	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-admit-cac-wmm) # <b>exit</b> Switch(config-pmap-c) #</pre>	<p>Returns to policy map class configuration mode.</p>

	Command or Action	Purpose
<b>Step 22</b>	<b>exit</b> <b>Example:</b> <pre>Switch(config-pmap-c) # exit Switch(config-pmap) #</pre>	Returns to policy map configuration mode.
<b>Step 23</b>	<b>class class name</b> <b>Example:</b> <pre>Switch(config-pmap) # class video Switch(config-pmap-c) #</pre>	<p>Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following:</p> <ul style="list-style-type: none"> <li>• <i>word</i>—Class map name.</li> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul>
<b>Step 24</b>	<b>priority level level_value</b> <b>Example:</b> <pre>Switch(config-pmap-c) # priority level 2</pre>	<p>The <b>priority</b> command assigns a strict scheduling priority for the class.</p> <p><b>Note</b> Priority level 1 is more important than priority level 2. Priority level 1 reserves bandwidth that is processed first for QoS, so its latency is very low. Both priority level 1 and 2 reserve bandwidth.</p>
<b>Step 25</b>	<b>police [target_bit_rate   cir   rate ]</b> <b>Example:</b> <pre>Switch(config-pmap-c) # police cir 20m</pre>	<p>(Optional) Configures the policer:</p> <ul style="list-style-type: none"> <li>• <i>target_bit_rate</i>—Specifies the bit rate per second. Enter a value between 8000 and 10000000000.</li> <li>• <b>cir</b>—Committed Information Rate.</li> <li>• <b>rate</b>—Specifies the police rate, PCR for hierarchical policies, or SCR for single-level ATM 4.0 policer policies.</li> </ul>
<b>Step 26</b>	<b>admit cac wmm-tspec</b> <b>Example:</b> <pre>Switch(config-pmap-c) # admit cac wmm-tspec Switch(config-pmap-admit-cac-wmm) #</pre>	<p>Configures call admission control for the policy map.</p> <p><b>Note</b> This command only configures CAC for wireless QoS.</p>
<b>Step 27</b>	<b>rate value</b> <b>Example:</b>	Configures the target bit rate (Kilo Bits per second). Enter a value from 8 to 10000000.

	Command or Action	Purpose
	Switch(config-pmap-admit-cac-wmm) # <b>rate</b> 5000	
<b>Step 28</b>	<b>wlan-up</b> <i>value</i> <b>Example:</b> Switch(config-pmap-admit-cac-wmm) # <b>wlan-up 4 5</b>	Configures the WLAN UP value. Enter a value from 0 to 7.
<b>Step 29</b>	<b>exit</b> <b>Example:</b> Switch(config-pmap-cac-wmm) # <b>exit</b> Switch(config-pmap) #	Returns to policy map configuration mode.
<b>Step 30</b>	<b>exit</b> <b>Example:</b> Switch(config-pmap) # <b>exit</b> Switch(config) #	Returns to global configuration mode.
<b>Step 31</b>	<b>policy-map</b> <i>policy name</i> <b>Example:</b> Switch(config) # <b>policy-map ssid_cac</b> Switch(config-pmap) #	Enters policy map configuration mode.  Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<b>Step 32</b>	<b>class</b> <i>class-map-name</i> <b>Example:</b> Switch(config-pmap) # <b>class default</b>	Defines an interface-level traffic classification, and enters policy-map configuration mode.  In this example, the class map is set to default.
<b>Step 33</b>	<b>set dscp dscp table</b> <i>table_map_name</i> <b>Example:</b> Switch(config-pmap-c) # <b>set dscp dscp</b> <b>table dscp2dscp</b>	(Optional) Sets the QoS values. In this example, the <b>set dscp dscp table</b> command creates a table map and sets its values.
<b>Step 34</b>	<b>set wlan user-priority dscp table</b> <i>table_map_name</i> <b>Example:</b> Switch(config-pmap-c) # <b>set wlan</b>	(Optional) Sets the QoS values. In this example, the <b>set wlan user-priority dscp table</b> command sets the WLAN user priority.

	Command or Action	Purpose
	<code>user-priority dscp table dscp2up</code>	
<b>Step 35</b>	<p><b>shape average</b> {<i>target bit rate</i>   <b>percent percentage</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# <b>shape average</b> 100000000</pre>	Configures the average shape rate. You can configure the average shape rate by target bit rates (bits per second) or by percentage of interface bandwidth for the Committed Information Rate (CIR).
<b>Step 36</b>	<p><b>queue-buffers</b> {<b>ratio ratio value</b>}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# <b>queue-buffers</b> ratio 0</pre>	<p>Configures the relative buffer size for the queue.</p> <p><b>Note</b> The sum of all configured buffers in a policy must be less than or equal to 100 percent. Unallocated buffers are evenly distributed to all the remaining queues. Ensure sufficient buffers are allocated to all queues including the priority queues.</p> <p><b>Note</b> Protocol Data Units (PDUs) for network control protocols such as spanning-tree and LACP utilize the priority queue or queue 0 (when a priority queue is not configured). Ensure sufficient buffers are allocated to these queues for the protocols to function.</p>
<b>Step 37</b>	<p><b>service-policy</b> <i>policy_map_name</i></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# <b>service-policy</b> ssid_child_cac</pre>	Specifies the policy map for the service policy.
<b>Step 38</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap)# <b>end</b> Switch#</pre>	Saves configuration changes.
<b>Step 39</b>	<p><b>show policy-map</b></p> <p><b>Example:</b></p> <pre>Switch# <b>show policy-map</b></pre>	(Optional) Displays policy configuration information for all classes configured for all service policies.

**What to do next**

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or polices to an interface using the **service-policy** command.

For additional information about CAC, refer to the *System Management Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3650 Switches)*.

For additional information about CAC, refer to the *System Management Configuration Guide, Cisco IOS XE Release 3SE (Cisco WLC 5700 Series)*.

**Configuring Bandwidth (CLI)**

This procedure explains how to configure bandwidth on your switch.

**Before you begin**

You should have created a class map for bandwidth before beginning this procedure.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy name</i></b>  <b>Example:</b>  Switch(config)# <b>policy-map</b> <b>policy_bandwidth01</b> Switch(config-pmap)#	Enters policy map configuration mode.  Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<b>Step 3</b>	<b>class <i>class name</i></b>  <b>Example:</b>  Switch(config-pmap)# <b>class</b> <b>class_bandwidth01</b> Switch(config-pmap-c)#	Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following: <ul style="list-style-type: none"> <li>• <b>word</b>—Class map name.</li> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul>
<b>Step 4</b>	<b>bandwidth {<i>Kb/s</i>   <b>percent</b> <i>percentage</i>   <b>remaining</b> { <i>ratio</i> <i>ratio</i> } }</b>  <b>Example:</b>  Switch(config-pmap-c)# <b>bandwidth 200000</b>	Configures the bandwidth for the policy map. The parameters include: <ul style="list-style-type: none"> <li>• <b>Kb/s</b>—Configures a specific value in kilobits per second (from 20000 to 10000000).</li> </ul>

	Command or Action	Purpose
	Switch(config-pmap-c)#	<ul style="list-style-type: none"> <li>• <b>percent</b>—Allocates minimum bandwidth to a particular class based on a percentage. The queue can oversubscribe bandwidth in case other queues do not utilize the entire port bandwidth. The total sum cannot exceed 100 percent, and in case it is less than 100 percent, the rest of the bandwidth is equally divided along all bandwidth queues.</li> <li>• <b>remaining</b>— Allocates minimum bandwidth to a particular class. The queue can oversubscribe bandwidth in case other queues do not utilize entire port bandwidth. The total sum cannot exceed 100 percent. It is preferred to use this command when the <b>priority</b> command is used for certain queues in the policy. You can also assign ratios rather than percentages to each queue; the queues will be assigned certain weights which are inline with these ratios. Ratios can range from 0 to 100. Total bandwidth ratio allocation for the policy in this case can exceed 100.</li> </ul> <p><b>Note</b> You cannot mix bandwidth types on a policy map. For example, you cannot configure bandwidth in a single policy map using both a bandwidth percent and in kilobits per second.</p>
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-pmap-c)# end Switch#</pre>	Saves configuration changes.
<b>Step 6</b>	<b>show policy-map</b> <b>Example:</b> <pre>Switch# show policy-map</pre>	(Optional) Displays policy configuration information for all classes configured for all service policies.

### What to do next

Configure any additional policy maps for QoS for your network. After creating the policy maps, attach the traffic policy or polices to an interface using the **service-policy** command.

**Related Topics**

[Bandwidth](#), on page 811

**Configuring Police (CLI)**

This procedure explains how to configure policing on your switch.

**Before you begin**

You should have created a class map for policing before beginning this procedure.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy name</i></b> <b>Example:</b> <pre>Switch(config)# policy-map policy_police01 Switch(config-pmap)#</pre>	Enters policy map configuration mode.  Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<b>Step 3</b>	<b>class <i>class name</i></b> <b>Example:</b> <pre>Switch(config-pmap)# class class_police01 Switch(config-pmap-c)#</pre>	Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following: <ul style="list-style-type: none"> <li>• <i>word</i>—Class map name.</li> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul>
<b>Step 4</b>	<b>police {<i>target_bit_rate</i> [<i>burst bytes</i>   <b>bc</b>   <b>conform-action</b>   <b>pir</b> ]   <b>cir</b> {<i>target_bit_rate</i>   <b>percent <i>percentage</i></b>}   <b>rate</b> {<i>target_bit_rate</i>   <b>percent <i>percentage</i></b>} <b>conform-action transmit</b> <b>exceed-action</b> {<b>drop</b> [<b>violate action</b>]   <b>set-cos-transmit</b>   <b>set-dscp-transmit</b>   <b>set-prec-transmit</b>   <b>transmit</b> [<b>violate action</b>]}  <b>Example:</b>  <pre>Switch(config-pmap-c)# police 8000</pre> </b>	The following <b>police</b> subcommand options are available: <ul style="list-style-type: none"> <li>• <i>target_bit_rate</i>—Bits per second (from 8000 to 10000000000).</li> <li>• <i>burst bytes</i>—Enter a value from 1000 to 512000000.</li> <li>• <b>bc</b>—Conform burst.</li> <li>• <b>conform-action</b>—Action taken when rate is less than conform burst.</li> </ul>

	Command or Action	Purpose
	<pre>conform-action transmit exceed-action drop Switch(config-pmap-c)#</pre>	<ul style="list-style-type: none"> <li>• <b>pir</b>—Peak Information Rate.</li> <li>• <b>cir</b>—Committed Information Rate. <ul style="list-style-type: none"> <li>• <i>target_bit_rate</i>—Target bit rate (8000 to 10000000000).</li> <li>• <b>percent</b>—Percentage of interface bandwidth for CIR.</li> </ul> </li> <li>• <b>rate</b>—Specifies the police rate, PCR for hierarchical policies, or SCR for single-level ATM 4.0 policer policies. <ul style="list-style-type: none"> <li>• <i>target_bit_rate</i>—Target Bit Rate (8000 to 10000000000).</li> <li>• <b>percent</b>—Percentage of interface bandwidth for rate.</li> </ul> </li> </ul> <p>The following <b>police conform-action transmit exceed-action</b> subcommand options are available:</p> <ul style="list-style-type: none"> <li>• <b>drop</b>—Drops the packet.</li> <li>• <b>set-cos-transmit</b>—Sets the CoS value and sends it.</li> <li>• <b>set-dscp-transmit</b>—Sets the DSCP value and sends it.</li> <li>• <b>set-prec-transmit</b>—Rewrites the packet precedence and sends it.</li> <li>• <b>transmit</b>—Transmits the packet.</li> </ul> <p><b>Note</b> Policer-based markdown actions are only supported using table maps. Only one markdown table map is allowed for each marking field in the switch.</p>
<b>Step 5</b>	<pre>end  Example:  Switch(config-pmap-c)# end Switch#</pre>	Saves configuration changes.

	Command or Action	Purpose
<b>Step 6</b>	<b>show policy-map</b> <b>Example:</b> Switch# <code>show policy-map</code>	(Optional) Displays policy configuration information for all classes configured for all service policies.

**What to do next**

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or polices to an interface using the **service-policy** command.

**Configuring Priority (CLI)**

This procedure explains how to configure priority on your switch.

The switch supports giving priority to specified queues. There are two priority levels available (1 and 2).

**Note** Queues supporting voice and video should be assigned a priority level of 1.

**Before you begin**

You should have created a class map for priority before beginning this procedure.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy name</i></b> <b>Example:</b>	Enters policy map configuration mode.

	Command or Action	Purpose
	<pre>Switch(config)# policy-map policy_priority01 Switch(config-pmap)#</pre>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<b>Step 3</b>	<p><b>class</b> <i>class name</i></p> <p><b>Example:</b></p> <pre>Switch(config-pmap)# class class_priority01 Switch(config-pmap-c)#</pre>	<p>Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following:</p> <ul style="list-style-type: none"> <li>• <i>word</i>—Class map name.</li> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul>
<b>Step 4</b>	<p><b>priority</b> [<i>Kb/s</i> [<i>burst_in_bytes</i>]   <b>level</b> <i>level_value</i> [<i>Kb/s</i> [<i>burst_in_bytes</i>]   <b>percent</b> <i>percentage</i> [<i>burst_in_bytes</i>] ]   <b>percent</b> <i>percentage</i> [<i>burst_in_bytes</i>] ]</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# priority level 1 Switch(config-pmap-c)#</pre>	<p>(Optional) The <b>priority</b> command assigns a strict scheduling priority for the class.</p> <p>The command options include:</p> <ul style="list-style-type: none"> <li>• <i>Kb/s</i>—Specifies the kilobits per second (from 1 to 2000000).</li> <li>• <i>burst_in_bytes</i>—Specifies the burst in bytes (from 32 to 2000000).</li> <li>• <b>level</b> <i>level_value</i>—Specifies the multilevel (1-2) priority queue. <ul style="list-style-type: none"> <li>• <i>Kb/s</i>—Specifies the kilobits per second (from 1 to 2000000).</li> <li>• <i>burst_in_bytes</i>—Specifies the burst in bytes (from 32 to 2000000).</li> </ul> </li> <li>• <b>percent</b>—Percentage of the total bandwidth. <ul style="list-style-type: none"> <li>• <i>burst_in_bytes</i>—Specifies the burst in bytes (from 32 to 2000000).</li> </ul> </li> <li>• <b>percent</b>—Percentage of the total bandwidth. <ul style="list-style-type: none"> <li>• <i>burst_in_bytes</i>—Specifies the burst in bytes (32 to 2000000).</li> </ul> </li> </ul>

	Command or Action	Purpose
		<b>Note</b> Priority level 1 is more important than priority level 2. Priority level 1 reserves bandwidth that is processed first for QoS, so its latency is very low. Both priority level 1 and 2 reserve bandwidth.
<b>Step 5</b>	<b>end</b> <b>Example:</b>  Switch(config-pmap-c)# <b>end</b> Switch#	Saves configuration changes.
<b>Step 6</b>	<b>show policy-map</b> <b>Example:</b>  Switch# <b>show policy-map</b>	(Optional) Displays policy configuration information for all classes configured for all service policies.

**What to do next**

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or policies to an interface using the **service-policy** command.

**Related Topics**

[Priority Queues](#), on page 813

## Configuring Queues and Shaping

### Configuring Egress Queue Characteristics

Depending on the complexity of your network and your QoS solution, you may need to perform all of the procedures in this section. You need to make decisions about these characteristics:

- Which packets are mapped by DSCP, CoS, or QoS group value to each queue and threshold ID?
- What drop percentage thresholds apply to the queues, and how much reserved and maximum memory is needed for the traffic type?
- How much of the fixed buffer space is allocated to the queues?
- Does the bandwidth of the port need to be rate limited?
- How often should the egress queues be serviced and which technique (shaped, shared, or both) should be used?

**Note** You can only configure the egress queues on the switch.

## Configuring Queue Buffers (CLI)

The switch allows you to allocate buffers to queues. If there is no allocation made to buffers, then they are divided equally for all queues. You can use the queue-buffer ratio to divide it in a particular ratio. Since by default DTS (Dynamic Threshold and Scaling) is active on all queues, these are soft buffers.

### Before you begin

The following are prerequisites for this procedure:

- You should have created a class map for the queue buffer before beginning this procedure.
- You must have configured either bandwidth, shape, or priority on the policy map prior to configuring the queue buffers.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy name</i></b> <b>Example:</b> <pre>Switch(config)# policy-map policy_queuebuffer01 Switch(config-pmap)#</pre>	Enters policy map configuration mode.  Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<b>Step 3</b>	<b>class <i>class name</i></b> <b>Example:</b> <pre>Switch(config-pmap)# class class_queuebuffer01 Switch(config-pmap-c)#</pre>	Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following: <ul style="list-style-type: none"> <li>• <i>word</i>—Class map name.</li> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul>
<b>Step 4</b>	<b>bandwidth {<i>Kb/s</i>   <b>percent</b> <i>percentage</i>   <b>remaining</b> { <i>ratio</i> <i>ratio value</i> }}</b> <b>Example:</b> <pre>Switch(config-pmap-c)# bandwidth percent 80 Switch(config-pmap-c)#</pre>	Configures the bandwidth for the policy map. The command parameters include: <ul style="list-style-type: none"> <li>• <i>Kb/s</i>—Use this command to configure a specific value. The range is 20000 to 10000000.</li> <li>• <b>percent</b>—Allocates a minimum bandwidth to a particular class using a percentage.</li> </ul>

	Command or Action	Purpose
		<p>The queue can oversubscribe bandwidth in case other queues do not utilize the entire port bandwidth. The total sum cannot exceed 100 percent, and in case it is less than 100 percent, the rest of the bandwidth is equally divided along all bandwidth queues.</p> <ul style="list-style-type: none"> <li>• <b>remaining</b>—Allocates a minimum bandwidth to a particular class. The queue can oversubscribe bandwidth in case other queues do not utilize entire port bandwidth. The total sum cannot exceed 100 percent. It is preferred to use this command when the <b>priority</b> command is used for certain queues in the policy. You can also assign ratios rather than a percentage to each queue; the queues will be assigned certain weights that are inline with these ratios. Ratios can range from 0 to 100. Total bandwidth ratio allocation for the policy in this case can exceed 100.</li> </ul> <p><b>Note</b> You cannot mix bandwidth types on a policy map.</p>
<b>Step 5</b>	<p><b>queue-buffers</b> {ratio ratio value}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# queue-buffers ratio 10 Switch(config-pmap-c)#</pre>	<p>Configures the relative buffer size for the queue.</p> <p><b>Note</b> The sum of all configured buffers in a policy must be less than or equal to 100 percent. Unallocated buffers are evenly distributed to all the remaining queues. Ensure sufficient buffers are allocated to all queues including the priority queues.</p> <p><b>Note</b> Protocol Data Units(PDUs) for network control protocols such as spanning-tree and LACP utilize the priority queue or queue 0 (when a priority queue is not configured). Ensure sufficient buffers are allocated to these queues for the protocols to function.</p>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# end Switch#</pre>	<p>Saves configuration changes.</p>

	Command or Action	Purpose
<b>Step 7</b>	<b>show policy-map</b> <b>Example:</b> Switch# <code>show policy-map</code>	(Optional) Displays policy configuration information for all classes configured for all service policies.

**What to do next**

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or polices to an interface using the **service-policy** command.

**Related Topics**

[Queue Buffer Allocation](#), on page 814

[Examples: Queue Buffers Configuration](#), on page 897

**Configuring Queue Limits (CLI)**

You use queue limits to configure Weighted Tail Drop (WTD). WTD ensures the configuration of more than one threshold per queue. Each class of service is dropped at a different threshold value to provide for QoS differentiation. With the switch, each queue has 3 explicit programmable threshold classes—0, 1, 2. Therefore, the enqueue/drop decision of each packet per queue is determined by the packet's threshold class assignment, which is determined by the DSCP, CoS, or QoS group field of the frame header.

WTD also uses a soft limit, and therefore you are allowed to configure the queue limit to up to 400 percent (maximum four times the reserved buffer from common pool). This soft limit prevents overrunning the common pool without impacting other features.

---

**Note** You can only configure queue limits on the switch egress queues on wired ports.

---

**Before you begin**

The following are prerequisites for this procedure:

- You should have created a class map for the queue limits before beginning this procedure.
- You must have configured either bandwidth, shape, or priority on the policy map prior to configuring the queue limits.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<p><b>policy-map</b> <i>policy name</i></p> <p><b>Example:</b></p> <pre>Switch(config) # <b>policy-map</b> <b>policy_queue-limit01</b> Switch(config-pmap) #</pre>	<p>Enters policy map configuration mode.</p> <p>Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.</p>
<b>Step 3</b>	<p><b>class</b> <i>class name</i></p> <p><b>Example:</b></p> <pre>Switch(config-pmap) # <b>class</b> <b>class_queue-limit01</b> Switch(config-pmap-c) #</pre>	<p>Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following:</p> <ul style="list-style-type: none"> <li>• <b>word</b>—Class map name.</li> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul>
<b>Step 4</b>	<p><b>bandwidth</b> {<i>Kb/s</i>   <b>percent</b> <i>percentage</i>   <b>remaining</b> { <i>ratio</i> <i>ratio value</i> }}</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c) # <b>bandwidth</b> 500000 Switch(config-pmap-c) #</pre>	<p>Configures the bandwidth for the policy map. The parameters include:</p> <ul style="list-style-type: none"> <li>• <b>Kb/s</b>—Use this command to configure a specific value. The range is 20000 to 10000000.</li> <li>• <b>percent</b>—Allocates a minimum bandwidth to a particular class. The queue can oversubscribe bandwidth in case other queues do not utilize the entire port bandwidth. The total sum cannot exceed 100 percent, and in case it is less than 100 percent, the rest of the bandwidth is equally divided along all bandwidth queues.</li> <li>• <b>remaining</b>—Allocates a minimum bandwidth to a particular class. The queue can oversubscribe bandwidth in case other queues do not utilize entire port bandwidth. The total sum cannot exceed 100 percent. It is preferred to use this command when the <b>priority</b> command is used for certain queues in the policy. You can also assign ratios rather than a percentage to each queue; the queues will be assigned certain weights that are inline with these ratios. Ratios can range from 0 to 100. Total bandwidth ratio allocation for the policy in this case can exceed 100.</li> </ul>

	Command or Action	Purpose
		<b>Note</b> You cannot mix bandwidth types on a policy map.
<b>Step 5</b>	<p><b>queue-limit</b> {<i>packets</i> <b>packets</b>   <b>cos</b> {<i>cos value</i> {<i>maximum threshold value</i>   <b>percent percentage</b> }   <b>values</b> {<i>cos value</i>   <b>percent percentage</b> } }   <b>dscp</b> {<i>dscp value</i> {<i>maximum threshold value</i>   <b>percent percentage</b>}   <b>match packet</b> {<i>maximum threshold value</i>   <b>percent percentage</b>}   <b>default</b> {<i>maximum threshold value</i>   <b>percent percentage</b>}   <b>ef</b> {<i>maximum threshold value</i>   <b>percent percentage</b>}   <b>dscp values</b> <i>dscp value</i>}   <b>percent percentage</b> } }</p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# queue-limit dscp 3 percent 20 Switch(config-pmap-c)# queue-limit dscp 4 percent 30 Switch(config-pmap-c)# queue-limit dscp 5 percent 40</pre>	<p>Sets the queue limit threshold percentage values.</p> <p>With every queue, there are three thresholds (0,1,2), and there are default values for each of these thresholds. Use this command to change the default or any other queue limit threshold setting. For example, if DSCP 3, 4, and 5 packets are being sent into a specific queue in a configuration, then you can use this command to set the threshold percentages for these three DSCP values. For additional information about queue limit threshold values, see <a href="#">Weighted Tail Drop, on page 811</a>.</p> <p><b>Note</b> The switch does not support absolute queue-limit percentages. The switch only supports DSCP or CoS queue-limit percentages.</p>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-pmap-c)# end Switch#</pre>	Saves configuration changes.
<b>Step 7</b>	<p><b>show policy-map</b></p> <p><b>Example:</b></p> <pre>Switch# show policy-map</pre>	(Optional) Displays policy configuration information for all classes configured for all service policies.

**What to do next**

Proceed to configure any additional policy maps for QoS for your network. After creating your policy maps, proceed to attach the traffic policy or polices to an interface using the **service-policy** command.

**Related Topics**

[Weighted Tail Drop, on page 811](#)

**Configuring Shaping (CLI)**

You use the **shape** command to configure shaping (maximum bandwidth) for a particular class. The queue's bandwidth is restricted to this value even though the port has additional bandwidth left. You can configure shaping as an average percent, as well as a shape average value in bits per second.

**Before you begin**

You should have created a class map for shaping before beginning this procedure.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy name</i></b> <b>Example:</b> <pre>Switch(config)# policy-map policy_shaping01 Switch(config-pmap)#</pre>	Enters policy map configuration mode.  Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<b>Step 3</b>	<b>class <i>class name</i></b> <b>Example:</b> <pre>Switch(config-pmap)# class class_shaping01 Switch(config-pmap-c)#</pre>	Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following: <ul style="list-style-type: none"> <li>• <i>word</i>—Class map name.</li> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul>
<b>Step 4</b>	<b>shape average {<i>target bit rate</i>   percent <i>percentage</i>}</b> <b>Example:</b> <pre>Switch(config-pmap-c)# shape average percent 50 Switch(config-pmap-c)#</pre>	Configures the average shape rate. You can configure the average shape rate by target bit rates (bits per second) or by percentage of interface bandwidth for the Committed Information Rate (CIR).  <b>Note</b> For the egress class-default SSID policy, you must configure the queue buffer ratio as 0 after you configure the average shape rate.
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-pmap-c)# end Switch#</pre>	Saves configuration changes.

	Command or Action	Purpose
<b>Step 6</b>	<b>show policy-map</b> <b>Example:</b> Switch# <b>show policy-map</b>	(Optional) Displays policy configuration information for all classes configured for all service policies.

### What to do next

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or polices to an interface using the **service-policy** command.

## Configuring Precious Metal Policies (CLI)

You can configure precious metal QoS policies on a per-WLAN basis.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global command mode.
<b>Step 2</b>	<b>wlan wlan-name</b> <b>Example:</b> Switchwlan <b>test4</b>	Enters the WLAN configuration submode.
<b>Step 3</b>	<b>service-policy {input   output} policy-name</b> <b>Example:</b> Switch(config-wlan)# <b>service-policy output platinum</b> <b>Example:</b> Switch(config-wlan)# <b>service-policy input platinum-up</b>	Configures the WLAN with the QoS policy. To configure the WLAN with precious metal policies, you must enter one of the following keywords: <b>platinum</b> , <b>gold</b> , <b>silver</b> , or <b>bronze</b> . The upstream policy is specified with the keyword <b>platinum-up</b> as shown in the example. <b>Note</b> Upstream policies differ from downstream policies. The upstream policies have a suffix of -up.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode.

	Command or Action	Purpose
<b>Step 5</b>	<b>show wlan</b> { <i>wlan-id</i>   <i>wlan-name</i> } <b>Example:</b> Switch# <b>show wlan name qos-wlan</b>	Verifies the configured QoS policy on the WLAN.  Switch# <b>show wlan name qos-wlan</b> . . . . . . . . . QoS Service Policy - Input Policy Name : platinum-up Policy State : Validated QoS Service Policy - Output Policy Name : platinum Policy State : Validated . . . . . .

## Configuring QoS Policies for Multicast Traffic (CLI)

**Before you begin**

The following are the prerequisites for configuring a QoS policy for multicast traffic:

- You must have a multicast service policy configured.
- You must enable multicast-multicast mode before applying the policy.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ap capwap multicast service-policy output</b> <i>service-policy-name</i> <b>Example:</b> Switch(config)# <b>ap capwap multicast</b> <b>service-policy output</b> <b>service-policy-mcast</b>	Applies the configured multicast policy.

	Command or Action	Purpose
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Port Policies (GUI)

**Procedure**

- 
- Step 1** Choose **Configuration > Wireless**
- Step 2** Expand the **QoS** node by clicking on left pane and choose **QOS-Policy**.  
The **QOS-Policy** page is displayed.
- Step 3** Click **Add New** to create a new QoS policy.  
The **Create QoS Policy** page is displayed.
- Step 4** Select **Port** from the **Policy Type** drop-down menu.
- Step 5** Enter the policy name in the **Policy Name** text field.
- Step 6** Specify a description for the policy you want to create in the **Description** field.
- Step 7** Configure the voice or video priorities for the port policies by enabling the Enable Voice and Enable Video parameters.
- Note** You must attach the port policy to an interface. Default values are recommended.
- Step 8** Click **Add** to add the policy.
- 

**What to do next**

Proceed to assign the port policy on an interface.

**Related Topics**

## Applying or Changing Port Policies (GUI)

### Procedure

- Step 1** Choose **Configuration > Controller > System > Interfaces > Port Summary**.  
The **Port Configuration** page is displayed.
- Step 2** Select the interface on which you want to configure the port policy from the **Interface Name** column.
- Step 3** Apply or change the **QoS Port Policy** by selecting the policy from the **Assign Policy** drop-down list.  
The **Existing Policy** field displays the current policy assigned.
- Note** All interfaces in a channel group must be assigned to the same port policy.
- Step 4** Click **Apply**.

### Related Topics

## Applying a QoS Policy on a WLAN (GUI)

### Procedure

- Step 1** Choose **Configuration > Wireless**.
- Step 2** Expand the **WLAN** node by clicking on the left pane and choose **WLANs**.  
The **WLANs** page is displayed.
- Step 3** Select the WLAN for which you want to configure the QoS policies by clicking on the **WLAN Profile**.
- Step 4** Click the **QoS** tab to configure the QoS policies on the WLAN.  
You can also configure precious metal policies for the WLAN.  
The following options are available:

Parameter	Description
<b>QoS SSID Policy</b>	
Egress Policy	QoS downstream policy configuration.  The <b>Existing Policy</b> column displays the current applied policy. To change the existing policy, select the policy from the drop-down list in the <b>Assign Policy</b> column.  If a policy is not selected, NONE is displayed.

Parameter	Description
Ingress Policy	QoS upstream policy configuration. The <b>Existing Policy</b> column displays the current applied policy. To change the existing policy, select the policy from the drop-down list in the <b>Assign Policy</b> column. If a policy is not selected, NONE is displayed.
<b>QoS Client Policy</b>	
Egress Policy	QoS downstream policy configuration. The <b>Existing Policy</b> column displays the current applied policy. To change the existing policy, select the policy from the drop-down list in the <b>Assign Policy</b> column. If a policy is not selected, NONE is displayed.
Ingress Policy	QoS upstream policy configuration. The <b>Existing Policy</b> column displays the current applied policy. To change the existing policy, select the policy from the drop-down list in the <b>Assign Policy</b> column. If a policy is not selected, NONE is displayed.
<b>WMM</b>	
WMM Policy	WMM Policy. This parameter has the following values: <ul style="list-style-type: none"> <li>• Disabled—Disables this WMM policy.</li> <li>• Allowed—Allows the clients to communicate with the WLAN.</li> <li>• Require—Ensures that it is mandatory for the clients to have WMM features enabled on them to communicate with the WLAN.</li> </ul>

**Step 5** Click **Apply**.

# Monitoring QoS

The following commands can be used to monitor QoS on the switch.

**Table 69: Monitoring QoS**

Command	Description
<b>show class-map</b> [ <i>class_map_name</i> ]	Displays a list of all class maps configured.
<b>show class-map type control subscriber</b> {all   <i>name</i> } <b>show class-map type control subscriber detail</b>	Displays control class map and statistics. <ul style="list-style-type: none"> <li>• all—Displays information for all class maps.</li> <li>• name—Displays configured class maps.</li> </ul>
<b>show policy-map</b> [ <i>policy_map_name</i> ]	Displays a list of all policy maps configured. Command parameters include: <ul style="list-style-type: none"> <li>• <b>policy map name</b></li> <li>• <b>interface</b></li> <li>• <b>session</b></li> </ul>

Command	Description
<b>show policy-map interface</b> { <b>Auto-template</b>   <b>Capwap</b>   <b>GigabitEthernet</b>   <b>GroupVI</b>   <b>InternalInterface</b>   <b>Loopback</b>   <b>Lspvif</b>   <b>Null</b>   <b>Port-channel</b>   <b>TenGigabitEthernet</b>   <b>Tunnel</b>   <b>Vlan</b>   <b>brief</b>   <b>class</b>   <b>input</b>   <b>output</b>   <b>wireless</b> }	Displays the runtime representation and statistics of all the policies configured on the switch. Command parameters include: <ul style="list-style-type: none"> <li>• <b>Auto-template</b>—Auto-Template interface</li> <li>• <b>Capwap</b>—CAPWAP tunnel interface</li> <li>• <b>GigabitEthernet</b>—Gigabit Ethernet IEEE.802.3z</li> <li>• <b>GroupVI</b>—Group virtual interface</li> <li>• <b>InternalInterface</b>—Internal interface</li> <li>• <b>Loopback</b>—Loopback interface</li> <li>• <b>Lspvif</b>—LSP virtual interface</li> <li>• <b>Null</b>—Null interface</li> <li>• <b>Port-channel</b>—Ethernet channel of interfaces</li> <li>• <b>TenGigabitEthernet</b>—10-Gigabit Ethernet</li> <li>• <b>Tunnel</b>—Tunnel interface</li> <li>• <b>Vlan</b>—Catalyst VLANs</li> <li>• <b>brief</b>—Brief description of policy maps</li> <li>• <b>class</b>—Statistics for individual class</li> <li>• <b>input</b>—Input policy</li> <li>• <b>output</b>—Output policy</li> <li>• <b>Wireless</b>—wireless</li> </ul>
<b>show policy-map interface wireless ap</b> [ <i>access point</i> ]	Displays the runtime representation and statistics for all the wireless APs on the switch.
<b>show policy-map interface wireless ssid</b> [ <i>ssid</i> ]	Displays the runtime representation and statistics for all the SSID targets on the switch.

Command	Description
<b>show policy-map interface wireless client mac</b> [ <i>mac_address</i> ]	Displays the runtime representation and statistics for all the client targets on the switch.
<b>show policy-map session</b> [ <b>input</b>   <b>output</b>   <b>uid</b> <i>UUID</i> ]	Displays the session QoS policy. Command parameters include: <ul style="list-style-type: none"> <li>• <b>input</b>—Input policy</li> <li>• <b>output</b>—Output policy</li> <li>• <b>uid</b>—Policy based on SSS unique identification.</li> </ul>
<b>show policy-map type control subscriber</b> { <b>all</b>   <b>name</b> }	Displays the type QoS policy-map.
<b>show table-map</b>	Displays all the table maps and their configurations.
<b>show platform qos wireless</b> { <b>afd</b> { <b>client</b>   <b>ssid</b> }   <b>stats</b> { <b>bssid</b> <i>bssid-value</i>   <b>client</b> <i>client name</i>   <b>ssid</b> { <i>ssid-value</i>   <b>all</b> } <b>client</b> <b>all</b> } }	Displays wireless targets. The following command parameters are supported: <ul style="list-style-type: none"> <li>• <b>afd</b>—AFD information</li> <li>• <b>stats</b>—Statistics information</li> </ul>
<b>show policy-map interface wireless ssid name</b> <i>ssid-name</i> [ <b>radio type</b> { <b>24ghz</b>   <b>5ghz</b> } <b>ap name</b> <i>ap-name</i>   <b>ap name</b> <i>ap-name</i> ]	Displays SSID policy configuration on an access point.
<b>show wireless client mac-address</b> <i>mac_address</i> <b>service-policy</b> { <b>input</b>   <b>output</b> }	Displays details of the client policy.
<b>show wlan qos service-policies</b>	Displays the SSID policies configured on all WLANs.
<b>show ap name</b> <i>ap_name</i> <b>service-policy</b>	Displays all the policies configured on the AP.

## Monitoring SSID and Client Policies Statistics (GUI)

Statistics are supported only for ingress policies with a maximum of five classes on wireless targets. For very large policies, statistics for ingress policies are not visible at the switch. The frequency of the statistics depends on the number of clients associated with the access point.

Type of Statistics	Method	Details
SSID Policies	Choose <b>Monitor &gt; Controller &gt; Statistics &gt; QoS</b> .	<p>The QoS page is displayed with a list of SSID policies, Radio Type, and AP.</p> <p>Choose an SSID policy, radio, and access point from the drop-down lists and click <b>Apply</b> to view the statistics of the chosen SSID policy.</p> <p>You can view details such as match criteria, confirmed bytes, conformed rate, and exceeded rate.</p>
Client Policies	Choose <b>Monitor &gt; Clients &gt; Client Details</b> .	<p>The Clients page is displayed with a list of client MAC addresses, AP, and other details.</p> <p>Click the MAC address of a client and click the <b>QoS Statistics</b> tab.</p> <p>You can view details such as match criteria, confirmed bytes, conformed rate, and exceeded rate.</p>

## Configuration Examples for QoS

### Examples: Classification by Access Control Lists

This example shows how to classify packets for QoS by using access control lists (ACLs):

```
Switch# configure terminal
Switch(config)# access-list 101 permit ip host 12.4.1.1 host 15.2.1.1
Switch(config)# class-map acl-101
Switch(config-cmap)# description match on access-list 101
Switch(config-cmap)# match access-group 101
Switch(config-cmap)#
```

After creating a class map by using an ACL, you then create a policy map for the class, and apply the policy map to an interface for QoS.

#### Related Topics

[Creating a Traffic Class \(CLI\)](#), on page 828

[Class Maps](#), on page 802

### Examples: Class of Service Layer 2 Classification

This example shows how to classify packets for QoS using a class of service Layer 2 classification:

```
Switch# configure terminal
Switch(config)# class-map cos
Switch(config-cmap)# match cos ?
    <0-7> Enter up to 4 class-of-service values separated by white-spaces
Switch(config-cmap)# match cos 3 4 5
Switch(config-cmap)#
```

After creating a class map by using a CoS Layer 2 classification, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: Class of Service DSCP Classification

This example shows how to classify packets for QoS using a class of service DSCP classification:

```
Switch# configure terminal
Switch(config)# class-map dscp
Switch(config-cmap)# match dscp af21 af22 af23
Switch(config-cmap)#
```

After creating a class map by using a DSCP classification, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: VLAN ID Layer 2 Classification

This example shows how to classify for QoS using a VLAN ID Layer 2 classification:

```
Switch# configure terminal
Switch(config)# class-map vlan-120
Switch(config-cmap)# match vlan ?
    <1-4095> VLAN id
Switch(config-cmap)# match vlan 120
Switch(config-cmap)#
```

After creating a class map by using a VLAN Layer 2 classification, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: Classification by DSCP or Precedence Values

This example shows how to classify packets by using DSCP or precedence values:

```
Switch# configure terminal
Switch(config)# class-map prec2
Switch(config-cmap)# description matching precedence 2 packets
Switch(config-cmap)# match ip precedence 2
Switch(config-cmap)# exit
Switch(config)# class-map ef
Switch(config-cmap)# description EF traffic
Switch(config-cmap)# match ip dscp ef
Switch(config-cmap)#
```

After creating a class map by using a DSCP or precedence values, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: Hierarchical Classification

The following is an example of a hierarchical classification, where a class named parent is created, which matches another class named child. The class named child matches based on the IP precedence being set to 2.

```
Switch# configure terminal
Switch(config)# class-map child
Switch(config-cmap)# match ip precedence 2
Switch(config-cmap)# exit
Switch(config)# class-map parent
Switch(config-cmap)# match class child
Switch(config-cmap)#
```

After creating the parent class map, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: Hierarchical Policy Configuration

The following is an example of a configuration using hierarchical polices:

```
Switch# configure terminal
Switch(config)# class-map c1
Switch(config-cmap)# match dscp 30
Switch(config-cmap)# exit

Switch(config)# class-map c2
Switch(config-cmap)# match precedence 4
Switch(config-cmap)# exit

Switch(config)# class-map c3
Switch(config-cmap)# exit

Switch(config)# policy-map child
Switch(config-pmap)# class c1
Switch(config-pmap-c)# priority level 1
Switch(config-pmap-c)# police rate percent 20 conform-action transmit exceed action drop
Switch(config-pmap-c-police)# exit
Switch(config-pmap-c)# exit

Switch(config-pmap)# class c2
Switch(config-pmap-c)# bandwidth 20000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# bandwidth 20000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit

Switch(config)# policy-map parent
Switch(config-pmap)# class class-default
```

```
Switch(config-pmap-c) # shape average 1000000
Switch(config-pmap-c) # service-policy child
Switch(config-pmap-c) # end
```

The following example shows a hierarchical policy using table maps:

```
Switch(config)# table-map dscp2dscp
Switch(config-tablemap)# default copy
Switch(config)# table-map dscp2up
Switch(config-tablemap)# map from 46 to 6
Switch(config-tablemap)# map from 34 to 5
Switch(config-tablemap)# default copy
Switch(config)# policy-map ssid_child_policy
Switch(config-pmap)# class voice
Switch(config-pmap-c)# priority level 1
Switch(config-pmap-c)# police 15000000
Switch(config-pmap)# class video
Switch(config-pmap-c)# priority level 2
Switch(config-pmap-c)# police 10000000
Switch(config)# policy-map ssid_policy
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# shape average 30000000
Switch(config-pmap-c)# queue-buffer ratio 0
Switch(config-pmap-c)# set dscp dscp table dscp2dscp
Switch(config-pmap-c)# service-policy ssid_child_policy
```

## Examples: Classification for Voice and Video

This example describes how to classify packet streams for voice and video using switch specific information.

In this example, voice and video are coming in from end-point A into GigabitEthernet1/0/1 on the switch and have precedence values of 5 and 6, respectively. Additionally, voice and video are also coming from end-point B into GigabitEthernet1/0/2 on the switch with DSCP values of EF and AF11, respectively.

Assume that all the packets from the both the interfaces are sent on the uplink interface, and there is a requirement to police voice to 100 Mbps and video to 150 Mbps.

To classify per the above requirements, a class to match voice packets coming in on GigabitEthernet1/0/1 is created, named voice-interface-1, which matches precedence 5. Similarly another class for voice is created, named voice-interface-2, which will match voice packets in GigabitEthernet1/0/2. These classes are associated to two separate policies named input-interface-1, which is attached to GigabitEthernet1/0/1, and input-interface-2, which is attached to GigabitEthernet1/0/2. The action for this class is to mark the qos-group to 10. To match packets with QoS-group 10 on the output interface, a class named voice is created which matches on QoS-group 10. This is then associated to another policy named output-interface, which is associated to the uplink interface. Video is handled in the same way, but matches on QoS-group 20.

The following example shows how classify using the above switch specific information:

```
Switch(config)#
Switch(config)# class-map voice-interface-1
Switch(config-cmap)# match ip precedence 5
Switch(config-cmap)# exit

Switch(config)# class-map video-interface-1
Switch(config-cmap)# match ip precedence 6
```

```

Switch(config-cmap) # exit

Switch(config) # class-map voice-interface-2
Switch(config-cmap) # match ip dscp ef
Switch(config-cmap) # exit

Switch(config) # class-map video-interface-2
Switch(config-cmap) # match ip dscp af11
Switch(config-cmap) # exit

Switch(config) # policy-map input-interface-1
Switch(config-pmap) # class voice-interface-1
Switch(config-pmap-c) # set qos-group 10
Switch(config-pmap-c) # exit

Switch(config-pmap) # class video-interface-1
Switch(config-pmap-c) # set qos-group 20

Switch(config-pmap-c) # policy-map input-interface-2
Switch(config-pmap) # class voice-interface-2
Switch(config-pmap-c) # set qos-group 10
Switch(config-pmap-c) # class video-interface-2
Switch(config-pmap-c) # set qos-group 20
Switch(config-pmap-c) # exit
Switch(config-pmap) # exit

Switch(config) # class-map voice
Switch(config-cmap) # match qos-group 10
Switch(config-cmap) # exit

Switch(config) # class-map video
Switch(config-cmap) # match qos-group 20

Switch(config) # policy-map output-interface
Switch(config-pmap) # class voice
Switch(config-pmap-c) # police 256000 conform-action transmit exceed-action drop
Switch(config-pmap-c-police) # exit
Switch(config-pmap-c) # exit

Switch(config-pmap) # class video
Switch(config-pmap-c) # police 1024000 conform-action transmit exceed-action drop
Switch(config-pmap-c-police) # exit
Switch(config-pmap-c) # exit

```

## Examples: Wireless QoS Policy Classified by Voice, Video, and Multicast Traffic

The following example provides a template for creating a port child policy for managing quality of service for voice and video traffic.

```

Policy-map port_child_policy
  Class voice (match dscp ef)
    Priority level 1
    Police Multicast Policer
  Class video (match dscp af41)
    Priority level 2
    Police Multicast Policer
  Class mcast-data (match non-client-nrt)

```

```

    Bandwidth remaining ratio <>
Class class-default (NRT Data)
    Bandwidth remaining ratio <>

```

**Note** Multicast Policer in the example above is not a keyword. It refers to the policing policy configured.

Two class maps with name voice and video are configured with DSCP assignments of 46 and 34. The voice traffic is assigned the priority of 1 and the video traffic is assigned the priority level 2 and is processed using Q0 and Q1. If your network receives multicast voice and video traffic, you can configure multicast policers. The non-client NRT data and NRT data are processed using the Q2 and Q3 queues.

## Examples: Configuring Downstream SSID Policy

To configure a downstream BSSID policy, you must first configure a port child policy with priority level queuing.

Type of Policy	Example
User-defined port child policy	<pre> policy-map port_child_policy   class voice     priority level 1 20000    class video     priority level 2 10000    class non-client-nrt-class     bandwidth remaining ratio 10    class class-default     bandwidth remaining ratio 15 </pre>
Egress BSSID policy	<pre> policy-map bssid-policer   queue-buffer ratio 0   class class-default     shape average 30000000   set dscp dscp table dscp2dscp   set wlan user-priority dscp table dscp2up   service-policy ssid_child_qos </pre>

Type of Policy	Example
SSID Child QoS policy	<pre> Policy Map ssid-child_qos Class voice   priority level 1   police cir 5m   admit cac wmm-tspec     UP 6,7 / tells WCM allow 'voice'   TSPEC\SIP snoop for this ssid     rate 4000 / must be police rate value is in kbps) Class video   priority level 2   police cir 60000 </pre>

## Examples: Ingress SSID Policies

The following examples show ingress SSID hierarchical policies:

Type of ingress SSID policies	Example
Ingress SSID hierarchical policies	<pre> policy-map ssid-child-policy class voice //match dscp 46 police 3m class video //match dscp 34 police 4m policy-map ssid-in-policy class class-default set dscp wlan user-priority table up2dscp service-policy ssid-child-policy </pre>
	<pre> policy-map ssid_in_policy class dscp-40 set cos 1 police 10m class up-1 set dscp 34 police 12m class dscp-10 set dscp 20 police 15m class class-default set dscp wlan user-priority table up2dscp police 50m </pre>

## Examples: Client Policies

Type of Client Policy	Example/Details
Default egress client policy	<p>Any incoming traffic contains the user-priority as 0.</p> <p><b>Note</b> The default client policy is enabled only on WMM clients that are ACM-enabled.</p> <p>You can verify if ACM is enabled by using the <b>show ap dot11 5ghz network</b> command. To enable ACM, use the <b>ap dot11 5ghz cac voice acm</b> command.</p> <pre>Policy-map client-def-down   class class-default     set wlan user-priority 0</pre>
Default ingress client policy	<p>Any traffic that is sent to the wired network from wireless network will result in the DSCP value being set to 0.</p> <p><b>Note</b> The default client policy is enabled only on WMM clients that are ACM-enabled.</p> <pre>Policy-map client-def-up   class class-default     set dscp 0</pre>
Client policies generated automatically and applied to the WMM client when the client authenticates to a profile in AAA with a configured QoS-level attribute.	<pre>Policy Map platinum-WMM Class voice-plat   set wlan user-priority 6 Class video-plat   set wlan user-priority 4 Class class-default   set wlan user-priority 0  Policy Map gold-WMM Class voice-gold   set wlan user-priority 4 Class video-gold   set wlan user-priority 4 Class class-default   set wlan user-priority 0</pre>
Non-WMM client precious metal policies	<pre>Policy Map platinum   set wlan user-priority 6</pre>

Type of Client Policy	Example/Details
Egress client policy where any traffic matching class voice1, the user priority is set to a pre-defined value.	<p>The class can be set to assign a DSCP or ACL.</p> <pre> Policy Map client1-down Class voice1 //match dscp, cos   set wlan user-priority &lt;&gt; Class voice2 //match acl   set wlan user-priority &lt;&gt; Class voice3   set wlan user-priority &lt;&gt; Class class-default   set wlan user-priority 0 </pre>
Client policy based on AAA and TCLAS	<pre> Policy Map client2-down[ AAA+ TCLAS pol example] Class voice \\match dscp   police &lt;&gt;   set &lt;&gt; Class class-default   set &lt;&gt; Class voice1   voice2 [match acls]   police &lt;&gt;   class voice1     set &lt;&gt;   class voice2     set &lt;&gt; </pre>
Client policy for voice and video for traffic in the egress direction	<pre> Policy Map client3-down   class voice \\match dscp, cos     police X   class video     police Y   class class-default     police Z </pre>
Client policy for voice and video for traffic in the ingress direction using policing	<pre> Policy Map client1-up   class voice \\match dscp, up, cos     police X   class video     police Y   class class-default     police Z </pre>
Client policy for voice and video based on DSCP	<pre> Policy Map client2-up   class voice \\match dscp, up, cos set dscp &lt;&gt;   class video     set dscp &lt;&gt;   class class-default     set dscp &lt;&gt; </pre>

Type of Client Policy	Example/Details
Client ingress policy with marking and policing	<pre> policy-map client_in_policy class dscp-48 //match dscp 48   set cos 3   police 2m class up-4 //match wlan user-priority 4   set dscp 10   police 3m class acl //match acl   set cos 2   police 5m class class-default   set dscp 20   police 15m </pre>
Hierarchical client ingress policy	<pre> policy-map client-child-policy class voice //match dscp 46   set dscp 40   police 5m class video //match dscp 34   set dscp 30   police 7m policy-map client-in-policy class class-default   police 15m service-policy client-child-policy </pre>

## Examples: Average Rate Shaping Configuration

The following example shows how to configure average rate shaping:

```

Switch# configure terminal
Switch(config)# class-map prec1
Switch(config-cmap)# description matching precedence 1 packets
Switch(config-cmap)# match ip precedence 1
Switch(config-cmap)# end

```

```

Switch# configure terminal
Switch(config)# class-map prec2
Switch(config-cmap)# description matching precedence 2 packets
Switch(config-cmap)# match ip precedence 2
Switch(config-cmap)# exit

```

```

Switch(config)# policy-map shaper
Switch(config-pmap)# class prec1
Switch(config-pmap-c)# shape average 512000
Switch(config-pmap-c)# exit

```

```
Switch(config-pmap) # policy-map shaper
Switch(config-pmap) # class prec2
Switch(config-pmap-c) # shape average 512000
Switch(config-pmap-c) # exit

Switch(config-pmap) # class class-default
Switch(config-pmap-c) # shape average 1024000
```

After configuring the class maps, policy map, and shape averages for your configuration, proceed to then apply the policy map to the interface for QoS.

### Related Topics

[Average Rate Shaping](#), on page 810

## Examples: Queue-limit Configuration

The following example shows how to configure a queue-limit policy based upon DSCP values and percentages:

```
Switch# configure terminal
Switch#(config)# policy-map port-queue
Switch#(config-pmap)# class dscp-1-2-3
Switch#(config-pmap-c)# bandwidth percent 20
Switch#(config-pmap-c)# queue-limit dscp 1 percent 80
Switch#(config-pmap-c)# queue-limit dscp 2 percent 90
Switch#(config-pmap-c)# queue-limit dscp 3 percent 100
Switch#(config-pmap-c)# exit

Switch#(config-pmap)# class dscp-4-5-6
Switch#(config-pmap-c)# bandwidth percent 20
Switch#(config-pmap-c)# queue-limit dscp 4 percent 20
Switch#(config-pmap-c)# queue-limit dscp 5 percent 30
Switch#(config-pmap-c)# queue-limit dscp 6 percent 20
Switch#(config-pmap-c)# exit

Switch#(config-pmap)# class dscp-7-8-9
Switch#(config-pmap-c)# bandwidth percent 20
Switch#(config-pmap-c)# queue-limit dscp 7 percent 20
Switch#(config-pmap-c)# queue-limit dscp 8 percent 30
Switch#(config-pmap-c)# queue-limit dscp 9 percent 20
Switch#(config-pmap-c)# exit

Switch#(config-pmap)# class dscp-10-11-12
Switch#(config-pmap-c)# bandwidth percent 20
Switch#(config-pmap-c)# queue-limit dscp 10 percent 20
Switch#(config-pmap-c)# queue-limit dscp 11 percent 30
Switch#(config-pmap-c)# queue-limit dscp 12 percent 20
Switch#(config-pmap-c)# exit

Switch#(config-pmap)# class dscp-13-14-15
Switch#(config-pmap-c)# bandwidth percent 10
Switch#(config-pmap-c)# queue-limit dscp 13 percent 20
Switch#(config-pmap-c)# queue-limit dscp 14 percent 30
Switch#(config-pmap-c)# queue-limit dscp 15 percent 20
Switch#(config-pmap-c)# end
Switch#
```

After finishing with the above policy map queue-limit configuration, you can then proceed to apply the policy map to an interface for QoS.

## Examples: Policing Action Configuration

The following example displays the various policing actions that can be associated to the policer. These actions are accomplished using the conforming, exceeding, or violating packet configurations. You have the flexibility to drop, mark and transmit, or transmit packets that have exceeded or violated a traffic profile.

For example, a common deployment scenario is one where the enterprise customer polices traffic exiting the network towards the service provider and marks the conforming, exceeding and violating packets with different DSCP values. The service provider could then choose to drop the packets marked with the exceeded and violated DSCP values under cases of congestion, but may choose to transmit them when bandwidth is available.

**Note** The Layer 2 fields can be marked to include the CoS fields, and the Layer 3 fields can be marked to include the precedence and the DSCP fields.

One useful feature is the ability to associate multiple actions with an event. For example, you could set the precedence bit and the CoS for all conforming packets. A submode for an action configuration could then be provided by the policing feature.

This is an example of a policing action configuration:

```
Switch# configure terminal
```

```
Switch(config)# policy-map police
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# police cir 1000000 pir 2000000
Switch(config-pmap-c-police)# conform-action transmit
Switch(config-pmap-c-police)# exceed-action set-dscp-transmit dscp table exceed-markdown-table
Switch(config-pmap-c-police)# violate-action set-dscp-transmit dscp table
violate-markdown-table
Switch(config-pmap-c-police)# end
```

In this example, the exceed-markdown-table and violate-mark-down-table are table maps.

---

**Note** Policer-based markdown actions are only supported using table maps. Only one markdown table map is allowed for each marking field in the switch.

---

## Examples: Policer VLAN Configuration

The following example displays a VLAN policer configuration. At the end of this configuration, the VLAN policy map is applied to an interface for QoS.

```
Switch# configure terminal
Switch(config)# class-map vlan100
Switch(config-cmap)# match vlan 100
Switch(config-cmap)# exit
Switch(config)# policy-map vlan100
Switch(config-pmap)# policy-map class vlan100
Switch(config-pmap-c)# police 100000 bc conform-action transmit exceed-action drop
Switch(config-pmap-c-police)# end
Switch# configure terminal
Switch(config)# interface gigabitEthernet1/0/5
Switch(config-if)# service-policy input vlan100
```

## Examples: Policing Units

The following examples display the various units of policing that are supported for QoS. The policing unit is the basis on which the token bucket works .

The following units of policing are supported:

- CIR and PIR are specified in bits per second. The burst parameters are specified in bytes. This is the default mode; it is the unit that is assumed when no units are specified. The CIR and PIR can also be configured in percent, in which case the burst parameters have to be configured in milliseconds.

- CIR and PIR are specified in packets per second. In this case, the burst parameters are configured in packets as well.

The following is an example of a policer configuration in bits per second:

```
Switch(config)# policy-map bps-policer
Switch(config-pmap)# class class-default
Switch(config-pmap-c) # police rate 256000 bps burst 1000 bytes
conform-action transmit exceed-action drop
```

The following is an example of a policer configuration in packets per second. In this configuration, a dual-rate three-color policer is configured where the units of measurement is packet. The burst and peak burst are all specified in packets.

```
Switch(config)# policy-map pps-policer
Switch(config-pmap)# class class-default
Switch(config-pmap-c) # police rate 5000 pps burst 100 packets
peak-rate 10000 pps peak-burst 200 packets conform-action transmit
exceed-action drop violate-action drop
```

#### Related Topics

[Configuring Police \(CLI\)](#), on page 867

## Examples: Single-Rate Two-Color Policing Configuration

The following example shows how to configure a single-rate two-color policer:

```
Switch(config)# class-map match-any precl
Switch(config-cmap)# match ip precedence 1
Switch(config-cmap)# exit
Switch(config)# policy-map policer
Switch(config-pmap)# class precl
Switch(config-pmap-c) # police cir 256000 conform-action transmit exceed-action drop
Switch(config-pmap-c-police)# exit
Switch(config-pmap-c)#
```

#### Related Topics

[Configuring Police \(CLI\)](#), on page 867

[Single-Rate Two-Color Policing](#), on page 808

## Examples: Dual-Rate Three-Color Policing Configuration

The following example shows how to configure a dual-rate three-color policer:

```
Switch# configure terminal
Switch(config)# policy-Map dual-rate-3color-policer
Switch(config-pmap)# class class-default
Switch(config-pmap-c) # police cir 64000 bc 2000 pir 128000 be 2000
Switch(config-pmap-c-police)# conform-action transmit
Switch(config-pmap-c-police)# exceed-action set-dscp-transmit dscp table exceed-markdown-table
Switch(config-pmap-c-police)# violate-action set-dscp-transmit dscp table
```

```
violate-markdown-table
Switch(config-pmap-c-police) # exit
Switch(config-pmap-c) #
```

In this example, the exceed-markdown-table and violate-mark-down-table are table maps.

**Note** Policer based markdown actions are only supported using table maps. Only one markdown table map is allowed for each marking field in the switch.

[Dual-Rate Three-Color Policing](#), on page 809

## Examples: Table Map Marking Configuration

The following steps and examples show how to use table map marking for your QoS configuration:

### 1. Define the table map.

Define the table-map using the **table-map** command and indicate the mapping of the values. This table does not know of the policies or classes within which it will be used. The default command in the table map indicates the value to be copied into the ‘to’ field when there is no matching ‘from’ field. In the example, a table map named table-map1 is created. The mapping defined is to convert the value from 0 to 1 and from 2 to 3, while setting the default value to 4.

```
Switch(config) # table-map table-map1
Switch(config-tablemap) # map from 0 to 1
Switch(config-tablemap) # map from 2 to 3
Switch(config-tablemap) # default 4
Switch(config-tablemap) # exit
```

### 2. Define the policy map where the table map will be used.

In the example, the incoming CoS is mapped to the DSCP based on the mapping specified in the table table-map1. For this example, if the incoming packet has a DSCP of 0, the CoS in the packet is set 1. If no table map name is specified the command assumes a default behavior where the value is copied as is from the ‘from’ field (DSCP in this case) to the ‘to’ field (CoS in this case). Note however, that while the CoS is a 3-bit field, the DSCP is a 6-bit field, which implies that the CoS is copied to the first three bits in the DSCP.

```
Switch(config) # policy map policy1
Switch(config-pmap) # class class-default
Switch(config-pmap-c) # set cos dscp table table-map1
Switch(config-pmap-c) # exit
```

### 3. Associate the policy to an interface.

```
Switch(config) # interface GigabitEthernet1/0/1
Switch(config-if) # service-policy output policy1
```

```
Switch(config-if) # exit
```

### Related Topics

[Table Map Marking](#), on page 806

## Example: Table Map Configuration to Retain CoS Markings

The following example shows how to use table maps to retain CoS markings on an interface for your QoS configuration.

The `cos-trust-policy` policy (configured in the example) is enabled in the ingress direction to retain the CoS marking coming into the interface. If the policy is not enabled, only the DSCP is trusted by default. If a pure Layer 2 packet arrives at the interface, then the CoS value will be rewritten to 0 when there is no such policy in the ingress port for CoS.

```
Switch# configure terminal
Switch(config)# table-map cos2cos
Switch(config-tablemap)# default copy
Switch(config-tablemap)# exit

Switch(config)# policy map cos-trust-policy
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set cos cos table cos2cos
Switch(config-pmap-c)# exit

Switch(config)# interface GigabitEthernet1/0/2
Switch(config-if)# service-policy input cos-trust-policy
Switch(config-if)# exit
```

## Feature History and Information for QoS

Release	Modification
Cisco IOS XE 3.3SE	This feature was introduced.
Cisco IOS XE 3.3SE	<p>Consistent system default trust behavior for both wired and wireless ports.</p> <p>The Cisco IOS XE 3.2 Release supported different trust defaults for wired and wireless ports. The trust default for wired ports was the same as for this software release. For wireless ports, the default system behavior was non-trust, which meant that when the switch came up, all markings for the wireless ports were defaulted to zero and no traffic received priority treatment. For compatibility with an existing wired switch, all traffic went to the best-effort queue by default. The access point performed priority queuing by default.</p> <p>The default trust behavior in the case of wireless ports could be changed by using the <b>no qos wireless default untrust</b> command.</p>

Release	Modification
Cisco IOS XE 3.3SE	Support for IPv6 wireless clients. The Cisco IOS XE 3.2 software release did not support IPv6 for wireless clients. This is now supported. Client policies can now have IPv4 and IPv6 filters.
Cisco IOS XE 3.3SE	Support for 3 radios and 11ac.
Cisco IOS XE 3.3SE	New classification counters available in the <b>show policy-map</b> command.  <b>Note</b> This feature is only available on wired targets.
Cisco IOS XE 3.6E	Marking and policing actions for ingress SSID policies. Client policies are applied at the access point.
Cisco IOS XE 3.6E	New classification counters for wireless targets available in the <b>show policy-map</b> command.
Cisco IOS XE 3.6E	Statistics are supported only for ingress policies.

Release	Modification
Cisco IOS XE 3.3SE	This feature was introduced.
Cisco IOS XE 3.6E	Marking and policing actions for upstream SSID and client policies are applied at the access point.
Cisco IOS XE 3.6E	New classification counters for wireless targets available in the <b>show policy-map</b> command.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Auto-QoS

The prerequisites for auto-QoS are the same as the prerequisites for standard QoS.

## Restrictions for Auto-QoS

The following are restrictions for auto-QoS:

- Auto-qos is not supported on SVI interfaces.

- The **trust device** *device\_type* command available in interface configuration mode is a stand-alone command on the switch. When using this command, if the connected peer device is not a corresponding device (defined as a device matching your trust policy), both CoS and DSCP values are set to "0" and any input policy will not take effect. If the connected peer device is a corresponding device, input policy will take effect.
- You must exercise caution when copying a pre-3.2.2 software version to this switch. If you do copy a pre-3.2.2 software version to this switch, then you must follow the auto-QoS upgrade procedure described later in this chapter.
- Do not configure the **auto qos voip cisco-phone** option for IP phones that support video. This option causes DSCP markings of video packets to get overwritten, because these packets do not have Expedited Forwarding priority, which results in these packets getting classified in the class-default class.
- Auto-QoS does not generate configuration when it is pushed from the startup-configuration using the **auto qos voip cisco-phone** command to the running-configuration. This is expected behavior and this is to prevent overwriting of user-created customized QoS policies by the default configuration, if any, every time the command **auto qos voip cisco-phone** is pushed from the startup-config.

You can use any of the following workarounds for this limitation:

- Configure the **auto qos voip cisco-phone** command manually on the switch interfaces.
- For new switches, if you push auto-QoS commands through startup-config, the command should include each of the following as part of the standard template
  1. Interface-level:
    - **trust device cisco-phone**
    - **auto qos voip cisco-phone**
    - **service-policy input** AutoQos-4.0-CiscoPhone-Input-Policy
    - **service-policy output** AutoQos-4.0-Output-Policy
  2. Global-level:
    - Class-map
    - Policy-map
    - ACL(ACE)
- If the **auto qos voip cisco-phone** command is already configured on an interface but policies are not being generated, disable the command from all the interfaces and reconfigure the command on each interface manually.

# Information About Configuring Auto-QoS

## Auto-QoS Overview

You can use the auto-QoS feature to simplify the deployment of QoS features. Auto-QoS determines the network design and enables QoS configurations so that the switch can prioritize different traffic flows.

The switch employs the MQC model. This means that instead of using certain global configurations, auto-QoS applied to any interface on a switch configures several global class maps and policy maps.

Auto-QoS matches traffic and assigns each matched packet to qos-groups. This allows the output policy map to put specific qos-groups into specific queues, including into the priority queue.

QoS is needed in both directions, both on inbound and outbound. When inbound, the switch port needs to trust the DSCP in the packet (done by default). When outbound, the switch port needs to give voice packets "front of line" priority. If voice is delayed too long by waiting behind other packets in the outbound queue, the end host drops the packet because it arrives outside of the receive window for that packet.

## Auto-QoS Compact Overview

When you enter an auto-QoS command, the switch displays all the generated commands as if the commands were entered from the CLI. You can use the auto-QoS compact feature to hide the auto-QoS generated commands from the running configuration. This would make it easier to comprehend the running-configuration and also help to increase efficient usage of memory.

## Auto-QoS Global Configuration Templates

In general, an auto-QoS command generates a series of class maps that either match on ACLs or on DSCP and/or CoS values to differentiate traffic into application classes. An input policy is also generated, which matches the generated classes and in some cases, polices the classes to a set bandwidth. Eight egress-queue class maps are generated. The actual egress output policy assigns a queue to each one of these eight egress-queue class maps.

The auto-QoS commands only generate templates as needed. For example, the first time any new auto-QoS command is used, global configurations that define the eight queue egress service-policy are generated. From this point on, auto-QoS commands applied to other interfaces do not generate templates for egress queuing because all auto-QoS commands rely on the same eight queue models, which have already been generated from the first time a new auto-QoS command was used.

## Auto-QoS Policy and Class Maps

After entering the appropriate auto-QoS command, the following actions occur:

- Specific class maps are created.
- Specific policy maps (input and output) are created.
- Policy maps are attached to the specified interface.
- Trust level for the interface is configured.

### Related Topics

[Configuring Auto-QoS \(CLI\)](#), on page 909

## Effects of Auto-QoS on Running Configuration

When auto-QoS is enabled, the **auto qos** interface configuration commands and the generated global configuration are added to the running configuration.

The switch applies the auto-QoS-generated commands as if the commands were entered from the CLI. An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions may occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands are not applied, the previous running configuration is restored.

## Effects of Auto-QoS Compact on Running Configuration

If auto-QoS compact is enabled:

- Only the auto-QoS commands entered from the CLI are displayed in running-config.
- The generated global and interface configurations are hidden.
- When you save the configuration, only the auto-qos commands you have entered are saved (and not the hidden configuration).
- When you reload the switch, the system detects and re-executes the saved auto-QoS commands and the AutoQoS SRND4.0 compliant config-set is generated .

---

**Note**

Do not make changes to the auto-QoS-generated commands when auto-QoS compact is enabled, because user-modifications are overridden when the switch reloads.

---

When auto-qos global compact is enabled:

- **show derived-config** command can be used to view hidden AQC derived commands.
- AQC commands will not be stored to memory. They will be regenerated every time the switch is reloaded.
- When compaction is enabled, auto-qos generated commands should not be modified .
- If the interface is configured with auto-QoS and if AQC needs to be disabled, auto-qos should be disabled at interface level first.

# How to Configure Auto-QoS

## Configuring Auto-QoS (CLI)

For optimum QoS performance, configure auto-QoS on all the devices in your network.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Switch(config)# <b>interface</b> <b>gigabitethernet 3/0/1</b>	Specifies the port that is connected to a VoIP port, video device, or the uplink port that is connected to another trusted switch or router in the network interior, and enters the interface configuration mode.
<b>Step 3</b>	Depending on your auto-QoS configuration, use one of the following commands: <ul style="list-style-type: none"> <li>• <b>auto qos voip {cisco-phone   cisco-softphone   trust}</b></li> <li>• <b>auto qos video {cts   ip-camera   media-player}</b></li> <li>• <b>auto qos classify [police]</b></li> <li>• <b>auto qos trust {cos   dscp}</b></li> </ul> <b>Example:</b> Switch(config-if)# <b>auto qos trust dscp</b>	The following commands enable auto-QoS for VoIP: <ul style="list-style-type: none"> <li>• <b>auto qos voip cisco-phone</b>—If the port is connected to a Cisco IP Phone, the QoS labels of incoming packets are only trusted (conditional trust through CDP) when the telephone is detected.</li> </ul> <p><b>Note</b> Do not configure the <b>auto qos voip cisco-phone</b> option for IP phones that support video. This option causes DSCP markings of video packets to get overwritten, because these packets do not have Expedited Forwarding priority, which results in these packets getting classified in the class-default class.</p> <ul style="list-style-type: none"> <li>• <b>auto qos voip cisco-softphone</b>—The port is connected to device running the Cisco SoftPhone feature. This command generates a QoS configuration for interfaces connected to PCs running the Cisco IP SoftPhone application and mark,</li> </ul>

	Command or Action	Purpose
		<p>as well as police traffic coming from such interfaces. Ports configured with this command are considered untrusted.</p> <ul style="list-style-type: none"> <li>• <b>auto qos voip trust</b>—The uplink port is connected to a trusted switch or router, and the VoIP traffic classification in the ingress packet is trusted.</li> </ul> <p>The following commands enable auto-QoS for the specified video device (system, camera, or media player):</p> <ul style="list-style-type: none"> <li>• <b>auto qos video cts</b>—A port connected to a Cisco Telepresence system. QoS labels of incoming packets are only trusted (conditional trust through CDP) when a Cisco TelePresence is detected.</li> <li>• <b>auto qos video ip-camera</b>—A port connected to a Cisco video surveillance camera. QoS labels of incoming packets are only trusted (conditional trust through CDP) when a Cisco camera is detected.</li> <li>• <b>auto qos video media-player</b>—A port connected to a CDP-capable Cisco digital media player. QoS labels of incoming packets are only trusted (conditional trust through CDP) when a digital media player is detected.</li> </ul> <p>The following command enables auto-QoS for classification:</p> <ul style="list-style-type: none"> <li>• <b>auto qos classify police</b>— This command generates a QoS configuration for untrusted interfaces. The configuration places a service-policy on the interface to classify traffic coming from untrusted desktops/devices and mark them accordingly. The service-policies generated do police.</li> </ul> <p>The following commands enable auto-QoS for trusted interfaces:</p> <ul style="list-style-type: none"> <li>• <b>auto qos trust cos</b>—Class of service.</li> <li>• <b>auto qos trust dscp</b>—Differentiated Services Code Point.</li> </ul>

	Command or Action	Purpose
<b>Step 4</b>	<b>end</b> <b>Example:</b> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show auto qos interface <i>interface-id</i></b> <b>Example:</b> <pre>Switch# show auto qos interface gigabitethernet 3/0/1</pre>	(Optional) Displays the auto-QoS command on the interface on which auto-QoS was enabled. Use the <b>show running-config</b> command to display the auto-QoS configuration and user modifications.

**Related Topics**

[Auto-QoS Policy and Class Maps](#), on page 907

## Upgrading Auto-QoS (CLI)

This procedure should only be followed after copying a pre-3.2.2 software version to this switch. If you do copy a pre-3.2.2 software version to this switch, then you must follow this auto-QoS upgrade procedure.

**Before you begin**

Prior to upgrading, you need to remove all auto-QoS configurations currently on the switch. This sample procedure describes that process.

After following this sample procedure, you must then reboot the switch with the new or upgraded software image and reconfigure auto-QoS.

**Procedure**

---

**Step 1**    **show auto qos**

**Example:**

```
Switch# show auto qos

GigabitEthernet2/0/3
auto qos voip cisco-phone

GigabitEthernet2/0/27
auto qos voip cisco-softphone
```

In privileged EXEC mode, record all current auto QoS configurations by entering this command.

**Step 2**    **no auto qos**

**Example:**

```
Switch(config-if)#no auto qos
```

In interface configuration mode, run the appropriate **no auto qos** command on each interface that has an auto QoS configuration.

**Step 3**    **show running-config | i autoQos**

**Example:**

```
Switch# show running-config | i autoQos
```

Return to privileged EXEC mode, and record any remaining auto QoS maps class maps, policy maps, access lists, table maps, or other configurations by entering this command.

**Step 4**    **no policy-map *policy-map\_name***

**Example:**

```
Switch)config# no policy-map pmap_101
Switch)config# no class-map cmap_101
Switch)config# no ip access-list extended AutoQos-101
Switch)config# no table-map 101
Switch)config# no table-map policed-dscp
```

In global configuration mode, remove the QoS class maps, policy maps, access-lists, table maps, and any other auto QoS configurations by entering these commands:

- **no policy-map *policy-map-name***
- **no class-map *class-map-name***
- **no ip access-list extended *Auto-QoS-x***
- **no table-map *table-map-name***
- **no table-map policed-dscp**

**Step 5**    **show running-config | i AutoQoS**

**Example:**

```
Switch# show running-config | i AutoQos
```

Return to privileged EXEC mode, run this command again to ensure that no auto-QoS configuration or remaining parts of the auto-QoS configuration exists

**Step 6**    **show auto qos**

**Example:**

```
Switch# show auto qos
```

Run this command to ensure that no auto-QoS configuration or remaining parts of the configuration exists.

**Step 7**    **write memory**

**Example:**

```
Switch# write memory
```

Write the changes to the auto QoS configuration to NV memory by entering the **write memory** command.

**What to do next**

Reboot the switch with the new or upgraded software image.

After rebooting with the new or upgraded software image, re-configure auto-QoS for the appropriate switch interfaces as determined by running the **show auto qos** command described in step 1.

**Note** There is only one table-map for exceed and another table-map for violate markdown per switch or stack. If the switch already has a table-map under the exceed action, then the auto-qos policy cannot be applied.

**Related Topics**

[Restrictions for Auto-QoS](#), on page 905

## Enabling Auto-Qos Compact

To enable auto-Qos compact, enter this command:

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<b>auto qos global compact</b> <b>Example:</b> <pre>Switch(config)# auto qos global compact</pre>	<p>Enables auto-Qos compact and generates (hidden) the global configurations for auto-QoS.</p> <p>You can then enter the auto-QoS command you want to configure in the interface configuration mode and the interface commands that the system generates are also hidden.</p> <p>To display the auto-QoS configuration that has been applied, use these the privileged EXEC commands:</p> <ul style="list-style-type: none"> <li>• <b>show derived-config</b></li> <li>• <b>show policy-map</b></li> <li>• <b>show access-list</b></li> <li>• <b>show class-map</b></li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>show table-map</b></li> <li>• <b>show auto-qos</b></li> <li>• <b>show policy-map interface</b></li> <li>• <b>show ip access-lists</b></li> </ul> <p>These commands will have keyword "AutoQos-".</p>

### What to do next

To disable auto-QoS compact, remove auto-QoS instances from all interfaces by entering the **no** form of the corresponding auto-QoS commands and then enter the **no auto qos global compact** global configuration command.

## Monitoring Auto-QoS

Table 70: Commands for Monitoring Auto-QoS

Command	Description
<b>show auto qos</b> [interface <i>[interface-id]</i> ]	Displays the initial auto-QoS configuration. You can compare the <b>show auto qos</b> and the <b>show running-config</b> command output to identify the user-defined QoS settings.
<b>show running-config</b>	Displays information about the QoS configuration that might be affected by auto-QoS. You can compare the <b>show auto qos</b> and the <b>show running-config</b> command output to identify the user-defined QoS settings.
<b>show derived-config</b>	Displays the hidden <b>mls qos</b> command which get configured along with the running configs because of auto-qos template.

## Troubleshooting Auto-QoS

To troubleshoot auto-QoS, use the **debug auto qos** privileged EXEC command. For more information, see the **debug auto qos** command in the command reference for this release.

To disable auto-QoS on a port, use the **no** form of the **auto qos** command interface configuration command, such as **no auto qos voip**. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos voip** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

# Configuration Examples for Auto-QoS

## Example: auto qos trust cos

The following is an example of the **auto qos trust cos** command and the applied policies and class maps.

The following policy maps are created and applied when running this command:

- AutoQos-4.0-Trust-Cos-Input-Policy
- AutoQos-4.0-Output-Policy

The following class maps are created and applied when running this command:

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

```
Switch(config)# interface gigabitEthernet1/0/17

## auto qos global compact

The following is an example of the **auto qos global compact** command.

```
Switch# configure terminal
Switch(config)# auto qos global compact
Switch(config)# interface GigabitEthernet1/2
Switch(config-if)# auto qos voip cisco-phone

Switch# show auto-qos

GigabitEthernet1/2
auto qos voip cisco-phone

Switch# show running-config interface GigabitEthernet 1/0/2

interface GigabitEthernet1/0/2
auto qos voip cisco-phone
end
```

## Where to Go Next for Auto-QoS

Review the QoS documentation if you require any specific QoS changes to your auto-QoS configuration.

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring Radio Resource Management

The switch should be configured as a mobility controller and not a mobility anchor to configure Radio Resource Management. It may require dynamic channel assignment functionality for the home APs to be supported.

The new mobility architecture that involves mobility controller and mobility agent must be configured on the switch or controllers for RRM to work.

---

**Note** Refer Mobility Configuration Guide for configuring mobility controller and mobility agent.

---

## Restrictions for Radio Resource Management

The number of APs in a RF-group is limited to 2000.

If an AP tries to join the RF-group that already holds the maximum number of APs it can support, the device rejects the application and throws an error.

To enable Airtime Fairness mode for APs, you should disable enforce-policy mode and reapply it again. This will change the airtime fairness configuration for all the APs. You can also use the **ap name <ap-name> dot11 24ghz airtime-fairness mode enforce-policy** command to change airtime fairness mode for individual APs.

## Information About Radio Resource Management

The Radio Resource Management (RRM) software embedded in the switch acts as a built-in RF engineer to consistently provide real-time RF management of your wireless network. RRM enables switches to continually monitor their associated lightweight access points for the following information:

- Traffic load—The total bandwidth used for transmitting and receiving traffic. It enables wireless LAN managers to track and plan network growth ahead of client demand.
- Interference—The amount of traffic coming from other 802.11 sources.
- Noise—The amount of non-802.11 traffic that is interfering with the currently assigned channel.
- Coverage—The Received Signal Strength (RSSI) and signal-to-noise ratio (SNR) for all connected clients.
- Other —The number of nearby access points.

RRM performs these functions:

- Radio resource monitoring
- Transmit power control
- Dynamic channel assignment
- Coverage hole detection and correction
- RF grouping

---

**Note**

RRM grouping will not happen, since AP operates in a static channel which is not in the DCA channel list. NDP is sent only on DCA channels and when radio operates on a non-DCA channel it will not receive NDA on-channel.

---

## Radio Resource Monitoring

RRM automatically detects and configures new switches and lightweight access points as they are added to the network. It then automatically adjusts associated and nearby lightweight access points to optimize coverage and capacity.

Lightweight access points can scan all valid 2.4 GHz and 5 GHz channels for the country of operation as well as for channels available in other locations. The access points in local mode go “off-channel” for a period not greater than 60 ms to monitor these channels for noise and interference. Packets collected during this time are analyzed to detect rogue access points, rogue clients, ad-hoc clients, and interfering access points.

---

**Note** In the presence of voice traffic or other critical traffic (in the last 100 ms), the access points can defer off-channel measurements. It also defers based on WLAN scan defer priority configurations.

---

Each access point spends only 0.2 percent of its time off-channel. This activity is distributed across all access points so that adjacent access points are not scanning at the same time, which could adversely affect wireless LAN performance.

RRM supports new mobility architecture for RF grouping that involves Mobility Controller (MC) and Mobility Agent (MA).

- Mobility Controller (MC)—The Cisco WLC 5700 Series Controllers, Cisco Catalyst 3850 Switch, or Cisco Unified Wireless Networking Solution controller can act as MC. The MC has MC functionality and MA functionality that is running internally into it.
- Mobility Agent (MA)—The Mobility Agent is the component that maintains client mobility state machine for a mobile client.

## Information About RF Groups

An RF group is a logical collection of Cisco WLCs that coordinate to perform RRM in a globally optimized manner to perform network calculations on a per-radio basis. An RF group exists for each 802.11 network type. Clustering Cisco WLCs into a single RF group enable the RRM algorithms to scale beyond the capabilities of a single Cisco WLC.

RF group is created based on following parameters:

- User-configured RF network name.
- Neighbor discovery performed at the radio level.
- Country list configured on MC.

RF grouping runs between MCs.

Lightweight access points periodically send out neighbor messages over the air. Access points using the same RF group name validate messages from each other.

When access points on different Cisco WLCs hear validated neighbor messages at a signal strength of –80 dBm or stronger, the Cisco WLCs dynamically form an RF neighborhood in auto mode. In static mode, the leader is manually selected and the members are added to the RF Group. To know more about RF Group modes, [RF Group Leader](#).

---

**Note** RF groups and mobility groups are similar in that they both define clusters of Cisco WLCs, but they are different in terms of their use. An RF group facilitates scalable, system-wide dynamic RF management while a mobility group facilitates scalable, system-wide mobility and Cisco WLC redundancy.

---

## RF Group Leader

Starting in the 7.0.116.0 release, the RF Group Leader can be configured in two ways as follows:

- **Auto Mode**—In this mode, the members of an RF group elect an RF group leader to maintain a “master” power and channel scheme for the group. The RF grouping algorithm dynamically chooses the RF group leader and ensures that an RF group leader is always present. Group leader assignments can and do change (for instance, if the current RF group leader becomes inoperable or if RF group members experience major changes).
- **Static Mode**—In this mode, the user selects a Cisco WLC as an RF group leader manually. In this mode, the leader and the members are manually configured and are therefore fixed. If the members are unable to join the RF group, the reason is indicated. The leader tries to establish a connection with a member every 1 minute if the member has not joined in the previous attempt.

The RF group leader analyzes real-time radio data collected by the system, calculates the power and channel assignments, and sends them to each of the Cisco WLCs in the RF group. The RRM algorithms ensure system-wide stability and restrain channel and power scheme changes to the appropriate local RF neighborhoods.

In Cisco WLC software releases prior to 6.0, the dynamic channel assignment (DCA) search algorithm attempts to find a good channel plan for the radios associated to Cisco WLCs in the RF group, but it does not adopt a new channel plan unless it is considerably better than the current plan. The channel metric of the worst radio in both plans determines which plan is adopted. Using the worst-performing radio as the single criterion for adopting a new channel plan can result in pinning or cascading problems.

Pinning occurs when the algorithm could find a better channel plan for some of the radios in an RF group but is prevented from pursuing such a channel plan change because the worst radio in the network does not have any better channel options. The worst radio in the RF group could potentially prevent other radios in the group from seeking better channel plans. The larger the network, the more likely pinning becomes.

Cascading occurs when one radio’s channel change results in successive channel changes to optimize the remaining radios in the RF neighborhood. Optimizing these radios could lead to their neighbors and their neighbors’ neighbors having a suboptimal channel plan and triggering their channel optimization. This effect could propagate across multiple floors or even multiple buildings, if all the access point radios belong to the same RF group. This change results in considerable client confusion and network instability.

The main cause of both pinning and cascading is the way in which the search for a new channel plan is performed and that any potential channel plan changes are controlled by the RF circumstances of a single radio. In Cisco WLC software release 6.0, the DCA algorithm has been redesigned to prevent both pinning and cascading. The following changes have been implemented:

- **Multiple local searches**—The DCA search algorithm performs multiple local searches initiated by different radios within the same DCA run rather than performing a single global search driven by a single radio. This change addresses both pinning and cascading while maintaining the desired flexibility and adaptability of DCA and without jeopardizing stability.

- Multiple channel plan change initiators (CPCIs)—Previously, the single worst radio was the sole initiator of a channel plan change. Now each radio within the RF group is evaluated and prioritized as a potential initiator. Intelligent randomization of the resulting list ensures that every radio is eventually evaluated, which eliminates the potential for pinning.
- Limiting the propagation of channel plan changes (Localization)—For each CPCI radio, the DCA algorithm performs a local search for a better channel plan, but only the CPCI radio itself and its one-hop neighboring access points are actually allowed to change their current transmit channels. The impact of an access point triggering a channel plan change is felt only to within two RF hops from that access point, and the actual channel plan changes are confined to within a one-hop RF neighborhood. Because this limitation applies across all CPCI radios, cascading cannot occur.
- Non-RSSI-based cumulative cost metric—A cumulative cost metric measures how well an entire region, neighborhood, or network performs with respect to a given channel plan. The individual cost metrics of all access points in that area are considered in order to provide an overall understanding of the channel plan's quality. These metrics ensure that the improvement or deterioration of each single radio is factored into any channel plan change. The objective is to prevent channel plan changes in which a single radio improves but at the expense of multiple other radios experiencing a considerable performance decline.

The RRM algorithms run at a specified updated interval, which is 600 seconds by default. Between update intervals, the RF group leader sends keepalive messages to each of the RF group members and collects real-time RF data.

---

**Note** Several monitoring intervals are also available. See the Configuring RRM section for details.

---

## RF Group Name

A Cisco WLC is configured with an RF group name, which is sent to all access points joined to the Cisco WLC and used by the access points as the shared secret for generating the hashed MIC in the neighbor messages. To create an RF group, you configure all of the Cisco WLCs to be included in the group with the same RF group name.

If there is any possibility that an access point joined to a Cisco WLC may hear RF transmissions from an access point on a different Cisco WLC, you should configure the Cisco WLCs with the same RF group name. If RF transmissions between access points can be heard, then system-wide RRM is recommended to avoid 802.11 interference and contention as much as possible.

## Mobility Controller

An MC can either be a group leader or a group member. One of the MCs can act as a RF group leader based on RF grouping and RF group election with other MCs. The order of priority to elect the RF leader is based on the maximum number of APs the controller or switch can support. The highest priority being 1 and the least being 5.

1. WiSM 2 Controllers
2. Cisco WLC 5700 Series Controllers
3. WiSM 1 Controllers
4. Catalyst 3850 Series Switches
5. Catalyst 3650 Series Switches

When one of the MCs becomes the RRM group leader, the remaining MCs become RRM group members. RRM group members send their RF information to the Group Leader. The group leader determines a channel and Tx power plan for the network and passes the information back to the RF group members. The MCs push the power plan to MA for the radios that belong to MA. These channel and power plans are ultimately pushed down to individual radios.

---

**Note** MC has MA functionality within it.

---

## Mobility Agent

The MA communicates with the MC. The MC includes MAC or IP address of the switch/controller while communicating with the MA.

The MA provides the following information when polled by the MC:

- Interference or noise data.
- Neighbor data.
- Radio capabilities (supported channels, power levels).
- Radio configuration (power, channel, channel width).
- Radar data.

The MC exchanges the following information with the switch/controller (MA). The message includes:

- Configurations (channel/power/channel width) for individual radios.
- Polling requests for current configurations and RF measurements for individual radios
- Group Leader Update

In turn, the MA communicates the following messages with the MC:

- RF measurements from radios (e.g. load, noise and neighbor information)
- RF capabilities and configurations of individual radios

The MA sets channel, power, and channel width on the radios when directed by the MC. The DFS, coverage hole detection/mitigation, static channel/power configurations are performed by the MA.

## Information About Rogue Access Point Detection in RF Groups

After you have created an RF group of Cisco WLCs, you need to configure the access points connected to the Cisco WLCs to detect rogue access points. The access points will then select the beacon/probe-response frames in neighboring access point messages to see if they contain an authentication information element (IE) that matches that of the RF group. If the select is successful, the frames are authenticated. Otherwise, the authorized access point reports the neighboring access point as a rogue, records its BSSID in a rogue table, and sends the table to the Cisco WLC.

The AP has a RRM CAPWAP subsystem that exchanges messages with the mobility agent.

RRM components on the AP perform the following functions:

- AP measurements such as interference (Wi-Fi), noise, coverage, and load, and client measurements.
- Radio neighbor discovery.
- Radar detection.
- Set various RF parameters (channel, channel width, transmit power control, etc)

## Transmit Power Control

The switch dynamically controls access point transmit power based on real-time wireless LAN conditions.

The Transmit Power Control (TPC) algorithm both increases and decreases an access point's power in response to changes in the RF environment. In most instances, TPC seeks to lower an access point's power to reduce interference, but in the case of a sudden change in the RF coverage—for example, if an access point fails or becomes disabled—TPC can also increase power on surrounding access points. This feature is different from coverage hole detection, which is primarily concerned with clients. TPC provides enough RF power to achieve desired coverage levels while avoiding channel interference between access points.

## Overriding the TPC Algorithm with Minimum and Maximum Transmit Power Settings

The TPC algorithm balances RF power in many diverse RF environments. However, it is possible that automatic power control will not be able to resolve some scenarios in which an adequate RF design was not possible to implement due to architectural restrictions or site restrictions—for example, when all access points must be mounted in a central hallway, placing the access points close together, but requiring coverage out to the edge of the building.

In these scenarios, you can configure maximum and minimum transmit power limits to override TPC recommendations. The maximum and minimum TPC power settings apply to all access points through RF profiles in a RF network.

To set the Maximum Power Level Assignment and Minimum Power Level Assignment, enter the maximum and minimum transmit power used by RRM in the text boxes in the Tx Power Control page. The range for these parameters is -10 to 30 dBm. The minimum value cannot be greater than the maximum value; the maximum value cannot be less than the minimum value.

If you configure a maximum transmit power, RRM does not allow any access point attached to the switch to exceed this transmit power level (whether the power is set by RRM TPC or by coverage hole detection). For example, if you configure a maximum transmit power of 11 dBm, then no access point would transmit above 11 dBm, unless the access point is configured manually.

## Dynamic Channel Assignment

Two adjacent access points on the same channel can cause either signal contention or signal collision. In a collision, data is not received by the access point. This functionality can become a problem, for example, when someone reading e-mail in a café affects the performance of the access point in a neighboring business. Even though these are completely separate networks, someone sending traffic to the café on channel 1 can disrupt communication in an enterprise using the same channel. Switches can dynamically allocate access point channel assignments to avoid conflict and to increase capacity and performance. Channels are “reused”

to avoid wasting scarce RF resources. In other words, channel 1 is allocated to a different access point far from the café, which is more effective than not using channel 1 altogether.

The switch's Dynamic Channel Assignment (DCA) capabilities are also useful in minimizing adjacent channel interference between access points. For example, two overlapping channels in the 802.11b/g band, such as 1 and 2, cannot both simultaneously use 11/54 Mbps. By effectively reassigning channels, the switch keeps adjacent channels separated.

---

**Note** We recommend that you use only non-overlapping channels (1, 6, 11, and so on).

---

The switch examines a variety of real-time RF characteristics to efficiently handle channel assignments as follows:

- Access point received energy—The received signal strength measured between each access point and its nearby neighboring access points. Channels are optimized for the highest network capacity.
- Noise—Noise can limit signal quality at the client and access point. An increase in noise reduces the effective cell size and degrades user experience. By optimizing channels to avoid noise sources, the switch can optimize coverage while maintaining system capacity. If a channel is unusable due to excessive noise, that channel can be avoided.
- 802.11 Interference—Interference is any 802.11 traffic that is not part of your wireless LAN, including rogue access points and neighboring wireless networks. Lightweight access points constantly scan all channels looking for sources of interference. If the amount of 802.11 interference exceeds a predefined configurable threshold (the default is 10 percent), the access point sends an alert to the switch. Using the RRM algorithms, the switch may then dynamically rearrange channel assignments to increase system performance in the presence of the interference. Such an adjustment could result in adjacent lightweight access points being on the same channel, but this setup is preferable to having the access points remain on a channel that is unusable due to an interfering foreign access point.

In addition, if other wireless networks are present, the switch shifts the usage of channels to complement the other networks. For example, if one network is on channel 6, an adjacent wireless LAN is assigned to channel 1 or 11. This arrangement increases the capacity of the network by limiting the sharing of frequencies. If a channel has virtually no capacity remaining, the switch may choose to avoid this channel. In very dense deployments in which all nonoverlapping channels are occupied, the switch does its best, but you must consider RF density when setting expectations.

- Load and utilization—When utilization monitoring is enabled, capacity calculations can consider that some access points are deployed in ways that carry more traffic than other access points (for example, a lobby versus an engineering area). The switch can then assign channels to improve the access point with the worst performance reported. The load is taken into account when changing the channel structure to minimize the impact on clients currently in the wireless LAN. This metric keeps track of every access point's transmitted and received packet counts to determine how busy the access points are. New clients avoid an overloaded access point and associate to a new access point. This parameter is disabled by default.

The switch combines this RF characteristic information with RRM algorithms to make system-wide decisions. Conflicting demands are resolved using soft-decision metrics that guarantee the best choice for minimizing network interference. The end result is optimal channel configuration in a three-dimensional space, where access points on the floor above and below play a major factor in an overall wireless LAN configuration.

---

**Note** Radios using 40-MHz channels in the 2.4-GHz band or 80MHz channels are not supported by DCA.

---

The RRM startup mode is invoked in the following conditions:

- In a single-switch environment, the RRM startup mode is invoked after the switch is upgraded and rebooted.
- In a multiple-switch environment, the RRM startup mode is invoked after an RF Group leader is elected.

You can trigger RRM startup mode from CLI.

RRM startup mode runs for 100 minutes (10 iterations at 10-minute intervals). The duration of the RRM startup mode is independent of the DCA interval, sensitivity, and network size. The startup mode consists of 10 DCA runs with high sensitivity (making channel changes easy and sensitive to the environment) to converge to a steady state channel plan. After the startup mode is finished, DCA continues to run at the specified interval and sensitivity.

---

**Note** DCA algorithm interval is set to one hour, but DCA algorithm always runs in default interval of 10min, channel allocation happens for every 10min interval for the first 10 cycles, and channel changes as per DCA algorithm for every 10min. After that it goes back to the configured time interval. This is common for both DCA interval and Anchor time since it follows the steady state.

---

---

**Note** If DCA/TPC is turned off on the RF-group member, and auto is set on RF-group leader, the channel/TX power on member gets changed as per the algorithm run on the RF-group leader.

---

## Coverage Hole Detection and Correction

The RRM coverage hole detection algorithm can detect areas of radio coverage in a wireless LAN that are below the level needed for robust radio performance. This feature can alert you to the need for an additional (or relocated) lightweight access point.

If clients on a lightweight access point are detected at threshold levels (RSSI, failed client count, percentage of failed packets, and number of failed packets) lower than those specified in the RRM configuration, the access point sends a “coverage hole” alert to the switch. The alert indicates the existence of an area where clients are continually experiencing poor signal coverage, without having a viable access point to which to roam. The switch discriminates between coverage holes that can and cannot be corrected. For coverage holes that can be corrected, the switch mitigates the coverage hole by increasing the transmit power level for that specific access point. The switch does not mitigate coverage holes caused by clients that are unable to increase their transmit power or are statically set to a power level because increasing their downstream transmit power might increase interference in the network.

# How to Configure RRM

## Configuring Advanced RRM CCX Parameters (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz   5ghz rrm ccx location-measurement interval</b> <b>Example:</b> Switch(config)# <code>ap dot11 24ghz rrm ccx location-measurement 15</code>	Configures the interval for 802.11 CCX client location measurements. The range is from 10 to 32400 seconds.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Neighbor Discovery Type (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz   5ghz rrm ndp-type {protected   transparent}</b> <b>Example:</b> Switch(config)# <code>ap dot11 24ghz rrm ndp-type protected</code> Switch(config)# <code>ap dot11 24ghz rrm ndp-type transparent</code>	Configures the neighbor discovery type. By default, the mode is set to “transparent”. <ul style="list-style-type: none"> <li>• <b>protected</b>—Sets the neighbor discover type to protected. Packets are encrypted.</li> <li>• <b>transparent</b>—Sets the neighbor discover type to transparent. Packets are sent as is.</li> </ul>

	Command or Action	Purpose
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring RRM Profile Thresholds, Monitoring Channels, and Monitoring Intervals (GUI)

### Procedure

- Step 1** Choose **Configuration > Wireless > 802.11a/n/ac > RRM > General** or **Configuration > Wireless > 802.11b/g/n > RRM > General** to open RRM General page.
- Step 2** Configure profile thresholds used for alarming as follows:
- Note** The profile thresholds have no bearing on the functionality of the RRM algorithms. Switches send an SNMP trap (or an alert) to the Cisco Prime Infrastructure or another trap receiver when individual APs values set for these threshold parameters are exceeded.
- In the **Interference** text box, enter the percentage of interference (802.11 traffic from sources outside of your wireless network) on a single access point. The valid range is 0 to 100%, and the default value is 10%.
  - In the **Clients** text box, enter the number of clients on a single access point. The valid range is 1 to 75, and the default value is 12.
  - In the **Noise** text box, enter the level of noise (non-802.11 traffic) on a single access point. The valid range is -127 to 0 dBm, and the default value is -70 dBm.
  - In the **Utilization** text box, enter the percentage of RF bandwidth being used by a single access point. The valid range is 0 to 100%, and the default value is 80%.
  - In the **Throughput** text box, enter the level of Throughput being used by a single access point. The valid range is 1000 to 10000000, and the default value is 1000000.
- Step 3** From the **Channel List** drop-down list, choose one of the following options to specify the set of channels that the access point uses for RRM scanning:
- **All Channels**—RRM channel scanning occurs on all channels supported by the selected radio, which includes channels not allowed in the country of operation.
  - **Country Channels**—RRM channel scanning occurs only on the data channels in the country of operation. This is the default value.
  - **DCA Channels**—RRM channel scanning occurs only on the channel set used by the DCA algorithm, which by default includes all of the non-overlapping channels allowed in the country of operation. However, you can specify the channel set to be used by DCA if desired. To do so, follow instructions in the [Dynamic Channel Assignment](#).
- Step 4** Configure monitor intervals as follows:
- In the **Channel Scan Interval** text box, enter (in seconds) the sum of the time between scans for each channel within a radio band. The entire scanning process takes 50 ms per channel, per radio and runs at

the interval configured here. The time spent listening on each channel is determined by the non-configurable 50-ms scan time and the number of channels to be scanned. For example, in the U.S. all 11 802.11b/g channels are scanned for 50 ms each within the default 180-second interval. So every 16 seconds, 50 ms is spent listening on each scanned channel ( $180/11 = \sim 16$  seconds). The Channel Scan Interval parameter determines the interval at which the scanning occurs. The valid range is 60 to 3600 seconds, and the default value for 802.11a/n/ac and 802.11b/g/n radios is 180 seconds.

- b. In the **Neighbor Packet Frequency** text box, enter (in seconds) how frequently neighbor packets (messages) are sent, which eventually builds the neighbor list. The valid range is 60 to 3600 seconds, and the default value is 60 seconds.

**Note** If the access point radio does not receive a neighbor packet from an existing neighbor within 60 minutes, the Cisco WLC deletes that neighbor from the neighbor list.

**Step 5** Click **Apply**.

**Step 6** Click **Save Configuration**.

**Note** Click **Set to Factory Default** if you want to return all of the Cisco WLC's RRM parameters to their factory-default values.

## Configuring RF Groups

This section describes how to configure RF groups through either the GUI or the CLI.

**Note** The RF group name is generally set at deployment time through the Startup Wizard. However, you can change it as necessary.

**Note** When the multiple-country feature is being used, all Cisco WLCs intended to join the same RF group must be configured with the same set of countries, configured in the same order.

**Note** You can also configure RF groups using the Cisco Prime Infrastructure.

## Configuring the RF Group Mode (GUI)

### Procedure

**Step 1** Choose **Configuration > Wireless > 802.11a/n/ac > RRM > RF Grouping** or **Configuration > Wireless > 802.11b/g/n > RRM > RF Grouping** to open the RF Grouping page.

**Step 2** From the **Group Mode** drop-down list, choose the mode that you want to configure for this Cisco WLC.

You can configure RF grouping in the following modes:

- **auto**—Sets the RF group selection to automatic update mode.

**Note** A configured static leader cannot become a member of another RF group until its mode is set to “auto”.

- **leader**—Sets the RF group selection to static mode, and sets this Cisco WLC as the group leader.

- **off**—Sets the RF group selection off. Every Cisco WLC optimizes its own access point parameters.

**Note** A Cisco WLC with a lower priority cannot assume the role of a group leader if a Cisco WLC with a higher priority is available. Here, priority is related to the processing power of the Cisco WLC.

**Note** We recommend that Cisco WLCs participate in automatic RF grouping. You can override RRM settings without disabling automatic RF group participation.

**Step 3** Click **Apply** to save the configuration and click **Restart** to restart the RRM RF Grouping algorithm.

**Step 4** If you configured RF Grouping mode for this Cisco WLC as a static leader, you can add group members from the Group Members section as follows:

- In the switch Name text box, enter the Cisco WLC that you want to add as a member to this group.
- In the IP Address text box, enter the IP address of the Cisco WLC.
- Click **Add** to add the member to this group.

**Note** If the member has not joined the static leader, the reason of the failure is shown in parentheses.

**Step 5** Click **Apply**.

**Step 6** Click **Save Configuration**.

## Configuring RF Group Selection Mode (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz   5ghz rrm group-mode {auto   leader   off}</b>  <b>Example:</b> Switch(config)# <code>ap dot11 24ghz rrm group-mode leader</code>	Configures RF group selection mode for 802.11 bands.  <ul style="list-style-type: none"> <li>• <b>auto</b>—Sets the 802.11 RF group selection to automatic update mode.</li> <li>• <b>leader</b>—Sets the 802.11 RF group selection to leader mode.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>off</b>—Disables the 802.11 RF group selection.</li> </ul>
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring an RF Group Name (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless rf-network <i>name</i></b> <b>Example:</b> Switch (config)# <b>wireless rf-network test1</b>	Creates an RF group. The group name should be ASCII String up to 19 characters and is case sensitive.  <b>Note</b> Repeat this procedure for each controller that you want to include in the RF group.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 4</b>	<b>show network profile <i>profile_number</i></b>	Displays the RF group.  <b>Note</b> You can view the network profile number from 1 to 4294967295.

## Configuring an RF Group Name (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Controller > General** to open the General page.
- Step 2** Enter a name for the RF group in the RF Group Name text box. The name can contain up to 19 ASCII characters and is case sensitive.
- Step 3** Click **Apply** to commit your changes.
- Step 4** Click **Save Configuration** to save your changes.

**Step 5** Repeat this procedure for each controller that you want to include in the RF group.

## Configuring Members in a 802.11 Static RF Group (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz   5ghz rrm group-member</b> <i>group_name ip_addr</i> <b>Example:</b> Switch(config)# <code>ap dot11 24ghz rrm</code> <code>group-member Grpmem01 10.1.1.1</code>	Configures members in a 802.11 static RF group. The group mode should be set as leader for the group member to be active.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Transmit Power Control

### Configuring the Tx-Power Control Threshold (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz   5ghz rrm tpc-threshold</b> <i>threshold_value</i> <b>Example:</b> Switch(config)# <code>ap dot11 24ghz rrm</code> <code>tpc-threshold -60</code>	Configures the Tx-power control threshold used by RRM for auto power assignment. The range is from -80 to -50.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring the Tx-Power Level (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz   5ghz rrm txpower {trans_power_level   auto   max   min   once}</b>  <b>Example:</b> Switch(config)# <b>ap dot11 24ghz rrm txpower auto</b>	Configures the 802.11 tx-power level <ul style="list-style-type: none"> <li>• <b>trans_power_level</b>—Sets the transmit power level.</li> <li>• <b>auto</b>—Enables auto-RF.</li> <li>• <b>max</b>—Configures the maximum auto-RF tx-power.</li> <li>• <b>min</b>—Configures the minimum auto-RF tx-power.</li> <li>• <b>once</b>—Enables one-time auto-RF.</li> </ul>
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Transmit Power Control (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > 802.11a/n/ac > RRM > TPC** or **Configuration > Wireless > 802.11b > RRM > TPC** to open RRM Tx Power Control (TPC) page.
- Step 2** Choose the Transmit Power Control.
- Coverage Optimal Mode (TPCv1)— Offers strong signal coverage and stability. In this mode, power can be kept low to gain extra capacity and reduce interference.
- Step 3** Choose one of the following options from the Power Level Assignment Method list to specify the Cisco WLC's dynamic power assignment mode:
- **Automatic**—Causes the Cisco WLC to periodically evaluate and, if necessary, update the transmit power for all joined access points. This is the default value.
  - **On Demand**—Causes the Cisco WLC to periodically evaluate the transmit power for all joined access points. However, the Cisco WLC updates the power, if necessary, only when you click **Apply** after choosing **On Demand**.
- Note** The Cisco WLC does not evaluate and update the transmit power immediately when you click **Apply** after choosing **On Demand**. It waits for the next 600-second interval. This value is not configurable.

- **Fixed**—Prevents the Cisco WLC from evaluating and, if necessary, updating the transmit power for joined access points. The power level is set to the fixed value chosen from the drop-down list. The corresponding option for **Fixed** when you try to configure from CLI is **once**.

**Note** The transmit power level is assigned an integer value instead of a value in mW or dBm. The integer corresponds to a power level that varies depending on the regulatory domain, channel, and antennas in which the access points are deployed.

**Note** For optimal performance, we recommend that you use the Automatic setting.

**Step 4** Enter the maximum and minimum power level assignment values in the Maximum Power Level Assignment and Minimum Power Level Assignment text boxes.

The range for the Maximum Power Level Assignment is –10 to 30 dBm.

The range for the Minimum Power Level Assignment is –10 to 30 dBm.

**Step 5** In the Power Threshold text box, enter the cutoff signal level used by RRM when determining whether to reduce an access point's power. The default value for this parameter is –70 dBm for TPCv1, but can be changed when access points are transmitting at higher (or lower) than desired power levels.

The range for this parameter is –80 to –50 dBm. Increasing this value (between –65 and –50 dBm) causes the access points to operate at a higher transmit power. Decreasing the value has the opposite effect.

In applications with a dense population of access points, it may be useful to decrease the threshold to –80 or –75 dBm to reduce the number of BSSIDs (access points) and beacons seen by the wireless clients. Some wireless clients might have difficulty processing a large number of BSSIDs or a high beacon rate and might exhibit problematic behavior with the default threshold.

This page also shows the following nonconfigurable transmit power level parameter settings:

- Power Neighbor Count—The minimum number of neighbors an access point must have for the transmit power control algorithm to run.
- Power Assignment Leader—The MAC address of the RF group leader, which is responsible for power level assignment.
- Last Power Level Assignment—The last time RRM evaluated the current transmit power level assignments.

**Step 6** Click **Apply**.

**Step 7** Click **Save Configuration**.

---

## Configuring 802.11 RRM Parameters

### Configuring Advanced 802.11 Channel Assignment Parameters (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 {24ghz   5ghz} rrm channel cleanair-event sensitivity {high   low   medium}</b>  <b>Example:</b> Switch(config)# <b>ap dot11 24ghz rrm channel cleanair-event sensitivity high</b>	Configures CleanAir event-driven RRM parameters. <ul style="list-style-type: none"> <li>• <b>High</b>—Specifies the most sensitivity to non-Wi-Fi interference as indicated by the air quality (AQ) value.</li> <li>• <b>Low</b>—Specifies the least sensitivity to non-Wi-Fi interference as indicated by the AQ value.</li> <li>• <b>Medium</b>—Specifies medium sensitivity to non-Wi-Fi interference as indicated by the AQ value.</li> </ul>
<b>Step 3</b>	<b>ap dot11 {24ghz   5ghz} rrm channel dca {channel number   anchor-time   global {auto   once}   interval   min-metric   sensitivity {high   low   medium}}</b>  <b>Example:</b> Switch(config)# <b>ap dot11 24ghz rrm channel dca interval 2</b>	Configures Dynamic Channel Assignment (DCA) algorithm parameters for the 802.11 band. <ul style="list-style-type: none"> <li>• <b>&lt;I-14&gt;</b>—Enter a channel number to be added to the DCA list.</li> <li>• <b>anchor-time</b>—Configures the anchor time for the DCA. The range is between 0 and 23 hours.</li> <li>• <b>global</b>—Configures the DCA mode for all 802.11 Cisco APs.               <ul style="list-style-type: none"> <li>• <b>auto</b>—Enables auto-RF.</li> <li>• <b>once</b>—Enables auto-RF only once.</li> </ul> </li> <li>• <b>interval</b>—Configures the DCA interval value. The values are 1, 2, 3, 4, 6, 8, 12 and 24 hours and the default value 0 denotes 10 minutes.</li> <li>• <b>min-metric</b>—Configures the DCA minimum RSSI energy metric. The range is between -100 and -60.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>sensitivity</b>—Configures the DCA sensitivity level to changes in the environment. <ul style="list-style-type: none"> <li>• <b>high</b>—Specifies the most sensitivity.</li> <li>• <b>low</b>—Specifies the least sensitivity.</li> <li>• <b>medium</b>—Specifies medium sensitivity.</li> </ul> </li> </ul>
<b>Step 4</b>	<b>ap dot11 5ghz rrm channel dca chan-width {20   40   80}</b>	Configures the DCA channel width for all 802.11 radios in the 5-GHz band. Sets the channel width to 20 MHz, 40 MHz, or 80 MHz ; 20 MHz is the default value.
<b>Step 5</b>	<b>ap dot11 {24ghz   5ghz} rrm channel dca</b> <b>{{add   remove} channel number  </b> <b>anchor-time   global {auto   once}   interval</b> <b>  min-metric   sensitivity {high   low  </b> <b>medium}}</b>  <b>Example:</b>  <pre>Switch(config)#ap dot11 24ghz rrm channel dca interval 2</pre>	Configures dynamic channel assignment (DCA) algorithm parameters for the 802.11 band. <ul style="list-style-type: none"> <li>• <b>&lt;1-14&gt;</b>—Enter a channel number to be added to the DCA list.</li> <li>• <b>anchor-time</b>—Configures the anchor time for the DCA. The range is between 0 and 23 hours.</li> <li>• <b>global</b>—Configures the DCA mode for all 802.11 Cisco APs. <ul style="list-style-type: none"> <li>• <b>auto</b>—Runs auto-RF.</li> <li>• <b>once</b>—Runs auto-RF only once.</li> </ul> </li> <li>• <b>interval</b>— Configures the DCA interval value. The values are 1, 2, 3, 4, 6, 8, 12 and 24 hours and the default value 0 denotes 10 minutes.</li> <li>• <b>min-metric</b>—Configures the DCA minimum RSSI energy metric. The range is between -100 and -60.</li> <li>• <b>sensitivity</b>—Configures the DCA sensitivity level to changes in the environment. <ul style="list-style-type: none"> <li>• <b>high</b>—Specifies the most sensitivity.</li> <li>• <b>low</b>—Specifies the least sensitivity.</li> <li>• <b>medium</b>—Specifies medium sensitivity.</li> </ul> </li> </ul>

	Command or Action	Purpose
<b>Step 6</b>	<b>ap dot11 {24ghz   5ghz} rrm channel device</b> <b>Example:</b> <pre>Switch(config)#ap dot11 24ghz rrm channel device</pre>	Configures the persistent non-Wi-Fi device avoidance in the 802.11 channel assignment.
<b>Step 7</b>	<b>ap dot11 {24ghz   5ghz} rrm channel foreign</b> <b>Example:</b> <pre>Switch(config)#ap dot11 24ghz rrm channel foreign</pre>	Configures the foreign AP 802.11 interference avoidance in the channel assignment.
<b>Step 8</b>	<b>ap dot11 {24ghz   5ghz} rrm channel load</b> <b>Example:</b> <pre>Switch(config)#ap dot11 24ghz rrm channel load</pre>	Configures the Cisco AP 802.11 load avoidance in the channel assignment.
<b>Step 9</b>	<b>ap dot11 {24ghz   5ghz} rrm channel noise</b> <b>Example:</b> <pre>Switch(config)#ap dot11 24ghz rrm channel noise</pre>	Configures the 802.11 noise avoidance in the channel assignment.
<b>Step 10</b>	<b>end</b> <b>Example:</b> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Dynamic Channel Assignment (GUI)

You can specify the channels that the Dynamic Channel Assignment (DCA) algorithm considers when selecting the channels to be used for RRM scanning by using the Cisco WLC GUI.

**Note** This functionality is helpful when you know that the clients do not support certain channels because they are legacy devices or they have certain regulatory restrictions.

### Procedure

#### Step 1

Disable the 802.11a/n/ac or 802.11b/g/n network as follows:

- Choose **Configuration > Wireless > 802.11a/n/ac > Network** or **Configuration > Wireless > 802.11b/g/n > Network** to open the Global Parameters page.
- Unselect the **802.11a/n/ac** (or **802.11b/g/n**) **Network Status** check box.
- Click **Apply**.

- Step 2** Choose **Configuration > Wireless > 802.11a/n/ac > RRM > DCA** or **Configuration > Wireless > 802.11b/g/n > RRM > DCA** to open the Dynamic Channel Assignment (DCA) page.
- Step 3** Choose one of the following options from the **Channel Assignment Method** drop-down list to specify the Cisco WLC's DCA mode:
- **Automatic**—Causes the Cisco WLC to periodically evaluate and, if necessary, update the channel assignment for all joined access points. This is the default value.
  - **Freeze**—Causes the Cisco WLC to evaluate and update the channel assignment for all joined access points, if necessary, only when you click **Apply** after selecting the **Freeze** option.  
**Note** The Cisco WLC does not evaluate and update the channel assignment immediately when you click **Apply** after selecting the **Freeze** option. It waits for the next interval to elapse.
  - **OFF**—Turns off DCA and sets all access point radios to the first channel of the band. If you choose this option, you must manually assign channels on all radios.  
**Note** For optimal performance, we recommend that you use the Automatic setting.
- Step 4** From the Interval drop-down list, choose one of the following options to specify how often the DCA algorithm is allowed to run: **10 minutes**, **1 hour**, **2 hours**, **3 hours**, **4 hours**, **6 hours**, **8 hours**, **12 hours**, or **24 hours**. The default value is 10 minutes.
- Step 5** From the AnchorTime drop-down list, choose a number to specify the time of day when the DCA algorithm is to start. The options are numbers between 0 and 23 (inclusive) representing the hour of the day from 12:00 a.m. to 11:00 p.m.
- Step 6** Check the **Avoid Foreign AP Interference** check box to cause the Cisco WLC's RRM algorithms to consider 802.11 traffic from foreign access points (those not included in your wireless network) when assigning channels to lightweight access points, or unselect it to disable this feature. For example, RRM may adjust the channel assignment to have access points avoid channels close to foreign access points. The default value is selected.
- Step 7** Select the **Avoid Cisco AP Load** check box to cause the Cisco WLC's RRM algorithms to consider 802.11 traffic from Cisco lightweight access points in your wireless network when assigning channels, or unselect it to disable this feature. For example, RRM can assign better reuse patterns to access points that carry a heavier traffic load. The default value is unselected.
- Step 8** Select the **Avoid Non-802.11a (802.11b) Noise** check box to cause the Cisco WLC's RRM algorithms to consider noise (non-802.11 traffic) in the channel when assigning channels to lightweight access points, or unselect it to disable this feature. For example, RRM may have access points avoid channels with significant interference from nonaccess point sources, such as microwave ovens. The default value is selected.
- Step 9** Select the **Avoid Persistent Non-WiFi Interference** check box to enable the Cisco WLC to ignore persistent non-Wi-Fi interference.
- Step 10** From the **DCA Channel Sensitivity** drop-down list, choose one of the following options to specify how sensitive the DCA algorithm is to environmental changes such as signal, load, noise, and interference when determining whether to change channels:
- **Low**—The DCA algorithm is not particularly sensitive to environmental changes.
  - **Medium**—The DCA algorithm is moderately sensitive to environmental changes.
  - **High**—The DCA algorithm is highly sensitive to environmental changes.

The default value is Medium. The DCA sensitivity thresholds vary by radio band, as noted in the following table:

Table 71: DCA Sensitivity Thresholds

Option	2.4-GHz DCA Sensitivity Threshold	5-GHz DCA Sensitivity Threshold
High	5 dB	5 dB
Medium	10 dB	15 dB
Low	20 dB	20 dB

**Step 11**

For 802.11a/n/ac networks only, choose one of the following channel width options to specify the channel bandwidth supported for all 802.11n radios in the 5-GHz band:

- **20 MHz**—The 20-MHz channel bandwidth (default)
- **40 MHz**—The 40-MHz channel bandwidth

**Note** If you choose 40 MHz, be sure to choose at least two adjacent channels from the DCA Channel List in *Step 13* (for example, a primary channel of 36 and an extension channel of 40). If you choose only one channel, that channel is not used for 40-MHz channel width.

**Note** If you choose 40 MHz, you can also configure the primary and extension channels used by individual access points.

**Note** To override the globally configured DCA channel width setting, you can statically configure an access point's radio for 20- or 40-MHz mode in the 802.11a/n Cisco APs > Configure page. If you then change the static RF channel assignment method to WLC Controlled on the access point radio, the global DCA configuration overrides the channel width configuration that the access point was previously using. It can take up to 30 minutes (depending on how often DCA is configured to run) for the change to take effect.

**Note** If you choose 40 MHz on the A radio, you cannot pair channels 116, 140, and 165 with any other channels.

This page also shows the following nonconfigurable channel parameter settings:

- Channel Assignment Leader—The MAC address of the RF group leader, which is responsible for channel assignment.
- Last Auto Channel Assignment—The last time RRM evaluated the current channel assignments. This is used only for RF leader and not for the RF member.

**Step 12**

In the DCA Channel List area, the DCA Channels text box shows the channels that are currently selected. To choose a channel, select its check box in the Select column. To exclude a channel, unselect its check box.

The ranges are as follows:

- 802.11a—36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 132, 136, 140, 149, 153, 157, 161, 165 (depending on countries).
- 802.11b/g—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14 (depending on countries).

The defaults are as follows:

- 802.11a—36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 132, 136, 140, 149, 153, 157, 161

- 802.11b/g—1, 6, 11

**Step 13** Click **Apply**.

**Step 14** Reenable the 802.11 networks as follows:

- Choose **Configuration > Wireless > 802.11a/n/ac > Network** or **Configuration > Wireless > 802.11b/g/n > Network** to open the Global Parameters page.
- Select the **802.11a/n/ac** (or **802.11b/g/n**) **Network Status** check box.
- Click **Apply**.

**Step 15** Click **Save Configuration**.

## Configuring 802.11 Coverage Hole Detection (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz   5ghz rrm coverage data {fail-percentage   packet-count   rssi-threshold}</b> <b>Example:</b> Switch(config)# <code>ap dot11 24ghz rrm coverage data fail-percentage 60</code>	Configures the 802.11 coverage hole detection for data packets. <ul style="list-style-type: none"> <li>• <b>fail-percentage</b>—Configures the 802.11 coverage failure-rate threshold for uplink data packets as a percentage that ranges from 1 to 100%.</li> <li>• <b>packet-count</b>—Configures the 802.11 coverage minimum failure count threshold for uplink data packets that ranges from 1 to 255.</li> <li>• <b>rssi-threshold</b>—Configures the 802.11 minimum receive coverage level for data packets that range from -90 to -60 dBm.</li> </ul>
<b>Step 3</b>	<b>ap dot11 24ghz   5ghz rrm coverage exception global <i>exception level</i></b> <b>Example:</b> Switch(config)# <code>ap dot11 24ghz rrm coverage exception global 50</code>	Configures the 802.11 Cisco AP coverage exception level as a percentage that ranges from 0 to 100%.

	Command or Action	Purpose
<b>Step 4</b>	<p><b>ap dot11 24ghz   5ghz rrm coverage level global cli_min exception level</b></p> <p><b>Example:</b></p> <pre>Switch(config)#ap dot11 24ghz rrm coverage level global 10</pre>	Configures the 802.11 Cisco AP client minimum exception level that ranges from 1 to 75 clients.
<b>Step 5</b>	<p><b>ap dot11 24ghz   5ghz rrm coverage voice{fail-percentage   packet-count   rssi-threshold}</b></p> <p><b>Example:</b></p> <pre>Switch(config)#ap dot11 24ghz rrm coverage voice packet-count 10</pre>	<p>Configures the 802.11 coverage hole detection for voice packets.</p> <ul style="list-style-type: none"> <li>• <b>fail-percentage</b>—Configures the 802.11 coverage failure-rate threshold for uplink voice packets as a percentage that ranges from 1 to 100%.</li> <li>• <b>packet-count</b>—Configures the 802.11 coverage minimum failure count threshold for uplink voice packets that ranges from 1 to 255.</li> <li>• <b>rssi-threshold</b>—Configures the 802.11 minimum receive coverage level for voice packets that range from -90 to -60 dBm.</li> </ul>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Coverage Hole Detection (GUI)

### Procedure

- Step 1** Disable the 802.11 network as follows:
- Choose **Configuration > Wireless > 802.11a/n/ac** or **Configuration > Wireless > 802.11b/g/n** to open the 802.11a/n/ac (or 802.11b/g/n) Global Parameters page.
  - Unselect the **802.11a/n/ac** (or **802.11b/g/n**) **Network Status** check box.
  - Click **Apply**.
- Step 2** Choose **Configuration > Wireless > 802.11a/n/ac > RRM > Coverage Thresholds** or **Configuration > Wireless > 802.11b/g/n > RRM > Coverage Thresholds** to open coverage page.
- Step 3** Select the **Enable Coverage Hole Detection** check box to enable coverage hole detection, or unselect it to disable this feature. If you enable coverage hole detection, the Cisco WLC automatically determines, based on data received from the access points, if any access points have clients that are potentially located in areas with poor coverage. The default value is selected.
- Step 4** In the **Data RSSI** text box, enter the minimum Receive Signal Strength Indication (RSSI) value for data packets received by the access point. The value that you enter is used to identify coverage holes (or areas of poor coverage) within your network. If the access point receives a packet in the data queue with an RSSI value

below the value that you enter here, a potential coverage hole has been detected. The valid range is –90 to –60 dBm, and the default value is –80 dBm. The access point takes data RSSI measurements every 5 seconds and reports them to the Cisco WLC in 90-second intervals.

**Step 5** In the **Voice RSSI** text box, enter the minimum Receive Signal Strength Indication (RSSI) value for voice packets received by the access point. The value that you enter is used to identify coverage holes within your network. If the access point receives a packet in the voice queue with an RSSI value below the value that you enter here, a potential coverage hole has been detected. The valid range is –90 to –60 dBm, and the default value is –80 dBm. The access point takes voice RSSI measurements every 5 seconds and reports them to the Cisco WLC in 90-second intervals.

**Step 6** In the **Min Failed Client Count per AP** text box, enter the minimum number of clients on an access point with an RSSI value at or below the data or voice RSSI threshold. The valid range is 1 to 75, and the default value is 3.

**Step 7** In the **Coverage Exception Level per AP** text box, enter the percentage of clients on an access point that are experiencing a low signal level but cannot roam to another access point. The valid range is 0 to 100%, and the default value is 25%.

**Note** If both the number and percentage of failed packets exceed the values configured for Failed Packet Count and Failed Packet Percentage (configurable through the Cisco WLC CLI) for a 5-second period, the client is considered to be in a pre-alarm condition. The Cisco WLC uses this information to distinguish between real and false coverage holes. False positives are generally due to the poor roaming logic implemented on most clients. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the Min Failed Client Count per AP and Coverage Exception Level per AP text boxes over two 90-second periods (a total of 180 seconds). The Cisco WLC determines if the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

**Step 8** Click **Apply**.

**Step 9** Reenable the 802.11 network as follows:

- a) Choose **Configuration > Wireless > 802.11a/n/ac > Network** or **Configuration > Wireless > 802.11b/g/n > Network** to open the 802.11a (or 802.11b/g) Global Parameters page.
- b) Select the **802.11a/n/ac** (or **802.11b/g/n**) **Network Status** check box.
- c) Click **Apply**.

**Step 10** Click **Save Configuration**.

## Configuring 802.11 Event Logging (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<code>ap dot11 24ghz   5ghz rrm logging {channel   coverage   foreign   load   noise   performance   txpower}</code>	Configures event-logging for various parameters.

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Switch(config)#ap dot11 24ghz rrm logging channel</pre> <pre>Switch(config)#ap dot11 24ghz rrm logging coverage</pre> <pre>Switch(config)#ap dot11 24ghz rrm logging foreign</pre> <pre>Switch(config)#ap dot11 24ghz rrm logging load</pre> <pre>Switch(config)#ap dot11 24ghz rrm logging noise</pre> <pre>Switch(config)#ap dot11 24ghz rrm logging performance</pre> <pre>Switch(config)#ap dot11 24ghz rrm logging txpower</pre>	<ul style="list-style-type: none"> <li>• <b>channel</b>—Configures the 802.11 channel change logging mode.</li> <li>• <b>coverage</b>—Configures the 802.11 coverage profile logging mode.</li> <li>• <b>foreign</b>—Configures the 802.11 foreign interference profile logging mode.</li> <li>• <b>load</b>—Configures the 802.11 load profile logging mode.</li> <li>• <b>noise</b>—Configures the 802.11 noise profile logging mode.</li> <li>• <b>performance</b>—Configures the 802.11 performance profile logging mode.</li> <li>• <b>txpower</b>—Configures the 802.11 transmit power change logging mode.</li> </ul>
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	<p>Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

## Configuring 802.11 Statistics Monitoring (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>	<p>Enters global configuration mode.</p>
<b>Step 2</b>	<p><b>ap dot11 24ghz   5ghz rrm monitor channel-list {all   country   dca}</b></p> <p><b>Example:</b></p> <pre>Switch(config)#ap dot11 24ghz rrm monitor channel-list all</pre>	<p>Sets the 802.11 monitoring channel-list for parameters such as noise/interference/roque.</p> <ul style="list-style-type: none"> <li>• <b>all</b>— Monitors all channels.</li> <li>• <b>country</b>— Monitor channels used in configured country code.</li> <li>• <b>dca</b>— Monitor channels used by dynamic channel assignment.</li> </ul>
<b>Step 3</b>	<p><b>ap dot11 24ghz   5ghz rrm monitor coverage interval</b></p> <p><b>Example:</b></p>	<p>Configures the 802.11 coverage measurement interval in seconds that ranges from 60 to 3600.</p>

	Command or Action	Purpose
	Switch(config)#ap dot11 24ghz rrm monitor coverage 600	
<b>Step 4</b>	<b>ap dot11 24ghz   5ghz rrm monitor load interval</b> <b>Example:</b> Switch(config)#ap dot11 24ghz rrm monitor load 180	Configures the 802.11 load measurement interval in seconds that ranges from 60 to 3600.
<b>Step 5</b>	<b>ap dot11 24ghz   5ghz rrm monitor noise interval</b> <b>Example:</b> Switch(config)#ap dot11 24ghz rrm monitor noise 360	Configures the 802.11 noise measurement interval (channel scan interval) in seconds that ranges from 60 to 3600.
<b>Step 6</b>	<b>ap dot11 24ghz   5ghz rrm monitor signal interval</b> <b>Example:</b> Switch(config)#ap dot11 24ghz rrm monitor signal 480	Configures the 802.11 signal measurement interval (neighbor packet frequency) in seconds that ranges from 60 to 3600.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring the 802.11 Performance Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz   5ghz rrm profile clients cli_threshold_value</b> <b>Example:</b> Switch(config)#ap dot11 24ghz rrm profile clients 20	Sets the threshold value for 802.11 Cisco AP clients that range between 1 and 75 clients.

	Command or Action	Purpose
Step 3	<b>ap dot11 24ghz   5ghz rrm profile foreign</b> <i>int_threshold_value</i>  <b>Example:</b>  <pre>Switch(config)#ap dot11 24ghz rrm profile foreign 50</pre>	Sets the threshold value for 802.11 foreign interference that ranges between 0 and 100%.
Step 4	<b>ap dot11 24ghz   5ghz rrm profile noise</b> <i>for_noise_threshold_value</i>  <b>Example:</b>  <pre>Switch(config)#ap dot11 24ghz rrm profile noise -65</pre>	Sets the threshold value for 802.11 foreign noise ranges between -127 and 0 dBm.
Step 5	<b>ap dot11 24ghz   5ghz rrm profile</b> <b>throughput</b> <i>throughput_threshold_value</i>  <b>Example:</b>  <pre>Switch(config)#ap dot11 24ghz rrm profile throughput 10000</pre>	Sets the threshold value for 802.11 Cisco AP throughput that ranges between 1000 and 10000000 bytes per second.
Step 6	<b>ap dot11 24ghz   5ghz rrm profile utilization</b> <i>rf_util_threshold_value</i>  <b>Example:</b>  <pre>Switch(config)#ap dot11 24ghz rrm profile utilization 75</pre>	Sets the threshold value for 802.11 RF utilization that ranges between 0 to 100%.
Step 7	<b>end</b>  <b>Example:</b>  <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Rogue Access Point Detection in RF Groups

### Configuring Rogue Access Point Detection in RF Groups (CLI)

#### Before you begin

Ensure that each Cisco WLC in the RF group has been configured with the same RF group name.

#### Note

The name is used to verify the authentication IE in all beacon frames. If the Cisco WLCs have different names, false alarms will occur.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>ap name</b> <i>Cisco_AP</i> <b>mode</b> { <b>local</b>   <b>monitor</b> } <b>Example:</b> Switch# <b>ap name ap1 mode local</b>	Configures a particular access point for local (normal) mode or monitor (listen-only) mode. Perform this step for every access point connected to the Cisco WLC.
<b>Step 2</b>	<b>end</b> <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.
<b>Step 3</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 4</b>	<b>wireless wps ap-authentication</b> <b>Example:</b> Switch (config)# <b>wireless wps ap-authentication</b>	Enables rogue access point detection.
<b>Step 5</b>	<b>wireless wps ap-authentication threshold</b> <i>value</i> <b>Example:</b> Switch (config)# <b>wireless wps ap-authentication threshold 50</b>	<p>Specifies when a rogue access point alarm is generated. An alarm occurs when the threshold value (which specifies the number of access point frames with an invalid authentication IE) is met or exceeded within the detection period.</p> <p>The valid threshold range is from 1 to 255, and the default threshold value is 1. To avoid false alarms, you may want to set the threshold to a higher value.</p> <p><b>Note</b> Enable rogue access point detection and threshold value on every Cisco WLC in the RF group.</p> <p><b>Note</b> If rogue access point detection is not enabled on every Cisco WLC in the RF group, the access points on the Cisco WLCs with this feature disabled are reported as rogues.</p>

## Enabling Rogue Access Point Detection in RF Groups (GUI)

## Procedure

- Step 1** Make sure that each Cisco WLC in the RF group has been configured with the same RF group name.

**Note** The name is used to verify the authentication IE in all beacon frames. If the Cisco WLCs have different names, false alarms will occur.

- Step 2** Choose **Configuration > Wireless > Access Points > All APs** to open the All APs page.
- Step 3** Click the name of an access point to open the All APs > Edit page.
- Step 4** Choose either **local** or **monitor** from the AP Mode drop-down list and click **Apply** to commit your changes.
- Step 5** Click **Save Configuration** to save your changes.
- Step 6** Repeat **Step 2** through **Step 5** for every access point connected to the Cisco WLC.
- Step 7** Choose **Configuration > Security > Wireless Protection Policies > AP Authentication/MFP** to open the AP Authentication Policy page.
- The name of the RF group to which this Cisco WLC belongs appears at the top of the page.
- Step 8** Choose **AP Authentication** from the Protection Type drop-down list to enable rogue access point detection.
- Step 9** Enter a number in the Alarm Trigger Threshold edit box to specify when a rogue access point alarm is generated. An alarm occurs when the threshold value (which specifies the number of access point frames with an invalid authentication IE) is met or exceeded within the detection period.
- Note** The valid threshold range is from 1 to 255, and the default threshold value is 1. To avoid false alarms, you may want to set the threshold to a higher value.
- Step 10** Click **Apply** to commit your changes.
- Step 11** Click **Save Configuration** to save your changes.
- Step 12** Repeat this procedure on every Cisco WLC in the RF group.
- Note** If rogue access point detection is not enabled on every Cisco WLC in the RF group, the access points on the Cisco WLCs with this feature disabled are reported as rogue.

## Monitoring RRM Parameters and RF Group Status

### Monitoring RRM Parameters

*Table 72: Commands for monitoring Radio Resource Management*

Commands	Description
show ap dot11 24ghz ccx	Displays the 802.11b CCX information for all Cisco APs.
show ap dot11 24ghz channel	Displays the configuration and statistics of the 802.11b channel assignment.
show ap dot11 24ghz coverage	Displays the configuration and statistics of the 802.11b coverage.
show ap dot11 24ghz group	Displays the configuration and statistics of the 802.11b grouping.
show ap dot11 24ghz l2roam	Displays 802.11b l2roam information.
show ap dot11 24ghz logging	Displays the configuration and statistics of the 802.11b event logging.

Commands	Description
show ap dot11 24ghz monitor	Displays the configuration and statistics of the 802.11b monitoring.
show ap dot11 24ghz profile	Displays 802.11b profiling information for all Cisco APs.
show ap dot11 24ghz receiver	Displays the configuration and statistics of the 802.11b receiver.
show ap dot11 24ghz summary	Displays the configuration and statistics of the 802.11b Cisco APs.
show ap dot11 24ghz txpower	Displays the configuration and statistics of the 802.11b transmit power control.
show ap dot11 5ghz ccx	Displays 802.11a CCX information for all Cisco APs.
show ap dot11 5ghz channel	Displays the configuration and statistics of the 802.11a channel assignment.
show ap dot11 5ghz coverage	Displays the configuration and statistics of the 802.11a coverage.
show ap dot11 5ghz group	Displays the configuration and statistics of the 802.11a grouping.
show ap dot11 5ghz l2roam	Displays 802.11a l2roam information.
show ap dot11 5ghz logging	Displays the configuration and statistics of the 802.11a event logging.
show ap dot11 5ghz monitor	Displays the configuration and statistics of the 802.11a monitoring.
show ap dot11 5ghz profile	Displays 802.11a profiling information for all Cisco APs.
show ap dot11 5ghz receiver	Displays the configuration and statistics of the 802.11a receiver.
show ap dot11 5ghz summary	Displays the configuration and statistics of the 802.11a Cisco APs.
show ap dot11 5ghz txpower	Displays the configuration and statistics of the 802.11a transmit power control.

## Monitoring RF Group Status (CLI)

This section describes the new commands for RF group status.

The following commands can be used to monitor RF group status on the switch.

**Table 73: Monitoring Aggressive Load Balancing Command**

Command	Purpose
<b>show ap dot11 5ghz group</b>	Displays the Cisco WLC name which is the RF group leader for the 802.11a RF network.
<b>show ap dot11 24ghz group</b>	Displays the Cisco WLC name which is the RF group leader for the 802.11b/g RF network.

## Monitoring RF Group Status (GUI)

### Procedure

**Step 1** Choose **Configuration > Wireless > 802.11a/n > or 802.11b/g/n > RRM > RF Grouping** to open the RF Grouping Algorithm page.

This page shows the details of the RF group, displaying the configurable parameter **Group mode**, the **Group role** of this Cisco WLC, the **Group Update Interval** and the Cisco WLC name and IP address of the **Group Leader** to this Cisco WLC.

**Note** RF grouping mode can be set using the **Group Mode** drop-down list.

Tip Once a Cisco WLC has joined as a static member and you want to change the grouping mode, we recommend that you remove the member from the configured static-leader and also make sure that a member Cisco WLC has not been configured to be a member on multiple static leaders. This is to avoid repeated join attempts from one or more RF static leaders.

**Step 2** (Optional) Repeat this procedure for the network type that you did not select (802.11a/n or 802.11b/g/n).

## Examples: RF Group Configuration

This example shows how to configure RF group name:

```
Switch# configure terminal
Switch(config)# wireless rf-network test1
Switch(config)# ap dot11 24ghz shutdown
Switch(config)# end
Switch # show network profile 5
```

This example shows how to configure rogue access point detection in RF groups:

```
Switch# ap name ap1 mode local
Switch# end
Switch# configure terminal
Switch(config)# wireless wps ap-authentication
Switch(config)# wireless wps ap-authentication threshold 50
Switch(config)# end
```

## Information About ED-RRM

Spontaneous interference is interference that appears suddenly on a network, perhaps jamming a channel or a range of channels completely. The Cisco CleanAir spectrum event-driven RRM feature allows you to set a threshold for air quality (AQ) that, if exceeded, triggers an immediate channel change for the affected access point. Most RF management systems can avoid interference, but this information takes time to propagate through the system. Cisco CleanAir relies on AQ measurements to continuously evaluate the spectrum and can trigger a move within 30 seconds. For example, if an access point detects interference from a video camera,

it can recover by changing channels within 30 seconds of the camera becoming active. Cisco CleanAir also identifies and locates the source of interference so that more permanent mitigation of the device can be performed at a later time.

## Configuring ED-RRM on the Cisco Wireless LAN Controller (CLI)

### Procedure

- 
- Step 1** Trigger spectrum event-driven radio resource management (RRM) to run when a Cisco CleanAir-enabled access point detects a significant level of interference by entering these commands:
- ap dot11 {24ghz | 5ghz} rrm channel cleanair-event**—Configures CleanAir driven RRM parameters for the 802.11 Cisco lightweight access points.
- ap dot11 {24ghz | 5ghz} rrm channel cleanair-event sensitivity {low | medium | high | custom}**—Configures CleanAir driven RRM sensitivity for the 802.11 Cisco lightweight access points. Default selection is Medium.
- ap dot11 {24ghz | 5ghz} rrm channel cleanair-event rogue-contribution**—Enables rogue contribution.
- ap dot11 {24ghz | 5ghz} rrm channel cleanair-event rogue-contributionduty-cycle thresholdvalue**—Configures threshold value for rogue contribution. The valid range is from 1 to 99, with 80 as the default.
- Step 2** Save your changes by entering this command:
- write memory**
- Step 3** See the CleanAir configuration for the 802.11a/n/ac or 802.11b/g/n network by entering this command:
- show ap dot11 {24ghz | 5ghz} cleanair config**
- Information similar to the following appears:

```
AdditionalClean Air Settings:
CleanAir Event-driven RRM State..... : Enabled
CleanAir Driven RRM Sensitivity..... : LOW
CleanAir Event-driven RRM Rogue Option..... : Enabled
CleanAir Event-driven RRM Rogue Duty Cycle... : 80
CleanAir Persistent Devices state..... : Disabled
CleanAir Persistent Device Propagation..... : Disabled
```

## Configuring ED-RRM (GUI)

### Procedure

- 
- Step 1** Choose **Configure > Radio Configurations > 2.4 GHZ or 5 GHZ > RRM > DCA** to open the ED-RRM page.

**Note** Before enabling ED-RRM, you have to disable Network Status from **Configure > Radio Configurations > 2.4 GHZ or 5 GHZ > Network > General** page, and then re-enable the network after configuring ED-RRM.

**Step 2** In the Event Driven RRM section, select the **EDRRM** check box to reveal ED-RRM parameters .

**Step 3** From the Sensitivity Threshold drop-down, select the value.

Options are: Low, Medium, or High. Default selection is Medium.

**Step 4** Select the **Rogue Contribution** check box to reveal Rogue Duty-Cycle parameters .

**Step 5** Enter the **Rogue Duty Cycle** value in the text box.

The valid range is from 1 to 99, with 80 as the default.

**Step 6** Click **Apply**.

**Step 7** Click **Save Configuration**.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring MSDP

This section describes how to configure the Multicast Source Discovery Protocol (MSDP) on the switch. The MSDP connects multiple Protocol-Independent Multicast sparse-mode (PIM-SM) domains.

MSDP is not fully supported in this software release because of a lack of support for Multicast Border Gateway Protocol (MBGP), which works closely with MSDP. However, it is possible to create default peers that MSDP can operate with if MBGP is not running.

---

**Note** To use this feature, the active switch must be running the IP services feature set.

---

## MSDP Overview

MSDP allows multicast sources for a group to be known to all rendezvous points (RPs) in different domains. Each PIM-SM domain uses its own RPs and does not depend on RPs in other domains. An RP runs MSDP over the Transmission Control Protocol (TCP) to discover multicast sources in other domains.

An RP in a PIM-SM domain has an MSDP peering relationship with MSDP-enabled devices in another domain. The peering relationship occurs over a TCP connection, primarily exchanging a list of sources sending to multicast groups. The TCP connections between RPs are achieved by the underlying routing system. The receiving RP uses the source lists to establish a source path.

The purpose of this topology is to have domains discover multicast sources in other domains. If the multicast sources are of interest to a domain that has receivers, multicast data is delivered over the normal, source-tree building mechanism in PIM-SM. MSDP is also used to announce sources sending to a group. These announcements must originate at the domain's RP.

MSDP depends heavily on the Border Gateway Protocol (BGP) or MBGP for interdomain operation. We recommend that you run MSDP in RPs in your domain that are RPs for sources sending to global groups to be announced to the Internet.

## MSDP Operation

When a source sends its first multicast packet, the first-hop router (*designated router* or RP) directly connected to the source sends a PIM register message to the RP. The RP uses the register message to register the active source and to forward the multicast packet down the shared tree in the local domain. With MSDP configured, the RP also forwards a source-active (SA) message to all MSDP peers. The SA message identifies the source, the group the source is sending to, and the address of the RP or the originator ID (the IP address of the interface used as the RP address), if configured.

Each MSDP peer receives and forwards the SA message away from the originating RP to achieve peer reverse-path flooding (RPF). The MSDP device examines the BGP or MBGP routing table to discover which peer is the next hop toward the originating RP of the SA message. Such a peer is called an *RPF peer* (reverse-path forwarding peer). The MSDP device forwards the message to all MSDP peers other than the RPF peer. For information on how to configure an MSDP peer when BGP and MBGP are not supported, see the [Configuring a Default MSDP Peer, on page 990](#).

If the MSDP peer receives the same SA message from a non-RPF peer toward the originating RP, it drops the message. Otherwise, it forwards the message to all its MSDP peers.

The RP for a domain receives the SA message from an MSDP peer. If the RP has any join requests for the group the SA message describes and if the (\*,G) entry exists with a nonempty outgoing interface list, the domain is interested in the group, and the RP triggers an (S,G) join toward the source. After the (S,G) join reaches the source's DR, a branch of the source tree has been built from the source to the RP in the remote domain. Multicast traffic can now flow from the source across the source tree to the RP and then down the shared tree in the remote domain to the receiver.

**Figure 63: MSDP Running Between RP Peers**

This figure shows MSDP operating between two MSDP peers. PIM uses MSDP as the standard mechanism to register a source with the RP of a domain. When MSDP is configured, this sequence occurs.

By default, the switch does not cache source or group pairs from received SA messages. When the switch forwards the MSDP SA information, it does not store it in memory. Therefore, if a member joins a group soon after an SA message is received by the local RP, that member needs to wait until the next SA message to hear about the source. This delay is known as join latency.

Local RPs can send SA requests and get immediate responses for all active sources for a given group. By default, the switch does not send any SA request messages to its MSDP peers when a new member joins a group and wants to receive multicast traffic. The new member waits to receive the next periodic SA message.

If you want a new member of a group to learn the active multicast sources in a connected PIM sparse-mode domain that are sending to a group, configure the switch to send SA request messages to the specified MSDP peer when a new member joins a group.

## MSDP Benefits

MSDP has these benefits:

- It breaks up the shared multicast distribution tree. You can make the shared tree local to your domain. Your local members join the local tree, and join messages for the shared tree never need to leave your domain.
- PIM sparse-mode domains can rely only on their own RPs, decreasing reliance on RPs in another domain. This increases security because you can prevent your sources from being known outside your domain.
- Domains with only receivers can receive data without globally advertising group membership.
- Global source multicast routing table state is not required, saving memory.

# How to Configure MSDP

## Default MSDP Configuration

MSDP is not enabled, and no default MSDP peer exists.

## Configuring a Default MSDP Peer

### Before you begin

Configure an MSDP peer.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip msdp default-peer <i>ip-address</i>   <i>name</i> [prefix-list <i>list</i>]</b> <b>Example:</b> <pre>Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a</pre>	Defines a default peer from which to accept all MSDP SA messages. <ul style="list-style-type: none"> <li>For <i>ip-address</i>   <i>name</i>, enter the IP address or Domain Name System (DNS) server name of the MSDP default peer.</li> <li>(Optional) For <b>prefix-list</b> <i>list</i>, enter the list name that specifies the peer to be the default peer only for the listed prefixes. You can have multiple active default peers when you have a prefix list associated with each.</li> </ul> <p>When you enter multiple <b>ip msdp default-peer</b> commands with the <b>prefix-list</b> keyword, you use all the default peers at the same time for different RP prefixes. This syntax is typically used in a service provider cloud that connects stub site clouds.</p>

	Command or Action	Purpose
		When you enter multiple <b>ip msdp default-peer</b> commands without the <b>prefix-list</b> keyword, a single active peer accepts all SA messages. If that peer fails, the next configured default peer accepts all SA messages. This syntax is typically used at a stub site.
<b>Step 4</b>	<p><b>ip prefix-list</b> <i>name</i> [<b>description</b> <i>string</i>]   <b>seq number</b> {<b>permit</b>   <b>deny</b>} <i>network length</i></p> <p><b>Example:</b></p> <pre>Router(config)# ip prefix-list site-a seq 3 permit 12 network length 128</pre>	<p>(Optional) Creates a prefix list using the name specified in Step 2.</p> <ul style="list-style-type: none"> <li>• (Optional) For <b>description</b> <i>string</i>, enter a description of up to 80 characters to describe this prefix list.</li> <li>• For <b>seq number</b>, enter the sequence number of the entry. The range is 1 to 4294967294.</li> <li>• The <b>deny</b> keyword denies access to matching conditions.</li> <li>• The <b>permit</b> keyword permits access to matching conditions.</li> <li>• For <i>network length</i>, specify the network number and length (in bits) of the network mask that is permitted or denied.</li> </ul>
<b>Step 5</b>	<p><b>ip msdp description</b> {<i>peer-name</i>   <i>peer-address</i>} <i>text</i></p> <p><b>Example:</b></p> <pre>Router(config)# ip msdp description peer-name site-b</pre>	<p>(Optional) Configures a description for the specified peer to make it easier to identify in a configuration or in <b>show</b> command output.</p> <p>By default, no description is associated with an MSDP peer.</p>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 7</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 8</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p>	(Optional) Saves your entries in the configuration file.

	Command or Action	Purpose
	Switch# <code>copy running-config startup-config</code>	

## Caching Source-Active State

If you want to sacrifice some memory in exchange for reducing the latency of the source information, you can configure the Switch to cache SA messages. Perform the following steps to enable the caching of source/group pairs:

Follow these steps to enable the caching of source/group pairs:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip msdp cache-sa-state</b> [ <i>list access-list-number</i> ] <b>Example:</b> Switch(config)# <code>ip msdp cache-sa-state 100</code>	Enables the caching of source/group pairs (create an SA state). Those pairs that pass the access list are cached.  For <b>list</b> <i>access-list-number</i> , the range is 100 to 199.  <b>Note</b> An alternative to this command is the <b>ip msdp sa-reques</b> global configuration command, which causes the Switch to send an SA request message to the MSDP peer when a new member for a group becomes active.
<b>Step 4</b>	<b>access-list</b> <i>access-list-number</i> { <b>deny</b>   <b>permit</b> } <i>protocol source source-wildcard destination destination-wildcard</i> <b>Example:</b> Switch(config)# <code>access-list 100 permit</code>	Creates an IP extended access list, repeating the command as many times as necessary. <ul style="list-style-type: none"> <li>For <i>access-list-number</i>, the range is 100 to 199. Enter the same number created in Step 2.</li> </ul>

	Command or Action	Purpose
	<pre>ip 171.69.0.0 0.0.255.255 224.2.0.0 0.0.255.255</pre>	<ul style="list-style-type: none"> <li>• The <b>deny</b> keyword denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>• For <i>protocol</i>, enter <b>ip</b> as the protocol name.</li> <li>• For <i>source</i>, enter the number of the network or host from which the packet is being sent.</li> <li>• For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> <li>• For <i>destination</i>, enter the number of the network or host to which the packet is being sent.</li> <li>• For <i>destination-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.</li> </ul> <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 7</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Controlling Source Information that Your Switch Originates

You can control the multicast source information that originates with your Switch:

- Sources you advertise (based on your sources)
- Receivers of source information (based on knowing the requestor)

For more information, see the [Redistributing Sources, on page 994](#) and the [Filtering Source-Active Request Messages, on page 996](#).

## Redistributing Sources

SA messages originate on RPs to which sources have registered. By default, any source that registers with an RP is advertised. The *A flag* is set in the RP when a source is registered, which means the source is advertised in an SA unless it is filtered.

Follow these steps to further restrict which registered sources are advertised:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip msdp redistribute</b> [ <i>list access-list-name</i> ] [ <i>asn aspath-access-list-number</i> ] [ <i>route-map map</i> ] <b>Example:</b> <pre>Switch(config)# ip msdp redistribute list 21</pre>	<p>Configures which (S,G) entries from the multicast routing table are advertised in SA messages.</p> <p>By default, only sources within the local domain are advertised.</p> <ul style="list-style-type: none"> <li>• (Optional) <b>list</b> <i>access-list-name</i>— Enters the name or number of an IP standard or extended access list. The range is 1 to 99 for standard access lists and 100 to 199 for extended lists. The access list controls which local sources are advertised and to which groups they send.</li> <li>• (Optional) <b>asn</b> <i>aspath-access-list-number</i>—Enters the IP standard or extended access list number in the range 1 to 199. This access list number must also be configured in the <b>ip as-path access-list</b> command.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>(Optional) <b>route-map map</b>—Enters the IP standard or extended access list number in the range 1 to 199. This access list number must also be configured in the <b>ip as-path access-list</b> command.</li> </ul> <p>The Switch advertises (S,G) pairs according to the access list or autonomous system path access list.</p>
<b>Step 4</b>	<p>Use one of the following:</p> <ul style="list-style-type: none"> <li><code>access-list <i>access-list-number</i> {deny   permit} <i>source</i> [<i>source-wildcard</i>]</code></li> <li><code>access-list <i>access-list-number</i> {deny   permit} <i>protocol source source-wildcard destination destination-wildcard</i></code></li> </ul> <p><b>Example:</b></p> <pre>Switch(config)# access list 21 permit 194.1.22.0</pre> <p>or</p> <pre>Switch(config)# access list 21 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1</pre>	<p>Creates an IP standard access list, repeating the command as many times as necessary.</p> <p>or</p> <p>Creates an IP extended access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> <li><i>access-list-number</i>—Enters the same number created in Step 2. The range is 1 to 99 for standard access lists and 100 to 199 for extended lists.</li> <li><b>deny</b>—Denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</li> <li><i>protocol</i>—Enters <b>ip</b> as the protocol name.</li> <li><i>source</i>—Enters the number of the network or host from which the packet is being sent.</li> <li><i>source-wildcard</i>—Enters the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> <li><i>destination</i>—Enters the number of the network or host to which the packet is being sent.</li> <li><i>destination-wildcard</i>—Enters the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.</li> </ul> <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p>	<p>Returns to privileged EXEC mode.</p>

	Command or Action	Purpose
	<code>Switch(config)# end</code>	
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b> <code>Switch# show running-config</code>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> <code>Switch# copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Filtering Source-Active Request Messages

By default, only Switch that are caching SA information can respond to SA requests. By default, such a Switch honors all SA request messages from its MSDP peers and supplies the IP addresses of the active sources.

However, you can configure the Switch to ignore all SA requests from an MSDP peer. You can also honor only those SA request messages from a peer for groups described by a standard access list. If the groups in the access list pass, SA request messages are accepted. All other such messages from the peer for other groups are ignored.

To return to the default setting, use the **no ip msdp filter-sa-request** *{ip-address| name}* global configuration command.

Follow these steps to configure one of these options:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <code>Switch&gt; enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <code>Switch# configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <code>ip msdp filter-sa-request {ip-addressname}</code></li> </ul>	Filters all SA request messages from the specified MSDP peer. or

	Command or Action	Purpose
	<ul style="list-style-type: none"> <li><code>ip msdp filter-sa-request {ip-addressname} list access-list-number</code></li> </ul> <p><b>Example:</b></p> <pre>Switch(config)# ip msdp filter sa-request 171.69.2.2</pre>	Filters SA request messages from the specified MSDP peer for groups that pass the standard access list. The access list describes a multicast group address. The range for the access-list-number is 1 to 99.
<b>Step 4</b>	<p><code>access-list access-list-number {deny   permit} source [source-wildcard]</code></p> <p><b>Example:</b></p> <pre>Switch(config)# access-list 1 permit 192.4.22.0 0.0.0.255</pre>	<p>Creates an IP standard access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> <li>For <i>access-list-number</i>, the range is 1 to 99.</li> <li>The <b>deny</b> keyword denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>For <i>source</i>, enter the number of the network or host from which the packet is being sent.</li> <li>(Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul> <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 7</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Controlling Source Information that Your Switch Forwards

By default, the Switch forwards all SA messages it receives to all its MSDP peers. However, you can prevent outgoing messages from being forwarded to a peer by using a filter or by setting a time-to-live (TTL) value.

### Using a Filter

By creating a filter, you can perform one of these actions:

- Filter all source/group pairs
- Specify an IP extended access list to pass only certain source/group pairs
- Filter based on match criteria in a route map

Follow these steps to apply a filter:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>ip msdp sa-filter out</b>  <pre>{ip-address name}</pre></li> <li>• <b>ip msdp sa-filter out</b>  <pre>{ip-address name} list access-list-number</pre></li> <li>• <b>ip msdp sa-filter out</b>  <pre>{ip-address name} route-map map-tag</pre></li> </ul> <b>Example:</b> <pre>Switch(config)# ip msdp sa-filter out switch.cisco.com</pre> or	<ul style="list-style-type: none"> <li>• Filters all SA messages to the specified MSDP peer.</li> <li>• Passes only those SA messages that pass the IP extended access list to the specified peer. The range for the extended <i>access-list-number</i> is 100 to 199.</li> </ul> If both the <b>list</b> and the <b>route-map</b> keywords are used, all conditions must be true to pass any (S,G) pair in outgoing SA messages. <ul style="list-style-type: none"> <li>• Passes only those SA messages that meet the match criteria in the route map <i>map-tag</i> to the specified MSDP peer.</li> </ul> If all match criteria are true, a <b>permit</b> from the route map passes routes through the filter. A <b>deny</b> filters routes.

	Command or Action	Purpose
	<pre>Switch(config)# ip msdp sa-filter out list 100</pre> <p>OR</p> <pre>Switch(config)# ip msdp sa-filter out switch.cisco.com route-map 22</pre>	
<b>Step 4</b>	<p><b>access-list</b> <i>access-list-number</i> {deny   permit} <i>protocol source source-wildcard destination-wildcard</i></p> <p><b>Example:</b></p> <pre>Switch(config)# access list 100 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1</pre>	<p>(Optional) Creates an IP extended access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> <li>• For <i>access-list-number</i>, enter the number specified in Step 2.</li> <li>• The <b>deny</b> keyword denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>• For <i>protocol</i>, enter <b>ip</b> as the protocol name.</li> <li>• For <i>source</i>, enter the number of the network or host from which the packet is being sent.</li> <li>• For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> <li>• For <i>destination</i>, enter the number of the network or host to which the packet is being sent.</li> <li>• For <i>destination-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.</li> </ul> <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p>	Verifies your entries.

	Command or Action	Purpose
	Switch# <code>show running-config</code>	
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Using TTL to Limit the Multicast Data Sent in SA Messages

You can use a TTL value to control what data is encapsulated in the first SA message for every source. Only multicast packets with an IP-header TTL greater than or equal to the *tll* argument are sent to the specified MSDP peer. For example, you can limit internal traffic to a TTL of 8. If you want other groups to go to external locations, you must send those packets with a TTL greater than 8.

Follow these steps to establish a TTL threshold:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip msdp ttl-threshold {ip-address   name} tll</b> <b>Example:</b> Switch(config)# <code>ip msdp ttl-threshold switch.cisco.com 0</code>	Limits which multicast data is encapsulated in the first SA message to the specified MSDP peer. <ul style="list-style-type: none"> <li>• For <i>ip-address   name</i>, enter the IP address or name of the MSDP peer to which the TTL limitation applies.</li> <li>• For <i>tll</i>, enter the TTL value. The default is 0, which means all multicast data packets are forwarded to the peer until the TTL is exhausted. The range is 0 to 255.</li> </ul>
<b>Step 4</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Switch(config)# <b>end</b>	
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b> Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Controlling Source Information that Your Switch Receives

By default, the Switch receives all SA messages that its MSDP RPF peers send to it. However, you can control the source information that you receive from MSDP peers by filtering incoming SA messages. In other words, you can configure the Switch to not accept them.

You can perform one of these actions:

- Filter all incoming SA messages from an MSDP peer
- Specify an IP extended access list to pass certain source/group pairs
- Filter based on match criteria in a route map

Follow these steps to apply a filter:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>ip msdp sa-filter in</b></li> </ul>	<ul style="list-style-type: none"> <li>• Filters all SA messages to the specified MSDP peer.</li> </ul>

	Command or Action	Purpose
	<pre>{ip-address name} • ip msdp sa-filter in  {ip-address name} list access-list-number • ip msdp sa-filter in  {ip-address name} route-map map-tag</pre> <p><b>Example:</b></p> <pre>Switch(config)# ip msdp sa-filter in switch.cisco.com</pre> <p>OR</p> <pre>Switch(config)# ip msdp sa-filter in list 100</pre> <p>OR</p> <pre>Switch(config)# ip msdp sa-filter in switch.cisco.com route-map 22</pre>	<ul style="list-style-type: none"> <li>• Passes only those SA messages from the specified peer that pass the IP extended access list. The range for the extended <i>access-list-number</i> is 100 to 199.</li> </ul> <p>If both the <b>list</b> and the <b>route-map</b> keywords are used, all conditions must be true to pass any (S,G) pair in outgoing SA messages.</p> <ul style="list-style-type: none"> <li>• Passes only those SA messages from the specified MSDP peer that meet the match criteria in the route map <i>map-tag</i>.</li> </ul> <p>If all match criteria are true, a <b>permit</b> from the route map passes routes through the filter. A <b>deny</b> filters routes.</p>
<b>Step 4</b>	<pre>access-list access-list-number {deny   permit} protocol source source-wildcard destination destination-wildcard</pre> <p><b>Example:</b></p> <pre>Switch(config)# access list 100 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1</pre>	<p>(Optional) Creates an IP extended access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> <li>• <i>access-list-number</i>, enter the number specified in Step 2.</li> <li>• The <b>deny</b> keyword denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>• For <i>protocol</i>, enter <b>ip</b> as the protocol name.</li> <li>• For <i>source</i>, enter the number of the network or host from which the packet is being sent.</li> <li>• For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> <li>• For <i>destination</i>, enter the number of the network or host to which the packet is being sent.</li> <li>• For <i>destination-wildcard</i>, enter the wildcard bits in dotted decimal notation to</li> </ul>

	Command or Action	Purpose
		be applied to the destination. Place ones in the bit positions that you want to ignore.  Recall that the access list is always terminated by an implicit deny statement for everything.
<b>Step 5</b>	<b>end</b> <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b>  Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring an MSDP Mesh Group

An MSDP mesh group is a group of MSDP speakers that have fully meshed MSDP connectivity among one another. Any SA messages received from a peer in a mesh group are not forwarded to other peers in the same mesh group. Thus, you reduce SA message flooding and simplify peer-RPF flooding. Use the **ip msdp mesh-group** global configuration command when there are multiple RPs within a domain. It is especially used to send SA messages across a domain. You can configure multiple mesh groups (with different names) in a single Switch.

Follow these steps to create a mesh group:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Switch# <code>configure terminal</code>	
<b>Step 3</b>	<p><b>ip msdp mesh-group</b> <i>name</i> {<i>ip-address</i>   <i>name</i>}</p> <p><b>Example:</b></p> <pre>Switch(config)# ip msdp mesh-group 2 switch.cisco.com</pre>	<p>Configures an MSDP mesh group, and specifies the MSDP peer belonging to that mesh group.</p> <p>By default, the MSDP peers do not belong to a mesh group.</p> <ul style="list-style-type: none"> <li>• For <i>name</i>, enter the name of the mesh group.</li> <li>• For <i>ip-address</i>   <i>name</i>, enter the IP address or name of the MSDP peer to be a member of the mesh group.</li> </ul> <p>Repeat this procedure on each MSDP peer in the group.</p>
<b>Step 4</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 5</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>	Verifies your entries.
<b>Step 6</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Shutting Down an MSDP Peer

If you want to configure many MSDP commands for the same peer and you do not want the peer to become active, you can shut down the peer, configure it, and later bring it up. When a peer is shut down, the TCP connection is terminated and is not restarted. You can also shut down an MSDP session without losing configuration information for the peer.

Follow these steps to shut down a peer:

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip msdp shutdown</b> { <i>peer-name</i>   <i>peer address</i> } <b>Example:</b>  Switch(config)# <b>ip msdp shutdown</b> <b>switch.cisco.com</b>	Shuts down the specified MSDP peer without losing configuration information.  For <i>peer-name</i>   <i>peer address</i> , enter the IP address or name of the MSDP peer to shut down.
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Switch(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b>  Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <b>copy running-config</b> <b>startup-config</b>	(Optional) Saves your entries in the configuration file.

## Including a Bordering PIM Dense-Mode Region in MSDP

You can configure MSDP on a Switch that borders a PIM sparse-mode region with a dense-mode region. By default, active sources in the dense-mode region do not participate in MSDP.

**Note** We do not recommend using the **ip msdp border sa-address** global configuration command. It is better to configure the border router in the sparse-mode domain to proxy-register sources in the dense-mode domain to the RP of the sparse-mode domain and have the sparse-mode domain use standard MSDP procedures to advertise these sources.

The **ip msdp originator-id** global configuration command also identifies an interface to be used as the RP address. If both the **ip msdp border sa-address** and the **ip msdp originator-id** global configuration commands are configured, the address derived from the **ip msdp originator-id** command specifies the RP address.

Follow these steps to configure the border router to send SA messages for sources active in the dense-mode region to the MSDP peers:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Switch&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip msdp border sa-address <i>interface-id</i></b> <b>Example:</b> <pre>Switch(config)# ip msdp border sa-address 0/1</pre>	<p>Configures the switch on the border between a dense-mode and sparse-mode region to send SA messages about active sources in the dense-mode region.</p> <p>For <i>interface-id</i>, specifies the interface from which the IP address is derived and used as the RP address in SA messages.</p> <p>The IP address of the interface is used as the Originator-ID, which is the RP field in the SA message.</p>
<b>Step 4</b>	<b>ip msdp redistribute [list <i>access-list-name</i>] [<i>asn aspath-access-list-number</i>] [route-map <i>map</i>]</b> <b>Example:</b> <pre>Switch(config)# ip msdp redistribute list 100</pre>	<p>Configures which (S,G) entries from the multicast routing table are advertised in SA messages.</p> <p>For more information, see the <a href="#">Redistributing Sources, on page 994</a>.</p>

	Command or Action	Purpose
<b>Step 5</b>	<b>end</b> <b>Example:</b> Switch(config) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b> Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring an Originating Address other than the RP Address

You can allow an MSDP speaker that originates an SA message to use the IP address of the interface as the RP address in the SA message by changing the Originator ID. You might change the Originator ID in one of these cases:

- If you configure a logical RP on multiple Switch in an MSDP mesh group.
- If you have a Switch that borders a PIM sparse-mode domain and a dense-mode domain. If a Switch borders a dense-mode domain for a site, and sparse-mode is being used externally, you might want dense-mode sources to be known to the outside world. Because this Switch is not an RP, it would not have an RP address to use in an SA message. Therefore, this command provides the RP address by specifying the address of the interface.

If both the **ip msdp border sa-address** and the **ip msdp originator-id** global configuration commands are configured, the address derived from the **ip msdp originator-id** command specifies the address of the RP.

Follow these steps to allow an MSDP speaker that originates an SA message to use the IP address on the interface as the RP address in the SA message:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip msdp originator-id <i>interface-id</i></b> <b>Example:</b>  Switch(config)# <code>ip msdp originator-id 0/1</code>	Configures the RP address in SA messages to be the address of the originating device interface.  For <i>interface-id</i> , specify the interface on the local Switch.
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Switch(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b>  Switch# <code>show running-config</code>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Monitoring and Maintaining MSDP

Commands that monitor MSDP SA messages, peers, state, and peer status:

*Table 74: Commands for Monitoring and Maintaining MSDP*

Command	Purpose
<code>debug ip msdp [peer-address   name] [detail] [routes]</code>	Debugs an MSDP activity.
<code>debug ip msdp resets</code>	Debugs MSDP peer reset reasons.

Command	Purpose
<b>show ip msdp count</b> [ <i>autonomous-system-number</i> ]	Displays the number of sources and groups originated in SA messages from each autonomous system. The <b>ip msdp cache-sa-state</b> command must be configured for this command to produce any output.
<b>show ip msdp peer</b> [ <i>peer-address</i>   <i>name</i> ]	Displays detailed information about an MSDP peer.
<b>show ip msdp sa-cache</b> [ <i>group-address</i>   <i>source-address</i>   <i>group-name</i>   <i>source-name</i> ] [ <i>autonomous-system-number</i> ]	Displays (S,G) state learned from MSDP peers.
<b>show ip msdp summary</b>	Displays MSDP peer status and SA message counts.

Commands that clear MSDP connections, statistics, and SA cache entries:

**Table 75: Commands for Clearing MSDP Connections, Statistics, or SA Cache Entries**

Command	Purpose
<b>clear ip msdp peer</b> <i>peer-address</i>   <i>name</i>	Clears the TCP connection to the specified MSDP peer, resetting all MSDP message counters.
<b>clear ip msdp statistics</b> [ <i>peer-address</i>   <i>name</i> ]	Clears statistics counters for one or all the MSDP peers without resetting the sessions.
<b>clear ip msdp sa-cache</b> [ <i>group-address</i>   <i>name</i> ]	Clears the SA cache entries for all entries, all sources for a specific group, or all entries for a specific source/group pair.

## Configuration Examples for Configuring MSDP

### Configuring a Default MSDP Peer: Example

This example shows a partial configuration of Router A and Router C in . Each of these ISPs have more than one customer (like the customer in ) who use default peering (no BGP or MBGP). In that case, they might have similar configurations. That is, they accept SAs only from a default peer if the SA is permitted by the corresponding prefix list.

Router A

```
Router(config)# ip msdp default-peer 10.1.1.1
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
Router(config)# ip prefix-list site-b permit 10.0.0.0/1
```

Router C

```
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
Router(config)# ip prefix-list site-b permit 10.0.0.0/1
```

## Caching Source-Active State: Example

This example shows how to enable the cache state for all sources in 171.69.0.0/16 sending to groups 224.2.0.0/16:

```
Switch(config)# ip msdp cache-sa-state 100
Switch(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.2.0.0 0.0.255.255
```

## Controlling Source Information that Your Switch Originates: Example

This example shows how to configure the switch to filter SA request messages from the MSDP peer at 171.69.2.2. SA request messages from sources on network 192.4.22.0 pass access list 1 and are accepted; all others are ignored.

```
Switch(config)# ip msdp filter sa-request 171.69.2.2 list 1
Switch(config)# access-list 1 permit 192.4.22.0 0.0.0.255
```

## Controlling Source Information that Your Switch Forwards: Example

This example shows how to allow only (S,G) pairs that pass access list 100 to be forwarded in an SA message to the peer named *switch.cisco.com*:

```
Switch(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet1/0/1
Switch(config)# ip msdp sa-filter out switch.cisco.com list 100
Switch(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.2.0.0 0.0.255.255
```

## Controlling Source Information that Your Switch Receives: Example

This example shows how to filter all SA messages from the peer named *switch.cisco.com*:

```
Switch(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet1/0/1
Switch(config)# ip msdp sa-filter in switch.cisco.com
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring IP Unicast Routing

This module describes how to configure IP Version 4 (IPv4) unicast routing on the switch.

A switch stack operates and appears as a single router to the rest of the routers in the network. Basic routing functions like static routing and the Routing Information Protocol (RIP), are available with both the IP Base feature set and the IP Services feature set. To use advanced routing features and other routing protocols, you must have the IP Services feature set enabled on the standalone switch or on the active switch.

### Note

In addition to IPv4 traffic, you can also enable IP Version 6 (IPv6) unicast routing and configure interfaces to forward IPv6 traffic if the switch or switch stack is running the IP Base or IP Services feature set.

## Information About IP Routing

In some network environments, VLANs are associated with individual networks or subnetworks. In an IP network, each subnetwork is mapped to an individual VLAN. Configuring VLANs helps control the size of the broadcast domain and keeps local traffic local. However, network devices in different VLANs cannot communicate with one another without a Layer 3 device (router) to route traffic between the VLAN, referred to as inter-VLAN routing. You configure one or more routers to route traffic to the appropriate destination VLAN.

**Figure 64: Routing Topology Example**

This figure shows a basic routing topology. Switch A is in VLAN 10, and Switch B is in VLAN 20. The router

has an interface in each VLAN.

When Host A in VLAN 10 needs to communicate with Host B in VLAN 10, it sends a packet addressed to that host. Switch A forwards the packet directly to Host B, without sending it to the router.

When Host A sends a packet to Host C in VLAN 20, Switch A forwards the packet to the router, which receives the traffic on the VLAN 10 interface. The router checks the routing table, finds the correct outgoing

interface, and forwards the packet on the VLAN 20 interface to Switch B. Switch B receives the packet and forwards it to Host C.

## Types of Routing

Routers and Layer 3 switches can route packets in these ways:

- By using default routing
- By using preprogrammed static routes for the traffic
- By dynamically calculating routes by using a routing protocol

Default routing refers to sending traffic with a destination unknown to the router to a default outlet or destination.

Static unicast routing forwards packets from predetermined ports through a single path into and out of a network. Static routing is secure and uses little bandwidth, but does not automatically respond to changes in the network, such as link failures, and therefore, might result in unreachable destinations. As networks grow, static routing becomes a labor-intensive liability.

Switches running the LAN base feature set support 16 user-configured static routes, in addition to any default routes used for the management interface. The LAN base image supports static routing only on SVIs.

Dynamic routing protocols are used by routers to dynamically calculate the best route for forwarding traffic. There are two types of dynamic routing protocols:

- Routers using distance-vector protocols maintain routing tables with distance values of networked resources, and periodically pass these tables to their neighbors. Distance-vector protocols use one or a series of metrics for calculating the best routes. These protocols are easy to configure and use.
- Routers using link-state protocols maintain a complex database of network topology, based on the exchange of link-state advertisements (LSAs) between routers. LSAs are triggered by an event in the network, which speeds up the convergence time or time required to respond to these changes. Link-state protocols respond quickly to topology changes, but require greater bandwidth and more resources than distance-vector protocols.

Distance-vector protocols supported by the switch are Routing Information Protocol (RIP), which uses a single distance metric (cost) to determine the best path and Border Gateway Protocol (BGP), which adds a path vector mechanism. The switch also supports the Open Shortest Path First (OSPF) link-state protocol and Enhanced IGRP (EIGRP), which adds some link-state routing features to traditional Interior Gateway Routing Protocol (IGRP) to improve efficiency.

---

**Note** On a switch or switch stack, the supported protocols are determined by the software running on the active switch. If the active switch is running the IP base feature set, only default routing, static routing and RIP are supported. If the switch is running the LAN base feature set, you can configure 16 static routes on SVIs. All other routing protocols require the IP services feature set.

---

## IP Routing and Switch Stacks

A switch stack appears to the network as a single switch, regardless of which switch in the stack is connected to a routing peer.

The active switch performs these functions:

- It initializes and configures the routing protocols.
- It sends routing protocol messages and updates to other routers.
- It processes routing protocol messages and updates received from peer routers.
- It generates, maintains, and distributes the distributed Cisco Express Forwarding (dCEF) database to all stack members. The routes are programmed on all switches in the stack bases on this database.
- The MAC address of the active switch is used as the router MAC address for the whole stack, and all outside devices use this address to send IP packets to the stack.
- All IP packets that require software forwarding or processing go through the CPU of the active switch.

Stack members perform these functions:

- They act as routing standby switches, ready to take over in case they are elected as the new active switch if the active switch fails.
- They program the routes into hardware.

If a active switch fails, the stack detects that the active switch is down and elects one of the stack members to be the new active switch. During this period, except for a momentary interruption, the hardware continues to forward packets with no active protocols.

However, even though the switch stack maintains the hardware identification after a failure, the routing protocols on the router neighbors might flap during the brief interruption before the active switch restarts. Routing protocols such as OSPF and EIGRP need to recognize neighbor transitions. The router uses two levels of nonstop forwarding (NSF) to detect a switchover, to continue forwarding network traffic, and to recover route information from peer devices:

- NSF-aware routers tolerate neighboring router failures. After the neighbor router restarts, an NSF-aware router supplies information about its state and route adjacencies on request.
- NSF-capable routers support NSF. When they detect a active switch change, they rebuild routing information from NSF-aware or NSF-capable neighbors and do not wait for a restart.

The switch stack supports NSF-capable routing for OSPF and EIGRP.

Upon election, the new active switch performs these functions:

- It starts generating, receiving, and processing routing updates.
- It builds routing tables, generates the CEF database, and distributes it to stack members.
- It uses its MAC address as the router MAC address. To notify its network peers of the new MAC address, it periodically (every few seconds for 5 minutes) sends a gratuitous ARP reply with the new router MAC address.

---

**Note** If you configure the persistent MAC address feature on the stack and the active switch changes, the stack MAC address does not change for the configured time period. If the previous active switch rejoins the stack as a member switch during that time period, the stack MAC address remains the MAC address of the previous active switch.

---

- It attempts to determine the reachability of every proxy ARP entry by sending an ARP request to the proxy ARP IP address and receiving an ARP reply. For each reachable proxy ARP IP address, it generates a gratuitous ARP reply with the new router MAC address. This process is repeated for 5 minutes after a new active switch election.

---

**Note** When a active switch is running the IP services feature set, the stack can run all supported protocols, including Open Shortest Path First (OSPF), and Enhanced IGRP (EIGRP) . If the active switch fails and the new elected active switch is running the IP base or LAN base feature set, these protocols will no longer run in the stack.

---

---

**Caution** Partitioning of the switch stack into two or more stacks might lead to undesirable behavior in the network.

---

If the switch is reloaded, then all the ports on that switch go down and there is a loss of traffic for the interfaces involved in routing, despite NSF/SSO capability.

## Classless Routing

By default, classless routing behavior is enabled on the Switch when it is configured to route. With classless routing, if a router receives packets for a subnet of a network with no default route, the router forwards the packet to the best supernet route. A supernet consists of contiguous blocks of Class C address spaces used to simulate a single, larger address space and is designed to relieve the pressure on the rapidly depleting Class B address space.

In the figure, classless routing is enabled. When the host sends a packet to 120.20.4.1, instead of discarding the packet, the router forwards it to the best supernet route. If you disable classless routing and a router receives packets destined for a subnet of a network with no network default route, the router discards the packet.

Figure 65: IP Classless Routing

In the figure, the router in network 128.20.0.0 is connected to subnets 128.20.1.0, 128.20.2.0, and 128.20.3.0. If the host sends a packet to 128.20.4.1, because there is no network default route, the router discards the packet.

Figure 66: No IP Classless Routing

To prevent the Switch from forwarding packets destined for unrecognized subnets to the best supernet route possible, you can disable classless routing behavior.

## Address Resolution

You can control interface-specific handling of IP by using address resolution. A device using IP can have both a local address or MAC address, which uniquely defines the device on its local segment or LAN, and a network address, which identifies the network to which the device belongs.

**Note** In a switch stack, network communication uses a single MAC address and the IP address of the stack.

The local address or MAC address is known as a data link address because it is contained in the data link layer (Layer 2) section of the packet header and is read by data link (Layer 2) devices. To communicate with a device on Ethernet, the software must learn the MAC address of the device. The process of learning the MAC address from an IP address is called *address resolution*. The process of learning the IP address from the MAC address is called *reverse address resolution*.

The Switch can use these forms of address resolution:

- Address Resolution Protocol (ARP) is used to associate IP address with MAC addresses. Taking an IP address as input, ARP learns the associated MAC address and then stores the IP address/MAC address association in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests or replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP).
- Proxy ARP helps hosts with no routing tables learn the MAC addresses of hosts on other networks or subnets. If the Switch (router) receives an ARP request for a host that is not on the same interface as the ARP request sender, and if the router has all of its routes to the host through other interfaces, it generates a proxy ARP packet giving its own local data link address. The host that sent the ARP request then sends its packets to the router, which forwards them to the intended host.

The Switch also uses the Reverse Address Resolution Protocol (RARP), which functions the same as ARP does, except that the RARP packets request an IP address instead of a local MAC address. Using RARP requires a RARP server on the same network segment as the router interface. Use the **ip rarp-server address** interface configuration command to identify the server.

For more information on RARP, see the *Cisco IOS Configuration Fundamentals Configuration Guide*

## Proxy ARP

Proxy ARP, the most common method for learning about other routes, enables an Ethernet host with no routing information to communicate with hosts on other networks or subnets. The host assumes that all hosts are on the same local Ethernet and that they can use ARP to learn their MAC addresses. If a Switch receives an ARP request for a host that is not on the same network as the sender, the Switch evaluates whether it has the best route to that host. If it does, it sends an ARP reply packet with its own Ethernet MAC address, and the host that sent the request sends the packet to the Switch, which forwards it to the intended host. Proxy ARP treats all networks as if they are local and performs ARP requests for every IP address.

## ICMP Router Discovery Protocol

Router discovery allows the Switch to dynamically learn about routes to other networks using ICMP router discovery protocol (IRDP). IRDP allows hosts to locate routers. When operating as a client, the Switch generates router discovery packets. When operating as a host, the Switch receives router discovery packets. The Switch can also listen to Routing Information Protocol (RIP) routing updates and use this information to infer locations of routers. The Switch does not actually store the routing tables sent by routing devices; it merely keeps track of which systems are sending the data. The advantage of using IRDP is that it allows each router to specify both a priority and the time after which a device is assumed to be down if no further packets are received.

Each device discovered becomes a candidate for the default router, and a new highest-priority router is selected when a higher priority router is discovered, when the current default router is declared down, or when a TCP connection is about to time out because of excessive retransmissions.

## UDP Broadcast Packets and Protocols

User Datagram Protocol (UDP) is an IP host-to-host layer protocol, as is TCP. UDP provides a low-overhead, connectionless session between two end systems and does not provide for acknowledgment of received datagrams. Network hosts occasionally use UDP broadcasts to find address, configuration, and name information. If such a host is on a network segment that does not include a server, UDP broadcasts are normally not forwarded. You can remedy this situation by configuring an interface on a router to forward certain classes of broadcasts to a helper address. You can use more than one helper address per interface.

You can specify a UDP destination port to control which UDP services are forwarded. You can specify multiple UDP protocols. You can also specify the Network Disk (ND) protocol, which is used by older diskless Sun workstations and the network security protocol SDNS.

By default, both UDP and ND forwarding are enabled if a helper address has been defined for an interface. The description for the **ip forward-protocol** interface configuration command in the *Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services* lists the ports that are forwarded by default if you do not specify any UDP ports.

## Broadcast Packet Handling

After configuring an IP interface address, you can enable routing and configure one or more routing protocols, or you can configure the way the Switch responds to network broadcasts. A broadcast is a data packet destined for all hosts on a physical network. The Switch supports two kinds of broadcasting:

- A directed broadcast packet is sent to a specific network or series of networks. A directed broadcast address includes the network or subnet fields.
- A flooded broadcast packet is sent to every network.

---

**Note** You can also limit broadcast, unicast, and multicast traffic on Layer 2 interfaces by using the **storm-control** interface configuration command to set traffic suppression levels.

---

Routers provide some protection from broadcast storms by limiting their extent to the local cable. Bridges (including intelligent bridges), because they are Layer 2 devices, forward broadcasts to all network segments, thus propagating broadcast storms. The best solution to the broadcast storm problem is to use a single broadcast address scheme on a network. In most modern IP implementations, you can set the address to be used as the broadcast address. Many implementations, including the one in the Switch, support several addressing schemes for forwarding broadcast messages.

## IP Broadcast Flooding

You can allow IP broadcasts to be flooded throughout your internetwork in a controlled fashion by using the database created by the bridging STP. Using this feature also prevents loops. To support this capability, bridging must be configured on each interface that is to participate in the flooding. If bridging is not configured

on an interface, it still can receive broadcasts. However, the interface never forwards broadcasts it receives, and the router never uses that interface to send broadcasts received on a different interface.

Packets that are forwarded to a single network address using the IP helper-address mechanism can be flooded. Only one copy of the packet is sent on each network segment.

To be considered for flooding, packets must meet these criteria. (Note that these are the same conditions used to consider packet forwarding using IP helper addresses.)

- The packet must be a MAC-level broadcast.
- The packet must be an IP-level broadcast.
- The packet must be a TFTP, DNS, Time, NetBIOS, ND, or BOOTP packet, or a UDP specified by the **ip forward-protocol udp** global configuration command.
- The time-to-live (TTL) value of the packet must be at least two.

A flooded UDP datagram is given the destination address specified with the **ip broadcast-address** interface configuration command on the output interface. The destination address can be set to any address. Thus, the destination address might change as the datagram propagates through the network. The source address is never changed. The TTL value is decremented.

When a flooded UDP datagram is sent out an interface (and the destination address possibly changed), the datagram is handed to the normal IP output routines and is, therefore, subject to access lists, if they are present on the output interface.

In the Switch, the majority of packets are forwarded in hardware; most packets do not go through the Switch CPU. For those packets that do go to the CPU, you can speed up spanning tree-based UDP flooding by a factor of about four to five times by using turbo-flooding. This feature is supported over Ethernet interfaces configured for ARP encapsulation.

## How to Configure IP Routing

By default, IP routing is disabled on the Switch, and you must enable it before routing can take place. For detailed IP routing configuration information, see the *Cisco IOS IP Configuration Guide*.

In the following procedures, the specified interface must be one of these Layer 3 interfaces:

- A routed port: a physical port configured as a Layer 3 port by using the **no switchport** interface configuration command.
- A switch virtual interface (SVI): a VLAN interface created by using the **interface vlan** *vlan\_id* global configuration command and by default a Layer 3 interface.
- An EtherChannel port channel in Layer 3 mode: a port-channel logical interface created by using the **interface port-channel** *port-channel-number* global configuration command and binding the Ethernet interface into the channel group. For more information, see the “Configuring Layer 3 EtherChannels” chapter in the Layer 2 Configuration Guide.

---

**Note** The switch does not support tunnel interfaces for unicast routed traffic.

---

All Layer 3 interfaces on which routing will occur must have IP addresses assigned to them.

**Note** A Layer 3 switch can have an IP address assigned to each routed port and SVI.

The number of routed ports and SVIs that you can configure is limited to 128, exceeding the recommended number and volume of features being implemented might impact CPU utilization because of hardware limitations.

Configuring routing consists of several main procedures:

- To support VLAN interfaces, create and configure VLANs on the Switch or switch stack, and assign VLAN membership to Layer 2 interfaces. For more information, see the "Configuring VLANs" chapter in the VLAN Configuration Guide.
- Configure Layer 3 interfaces.
- Enable IP routing on the switch.
- Assign IP addresses to the Layer 3 interfaces.
- Enable selected routing protocols on the switch.
- Configure routing protocol parameters (optional).

## How to Configure IP Addressing

A required task for configuring IP routing is to assign IP addresses to Layer 3 network interfaces to enable the interfaces and allow communication with the hosts on those interfaces that use IP. The following sections describe how to configure various IP addressing features. Assigning IP addresses to the interface is required; the other procedures are optional.

- Default Addressing Configuration
- Assigning IP Addresses to Network Interfaces
- Configuring Address Resolution Methods
- Routing Assistance When IP Routing is Disabled
- Configuring Broadcast Packet Handling
- Monitoring and Maintaining IP Addressing

## Default IP Addressing Configuration

*Table 76: Default Addressing Configuration*

Feature	Default Setting
IP address	None defined.

Feature	Default Setting
ARP	No permanent entries in the Address Resolution Protocol (ARP) cache. Encapsulation: Standard Ethernet-style ARP. Timeout: 14400 seconds (4 hours).
IP broadcast address	255.255.255.255 (all ones).
IP classless routing	Enabled.
IP default gateway	Disabled.
IP directed broadcast	Disabled (all IP directed broadcasts are dropped).
IP domain	Domain list: No domain names defined. Domain lookup: Enabled. Domain name: Enabled.
IP forward-protocol	If a helper address is defined or User Datagram Protocol (UDP) flooding is configured, UDP forwarding is enabled on default ports. Any-local-broadcast: Disabled. Spanning Tree Protocol (STP): Disabled. Turbo-flood: Disabled.
IP helper address	Disabled.
IP host	Disabled.
IRDP	Disabled. Defaults when enabled: <ul style="list-style-type: none"> <li>• Broadcast IRDP advertisements.</li> <li>• Maximum interval between advertisements: 600 seconds.</li> <li>• Minimum interval between advertisements: 0.75 times max interval</li> <li>• Preference: 0.</li> </ul>
IP proxy ARP	Enabled.
IP routing	Disabled.
IP subnet-zero	Disabled.

## Assigning IP Addresses to Network Interfaces

An IP address identifies a location to which IP packets can be sent. Some IP addresses are reserved for special uses and cannot be used for host, subnet, or network addresses. RFC 1166, “Internet Numbers,” contains the official description of IP addresses.

An interface can have one primary IP address. A mask identifies the bits that denote the network number in an IP address. When you use the mask to subnet a network, the mask is referred to as a subnet mask. To receive an assigned network number, contact your Internet service provider.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b>  Switch(config)# <b>interface</b> <b>gigabitethernet 1/0/1</b>	Enters interface configuration mode, and specifies the Layer 3 interface to configure.
<b>Step 4</b>	<b>no switchport</b> <b>Example:</b>  Switch(config-if)# <b>no switchport</b>	Removes the interface from Layer 2 configuration mode (if it is a physical interface).
<b>Step 5</b>	<b>ip address <i>ip-address subnet-mask</i></b> <b>Example:</b>  Switch(config-if)# <b>ip address 10.1.5.1</b> <b>255.255.255.0</b>	Configures the IP address and IP subnet mask.
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b>  Switch(config-if)# <b>no shutdown</b>	Enables the physical interface.
<b>Step 7</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Switch(config)# <b>end</b>	
<b>Step 8</b>	<b>show ip route</b> <b>Example:</b> Switch# show ip route	Verifies your entries.
<b>Step 9</b>	<b>show ip interface [interface-id]</b> <b>Example:</b> Switch# show ip interface gigabitethernet 1/0/1	Verifies your entries.
<b>Step 10</b>	<b>show running-config</b> <b>Example:</b> Switch# <b>show running-config</b>	Verifies your entries.
<b>Step 11</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Using Subnet Zero

Subnetting with a subnet address of zero is strongly discouraged because of the problems that can arise if a network and a subnet have the same addresses. For example, if network 131.108.0.0 is subnetted as 255.255.255.0, subnet zero would be written as 131.108.0.0, which is the same as the network address.

You can use the all ones subnet (131.108.255.0) and even though it is discouraged, you can enable the use of subnet zero if you need the entire subnet space for your IP address.

Use the **no ip subnet-zero** global configuration command to restore the default and disable the use of subnet zero.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Switch# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip subnet-zero</b> <b>Example:</b>  Switch(config)# <code>ip subnet-zero</code>	Enables the use of subnet zero for interface addresses and routing updates.
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Switch(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b>  Switch# <code>show running-config</code>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Disabling Classless Routing

To prevent the Switch from forwarding packets destined for unrecognized subnets to the best supernet route possible, you can disable classless routing behavior.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Switch> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Switch# <code>configure terminal</code>	
<b>Step 3</b>	<b>no ip classless</b> <b>Example:</b> Switch(config)# <code>no ip classless</code>	Disables classless routing behavior.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b> Switch# <code>show running-config</code>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Configuring Address Resolution Methods

You can perform the following tasks to configure address resolution.

### Defining a Static ARP Cache

ARP and other address resolution protocols provide dynamic mapping between IP addresses and MAC addresses. Because most hosts support dynamic address resolution, you usually do not need to specify static ARP cache entries. If you must define a static ARP cache entry, you can do so globally, which installs a permanent entry in the ARP cache that the Switch uses to translate IP addresses into MAC addresses. Optionally, you can also specify that the Switch respond to ARP requests as if it were the owner of the specified IP address. If you do not want the ARP entry to be permanent, you can specify a timeout period for the ARP entry.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Switch> <b>enable</b>	
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
