## CONTENTS

---

### Preface

#### Preface **xcv**

Document Conventions **xcv**

Related Documentation **xcvii**

Obtaining Documentation and Submitting a Service Request **xcvii**

---

### CHAPTER 1

#### Using the Command-Line Interface **1**

Information About Using the Command-Line Interface **1**

Command Modes **1**

Using the Help System **3**

Understanding Abbreviated Commands **4**

No and Default Forms of Commands **5**

CLI Error Messages **5**

Configuration Logging **5**

How to Use the CLI to Configure Features **6**

Configuring the Command History **6**

    Changing the Command History Buffer Size **6**

    Recalling Commands **6**

    Disabling the Command History Feature **7**

Enabling and Disabling Editing Features **7**

    Editing Commands Through Keystrokes **8**

    Editing Command Lines That Wrap **9**

Searching and Filtering Output of show and more Commands **10**

Accessing the CLI on a Switch Stack **11**

Accessing the CLI Through a Console Connection or Through Telnet **11**

---

### CHAPTER 2

#### Using the Web Graphical User Interface **13**

Prerequisites for Using the Web GUI **13**

Information About Using The Web GUI	13
Web GUI Features	13
Connecting the Console Port of the Switch	15
Logging On to the Web GUI	15
Enabling Web and Secure Web Modes	15
Configuring the Switch Web GUI	16

**PART I****Cisco Flexible NetFlow 21****CHAPTER 3****Configuring Flexible NetFlow 23**

Finding Feature Information	23
Prerequisites for Flexible NetFlow	23
Prerequisites for Wireless Flexible NetFlow	24
Restrictions for Flexible NetFlow	24
Information About NetFlow	25
Flexible NetFlow Overview	25
Wireless Flexible NetFlow Overview	26
Flow Records	27
Flexible NetFlow Match Parameters	27
Flexible NetFlow Collect Parameters	29
Exporters	30
Export Formats	31
Monitors	31
Samplers	32
Supported Flexible NetFlow Fields	32
Default Settings	36
How to Configure Flexible NetFlow	37
Creating a Flow Record	37
Creating a Flow Exporter	39
Creating a Flow Monitor	41
Creating a Sampler	43
Applying a Flow to an Interface	44
Configuring a Bridged NetFlow on a VLAN	46
Configuring Layer 2 NetFlow	47
Configuring WLAN to Apply Flow Monitor in Data Link Input/Output Direction	48

Configuring WLAN to Apply Flow Monitor in IPV4 and IPv6 Input/Output Direction	49
Monitoring Flexible NetFlow	50
Configuration Examples for Flexible NetFlow	51
Example: Configuring a Flow	51
Example: Configuring IPv4 Flexible NetFlow in WLAN (Ingress Direction)	52
Example: Configuring IPv6 and Transport Flag Flexible NetFlow in WLAN (Egress Direction)	52
Example: Configuring IPv6 Flexible NetFlow in WLAN (Both Ingress and Egress Directions)	53
Additional References	54
Feature Information for Flexible NetFlow	55

---

**PART II**
**CleanAir 57**

---

**CHAPTER 4**
**Configuring Cisco CleanAir 59**

Finding Feature Information	59
Prerequisites for CleanAir	59
Restrictions for CleanAir	60
Information About CleanAir	61
Cisco CleanAir Components	61
Terms Used in Cisco CleanAir	63
Interference Types that Cisco CleanAir can Detect	63
Interference Device Merging	65
Persistent Devices	65
Persistent Devices Detection	65
Persistent Device Avoidance	65
EDRRM and AQR Update Mode	65
CleanAir High Availability	66
How to Configure CleanAir	66
Enabling CleanAir for 2.4-GHz Band	66
Configuring a CleanAir Alarm for 2.4-GHz Air-Quality and Devices	67
Configuring Interference Reporting for 2.4-GHz Devices	68
Enabling CleanAir for 5-GHz Band	70
Configuring a CleanAir Alarm for 5-GHz Air-Quality and Devices	71
Configuring Interference Reporting for 5-GHz devices	72

Configuring EDRRM for CleanAir-Events	73
Configuring Persistent Device Avoidance	74
Configuring Cisco CleanAir using the Controller GUI	75
Configuring Cisco CleanAir on the Cisco Wireless LAN Controller (GUI)	75
Configuring Cisco CleanAir on an Access Point (GUI)	77
Configuring Cisco Spectrum Expert	78
Configuring Spectrum Expert (GUI)	78
Configuring Spectrum Expert (CLI)	79
Monitoring CleanAir Parameters	80
Monitoring the Interference Devices	83
Monitoring the Interference Devices (GUI)	83
Monitoring the Worst Air Quality of Radio Bands (GUI)	84
Configuration Examples for Configuring CleanAir	85
CleanAir FAQs	85
Additional References	87

---

**PART III**
**Interface and Hardware Component 89**

---

**CHAPTER 5**
**Configuring Interface Characteristics 91**

Finding Feature Information	91
Information About Configuring Interface Characteristics	91
Interface Types	91
Port-Based VLANs	92
Switch Ports	92
Access Ports	92
Trunk Ports	93
Tunnel Ports	93
Routed Ports	93
Switch Virtual Interfaces	94
SVI Autostate Exclude	94
EtherChannel Port Groups	95
Power over Ethernet Ports	95
Using the Switch USB Ports	95
USB Mini-Type B Console Port	95
Console Port Change Logs	96

Interface Connections	96
Default Ethernet Interface Configuration	97
Interface Speed and Duplex Mode	98
Speed and Duplex Configuration Guidelines	99
IEEE 802.3x Flow Control	99
Layer 3 Interfaces	100
How to Configure Interface Characteristics	101
Configuring Interfaces Procedure	101
Adding a Description for an Interface	102
Configuring a Range of Interfaces	103
Configuring and Using Interface Range Macros	104
Configuring Ethernet Interfaces	105
Setting the Interface Speed and Duplex Parameters	105
Configuring IEEE 802.3x Flow Control	107
Configuring Layer 3 Interfaces	108
Configuring SVI Autostate Exclude	109
Shutting Down and Restarting the Interface	110
Configuring the Console Media Type	111
Configuring the USB Inactivity Timeout	112
Monitoring Interface Characteristics	113
Monitoring Interface Status	113
Clearing and Resetting Interfaces and Counters	114
Configuration Examples for Interface Characteristics	115
Adding a Description to an Interface: Example	115
Identifying Interfaces on a Stack-Capable Switch: Examples	115
Configuring a Range of Interfaces: Examples	115
Configuring and Using Interface Range Macros: Examples	116
Setting Interface Speed and Duplex Mode: Example	116
Configuring Layer 3 Interfaces: Example	116
Configuring the Console Media Type: Example	117
Configuring the USB Inactivity Timeout: Example	117
Additional References for the Interface Characteristics Feature	118
Feature History and Information for Configuring Interface Characteristics	119

Prerequisites for Auto-MDIX	121
Restrictions for Auto-MDIX	121
Information about Configuring Auto-MDIX	122
Auto-MDIX on an Interface	122
How to Configure Auto-MDIX	122
Configuring Auto-MDIX on an Interface	122
Monitoring Auto-MDIX	123
Example for Configuring Auto-MDIX	124
Additional References	124
Feature History and Information for Auto-MDIX	125

**CHAPTER 7****Configuring Ethernet Management Port 127**

Finding Feature Information	127
Prerequisites for Ethernet Management Ports	127
Information about the Ethernet Management Port	127
Ethernet Management Port Direct Connection to a Switch	128
Ethernet Management Port Connection to Stack Switches using a Hub	128
Ethernet Management Port and Routing	128
Supported Features on the Ethernet Management Port	129
How to Configure the Ethernet Management Port	130
Disabling and Enabling the Ethernet Management Port	130
Additional References	131
Feature Information for Ethernet Management Ports	132

**CHAPTER 8****Configuring LLDP, LLDP-MED, and Wired Location Service 133**

Finding Feature Information	133
LLDP, LLDP-MED, and Wired Location Service Overview	133
LLDP	133
LLDP Supported TLVs	134
LLDP and Cisco Switch Stacks	134
LLDP and Cisco Medianet	134
LLDP-MED	134
LLDP-MED Supported TLVs	134
Wired Location Service	136
Default LLDP Configuration	137

Configuration Guidelines	137
How to Configure LLDP, LLDP-MED, and Wired Location Service	138
Enabling LLDP	138
Configuring LLDP Characteristics	139
Configuring LLDP-MED TLVs	141
Configuring Network-Policy TLV	143
Configuring Location TLV and Wired Location Service	145
Enabling Wired Location Service on the Switch	148
Configuration Examples for LLDP, LLDP-MED, and Wired Location Service	149
Configuring Network-Policy TLV: Examples	149
Monitoring and Maintaining LLDP, LLDP-MED, and Wired Location Service	150
Additional References for LLDP, LLDP-MED, and Wired Location Service	151
Feature Information for LLDP, LLDP-MED, and Wired Location Service	151

**CHAPTER 9****Configuring System MTU 153**

Finding Feature Information	153
Information about the MTU	153
System MTU Values	153
System MTU Guidelines	154
System MTU Value Application	154
How to Configure MTU Sizes	154
Configuring the System MTU	154
Configuring Protocol-Specific MTU	155
Configuration Examples for System MTU	157
Additional References for System MTU	157
Feature Information for System MTU	158

**CHAPTER 10****Configuring Internal Power Supplies 159**

Information About Internal Power Supplies	159
How to Configure Internal Power Supplies	159
Configuring an Internal Power Supply	159
Monitoring Internal Power Supplies	160
Configuration Examples for Internal Power Supplies	160
Additional References	161
Feature History and Information for Internal Power Supplies	162

---

**CHAPTER 11****Configuring PoE 163**

- Finding Feature Information 163
- Information about PoE 163
  - Power over Ethernet Ports 163
    - Supported Protocols and Standards 164
    - Powered-Device Detection and Initial Power Allocation 164
    - Power Management Modes 166
      - Power Monitoring and Power Policing 167
      - Power Consumption Values 167
- How to Configure PoE 168
  - Configuring a Power Management Mode on a PoE Port 168
  - Configuring Power Policing 169
- Monitoring Power Status 172
- Additional References 172
- Feature Information for PoE 173

---

**CHAPTER 12****Configuring EEE 175**

- Finding Feature Information 175
- Information About EEE 175
  - EEE Overview 175
  - Default EEE Configuration 176
- Restrictions for EEE 176
- How to Configure EEE 176
  - Enabling or Disabling EEE 176
- Monitoring EEE 177
- Configuration Examples for Configuring EEE 177
- Additional References 178
- Feature History and Information for Configuring EEE 179

---

**PART IV****IP Multicast Routing 181**

---

**CHAPTER 13****Configuring IGMP 183**

- Finding Feature Information 183
- Restrictions for Configuring IGMP 183

Information About IGMP	184
IP Multicast Group Addresses	184
IGMP Versions	185
IGMP Version 1	185
IGMP Version 2	185
IGMP Version 3	185
IGMPv3 Host Signalling	185
IGMP Snooping	186
Joining a Multicast Group	186
Leaving a Multicast Group	188
Immediate Leave	189
IGMP Configurable-Leave Timer	189
IGMP Report Suppression	189
IGMP Snooping and Switch Stacks	190
IGMP Filtering and Throttling Overview	190
Default IGMP Configuration	190
Default IGMP Snooping Configuration	191
Default IGMP Filtering and Throttling Configuration	191
How to Configure IGMP	192
Configuring the Switch as a Member of a Group (CLI)	192
Controlling Access to IP Multicast Group (CLI)	194
Modifying the IGMP Host-Query Message Interval (CLI)	196
Changing the IGMP Query Timeout for IGMPv2 (CLI)	198
Changing the Maximum Query Response Time for IGMPv2 (CLI)	200
Configuring the Switch as a Statically Connected Member (CLI)	202
Configuring IGMP Profiles (CLI)	203
Applying IGMP Profiles (CLI)	205
Setting the Maximum Number of IGMP Groups (CLI)	207
Configuring the IGMP Throttling Action (CLI)	208
How to Configure IGMP Snooping	211
Enabling or Disabling IGMP Snooping on a Switch (CLI)	211
Enabling or Disabling IGMP Snooping on a VLAN Interface (CLI)	212
Setting the Snooping Method (CLI)	213
Configuring a Multicast Router Port (CLI)	214
Configuring a Host Statically to Join a Group (CLI)	216

Enabling IGMP Immediate Leave (CLI)	217
Configuring the IGMP Leave Timer (CLI)	218
Configuring the IGMP Robustness-Variable (CLI)	220
Configuring the IGMP Last Member Query Count (CLI)	222
Configuring TCN-Related Commands	223
Controlling the Multicast Flooding Time After a TCN Event (CLI)	223
Recovering from Flood Mode (CLI)	224
Disabling Multicast Flooding During a TCN Event (CLI)	226
Configuring the IGMP Snooping Querier (CLI)	227
Disabling IGMP Report Suppression (CLI)	230
Monitoring IGMP	231
Displaying IGMP Snooping Information	232
Displaying IGMP Filtering and Throttling Configuration	233
Configuration Examples for IGMP	234
Example: Configuring the Switch as a Member of a Multicast Group	234
Example: Controlling Access to Multicast Groups	234
Examples: Configuring IGMP Snooping	234
Examples: Configuring Filtering and Throttling	235
Example: Interface Configuration as a Routed Port	236
Example: Interface Configuration as an SVI	236
Where to Go Next for IGMP	237
Additional References	237
Feature History and Information for IGMP	238

**CHAPTER 14**

<b>Configuring Wireless Multicast</b>	<b>239</b>
Finding Feature Information	239
Prerequisites for Configuring Wireless Multicast	239
Restrictions for Configuring Wireless Multicast	240
Information About Wireless Multicast	240
Information About Multicast Optimization	241
How to Configure Wireless Multicast	241
Configuring Wireless Multicast-MCMC Mode (CLI)	241
Configuring Wireless Multicast-MCUC Mode (CLI)	242
Configuring IPv6 Snooping (CLI)	243
Configuring IPv6 Snooping Policy (CLI)	244

Configuring Layer 2 Port as Multicast Router Port (CLI)	245
Configuring RA Guard (CLI)	246
Configuring Non-IP Wireless Multicast (CLI)	247
Configuring Wireless Broadcast (CLI)	248
Configuring IP Multicast VLAN for WLAN (CLI)	249
Monitoring Wireless Multicast	250
Where to Go Next for Wireless Multicast	251
Additional References	251

---

**CHAPTER 15****Configuring PIM 253**

Finding Feature Information	253
Prerequisites for Configuring PIM	253
Restrictions for Configuring PIM	254
Restrictions for Configuring Auto-RP	254
Restrictions for Configuring Auto-RP and BSR	255
Information About PIM	255
PIM Versions	256
PIMv1 and PIMv2 Interoperability	256
PIM Modes	257
PIM DM	257
PIM-SM	257
Multicast Source Discovery Protocol (MSDP)	258
PIM Stub Routing	258
IGMP Helper	259
Auto-RP	259
Auto-RP Benefits	260
PIM v2 BSR	260
Multicast Forwarding and Reverse Path Check	261
PIM Shared Tree and Source Tree	262
Default PIM Routing Configuration	264
How to Configure PIM	264
Enabling PIM Stub Routing (CLI)	264
Configuring a Rendezvous Point	267
Manually Assigning an RP to Multicast Groups (CLI)	267
Setting Up Auto-RP in a New Internetwork (CLI)	269

Adding Auto-RP to an Existing Sparse-Mode Cloud (CLI)	272
Preventing Join Messages to False RPs (CLI)	275
Filtering Incoming RP Announcement Messages (CLI)	275
Configuring PIMv2 BSR	277
Defining the PIM Domain Border (CLI)	277
Defining the IP Multicast Boundary (CLI)	280
Configuring Candidate BSRs (CLI)	282
Configuring the Candidate RPs (CLI)	283
Configuring Auto-RP and BSR for the Network (CLI)	285
Delaying the Use of PIM Shortest-Path Tree (CLI)	286
Modifying the PIM Router-Query Message Interval (CLI)	288
Monitoring PIM	290
Monitoring RP Mapping	291
Troubleshooting PIMv1 and PIMv2 Interoperability Problems	291
Configuration Examples for PIM	292
Example: Enabling PIM Stub Routing	292
Example: Verifying PIM Stub Routing	292
Example: Manually Assigning an RP to Multicast Groups	292
Example: Configuring Auto-RP	293
Example: Defining the IP Multicast Boundary to Deny Auto-RP Information	293
Example: Filtering Incoming RP Announcement Messages	293
Example: Preventing Join Messages to False RPs	294
Example: Configuring Candidate BSRs	294
Example: Configuring Candidate RPs	294
Where to Go Next for PIM	294
Additional References	295
Feature History and Information for PIM	297

**CHAPTER 16****Configuring SSM 299**

Finding Feature Information	299
Prerequisites for Configuring SSM	299
Restrictions for Configuring SSM	300
Information About SSM	301
SSM Components Overview	301
SSM and Internet Standard Multicast (ISM)	301

SSM IP Address Range	302
SSM Operations	302
SSM Mapping	302
Static SSM Mapping	303
DNS-Based SSM Mapping	303
How to Configure SSM	304
Configuring SSM (CLI)	304
Configuring Source Specific Multicast Mapping	306
Configuring Static SSM Mapping (CLI)	306
Configuring DNS-Based SSM Mapping (CLI)	307
Configuring Static Traffic Forwarding with SSM Mapping (CLI)	309
Monitoring SSM	311
Monitoring SSM Mapping	312
Where to Go Next for SSM	312
Additional References	312
Feature History and Information for SSM	314

---

**CHAPTER 17**

<b>Configuring IP Multicast Routing</b>	<b>315</b>
Finding Feature Information	315
Prerequisites for Configuring IP Multicast Routing	315
Restrictions for Configuring IP Multicast Routing	316
Information About IP Multicast Routing	316
Cisco's Implementation of IP Multicast Routing	316
Multicast Forwarding Information Base Overview	317
Multicast Group Concept	318
Multicast Boundaries	318
Multicast Routing and Switch Stacks	319
Default Multicast Routing Configuration	320
How to Configure Basic IP Multicast Routing	320
Configuring Basic IP Multicast Routing (CLI)	320
Configuring IP Multicast Forwarding (CLI)	322
Configuring a Static Multicast Route (mroute) (CLI)	324
Configuring sdr Listener Support	326
Enabling sdr Listener Support (CLI)	326
Limiting How Long an sdr Cache Entry Exists (CLI)	328

Configuring an IP Multicast Boundary (CLI)	329
Monitoring and Maintaining IP Multicast Routing	332
Clearing Caches, Tables, and Databases	332
Displaying System and Network Statistics	333
Monitoring IP Multicast Routing	335
Configuration Examples for IP Multicast Routing	336
Example: Configuring an IP Multicast Boundary	336
Example: Responding to mrinfo Requests	336
Where to Go Next for IP Multicast	336
Additional References	337
Feature History and Information for IP Multicast	338

**CHAPTER 18****Configuring the Service Discovery Gateway 339**

Finding Feature Information	339
Restrictions for Configuring the Service Discovery Gateway	339
Information about the Service Discovery Gateway and mDNS	340
mDNS	340
mDNS-SD	340
mDNS-SD Considerations for Wireless Clients	340
Service Discovery Gateway	341
mDNS Gateway and Subnets	341
Filtering	342
How to Configure the Service Discovery Gateway	343
Configuring the Service List (CLI)	343
Configuring Service List (GUI)	346
Enabling mDNS Gateway and Redistributing Services (CLI)	347
Enabling Multicast DNS Gateway (GUI)	350
Monitoring Service Discovery Gateway	351
Configuration Examples	351
Example: Specify Alternative Source Interface for Outgoing mDNS Packets	351
Example: Redistribute Service Announcements	351
Example: Disable Bridging of mDNS Packets to Wireless Clients	352
Example: Creating a Service-List, Applying a Filter and Configuring Parameters	352
Example: Enabling mDNS Gateway and Redistributing Services	352
Example: Global mDNS Configuration	353

Example: Interface mDNS Configuration	353
Where to Go Next for Configuring Services Discovery Gateway	353
Additional References	354
Feature History and Information for Services Discovery Gateway	355

**PART V****IPv6 357****CHAPTER 19****Configuring MLD Snooping 359**

Finding Feature Information	359
Information About Configuring IPv6 MLD Snooping	359
Understanding MLD Snooping	360
MLD Messages	360
MLD Queries	361
Multicast Client Aging Robustness	361
Multicast Router Discovery	361
MLD Reports	362
MLD Done Messages and Immediate-Leave	362
Topology Change Notification Processing	363
MLD Snooping in Switch Stacks	363
How to Configure IPv6 MLD Snooping	363
Default MLD Snooping Configuration	363
MLD Snooping Configuration Guidelines	364
Enabling or Disabling MLD Snooping on the Switch (CLI)	364
Enabling or Disabling MLD Snooping on a VLAN (CLI)	365
Configuring a Static Multicast Group (CLI)	366
Configuring a Multicast Router Port (CLI)	367
Enabling MLD Immediate Leave (CLI)	368
Configuring MLD Snooping Queries (CLI)	369
Disabling MLD Listener Message Suppression (CLI)	370
Displaying MLD Snooping Information	371
Configuration Examples for Configuring MLD Snooping	372
Configuring a Static Multicast Group: Example	372
Configuring a Multicast Router Port: Example	373
Enabling MLD Immediate Leave: Example	373
Configuring MLD Snooping Queries: Example	373

---

**CHAPTER 20**

<b>Configuring IPv6 Unicast Routing</b>	<b>375</b>
Finding Feature Information	375
Information About Configuring IPv6 Unicast Routing	375
Understanding IPv6	375
IPv6 Addresses	376
Supported IPv6 Unicast Routing Features	376
128-Bit Wide Unicast Addresses	376
DNS for IPv6	377
Path MTU Discovery for IPv6 Unicast	377
ICMPv6	377
Neighbor Discovery	377
Default Router Preference	377
IPv6 Stateless Autoconfiguration and Duplicate Address Detection	378
IPv6 Applications	378
DHCP for IPv6 Address Assignment	378
Static Routes for IPv6	378
RIP for IPv6	378
OSPF for IPv6	379
HSRP for IPv6	379
EIGRP IPv6	379
SNMP and Syslog Over IPv6	379
HTTP(S) Over IPv6	380
Unsupported IPv6 Unicast Routing Features	380
IPv6 Feature Limitations	381
IPv6 and Switch Stacks	381
Default IPv6 Configuration	382
Configuring IPv6 Addressing and Enabling IPv6 Routing (CLI)	382
Configuring IPv4 and IPv6 Protocol Stacks (CLI)	385
Configuring Default Router Preference (CLI)	388
Configuring IPv6 ICMP Rate Limiting (CLI)	389
Configuring CEF and dCEF for IPv6	390
Configuring Static Routing for IPv6 (CLI)	390
Configuring RIP for IPv6 (CLI)	392
Configuring OSPF for IPv6 (CLI)	394

Configuring EIGRP for IPv6	396
Displaying IPv6	397
Configuring DHCP for IPv6 Address Assignment	398
Default DHCPv6 Address Assignment Configuration	398
DHCPv6 Address Assignment Configuration Guidelines	398
Enabling DHCPv6 Server Function (CLI)	398
Enabling DHCPv6 Client Function (CLI)	401
Configuration Examples for IPv6 Unicast Routing	402
Configuring IPv6 Addressing and Enabling IPv6 Routing: Example	402
Configuring Default Router Preference: Example	403
Configuring IPv4 and IPv6 Protocol Stacks: Example	403
Enabling DHCPv6 Server Function: Example	403
Enabling DHCPv6 Client Function: Example	404
Configuring IPv6 ICMP Rate Limiting: Example	404
Configuring Static Routing for IPv6: Example	404
Configuring RIP for IPv6: Example	404
Displaying IPv6: Example	404

---

**CHAPTER 21**

<b>Configuring IPv6 Client IP Address Learning</b>	<b>407</b>
Prerequisites for IPv6 Client Address Learning	407
Information About IPv6 Client Address Learning	408
SLAAC Address Assignment	408
Stateful DHCPv6 Address Assignment	409
Static IP Address Assignment	410
Router Solicitation	411
Router Advertisement	411
Neighbor Discovery	411
Neighbor Discovery Suppression	411
RA Guard	412
RA Throttling	413
Configuring IPv6 Unicast (CLI)	413
Configuring RA Guard Policy (CLI)	414
Applying RA Guard Policy (CLI)	415
Configuring RA Throttle Policy (CLI)	416
Applying RA Throttle Policy on VLAN (CLI)	417

Configuring IPv6 Snooping (CLI)	418
Configuring IPv6 ND Suppress Policy (CLI)	419
Configuring IPv6 Snooping on VLAN/PortChannel	420
Configuring IPv6 on Switch (CLI)	421
Configuring DHCP Pool (CLI)	422
Configuring Stateless Auto Address Configuration Without DHCP (CLI)	423
Configuring Stateless Auto Address Configuration With DHCP (CLI)	424
Configuring Stateful DHCP Locally (CLI)	425
Configuring Stateful DHCP Externally (CLI)	427
Monitoring IPv6 Clients (GUI)	429
Verifying IPv6 Address Learning Configuration	430
Additional References	431
Feature Information for IPv6 Client Address Learning	432

---

**CHAPTER 22**
**Configuring IPv6 WLAN Security 433**

Prerequisites for IPv6 WLAN Security	433
Restrictions for IPv6 WLAN Security	433
Information About IPv6 WLAN Security	434
How to Configure IPv6 WLAN Security	436
Configuring Local Authentication	436
Creating a Local User	436
Creating an Client VLAN and Interface	437
Configuring a EAP Profile	438
Creating a Local Authentication Model	441
Creating a Client WLAN	442
Configuring Local Authentication with WPA2+AES	444
Creating Client VLAN for WPA2+AES	445
Creating WLAN for WPA2+AES	447
Configuring External RADIUS Server	448
Configuring RADIUS Authentication Server Host	448
Configuring RADIUS Authentication Server Group	449
Creating a Client VLAN	451
Creating 802.1x WLAN Using an External RADIUS Server	452
Additional References	454
Feature Information for IPv6 WLAN Security	455

---

**CHAPTER 23****Configuring IPv6 ACL 457**

Prerequisites for IPv6 ACL 457

Restrictions for IPv6 ACL 457

Information About IPv6 ACL 458

Understanding IPv6 ACLs 458

Types of ACL 459

Per User IPv6 ACL 459

Filter ID IPv6 ACL 459

Downloadable IPv6 ACL 459

IPv6 ACLs and Switch Stacks 460

Configuring IPv6 ACLs 460

Default IPv6 ACL Configuration 461

Interaction with Other Features and Switches 461

How To Configure an IPv6 ACL 461

Creating IPv6 ACL 461

Applying an IPv6 to an Interface 465

Creating WLAN IPv6 ACL 467

Verifying IPv6 ACL 467

Displaying IPv6 ACLs 467

Configuration Examples for IPv6 ACL 468

Example: Creating IPv6 ACL 468

Example: Applying IPv6 ACLs 468

Example: Displaying IPv6 ACLs 469

Example: Configuring RA Throttling and NS Suppression 469

Example: Configuring RA Guard Policy 471

Example: Configuring IPv6 Neighbor Binding 472

Additional References 473

Feature Information for IPv6 ACLs 474

---

**CHAPTER 24****Configuring IPv6 Web Authentication 475**

Prerequisites for IPv6 Web Authentication 475

Restrictions for IPv6 Web Authentication 475

Information About IPv6 Web Authentication 476

Web Authentication Process 476

How to Configure IPv6 Web Authentication	477
Disabling WPA	477
Enabling Security on the WLAN	478
Enabling a Parameter Map on the WLAN	479
Enabling Authentication List on WLAN	479
Configuring a Global WebAuth WLAN Parameter Map	480
Configuring the WLAN	481
Enabling IPv6 in Global Configuration Mode	482
Verifying IPv6 Web Authentication	483
Verifying the Parameter Map	483
Verifying Authentication List	483
Additional References	484
Feature Information for IPv6 Web Authentication	485

**CHAPTER 25****Configuring IPv6 Client Mobility 487**

Prerequisites for IPv6 Client Mobility	487
Restrictions For IPv6 Client Mobility	487
Information About IPv6 Client Mobility	488
Using Router Advertisement	488
RA Throttling and NS suppression	489
IPv6 Address Learning	490
Handling Multiple IP Addresses	490
IPv6 Configuration	490
High Availability	491
Verifying IPv6 Client Mobility	491
Monitoring IPv6 Client Mobility	492
Additional References	492
Feature Information For IPv6 Client Mobility	493

**CHAPTER 26****Configuring IPv6 Mobility 495**

Pre-requisites for IPv6 Mobility	495
Information About IPv6 Mobility	495
Inter Controller Roaming	496
Intra Subnet Roaming with Sticky Anchoring, and Inter Subnet Roaming	496
How to Configure IPv6 Mobility	496

Monitoring IPv6 Mobility	496
Additional References	498
Feature Information for IPv6 Mobility	499

**CHAPTER 27****Configuring IPv6 NetFlow 501**

Prerequisites For IPv6 Netflow	501
Restrictions For IPv6 Netflow	501
Information About IPv6 Netflow	502
Understanding Flexible Netflow	502
IPv6 Netflow	503
How To Configure IPv6 Netflow	504
Configuring a Customized Flow Record	504
Configuring the Flow Exporters	506
Configuring a Customized Flow Monitor	510
Applying a Flow Monitor to an Interface	512
Configuring and Enabling Flow Sampling	514
Verifying IPv6 Netflow	516
Monitoring IPv6 Netflow	516
Additional References	516
Feature Information for IPv6 NetFlow	517

**PART VI****Layer 2/3 519****CHAPTER 28****Configuring Spanning Tree Protocol 521**

Finding Feature Information	521
Restrictions for STP	521
Information About Spanning Tree Protocol	522
Spanning Tree Protocol	522
Spanning-Tree Topology and BPDUs	523
Bridge ID, Device Priority, and Extended System ID	524
Port Priority Versus Path Cost	525
Spanning-Tree Interface States	526
Blocking State	527
Listening State	528
Learning State	528

Forwarding State	528
Disabled State	528
How a Switch or Port Becomes the Root Switch or Root Port	529
Spanning Tree and Redundant Connectivity	529
Spanning-Tree Address Management	530
Accelerated Aging to Retain Connectivity	530
Spanning-Tree Modes and Protocols	531
Supported Spanning-Tree Instances	531
Spanning-Tree Interoperability and Backward Compatibility	532
STP and IEEE 802.1Q Trunks	532
VLAN-Bridge Spanning Tree	532
Spanning Tree and Switch Stacks	533
Default Spanning-Tree Configuration	533
How to Configure Spanning-Tree Features	534
Changing the Spanning-Tree Mode (CLI)	534
Disabling Spanning Tree (CLI)	536
Configuring the Root Switch (CLI)	537
Configuring a Secondary Root Device (CLI)	538
Configuring Port Priority (CLI)	539
Configuring Path Cost (CLI)	540
Configuring the Device Priority of a VLAN (CLI)	542
Configuring the Hello Time (CLI)	543
Configuring the Forwarding-Delay Time for a VLAN (CLI)	544
Configuring the Maximum-Aging Time for a VLAN (CLI)	544
Configuring the Transmit Hold-Count (CLI)	545
Monitoring Spanning-Tree Status	546
Additional References for Spanning-Tree Protocol	547
Feature Information for STP	548

---

**CHAPTER 29**
**Configuring Multiple Spanning-Tree Protocol 549**

Finding Feature Information	549
Prerequisites for MSTP	549
Restrictions for MSTP	550
Information About MSTP	551
MSTP Configuration	551

MSTP Configuration Guidelines	551
Root Switch	552
Multiple Spanning-Tree Regions	553
IST, CIST, and CST	553
Operations Within an MST Region	554
Operations Between MST Regions	554
IEEE 802.1s Terminology	555
Illustration of MST Regions	556
Hop Count	556
Boundary Ports	557
IEEE 802.1s Implementation	557
Port Role Naming Change	558
Interoperation Between Legacy and Standard Switches	558
Detecting Unidirectional Link Failure	559
MSTP and Switch Stacks	559
Interoperability with IEEE 802.1D STP	559
RSTP Overview	560
Port Roles and the Active Topology	560
Rapid Convergence	561
Synchronization of Port Roles	562
Bridge Protocol Data Unit Format and Processing	563
Processing Superior BPDU Information	564
Processing Inferior BPDU Information	564
Topology Changes	564
Protocol Migration Process	565
Default MSTP Configuration	565
How to Configure MSTP Features	566
Specifying the MST Region Configuration and Enabling MSTP (CLI)	566
Configuring the Root Switch (CLI)	569
Configuring a Secondary Root Switch (CLI)	570
Configuring Port Priority (CLI)	571
Configuring Path Cost (CLI)	572
Configuring the Switch Priority (CLI)	574
Configuring the Hello Time (CLI)	575
Configuring the Forwarding-Delay Time (CLI)	576

Configuring the Maximum-Aging Time (CLI)	577
Configuring the Maximum-Hop Count (CLI)	578
Specifying the Link Type to Ensure Rapid Transitions (CLI)	579
Designating the Neighbor Type (CLI)	580
Restarting the Protocol Migration Process (CLI)	582
Monitoring MST Configuration and Status	583
Additional References for MSTP	583
Feature Information for MSTP	584

**CHAPTER 30****Configuring Optional Spanning-Tree Features 585**

Finding Feature Information	585
Restriction for Optional Spanning-Tree Features	585
Information About Optional Spanning-Tree Features	586
PortFast	586
BPDU Guard	586
BPDU Filtering	587
UplinkFast	588
Cross-Stack UplinkFast	589
How Cross-Stack UplinkFast Works	590
Events That Cause Fast Convergence	592
BackboneFast	592
EtherChannel Guard	595
Root Guard	595
Loop Guard	596
How to Configure Optional Spanning-Tree Features	596
Enabling PortFast (CLI)	596
Enabling BPDU Guard (CLI)	598
Enabling BPDU Filtering (CLI)	599
Enabling UplinkFast for Use with Redundant Links (CLI)	601
Disabling UplinkFast (CLI)	602
Enabling BackboneFast (CLI)	603
Enabling EtherChannel Guard (CLI)	604
Enabling Root Guard (CLI)	605
Enabling Loop Guard (CLI)	606
Monitoring the Spanning-Tree Status	608

Additional References for Optional Spanning Tree Features 608

Feature Information for Optional Spanning-Tree Features 609

---

**CHAPTER 31**

**Configuring EtherChannels 611**

Finding Feature Information 611

Restrictions for EtherChannels 611

Information About EtherChannels 612

    EtherChannel Overview 612

        EtherChannel Modes 613

        EtherChannel on Switches 614

        EtherChannel Link Failover 615

    Channel Groups and Port-Channel Interfaces 615

    Port Aggregation Protocol 617

        PAgP Modes 617

            Silent Mode 618

        PAgP Learn Method and Priority 618

        PAgP Interaction with Other Features 619

    Link Aggregation Control Protocol 619

        LACP Modes 620

        LACP and Link Redundancy 620

        LACP Interaction with Other Features 621

    EtherChannel On Mode 621

    Load-Balancing and Forwarding Methods 621

        MAC Address Forwarding 622

        IP Address Forwarding 622

        Load-Balancing Advantages 623

    EtherChannel and Switch Stacks 624

        Switch Stack and PAgP 625

        Switch Stacks and LACP 625

    Default EtherChannel Configuration 625

    EtherChannel Configuration Guidelines 626

        Layer 2 EtherChannel Configuration Guidelines 628

        Layer 3 EtherChannel Configuration Guidelines 629

How to Configure EtherChannels 629

    Configuring Layer 2 EtherChannels (CLI) 629

Configuring Layer 3 EtherChannels (CLI)	631
Configuring EtherChannel Load-Balancing (CLI)	633
Configuring EtherChannel Extended Load-Balancing (CLI)	635
Configuring the PAgP Learn Method and Priority (CLI)	636
Configuring LACP Hot-Standby Ports	637
Configuring the LACP Max Bundle Feature (CLI)	638
Configuring the Port Channel Min-Links Feature (CLI)	639
Configuring the LACP System Priority (CLI)	640
Configuring the LACP Port Priority (CLI)	641
Monitoring EtherChannel, PAgP, and LACP Status	642
Configuration Examples for Configuring EtherChannels	643
Configuring Layer 2 EtherChannels: Examples	643
Configuring Layer 3 EtherChannels: Examples	644
Configuring LACP Hot-Standby Ports: Example	645
Additional References for EtherChannels	645
Feature Information for EtherChannels	646

**CHAPTER 32****Configuring Flex Links and the MAC Address-Table Move Update Feature 647**

Finding Feature Information	647
Restrictions for Configuring Flex Links and MAC Address-Table Move Update	647
Information About Flex Links and MAC Address-Table Move Update	648
Flex Links	648
Flex Links Configuration	649
VLAN Flex Links Load Balancing and Support	649
Multicast Fast Convergence with Flex Links Failover	650
Learning the Other Flex Links Port as the mrouter Port	650
Generating IGMP Reports	650
Leaking IGMP Reports	651
MAC Address-Table Move Update	651
Flex Links VLAN Load Balancing Configuration Guidelines	653
MAC Address-Table Move Update Configuration Guidelines	653
Default Flex Links and MAC Address-Table Move Update Configuration	653
How to Configure Flex Links and the MAC Address-Table Move Update Feature	654
Configuring Flex Links (CLI)	654
Configuring a Preemption Scheme for a Pair of Flex Links (CLI)	655

Configuring VLAN Load Balancing on Flex Links (CLI)	657
Configuring MAC Address-Table Move Update (CLI)	658
Configuring a Switch to Obtain and Process MAC Address-Table Move Update Messages (CLI)	659
Monitoring Flex Links, Multicast Fast Convergence, and MAC Address-Table Move Update	660
Configuration Examples for Flex Links	661
Configuring Flex Links: Examples	661
Configuring VLAN Load Balancing on Flex Links: Examples	661
Configuring the MAC Address-Table Move Update: Examples	663
Configuring Multicast Fast Convergence with Flex Links Failover: Examples	663
Additional References for Flex Links and MAC Address-Table Move Update	665
Feature Information for Flex Links and MAC Address-Table Move Update	667

---

**CHAPTER 33**
**Configuring UniDirectional Link Detection** 669

Finding Feature Information	669
Restrictions for Configuring UDLD	669
Information About UDLD	670
Modes of Operation	670
Normal Mode	670
Aggressive Mode	670
Methods to Detect Unidirectional Links	671
Neighbor Database Maintenance	671
Event-Driven Detection and Echoing	671
UDLD Reset Options	672
Default UDLD Configuration	672
How to Configure UDLD	673
Enabling UDLD Globally (CLI)	673
Enabling UDLD on an Interface (CLI)	674
Monitoring and Maintaining UDLD	675
Additional References for UDLD	675
Feature Information for UDLD	676

---

**PART VII**
**Lightweight Access Point** 679

---

**CHAPTER 34****Configuring the Switch for Access Point Discovery 681**

- Finding Feature Information 681
- Prerequisites for Configuring the Switch for Access Point Discovery 681
- Restrictions for Configuring the Switch for Access Point Discovery 682
- Information About Configuring the Switch for Access Point Discovery 682
  - Access Point Communication Protocols 682
  - Viewing Access Point Join Information 683
  - Troubleshooting the Access Point Join Process 683
- How to Configure Access Point Discovery 684
  - Configuring the Syslog Server for Access Points (GUI) 684
  - Configuring the Syslog Server for Access Points (CLI) 684
  - Monitoring Access Point Join Information (CLI) 685
  - Searching for Access Point Radios (GUI) 686
  - Monitoring the Interface Details (GUI) 686
- Configuration Examples for Configuring the Switch for Access Point Discovery 686
  - Displaying the MAC Addresses of all Access Points: Example 686
  - DHCP Option 43 for Lightweight Cisco Aironet Access Points Configuration Example 687

---

**CHAPTER 35****Configuring Data Encryption 689**

- Finding Feature Information 689
- Prerequisites for Configuring Data Encryption 689
- Restrictions for Configuring Data Encryption 689
- Information About Data Encryption 690
- How to Configure Data Encryption 690
  - Configuring Data Encryption (CLI) 690
  - Configuring Data Encryption (GUI) 691
- Configuration Examples for Configuring Data Encryption 691
  - Displaying Data Encryption States for all Access Points: Examples 691

---

**CHAPTER 36****Configuring Retransmission Interval and Retry Count 693**

- Finding Feature Information 693
- Prerequisites for Configuring the Access Point Retransmission Interval and Retry Count 693

Information About Retransmission Interval and Retry Count	694
How to Configure Access Point Retransmission Interval and Retry Count	694
Configuring the Access Point Retransmission Interval and Retry Count (CLI)	694
Configuring the Access Point Retransmission Interval and Retry Count (GUI)	695
Viewing CAPWAP Maximum Transmission Unit Information (CLI)	696
Viewing CAPWAP Maximum Transmission Unit Information (GUI)	696
Configuration Examples for Configuring Access Point Retransmission Interval and Retry Count	697
Viewing the CAPWAP Retransmission Details: Example	697
Viewing Maximum Transmission Unit Information: Example	697

**CHAPTER 37****Configuring Adaptive Wireless Intrusion Prevention System 699**

Finding Feature Information	699
Prerequisites for Configuring wIPS	699
How to Configure wIPS on Access Points	700
Configuring wIPS on an Access Point (CLI)	700
Configuring wIPS on an Access Point (GUI)	701
Monitoring wIPS Information	702
Configuration Examples for Configuring wIPS on Access Points	703
Displaying the Monitor Configuration Channel Set: Example	703
Displaying wIPS Information: Examples	703

**CHAPTER 38****Configuring Authentication for Access Points 705**

Finding Feature Information	705
Prerequisites for Configuring Authentication for Access Points	705
Restrictions for Configuring Authentication for Access Points	706
Information about Configuring Authentication for Access Points	706
How to Configure Authentication for Access Points	707
Configuring Global Credentials for Access Points (CLI)	707
Configuring Global Credentials for Access Points (GUI)	708
Configuring Authentication for Access Points (CLI)	709
Configuring Authentication for Access Points (GUI)	711
Configuring the Switch for Authentication (CLI)	712
Configuration Examples for Configuring Authentication for Access Points	714
Displaying the Authentication Settings for Access Points: Examples	714

---

**CHAPTER 39****Converting Autonomous Access Points to Lightweight Mode 715**

Finding Feature Information 715

Prerequisites for Converting Autonomous Access Points to Lightweight Mode 715

Information About Autonomous Access Points Converted to Lightweight Mode 716

Reverting from Lightweight Mode to Autonomous Mode 716

Using DHCP Option 43 and DHCP Option 60 716

How Converted Access Points Send Crash Information to the Switch 717

Uploading Memory Core Dumps from Converted Access Points 717

Displaying MAC Addresses for Converted Access Points 717

Configuring a Static IP Address for a Lightweight Access Point 717

How to Convert a Lightweight Access Point Back to an Autonomous Access Point 718

Converting a Lightweight Access Point Back to an Autonomous Access Point  
(CLI) 718Converting a Lightweight Access Point Back to an Autonomous Access Point (Using  
the Mode Button and a TFTP Server) 718

Authorizing Access Points (CLI) 719

Authorizing Access Points (GUI) 720

Disabling the Reset Button on Converted Access Points (CLI) 721

Monitoring the AP Crash Log Information 722

How to Configure a Static IP Address on an Access Point 723

Configuring a Static IP Address on an Access Point (CLI) 723

Configuring a Static IP Address on an Access Point (GUI) 724

Recovering the Access Point Using the TFTP Recovery Procedure 725

Configuration Examples for Converting Autonomous Access Points to Lightweight  
Mode 725

Displaying the IP Address Configuration for Access Points: Example 725

Displaying Access Point Crash File Information: Example 726

---

**CHAPTER 40****Using Cisco Workgroup Bridges 727**

Finding Feature Information 727

Information About Cisco Workgroup Bridges and non-Cisco Workgroup bridges 727

Monitoring the Status of Workgroup Bridges 728

Debugging WGB Issues (CLI) 728

Configuration Examples for Configuring Workgroup Bridges 730

WGB Configuration: Example 730

---

**CHAPTER 41**

**Configuring Probe Request Forwarding 731**

Finding Feature Information 731

Information About Configuring Probe Request Forwarding 731

How to Configure Probe Request Forwarding (CLI) 731

---

**CHAPTER 42**

**Optimizing RFID Tracking 733**

Finding Feature Information 733

Optimizing RFID Tracking on Access Points 733

How to Optimize RFID Tracking on Access Points 734

    Optimizing RFID Tracking on Access Points (CLI) 734

Configuration Examples for Optimizing RFID Tracking 735

    Displaying all the Access Points in Monitor Mode: Example 735

---

**CHAPTER 43**

**Configuring Country Codes 737**

Finding Feature Information 737

Prerequisites for Configuring Country Codes 737

Information About Configuring Country Codes 738

How to Configure Country Codes (CLI) 738

Configuration Examples for Configuring Country Codes 741

    Displaying Channel List for Country Codes: Example 741

---

**CHAPTER 44**

**Configuring Link Latency 743**

Finding Feature Information 743

Prerequisites for Configuring Link Latency 743

Restrictions for Configuring Link Latency 744

Information About Configuring Link Latency 744

    TCP MSS 744

    Link Tests 744

How to Configure Link Latency 745

    Configuring Link Latency (CLI) 745

    Configuring Link Latency (GUI) 747

How to Configure TCP MSS 748

    Configuring TCP MSS (CLI) 748

Configuring TCP MSS (GUI)	748
Performing a Link Test (CLI)	749
Configuration Examples for Configuring Link Latency	750
Running a Link Test: Example	750
Displaying Link Latency Information: Example	750
Displaying TCP MSS Settings: Example	751

---

**CHAPTER 45**

<b>Configuring Power over Ethernet</b>	<b>753</b>
Finding Feature Information	753
Information About Configuring Power over Ethernet	753
How to Configure Power over Ethernet	754
Configuring Power over Ethernet (CLI)	754
Configuring Power over Ethernet (GUI)	755
Configuration Examples for Configuring Power over Ethernet	756
Displaying Power over Ethernet Information: Example	756

---

**PART VIII****Mobility 757**

---

**CHAPTER 46**

<b>Information About Mobility</b>	<b>759</b>
Overview	759
Wired and Wireless Mobility	760
Features of Mobility	760
Sticky Anchoring for Low Latency Roaming	762
Bridge Domain ID and L2/L3 Roaming	762
Link Down Behavior	762
Platform Specific Scale Requirement for the Mobility Controller	762

---

**CHAPTER 47**

<b>Mobility Network Elements</b>	<b>765</b>
Mobility Agent	765
Mobility Controller	766
Mobility Oracle	767
Guest Controller	767

---

**CHAPTER 48**

<b>Mobility Control Protocols</b>	<b>769</b>
About Mobility Control Protocols	769

Initial Association and Roaming	769
Initial Association	770
Intra Switch Handoff	771
Intra Switch Peer Group Handoff	771
Inter Switch Peer Group Handoff	772
Inter Sub Domain Handoff	774
Inter Mobility Group Handoff	775

**CHAPTER 49****Configuring Mobility 777**

Configuring Mobility Controller	777
Configuring Converged Access Controllers	777
Creating Peer Groups, Peer Group Member, and Bridge Domain ID (CLI)	777
Creating Peer Groups, Peer Group Member, and Bridge Domain ID (GUI)	779
Configuring Local Mobility Group (CLI)	779
Configuring Local Mobility Group (GUI)	780
Adding a Peer Mobility Group (CLI)	781
Adding a Peer Mobility Group (GUI)	781
Configuring Optional Parameters for Roaming Behavior	782
Pointing the Mobility Controller to a Mobility Oracle (CLI)	782
Pointing the Mobility Controller to a Mobility Oracle (GUI)	783
Configuring Guest Controller	783
Configuring Guest Anchor	785
Configuring Mobility Agent	785
Configuring Mobility Agent by Pointing to Mobility Controller (CLI)	785
Configuring Mobility Agent by Pointing to Mobility Controller (GUI)	786
Configuring the Mobility Controller for the Mobility Agent (CLI)	787
Adding a Mobility Controller Role to the Mobility Agent	788
Configuring Optional Parameters on a Mobility Agent (CLI)	788

**PART IX****Network Management 789****CHAPTER 50****Configuring Cisco IOS Configuration Engine 791**

Finding Feature Information	791
Prerequisites for Configuring the Configuration Engine	791
Restrictions for Configuring the Configuration Engine	792

Information About Configuring the Configuration Engine	792
Cisco Configuration Engine Software	792
Configuration Service	793
Event Service	794
NameSpace Mapper	794
Cisco Networking Services IDs and Device Hostnames	794
ConfigID	794
DeviceID	795
Hostname and DeviceID	795
Hostname, DeviceID, and ConfigID	795
Cisco IOS CNS Agents	796
Initial Configuration	796
Incremental (Partial) Configuration	797
Synchronized Configuration	797
Automated CNS Configuration	797
How to Configure the Configuration Engine	798
Enabling the CNS Event Agent	798
Enabling the Cisco IOS CNS Agent	800
Enabling an Initial Configuration for Cisco IOS CNS Agent	801
Refreshing DeviceIDs	806
Enabling a Partial Configuration for Cisco IOS CNS Agent	808
Monitoring CNS Configurations	809
Additional References	810
Feature History and Information for the Configuration Engine	811

---

**CHAPTER 51**
**Configuring the Cisco Discovery Protocol 813**

Finding Feature Information	813
Information About CDP	813
CDP Overview	813
CDP and Stacks	814
Default CDP Configuration	814
How to Configure CDP	814
Configuring CDP Characteristics	814
Disabling CDP	816
Enabling CDP	817

Disabling CDP on an Interface	818
Enabling CDP on an Interface	819
Monitoring and Maintaining CDP	820
Additional References	821
Feature History and Information for Cisco Discovery Protocol	822

**CHAPTER 52****Configuring Simple Network Management Protocol 823**

Finding Feature Information	823
Prerequisites for SNMP	823
Restrictions for SNMP	825
Information About SNMP	826
SNMP Overview	826
SNMP Manager Functions	826
SNMP Agent Functions	827
SNMP Community Strings	827
SNMP MIB Variables Access	827
SNMP Notifications	828
SNMP ifIndex MIB Object Values	828
Default SNMP Configuration	829
SNMP Configuration Guidelines	829
How to Configure SNMP	830
Disabling the SNMP Agent	830
Configuring Community Strings	831
Configuring SNMP Groups and Users	833
Configuring SNMP Notifications	835
Setting the Agent Contact and Location Information	839
Limiting TFTP Servers Used Through SNMP	840
Configuring Trap Flags for SNMP	842
Enabling SNMP Wireless Trap Notification	844
Monitoring SNMP Status	845
SNMP Examples	845

**CHAPTER 53****Configuring Service Level Agreements 847**

Finding Feature Information	847
Restrictions on SLAs	847

Information About SLAs	848
Cisco IOS IP Service Level Agreements (SLAs)	848
Network Performance Measurement with Cisco IOS IP SLAs	849
IP SLA Responder and IP SLA Control Protocol	850
Response Time Computation for IP SLAs	850
IP SLAs Operation Scheduling	851
IP SLA Operation Threshold Monitoring	851
UDP Jitter	852
Configuration Guidelines	853
How to Configure IP SLAs Operations	854
Configuring the IP SLA Responder	854
Implementing IP SLA Network Performance Measurement	855
Analyzing IP Service Levels by Using the UDP Jitter Operation	858
Analyzing IP Service Levels by Using the ICMP Echo Operation	861
Monitoring IP SLA Operations	864
Monitoring IP SLA Operation Examples	865
Feature History and Information for Service Level Agreements	866

**CHAPTER 54**

<b>Configuring SPAN and RSPAN</b>	<b>867</b>
Finding Feature Information	867
Prerequisites for SPAN and RSPAN	867
Restrictions for SPAN and RSPAN	868
Information About SPAN and RSPAN	870
SPAN and RSPAN	870
Local SPAN	870
Remote SPAN	871
SPAN and RSPAN Concepts and Terminology	872
SPAN Sessions	873
Monitored Traffic	874
Source Ports	875
Source VLANs	875
VLAN Filtering	875
Destination Port	876
RSPAN VLAN	877
SPAN and RSPAN Interaction with Other Features	877

SPAN and RSPAN and Device Stacks	878
Flow-Based SPAN	878
Default SPAN and RSPAN Configuration	879
Configuration Guidelines	880
SPAN Configuration Guidelines	880
RSPAN Configuration Guidelines	880
FSPAN and FRSPAN Configuration Guidelines	880
How to Configure SPAN and RSPAN	881
Creating a Local SPAN Session	881
Creating a Local SPAN Session and Configuring Incoming Traffic	882
Specifying VLANs to Filter	884
Configuring a VLAN as an RSPAN VLAN	886
Creating an RSPAN Source Session	887
Specifying VLANs to Filter	888
Creating an RSPAN Destination Session	890
Creating an RSPAN Destination Session and Configuring Incoming Traffic	892
Configuring an FSPAN Session	893
Configuring an FRSPAN Session	895
Monitoring SPAN and RSPAN Operations	898
SPAN and RSPAN Configuration Examples	898
Example: Configuring Local SPAN	898
Examples: Creating an RSPAN VLAN	899
Feature History and Information for SPAN and RSPAN	900

**CHAPTER 55****Configuring Wireshark 901**

Finding Feature Information	901
Prerequisites for Wireshark	901
Restrictions for Wireshark	901
Information About Wireshark	903
Wireshark Overview	903
Capture Points	903
Attachment Points	903
Filters	904
Actions	904
Storage of Captured Packets to Buffer in Memory	905

Storage of Captured Packets to a .pcap File	905
Packet Decoding and Display	906
Packet Storage and Display	906
Wireshark Capture Point Activation and Deactivation	907
Wireshark Features	907
Guidelines for Wireshark	909
Default Wireshark Configuration	911
How to Configure Wireshark	912
Defining a Capture Point	912
Adding or Modifying Capture Point Parameters	916
Deleting Capture Point Parameters	918
Deleting a Capture Point	919
Activating and Deactivating a Capture Point	920
Clearing the Capture Point Buffer	921
Monitoring Wireshark	921
Configuration Examples for Wireshark	922
Example: Displaying a Brief Output from a .pcap File	922
Example: Displaying Detailed Output from a .pcap File	924
Example: Simple Capture and Display	926
Example: Simple Capture and Store	927
Example: Using Buffer Capture	928
Example: Capture Sessions	932
Example: Capture and Store in Lock-step Mode	932
Example: Simple Capture and Store of Packets in Egress Direction	933
Additional References	935
Feature History and Information for WireShark	936

---

**PART X****QoS 937**

---

**CHAPTER 56****Configuring QoS 939**

Finding Feature Information	939
Prerequisites for QoS	939
QoS Components	940
QoS Terminology	940
Information About QoS	941

QoS Overview	941
Modular QoS Command-Line Interface	941
Wireless QoS Overview	941
QoS and IPv6 for Wireless	942
Wired and Wireless Access Supported Features	942
Supported QoS Features on Wireless Targets	944
Port Policies	945
Port Policy Format	946
Radio Policies	947
SSID Policies	948
Client Policies	948
Hierarchical QoS	949
Hierarchical Wireless QoS	950
Wireless Packet Format	950
Hierarchical AFD	951
QoS Implementation	951
Layer 2 Frame Prioritization Bits	952
Layer 3 Packet Prioritization Bits	953
End-to-End QoS Solution Using Classification	953
Packet Classification	953
Classification Based on Information That is Propagated with the Packet	954
Classification Based on Layer 3 or Layer 4 Header	954
Classification Based on Layer 2 Header	955
Classification Based on Information that is Device Specific (QoS Groups)	955
Hierarchical Classification	955
QoS Wired Model	955
Ingress Port Activity	956
Egress Port Activity	956
Classification	956
Access Control Lists	957
Class Maps	957
Policy Maps	958
Policy Map on Physical Port	958
Policy Map on VLANs	959
Wireless QoS Rate Limiting	959

Wireless QoS Multicast	959
Policing	959
Token-Bucket Algorithm	960
Marking	960
Packet Header Marking	961
Switch Specific Information Marking	961
Table Map Marking	961
Traffic Conditioning	962
Policing	963
Single-Rate Two-Color Policing	964
Dual-Rate Three-Color Policing	964
Shaping	964
Class-Based Traffic Shaping	965
Average Rate Shaping	965
Hierarchical Shaping	965
Queueing and Scheduling	965
Bandwidth	966
Bandwidth Percent	966
Bandwidth Remaining Ratio	966
Weighted Tail Drop	966
Weighted Tail Drop Default Values	967
Priority Queues	968
Queue Buffer	968
Queue Buffer Allocation	969
Dynamic Threshold and Scaling	969
Queueing in Wireless	969
Trust Behavior	970
Trust Behavior for Wired and Wireless Ports	970
Port Security on a Trusted Boundary for Cisco IP Phones	971
Wireless QoS Mobility	972
Inter-Switch Roaming	972
Intra-Switch Roaming	973
Precious Metal Policies for Wireless QoS	973
Standard QoS Default Settings	974
Default Wired QoS Configuration	974

DSCP Maps	974
Default CoS-to-DSCP Map	974
Default IP-Precedence-to-DSCP Map	974
Default DSCP-to-CoS Map	975
Default Wireless QoS Configuration	975
Restrictions for QoS on Wired Targets	976
Restrictions for QoS on Wireless Targets	978
How to Configure QoS	981
Configuring Class, Policy, and Table Maps	981
Creating a Traffic Class (CLI)	981
Creating a Traffic Policy (CLI)	984
Configuring Client Policies (GUI)	988
Configuring Class-Based Packet Marking (CLI)	990
Configuring Class Maps for Voice and Video (CLI)	994
Attaching a Traffic Policy to an Interface (CLI)	995
Configuring SSID Policies (GUI)	997
Applying an SSID or Client Policy on a WLAN (CLI)	999
Classifying, Policing, and Marking Traffic on Physical Ports by Using Policy Maps (CLI)	1000
Classifying, Policing, and Marking Traffic on SVIs by Using Policy Maps (CLI)	1003
Configuring Table Maps (CLI)	1007
Configuring Trust	1009
Configuring Trust Behavior for Wireless Traffic (CLI)	1009
Configuring QoS Features and Functionality	1010
Configuring Call Admission Control (CLI)	1010
Configuring Bandwidth (CLI)	1017
Configuring Police (CLI)	1019
Configuring Priority (CLI)	1022
Configuring Queues and Shaping	1024
Configuring Egress Queue Characteristics	1024
Configuring Queue Buffers (CLI)	1024
Configuring Queue Limits (CLI)	1026
Configuring Shaping (CLI)	1029
Configuring Precious Metal Policies (CLI)	1031
Configuring QoS Policies for Multicast Traffic (CLI)	1032

Applying a QoS Policy on a WLAN (GUI)	1033
Monitoring QoS	1035
Configuration Examples for QoS	1037
Examples: Classification by Access Control Lists	1037
Examples: Class of Service Layer 2 Classification	1037
Examples: Class of Service DSCP Classification	1038
Examples: VLAN ID Layer 2 Classification	1038
Examples: Classification by DSCP or Precedence Values	1038
Examples: Hierarchical Classification	1038
Examples: Hierarchical Policy Configuration	1039
Examples: Classification for Voice and Video	1039
Examples: Wireless QoS Policy Classified by Voice, Video, and Multicast Traffic	1041
Examples: Configuring Downstream SSID Policy	1041
Examples: Client Policies	1042
Examples: Average Rate Shaping Configuration	1044
Examples: Queue-limit Configuration	1045
Examples: Queue Buffers Configuration	1045
Examples: Policing Action Configuration	1046
Examples: Policer VLAN Configuration	1047
Examples: Policing Units	1047
Examples: Single-Rate Two-Color Policing Configuration	1048
Examples: Dual-Rate Three-Color Policing Configuration	1048
Examples: Table Map Marking Configuration	1048
Example: Table Map Configuration to Retain CoS Markings	1049
Where to Go Next	1050
Additional References for QoS	1050
Feature History and Information for QoS	1051

**CHAPTER 57****Configuring Auto-QoS 1053**

Finding Feature Information	1053
Prerequisites for Auto-QoS	1053
Restrictions for Auto-QoS	1053
Information About Configuring Auto-QoS	1054
Auto-QoS Overview	1054
Auto-QoS Global Configuration Templates	1054

Auto-QoS Policy and Class Maps	1055
Effects of Auto-QoS on Running Configuration	1055
How to Configure Auto-QoS	1055
Configuring Auto-QoS (CLI)	1055
Upgrading Auto-QoS (CLI)	1058
Monitoring Auto-QoS	1060
Troubleshooting Auto-QoS	1060
Configuration Examples for Auto-QoS	1061
Example: auto qos trust cos	1061
Example: auto qos trust dscp	1063
Example: auto qos video cts	1065
Example: auto qos video ip-camera	1068
Example: auto qos video media-player	1070
Example: auto qos voip trust	1073
Example: auto qos voip cisco-phone	1075
Example: auto qos voip cisco-softphone	1078
auto qos classify police	1083
Where to Go Next for Auto-QoS	1087
Additional References for Auto-QoS	1087
Feature History and Information for Auto-QoS	1088

**PART XI**
**Radio Resource Management 1089**

---

**CHAPTER 58**
**Configuring Radio Resource Management 1091**

Finding Feature Information	1091
Prerequisites for Configuring Radio Resource Management	1091
Restrictions for Radio Resource Management	1092
Information About Radio Resource Management	1092
Radio Resource Monitoring	1092
Information About RF Groups	1093
RF Group Leader	1093
RF Group Name	1095
Mobility Controller	1095
Mobility Agent	1096
Information About Rogue Access Point Detection in RF Groups	1096

Transmit Power Control	1096
Overriding the TPC Algorithm with Minimum and Maximum Transmit Power Settings	1097
Dynamic Channel Assignment	1097
Coverage Hole Detection and Correction	1098
How to Configure RRM	1099
Configuring Advanced RRM CCX Parameters (CLI)	1099
Configuring Neighbor Discovery Type (CLI)	1100
Configuring RRM Profile Thresholds, Monitoring Channels, and Monitoring Intervals (GUI)	1100
Configuring RF Groups	1101
Configuring the RF Group Mode (GUI)	1102
Configuring RF Group Selection Mode (CLI)	1103
Configuring an RF Group Name (CLI)	1103
Configuring an RF Group Name (GUI)	1104
Configuring Members in a 802.11 Static RF Group (CLI)	1104
Configuring Transmit Power Control	1105
Configuring the Tx-Power Control Threshold (CLI)	1105
Configuring the Tx-Power Level (CLI)	1106
Configuring Transmit Power Control (GUI)	1107
Configuring 802.11 RRM Parameters	1108
Configuring Advanced 802.11 Channel Assignment Parameters (CLI)	1108
Configuring Dynamic Channel Assignment (GUI)	1110
Configuring 802.11 Coverage Hole Detection (CLI)	1112
Configuring Coverage Hole Detection (GUI)	1113
Configuring 802.11 Event Logging (CLI)	1115
Configuring 802.11 Statistics Monitoring (CLI)	1116
Configuring the 802.11 Performance Profile (CLI)	1117
Configuring Rogue Access Point Detection in RF Groups	1118
Configuring Rogue Access Point Detection in RF Groups (CLI)	1118
Enabling Rogue Access Point Detection in RF Groups (GUI)	1120
Monitoring RRM Parameters and RF Group Status	1120
Monitoring RRM Parameters	1120
Monitoring RF Group Status (CLI)	1122
Monitoring RF Group Status (GUI)	1122

- Examples: RF Group Configuration **1123**
- Additional References for Radio Resource Management **1123**
- Feature History and Information For Performing Radio Resource Management Configuration **1124**

**CHAPTER 59**
**Configuring MSDP 1127**

- Finding Feature Information **1127**
- Information About Configuring MSDP **1127**
  - Understanding MSDP **1127**
    - MSDP Operation **1128**
    - MSDP Benefits **1128**
- How to Configure MSDP **1129**
  - Default MSDP Configuration **1129**
  - Configuring a Default MSDP Peer **1129**
  - Caching Source-Active State **1131**
  - Requesting Source Information from an MSDP Peer **1132**
  - Controlling Source Information that Your Switch Originates **1133**
    - Redistributing Sources **1134**
    - Filtering Source-Active Request Messages **1135**
  - Controlling Source Information that Your Switch Forwards **1137**
    - Using a Filter **1137**
    - Using TTL to Limit the Multicast Data Sent in SA Messages **1139**
  - Controlling Source Information that Your Switch Receives **1140**
  - Configuring an MSDP Mesh Group **1142**
  - Shutting Down an MSDP Peer **1143**
  - Including a Bordering PIM Dense-Mode Region in MSDP **1144**
  - Configuring an Originating Address other than the RP Address **1146**
- Monitoring and Maintaining MSDP **1147**
- Configuration Examples for Configuring MSDP **1148**
  - Configuring a Default MSDP Peer: Example **1148**
  - Caching Source-Active State: Example **1148**
  - Requesting Source Information from an MSDP Peer: Example **1148**
  - Controlling Source Information that Your Switch Originates: Example **1148**

Controlling Source Information that Your Switch Forwards: Example	1149
Controlling Source Information that Your Switch Receives: Example	1149

**CHAPTER 60**

<b>Configuring IP Unicast Routing</b>	<b>1151</b>
Finding Feature Information	1152
Information About Configuring IP Unicast Routing	1152
Information About IP Routing	1152
Types of Routing	1153
IP Routing and Switch Stacks	1154
Classless Routing	1155
Address Resolution	1156
Proxy ARP	1157
ICMP Router Discovery Protocol	1157
UDP Broadcast Packets and Protocols	1158
Broadcast Packet Handling	1158
IP Broadcast Flooding	1158
How to Configure IP Routing	1159
How to Configure IP Addressing	1160
Default IP Addressing Configuration	1160
Assigning IP Addresses to Network Interfaces	1161
Using Subnet Zero	1163
Enabling Classless Routing	1164
Configuring Address Resolution Methods	1164
Defining a Static ARP Cache	1164
Setting ARP Encapsulation	1166
Enabling Proxy ARP	1167
Routing Assistance When IP Routing is Disabled	1168
Proxy ARP	1168
Default Gateway	1168
ICMP Router Discovery Protocol (IRDP)	1169
Configuring Broadcast Packet Handling	1171
Enabling Directed Broadcast-to-Physical Broadcast Translation	1171
Forwarding UDP Broadcast Packets and Protocols	1173
Establishing an IP Broadcast Address	1174
Flooding IP Broadcasts	1175

Monitoring and Maintaining IP Addressing	1176
How to Configure IP Unicast Routing	1177
Enabling IP Unicast Routing	1177
Example of Enabling IP Routing	1178
What to Do Next	1178
Information About RIP	1178
Summary Addresses and Split Horizon	1179
How to Configure RIP	1179
Default RIP Configuration	1179
Configuring Basic RIP Parameters	1180
Configuring RIP Authentication	1182
Configuring Summary Addresses and Split Horizon	1183
Configuring Split Horizon	1184
Configuration Example for Summary Addresses and Split Horizon	1186
Information About OSPF	1186
OSPF Nonstop Forwarding	1187
OSPF NSF Awareness	1187
OSPF NSF Capability	1187
OSPF Area Parameters	1188
Other OSPF Parameters	1188
LSA Group Pacing	1189
Loopback Interfaces	1189
How to Configure OSPF	1189
Default OSPF Configuration	1189
Configuring Basic OSPF Parameters	1191
Configuring OSPF Interfaces	1192
Configuring OSPF Area Parameters	1195
Configuring Other OSPF Parameters	1196
Changing LSA Group Pacing	1199
Configuring a Loopback Interface	1200
Monitoring OSPF	1200
Configuration Examples for OSPF	1201
Example: Configuring Basic OSPF Parameters	1201
Information About EIGRP	1201
EIGRP Features	1202

EIGRP Components	1202
EIGRP Nonstop Forwarding	1203
EIGRP NSF Awareness	1203
EIGRP NSF Capability	1203
EIGRP Stub Routing	1204
How to Configure EIGRP	1205
Default EIGRP Configuration	1205
Configuring Basic EIGRP Parameters	1207
Configuring EIGRP Interfaces	1208
Configuring EIGRP Route Authentication	1210
Monitoring and Maintaining EIGRP	1212
Information About BGP	1212
BGP Network Topology	1213
Nonstop Forwarding Awareness	1214
Information About BGP Routing	1214
Routing Policy Changes	1215
BGP Decision Attributes	1215
Route Maps	1216
BGP Filtering	1217
Prefix List for BGP Filtering	1217
BGP Community Filtering	1217
BGP Neighbors and Peer Groups	1218
Aggregate Routes	1218
Routing Domain Confederations	1218
BGP Route Reflectors	1219
Route Dampening	1219
More BGP Information	1219
How to Configure BGP	1220
Default BGP Configuration	1220
Enabling BGP Routing	1223
Managing Routing Policy Changes	1225
Configuring BGP Decision Attributes	1226
Configuring BGP Filtering with Route Maps	1228
Configuring BGP Filtering by Neighbor	1229
Configuring BGP Filtering by Access Lists and Neighbors	1230

Configuring Prefix Lists for BGP Filtering	1231
Configuring BGP Community Filtering	1232
Configuring BGP Neighbors and Peer Groups	1234
Configuring Aggregate Addresses in a Routing Table	1236
Configuring Routing Domain Confederations	1237
Configuring BGP Route Reflectors	1239
Configuring Route Dampening	1240
Monitoring and Maintaining BGP	1241
Configuration Examples for BGP	1242
Example: Configuring BGP on Routers	1242
Information About ISO CLNS Routing	1243
Connectionless Routing	1243
IS-IS Dynamic Routing	1244
Nonstop Forwarding Awareness	1245
IS-IS Global Parameters	1245
IS-IS Interface Parameters	1245
How to Configure ISO CLNS Routing	1246
Default IS-IS Configuration	1246
Enabling IS-IS Routing	1247
Configuring IS-IS Global Parameters	1249
Configuring IS-IS Interface Parameters	1253
Monitoring and Maintaining ISO IGRP and IS-IS	1255
Configuration Examples for ISO CLNS Routing	1256
Example: Configuring IS-IS Routing	1256
Information About Multi-VRF CE	1257
Understanding Multi-VRF CE	1257
Network Topology	1258
Packet-Forwarding Process	1259
Network Components	1259
VRF-Aware Services	1259
How to Configure Multi-VRF CE	1260
Default Multi-VRF CE Configuration	1260
Multi-VRF CE Configuration Guidelines	1261
Configuring VRFs	1262
Configuring VRF-Aware Services	1263

Configuring VRF-Aware Services for ARP	1263
Configuring VRF-Aware Services for Ping	1264
Configuring VRF-Aware Services for SNMP	1264
Configuring VRF-Aware Services for uRPF	1265
Configuring VRF-Aware RADIUS	1266
Configuring VRF-Aware Services for Syslog	1266
Configuring VRF-Aware Services for Traceroute	1267
Configuring VRF-Aware Services for FTP and TFTP	1268
Configuring Multicast VRFs	1269
Configuring a VPN Routing Session	1271
Configuring BGP PE to CE Routing Sessions	1272
Monitoring Multi-VRF CE	1274
Configuration Examples for Multi-VRF CE	1274
Multi-VRF CE Configuration Example	1274
Configuring Unicast Reverse Path Forwarding	1278
Protocol-Independent Features	1278
Distributed Cisco Express Forwarding	1279
Information About Cisco Express Forwarding	1279
How to Configure Cisco Express Forwarding	1279
Number of Equal-Cost Routing Paths	1281
Information About Equal-Cost Routing Paths	1281
How to Configure Equal-Cost Routing Paths	1281
Static Unicast Routes	1282
Information About Static Unicast Routes	1282
Configuring Static Unicast Routes	1283
Default Routes and Networks	1284
Information About Default Routes and Networks	1284
How to Configure Default Routes and Networks	1284
Route Maps to Redistribute Routing Information	1285
Information About Route Maps	1285
How to Configure a Route Map	1286
How to Control Route Distribution	1289
Policy-Based Routing	1291
Information About Policy-Based Routing	1291
How to Configure PBR	1292

Filtering Routing Information	1295
Setting Passive Interfaces	1295
Controlling Advertising and Processing in Routing Updates	1296
Filtering Sources of Routing Information	1297
Managing Authentication Keys	1298
Prerequisites	1298
How to Configure Authentication Keys	1299
Monitoring and Maintaining the IP Network	1300

**Controlling Switch Access with Passwords and Privilege Levels 1305**

Finding Feature Information	1305
Restrictions for Controlling Switch Access with Passwords and Privileges	1305
Information About Passwords and Privilege Levels	1306
Default Password and Privilege Level Configuration	1306
Additional Password Security	1306
Password Recovery	1306
Terminal Line Telnet Configuration	1307
Username and Password Pairs	1307
Privilege Levels	1307
How to Control Switch Access with Passwords and Privilege Levels	1308
Setting or Changing a Static Enable Password	1308
Protecting Enable and Enable Secret Passwords with Encryption	1309
Disabling Password Recovery	1311
Setting a Telnet Password for a Terminal Line	1312
Configuring Username and Password Pairs	1313
Setting the Privilege Level for a Command	1315
Changing the Default Privilege Level for Lines	1316
Logging into and Exiting a Privilege Level	1317
Monitoring Switch Access	1318

Configuration Examples for Setting Passwords and Privilege Levels	1318
Example: Setting or Changing a Static Enable Password	1318
Example: Protecting Enable and Enable Secret Passwords with Encryption	1318
Example: Setting a Telnet Password for a Terminal Line	1318
Example: Setting the Privilege Level for a Command	1319
Additional References	1319

**CHAPTER 63****Configuring TACACS+ 1321**

Finding Feature Information	1321
Prerequisites for Controlling Switch Access with Terminal Access Controller Access Control System Plus (TACACS+)	1321
Information About TACACS+	1323
TACACS+ and Switch Access	1323
TACACS+ Overview	1323
TACACS+ Operation	1325
Method List Description	1326
TACACS+ Configuration Options	1326
TACACS+ Login Authentication	1326
TACACS+ Authorization for Privileged EXEC Access and Network Services	1326
TACACS+ Accounting	1327
Default TACACS+ Configuration	1327
How to Configure TACACS+	1327
Identifying the TACACS+ Server Host and Setting the Authentication Key	1327
Configuring TACACS+ Login Authentication	1329
Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services	1331
Starting TACACS+ Accounting	1332
Establishing a Session with a Router if the AAA Server is Unreachable	1333
Monitoring TACACS+	1333
Additional References	1334

**CHAPTER 64****Configuring RADIUS 1337**

Finding Feature Information	1337
Prerequisites for Controlling Switch Access with RADIUS	1337
Restrictions for Controlling Switch Access with RADIUS	1338

Information about RADIUS	1339
RADIUS and Switch Access	1339
RADIUS Overview	1339
RADIUS Operation	1340
RADIUS Change of Authorization	1341
Change-of-Authorization Requests	1341
RFC 5176 Compliance	1342
CoA Request Response Code	1343
Session Identification	1343
CoA ACK Response Code	1344
CoA NAK Response Code	1344
CoA Request Commands	1344
Session Reauthentication	1344
Session Reauthentication in a Switch Stack	1345
Session Termination	1345
CoA Disconnect-Request	1345
CoA Request: Disable Host Port	1345
CoA Request: Bounce-Port	1346
Stacking Guidelines for Session Termination	1346
Stacking Guidelines for CoA-Request Bounce-Port	1346
Stacking Guidelines for CoA-Request Disable-Port	1347
Default RADIUS Configuration	1347
RADIUS Server Host	1347
RADIUS Login Authentication	1348
AAA Server Groups	1348
AAA Authorization	1349
RADIUS Accounting	1349
Vendor-Specific RADIUS Attributes	1349
Vendor-Proprietary RADIUS Server Communication	1350
How to Configure RADIUS	1350
Identifying the RADIUS Server Host	1350
Configuring RADIUS Login Authentication	1352
Defining AAA Server Groups	1354
Configuring RADIUS Authorization for User Privileged Access and Network Services	1356
Starting RADIUS Accounting	1357

Configuring Settings for All RADIUS Servers	1358
Configuring the Switch to Use Vendor-Specific RADIUS Attributes	1360
Configuring the Switch for Vendor-Proprietary RADIUS Server Communication	1361
Configuring CoA on the Switch	1362
Monitoring CoA Functionality	1364
Configuration Examples for Controlling Switch Access with RADIUS	1365
Examples: Identifying the RADIUS Server Host	1365
Examples: Configuring the Switch to Use Vendor-Specific RADIUS Attributes	1365
Example: Configuring the Switch for Vendor-Proprietary RADIUS Server Communication	1366
Additional References	1366

**CHAPTER 65****Configuring Kerberos 1369**

Finding Feature Information	1369
Prerequisites for Controlling Switch Access with Kerberos	1369
Information about Kerberos	1370
Kerberos and Switch Access	1370
Kerberos Overview	1370
Kerberos Operation	1373
Authenticating to a Boundary Switch	1373
Obtaining a TGT from a KDC	1373
Authenticating to Network Services	1373
How to Configure Kerberos	1374
Monitoring the Kerberos Configuration	1374
Additional References	1374

**CHAPTER 66****Configuring Local Authentication and Authorization 1377**

Finding Feature Information	1377
How to Configure Local Authentication and Authorization	1377
Configuring the Switch for Local Authentication and Authorization	1377
Monitoring Local Authentication and Authorization	1379
Additional References	1379

**CHAPTER 67****Configuring Secure Shell (SSH) 1381**

Finding Feature Information	1381
-----------------------------	------

Prerequisites for Configuring the Switch for Secure Shell (SSH) and Secure Copy Protocol (SCP)	1381
Restrictions for Configuring the Switch for SSH	1382
Information about SSH	1382
SSH and Switch Access	1382
SSH Servers, Integrated Clients, and Supported Versions	1383
SSH Configuration Guidelines	1383
Secure Copy Protocol Overview	1384
Secure Copy Protocol Concepts	1384
How to Configure SSH	1385
Setting Up the Switch to Run SSH	1385
Configuring the SSH Server	1386
Monitoring the SSH Configuration and Status	1388
Additional References	1388

**CHAPTER 69**

<b>Configuring IPv4 ACLs</b>	<b>1405</b>
Finding Feature Information	1405
Prerequisites for Configuring Network Security with ACLs	1405
Restrictions for Configuring Network Security with ACLs	1405

Information about Network Security with ACLs	1407
ACL Overview	1407
Access Control Entries	1407
ACL Supported Types	1407
Supported ACLs	1408
ACL Precedence	1408
Port ACLs	1409
Router ACLs	1410
VLAN Maps	1410
ACEs and Fragmented and Unfragmented Traffic	1411
Example: ACEs and Fragmented and Unfragmented Traffic	1411
ACLs and Switch Stacks	1412
Active Switch and ACL Functions	1412
Stack Member and ACL Functions	1412
Active Switch Failure and ACLs	1412
Standard and Extended IPv4 ACLs	1413
IPv4 ACL Switch Unsupported Features	1413
Access List Numbers	1413
Numbered Standard IPv4 ACLs	1414
Numbered Extended IPv4 ACLs	1414
Named IPv4 ACLs	1415
ACL Logging	1416
Hardware and Software Treatment of IP ACLs	1416
VLAN Map Configuration Guidelines	1416
VLAN Maps with Router ACLs	1417
VLAN Maps and Router ACL Configuration Guidelines	1417
VACL Logging	1418
Time Ranges for ACLs	1418
IPv4 ACL Interface Considerations	1419
How to Configure ACLs	1419
Configuring IPv4 ACLs	1419
Creating a Numbered Standard ACL	1420
Creating a Numbered Extended ACL	1421
Creating Named Standard ACLs	1424
Creating Extended Named ACLs	1425

Configuring Time Ranges for ACLs	1427
Applying an IPv4 ACL to a Terminal Line	1428
Applying an IPv4 ACL to an Interface	1430
Creating Named MAC Extended ACLs	1431
Applying a MAC ACL to a Layer 2 Interface	1433
Configuring VLAN Maps	1434
Creating a VLAN Map	1436
Applying a VLAN Map to a VLAN	1437
Monitoring IPv4 ACLs	1439
Configuration Examples for ACLs	1440
Examples: Using Time Ranges with ACLs	1440
Examples: Including Comments in ACLs	1440
IPv4 ACL Configuration Examples	1441
ACLs in a Small Networked Office	1442
Examples: ACLs in a Small Networked Office	1442
Example: Numbered ACLs	1443
Examples: Extended ACLs	1443
Examples: Named ACLs	1444
Examples: Time Range Applied to an IP ACL	1444
Examples: Commented IP ACL Entries	1445
Examples: ACL Logging	1445
Configuration Examples for ACLs and VLAN Maps	1446
Example: Creating an ACL and a VLAN Map to Deny a Packet	1446
Example: Creating an ACL and a VLAN Map to Permit a Packet	1447
Example: Default Action of Dropping IP Packets and Forwarding MAC Packets	1447
Example: Default Action of Dropping MAC Packets and Forwarding IP Packets	1447
Example: Default Action of Dropping All Packets	1448
Configuration Examples for Using VLAN Maps in Your Network	1448
Example: Wiring Closet Configuration	1448
Example: Restricting Access to a Server on Another VLAN	1450
Example: Denying Access to a Server on Another VLAN	1450
Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs	1451
Example: ACLs and Switched Packets	1451
Example: ACLs and Bridged Packets	1451
Example: ACLs and Routed Packets	1452

Example: ACLs and Multicast Packets 1453

**CHAPTER 89****Configuring Right-To-Use Licenses 1883**

Finding Feature Information	1883
Restrictions for Configuring RTU Licenses	1883
Information About Configuring RTU Licenses	1884
Right-To-Use Licensing	1884
Right-To-Use Image Based Licenses	1884
Right-To-Use License States	1885
License Activation for Switch Stacks	1885
Mobility Controller Mode	1885
Right-To-Use AP-Count Licensing	1886
Right-to-Use AP-Count Evaluation Licenses	1886
Right-To-Use Adder AP-Count Rehosting Licenses	1887
How to Configure RTU Licenses	1887

Activating an Imaged Based License	1887
Activating an AP-Count License	1888
Obtaining an Upgrade or Capacity Adder License	1889
Rehosting a License	1890
Changing Mobility Mode	1891
Monitoring and Maintaining RTU Licenses	1892
Configuration Examples for RTU Licensing	1893
Examples: Activating RTU Image Based Licenses	1893
Examples: Displaying RTU Licensing Information	1893
Example: Displaying RTU License Details	1894
Example: Displaying RTU License Mismatch	1895
Example: Displaying RTU Licensing Usage	1896
Additional References for RTU Licensing	1897
Feature History and Information for RTU Licensing	1898

**CHAPTER 90****Configuring Administrator Usernames and Passwords 1899**

Finding Feature Information	1899
Information About Configuring Administrator Usernames and Passwords	1899
Configuring Administrator Usernames and Passwords	1900
Examples: Administrator Usernames and Passwords Configuration	1902
Additional References for Administrator Usernames and Passwords	1902
Feature History and Information For Performing Administrator Usernames and Passwords Configuration	1903

**CHAPTER 91****Configuring 802.11 parameters and Band Selection 1905**

Finding Feature Information	1905
Restrictions on Band Selection, 802.11 Bands, and Parameters	1905
Information About Configuring Band Selection, 802.11 Bands, and Parameters	1906
Band Selection	1906
802.11 Bands	1906
802.11n Parameter	1906
802.11h Parameter	1907
How to Configure 802.11 Bands and Parameters	1907
Configuring Band Selection (CLI)	1907
Configuring the 802.11 Bands (CLI)	1908

Configuring the 802.11 Bands (GUI)	1911
Configuring 802.11n Parameters (CLI)	1912
Configuring the 802.11n Parameters (GUI)	1915
Configuring 802.11h Parameters (CLI)	1916
Configuring the 802.11h Parameters (GUI)	1917
Monitoring Configuration Settings for Band Selection, 802.11 Bands, and Parameters	1918
Monitoring Configuration Settings Using Band Selection and 802.11 Bands	
Commands	1918
Example: Viewing the Configuration Settings for 5-GHz Band	1918
Example: Viewing the Configuration Settings for 24-GHz Band	1920
Example: Viewing the status of 802.11h Parameters	1921
Example: Verifying the Band Selection Settings	1921
Configuration Examples for Band Selection, 802.11 Bands, and Parameters	1922
Examples: Band Selection Configuration	1922
Examples: 802.11 Bands Configuration	1922
Examples: 802.11n Configuration	1923
Examples: 802.11h Configuration	1923
Additional References for 802.11 Parameters and Band Selection	1924
Feature History and Information For Performing 802.11 parameters and Band Selection	
Configuration	1925

**CHAPTER 92****Configuring Aggressive Load Balancing 1927**

Finding Feature Information	1927
Restrictions for Aggressive Load Balancing	1927
Information for Configuring Aggressive Load Balancing Parameters	1928
Aggressive Load Balancing	1928
How to Configure Aggressive Load Balancing	1929
Configuring Aggressive Load Balancing	1929
Monitoring Aggressive Load Balancing	1930
Examples: Aggressive Load Balancing Configuration	1930
Additional References for Aggressive Load Balancing	1931
Feature History and Information For Performing Aggressive Load Balancing Configuration	
	1932

**CHAPTER 93****Configuring Client Roaming 1933**

Finding Feature Information	1933
Restrictions for Configuring Client Roaming	1933
Information About Client Roaming	1934
Inter-Subnet Roaming	1935
Voice-over-IP Telephone Roaming	1935
CCX Layer 2 Client Roaming	1935
How to Configure Layer 2 or Layer 3 Roaming	1936
Configuring Layer 2 or Layer 3 Roaming	1936
Configuring CCX Client Roaming Parameters (CLI)	1937
Configuring Mobility Oracle	1939
Configuring Mobility Controller	1940
Configuring Mobility Agent	1942
Monitoring Client Roaming Parameters	1943
Monitoring Mobility Configurations	1943
Additional References for Configuring Client Roaming	1945
Feature History and Information For Performing Client Roaming Configuration	1946

---

**CHAPTER 94**
**Configuring Application Visibility and Control 1947**

Finding Feature Information	1947
Information About Application Visibility and Control	1947
Restrictions for Application Visibility and Control	1948
How to Configure Application Visibility and Control	1948
Configuring Application Visibility and Control (CLI)	1948
Creating a Flow Record	1948
Creating a Flow Exporter (Optional)	1951
Creating a Flow Monitor	1952
Configuring WLAN to Apply Flow Monitor in IPV4 Input/Output Direction	1954
Configuring Application Visibility and Control (GUI)	1955
Monitoring Application Visibility and Control	1955
Monitoring Application Visibility and Control (CLI)	1955
Monitoring Application Visibility and Control (GUI)	1956
Examples: Application Visibility and Control Configuration	1957
Additional References for Application Visibility and Control	1958
Feature History and Information For Application Visibility and Control	1959

**CHAPTER 95****Configuring Voice and Video Parameters 1961**

- Finding Feature Information 1961
- Prerequisites for Voice and Video Parameters 1961
- Restrictions for Voice and Video Parameters 1961
- Information About Configuring Voice and Video Parameters 1962
  - Call Admission Control 1962
    - Static-Based CAC 1962
    - Load-Based CAC 1963
  - IOSd Call Admission Control 1963
  - Expedited Bandwidth Requests 1964
  - U-APSD 1964
  - Traffic Stream Metrics 1965
  - Information About Configuring Voice Prioritization Using Preferred Call Numbers 1965
  - Information About EDCA Parameters 1966
- How to Configure Voice and Video Parameters 1966
  - Configuring Voice Parameters (CLI) 1966
  - Configuring Video Parameters (CLI) 1970
  - Configuring SIP-Based CAC (CLI) 1973
  - Configuring a Preferred Call Number (CLI) 1974
  - Configuring EDCA Parameters (CLI) 1976
  - Configuring EDCA Parameters (GUI) 1977
- Monitoring Voice and Video Parameters 1978
- Additional References for Voice and Video Parameters 1980
- Feature History and Information For Performing Voice and Video Parameters Configuration 1981

---

**CHAPTER 96****Configuring RFID Tag Tracking 1983**

- Finding Feature Information 1983
- Information About Configuring RFID Tag Tracking 1983
- How to Configure RFID Tag Tracking 1984
  - Configuring RFID Tag Tracking (CLI) 1984
- Monitoring RFID Tag Tracking Information 1985
- Additional References RFID Tag Tracking 1985
- Feature History and Information For Performing RFID Tag Tracking Configuration 1986

---

**CHAPTER 97****Configuring Location Settings 1987**

Finding Feature Information 1987

Information About Configuring Location Settings 1987

How to Configure Location Settings 1988

Configuring Location Settings (CLI) 1988

Modifying the NMSP Notification Interval for Clients, RFID Tags, and Rogues (CLI) 1990

    Modifying the NMSP Notification threshold for Clients, RFID Tags, and Rogues  
    (CLI) 1991

Monitoring Location Settings and NMSP Settings 1992

Monitoring Location Settings (CLI) 1992

Monitoring NMSP Settings (CLI) 1992

Examples: Location Settings Configuration 1993

Examples: NMSP Settings Configuration 1993

Additional References for Location Settings 1994

Feature History and Information For Performing Location Settings Configuration 1995

---

**CHAPTER 98****Monitoring Flow Control 1997**

Finding Feature Information 1997

Information About Flow Control 1997

Monitoring Flow Control 1997

Examples: Monitoring Flow Control 1998

Additional References for Monitoring Flow Control 1999

Feature History and Information For Monitoring Flow Control 2000

---

**CHAPTER 99****Configuring SDM Templates 2001**

Finding Feature Information 2001

Information About Configuring SDM Templates 2001

SDM Templates 2001

SDM Templates and Switch Stacks 2003

How to Configure SDM Templates 2003

Configuring SDM Templates 2003

Configuring the Switch SDM Template 2003

Setting the SDM Template 2003

Monitoring and Maintaining SDM Templates 2004

Configuration Examples for Configuring SDM Templates	2005
Examples: Configuring SDM Templates	2005
Examples: Displaying SDM Templates	2005
Additional References for SDM Templates	2006
Feature History and Information for Configuring SDM Templates	2007

---

**CHAPTER 100**

<b>Configuring System Message Logs</b>	<b>2009</b>
Finding Feature Information	2009
Information About Configuring System Message Logs	2009
System Message Logging	2009
System Log Message Format	2010
Default System Message Logging Settings	2011
Syslog Message Limits	2012
How to Configure System Message Logs	2012
Setting the Message Display Destination Device	2012
Synchronizing Log Messages	2014
Disabling Message Logging	2015
Enabling and Disabling Time Stamps on Log Messages	2016
Enabling and Disabling Sequence Numbers in Log Messages	2017
Defining the Message Severity Level	2018
Limiting Syslog Messages Sent to the History Table and to SNMP	2019
Logging Messages to a UNIX Syslog Daemon	2020
Monitoring and Maintaining System Message Logs	2021
Monitoring Configuration Archive Logs	2021
Configuration Examples for System Message Logs	2022
Example: Stacking System Message	2022
Example: Switch System Message	2022
Additional References for System Message Logs	2022
Feature History and Information For System Message Logs	2024

---

**CHAPTER 101**

<b>Configuring Online Diagnostics</b>	<b>2025</b>
Finding Feature Information	2025
Information About Configuring Online Diagnostics	2025
Online Diagnostics	2025
How to Configure Online Diagnostics	2026

Starting Online Diagnostic Tests	2026
Configuring Online Diagnostics	2027
Scheduling Online Diagnostics	2027
Configuring Health-Monitoring Diagnostics	2028
Monitoring and Maintaining Online Diagnostics	2030
Displaying Online Diagnostic Tests and Test Results	2030
Configuration Examples for Online Diagnostic Tests	2031
Examples: Start Diagnostic Tests	2031
Example: Configure a Health Monitoring Test	2031
Examples: Schedule Diagnostic Test	2031
Examples: Displaying Online Diagnostics	2032
Additional References for Online Diagnostics	2033
Feature History and Information for Configuring Online Diagnostics	2034

---

**CHAPTER 102**
**Managing Configuration Files 2035**

Prerequisites for Managing Configuration Files	2035
Restrictions for Managing Configuration Files	2035
Information About Managing Configuration Files	2035
Types of Configuration Files	2035
Configuration Mode and Selecting a Configuration Source	2036
Configuration File Changes Using the CLI	2036
Location of Configuration Files	2036
Copy Configuration Files from a Network Server to the Switch	2037
Copying a Configuration File from the Switch to a TFTP Server	2037
Copying a Configuration File from the Switch to an RCP Server	2037
Restrictions	2038
Requirements for the RCP Username	2039
Copying a Configuration File from the Switch to an FTP Server	2039
Understanding the FTP Username and Password	2039
Configuration Files Larger than NVRAM	2040
Compressing the Configuration File	2040
Storing the Configuration in Flash Memory on Class A Flash File Systems	2040
Loading the Configuration Commands from the Network	2040
Configuring the Switch to Download Configuration Files	2041
Network Versus Host Configuration Files	2041

How to Manage Configuration File Information	2041
Displaying Configuration File Information (CLI)	2041
Modifying the Configuration File (CLI)	2042
Copying a Configuration File from the Switch to a TFTP Server (CLI)	2044
What to Do Next	2045
Copying a Configuration File from the Switch to an RCP Server (CLI)	2045
Examples	2046
Storing a Running Configuration File on an RCP Server	2046
Storing a Startup Configuration File on an RCP Server	2047
What to Do Next	2047
Copying a Configuration File from the Switch to the FTP Server (CLI)	2047
Examples	2048
Storing a Running Configuration File on an FTP Server	2048
Storing a Startup Configuration File on an FTP Server	2049
What to Do Next	2049
Copying a Configuration File from a TFTP Server to the Switch (CLI)	2049
What to Do Next	2050
Copying a Configuration File from the rcp Server to the Switch (CLI)	2050
Examples	2052
Copy RCP Running-Config	2052
Copy RCP Startup-Config	2052
What to Do Next	2052
Copying a Configuration File from an FTP Server to the Switch (CLI)	2052
Examples	2054
Copy FTP Running-Config	2054
Copy FTP Startup-Config	2054
What to Do Next	2054
Maintaining Configuration Files Larger than NVRAM	2055
Compressing the Configuration File (CLI)	2055
Storing the Configuration in Flash Memory on Class A Flash File Systems (CLI)	2056
Loading the Configuration Commands from the Network (CLI)	2058
Copying Configuration Files from Flash Memory to the Startup or Running Configuration (CLI)	2060
Copying Configuration Files Between Flash Memory File Systems (CLI)	2061

Copying a Configuration File from an FTP Server to Flash Memory Devices (CLI)	2062
What to Do Next	2064
Copying a Configuration File from an RCP Server to Flash Memory Devices (CLI)	2064
Copying a Configuration File from a TFTP Server to Flash Memory Devices (CLI)	2065
Re-executing the Configuration Commands in the Startup Configuration File (CLI)	2066
Clearing the Startup Configuration (CLI)	2066
Deleting a Specified Configuration File (CLI)	2067
Specifying the CONFIG_FILE Environment Variable on Class A Flash File Systems (CLI)	2068
What to Do Next	2070
Configuring the Switch to Download Configuration Files	2070
Configuring the Switch to Download the Network Configuration File (CLI)	2070
Configuring the Switch to Download the Host Configuration File (CLI)	2072
Additional References	2074
<b>CHAPTER 103</b>	<b>Configuration Replace and Configuration Rollback 2077</b>
Prerequisites for Configuration Replace and Configuration Rollback	2077
Restrictions for Configuration Replace and Configuration Rollback	2078
Information About Configuration Replace and Configuration Rollback	2078
Configuration Archive	2078
Configuration Replace	2078
Configuration Rollback	2079
Configuration Rollback Confirmed Change	2080
Benefits of Configuration Replace and Configuration Rollback	2080
How to Use Configuration Replace and Configuration Rollback	2080
Creating a Configuration Archive (CLI)	2080
Performing a Configuration Replace or Configuration Rollback Operation (CLI)	2082
Monitoring and Troubleshooting the Feature (CLI)	2084
Configuration Examples for Configuration Replace and Configuration Rollback	2086
Creating a Configuration Archive	2086
Replacing the Current Running Configuration with a Saved Cisco IOS Configuration File	2087
Reverting to the Startup Configuration File	2087
Performing a Configuration Replace Operation with the configure confirm Command	2087
Performing a Configuration Rollback Operation	2088

## Document Conventions

This document uses the following conventions:

Convention	Description
^ or Ctrl	Both the ^ symbol and Ctrl represent the Control (Ctrl) key on a keyboard. For example, the key combination <b>^D</b> or <b>Ctrl-D</b> means that you hold down the Control key while you press the D key. (Keys are indicated in capital letters but are not case sensitive.)
<b>bold font</b>	Commands and keywords and user-entered text appear in <b>bold font</b> .
<i>Italic font</i>	Document titles, new or emphasized terms, and arguments for which you supply values are in <i>italic font</i> .
Courier font	Terminal sessions and information the system displays appear in <i>courier font</i> .
<b>Bold Courier font</b>	<b>Bold Courier font</b> indicates text that the user must enter.
[x]	Elements in square brackets are optional.
...	An ellipsis (three consecutive nonbolded periods without spaces) after a syntax element indicates that the element can be repeated.
	A vertical line, called a pipe, indicates a choice within a set of keywords or arguments.
[x   y]	Optional alternative keywords are grouped in brackets and separated by vertical bars.

Convention	Description
{x   y}	Required alternative keywords are grouped in braces and separated by vertical bars.
[x {y   z}]	Nested set of square brackets or braces indicate optional or required choices within optional or required elements. Braces and a vertical bar within square brackets indicate a required choice within an optional element.
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.
<>	Nonprinting characters such as passwords are in angle brackets.
[ ]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

### Reader Alert Conventions

This document may use the following conventions for reader alerts:

#### Note

Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

#### Tip

Means *the following information will help you solve a problem*.

#### Caution

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

#### Timesaver

Means *the described action saves time*. You can save time by performing the action described in the paragraph.

#### Warning

Means *reader be warned*. In this situation, you might perform an action that could result in bodily injury.

- [How to Use the CLI to Configure Features, page 6](#)

## Information About Using the Command-Line Interface

### Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

You can start a CLI session through a console connection, through Telnet, a SSH, or by using the browser.

When you start a session, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as **show** commands, which show the current configuration status, and **clear** commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode.

Table 1: Command Mode Summary

Mode	Access Method	Prompt	Exit Method	About This Mode
User EXEC	Begin a session using Telnet, SSH, or console.	Switch>	Enter <b>logout</b> or <b>quit</b> .	Use this mode to <ul style="list-style-type: none"> <li>• Change terminal settings.</li> <li>• Perform basic tests.</li> <li>• Display system information.</li> </ul>
Privileged EXEC	While in user EXEC mode, enter the <b>enable</b> command.	Switch#	Enter <b>disable</b> to exit.	Use this mode to verify commands that you have entered. Use a password to protect access to this mode.
Global configuration	While in privileged EXEC mode, enter the <b>configure</b> command.	Switch(config)#	To exit to privileged EXEC mode, enter <b>exit</b> or <b>end</b> , or press <b>Ctrl-Z</b> .	Use this mode to configure parameters that apply to the entire switch.
VLAN configuration	While in global configuration mode, enter the <b>vlan <i>vlan-id</i></b> command.	Switch(config-vlan)#	To exit to global configuration mode, enter the <b>exit</b> command.  To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> .	Use this mode to configure VLAN parameters. When VTP mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005) and save configurations in the switch startup configuration file.
Interface configuration	While in global configuration mode, enter the <b>interface</b> command (with a specific interface).	Switch(config-if)#		Use this mode to configure parameters for the Ethernet ports.

Mode	Access Method	Prompt	Exit Method	About This Mode
			To exit to global configuration mode, enter <b>exit</b> .  To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> .	
Line configuration	While in global configuration mode, specify a line with the <b>line vty</b> or <b>line console</b> command.	Switch(config-line)#	To exit to global configuration mode, enter <b>exit</b> .  To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> .	Use this mode to configure parameters for the terminal line.

## Using the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

### SUMMARY STEPS

1. **help**
2. *abbreviated-command-entry ?*
3. *abbreviated-command-entry <Tab>*
4. **?**
5. *command ?*
6. *command keyword ?*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>help</b>  <b>Example:</b> Switch# <b>help</b>	Obtains a brief description of the help system in any command mode.
Step 2	<i>abbreviated-command-entry ?</i>  <b>Example:</b> Switch# <b>di?</b> dir disable disconnect	Obtains a list of commands that begin with a particular character string.
Step 3	<i>abbreviated-command-entry &lt;Tab&gt;</i>  <b>Example:</b> Switch# <b>sh conf&lt;tab&gt;</b> Switch# <b>show configuration</b>	Completes a partial command name.
Step 4	<b>?</b>  <b>Example:</b> Switch> <b>?</b>	Lists all commands available for a particular command mode.
Step 5	<i>command ?</i>  <b>Example:</b> Switch> <b>show ?</b>	Lists the associated keywords for a command.
Step 6	<i>command keyword ?</i>  <b>Example:</b> Switch(config)# <b>cdp holdtime ?</b> <10-255> Length of time (in sec) that receiver must keep this packet	Lists the associated arguments for a keyword.

## Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the **show configuration** privileged EXEC command in an abbreviated form:

```
Switch# show conf
```

## No and Default Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to reenable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values.

## CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your switch.

**Table 2: Common CLI Error Messages**

Error Message	Meaning	How to Get Help
% Ambiguous command: "show con"	You did not enter enough characters for your switch to recognize the command.	Reenter the command followed by a question mark (?) without any space between the command and the question mark.  The possible keywords that you can enter with the command appear.
% Incomplete command.	You did not enter all of the keywords or values required by this command.	Reenter the command followed by a question mark (?) with a space between the command and the question mark.  The possible keywords that you can enter with the command appear.
% Invalid input detected at '^' marker.	You entered the command incorrectly. The caret (^) marks the point of the error.	Enter a question mark (?) to display all of the commands that are available in this command mode.  The possible keywords that you can enter with the command appear.

## Configuration Logging

You can log and view changes to the switch configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous

notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

**Note** Only CLI or HTTP changes are logged.

## How to Use the CLI to Configure Features

### Configuring the Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.

#### Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. This procedure is optional.

#### SUMMARY STEPS

1. `terminal history [size number-of-lines]`

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>terminal history [size number-of-lines]</b>  <b>Example:</b> Switch# <code>terminal history size 200</code>	Changes the number of command lines that the switch records during the current terminal session in privileged EXEC mode. You can configure the size from 0 to 256.

### Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

**Note** The arrow keys function only on ANSI-compatible terminals such as VT100s.

**SUMMARY STEPS**

1. **Ctrl-P** or use the **up arrow** key
2. **Ctrl-N** or use the **down arrow** key
3. **show history**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>Ctrl-P</b> or use the <b>up arrow</b> key	Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.
<b>Step 2</b>	<b>Ctrl-N</b> or use the <b>down arrow</b> key	Returns to more recent commands in the history buffer after recalling commands with <b>Ctrl-P</b> or the up arrow key. Repeat the key sequence to recall successively more recent commands.
<b>Step 3</b>	<b>show history</b>  <b>Example:</b> Switch# <b>show history</b>	Lists the last several commands that you just entered in privileged EXEC mode. The number of commands that appear is controlled by the setting of the <b>terminal history</b> global configuration command and the <b>history</b> line configuration command.

**Disabling the Command History Feature**

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. This procedure is optional.

**SUMMARY STEPS**

1. **terminal no history**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>terminal no history</b>  <b>Example:</b> Switch# <b>terminal no history</b>	Disables the feature during the current terminal session in privileged EXEC mode.

**Enabling and Disabling Editing Features**

Although enhanced editing mode is automatically enabled, you can disable it and reenable it.

**SUMMARY STEPS**

1. terminal editing
2. terminal no editing

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>terminal editing</b>  <b>Example:</b> Switch# <code>terminal editing</code>	Reenables the enhanced editing mode for the current terminal session in privileged EXEC mode.
<b>Step 2</b>	<b>terminal no editing</b>  <b>Example:</b> Switch# <code>terminal no editing</code>	Disables the enhanced editing mode for the current terminal session in privileged EXEC mode.

**Editing Commands Through Keystrokes**

The keystrokes help you to edit the command lines. These keystrokes are optional.

**Note**

The arrow keys function only on ANSI-compatible terminals such as VT100s.

**Table 3: Editing Commands**

Editing Commands	Description
<b>Ctrl-B</b> or use the <b>left arrow</b> key	Moves the cursor back one character.
<b>Ctrl-F</b> or use the <b>right arrow</b> key	Moves the cursor forward one character.
<b>Ctrl-A</b>	Moves the cursor to the beginning of the command line.
<b>Ctrl-E</b>	Moves the cursor to the end of the command line.
<b>Esc B</b>	Moves the cursor back one word.
<b>Esc F</b>	Moves the cursor forward one word.
<b>Ctrl-T</b>	Transposes the character to the left of the cursor with the character located at the cursor.

<b>Delete</b> or <b>Backspace</b> key	Erases the character to the left of the cursor.
<b>Ctrl-D</b>	Deletes the character at the cursor.
<b>Ctrl-K</b>	Deletes all characters from the cursor to the end of the command line.
<b>Ctrl-U</b> or <b>Ctrl-X</b>	Deletes all characters from the cursor to the beginning of the command line.
<b>Ctrl-W</b>	Deletes the word to the left of the cursor.
<b>Esc D</b>	Deletes from the cursor to the end of the word.
<b>Esc C</b>	Capitalizes at the cursor.
<b>Esc L</b>	Changes the word at the cursor to lowercase.
<b>Esc U</b>	Capitalizes letters from the cursor to the end of the word.
<b>Ctrl-V</b> or <b>Esc Q</b>	Designates a particular keystroke as an executable command, perhaps as a shortcut.
<b>Return</b> key	Scrolls down a line or screen on displays that are longer than the terminal screen can display.  <b>Note</b> The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including <b>show</b> command output. You can use the <b>Return</b> and <b>Space</b> bar keystrokes whenever you see the More prompt.
<b>Space</b> bar	Scrolls down one screen.
<b>Ctrl-L</b> or <b>Ctrl-R</b>	Redisplays the current command line if the switch suddenly sends a message to your screen.

## Editing Command Lines That Wrap

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press **Ctrl-B** or the left arrow key repeatedly. You can also press **Ctrl-A** to immediately move to the beginning of the line.

**Note**

The arrow keys function only on ANSI-compatible terminals such as VT100s.

The following example shows how to wrap a command line that extends beyond a single line on the screen.

**SUMMARY STEPS**

1. **access-list**
2. **Ctrl-A**
3. **Return** key

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>access-list</b>  <b>Example:</b> <pre>Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 Switch(config)# \$ 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 255.25 Switch(config)# \$t tcp 10.15.22.25 255.255.255.0 131.108.1.20 255.255.255.0 eq Switch(config)# \$15.22.25 255.255.255.0 10.15.22.35 255.255.255.0 eq 45</pre>	Displays the global configuration command entry that extends beyond one line.  When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign (\$) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.
<b>Step 2</b>	<b>Ctrl-A</b>  <b>Example:</b> <pre>Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.2\$</pre>	Checks the complete syntax.  The dollar sign (\$) appears at the end of the line to show that the line has been scrolled to the right.
<b>Step 3</b>	<b>Return</b> key	Execute the commands.  The software assumes that you have a terminal screen that is 80 columns wide. If you have a different width, use the <b>terminal width</b> privileged EXEC command to set the width of your terminal.  Use line wrapping with the command history feature to recall and modify previous complex command entries.

## Searching and Filtering Output of show and more Commands

You can search and filter the output for **show** and **more** commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

## SUMMARY STEPS

1. `{show | more} command | {begin | include | exclude} regular-expression`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>{show   more} command   {begin   include   exclude} regular-expression</code>  <b>Example:</b> <pre>Switch# show interfaces   include protocol Vlan1 is up, line protocol is up Vlan10 is up, line protocol is down GigabitEthernet1/0/1 is up, line protocol is down GigabitEthernet1/0/2 is up, line protocol is up</pre>	Searches and filters the output.  Expressions are case sensitive. For example, if you enter <code>  exclude output</code> , the lines that contain <b>output</b> are not displayed, but the lines that contain <b>output</b> appear.

## Accessing the CLI on a Switch Stack

You can access the CLI through a console connection, through Telnet, a SSH, or by using the browser.

You manage the switch stack and the stack member interfaces through the active switch. You cannot manage stack members on an individual switch basis. You can connect to the active switch through the console port or the Ethernet management port of one or more stack members. Be careful with using multiple CLI sessions on the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

### Note

We recommend using one CLI session when managing the switch stack.

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

To debug the standby switch, use the **session standby ios** privileged EXEC command from the active switch to access the IOS console of the standby switch. To debug a specific stack member, use the **session switch stack-member-number** privileged EXEC command from the active switch to access the diagnostic shell of the stack member. For more information about these commands, see the switch command reference.

## Accessing the CLI Through a Console Connection or Through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the switch console or connect a PC to the Ethernet management port and then power on the switch, as described in the hardware installation guide that shipped with your switch.

If your switch is already configured, you can access the CLI through a local console connection or through a remote Telnet session, but your switch must first be configured for this type of access.

You can use one of these methods to establish a connection with the switch:

- Connect the switch console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the switch hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.
  - The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.
  - The switch supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.

## Using the Web Graphical User Interface

---

- [Prerequisites for Using the Web GUI, page 13](#)
- [Information About Using The Web GUI, page 13](#)
- [Connecting the Console Port of the Switch , page 15](#)
- [Logging On to the Web GUI, page 15](#)
- [Enabling Web and Secure Web Modes , page 15](#)
- [Configuring the Switch Web GUI, page 16](#)

### Prerequisites for Using the Web GUI

- The GUI must be used on a PC running Windows 7, Windows XP SP1 (or later releases), or Windows 2000 SP4 (or later releases).
- The switch GUI is compatible with Microsoft Internet Explorer version 10.x, Mozilla Firefox 20.x, or Google Chrome 26.x.

### Information About Using The Web GUI

A web browser, or graphical user interface (GUI), is built into each switch.

You can use either the service port interface or the management interface to access the GUI. We recommend that you use the service-port interface. Click Help at the top of any page in the GUI to display online help. You might need to disable your browser's pop-up blocker to view the online help.

### Web GUI Features

The switch web GUI supports the following:

The Configuration Wizard—After initial configuration of the IP address and the local username/password or auth via the authentication server (privilege 15 needed), the wizard provides a method to complete the initial

wireless configuration. Start the wizard through Configuration -> Wizard and follow the nine-step process to configure the following:

- Admin Users
- SNMP System Summary
- Management Port
- Wireless Management
- RF Mobility and Country code
- Mobility configuration
- WLANs
- 802.11 Configuration
- Set Time

The Monitor tab:

- Displays summary details of switch, clients, and access points.
- Displays all radio and AP join statistics.
- Displays air quality on access points.
- Displays list of all Cisco Discovery Protocol (CDP) neighbors on all interfaces and the CDP traffic information.
- Displays all rogue access points based on their classification-friendly, malicious, ad hoc, classified, and unclassified.

The Configuration tab:

- Enables you to configure the switch for all initial operation using the web Configuration Wizard. The wizard allows you to configure user details, management interface, and so on.
- Enables you to configure the system, internal DHCP server, management, and mobility management parameters.
- Enables you to configure the switch, WLAN, and radios.
- Enables you to configure and set security policies on your switch.
- Enables you to access the switch operating system software management commands.

The Administration tab enables you to configure system logs.

# Connecting the Console Port of the Switch

## Before You Begin

Before you can configure the switch for basic operations, you need to connect it to a PC that uses a VT-100 terminal emulation program (such as HyperTerminal, ProComm, Minicom, or Tip).

- 
- Step 1** Connect one end of a null-modem serial cable to the switch's RJ-45 console port and the other end to your PC's serial port.
- Step 2** Plug the AC power cord into the switch and a grounded 100 to 240 VAC, 50/60-Hz electrical outlet. Turn on the power supply. The bootup script displays operating system software initialization (code download and power-on self-test verification) and basic configuration. If the switch passes the power-on self-test, the bootup script runs the configuration wizard, which prompts you for basic configuration input.
- Step 3** Enter **yes**. Proceed with basic initial setup configuration parameters in the CLI setup wizard. Specify the IP address for the service port which is the gigabitethernet 0/0 interface.  
After entering the configuration parameters in the configuration wizard, you can access the Web GUI. Now, the switch is configured with the IP address for service port.
- 

# Logging On to the Web GUI

---

Enter the switch IP address in your browser's address bar. For a secure connection, enter `https://ip-address`. For a less secure connection, enter `http://ip-address`.

---

# Enabling Web and Secure Web Modes

- 
- Step 1** Choose **Configuration > Switch > Management > Protocol Management > HTTP-HTTPS**.  
The **HTTP-HTTPS Configuration** page appears.
- Step 2** To enable web mode, which allows users to access the switch GUI using "http://ip-address," choose Enabled from the HTTP Access drop-down list. Otherwise, choose Disabled. Web mode (HTTP) is not a secure connection.

- Step 3** To enable secure web mode, which allows users to access the switch GUI using “https://ip-address,” choose Enabled from the HTTPS Access drop-down list. Otherwise, choose Disabled. Secure web mode (HTTPS) is a secure connection.
- Step 4** Choose to track the device in the IP Device Tracking check box.
- Step 5** Choose to enable the trust point in the Enable check box.
- Step 6** Choose the trustpoints from the Trustpoints drop-down list.
- Step 7** Enter the amount of time, in seconds, before the web session times out due to inactivity in the HTTP Timeout-policy (1 to 600 sec) text box.  
The valid range is from 1 to 600 seconds.
- Step 8** Enter the server life time in the Server Life Time (1 to 86400 sec) text box.  
The valid range is from 1 to 86400 seconds.
- Step 9** Enter the maximum number of connection requests that the server can accept in the Maximum number of Requests (1 to 86400) text box.  
The valid range is from 1 to 86400 connections.
- Step 10** Click **Apply**.
- Step 11** Click **Save Configuration**.
- 

## Configuring the Switch Web GUI

The configuration wizard enables you to configure basic settings on the switch. You can run the wizard after you receive the switch from the factory or after the switch has been reset to factory defaults. The configuration wizard is available in both GUI and CLI formats.

- 
- Step 1** Connect your PC to the service port and configure an IPv4 address to use the same subnet as the switch. The switch is loaded with IOS XE image and the service port interface is configured as gigabitethernet 0/0.
- Step 2** Start Internet Explorer 10 (or later), Firefox 2.0.0.11 (or later), or Google Chrome on your PC and enter the management interface IP address on the browser window. The management interface IP address is same as the gigabitethernet 0/0 (also known as service port interface). When you log in for the first time, you need to enter HTTP username and password. By default, the username is **admin** and the password is **cisco**.  
You can use both HTTP and HTTPS when using the service port interface. HTTPS is enabled by default and HTTP can also be enabled.  
When you log in for the first time, the **Accessing Cisco Switch <Model Number> <Hostname>** page appears.
- Step 3** On the **Accessing Cisco Switch** page, click the **Wireless Web GUI** link to access switch web GUI **Home** page.
- Step 4** Choose **Configuration > Wizard** to perform all steps that you need to configure the switch initially.  
The **Admin Users** page appears.
- Step 5** On the **Admin Users** page, enter the administrative username to be assigned to this switch in the User Name text box and the administrative password to be assigned to this switch in the Password and Confirm Password text boxes. Click **Next**.  
The default username is **admin** and the default password is **cisco**. You can also create a new administrator user for the switch. You can enter up to 24 ASCII characters for username and password.

The **SNMP System Summary** page appears.

- Step 6** On the **SNMP System Summary** page, enter the following SNMP system parameters for the switch, and click **Next**:
- Customer-definable switch location in the Location text box.
  - Customer-definable contact details such as phone number with names in the Contact text box.
  - Choose **enabled** to send SNMP notifications for various SNMP traps or **disabled** not to send SNMP notifications for various SNMP traps from the SNMP Global Trap drop-down list.
  - Choose **enabled** to send system log messages or **disabled** not to send system log messages from the SNMP Logging drop-down list.

**Note** The SNMP trap server, must be reachable through the distribution ports (and not through the gigabitethernet0/0 service or management interface).

The **Management Port** page appears.

- Step 7** In the **Management Port** page, enter the following parameters for the management port interface (gigabitethernet 0/0) and click **Next**.
- Interface IP address that you assigned for the service port in the IP Address text box.
  - Network mask address of the management port interface in the Netmask text box.
  - The IPv4 Dynamic Host Configuration Protocol (DHCP) address for the selected port in the IPv4 DHCP Server text box.

The **Wireless Management** page appears.

- Step 8** In the **Wireless Management** page, enter the following wireless interface management details, and click **Next**.
- Choose the interface—VLAN, or Ten Gigabit Ethernet from the Select Interface drop-down list.
  - VLAN tag identifier, or 0 for no VLAN tag in the VLAN id text box.
  - IP address of wireless management interface where access points are connected in the IP Address text box.
  - Network mask address of the wireless management interface in the Netmask text box.
  - DHCP IPv4 IP address in the IPv4 DHCP Server text box.

When selecting VLAN as interface, you can specify the ports as –Trunk or Access ports from the selected list displayed in the Switch Port Configuration text box.

The **RF Mobility and Country Code** page appears.

- Step 9** In the **RF Mobility and Country Code** page, enter the RF mobility domain name in the RF Mobility text box, choose current country code from the Country Code drop-down list, and click **Next**. From the GUI, you can select only one country code.

**Note** Before configuring RF grouping parameters and mobility configuration, ensure that you refer to the relevant conceptual content and then proceed with the configuration.

The **Mobility Configuration** page with mobility global configuration settings appears.

- Step 10** In the **Mobility Configuration** page, view and enter the following mobility global configuration settings, and click **Next**.
- Choose **Mobility Controller** or **Mobility Agent** from the Mobility Role drop-down list:

- If Mobility Agent is chosen, enter the mobility controller IP address in the Mobility Controller IP Address text box and mobility controller IP address in the Mobility Controller Public IP Address text box.
- If Mobility Controller is chosen, then the mobility controller IP address and mobility controller public IP address are displayed in the respective text boxes.
- Displays mobility protocol port number in the Mobility Protocol Port text box.
- Displays the mobility switch peer group name in the Mobility Switch Peer Group Name text box.
- Displays whether DTLS is enabled in the DTLS Mode text box.  
DTLS is a standards-track Internet Engineering Task Force (IETF) protocol based on TLS.
- Displays mobility domain identifier for 802.11 radios in the Mobility Domain ID for 802.11 radios text box.
- The amount of time (in seconds) between each ping request sent to a peer switch in the Mobility Keepalive Interval (1-30)sec text box.  
Valid range is from 1 to 30 seconds, and the default value is 10 seconds.
- Number of times a ping request is sent to a peer switch before the peer is considered to be unreachable in the Mobility Keepalive Count (3-20) text box.  
The valid range is from 3 to 20, and the default value is 3.
- The DSCP value that you can set for the mobility switch in the Mobility Control Message DSCP Value (0-63) text box.  
The valid range is 0 to 63, and the default value is 0.
- Displays the number of mobility switch peer group member configured in the Switch Peer Group Members Configured text box.

The **WLANs** page appears.

**Step 11** In the **WLANs** page, enter the following WLAN configuration parameters, and click **Next**.

- WLAN identifier in the WLAN ID text box.
- SSID of the WLAN that the client is associated with in the SSID text box.
- Name of the WLAN used by the client in the Profile Name text box.

The **802.11 Configuration** page appears.

**Step 12** In the **802.11 Configuration** page, check either one or both 802.11a/n/ac and 802.11b/g/n check boxes to enable the 802.11 radios, and click **Next**.  
The **Set Time** page appears.

**Step 13** In the **Set Time** page, you can configure the time and date on the switch based on the following parameters, and click **Next**.

- Displays current timestamp on the switch in the Current Time text box.
- Choose either Manual or NTP from the Mode drop-down list.  
On using the NTP server, all access points connected to the switch, synchronizes its time based on the NTP server settings available.

- Choose date on the switch from the Year, Month, and Day drop-down list.
- Choose time from the Hours, Minutes, and Seconds drop-down list.
- Enter the time zone in the Zone text box and select the off setting required when compared to the current time configured on the switch from the Offset drop-down list.

The **Save Wizard** page appears.

**Step 14**

In the **Save Wizard** page, you can review the configuration settings performed on the switch using these steps, and if you wish to change any configuration value, click **Previous** and navigate to that page. You can save the switch configuration created using the wizard only if a success message is displayed for all the wizards. If the **Save Wizard** page displays errors, you must recreate the wizard for initial configuration of the switch.

- [Feature Information for Flexible NetFlow, page 55](#)

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Prerequisites for Flexible NetFlow

The following are prerequisites for your Flexible NetFlow configuration:

- You must configure a source interface. If you do not configure a source interface, the exporter will remain in a disabled state.
- You must configure a valid record name for every flow monitor.

## Prerequisites for Wireless Flexible NetFlow

The following are the prerequisites for wireless Flexible NetFlow:

- Ensure that the networking device is running a Cisco release that supports wireless Flexible NetFlow.
- Ensure that the target is connected to a WLAN.
- The networking device must be configured to support protocol types such as IP, IPv6, and datalink.
- Valid flow record and monitor are required before generating the flow.

## Restrictions for Flexible NetFlow

The following are restrictions for Flexible NetFlow:

- Traditional NetFlow (TNF) accounting is not supported.
- Flexible NetFlow v5 export format is not supported, only NetFlow v9 export format is supported.
- Both ingress and egress NetFlow accounting is supported.
- Microflow policing feature shares the NetFlow hardware resource with FNF.
- Only one flow monitor per interface and per direction is supported.
- Layer 2, IPv4, and IPv6 traffic types are supported; however, the switch can apply a flow monitor to only one of these types at a time for a given direction and interface.
- Layer 2, VLAN, WLAN and Layer 3 interfaces are supported, but the switch does not support SVI and tunnels.
- The following NetFlow table sizes are supported:

Trim Level	Ingress NetFlow Table	Egress NetFlow Table
LAN Base	Not supported	Not supported
IP Base	8 K	16 K
IP Services	8 K	16 K

- Depending on the switch type, a switch will have one or two forwarding ASICs. The capacities listed in the above table are on a per-ASIC basis.
- The switch can support either one or two ASICs. Each ASIC has 8K ingress and 16 K egress entries.
- The NetFlow tables are on separate compartments and cannot be combined. Depending on which ASIC processed the packet, the flows will be created in the table in the corresponding ASIC.
- Both full flow accounting and sampled NetFlow accounting are supported.
- NetFlow hardware implementation supports four hardware samplers. You can select a sampler rate from 1 out of 2 to 1 out of 1024. Only random sampling mode is supported.

- With the microflow policing feature (which is enabled only for wireless implementation), NetFlow can and should be used only in full flow mode i.e. NetFlow policing cannot be used. For wireless traffic, applying a sampler is not permitted, as it hinders microflow QoS.
- Only full flow accounting is supported for wireless traffic.
- NetFlow hardware uses hash tables internally. Hash collisions can occur in the hardware. Therefore, in spite of the internal overflow Content Addressable Memory (CAM), the actual NetFlow table utilization could be about 80 percent.
- Depending on what fields are used for the flow, a single flow could take two consecutive entries. IPv6 flows also take two entries. In these situations, the effective usage of NetFlow entries is half the table size, which is separate from the above hash collision limitation.
- The switch supports up to 16 flow monitors.
- Microflow policing uses a separate set of flow monitors (limit 3).
- SSID-based NetFlow accounting is supported. SSID is treated in a manner similar to an interface. However, certain fields are not supported (such as AP MAC address and user ID ).
- NetFlow v9 format NetFlow export is supported.
- The NetFlow software implementation supports distributed NetFlow export, so the flows are exported from the same switch in which the flow was created.
- Ingress flows are present in the ASIC that first received the packets for the flow. Egress flows are present in the ASIC from which the packets actually left the switch set up.
- The reported value for the bytes count field (called "bytes long") is Layer-2-packet-size—18 bytes. For classic Ethernet traffic (802.3), this will be accurate. For all other Ethernet types, this field will not be accurate. Use the "bytes layer2" field, which always reports the accurate Layer 2 packet size. For information about supported Flexible NetFlow fields, see [Supported Flexible NetFlow Fields, on page 32](#).

## Information About NetFlow

NetFlow is a Cisco technology that provides statistics on packets flowing through the switch. NetFlow is the standard for acquiring IP operational data from IP networks. NetFlow provides data to enable network and security monitoring, network planning, traffic analysis, and IP accounting. Flexible NetFlow improves on original NetFlow by adding the capability to customize the traffic analysis parameters for your specific requirements. Flexible NetFlow facilitates the creation of more complex configurations for traffic analysis and data export through the use of reusable configuration components.

### Flexible NetFlow Overview

Flexible NetFlow uses flows to provide statistics for accounting, network monitoring, and network planning.

A flow is a unidirectional stream of packets that arrives on a source interface and has the same values for the keys. A key is an identified value for a field within the packet. You create a flow using a flow record to define the unique keys for your flow.

The switch supports the Flexible NetFlow feature that enables enhanced network anomalies and security detection. Flexible NetFlow allows you to define an optimal flow record for a particular application by selecting the keys from a large collection of predefined fields.

All key values must match for the packet to count in a given flow. A flow might gather other fields of interest, depending on the export record version that you configure. Flows are stored in the Flexible NetFlow cache.

You can export the data that Flexible NetFlow gathers for your flow by using an exporter and export this data to a remote Flexible NetFlow collector.

You define the size of the data that you want to collect for a flow using a monitor. The monitor combines the flow record and exporter with the Flexible NetFlow cache information.

## Wireless Flexible NetFlow Overview

The wireless Flexible NetFlow infrastructure supports the following:

- Flexible NetFlow Version 9.0
- User-based rate limiting
- Microflow policing
- Voice and video flow monitoring
- Reflexive access control list (ACL)

### Microflow Policing and User-Based Rate Limiting

Microflow policing associates a 2-color 1-rate policer and related drop statistics to each flow present in the NetFlow table. When the flow mask comprises all packet fields, this functionality is known as microflow policing. When the flow mask comprises either source or destination only, this functionality is known as user-based rate limiting.

### Voice and Video Flow Monitoring

Voice and video flows are full flow mask-based entries. The ASIC provides the flexibility to program the policer parameters, share policers across multiple flows and rewrite the IP address and Layer 4 port numbers of these flows.

#### Note

For dynamic entries, the NetFlow engine will use the policer parameters that are derived for the flow based on the policy (ACL/QoS-based policies). Dynamic entries cannot share policer across multiple flows.

### Reflexive ACL

Reflexive ACLs allow IP packets to be filtered based on upper-layer session information. The ACLs allow outbound traffic and limit inbound traffic in response to the sessions that originate inside the trusted network. The reflexive ACLs are transparent to the filtering mechanism until a data packet that matches the reflexive entry activates it. At this time, a temporary ACL entry is created and added to the IP-named access lists. The information obtained from the data packet to generate the reflexive ACL entry is permit/deny bit, the source IP address and port, the destination IP address, port, and the protocol type. During reflexive ACL entry evaluation, if the protocol type is either TCP or UDP, then the port information must match exactly. For other protocols, there is no port information to match. After this ACL is installed, the firewall is then opened for the reply packets to pass through. At this time, a potential hacker could have access to the network behind the firewall. To narrow this window, an idle timeout period can be defined. However, in the case of TCP, if two FIN bits or an RST is detected, the ACL entry can be removed.

## Flow Records

A flow record defines the keys that Flexible NetFlow uses to identify packets in the flow, as well as other fields of interest that Flexible NetFlow gathers for the flow. You can define a flow record with any combination of keys and fields of interest. The switch supports a rich set of keys. A flow record also defines the types of counters gathered per flow. You can configure 64-bit packet or byte counters. The switch enables the following match fields as the defaults when you create a flow record:

- `match datalink`—Layer 2 attributes
- `match flow`—Flow identifying attributes
- `match interface`—Interface attributes
- `match ipv4`—IPv4 attributes
- `match ipv6`—IPv6 attributes
- `match transport`—Transport layer fields

## Flexible NetFlow Match Parameters

The following table describes Flexible NetFlow match parameters. You must configure at least one of the following match parameters for the flow records.

**Table 4: Match Parameters**

Command	Purpose
<code>match datalink {dot1q   ethertype   mac   vlan }</code>	Specifies a match to datalink or Layer 2 fields. The following command options are available: <ul style="list-style-type: none"> <li>• <code>dot1q</code>—Matches to the dot1q field.</li> <li>• <code>ethertype</code>—Matches to the ethertype of the packet.</li> <li>• <code>mac</code>—Matches the source or destination MAC fields.</li> <li>• <code>vlan</code>—Matches to the VLAN that the packet is located on (input or output).</li> </ul>
<code>match flow direction</code>	Specifies a match to the flow identifying fields.

Command	Purpose
<b>match interface</b> {input   output}	<p>Specifies a match to the interface fields. The following command options are available:</p> <ul style="list-style-type: none"> <li>• <b>input</b>—Matches to the input interface.</li> <li>• <b>output</b>—Matches to the output interface.</li> </ul>
<b>match ipv4</b> {destination   protocol   source   tos   ttl   version}	<p>Specifies a match to the IPv4 fields. The following command options are available:</p> <ul style="list-style-type: none"> <li>• <b>destination</b>—Matches to the IPv4 destination address-based fields.</li> <li>• <b>protocol</b>—Matches to the IPv4 protocols.</li> <li>• <b>source</b>—Matches to the IPv4 source address based fields.</li> <li>• <b>tos</b>—Matches to the IPv4 Type of Service fields.</li> <li>• <b>ttl</b>—Matches to the IPv4 Time To Live fields.</li> <li>• <b>version</b>—Matches to the IP version from the IPv4 header.</li> </ul>
<b>match ipv6</b> {destination   hop-limit   protocol   source   traffic-class   version }	<p>Specifies a match to the IPv6 fields. The following command options are available:</p> <ul style="list-style-type: none"> <li>• <b>destination</b>—Matches to the IPv6 destination address-based fields.</li> <li>• <b>hop-limit</b>—Matches to the IPv6 hop limit fields.</li> <li>• <b>protocol</b>—Matches to the IPv6 payload protocol fields.</li> <li>• <b>source</b>—Matches to the IPv6 source address based fields.</li> <li>• <b>traffic-class</b>—Matches to the IPv6 traffic class.</li> <li>• <b>version</b>—Matches to the IP version from the IPv6 header.</li> </ul>

Command	Purpose
<b>match transport</b> { <b>destination-port</b>   <b>igmp</b>   <b>icmp</b>   <b>source-port</b> }	Specifies a match to the Transport Layer fields. The following command options are available: <ul style="list-style-type: none"> <li>• <b>destination-port</b>—Matches to the transport destination port.</li> <li>• <b>icmp</b>—Matches to ICMP fields, including ICMP IPv4 and IPv6 fields.</li> <li>• <b>igmp</b>—Matches to IGMP fields.</li> <li>• <b>source-port</b>—Matches to the transport source port.</li> </ul>

### Flexible NetFlow Collect Parameters

The following table describes the Flexible NetFlow collect parameters.

**Table 5: Collect Parameters**

Command	Purpose
<b>collect counter</b> { <b>bytes</b> { <b>layer2</b> { <b>long</b> }   <b>long</b> }   <b>packets</b> { <b>long</b> } }	Collects the counter fields total bytes and total packets.
<b>collect interface</b> { <b>input</b>   <b>output</b> }	Collects the fields from the input or output interface.
<b>collect timestamp absolute</b> { <b>first</b>   <b>last</b> }	Collects the fields for the absolute time the first packet was seen or the absolute time the most recent packet was last seen (in milliseconds).

Command	Purpose
<b>collect transport tcp flags</b>	<p>Collects the following transport TCP flags:</p> <ul style="list-style-type: none"> <li>• <b>ack</b>—TCP acknowledgement flag</li> <li>• <b>cwr</b>—TCP congestion window reduced flag</li> <li>• <b>ece</b>—TCP ECN echo flag</li> <li>• <b>fin</b>—TCP finish flag</li> <li>• <b>psh</b>—TCP push flag</li> <li>• <b>rst</b>—TCP reset flag</li> <li>• <b>syn</b>—TCP synchronize flag</li> <li>• <b>urg</b>—TCP urgent flag</li> </ul> <p><b>Note</b> On the switch, you cannot specify which TCP flag to collect. You can only specify to collect transport TCP flags. All TCP flags will be collected with this command.</p>

## Exporters

An exporter contains network layer and transport layer details for the Flexible NetFlow export packet. The following table lists the configuration options for an exporter.

**Table 6: Flexible NetFlow Exporter Configuration Options**

Exporter Configuration	Description
default	Sets a command to its default values.
description	Provides a description for the flow exporter.
destination	Export destination.
dscp	Optional DSCP value.
exit	Exits from the flow exporter configuration mode.
export-protocol	Export protocol version.
no	Negates the command or its default.
option	Selects option for exporting.
source	Originating interface for the net flow.
template	Flow exporter template configuration.

Exporter Configuration	Description
transport	Transport protocol.
ttl	Optional TTL or hop limit.

The switch exports data to the collector whenever a timeout occurs or when the flow is terminated (TCP Fin or Rst received, for example). You can configure the following timers to force a flow export:

- Active timeout—The flow continues to have the packets for the past  $m$  seconds since the flow was created.
- Inactive timeout—The flow does not have any packets for the past  $n$  seconds.

### Related Topics

[Creating a Flow Exporter, on page 39](#)

### Export Formats

The switch supports only NetFlow Version 9 export formats. NetFlow Version 9 export format provides the following features and functionality:

- Variable field specification format
- Support for IPv4 destination address export
- More efficient network utilization

#### Note

For information about the Version 9 export format, see RFC 3954.

### Monitors

A monitor references the flow record and flow exporter. You apply a monitor to an interface on the switch.

Note the following when applying a flow monitor to an interface:

- If you apply a flow monitor in the input direction:
  - Use the **match** keyword and use the input interface as a key field.
  - Use the **collect** keyword and use the output interface as a collect field. This field will be present in the exported records but with a value of 0.
- If you apply a flow monitor in the output direction:
  - Use the **match** keyword and use the output interface as a key field.
  - Use the **collect** keyword and use the input interface as a collect field. This field will be present in the exported records but with a value of 0.

**Related Topics**

[Creating a Flow Monitor, on page 41](#)

**Samplers**

If you are using sampled mode, you use the sampler to specify the rate at which packets are sampled.

**Related Topics**

[Creating a Sampler, on page 43](#)

**Supported Flexible NetFlow Fields**

The following tables provide a consolidated list of supported fields in Flexible NetFlow (FNF) for various traffic types and traffic direction.

**Note**

If the packet has a VLAN field, then that length is not accounted for.

Field	Layer 2 In	Layer 2 Out	IPv4 In	IP v4 Out	IPv6 In	IPv6 Out	Notes
<b>Key or Collect Fields</b>							
Interface input	Yes	—	Yes	—	Yes	—	<p>If you apply a flow monitor in the input direction:</p> <ul style="list-style-type: none"> <li>• Use the <b>match</b> keyword and use the input interface as a key field.</li> <li>• Use the <b>collect</b> keyword and use the output interface as a collect field. This field will be present in the exported records but with a value of 0.</li> </ul>

Field	Layer 2 In	Layer 2 Out	IPv4 In	IP v4 Out	IPv6 In	IPv6 Out	Notes
Interface output	—	Yes	—	Yes	—	Yes	<p>If you apply a flow monitor in the output direction:</p> <ul style="list-style-type: none"> <li>• Use the <b>match</b> keyword and use the output interface as a key field.</li> <li>• Use the <b>collect</b> keyword and use the input interface as a collect field. This field will be present in the exported records but with a value of 0.</li> </ul>

Field	Layer 2 In	Layer 2 Out	IPv4 In	IP v4 Out	IPv6 In	IPv6 Out	Notes
<b>Key Fields</b>							
Flow direction	Yes	Yes	Yes	Yes	Yes	Yes	
Ethertype	Yes	Yes	—	—	—	—	
VLAN input	Yes	—	Yes	—	Yes	—	Supported only for a switch port.
VLAN output	—	Yes	—	Yes	—	Yes	Supported only for a switch port.
dot1q VLAN input	Yes	—	Yes	—	Yes	—	Supported only for a switch port.
dot1q VLAN output	—	Yes	—	Yes	—	Yes	Supported only for a switch port.
dot1q priority	Yes	Yes	Yes	Yes	Yes	Yes	Supported only for a switch port.

Field	Layer 2 In	Layer 2 Out	IPv4 In	IP v4 Out	IPv6 In	IPv6 Out	Notes
MAC source address input	Yes	Yes	Yes	Yes	Yes	Yes	
MAC source address output	—	—	—	—	—	—	
MAC destination address input	Yes	—	Yes	—	Yes	—	
MAC destination address output	—	Yes	—	Yes	—	Yes	
IPv4 version	—	—	Yes	Yes	Yes	Yes	
IPv4 TOS	—	—	Yes	Yes	Yes	Yes	
IPv4 protocol	—	—	Yes	Yes	Yes	Yes	Must use if any of src/dest port, ICMP code/type, IGMP type or TCP flags are used.
IPv4 TTL	—	—	Yes	Yes	Yes	Yes	
IPv4 source address	—	—	Yes	Yes	—	—	
IPv4 destination address	—	—	Yes	Yes	—	—	
ICMP IPv4 type	—	—	Yes	Yes	—	—	
ICMP IPv4 code	—	—	Yes	Yes	—	—	

Field	Layer 2 In	Layer 2 Out	IPv4 In	IP v4 Out	IPv6 In	IPv6 Out	Notes
IGMP type	—	—	Yes	Yes	—	—	

Field	Layer 2 In	Layer 2 Out	IPv4 In	IP v4 Out	IPv6 In	IPv6 Out	Notes
<b>Key Fields continued</b>							
IPv6 version	—	—	Yes	Yes	Yes	Yes	Same as IP version.
IPv6 protocol	—	—	Yes	Yes	Yes	Yes	Same as IP protocol. Must use if any of src/dest port, ICMP code/type, IGMP type or TCP flags are used.
IPv6 source address	—	—	—	—	Yes	Yes	
IPv6 destination address	—	—	—	—	Yes	Yes	
IPv6 traffic-class	—	—	Yes	Yes	Yes	Yes	Same as IP TOS.
IPv6 hop-limit	—	—	Yes	Yes	Yes	Yes	Same as IP TTL.
ICMP IPv6 type	—	—	—	—	Yes	Yes	
ICMP IPv6 code	—	—	—	—	Yes	Yes	
source-port	—	—	Yes	Yes	Yes	Yes	
dest-port	—	—	Yes	Yes	Yes	Yes	

Field	Layer 2 In	Layer 2 Out	IPv4 In	IP v4 Out	IPv6 In	IPv6 Out	Notes
<b>Collect Fields</b>							
Bytes long	Yes	Yes	Yes	Yes	Yes	Yes	Packet size = (Ethernet frame size including FCS - 18 bytes) <b>Recommendat</b> Avoid this field and use Bytes layer2 long.
Packets long	Yes	Yes	Yes	Yes	Yes	Yes	
Timestamp absolute first	Yes	Yes	Yes	Yes	Yes	Yes	
Timestamp absolute last	Yes	Yes	Yes	Yes	Yes	Yes	
TCP flags	Yes	Yes	Yes	Yes	Yes	Yes	Collects all flags.
Bytes layer2 long	Yes	Yes	Yes	Yes	Yes	Yes	

## Default Settings

The following table lists the Flexible NetFlow default settings for the switch.

**Table 7: Default Flexible NetFlow Settings**

Setting	Default
Flow active timeout	1800 seconds
Flow timeout inactive	15 seconds

## How to Configure Flexible NetFlow

To configure Flexible NetFlow, follow these general steps:

- 1 Create a flow record by specifying keys and non-key fields to the flow.
- 2 Create an optional flow exporter by specifying the protocol and transport destination port, destination, and other parameters.
- 3 Create a flow monitor based on the flow record and flow exporter.
- 4 Create an optional sampler.
- 5 Apply the flow monitor to a Layer 2 port, Layer 3 port, or VLAN.
- 6 If applicable to your configuration, configure a WLAN to apply a flow monitor to.

### Creating a Flow Record

You can create a flow record and add keys to match on and fields to collect in the flow.

#### SUMMARY STEPS

1. **configure terminal**
2. **flow record** *name*
3. **description** *string*
4. **match** *type*
5. **collect** *type*
6. **end**
7. **show flow record** [*name record-name*]
8. **copy running-config startup-config**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
Step 2	<b>flow record</b> <i>name</i>  <b>Example:</b> Switch(config)# <b>flow record test</b> Switch(config-flow-record)#	Creates a flow record and enters flow record configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<p><code>description</code> <i>string</i></p> <p><b>Example:</b></p> <pre>Switch(config-flow-record) # <b>description</b> Ipv4Flow</pre>	(Optional) Describes this flow record as a maximum 63-character string.
<b>Step 4</b>	<p><code>match</code> <i>type</i></p> <p><b>Example:</b></p> <pre>Switch(config-flow-record) # <b>match ipv4 source address</b> Switch(config-flow-record) # <b>match ipv4 destination address</b> Switch(config-flow-record) # <b>match flow direction</b></pre>	Specifies a match key. For information about possible match key values, see <a href="#">Flexible NetFlow Match Parameters</a> , on page 27.
<b>Step 5</b>	<p><code>collect</code> <i>type</i></p> <p><b>Example:</b></p> <pre>Switch(config-flow-record) # <b>collect counter bytes layer2 long</b> Switch(config-flow-record) # <b>collect counter bytes long</b> Switch(config-flow-record) # <b>collect timestamp absolute first</b> Switch(config-flow-record) # <b>collect transport tcp flags</b></pre>	Specifies the collection field. For information about possible collection field values, see <a href="#">Flexible NetFlow Collect Parameters</a> , on page 29.
<b>Step 6</b>	<p><code>end</code></p> <p><b>Example:</b></p> <pre>Switch(config-flow-record) # <b>end</b></pre>	Returns to privileged EXEC mode.
<b>Step 7</b>	<p><code>show flow record</code> [<i>name record-name</i>]</p> <p><b>Example:</b></p> <pre>Switch <b>show flow record test</b></pre>	(Optional) Displays information about NetFlow flow records.
<b>Step 8</b>	<p><code>copy running-config startup-config</code></p> <p><b>Example:</b></p> <pre>Switch# <b>copy running-config startup-config</b></pre>	(Optional) Saves your entries in the configuration file.

### What to Do Next

Define an optional flow exporter by specifying the export format, protocol, destination, and other parameters.

**Related Topics**

[Flow Records, on page 27](#)

**Creating a Flow Exporter**

You can create a flow export to define the export parameters for a flow.

**SUMMARY STEPS**

1. **configure terminal**
2. **flow exporter** *name*
3. **description** *string*
4. **dscp** *value*
5. **destination** { *ipv4-address* }
6. **source** { *source type* }
7. **transport udp** *number*
8. **end**
9. **show flow exporter** [**name** *record-name*]
10. **copy running-config startup-config**

**DETAILED STEPS**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>flow exporter</b> <i>name</i>  <b>Example:</b> Switch(config)# <b>flow exporter ExportTest</b> Switch (config-flow-exporter)#	Creates a flow exporter and enters flow exporter configuration mode.
<b>Step 3</b>	<b>description</b> <i>string</i>  <b>Example:</b> Switch(config-flow-exporter)# <b>description ExportV9</b>	(Optional) Describes this flow record as a maximum 63-character string.

	Command or Action	Purpose
<b>Step 4</b>	<p><b>dscp</b> <i>value</i></p> <p><b>Example:</b></p> <pre>Switch(config-flow-exporter)# dscp 0</pre>	(Optional) Specifies the differentiated services codepoint value. The range is from 0 to 63.
<b>Step 5</b>	<p><b>destination</b> { <i>ipv4-address</i> }</p> <p><b>Example:</b></p> <pre>Switch(config-flow-exporter)# destination 192.0.2.1</pre>	Sets the destination IPv4 address or hostname for this exporter.
<b>Step 6</b>	<p><b>source</b> { <i>source type</i> }</p> <p><b>Example:</b></p> <pre>Switch(config-flow-exporter)# source gigabitEthernet1/0/1</pre>	<p>(Optional) Specifies the interface to use to reach the NetFlow collector at the configured destination. The following interfaces can be configured as source:</p> <ul style="list-style-type: none"> <li>• <b>Auto Template</b>—Auto-Template interface</li> <li>• <b>Capwap</b>—CAPWAP tunnel interface</li> <li>• <b>GigabitEthernet</b>—Gigabit Ethernet IEEE 802</li> <li>• <b>GroupVI</b>—Group virtual interface</li> <li>• <b>Internal Interface</b>—Internal interface</li> <li>• <b>Loopback</b>—Loopback interface</li> <li>• <b>Null</b>—Null interface</li> <li>• <b>Port-channel</b>—Ethernet Channel of interface</li> <li>• <b>TenGigabitEthernet</b>—10-Gigabit Ethernet</li> <li>• <b>Tunnel</b>—Tunnel interface</li> <li>• <b>Vlan</b>—Catalyst VLANs</li> </ul>
<b>Step 7</b>	<p><b>transport udp</b> <i>number</i></p> <p><b>Example:</b></p> <pre>Switch(config-flow-exporter)# transport udp 200</pre>	(Optional) Specifies the UDP port to use to reach the NetFlow collector. The range is from 0 to 65535.
<b>Step 8</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-flow-record)# end</pre>	Returns to privileged EXEC mode.
<b>Step 9</b>	<p><b>show flow exporter</b> [<i>name record-name</i>]</p>	(Optional) Displays information about NetFlow flow exporters.

	Command or Action	Purpose
	<b>Example:</b> Switch <code>show flow exporter ExportTest</code>	
<b>Step 10</b>	<b>copy running-config startup-config</b>  <b>Example:</b> Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

### What to Do Next

Define a flow monitor based on the flow record and flow exporter.

### Related Topics

[Exporters, on page 30](#)

## Creating a Flow Monitor

You can create a flow monitor and associate it with a flow record and a flow exporter.

### SUMMARY STEPS

1. **configure terminal**
2. **flow monitor** *name*
3. **description** *string*
4. **exporter** *name*
5. **record** *name*
6. **cache** { **timeout** { **active** | **inactive** } *seconds* | **type normal** }
7. **end**
8. **show flow monitor** [**name** *record-name*]
9. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>flow monitor name</b>  <b>Example:</b> Switch(config)# <b>flow monitor MonitorTest</b> Switch (config-flow-monitor)#	Creates a flow monitor and enters flow monitor configuration mode.
<b>Step 3</b>	<b>description string</b>  <b>Example:</b> Switch(config-flow-monitor)# <b>description Ipv4Monitor</b>	(Optional) Describes this flow record as a maximum 63-character string.
<b>Step 4</b>	<b>exporter name</b>  <b>Example:</b> Switch(config-flow-monitor)# <b>exporter ExportTest</b>	Associates a flow exporter with this flow monitor.
<b>Step 5</b>	<b>record name</b>  <b>Example:</b> Switch(config-flow-monitor)# <b>record test</b>	Associates a flow record with the specified flow monitor.
<b>Step 6</b>	<b>cache { timeout { active   inactive} seconds   type normal }</b>  <b>Example:</b> Switch(config-flow-monitor)# <b>cache timeout active 15000</b>	Associates a flow cache with the specified flow monitor.
<b>Step 7</b>	<b>end</b>  <b>Example:</b> Switch(config-flow-monitor)# <b>end</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
<b>Step 8</b>	<b>show flow monitor</b> [ <i>name record-name</i> ]  <b>Example:</b> Switch <b>show flow monitor name MonitorTest</b>	(Optional) Displays information about NetFlow flow monitors.
<b>Step 9</b>	<b>copy running-config startup-config</b>  <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

### What to Do Next

Apply the flow monitor to a Layer 2 interface, Layer 3 interface, or VLAN.

### Related Topics

[Monitors, on page 31](#)

## Creating a Sampler

You can create a sampler to define the NetFlow sampling rate for a flow.

### SUMMARY STEPS

1. **configure terminal**
2. **sampler** *name*
3. **description** *string*
4. **mode** {*random*}
5. **end**
6. **show sampler** [*name*]
7. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>sampler</b> <i>name</i>  <b>Example:</b> Switch(config)# sampler SampleTest Switch(config-flow-sampler)#	Creates a sampler and enters flow sampler configuration mode.
<b>Step 3</b>	<b>description</b> <i>string</i>  <b>Example:</b> Switch(config-flow-sampler)# <b>description samples</b>	(Optional) Describes this flow record as a maximum 63-character string.
<b>Step 4</b>	<b>mode</b> {random}  <b>Example:</b> Switch(config-flow-sampler)# <b>mode random 1 out-of 1024</b>	Defines the random sample mode.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Switch(config-flow-sampler)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show sampler</b> [ <i>name</i> ]  <b>Example:</b> Switch <b>show sample SampleTest</b>	(Optional) Displays information about NetFlow samplers.
<b>Step 7</b>	<b>copy running-config startup-config</b>  <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

### What to Do Next

Apply the flow monitor to a source interface, subinterface, VLAN interface, or a VLAN.

### Related Topics

[Samplers, on page 32](#)

## Applying a Flow to an Interface

You can apply a flow monitor and an optional sampler to an interface.

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *type*
3. **{ip flow monitor | ipv6 flow monitor}***name* [*sampler name*] { **input** | **output** }
4. **end**
5. **show flow interface** [*interface-type number*]
6. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>type</i>  <b>Example:</b> Switch(config)# <b>interface</b> <b>GigabitEthernet1/0/1</b> Switch(config-if)#	Enters interface configuration mode and configures an interface. Command parameters for the interface configuration include: <ul style="list-style-type: none"> <li>• <b>Auto</b>— Auto-Template interface</li> <li>• <b>Capwap</b>—CAPWAP tunnel interface</li> <li>• <b>GigabitEthernet</b>—GigabitEthernet IEEE 802</li> <li>• <b>GroupVI</b>—Group Virtual interface</li> <li>• <b>Internal Interface</b>—Internal Interface</li> <li>• <b>Loopback</b>—Loopback interface</li> <li>• <b>Null</b>—Null interface</li> <li>• <b>Port-channel</b>—Ethernet channel of interface</li> <li>• <b>TenGigabitEthernet</b>—10- Gigabit Ethernet</li> <li>• <b>Tunnel</b>—Tunnel interface</li> <li>• <b>Vlan</b>—Catalyst VLANs</li> <li>• <b>Range</b>—Interface range</li> </ul>
<b>Step 3</b>	<b>{ip flow monitor   ipv6 flow monitor}</b> <i>name</i> <b>[sampler name]</b> { <b>input</b>   <b>output</b> }  <b>Example:</b> Switch(config-if)# <b>ip flow monitor</b> <b>MonitorTest input</b>	Associate an IPv4 or an IPv6 flow monitor, and an optional sampler to the interface for input or output packets.

	Command or Action	Purpose
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Switch(config-flow-monitor)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show flow interface</b> [ <i>interface-type number</i> ]  <b>Example:</b> Switch# <b>show flow interface</b>	(Optional) Displays information about NetFlow on an interface.
<b>Step 6</b>	<b>copy running-config startup-config</b>  <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring a Bridged NetFlow on a VLAN

You can apply a flow monitor and an optional sampler to a VLAN.

### SUMMARY STEPS

1. **configure terminal**
2. **vlan** [**configuration**] *vlan-id*
3. **ip flow monitor** *name* [**sampler name**] {**input** |**output**}
4. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>vlan</b> [ <b>configuration</b> ] <i>vlan-id</i>  <b>Example:</b> Switch(config)# <b>vlan configuration 30</b>	Enters VLAN or VLAN configuration mode.

	Command or Action	Purpose
	Switch(config-vlan-config)#	
<b>Step 3</b>	<b>ip flow monitor</b> <i>name</i> [ <b>sampler</b> <i>name</i> ] { <b>input</b>   <b>output</b> }  <b>Example:</b>  Switch(config-vlan-config)# <b>ip flow monitor</b> <b>MonitorTest input</b>	Associates a flow monitor and an optional sampler to the VLAN for input or output packets.
<b>Step 4</b>	<b>copy running-config startup-config</b>  <b>Example:</b>  Switch# <b>copy running-config</b> <b>startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring Layer 2 NetFlow

You can define Layer 2 keys in Flexible NetFlow records that you can use to capture flows in Layer 2 interfaces.

### SUMMARY STEPS

1. **configure terminal**
2. **flow record** *name*
3. **match datalink** {**dot1q** | **ethertype** | **mac** | **vlan**}
4. **end**
5. **show flow record** [*name* ]
6. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b>  Switch# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>flow record</b> <i>name</i>  <b>Example:</b> Switch(config)# <b>flow record</b> <b>L2_record</b> Switch(config-flow-record)#	Enters flow record configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>match datalink</b> {dot1q   ethertype   mac   vlan}  <b>Example:</b> Switch(config-flow-record)# <b>match datalink ethertype</b>	Specifies the Layer 2 attribute as a key.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Switch(config-flow-record)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show flow record</b> [ <i>name</i> ]  <b>Example:</b> Switch# <b>show flow record</b>	(Optional) Displays information about NetFlow on an interface.
<b>Step 6</b>	<b>copy running-config startup-config</b>  <b>Example:</b> Switch# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring WLAN to Apply Flow Monitor in Data Link Input/Output Direction

### SUMMARY STEPS

1. **configure terminal**
2. **wlan** *wlan-name*
3. **datalink flow monitor monitor-name** {input | output}
4. **end**
5. **show wlan** *wlan-name*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wlan</b> <i>wlan-name</i>  <b>Example:</b> Switch (config) # <b>wlan</b> mywlan	Enters WLAN configuration submode. For <i>wlan-name</i> , enter the profile name. The range is 1 to 32 characters.
<b>Step 3</b>	<b>datalink flow monitor</b> <b>monitor-name</b> {input   output}  <b>Example:</b> Switch (config-wlan) # <b>datalink flow monitor</b> <b>flow-monitor-1</b> {input   output}	Applies flow monitor to Layer 2 traffic in the direction of interest.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Switch (config) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show wlan</b> <i>wlan-name</i>  <b>Example:</b> Switch # <b>show wlan</b> mywlan	(Optional) Verifies your configuration.

## Configuring WLAN to Apply Flow Monitor in IPV4 and IPv6 Input/Output Direction

### SUMMARY STEPS

1. **configure terminal**
2. **wlan** *wlan-id*
3. **{ip | ipv6} flow monitor** **monitor-name** {input | output}
4. **end**
5. **show wlan** *wlan-name*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# <b>configure terminal</b>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wlan</b> <i>wlan-id</i>  <b>Example:</b> Switch (config) # <b>wlan 1</b>	Enters WLAN configuration submode. For <i>wlan-id</i> , enter the WLAN ID. The range is 1 to 64.
<b>Step 3</b>	<b>{ip   ipv6} flow monitor monitor-name {input   output}</b>  <b>Example:</b> Switch (config-wlan) # <b>ip flow monitor flow-monitor-1 input</b>	Associates a flow monitor to the WLAN for input or output packets.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Switch (config) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show wlan wlan-name</b>  <b>Example:</b> Switch # <b>show wlan mywlan</b>	(Optional) Verifies your configuration.

## Monitoring Flexible NetFlow

The commands in the following table can be used to monitor Flexible NetFlow.

**Table 8: Flexible NetFlow Monitoring Commands**

Command	Purpose
<b>show flow exporter</b> [ <b>broker</b>   <b>export-ids</b>   <b>name</b>   <i>name</i>   <b>statistics</b>   <b>templates</b> ]	Displays information about NetFlow flow exporters and statistics.
<b>show flow exporter</b> [ <b>name</b> <i>exporter-name</i> ]	Displays information about NetFlow flow exporters and statistics.

Command	Purpose
<b>show flow interface</b>	Displays information about NetFlow interfaces.
<b>show flow monitor</b> [ name <i>exporter-name</i> ]	Displays information about NetFlow flow monitors and statistics.
<b>show flow monitor statistics</b>	Displays the statistics for the flow monitor
<b>show flow monitor cache format</b> {table   record   csv}	Displays the contents of the cache for the flow monitor, in the format specified.
<b>show flow record</b> [ name <i>record-name</i> ]	Displays information about NetFlow flow records.
<b>show flow ssid</b>	Displays NetFlow monitor installation status for a WLAN.
<b>show sampler</b> [broker   name   <i>name</i> ]	Displays information about NetFlow samplers.
<b>show wlan</b> <i>wlan-name</i>	Displays the WLAN configured on the device.

## Configuration Examples for Flexible NetFlow

### Example: Configuring a Flow

This example shows how to create a flow and apply it to an interface:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Switch(config)# flow export export1
Switch(config-flow-exporter)# destination 10.0.101.254
Switch(config-flow-exporter)# transport udp 2055
Switch(config-flow-exporter)# exit
Switch(config)# flow record record1
Switch(config-flow-record)# match ipv4 source address
Switch(config-flow-record)# match ipv4 destination address
Switch(config-flow-record)# match ipv4 protocol
Switch(config-flow-record)# match transport source-port
Switch(config-flow-record)# match transport destination-port
Switch(config-flow-record)# collect counter byte long
Switch(config-flow-record)# collect counter packet long
Switch(config-flow-record)# collect timestamp absolute first
Switch(config-flow-record)# collect timestamp absolute last
Switch(config-flow-record)# exit
Switch(config)# flow monitor monitor1
Switch(config-flow-monitor)# record record1
Switch(config-flow-monitor)# exporter export1
Switch(config-flow-monitor)# exit
Switch(config)# interface tenGigabitEthernet 1/0/1
Switch(config-if)# ip flow monitor monitor1 input
Switch(config-if)# end
```

## Example: Configuring IPv4 Flexible NetFlow in WLAN (Ingress Direction)

The following example shows how to configure IPv4 Flexible NetFlow on WLAN ingress direction:

```
Switch# configure terminal
Switch(config)# flow record fr_v4
Switch(config-flow-record)# match ipv4 destination address
Switch(config-flow-record)# match ipv4 source address
Switch(config-flow-record)# match ipv4 protocol
Switch(config-flow-record)# match ipv4 tos
Switch(config-flow-record)# match ipv4 ttl
Switch(config-flow-record)# match ipv4 version
Switch(config-flow-record)# match wireless ssid
Switch(config-flow-record)# collect wireless ap mac address
Switch(config-flow-record)# collect counter packets long
Switch(config-flow-record)# collect counter bytes long
Switch(config-flow-record)# collect timestamp absolute first
Switch(config-flow-record)# collect timestamp absolute last
Switch(config-flow-record)# exit

Switch(config)# flow monitor fm_v4
Switch(config-flow-monitor)# record fr_v4
Switch(config-flow-monitor)# exit

Switch(config)# wlan 1
Switch(config-wlan)# ip flow monitor fm_v4 in
Switch(config-wlan)# end

Switch# show flow monitor fm_v4 cache
```

### Related Topics

## Example: Configuring IPv6 and Transport Flag Flexible NetFlow in WLAN (Egress Direction)

The following example shows how to configure IPv6 and transport flag Flexible NetFlow on WLAN egress direction:

```
Switch# configure terminal
Switch(config)# flow record fr_v6
Switch(config-flow-record)# match ipv6 destination address
Switch(config-flow-record)# match ipv6 source address
Switch(config-flow-record)# match ipv6 hop-limit
Switch(config-flow-record)# match ipv6 protocol
Switch(config-flow-record)# match ipv6 traffic
Switch(config-flow-record)# match ipv6 version
Switch(config-flow-record)# match wireless ssid
Switch(config-flow-record)# collect wireless ap mac address
Switch(config-flow-record)# collect counter bytes long
Switch(config-flow-record)# collect transport tcp flags
Switch(config-flow-record)# exit

Switch(config)# flow monitor fm_v6
Switch(config-flow-monitor)# record fr_v6
Switch(config-flow-monitor)# exit

Switch(config)# wlan 1
Switch(config-wlan)# ipv6 flow monitor fm_v6 out
```

```
Switch(config-wlan)# end
Switch# show flow monitor fm_v6 cache
```

**Note**

On the switch, you cannot specify which TCP flag to collect. You can only specify to collect transport TCP flags.

**Example: Configuring IPv6 Flexible NetFlow in WLAN (Both Ingress and Egress Directions)**

The following example shows how to configure IPv6 Flexible NetFlow on WLAN in both directions:

```
Switch# configure terminal
Switch (config)# flow record fr_v6
Switch (config-flow-record)# match ipv6 destination address
Switch (config-flow-record)# match ipv6 source address
Switch (config-flow-record)# match ipv6 hop-limit
Switch (config-flow-record)# match ipv6 protocol
Switch (config-flow-record)# match ipv6 traffic
Switch (config-flow-record)# match ipv6 version
Switch (config-flow-record)# match wireless ssid
Switch (config-flow-record)# collect wireless ap mac address
Switch (config-flow-record)# collect counter packets long
Switch (config-flow-record)# exit

Switch (config)# flow monitor fm_v6
Switch (config-flow-monitor)# record fr_v6
Switch (config-flow-monitor)# exit

Switch (config)# wlan 1
Switch (config-wlan)# ipv6 flow monitor fm_v6 in
Switch (config-wlan)# ipv6 flow monitor fm_v6 out
Switch (config-wlan)# end

Switch# show flow monitor fm_v6 cache
```

### Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Prerequisites for CleanAir

You can configure Cisco CleanAir only on CleanAir-enabled access points.

Only Cisco CleanAir-enabled access points using the following access point modes can perform Cisco CleanAir spectrum monitoring:

- **Local**—In this mode, each Cisco CleanAir-enabled access point radio provides air quality and interference detection reports for the current operating channel only.

- **Monitor**—When Cisco CleanAir is enabled in monitor mode, the access point provides air quality and interference detection reports for all monitored channels.

The following options are available:

- **All**— All channels
- **DCA**—Channel selection governed by the DCA list
- **Country**—All channel legal within a regulatory domain

---

**Note** The access point does not participate in AQ HeatMap in Prime Infrastructure.

---

- **SE-Connect**—This mode enables a user to connect a Spectrum Expert application running on an external Microsoft Windows XP or Vista PC to a Cisco CleanAir-enabled access point in order to display and analyze detailed spectrum data. The Spectrum Expert application connects directly to the access point, bypassing the switch. An access point in SE-Connect mode does not provide any Wi-Fi, RF, or spectrum data to the switch. All CleanAir system functionality is suspended while the AP is in this mode, and no clients are served. This mode is intended for remote troubleshooting only. Up to three active Spectrum Expert connections are possible.

## Restrictions for CleanAir

- Access points in monitor mode do not transmit Wi-Fi traffic or 802.11 packets. They are excluded from radio resource management (RRM) planning and are not included in the neighbor access point list. IDR clustering depends on the switch's ability to detect neighboring in-network access points. Correlating interference device detections from multiple access points is limited between monitor-mode access points.
- Cisco recommends a ratio of 1 monitor mode access point for every 5 local mode access points, this may also vary based on the network design and expert guidance for best coverage.
- Spectrum Expert (Windows XP laptop client) and AP should be pingable, otherwise; it will not work.

## Information About CleanAir

Cisco CleanAir is a spectrum intelligence solution designed to proactively manage the challenges of a shared wireless spectrum. All of the users of the shared spectrum can be seen (both native devices and foreign interferers). It also enables the network to act upon this information. For example, the interfering device can be manually removed or the system can automatically change the channel away from the interference.

A Cisco CleanAir system consists of CleanAir-enabled access points, wireless controller modules, mobility controllers, mobility anchors and next generation switches. The access points join the mobility controller directly or through the mobility anchor. They collect information about all devices that operate in the industrial, scientific, and medical (ISM) bands, identify and evaluate the information as a potential interference source, and forward it to the switch. The switch controls the access points, collects spectrum data, and forwards information to Cisco Prime Infrastructure (PI) or a Cisco Mobility Services Engine (MSE) upon request.

Any networking configurations can be performed only on the mobility controller, configurations cannot be performed in the MA mode. However, any radio level CleanAir configurations can be done using mobility anchor.

For every device operating in the unlicensed band, Cisco CleanAir tells what it is, where it is, how it is impacting the wireless network, and what actions should be taken. It simplifies RF.

Wireless LAN systems operate in unlicensed 2.4-GHz and 5-GHz ISM bands. Many devices like microwave ovens, cordless phones, and Bluetooth devices also operate in these bands and can negatively affect the Wi-Fi operations.

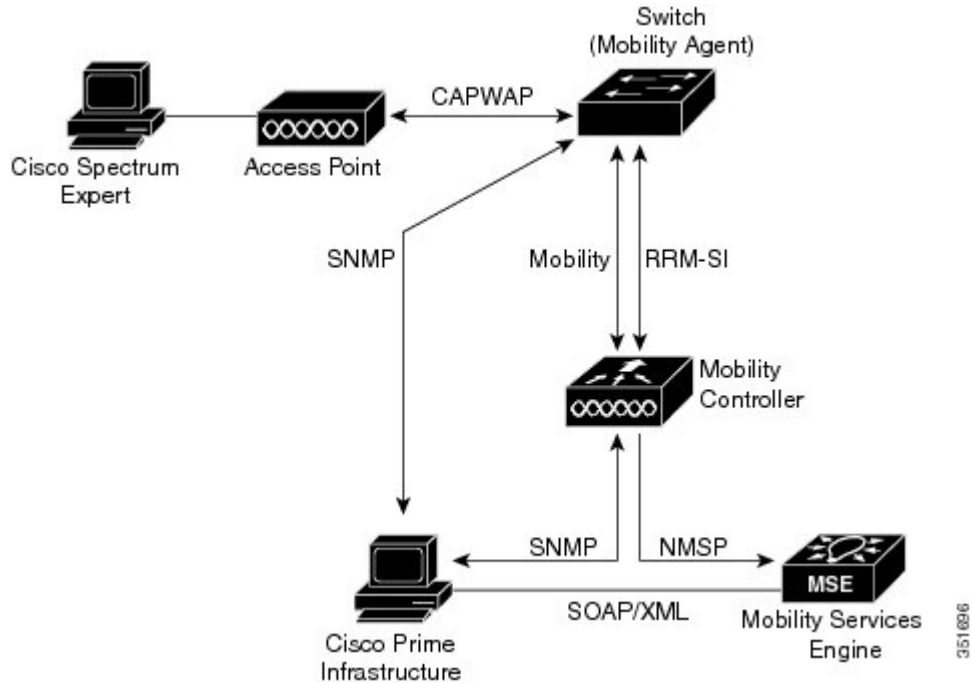

Some of the most advanced WLAN services, such as voice over wireless and IEEE 802.11n radio communications, could be significantly impaired by the interference caused by other legal users of the ISM bands. The integration of Cisco CleanAir functionality addresses this problem of radio frequency (RF) interference.

### Cisco CleanAir Components

The basic Cisco CleanAir architecture consists of Cisco CleanAir-enabled APs and switch. Cisco Prime Infrastructure (PI), Mobility Services Engine (MSE) and Cisco Spectrum Expert are optional system

components. Cisco PI and MSE provide user interfaces for advanced spectrum capabilities such as historic charts, tracking interference devices, location services and impact analysis.

**Figure 1: Cisco CleanAir Solution**

An access point equipped with Cisco CleanAir technology collects information about non-Wi-Fi interference sources, processes it, and forwards it to the MA. The access point sends AQR and IDR reports to the controller.

The mobility controller (MC) controls and configures CleanAir-capable access points, collects and processes spectrum data, and provides it to the PI and/or the MSE. The MC provides local user interfaces (GUI and CLI) to configure basic CleanAir features and services and display current spectrum information. The MC also does detection, merging and mitigation of interference devices using RRM TPC and DCM. For details on Interference Device Merging, see [Interference Device Merging](#), on page 65.

Cisco PI provides advanced user interfaces for CleanAir that include feature enabling and configuration, consolidated display information, historic AQ records and reporting engines. PI also shows charts of interference devices, AQ trends, and alerts.

Cisco MSE is required for location and historic tracking of interference devices, and provides coordination and consolidation of interference reports across multiple controllers. MSE also provides adaptive Wireless Intrusion Prevention System (WIPS) service that provides comprehensive over-the-air threat detection, location and mitigation. MSE also merges all the interference data.

To obtain detailed spectrum data that can be used to generate RF analysis plots similar to those provided by a spectrum analyzer, you can configure a Cisco CleanAir-enabled access point to connect directly to a Microsoft Windows XP or Vista PC running the Cisco Spectrum Expert application.

The switch performs the following tasks in a Cisco CleanAir system:

- Configures Cisco CleanAir capabilities on the access point.
- Provides interfaces (GUI, CLI, and SNMP) for configuring Cisco CleanAir features and retrieving data.

- Displays spectrum data.
- Collects and processes AQRs from the access point and stores them in the air quality database. AQRs contains information about the total interference from all identified sources represented by Air Quality Index (AQI) and summary for the most severe interference categories. The CleanAir system can also include unclassified interference information under per interference type reports which enable you to take action in cases where the interference due to unclassified interfering devices is frequent.
- Collects and processes Interference Device Reports (IDRs) from the access point and stores them in the interference device database.
- Forwards spectrum data to Prime Infrastructure and the MSE.

## Terms Used in Cisco CleanAir

**Table 9: CleanAir-related Terms**

Term	Description
AQI	Air Quality Index. The AQI is an indicator of air quality, based on the air pollutants. An AQI of 0 is bad and an AQI > 85 is good.
AQR	Air Quality Report. AQRs contain information about the total interference from all identified sources represented by AQI and summary of the most severe interference categories. AQRs are sent every 15 minutes to the Mobility Controller and every 30 seconds in the Rapid mode.
DC	Duty Cycle. Percentage of time that the channel is utilized by a device.
EDRRM	EDRRM Event Driven RRM. EDRRM allows an access point in distress to bypass normal RRM intervals and immediately change channels.
IDR	Interference Device Reports that the access point sends to the controller.
ISI	Interference Severity Index. The ISI is an indicator of the severity of the interference.
MA	Mobility Agent. An MA is either an access switch that has a wireless module running on it or an MC with an internal MA running on it. An MA is the wireless component that maintains client mobility state machine for a mobile client that is connected to an access point to the device that the MA is running on.
MC	Mobility Controller. An MC provides mobility management services for inter-peer group roaming events. The MC provides a central point of contact for management and sends the configuration to all the mobility agents under its sub-domain of their mobility configuration, peer group membership and list of members.
RSSI	Received Signal Strength Indicator. RSSI is a measurement of the power present in a received radio signal. It is the power at which an access point sees the interferer device.

## Interference Types that Cisco CleanAir can Detect

Cisco CleanAir can detect interference, report on the location and severity of the interference, and recommend different mitigation strategies. Two such mitigation strategies are persistent device avoidance and spectrum event-driven RRM. New

Wi-Fi chip-based RF management systems share these characteristics:

- Any RF energy that cannot be identified as a Wi-Fi signal is reported as noise.
- Noise measurements that are used to assign a channel plan tend to be averaged over a period of time to avoid instability or rapid changes that can be disruptive to certain client devices.
- Averaging measurements reduces the resolution of the measurement. As such, a signal that disrupts clients might not look like it needs to be mitigated after averaging.
- All RF management systems available today are reactive in nature.

Cisco CleanAir is different and can positively identify not only the source of the noise but also its location and potential impact to a WLAN. Having this information allows you to consider the noise within the context of the network and make intelligent and, where possible, proactive decisions. For CleanAir, two types of interference events are common:

- Persistent interference
- Spontaneous interference

Persistent interference events are created by devices that are stationary in nature and have intermittent but largely repeatable patterns of interference. For example, consider the case of a microwave oven located in a break room. Such a device might be active for only 1 or 2 minutes at a time. When operating, however, it can be disruptive to the performance of the wireless network and associated clients. Using Cisco CleanAir, you can positively identify the device as a microwave oven rather than indiscriminate noise. You can also determine exactly which part of the band is affected by the device, and because you can locate it, you can understand which access points are most severely affected. You can then use this information to direct RRM in selecting a channel plan that avoids this source of interference for the access points within its range. Because this interference is not active for a large portion of the day, existing RF management applications might attempt to again change the channels of the affected access points. Persistent device avoidance is unique, however, in that it remains in effect as long as the source of interference is periodically detected to refresh the persistent status. The Cisco CleanAir system knows that the microwave oven exists and includes it in all future planning. If you move either the microwave oven or the surrounding access points, the algorithm updates RRM automatically.

**Note**

---

Spectrum event-driven RRM can be triggered only by Cisco CleanAir-enabled access points in local mode.

---

Spontaneous interference is interference that appears suddenly on a network, perhaps jamming a channel or a range of channels completely. The Cisco CleanAir spectrum event-driven RRM feature allows you to set a threshold for air quality (AQ) that, if exceeded, triggers an immediate channel change for the affected access point. Most RF management systems can avoid interference, but this information takes time to propagate through the system. Cisco CleanAir relies on AQ measurements to continuously evaluate the spectrum and can trigger a move within 30 seconds. For example, if an access point detects interference from a video camera, it can recover by changing channels within 30 seconds of the camera becoming active. Cisco CleanAir also identifies and locates the source of interference so that more permanent mitigation of the device can be performed at a later time.

In the case of Bluetooth devices, Cisco CleanAir-enabled access points can detect and report interference only if the devices are actively transmitting. Bluetooth devices have extensive power save modes. For example, interference can be detected when data or voice is being streamed between the connected devices.

## Interference Device Merging

The Interference Devices (ID) messages are processed on a Mobility Controller (MC). The Mobility Anchor (MA) forwards the ID messages from APs and hence they are processed on the MC. The MC has visibility of the neighbor information across APs connected to different MAs.

ID merging logic requires AP neighbor information. Neighbor information is obtained from the RRM module. This api only gives neighbor information to the APs directly connected to MC.

Currently the AP neighbor list on MA is synced to MC once every 3 minutes; hence the AP neighbor list obtained by this api could be at most 3 mins old. This delay results in delay in merging of Devices as they are discovered. The subsequent periodic merge will pick up the updated neighbor information and merge is performed

## Persistent Devices

Some interference devices such as outdoor bridges and Microwave Ovens only transmit when needed. These devices can cause significant interference to the local WLAN due to short duration and periodic operation remain largely undetected by normal RF management metrics. With CleanAir the RRM DCA algorithm can detect, measure, register and remember the impact and adjust the DCA algorithm. This minimizes the use of channels affected by the persistent devices in the channel plan local to the interference source. Cisco CleanAir detects and stores the persistent device information in the switch and this information is used to mitigate interfering channels.

### Persistent Devices Detection

CleanAir-capable Monitor Mode access point collects information about persistent devices on all configured channels and store the information in controller. Local/Bridge mode AP detects interference devices on the serving channels only.

### Persistent Device Avoidance

When a Persistent Device (PD) is detected in the CleanAir module, it is reported to the RRM module on the MA. This information is used in the channel selection by the subsequent EDRRM Event Driven RRM (ED-RRM) signal sent to the RRM module.

## EDRRM and AQR Update Mode

EDRRM is a feature that allows an access point that is in distress to bypass normal RRM intervals and immediately change channels. A CleanAir access point always monitors AQ and reports the AQ every 15 minutes. AQ only reports classified interference devices. The key benefit of EDRRM is very fast action time. If an interfering device is operating on an active channel and causes enough AQ degradation to trigger an EDRRM, then no clients will be able to use that channel or the access point. You must remove the access point from the channel. EDRRM is not enabled by default, you must first enable CleanAir and then enable EDRRM.

AQRs are only available on the MC. The mode configuration and timers are held in Radio Control Block (RCB) on MA (for APs connected to MA). There is no change to the current API available for EMS/NMS. No change is required for directly connected APs as RCB (spectrum config and timers) is available locally. For remote APs (APs connected to MA), three new control messages are added. These three messages are for enable, restart timer and disable rapid update mode for a given AP MAC address and slot.

**Related Topics**

[Configuring EDRRM for CleanAir-Events, on page 73](#)

**CleanAir High Availability**

CleanAir configuration (network and radio) is stateful during the switchover. On the MC, Embedded Instrumentation Core (EICORE) provides the sync on network configurations across active and standby nodes. The radio configurations are synced using the HA Infrastructure. The CleanAir configurations on MA are pulled from the MC upon joining. The network configuration is not stored in the EICORE on MA, hence it is synced using HA Infrastructure.

CleanAir Data (AQ and IDR) reports are not stateful, that is, the standby and active nodes are not synced. On switchover, the APs send the reports to the current active slot. The RRM Client (HA Infra Client) is used for CleanAir HA sync.

**How to Configure CleanAir****Enabling CleanAir for 2.4-GHz Band****SUMMARY STEPS**

1. `configure terminal`
2. `ap dot11 24ghz cleanair`
3. `end`

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<code>configure terminal</code>  <b>Example:</b> <code>Switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<code>ap dot11 24ghz cleanair</code>  <b>Example:</b> <code>Switch(config)# ap dot11 24ghz cleanair</code> <code>Switch(config)# no ap dot11 24ghz cleanair</code>	Enables the CleanAir feature on 802.11b network. Add <b>no</b> in the command to disable CleanAir on the 802.11b network.
<b>Step 3</b>	<code>end</code>  <b>Example:</b> <code>Switch(config)# end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>Switch# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>ap dot11 {24ghz   5ghz} rrm channel device</b>  <b>Example:</b> Switch(config)# <b>ap dot11 24ghz rrm channel device</b>	Enables the persistent non Wi-Fi device avoidance in the 802.11 channel assignment. Add the <b>no</b> form of the command to disable the persistent device avoidance.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Switch(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Cisco CleanAir using the Controller GUI

### Configuring Cisco CleanAir on the Cisco Wireless LAN Controller (GUI)

- Step 1** Choose **Configuration > Wireless > 802.11a/n or 802.11b/g/n > CleanAir** to open the **802.11a (or 802.11b) > CleanAir** page.
- Step 2** Select the **CleanAir** check box to enable Cisco CleanAir functionality on the 802.11a/n or 802.11b/g/n network, or unselect it to prevent the switch from detecting spectrum interference. By default, the Cisco CleanAir is disabled.
- Step 3** Select the **Report Interferers** check box to enable the Cisco CleanAir system to report any detected sources of interference, or unselect it to prevent the switch from reporting interferers. The default value is selected.
- Note** Device Security alarms, Event Driven RRM, and the Persistence Device Avoidance algorithm do not work if Report Interferers are disabled.
- Step 4** Select the **Persistent Device Propagation** check box to enable propagation of information about persistent devices that can be detected by CleanAir. Persistent device propagation enables you to propagate information about persistent devices to the neighboring access points connected to the same switch. Persistent interferers are present at the location and interfere with the WLAN operations even if they are not detectable at all times.
- Step 5** Ensure that any sources of interference that need to be detected and reported by the Cisco CleanAir system appear in the Interferences to Detect box and any that do not need to be detected appear in the Interferences to Ignore box. Use the > and < buttons to move interference sources between these two boxes. By default, all interference sources are detected. The sources of interference that you can choose depend on the type of radio, 802.11a/n/ac or 802.11b/g/n, and are as follows:
- **802.11 FH**—A 802.11 FH device
  - **802.15.4**—A 802.15.4 or ZigBee device
  - **Continuous Transmitter**—A continuous transmitter
  - **Bluetooth Discovery**—A Bluetooth device
  - **DECT-like Phone**—A digital enhanced cordless communication (DECT)-compatible phone

- **Microsoft**—A Microsoft device
- **SuperAG**—A 802.11a/g SuperAG device
- **Microwave Phone**—A microwave phone
- **Jammer**—A jamming device
- **Canopy**—A canopy bridge device
- **TDD Transmitter**—A time division duplex (TDD) transmitter device
- **Video Camera**—An analog video camera
- **WiFi Invalid Channel**—A WiFi invalid channel
- **WiFi Inverted**—A device using spectrally inverted Wi-Fi signals (I and Q signals of the RF signal are inverted)
- **WiMAX Fixed**—A WiMAX fixed device (802.11a/n only)
- **WiMAX Mobile**—A WiMAX mobile device (802.11a/n only)

**Note** Access points that are associated to the switch send interference reports only for the interferers that appear in the Interferences to Detect box. This functionality allows you to filter out interferers that you do not want as well as any that may be flooding the network and causing performance problems for the switch or Prime Infrastructure. Filtering allows the system to resume normal performance levels.

**Step 6** Configure Cisco CleanAir alarms as follows:

- a) Select the **Enable AQI (Air Quality Index) Trap** check box to enable the triggering of air quality alarms, or unselect the box to disable this feature. The default value is selected.
- b) If you selected the **Enable AQI Trap** check box in *Step a*, enter a value between 1 and 100 (inclusive) in the AQI Alarm Threshold text box to specify the threshold at which you want the air quality alarm to be triggered. When the air quality falls below the threshold level, the alarm is triggered. A value of 1 represents the worst air quality, and 100 represents the best. The default value is 35.
- c) Enter the AQI threshold in the **AQI Alarm Threshold** text box. An alarm is generated when the air quality reaches a threshold value. The default is 35. The range is from 1 and 100.
- d) Select the **Enable Interference For Security Alarm** check box to trigger interferer alarms when the switch detects specified device types, or unselect it to disable this feature. The default value is selected
- e) Make sure that any sources of interference that need to trigger interferer alarms appear in the **Trap on These Types** box and any that do not need to trigger interferer alarms appear in the **Do Not Trap on These Types** box. Use the > and < buttons to move interference sources between these two boxes. By default, all interference sources trigger interferer alarms.  
For example, if you want the switch to send an alarm when it detects a jamming device, select the **Enable Interference For Security Alarm** check box and move the jamming device to the **Trap on These Types** box.

**Step 7** Click **Apply**.

**Step 8** Trigger spectrum event-driven radio resource management (RRM) to run when a Cisco CleanAir-enabled access point detects a significant level of interference as follows:

- a) Look at the **EDRRM** field to see the current status of spectrum event-driven RRM and, if enabled, the Sensitivity Threshold field to see the threshold level at which event-driven RRM is invoked.
- b) If you want to change the current status of event-driven RRM or the sensitivity level, go to the **802.11a (or 802.11b) > RRM > Dynamic Channel Assignment (DCA)** page.
- c) Select the **EDRRM** check box to trigger RRM to run when an access point detects a certain level of interference, or unselect it to disable this feature. The default value is selected.

- d) If you selected the **EDRRM** check box in *Step c*, choose **Low**, **Medium**, **High**, or **Custom** from the Sensitivity Threshold drop-down list to specify the threshold at which you want RRM to be triggered. When the interference for the access point rises above the threshold level, RRM initiates a local dynamic channel assignment (DCA) run and changes the channel of the affected access point radio if possible to improve network performance. EDRRM prevents the access point from returning to the original channel for three hours after the event.
- High—Represents an increased sensitivity to changes in the environment.

Custom—Allows you to set a threshold value in the Custom Sensitivity Threshold field. The default sensitivity is 35.

Low—Represents a decreased sensitivity to changes in the environment.

The EDRRM AQ threshold value for low sensitivity is 35, medium sensitivity is 50, and high sensitivity is 60.

- e) Click **Apply**.

**Step 9** Click **Save Configuration**.

---

## Configuring Cisco CleanAir on an Access Point (GUI)

---

**Step 1** Choose **Configuration > Wireless > Access Points > Radios > 802.11a/n or 802.11b/g/n** to open the 802.11a/n (or 802.11b/g/n) Radios page.

**Step 2** Select the check box adjacent to the desired access point and click **Configure**. The 802.11a/n (or 802.11b/g/n) Radios page appears.

The **CleanAir Capable** field shows whether this access point can support CleanAir functionality. If it can, go to the next step to enable or disable CleanAir for this access point. If the access point cannot support CleanAir functionality, you cannot enable CleanAir for this access point.

**Note** By default, the Cisco CleanAir functionality is enabled on the radios.

**Step 3** Enable Cisco CleanAir functionality for this access point by choosing **Enable** from the CleanAir Admin Status drop-down list. To disable CleanAir functionality for this access point, choose **Disable**. The default value is Enable. This setting overrides the global CleanAir configuration for this access point.

**Step 4** Click **Apply**.

**Step 5** Click **Save Configuration**.

---

# Configuring Cisco Spectrum Expert

## Configuring Spectrum Expert (GUI)

### Before You Begin

- Spectrum Expert (Windows XP laptop client) and access point should be pingable, otherwise; it will not work.
- Prior to establishing a connection between the Spectrum Expert console and the access point, make sure that IP address routing is properly configured and the network spectrum interface (NSI) ports are open in any intervening firewalls.
- The access point must be a TCP server listening on ports 37540 for 2.4 GHz and 37550 for 5 GHz frequencies. These ports must be opened for the spectrum expert application to connect to the access point using the NSI protocol.
- You can view the NSI key from the switch CLI by using the **show ap name *ap\_name* config dot11 {24ghz | 5ghz}** command.

- 
- Step 1** Ensure that Cisco CleanAir functionality is enabled for the access point that will be connected to the Spectrum Expert console.
- Note** The SE-Connect mode is set for the entire access point, not just a single radio. However, the Spectrum Expert console connects to a single radio at a time.
- Step 2** Choose **Configuration > Wireless > Access Points > All APs** to open the All APs page.
- Step 3** Click the name of the desired access point to open the All APs > Details page.
- Step 4** Choose **SE-Connect** from the AP Mode drop-down list. This mode is available only for access points that are capable of supporting Cisco CleanAir functionality. For the SE-Connect mode to appear as an available option, the access point must have at least one spectrum-capable radio in the Enable state.
- Step 5** Click **Apply** to commit your changes.
- Step 6** Click **OK** when prompted to reboot the access point.
- Step 7** On the Windows PC, access the Cisco Software Center from this URL:  
<http://www.cisco.com/cisco/software/navigator.html>
- Step 8** Click **Product > Wireless > Cisco Spectrum Intelligence > Cisco Spectrum Expert > Cisco Spectrum Expert Wi-Fi**, and then download the Spectrum Expert 4.1.11 executable (\*.exe) file.
- Step 9** Run the Spectrum Expert application on the PC.
- Step 10** When the Connect to Sensor dialog box appears, enter the IP address of the access point, choose the access point radio, and enter the 16-byte network spectrum interface (NSI) key to authenticate. The Spectrum Expert application opens a TCP/IP connection directly to the access point using the NSI protocol.  
When an access point in SE-Connect mode joins a switch, it sends a Spectrum Capabilities notification message, and the switch responds with a Spectrum Configuration Request. The request contains the 16-byte random NSI key generated by the switch for NSI authentication. The switch generates one key per access point, which the access point stores until it is rebooted.

**Note** You can establish up to three Spectrum Expert console connections per access point radio.

- Step 11** Verify that the Spectrum Expert console is connected to the access point by selecting the Slave Remote Sensor text box in the bottom right corner of the Spectrum Expert application. If the two devices are connected, the IP address of the access point appears in this text box.
- Step 12** Use the Spectrum Expert application to view and analyze spectrum data from the access point.
- 

## Configuring Spectrum Expert (CLI)

### Before You Begin

- Spectrum Expert (Windows XP laptop client) and access point should be pingable, otherwise; it will not work.
- Prior to establishing a connection between the Spectrum Expert console and the access point, make sure that IP address routing is properly configured and the network spectrum interface (NSI) ports are open in any intervening firewalls.
- The access point must be a TCP server listening on ports 37540 for 2.4-GHz and 37550 for 5-GHz frequencies. These ports must be opened for the spectrum expert application to connect to the access point using the NSI protocol.
- You can view the NSI key from the switch CLI by using the **show ap name *ap\_name* config dot11 {24ghz | 5ghz}** command.

- Step 1** To configure the access point for SE-Connect mode, enter this command:  
**ap name *ap\_name* mode se-connect**

**Example:**

```
Switch#ap name Cisco_AP3500 mode se-connect
```

- Step 2** When prompted to reboot the access point, enter **Y**.

- Step 3** To view the NSI key for the access point, enter this command:  
**show ap name *ap\_name* config dot11 {24ghz | 5ghz}**

**Example:**

```
Switch#show ap name Cisco_AP3500 config dot11 24ghz
```

```
<snippet>
CleanAir Management Information
  CleanAir Capable                : Yes
  CleanAir Management Admin State  : Enabled
  CleanAir Management Operation State : Up
  CleanAir NSI Key                 : 274F1F9B1A5206683FAF57D87BFFBC9B
  CleanAir Sensor State            : Configured
<snippet>
```

---

## What to Do Next

On the Windows PC, download Cisco Spectrum Expert:

- Access the Cisco Software Center from this URL: <http://www.cisco.com/cisco/software/navigator.html>
- Click **Product > Wireless > Cisco Spectrum Intelligence > Cisco Spectrum Expert > Cisco Spectrum Expert Wi-Fi**, and then download the Spectrum Expert 4.1.11 executable (\*.exe) file.
- Run the Spectrum Expert application on the PC.
- When the Connect to Sensor dialog box appears, enter the IP address of the access point, choose the access point radio, and enter the 16-byte network spectrum interface (NSI) key to authenticate. The Spectrum Expert application opens a TCP/IP connection directly to the access point using the NSI protocol.

When an access point in SE-Connect mode joins a switch, it sends a Spectrum Capabilities notification message, and the switch responds with a Spectrum Configuration Request. The request contains the 16-byte random NSI key generated by the switch for use in NSI authentication. The switch generates one key per access point, which the access point stores until it is rebooted.

**Note** You can establish up to three Spectrum Expert console connections per access point radio.

- Verify that the Spectrum Expert console is connected to the access point by selecting the Slave Remote Sensor text box in the bottom right corner of the Spectrum Expert application. If the two devices are connected, the IP address of the access point appears in this text box.
- Use the Spectrum Expert application to view and analyze spectrum data from the access point.

## Monitoring CleanAir Parameters

You can monitor CleanAir parameters using the following commands:

**Table 10: Commands for Monitoring CleanAir**

Commands	Description
show ap dot11 24ghz cleanair air-quality summary	Displays CleanAir Air Quality (AQ) data for 2.4-GHz band
show ap dot11 24ghz cleanair air-quality worst	Displays CleanAir Air Quality (AQ) worst data for 2.4-GHz band
show ap dot11 24ghz cleanair config	Displays CleanAir Configuration for 2.4-GHz band
show ap dot11 24ghz cleanair device type all	Displays all CleanAir Interferers for 2.4-GHz band
show ap dot11 24ghz cleanair device type bt-discovery	Displays CleanAir Interferers of type BT Discovery for 2.4-GHz band

Commands	Description
show ap dot11 24ghz cleanair device type bt-link	Displays CleanAir Interferers of type BT Link for 2.4-GHz band
show ap dot11 24ghz cleanair device type canopy	Displays CleanAir Interferers of type Canopy for 2.4-GHz band
show ap dot11 24ghz cleanair device type cont-tx	Displays CleanAir Interferers of type Continuous transmitter for 2.4-GHz band
show ap dot11 24ghz cleanair device type dect-like	Displays CleanAir Interferers of type DECT Like for 2.4-GHz band
show ap dot11 24ghz cleanair device type fh	Displays CleanAir Interferers of type 802.11FH for 2.4-GHz band
show ap dot11 24ghz cleanair device type inv	Displays CleanAir Interferers of type WiFi Inverted for 2.4-GHz band
show ap dot11 24ghz cleanair device type jammer	Displays CleanAir Interferers of type Jammer for 2.4-GHz band
show ap dot11 24ghz cleanair device type mw-oven	Displays CleanAir Interferers of type MW Oven for 2.4-GHz band
show ap dot11 24ghz cleanair device type nonstd	Displays CleanAir Interferers of type WiFi Inv. Ch for 2.4-GHz band
show ap dot11 24ghz cleanair device type persistent	Displays CleanAir Interferers of type Persistent for 2.4-GHz band
show ap dot11 24ghz cleanair device type superag	Displays CleanAir Interferers of type SuperAG for 2.4-GHz band
show ap dot11 24ghz cleanair device type tdd-tx	Displays CleanAir Interferers of type TDD Transmit for 2.4-GHz band
show ap dot11 24ghz cleanair device type video	Displays CleanAir Interferers of type Video Camera for 2.4-GHz band
show ap dot11 24ghz cleanair device type wimax-fixed	Displays CleanAir Interferers of type WiMax Fixed for 2.4-GHz band
show ap dot11 24ghz cleanair device type wimax-mobile	Displays CleanAir Interferers of type WiMax Mobile for 2.4-GHz band
show ap dot11 24ghz cleanair device type xbox	Displays CleanAir Interferers of type Xbox for 2.4-GHz band

Commands	Description
show ap dot11 24ghz cleanair device type zigbee	Displays CleanAir Interferers of type zigbee for 2.4-GHz band
show ap dot11 5ghz cleanair air-quality summary	Displays CleanAir Air Quality (AQ) data for 5-GHz band
show ap dot11 5ghz cleanair air-quality worst	Displays CleanAir Air Quality (AQ) worst data for 5-GHz band
show ap dot11 5ghz cleanair config	Displays CleanAir Configuration for 5-GHz band
show ap dot11 5ghz cleanair device type all	Displays all CleanAir Interferers for 5-GHz band
show ap dot11 5ghz cleanair device type canopy	Displays CleanAir Interferers of type Canopy for 5-GHz band
show ap dot11 5ghz cleanair device type cont-tx	Displays CleanAir Interferers of type Continuous TX for 5-GHz band
show ap dot11 5ghz cleanair device type dect-like	Displays CleanAir Interferers of type DECT Like for 5-GHz band
show ap dot11 5ghz cleanair device type inv	Displays CleanAir Interferers of type WiFi Inverted for 5-GHz band
show ap dot11 5ghz cleanair device type jammer	Displays CleanAir Interferers of type Jammer for 5-GHz band
show ap dot11 5ghz cleanair device type nonstd	Displays CleanAir Interferers of type WiFi Inv. Ch for 5-GHz band
show ap dot11 5ghz cleanair device type persistent	Displays CleanAir Interferers of type Persistent for 5-GHz band
show ap dot11 5ghz cleanair device type superag	Displays CleanAir Interferers of type SuperAG for 5-GHz band
show ap dot11 5ghz cleanair device type tdd-tx	Displays CleanAir Interferers of type TDD Transmit for 5-GHz band
show ap dot11 5ghz cleanair device type video	Displays CleanAir Interferers of type Video Camera for 5-GHz band
show ap dot11 5ghz cleanair device type wimax-fixed	Displays CleanAir Interferers of type WiMax Fixed for 5-GHz band
show ap dot11 5ghz cleanair device type wimax-mobile	Displays CleanAir Interferers of type WiMax Mobile for 5-GHz band

You can also check the CleanAir status of the access points using the switch GUI:

---

Choose **Monitor > Wireless > Access Points > 802.11 a/n/ac or 802.11 b/g/n**.

The **Radios** page is displayed showing a list of access points that are associated with the switch. You can see the CleanAir Admin and CleanAir Status.

The Cisco CleanAir status is one of the following:

- **UP**—The spectrum sensor for the access point radio is currently operational (error code 0).
  - **DOWN**—The spectrum sensor for the access point radio is currently not operational because an error has occurred. The most likely reason for the error is that the access point radio is disabled (error code 8). To correct this error, enable the radio.
  - **ERROR**—The spectrum sensor for the access point radio has crashed (error code 128), making CleanAir monitoring nonoperational for this radio. If this error occurs, reboot the access point. If the error continues to appear, you might want to disable Cisco CleanAir functionality on the radio.
  - **N/A**—This access point radio is not capable of supporting Cisco CleanAir functionality.
- 

## Monitoring the Interference Devices

When a CleanAir-enabled access point detects interference devices, detections of the same device from multiple sensors are merged together to create clusters. Each cluster is given a unique ID. Some devices conserve power by limiting the transmit time until actually needed which results in the spectrum sensor to temporarily stop detecting the device. This device is then correctly marked as down. A down device is correctly removed from the spectrum database. In cases when all the interferer detections for a specific devices are reported, the cluster ID is kept alive for an extended period of time to prevent possible device detection bouncing. If the same device is detected again, it is merged with the original cluster ID and the device detection history is preserved.

For example, some bluetooth headsets operate on battery power. These devices employ methods to reduce power consumption, such as turning off the transmitter when not actually needed. Such devices can appear to come and go from the classification. To manage these devices, CleanAir keeps the cluster IDs longer and they are remerged into a single record upon detection. This process smoothens the user records and accurately represents the device history.

### Monitoring the Interference Devices (GUI)

#### Before You Begin

You can configure Cisco CleanAir only on CleanAir-enabled access points.

- 
- Step 1** Choose **Monitor > Interferers > Cisco CleanAir > 802.11a/n or 802.11b/g/n > Interference Devices** to open the Cisco APs > Interference Devices page.

This page shows the following information:

- **AP Name**—The name of the access point where the interference device is detected.
- **Interferer Type**—Type of the interferer.
- **Affected Channel**—Channel that the device affects.
- **Severity**—Severity index of the interfering device.
- **Duty Cycle (%)**—Proportion of time during which the interfering device was active.
- **RSSI**—Receive signal strength indicator (RSSI) of the access point.
- **DevID**—Device identification number that uniquely identified the interfering device.
- **ClusterID**—Cluster identification number that uniquely identifies the type of the devices.

**Step 2** Click the **Filter** icon or choose the **Quick Filter** option from the Show drop-down list to display the information about interference devices based on a particular criteria.

---

[Configuring Interference Reporting for 5-GHz devices, on page 72](#)

## Monitoring the Worst Air Quality of Radio Bands (GUI)

---

Choose **Monitor > Cisco CleanAir > Worst Air-Quality** to open the Air Quality Report page.

This page shows the air quality of both the 802.11a/n and 802.11b/g/n radio bands. This page displays the following information:

- **AP Name**—Name of the access point that reported the worst air quality for the 802.11 radio band.
  - **Channel Number**—Radio channel with the worst reported air quality.
  - **Minimum Air Quality Index**—Minimum air quality for this radio channel. The range is from 1 to 100. An air quality index (AQI) value of 100 is the best, and 1 is the worst.
  - **Average Air Quality Index**—Average air quality for this radio channel. The range is from 1 to 100. An air quality index (AQI) value of 100 is the best, and 1 is the worst.
  - **Interference Device Count**—Number of interferers detected by the radios on the 802.11 radio band.
-

## Configuration Examples for Configuring CleanAir

### Enabling CleanAir on 2.4-GHz Band and an Access Point: Example

This example shows how to enable CleanAir on the 2.4-GHz band and an access point operating in the channel:

```
Switch#configure terminal
Switch(config)#ap dot11 24ghz cleanair
Switch(config)#exit
Switch#ap name TAP1 dot11 24ghz cleanair
Switch#end
```

### Configuring a CleanAir Alarm for 2.4-GHz Air-Quality and Devices: Example

This example shows how to configure a CleanAir Alarm for 2.4-GHz Air-Quality threshold of 50 dBm and an Xbox device:

```
Switch#configure terminal
Switch(config)#ap dot11 24ghz cleanair alarm air-quality threshold 50
Switch(config)#ap dot11 24ghz cleanair alarm device xbox
Switch(config)#end
```

### Configuring Interference Reporting for 5-GHz Devices: Example

This example shows how to configure interference reporting for 5-GHz devices:

```
Switch#configure terminal
Switch(config)#ap dot11 5ghz cleanair alarm device xbox
Switch(config)#end
```

### Configuring EDRRM for CleanAir-Events: Example

This example shows how to enable an EDRRM cleanair-event in the 2.4-GHz band and configure high sensitivity to non Wi-Fi interference:

```
Switch#configure terminal
Switch(config)#ap dot11 24ghz rrm channel cleanair-event
Switch(config)#ap dot11 24ghz rrm channel cleanair-event sensitivity high
Switch(config)#end
```

### Configuring Persistent Device Avoidance: Example

This example shows how to enable persistent non Wi-Fi device avoidance in the 2.4-GHz band:

```
Switch#configure terminal
Switch(config)#ap dot11 24ghz rrm channel device
Switch(config)#end
```

### Configuring an Access Point for SE-Connect Mode: Example

This example shows how to configure an access point in the SE-Connect mode:

```
Switch#ap name Cisco_AP3500 mode se-connect
```

## CleanAir FAQs

**Q.** How do I check if my MC is up?

**A.** To check if the MC is up, use the command: **show wireless mobility summary**.

This example shows how to display the mobility summary:

```
Switch#show wireless mobility summary

Mobility Controller Summary:
Mobility Role                : Mobility Controller
Mobility Protocol Port       : 16666
Mobility Group Name          : MG-AK
Mobility Oracle              : Disabled
Mobility Oracle IP Address   : 0.0.0.0
DTLS Mode                    : Enabled
Mobility Domain ID for 802.11r : 0x39b2
Mobility Keepalive Interval  : 10
Mobility Keepalive Count     : 3
Mobility Control Message DSCP Value : 48
Mobility Domain Member Count : 2
Link Status is Control Link Status : Data Link Status
Controllers configured in the Mobility Domain:
IP          Public IP      Group Name      Multicast IP      Link Status
-----
9.6.136.10 -              MG-AK           0.0.0.0           UP : UP
```

- Q.** Multiple access points detect the same interference device, however, the switch shows them as separate clusters or different suspected devices clustered together. Why does this happen?
- A.** Access points must be RF neighbors for the switch to consider the merging of devices that are detected by these access points. The access point takes time to establish neighbor relationships. A few minutes after the switch reboots or a change in the RF group and similar events, clustering will not be very accurate.
- Q.** Can I merge two monitor mode access points using a switch?
- A.** No, you cannot merge two monitor mode access points using a switch. You can merge the monitor mode access points only using MSE.
- Q.** How do I view neighbor access points?
- A.** To view neighbor access points, use the command: **show ap ap\_name auto-rf dot11 {24ghz | 5ghz}**

This example shows how to display the neighbor access points:

```
Switch#show ap name AS-5508-5-AP3 auto-rf dot11 24ghz

<snippet>
Nearby APs
AP 0C85.259E.C350 slot 0      : -12 dBm on 1 (10.10.0.5)
AP 0C85.25AB.CCA0 slot 0      : -24 dBm on 6 (10.10.0.5)
AP 0C85.25C7.B7A0 slot 0      : -26 dBm on 11 (10.10.0.5)
AP 0C85.25DE.2C10 slot 0      : -24 dBm on 6 (10.10.0.5)
AP 0C85.25DE.C8E0 slot 0      : -14 dBm on 11 (10.10.0.5)
AP 0C85.25DF.3280 slot 0      : -31 dBm on 6 (10.10.0.5)
AP 0CD9.96BA.5600 slot 0      : -44 dBm on 6 (10.0.0.2)
AP 24B6.5734.C570 slot 0      : -48 dBm on 11 (10.0.0.2)
<snippet>
```

- Q.** What are the debug commands available for CleanAir?
- A.** The debug commands for CleanAir are:
- ```
debug cleanair {all | error | event | internal-event | nmsp | packet}
debug rrm {all | channel | detail | error | group | ha | manager | message | packet | power | prealarm | profile | radar | rf-change | scale | spectrum}
```

- Q.** Why are CleanAir Alarms not generated for interferer devices?
- A.** Verify that the access points are CleanAir-capable and CleanAir is enabled both on the access point and the switch.
- Q.** Can the Cisco Catalyst 3850 and 3650 Series Switches function as a Mobility Agent (MA)?
- A.** Yes, the Cisco Catalyst 3850 and 3650 Series Switches can function as an MA.
- Q.** Are CleanAir configurations available on the MA?
- A.** From Release 3.3 SE, CleanAir configurations are available on the MA. You can use the following two CleanAir commands on the MA:
- **show ap dot11 5ghz cleanair config**
  - **show ap dot11 24ghz cleanair config**

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring Interface Characteristics

### Interface Types

This section describes the different types of interfaces supported by the switch. The rest of the chapter describes configuration procedures for physical interface characteristics.

**Note**

The stack ports on the rear of the stacking-capable switches are not Ethernet ports and cannot be configured.

## Port-Based VLANs

A VLAN is a switched network that is logically segmented by function, team, or application, without regard to the physical location of the users. Packets received on a port are forwarded only to ports that belong to the same VLAN as the receiving port. Network devices in different VLANs cannot communicate with one another without a Layer 3 device to route traffic between the VLANs.

VLAN partitions provide hard firewalls for traffic in the VLAN, and each VLAN has its own MAC address table. A VLAN comes into existence when a local port is configured to be associated with the VLAN, when the VLAN Trunking Protocol (VTP) learns of its existence from a neighbor on a trunk, or when a user creates a VLAN. VLANs can be formed with ports across the stack.

To configure VLANs, use the **vlan** *vlan-id* global configuration command to enter VLAN configuration mode. The VLAN configurations for normal-range VLANs (VLAN IDs 1 to 1005) are saved in the VLAN database. If VTP is version 1 or 2, to configure extended-range VLANs (VLAN IDs 1006 to 4094), you must first set VTP mode to transparent. Extended-range VLANs created in transparent mode are not added to the VLAN database but are saved in the switch running configuration. With VTP version 3, you can create extended-range VLANs in client or server mode. These VLANs are saved in the VLAN database.

In a switch stack, the VLAN database is downloaded to all switches in a stack, and all switches in the stack build the same VLAN database. The running configuration and the saved configuration are the same for all switches in a stack.

Add ports to a VLAN by using the **switchport** interface configuration commands:

- Identify the interface.
- For a trunk port, set trunk characteristics, and, if desired, define the VLANs to which it can belong.
- For an access port, set and define the VLAN to which it belongs.

## Switch Ports

Switch ports are Layer 2-only interfaces associated with a physical port. Switch ports belong to one or more VLANs. A switch port can be an access port or a trunk port. You can configure a port as an access port or trunk port or let the Dynamic Trunking Protocol (DTP) operate on a per-port basis to set the switchport mode by negotiating with the port on the other end of the link. Switch ports are used for managing the physical interface and associated Layer 2 protocols and do not handle routing or bridging.

Configure switch ports by using the **switchport** interface configuration commands.

### Access Ports

An access port belongs to and carries the traffic of only one VLAN (unless it is configured as a voice VLAN port). Traffic is received and sent in native formats with no VLAN tagging. Traffic arriving on an access port is assumed to belong to the VLAN assigned to the port. If an access port receives a tagged packet (Inter-Switch Link [ISL] or IEEE 802.1Q tagged), the packet is dropped, and the source address is not learned.

Two types of access ports are supported:

- Static access ports are manually assigned to a VLAN (or through a RADIUS server for use with IEEE 802.1x).
- VLAN membership of dynamic access ports is learned through incoming packets. By default, a dynamic access port is not a member of any VLAN, and forwarding to and from the port is enabled only when the VLAN membership of the port is discovered. Dynamic access ports on the switch are assigned to a

VLAN by a VLAN Membership Policy Server (VMPS). The VMPS can be a Catalyst 6500 series switch; the switch cannot be a VMPS server.

You can also configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.

### Trunk Ports

A trunk port carries the traffic of multiple VLANs and by default is a member of all VLANs in the VLAN database.

Although by default, a trunk port is a member of every VLAN known to the VTP, you can limit VLAN membership by configuring an allowed list of VLANs for each trunk port. The list of allowed VLANs does not affect any other port but the associated trunk port. By default, all possible VLANs (VLAN ID 1 to 4094) are in the allowed list. A trunk port can become a member of a VLAN only if VTP knows of the VLAN and if the VLAN is in the enabled state. If VTP learns of a new, enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of that VLAN and traffic is forwarded to and from the trunk port for that VLAN. If VTP learns of a new, enabled VLAN that is not in the allowed list for a trunk port, the port does not become a member of the VLAN, and no traffic for the VLAN is forwarded to or from the port.

### Tunnel Ports

Tunnel ports are used in IEEE 802.1Q tunneling to segregate the traffic of customers in a service-provider network from other customers who are using the same VLAN number. You configure an asymmetric link from a tunnel port on a service-provider edge switch to an IEEE 802.1Q trunk port on the customer switch. Packets entering the tunnel port on the edge switch, already IEEE 802.1Q-tagged with the customer VLANs, are encapsulated with another layer of an IEEE 802.1Q tag (called the metro tag), containing a VLAN ID unique in the service-provider network, for each customer. The double-tagged packets go through the service-provider network keeping the original customer VLANs separate from those of other customers. At the outbound interface, also a tunnel port, the metro tag is removed, and the original VLAN numbers from the customer network are retrieved.

Tunnel ports cannot be trunk ports or access ports and must belong to a VLAN unique to each customer.

### Routed Ports

A routed port is a physical port that acts like a port on a router; it does not have to be connected to a router. A routed port is not associated with a particular VLAN, as is an access port. A routed port behaves like a regular router interface, except that it does not support VLAN subinterfaces. Routed ports can be configured with a Layer 3 routing protocol. A routed port is a Layer 3 interface only and does not support Layer 2 protocols, such as DTP and STP.

Configure routed ports by putting the interface into Layer 3 mode with the **no switchport** interface configuration command. Then assign an IP address to the port, enable routing, and assign routing protocol characteristics by using the **ip routing** and **router protocol** global configuration commands.

#### Note

Entering a **no switchport** interface configuration command shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 2 mode into Layer 3 mode, the previous configuration information related to the affected interface might be lost.

The number of routed ports that you can configure is not limited by software. However, the interrelationship between this number and the number of other features being configured might impact CPU performance because of hardware limitations.

---

**Note** The IP base feature set supports static routing and the Routing Information Protocol (RIP). For full Layer 3 routing or for fallback bridging, you must enable the IP services feature set on the standalone switch, or the active switch.

---

## Switch Virtual Interfaces

A switch virtual interface (SVI) represents a VLAN of switch ports as one interface to the routing or bridging function in the system. You can associate only one SVI with a VLAN. You configure an SVI for a VLAN only to route between VLANs or to provide IP host connectivity to the switch. By default, an SVI is created for the default VLAN (VLAN 1) to permit remote switch administration. Additional SVIs must be explicitly configured.

---

**Note** You cannot delete interface VLAN 1.

---

SVIs provide IP host connectivity only to the system.

Although the switch stack or switch supports a total of 1005 VLANs and SVIs, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might impact CPU performance because of hardware limitations.

SVIs are created the first time that you enter the **vlan** interface configuration command for a VLAN interface. The VLAN corresponds to the VLAN tag associated with data frames on an ISL or IEEE 802.1Q encapsulated trunk or the VLAN ID configured for an access port. Configure a VLAN interface for each VLAN for which you want to route traffic, and assign it an IP address.

---

**Note** When you create an SVI, it does not become active until it is associated with a physical port.

---

### SVI Autostate Exclude

The line state of an SVI with multiple ports on a VLAN is in the *up* state when it meets these conditions:

- The VLAN exists and is active in the VLAN database on the switch
- The VLAN interface exists and is not administratively down.
- At least one Layer 2 (access or trunk) port exists, has a link in the *up* state on this VLAN, and is in the spanning-tree forwarding state on the VLAN.

---

**Note** The protocol link state for VLAN interfaces come up when the first switchport belonging to the corresponding VLAN link comes up and is in STP forwarding state.

---

The default action, when a VLAN has multiple ports, is that the SVI goes down when all ports in the VLAN go down. You can use the SVI autostate exclude feature to configure a port so that it is not included in the

SVI line-state up-or-down calculation. For example, if the only active port on the VLAN is a monitoring port, you might configure `autostate exclude` on that port so that the VLAN goes down when all other ports go down. When enabled on a port, **autostate exclude** applies to all VLANs that are enabled on that port.

The VLAN interface is brought up when one Layer 2 port in the VLAN has had time to converge (transition from STP listening-learning state to forwarding state). This prevents features such as routing protocols from using the VLAN interface as if it were fully operational and minimizes other problems, such as routing black holes.

## EtherChannel Port Groups

EtherChannel port groups treat multiple switch ports as one switch port. These port groups act as a single logical port for high-bandwidth connections between switches or between switches and servers. An EtherChannel balances the traffic load across the links in the channel. If a link within the EtherChannel fails, traffic previously carried over the failed link changes to the remaining links. You can group multiple trunk ports into one logical trunk port, group multiple access ports into one logical access port, group multiple tunnel ports into one logical tunnel port, or group multiple routed ports into one logical routed port. Most protocols operate over either single ports or aggregated switch ports and do not recognize the physical ports within the port group. Exceptions are the DTP, the Cisco Discovery Protocol (CDP), and the Port Aggregation Protocol (PAgP), which operate only on physical ports.

When you configure an EtherChannel, you create a port-channel logical interface and assign an interface to the EtherChannel. For Layer 3 interfaces, you manually create the logical interface by using the **interface port-channel** global configuration command. Then you manually assign an interface to the EtherChannel by using the **channel-group** interface configuration command. For Layer 2 interfaces, use the **channel-group** interface configuration command to dynamically create the port-channel logical interface. This command binds the physical and logical ports together.

## Power over Ethernet Ports

A PoE-capable switch port automatically supplies power to one of these connected devices if the switch senses that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
- an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also sense the real-time power consumption of the device by monitoring and policing the power usage.

## Using the Switch USB Ports

### USB Mini-Type B Console Port

The switch has the following console ports available on its front panel:

- USB mini-Type B console connection

- RJ-45 console port

Console output appears on devices connected to both ports, but console input is active on only one port at a time. By default, the USB connector takes precedence over the RJ-45 connector.

**Note** Windows PCs require a driver for the USB port. See the hardware installation guide for driver installation instructions.

Use the supplied USB Type A-to-USB mini-Type B cable to connect a PC or other device to the switch. The connected device must include a terminal emulation application. When the switch detects a valid USB connection to a powered-on device that supports host functionality (such as a PC), input from the RJ-45 console is immediately disabled, and input from the USB console is enabled. Removing the USB connection immediately reenables input from the RJ-45 console connection. An LED on the switch shows which console connection is in use.

### Console Port Change Logs

At software startup, a log shows whether the USB or the RJ-45 console is active. Each switch in a stack issues this log. Every switch always first displays the RJ-45 media type.

In the sample output, switch 1 has a connected USB console cable. Because the bootloader did not change to the USB console, the first log from switch 1 shows the RJ-45 console. A short time later, the console changes and the USB console log appears. Switch 2 and switch 3 have connected RJ-45 console cables.

```
switch-stack-1
*Mar 1 00:01:00.171: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
*Mar 1 00:01:00.431: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.
```

```
switch-stack-2
*Mar 1 00:01:09.835: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

```
switch-stack-3
*Mar 1 00:01:10.523: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

When the USB cable is removed or the PC de-activates the USB connection, the hardware automatically changes to the RJ-45 console interface:

```
switch-stack-1
Mar 1 00:20:48.635: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

You can configure the console type to always be RJ-45, and you can configure an inactivity timeout for the USB connector.

## Interface Connections

Devices within a single VLAN can communicate directly through any switch. Ports in different VLANs cannot exchange data without going through a routing device. With a standard Layer 2 switch, ports in different VLANs have to exchange information through a router. By using the switch with routing enabled, when you

configure both VLAN 20 and VLAN 30 with an SVI to which an IP address is assigned, packets can be sent from Host A to Host B directly through the switch with no need for an external router.

**Figure 2: Connecting VLANs with the Switch**

**Note** Switches running the LAN base feature set support configuring only 16 static routes on SVIs.

## Default Ethernet Interface Configuration

To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the **switchport** interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

This table shows the Ethernet interface default configuration, including some features that apply only to Layer 2 interfaces.

**Table 11: Default Layer 2 Ethernet Interface Configuration**

| Feature                              | Default Setting                                                        |
|--------------------------------------|------------------------------------------------------------------------|
| Operating mode                       | Layer 2 or switching mode ( <b>switchport</b> command).                |
| Allowed VLAN range                   | VLANs 1– 4094.                                                         |
| Default VLAN (for access ports)      | VLAN 1 (Layer 2 interfaces only).                                      |
| Native VLAN (for IEEE 802.1Q trunks) | VLAN 1 (Layer 2 interfaces only).                                      |
| VLAN trunking                        | Switchport mode dynamic auto (supports DTP) (Layer 2 interfaces only). |

| Feature                                                       | Default Setting                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port enable state                                             | All ports are enabled.                                                                                                                                                                                                                                                                                                      |
| Port description                                              | None defined.                                                                                                                                                                                                                                                                                                               |
| Speed                                                         | Autonegotiate. (Not supported on the 10-Gigabit interfaces.)                                                                                                                                                                                                                                                                |
| Duplex mode                                                   | Autonegotiate. (Not supported on the 10-Gigabit interfaces.)                                                                                                                                                                                                                                                                |
| Flow control                                                  | Flow control is set to <b>receive: off</b> . It is always off for sent packets.                                                                                                                                                                                                                                             |
| EtherChannel (PAgP)                                           | Disabled on all Ethernet ports.                                                                                                                                                                                                                                                                                             |
| Port blocking (unknown multicast and unknown unicast traffic) | Disabled (not blocked) (Layer 2 interfaces only).                                                                                                                                                                                                                                                                           |
| Broadcast, multicast, and unicast storm control               | Disabled.                                                                                                                                                                                                                                                                                                                   |
| Protected port                                                | Disabled (Layer 2 interfaces only).                                                                                                                                                                                                                                                                                         |
| Port security                                                 | Disabled (Layer 2 interfaces only).                                                                                                                                                                                                                                                                                         |
| Port Fast                                                     | Disabled.                                                                                                                                                                                                                                                                                                                   |
| Auto-MDIX                                                     | Enabled.<br><br><b>Note</b> The switch might not support a pre-standard powered device—such as Cisco IP phones and access points that do not fully support IEEE 802.3af—if that powered device is connected to the switch through a crossover cable. This is regardless of whether auto-MDIX is enabled on the switch port. |
| Power over Ethernet (PoE)                                     | Enabled (auto).                                                                                                                                                                                                                                                                                                             |

## Interface Speed and Duplex Mode

Ethernet interfaces on the switch operate at 10, 100, 1000, or 10,000 Mb/s and in either full- or half-duplex mode. In full-duplex mode, two stations can send and receive traffic at the same time. Normally, 10-Mb/s ports operate in half-duplex mode, which means that stations can either receive or send traffic.

Switch models include Gigabit Ethernet (10/100/1000-Mb/s) ports, 10-Gigabit Ethernet ports, and small form-factor pluggable (SFP) module slots supporting SFP modules.

## Speed and Duplex Configuration Guidelines

When configuring an interface speed and duplex mode, note these guidelines:

- The 10-Gigabit Ethernet ports do not support the speed and duplex features. These ports operate only at 10,000 Mb/s and in full-duplex mode.
- Gigabit Ethernet (10/100/1000-Mb/s) ports support all speed options and all duplex options (auto, half, and full). However, Gigabit Ethernet ports operating at 1000 Mb/s do not support half-duplex mode.
- For SFP module ports, the speed and duplex CLI options change depending on the SFP module type:
  - The 1000BASE-*x* (where *x* is -BX, -CWDM, -LX, -SX, and -ZX) SFP module ports support the **nonegotiate** keyword in the **speed** interface configuration command. Duplex options are not supported.
  - The 1000BASE-T SFP module ports support the same speed and duplex options as the 10/100/1000-Mb/s ports.

For information about which SFP modules are supported on your switch, see the product release notes.

- If both ends of the line support autonegotiation, we highly recommend the default setting of **auto** negotiation.
- If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces; do not use the **auto** setting on the supported side.
- When STP is enabled and a port is reconfigured, the switch can take up to 30 seconds to check for loops. The port LED is amber while STP reconfigures.

### Caution

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

## IEEE 802.3x Flow Control

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port by sending a pause frame to stop sending until the condition clears. Upon receipt of a pause frame, the sending device stops sending any data packets, which prevents any loss of data packets during the congestion period.

### Note

The switch ports can receive, but not send, pause frames.

You use the **flowcontrol** interface configuration command to set the interface's ability to **receive** pause frames to **on**, **off**, or **desired**. The default state is **off**.

When set to **desired**, an interface can operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.

These rules apply to flow control settings on the device:

- **receive on** (or **desired**): The port cannot send pause frames but can operate with an attached device that is required to or can send pause frames; the port can receive pause frames.
- **receive off**: Flow control does not operate in either direction. In case of congestion, no indication is given to the link partner, and no pause frames are sent or received by either device.

**Note**

For details on the command settings and the resulting flow control resolution on local and remote ports, see the **flowcontrol** interface configuration command in the command reference for this release.

## Layer 3 Interfaces

The switch supports these types of Layer 3 interfaces:

- **SVIs**: You should configure SVIs for any VLANs for which you want to route traffic. SVIs are created when you enter a VLAN ID following the **interface vlan** global configuration command. To delete an SVI, use the **no interface vlan** global configuration command. You cannot delete interface VLAN 1.

**Note**

When you create an SVI, it does not become active until it is associated with a physical port.

When configuring SVIs, you can also configure SVI autostate exclude on a port in the SVI to exclude that port from being included in determining SVI line-state status.

- **Routed ports**: Routed ports are physical ports configured to be in Layer 3 mode by using the **no switchport** interface configuration command.
- **Layer 3 EtherChannel ports**: EtherChannel interfaces made up of routed ports.

A Layer 3 switch can have an IP address assigned to each routed port and SVI.

There is no defined limit to the number of SVIs and routed ports that can be configured in a switch or in a switch stack. However, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might have an impact on CPU usage because of hardware limitations. If the switch is using its maximum hardware resources, attempts to create a routed port or SVI have these results:

- If you try to create a new routed port, the switch generates a message that there are not enough resources to convert the interface to a routed port, and the interface remains as a switchport.
- If you try to create an extended-range VLAN, an error message is generated, and the extended-range VLAN is rejected.
- If the switch is notified by VLAN Trunking Protocol (VTP) of a new VLAN, it sends a message that there are not enough hardware resources available and shuts down the VLAN. The output of the **show vlan** user EXEC command shows the VLAN in a suspended state.
- If the switch attempts to boot up with a configuration that has more VLANs and routed ports than hardware can support, the VLANs are created, but the routed ports are shut down, and the switch sends a message that this was due to insufficient hardware resources.

All Layer 3 interfaces require an IP address to route traffic. This procedure shows how to configure an interface as a Layer 3 interface and how to assign an IP address to an interface.

**Note** If the physical port is in Layer 2 mode (the default), you must enter the **no switchport** interface configuration command to put the interface into Layer 3 mode. Entering a **no switchport** command disables and then re-enables the interface, which might generate messages on the device to which the interface is connected. Furthermore, when you put an interface that is in Layer 2 mode into Layer 3 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration

## How to Configure Interface Characteristics

### Configuring Interfaces Procedure

These general instructions apply to all interface configuration processes.

#### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Enter the <b>configure terminal</b> command at the privileged EXEC prompt:<br><br><b>Example:</b><br><br>Switch# <b>configure terminal</b><br>Enter configuration commands, one per line. End with CNTL/Z.<br>Switch(config)#                                                                                                                                         |                                                                                                                                                                                                                                                               |
| <b>Step 2</b> | Enter the <b>interface</b> global configuration command. Identify the interface type, the switch number (only on stacking-capable switches), and the number of the connector. In this example, Gigabit Ethernet port 1 on switch 1 is selected:<br><br><b>Example:</b><br><br>Switch(config)# <b>interface gigabitethernet1/0/1</b><br>Switch(config-if)#             | <b>Note</b> You do not need to add a space between the interface type and the interface number. For example, in the preceding line, you can specify either <b>gigabitethernet 1/0/1</b> , <b>gigabitethernet1/0/1</b> , <b>gi 1/0/1</b> , or <b>gi1/0/1</b> . |
| <b>Step 3</b> | Follow each <b>interface</b> command with the interface configuration commands that the interface requires. The commands that you enter define the protocols and applications that will run on the interface. The commands are collected and applied to the interface when you enter another interface command or enter <b>end</b> to return to privileged EXEC mode. | You can also configure a range of interfaces by using the <b>interface range</b> or <b>interface range macro</b> global configuration commands. Interfaces configured in a range must be the same type and must be configured with the same feature options.  |
| <b>Step 4</b> | After you configure an interface, verify its status by using the <b>show</b> privileged EXEC commands.                                                                                                                                                                                                                                                                | Enter the <b>show interfaces</b> privileged EXEC command to see a list of all interfaces on or configured for the switch. A report is provided for each interface that the device supports or for the specified interface.                                    |

|  | Command or Action | Purpose |
|--|-------------------|---------|
|  | <b>Example:</b>   |         |

## Adding a Description for an Interface

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **description** *string*
4. **end**
5. **show interfaces** *interface-id* **description**

### DETAILED STEPS

|               | Command or Action                                                                                                                 | Purpose                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br><br>Switch# <b>configure terminal</b>                                         | Enters global configuration mode.                                                                       |
| <b>Step 2</b> | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br><br>Switch(config)# <b>interface</b> <b>gigabitethernet1/0/2</b>   | Specifies the interface for which you are adding a description, and enter interface configuration mode. |
| <b>Step 3</b> | <b>description</b> <i>string</i><br><br><b>Example:</b><br><br>Switch(config-if)# <b>description</b> <b>Connects to Marketing</b> | Adds a description (up to 240 characters) for an interface.                                             |
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br><br>Switch(config-if)# <b>end</b>                                                            | Returns to privileged EXEC mode.                                                                        |
| <b>Step 5</b> | <b>show interfaces</b> <i>interface-id</i> <b>description</b>                                                                     | Verifies your entry.                                                                                    |

## Configuring a Range of Interfaces

To configure multiple interfaces with the same configuration parameters, use the **interface range** global configuration command. When you enter the interface-range configuration mode, all command parameters that you enter are attributed to all interfaces within that range until you exit this mode.

### SUMMARY STEPS

1. **configure terminal**
2. **interface range** *{port-range | macro macro\_name}*
3. **end**
4. **show interfaces** *[interface-id]*

### DETAILED STEPS

|               | Command or Action                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>interface range</b> <i>{port-range   macro macro_name}</i><br><br><b>Example:</b><br>Switch(config)# <b>interface range macro</b> | Specifies the range of interfaces (VLANs or physical ports) to be configured, and enter interface-range configuration mode. <ul style="list-style-type: none"> <li>• You can use the <b>interface range</b> command to configure up to five port ranges or a previously defined macro.</li> <li>• The <b>macro</b> variable is explained in the <a href="#">Configuring and Using Interface Range Macros, on page 104</a>.</li> <li>• In a comma-separated <i>port-range</i>, you must enter the interface type for each entry and enter spaces before and after the comma.</li> <li>• In a hyphen-separated <i>port-range</i>, you do not need to re-enter the interface type, but you must enter a space before the hyphen.</li> </ul> <p><b>Note</b> Use the normal configuration commands to apply the configuration parameters to all interfaces in the range. Each command is executed as it is entered.</p> |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|               | Command or Action                                                                                       | Purpose                                                    |
|---------------|---------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <b>Step 4</b> | <b>show interfaces</b> [ <i>interface-id</i> ]<br><br><b>Example:</b><br>Switch# <b>show interfaces</b> | Verifies the configuration of the interfaces in the range. |

## Configuring and Using Interface Range Macros

You can create an interface range macro to automatically select a range of interfaces for configuration. Before you can use the **macro** keyword in the **interface range macro** global configuration command string, you must use the **define interface-range** global configuration command to define the macro.

### SUMMARY STEPS

1. **configure terminal**
2. **define interface-range** *macro\_name interface-range*
3. **interface range macro** *macro\_name*
4. **end**
5. **show running-config | include define**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | <b>define interface-range</b> <i>macro_name interface-range</i><br><br><b>Example:</b><br>Switch(config)# <b>define interface-range enet_list gigabitethernet1/0/1 - 2</b> | Defines the interface-range macro, and save it in NVRAM. <ul style="list-style-type: none"> <li>• The <i>macro_name</i> is a 32-character maximum character string.</li> <li>• A macro can contain up to five comma-separated interface ranges.</li> <li>• Each <i>interface-range</i> must consist of the same port type.</li> </ul> <p><b>Note</b> Before you can use the <b>macro</b> keyword in the <b>interface range macro</b> global configuration command string, you must use the <b>define interface-range</b> global configuration command to define the macro.</p> |

|               | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>interface range macro</b> <i>macro_name</i><br><br><b>Example:</b><br>Switch(config)# <b>interface range macro</b><br><b>enet_list</b> | Selects the interface range to be configured using the values saved in the interface-range macro called <i>macro_name</i> .<br><br>You can now use the normal configuration commands to apply the configuration to all interfaces in the defined macro. |
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                        |
| <b>Step 5</b> | <b>show running-config   include define</b><br><br><b>Example:</b><br>Switch# <b>show running-config   include</b><br><b>define</b>       | Shows the defined interface range macro configuration.                                                                                                                                                                                                  |

## Configuring Ethernet Interfaces

### Setting the Interface Speed and Duplex Parameters

#### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **speed** {10 | 100 | 1000 | auto [10 | 100 | 1000] | nonegotiate}
4. **duplex** {auto | full | half}
5. **end**
6. **show interfaces** *interface-id*
7. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                              | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet1/0/3</b>               | Specifies the physical interface to be configured, and enter interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>speed {10   100   1000   auto [10   100   1000]   nonegotiate}</b><br><br><b>Example:</b><br>Switch(config-if)# <b>speed 10</b> | <p>This command is not available on a 10-Gigabit Ethernet interface.</p> <p>Enter the appropriate speed parameter for the interface:</p> <ul style="list-style-type: none"> <li>• Enter <b>10</b>, <b>100</b>, or <b>1000</b> to set a specific speed for the interface. The <b>1000</b> keyword is available only for 10/100/1000 Mb/s ports.</li> <li>• Enter <b>auto</b> to enable the interface to autonegotiate speed with the connected device. If you use the <b>10</b>, <b>100</b>, or the <b>1000</b> keywords with the <b>auto</b> keyword, the port autonegotiates only at the specified speeds.</li> <li>• The <b>nonegotiate</b> keyword is available only for SFP module ports. SFP module ports operate only at 1000 Mb/s but can be configured to not negotiate if connected to a device that does not support autonegotiation.</li> </ul> |
| <b>Step 4</b> | <b>duplex {auto   full   half}</b><br><br><b>Example:</b><br>Switch(config-if)# <b>duplex half</b>                                 | <p>This command is not available on a 10-Gigabit Ethernet interface.</p> <p>Enter the duplex parameter for the interface.</p> <p>Enable half-duplex mode (for interfaces operating only at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 Mb/s.</p> <p>You can configure the duplex setting when the speed is set to <b>auto</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                                 | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 6</b> | <b>show interfaces <i>interface-id</i></b><br><br><b>Example:</b><br>Switch# <b>show interfaces</b>                                | Displays the interface speed and duplex mode configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|               | Command or Action                                                                                                             | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | <code>gigabitethernet1/0/3</code>                                                                                             |                                                          |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br><pre>Switch# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file. |

## Configuring IEEE 802.3x Flow Control

### SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **flowcontrol {receive} {on | off | desired}**
4. **end**
5. **show interfaces *interface-id***

### DETAILED STEPS

|               | Command or Action                                                                                                                    | Purpose                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br><br><pre>Switch# configure terminal</pre>                                        | Enters global configuration mode                                                           |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br><br><pre>Switch(config)# interface gigabitethernet1/0/1</pre>         | Specifies the physical interface to be configured, and enter interface configuration mode. |
| <b>Step 3</b> | <b>flowcontrol {receive} {on   off   desired}</b><br><br><b>Example:</b><br><br><pre>Switch(config-if)# flowcontrol receive on</pre> | Configures the flow control mode for the port.                                             |

|               | Command or Action                                                                                                        | Purpose                                       |
|---------------|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                       | Returns to privileged EXEC mode.              |
| <b>Step 5</b> | <b>show interfaces</b> <i>interface-id</i><br><br><b>Example:</b><br>Switch# <b>show interfaces</b> gigabitethernet1/0/1 | Verifies the interface flow control settings. |

## Configuring Layer 3 Interfaces

### SUMMARY STEPS

1. **configure terminal**
2. **interface** {gigabitethernet *interface-id* | {vlan *vlan-id*} | {port-channel *port-channel-number*}
3. **no switchport**
4. **ip address** *ip\_address subnet\_mask*
5. **no shutdown**
6. **end**
7. **show interfaces** [*interface-id*]

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                             | Purpose                                                                                                  |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                                                         | Enters global configuration mode.                                                                        |
| <b>Step 2</b> | <b>interface</b> {gigabitethernet <i>interface-id</i> }   {vlan <i>vlan-id</i> }   {port-channel <i>port-channel-number</i> }<br><br><b>Example:</b><br>Switch(config)# <b>interface</b> gigabitethernet1/0/2 | Specifies the interface to be configured as a Layer 3 interface, and enter interface configuration mode. |

|               | Command or Action                                                                                                                          | Purpose                                       |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| <b>Step 3</b> | <b>no switchport</b><br><br><b>Example:</b><br>Switch(config-if)# <b>no switchport</b>                                                     | For physical ports only, enters Layer 3 mode. |
| <b>Step 4</b> | <b>ip address <i>ip_address subnet_mask</i></b><br><br><b>Example:</b><br>Switch(config-if)# <b>ip address 192.20.135.21 255.255.255.0</b> | Configures the IP address and IP subnet.      |
| <b>Step 5</b> | <b>no shutdown</b><br><br><b>Example:</b><br>Switch(config-if)# <b>no shutdown</b>                                                         | Enables the interface.                        |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                                         | Returns to privileged EXEC mode.              |
| <b>Step 7</b> | <b>show interfaces [<i>interface-id</i>]</b>                                                                                               | Verifies the configuration.                   |

## Configuring SVI Autostate Exclude

### SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **switchport autostate exclude**
4. **end**
5. **show running config interface *interface-id***

## DETAILED STEPS

|               | Command or Action                                                                                                    | Purpose                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                | Enters global configuration mode.                                                                      |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet1/0/2</b> | Specifies a Layer 2 interface (physical port or port channel), and enter interface configuration mode. |
| <b>Step 3</b> | <b>switchport autostate exclude</b><br><br><b>Example:</b><br>Switch(config-if)# <b>switchport autostate exclude</b> | Excludes the access or trunk port when defining the status of an SVI line state (up or down)           |
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                   | Returns to privileged EXEC mode.                                                                       |
| <b>Step 5</b> | <b>show running config interface <i>interface-id</i></b>                                                             | (Optional) Shows the running configuration.<br>Verifies the configuration.                             |

## Shutting Down and Restarting the Interface

Shutting down an interface disables all functions on the specified interface and marks the interface as unavailable on all monitoring command displays. This information is communicated to other network servers through all dynamic routing protocols. The interface is not mentioned in any routing updates.

## SUMMARY STEPS

1. **configure terminal**
2. **interface {vlan *vlan-id*} | {gigabitethernet *interface-id*} | {port-channel *port-channel-number*}**
3. **shutdown**
4. **no shutdown**
5. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                          | Purpose                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                                                      | Enters global configuration mode.       |
| Step 2 | <b>interface {vlan <i>vlan-id</i>}   {gigabitethernet <i>interface-id</i>}   {port-channel <i>port-channel-number</i>}</b><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet1/0/2</b> | Selects the interface to be configured. |
| Step 3 | <b>shutdown</b><br><br><b>Example:</b><br>Switch(config-if)# <b>shutdown</b>                                                                                                                               | Shuts down an interface.                |
| Step 4 | <b>no shutdown</b><br><br><b>Example:</b><br>Switch(config-if)# <b>no shutdown</b>                                                                                                                         | Restarts an interface.                  |
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                                                                                                         | Returns to privileged EXEC mode.        |

## Configuring the Console Media Type

Beginning in privileged EXEC mode, follow these steps to set the console media type to RJ-45. If you configure the console as RJ-45, USB console operation is disabled, and input comes only through the RJ-45 connector.

This configuration applies to all switches in a stack.

## SUMMARY STEPS

1. **configure terminal**
2. **line console 0**
3. **media-type rj45**
4. **end**

## DETAILED STEPS

|        | Command or Action                                                                            | Purpose                                                                                                                                                  |
|--------|----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>        | Enters the global configuration mode.                                                                                                                    |
| Step 2 | <b>line console 0</b><br><br><b>Example:</b><br>Switch(config)# <b>line console 0</b>        | Configures the console and enters line configuration mode.                                                                                               |
| Step 3 | <b>media-type rj45</b><br><br><b>Example:</b><br>Switch(config-line)# <b>media-type rj45</b> | Configures the console media type to be only RJ-45 port. If you do not enter this command and both types are connected, the USB port is used by default. |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                              | Returns to privileged EXEC mode.                                                                                                                         |

## Configuring the USB Inactivity Timeout

The configurable inactivity timeout reactivates the RJ-45 console port if the USB console port is activated but no input activity occurs on it for a specified time period. When the USB console port is deactivated due to a timeout, you can restore its operation by disconnecting and reconnecting the USB cable.

**Note**

The configured inactivity timeout applies to all switches in a stack. However, a timeout on one switch does not cause a timeout on other switches in the stack.

Beginning in privileged EXEC mode, follow these steps to configure an inactivity timeout.

## SUMMARY STEPS

1. **configure terminal**
2. **line console 0**
3. **usb-inactivity-timeout** *timeout-minutes*

## DETAILED STEPS

|        | Command or Action                                                                                                                    | Purpose                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                | Enters the global configuration mode.                                                                                            |
| Step 2 | <b>line console 0</b><br><br><b>Example:</b><br>Switch(config)# <b>line console 0</b>                                                | Configures the console and enters line configuration mode.                                                                       |
| Step 3 | <b>usb-inactivity-timeout <i>timeout-minutes</i></b><br><br><b>Example:</b><br>Switch(config-line)# <b>usb-inactivity-timeout 30</b> | Specify an inactivity timeout for the console port. The range is 1 to 240 minutes. The default is to have no timeout configured. |

## Monitoring Interface Characteristics

### Monitoring Interface Status

Commands entered at the privileged EXEC prompt display information about the interface, including the versions of the software and the hardware, the configuration, and statistics about the interfaces.

This table lists some of the available interface monitoring commands.

**Table 12: Show Commands for Interfaces**

| Command                                                                          | Purpose                                                                                                                                                            |
|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show interfaces</b> [ <i>interface-id</i> ]                                   | Displays the status and configuration of all interfaces or a specific interface.                                                                                   |
| <b>show interfaces</b> <i>interface-id</i> <b>status</b> [ <b>err-disabled</b> ] | Displays interface status or a list of interfaces in the error-disabled state.                                                                                     |
| <b>show interfaces</b> [ <i>interface-id</i> ] <b>switchport</b>                 | Displays administrative and operational status of switching (nonrouting) ports. You can use this command to find out if a port is in routing or in switching mode. |

| Command                                                                                                                 | Purpose                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>show interfaces</b> [ <i>interface-id</i> ] <b>description</b>                                                       | Displays the description configured on an interface or all interfaces and the interface status.                           |
| <b>show ip interface</b> [ <i>interface-id</i> ]                                                                        | Displays the usability status of all interfaces configured for IP routing or the specified interface.                     |
| <b>show interface</b> [ <i>interface-id</i> ] <b>stats</b>                                                              | Displays the input and output packets by the switching path for the interface.                                            |
| <b>show interfaces</b> <i>interface-id</i>                                                                              | (Optional) Displays speed and duplex on the interface.                                                                    |
| <b>show interfaces transceiver dom-supported-list</b>                                                                   | (Optional) Displays Digital Optical Monitoring (DOM) status on the connect SFP modules.                                   |
| <b>show interfaces transceiver properties</b>                                                                           | (Optional) Displays temperature, voltage, or amount of current on the interface.                                          |
| <b>show interfaces</b> [ <i>interface-id</i> ] [{ <b>transceiver properties</b>   <b>detail</b> }] <i>module number</i> | Displays physical and operational status about an SFP module.                                                             |
| <b>show running-config interface</b> [ <i>interface-id</i> ]                                                            | Displays the running configuration in RAM for the interface.                                                              |
| <b>show version</b>                                                                                                     | Displays the hardware configuration, software version, the names and sources of configuration files, and the boot images. |
| <b>show controllers ethernet-controller</b> <i>interface-id</i> <b>phy</b>                                              | Displays the operational state of the auto-MDIX feature on the interface.                                                 |

## Clearing and Resetting Interfaces and Counters

*Table 13: Clear Commands for Interfaces*

| Command                                                                    | Purpose                                                   |
|----------------------------------------------------------------------------|-----------------------------------------------------------|
| <b>clear counters</b> [ <i>interface-id</i> ]                              | Clears interface counters.                                |
| <b>clear interface</b> <i>interface-id</i>                                 | Resets the hardware logic on an interface.                |
| <b>clear line</b> [ <i>number</i>   <b>console 0</b>   <b>vty number</b> ] | Resets the hardware logic on an asynchronous serial line. |

**Note**

The **clear counters** privileged EXEC command does not clear counters retrieved by using Simple Network Management Protocol (SNMP), but only those seen with the **show interface** privileged EXEC command.

## Configuration Examples for Interface Characteristics

### Adding a Description to an Interface: Example

```
Switch# configure terminal
Enter configuration commands, one per line. End with CTRL/Z.
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# description Connects to Marketing
Switch(config-if)# end
Switch# show interfaces gigabitethernet1/0/2 description
Interface Status          Protocol Description
Gi1/0/2    admin down      down      Connects to Marketing
```

### Identifying Interfaces on a Stack-Capable Switch: Examples

To configure 10/100/1000 port 4 on a standalone switch, enter this command:

```
Switch(config)# interface gigabitethernet1/0/4
```

### Configuring a Range of Interfaces: Examples

This example shows how to use the **interface range** global configuration command to set the speed to 100 Mb/s on ports 1 to 4 on switch 1:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet1/0/1 - 4
Switch(config-if-range)# speed 100
```

This example shows how to use a comma to add different interface type strings to the range to enable Gigabit Ethernet ports 1 to 3 and 10-Gigabit Ethernet ports 1 and 2 to receive flow-control pause frames:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet1/0/1 - 3 , tengigabitethernet1/0/1 - 2
Switch(config-if-range)# flowcontrol receive on
```

If you enter multiple configuration commands while you are in interface-range mode, each command is executed as it is entered. The commands are not batched and executed after you exit interface-range mode. If you exit interface-range configuration mode while the commands are being executed, some commands might not be executed on all interfaces in the range. Wait until the command prompt reappears before exiting interface-range configuration mode.

## Configuring and Using Interface Range Macros: Examples

This example shows how to define an interface-range named *enet\_list* to include ports 1 and 2 on switch 1 and to verify the macro configuration:

```
Switch# configure terminal
Switch(config)# define interface-range enet_list gigabitethernet1/0/1 - 2
Switch(config)# end
Switch# show running-config | include define
define interface-range enet_list GigabitEthernet1/0/1 - 2
This example shows how to create a multiple-interface macro named macro1:
```

```
Switch# configure terminal
Switch(config)# define interface-range macro1 gigabitethernet1/0/1 - 2, gigabitethernet1/0/5
- 7, tengigabitethernet1/0/1 -2
Switch(config)# end
```

This example shows how to enter interface-range configuration mode for the interface-range macro *enet\_list*:

```
Switch# configure terminal
Switch(config)# interface range macro enet_list
Switch(config-if-range)#
```

This example shows how to delete the interface-range macro *enet\_list* and to verify that it was deleted.

```
Switch# configure terminal
Switch(config)# no define interface-range enet_list
Switch(config)# end
Switch# show run | include define
Switch#
```

## Setting Interface Speed and Duplex Mode: Example

This example shows how to set the interface speed to 100 Mb/s and the duplex mode to half on a 10/100/1000 Mb/s port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# speed 10
Switch(config-if)# duplex half
```

This example shows how to set the interface speed to 100 Mb/s on a 10/100/1000 Mb/s port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# speed 100
```

## Configuring Layer 3 Interfaces: Example

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# no switchport
Switch(config-if)# ip address 192.20.135.21 255.255.255.0
Switch(config-if)# no shutdown
```

## Configuring the Console Media Type: Example

This example disables the USB console media type and enables the RJ-45 console media type.

```
Switch# configure terminal
Switch(config)# line console 0
Switch(config-line)# media-type rj45
```

This configuration terminates any active USB console media type in the stack. A log shows that this termination has occurred. This example shows that the console on switch 1 reverted to RJ-45.

```
*Mar 1 00:25:36.860: %USB_CONSOLE-6-CONFIG_DISABLE: Console media-type USB disabled by
system configuration, media-type reverted to RJ45.
```

At this point no switches in the stack allow a USB console to have input. A log entry shows when a console cable is attached. If a USB console cable is connected to switch 2, it is prevented from providing input.

```
*Mar 1 00:34:27.498: %USB_CONSOLE-6-CONFIG_DISALLOW: Console media-type USB is disallowed
by system configuration, media-type remains RJ45. (switch-stk-2)
```

This example reverses the previous configuration and immediately activates any USB console that is connected.

```
Switch# configure terminal
Switch(config)# line console 0
Switch(config-line)# no media-type rj45
```

## Configuring the USB Inactivity Timeout: Example

This example configures the inactivity timeout to 30 minutes:

```
Switch# configure terminal
Switch(config)# line console 0
Switch(config-line)# usb-inactivity-timeout 30
```

To disable the configuration, use these commands:

```
Switch# configure terminal
Switch(config)# line console 0
Switch(config-line)# no usb-inactivity-timeout
```

If there is no (input) activity on a USB console port for the configured number of minutes, the inactivity timeout setting applies to the RJ-45 port, and a log shows this occurrence:

```
*Mar 1 00:47:25.625: %USB_CONSOLE-6-INACTIVITY_DISABLE: Console media-type USB disabled
due to inactivity, media-type reverted to RJ45.
```

At this point, the only way to reactivate the USB console port is to disconnect and reconnect the cable.

When the USB cable on the switch has been disconnected and reconnected, a log similar to this appears:

```
*Mar 1 00:48:28.640: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.
```

## Additional References for the Interface Characteristics Feature

### Error Message Decoder

## Configuring Auto-MDIX

- [Prerequisites for Auto-MDIX, page 121](#)
- [Restrictions for Auto-MDIX, page 121](#)
- [Information about Configuring Auto-MDIX, page 122](#)
- [How to Configure Auto-MDIX, page 122](#)
- [Monitoring Auto-MDIX, page 123](#)
- [Example for Configuring Auto-MDIX, page 124](#)
- [Additional References, page 124](#)
- [Feature History and Information for Auto-MDIX, page 125](#)

### Prerequisites for Auto-MDIX

To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the **switchport** interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

Automatic medium-dependent interface crossover (auto-MDIX) is enabled by default. When you enable auto-MDIX, you must also set the interface speed and duplex to **auto** so that the feature operates correctly.

Auto-MDIX is supported on all 10/100/1000-Mb/s and on 10/100/1000BASE-TX small form-factor pluggable (SFP)-module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.

### Restrictions for Auto-MDIX

The switch might not support a pre-standard powered device—such as Cisco IP phones and access points that do not fully support IEEE 802.3af—if that powered device is connected to the switch through a crossover cable. This is regardless of whether auto-MIDX is enabled on the switch port.

## Information about Configuring Auto-MDIX

### Auto-MDIX on an Interface

When automatic medium-dependent interface crossover (auto-MDIX) is enabled on an interface, the interface automatically detects the required cable connection type (straight through or crossover) and configures the connection appropriately. When connecting switches without the auto-MDIX feature, you must use straight-through cables to connect to devices such as servers, workstations, or routers and crossover cables to connect to other switches or repeaters. With auto-MDIX enabled, you can use either type of cable to connect to other devices, and the interface automatically corrects for any incorrect cabling. For more information about cabling requirements, see the hardware installation guide.

This table shows the link states that result from auto-MDIX settings and correct and incorrect cabling.

**Table 14: Link Conditions and Auto-MDIX Settings**

| Local Side Auto-MDIX | Remote Side Auto-MDIX | With Correct Cabling | With Incorrect Cabling |
|----------------------|-----------------------|----------------------|------------------------|
| On                   | On                    | Link up              | Link up                |
| On                   | Off                   | Link up              | Link up                |
| Off                  | On                    | Link up              | Link up                |
| Off                  | Off                   | Link up              | Link down              |

## How to Configure Auto-MDIX

### Configuring Auto-MDIX on an Interface

#### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **speed auto**
4. **duplex auto**
5. **mdix auto**
6. **end**

## DETAILED STEPS

|               | Command or Action                                                                                                    | Purpose                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                | Enters global configuration mode                                                           |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet1/0/1</b> | Specifies the physical interface to be configured, and enter interface configuration mode. |
| <b>Step 3</b> | <b>speed auto</b><br><br><b>Example:</b><br>Switch(config-if)# <b>speed auto</b>                                     | Configures the interface to autonegotiate speed with the connected device.                 |
| <b>Step 4</b> | <b>duplex auto</b><br><br><b>Example:</b><br>Switch(config-if)# <b>duplex auto</b>                                   | Configures the interface to autonegotiate duplex mode with the connected device.           |
| <b>Step 5</b> | <b>mdix auto</b><br><br><b>Example:</b><br>Switch(config-if)# <b>mdix auto</b>                                       | Enables auto-MDIX on the interface.                                                        |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                   | Returns to privileged EXEC mode.                                                           |

## Monitoring Auto-MDIX

| Command | Purpose |
|---------|---------|
|---------|---------|

|                                                                           |                                                                           |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <code>show controllers ethernet-controller <i>interface-id</i> phy</code> | Verifies the operational state of the auto-MDIX feature on the interface. |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------|

## Example for Configuring Auto-MDIX

This example shows how to enable auto-MDIX on a port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# speed auto
Switch(config-if)# duplex auto
Switch(config-if)# mdix auto
Switch(config-if)# end
```

## Configuring Ethernet Management Port

- [Finding Feature Information, page 127](#)
- [Prerequisites for Ethernet Management Ports, page 127](#)
- [Information about the Ethernet Management Port, page 127](#)
- [How to Configure the Ethernet Management Port, page 130](#)
- [Additional References, page 131](#)
- [Feature Information for Ethernet Management Ports, page 132](#)

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Prerequisites for Ethernet Management Ports

When connecting a PC to the Ethernet management port, you must first assign an IP address.

### Information about the Ethernet Management Port

The Ethernet management port, also referred to as the *Gi0/0* or *GigabitEthernet0/0* port, is a VRF (VPN routing/forwarding) interface to which you can connect a PC. You can use the Ethernet management port instead of the switch console port for network management. When managing a switch stack, connect the PC to the Ethernet management port on a stack member.

## Ethernet Management Port Direct Connection to a Switch

This figure displays how to connect the Ethernet management port to the PC for a switch or a standalone switch.

**Figure 3: Connecting a Switch to a PC**

## Ethernet Management Port Connection to Stack Switches using a Hub

In a stack with only stack switches, all the Ethernet management ports on the stack members are connected to a hub to which the PC is connected. The active link is from the Ethernet management port on the active switch through the hub, to the PC. If the active switch fails and a new active switch is elected, the active link is now from the Ethernet management port on the new active switch to the PC.

This figure displays how a PC uses a hub to connect to a switch stack.

**Figure 4: Connecting a Switch Stack to a PC**

## Ethernet Management Port and Routing

By default, the Ethernet management port is enabled. The switch cannot route packets from the Ethernet management port to a network port, and the reverse. Even though the Ethernet management port does not support routing, you may need to enable routing protocols on the port.

In the following figure, you must enable routing protocols on the Ethernet management port when the PC is multiple hops away from the switch and the packets must pass through multiple Layer 3 devices to reach the PC.

**Figure 5: Network Example with Routing Protocols Enabled**

In the above figure, if the Ethernet management port and the network ports are associated with the same routing process, the routes are propagated as follows:

- The routes from the Ethernet management port are propagated through the network ports to the network.
- The routes from the network ports are propagated through the Ethernet management port to the network.

Because routing is not supported between the Ethernet management port and the network ports, traffic between these ports cannot be sent or received. If this happens, data packet loops occur between the ports, which disrupt the switch and network operation. To prevent the loops, configure route filters to avoid routes between the Ethernet management port and the network ports.

## Supported Features on the Ethernet Management Port

The Ethernet management port supports these features:

- Express Setup (only in switch stacks)
- Network Assistant
- Telnet with passwords
- TFTP
- Secure Shell (SSH)
- DHCP-based autoconfiguration
- SMNP (only the ENTITY-MIB and the IF-MIB)
- IP ping
- Interface features
  - Speed—10 Mb/s, 100 Mb/s, and autonegotiation
  - Duplex mode—Full, half, and autonegotiation
  - Loopback detection

- Cisco Discovery Protocol (CDP)
- DHCP relay agent
- IPv4 and IPv6 access control lists (ACLs)
- Routing protocols

**Caution**

Before enabling a feature on the Ethernet management port, make sure that the feature is supported. If you try to configure an unsupported feature on the Ethernet Management port, the feature might not work properly, and the switch might fail.

## How to Configure the Ethernet Management Port

### Disabling and Enabling the Ethernet Management Port

To disable or enable the Ethernet management port in the CLI, follow this procedure.

#### SUMMARY STEPS

1. **configure terminal**
2. **interface gigabitethernet0/0**
3. **shutdown**
4. **no shutdown**
5. **exit**
6. **show interfaces gigabitethernet0/0**

#### DETAILED STEPS

|               | Command or Action                                                                                                       | Purpose                                            |

| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <code>configure terminal</code>                             | Enters global configuration mode.                  |
| <b>Step 2</b> | <b>interface gigabitethernet0/0</b><br><br><b>Example:</b><br>Switch(config)# <code>interface gigabitethernet0/0</code> | Specifies the Ethernet management port in the CLI. |
| <b>Step 3</b> | <b>shutdown</b><br><br><b>Example:</b><br>Switch(config-if)# <code>shutdown</code>                                      | Disables the Ethernet management port.             |

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>no shutdown</b><br><br><b>Example:</b><br>Switch(config-if)# <b>no shutdown</b>                                    | Enables the Ethernet management port.                                                                                                                                                                                                                                     |
| <b>Step 5</b> | <b>exit</b><br><br><b>Example:</b><br>Switch(config-if)# <b>exit</b>                                                  | Exits interface configuration mode.                                                                                                                                                                                                                                       |
| <b>Step 6</b> | <b>show interfaces gigabitethernet0/0</b><br><br><b>Example:</b><br>Switch# <b>show interfaces gigabitethernet0/0</b> | Displays the link status.<br><br>To find out the link status to the PC, you can monitor the LED for the Ethernet management port. The LED is green (on) when the link is active, and the LED is off when the link is down. The LED is amber when there is a POST failure. |

### What to Do Next

Proceed to manage or configure your switch using the Ethernet management port. Refer to the *Network Management Configuration Guide (Catalyst 3650 Switches)*.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## LLDP, LLDP-MED, and Wired Location Service Overview

### LLDP

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, and switches). CDP allows network management applications to automatically discover and learn about other Cisco devices connected to the network.

To support non-Cisco devices and to allow for interoperability between other devices, the switch supports the IEEE 802.1AB Link Layer Discovery Protocol (LLDP). LLDP is a neighbor discovery protocol that is used

for network devices to advertise information about themselves to other devices on the network. This protocol runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

### LLDP Supported TLVs

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors. This protocol can advertise details such as configuration information, device capabilities, and device identity.

The switch supports these basic management TLVs. These are mandatory LLDP TLVs.

- Port description TLV
- System name TLV
- System description TLV
- System capabilities TLV
- Management address TLV

These organizationally specific LLDP TLVs are also advertised to support LLDP-MED.

- Port VLAN ID TLV (IEEE 802.1 organizationally specific TLVs)
- MAC/PHY configuration/status TLV (IEEE 802.3 organizationally specific TLVs)

### LLDP and Cisco Switch Stacks

A switch stack appears as a single switch in the network. Therefore, LLDP discovers the switch stack, not the individual stack members.

### LLDP and Cisco Medianet

When you configure LLDP or CDP location information on a per-port basis, remote devices can send Cisco Medianet location information to the switch. For information, go to [http://www.cisco.com/en/US/docs/ios/netmgmt/configuration/guide/nm\\_cdp\\_discover.html](http://www.cisco.com/en/US/docs/ios/netmgmt/configuration/guide/nm_cdp_discover.html).

## LLDP-MED

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices such as IP phones and network devices such as switches. It specifically provides support for voice over IP (VoIP) applications and provides additional TLVs for capabilities discovery, network policy, Power over Ethernet, inventory management and location information. By default, all LLDP-MED TLVs are enabled.

### LLDP-MED Supported TLVs

LLDP-MED supports these TLVs:

- LLDP-MED capabilities TLV

Allows LLDP-MED endpoints to determine the capabilities that the connected device supports and has enabled.

- Network policy TLV

Allows both network connectivity devices and endpoints to advertise VLAN configurations and associated Layer 2 and Layer 3 attributes for the specific application on that port. For example, the switch can notify a phone of the VLAN number that it should use. The phone can connect to any switch, obtain its VLAN number, and then start communicating with the call control.

By defining a network-policy profile TLV, you can create a profile for voice and voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode. These profile attributes are then maintained centrally on the switch and propagated to the phone.

- Power management TLV

Enables advanced power management between LLDP-MED endpoint and network connectivity devices. Allows switches and phones to convey power information, such as how the device is powered, power priority, and how much power the device needs.

LLDP-MED also supports an extended power TLV to advertise fine-grained power requirements, end-point power priority, and end-point and network connectivity-device power status. LLDP is enabled and power is applied to a port, the power TLV determines the actual power requirement of the endpoint device so that the system power budget can be adjusted accordingly. The switch processes the requests and either grants or denies power based on the current power budget. If the request is granted, the switch updates the power budget. If the request is denied, the switch turns off power to the port, generates a syslog message, and updates the power budget. If LLDP-MED is disabled or if the endpoint does not support the LLDP-MED power TLV, the initial allocation value is used throughout the duration of the connection.

You can change power settings by entering the **power inline** {**auto** [**max max-wattage**] | **never** | **static** [**max max-wattage**]} interface configuration command. By default the PoE interface is in **auto** mode; If no value is specified, the maximum is allowed (30 W).

- Inventory management TLV

Allows an endpoint to send detailed inventory information about itself to the switch, including information hardware revision, firmware version, software version, serial number, manufacturer name, model name, and asset ID TLV.

- Location TLV

Provides location information from the switch to the endpoint device. The location TLV can send this information:

- Civic location information

Provides the civic address information and postal information. Examples of civic location information are street address, road name, and postal community name information.

- ELIN location information

Provides the location information of a caller. The location is determined by the Emergency location identifier number (ELIN), which is a phone number that routes an emergency call to the local public safety answering point (PSAP) and which the PSAP can use to call back the emergency caller.

- Geographic location information

Provides the geographical details of a switch location such as latitude, longitude, and altitude of a switch.

- custom location

Provides customized name and value of a switch location.

## Wired Location Service

The switch uses the location service feature to send location and attachment tracking information for its connected devices to a Cisco Mobility Services Engine (MSE). The tracked device can be a wireless endpoint, a wired endpoint, or a wired switch or controller. The switch notifies the MSE of device link up and link down events through the Network Mobility Services Protocol (NMSP) location and attachment notifications.

The MSE starts the NMSP connection to the switch, which opens a server port. When the MSE connects to the switch there are a set of message exchanges to establish version compatibility and service exchange information followed by location information synchronization. After connection, the switch periodically sends location and attachment notifications to the MSE. Any link up or link down events detected during an interval are aggregated and sent at the end of the interval.

When the switch determines the presence or absence of a device on a link-up or link-down event, it obtains the client-specific information such as the MAC address, IP address, and username. If the client is LLDP-MED- or CDP-capable, the switch obtains the serial number and UDI through the LLDP-MED location TLV or CDP.

Depending on the device capabilities, the switch obtains this client information at link up:

- Slot and port specified in port connection
- MAC address specified in the client MAC address
- IP address specified in port connection
- 802.1X username if applicable
- Device category is specified as a *wired station*
- State is specified as *new*
- Serial number, UDI
- Model number
- Time in seconds since the switch detected the association

Depending on the device capabilities, the switch obtains this client information at link down:

- Slot and port that was disconnected
- MAC address
- IP address
- 802.1X username if applicable
- Device category is specified as a *wired station*
- State is specified as *delete*
- Serial number, UDI

- Time in seconds since the switch detected the disassociation

When the switch shuts down, it sends an attachment notification with the state *delete* and the IP address before closing the NMSP connection to the MSE. The MSE interprets this notification as disassociation for all the wired clients associated with the switch.

If you change a location address on the switch, the switch sends an NMSP location notification message that identifies the affected ports and the changed address information.

## Default LLDP Configuration

**Table 15: Default LLDP Configuration**

| Feature                              | Default Setting                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| LLDP global state                    | Disabled                                                                                         |
| LLDP holdtime (before discarding)    | 120 seconds                                                                                      |
| LLDP timer (packet update frequency) | 30 seconds                                                                                       |
| LLDP reinitialization delay          | 2 seconds                                                                                        |
| LLDP tlv-select                      | Disabled to send and receive all TLVs                                                            |
| LLDP interface state                 | Disabled                                                                                         |
| LLDP receive                         | Disabled                                                                                         |
| LLDP transmit                        | Disabled                                                                                         |
| LLDP med-tlv-select                  | Disabled to send all LLDP-MED TLVs. When LLDP is globally enabled, LLDP-MED-TLV is also enabled. |

## Configuration Guidelines

- If the interface is configured as a tunnel port, LLDP is automatically disabled.
- If you first configure a network-policy profile on an interface, you cannot apply the **switchport voice vlan** command on the interface. If the **switchport voice vlan *vlan-id*** is already configured on an interface, you can apply a network-policy profile on the interface. This way the interface has the voice or voice-signaling VLAN network-policy profile applied on the interface.
- You cannot configure static secure MAC addresses on an interface that has a network-policy profile.
- For wired location to function, you must first enter the **ip device tracking** global configuration command.

# How to Configure LLDP, LLDP-MED, and Wired Location Service

## Enabling LLDP

Beginning in privileged EXEC mode, follow these steps to enable LLDP:

### SUMMARY STEPS

1. **configure terminal**
2. **lldp run**
3. **interface *interface-id***
4. **lldp transmit**
5. **lldp receive**
6. **end**
7. **show lldp**
8. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                               | Purpose                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                           | Enters global configuration mode.                                                               |
| <b>Step 2</b> | <b>lldp run</b><br><br><b>Example:</b><br>Switch (config)# <b>lldp run</b>                                                      | Enables LLDP globally on the switch.                                                            |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch (config)# <b>interface</b><br><b>gigabitethernet2/0/1</b> | Specifies the interface on which you are enabling LLDP, and enter interface configuration mode. |
| <b>Step 4</b> | <b>lldp transmit</b><br><br><b>Example:</b><br>Switch(config-if)# <b>lldp transmit</b>                                          | Enables the interface to send LLDP packets.                                                     |

|               | Command or Action                                                                                                     | Purpose                                                  |
|---------------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 5</b> | <b>lldp receive</b><br><br><b>Example:</b><br>Switch(config-if)# <b>lldp receive</b>                                  | Enables the interface to receive LLDP packets.           |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                    | Returns to privileged EXEC mode.                         |
| <b>Step 7</b> | <b>show lldp</b><br><br><b>Example:</b><br>Switch# <b>show lldp</b>                                                   | Verifies the configuration.                              |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring LLDP Characteristics

You can configure the frequency of LLDP updates, the amount of time to hold the information before discarding it, and the initialization delay time. You can also select the LLDP and LLDP-MED TLVs to send and receive.

Beginning in privileged EXEC mode, follow these steps to configure the LLDP characteristics.

### Note

Steps 2 through 5 are optional and can be performed in any order.

**SUMMARY STEPS**

1. **configure terminal**
2. **lldp holdtime** *seconds*
3. **lldp reinit** *delay*

9. **show lldp**
10. **copy running-config startup-config**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                               | <b>Purpose</b>                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                  | Enters global configuration mode.                                                                                                                                                                 |
| <b>Step 2</b> | <b>lldp holdtime</b> <i>seconds</i><br><br><b>Example:</b><br>Switch(config)# <b>lldp holdtime 120</b> | (Optional) Specifies the amount of time a receiving device should hold the information from your device before discarding it.<br><br>The range is 0 to 65535 seconds; the default is 120 seconds. |
| <b>Step 3</b> | <b>lldp reinit</b> <i>delay</i><br><br><b>Example:</b><br>Switch(config)# <b>lldp reinit 2</b>         | (Optional) Specifies the delay time in seconds for LLDP to initialize on an interface.<br><br>The range is 2 to 5 seconds; the default is 2 seconds.                                              |
| <b>Step 4</b> | <b>lldp timer</b> <i>rate</i><br><br><b>Example:</b><br>Switch(config)# <b>lldp timer 30</b>           | (Optional) Sets the sending frequency of LLDP updates in seconds.<br><br>The range is 5 to 65534 seconds; the default is 30 seconds.                                                              |
| <b>Step 5</b> | <b>lldp tlv-select</b><br><br><b>Example:</b><br>Switch(config)# <b>tlv-select</b>                     | (Optional) Specifies the LLDP TLVs to send or receive.                                                                                                                                            |

|         | Command or Action                                                                                                            | Purpose                                                                                         |
|---------|------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Step 6  | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br><pre>Switch (config)# interface gigabitethernet2/0/1</pre>    | Specifies the interface on which you are enabling LLDP, and enter interface configuration mode. |
| Step 7  | <b>lldp med-tlv-select</b><br><br><b>Example:</b><br><pre>Switch (config-if)# lldp med-tlv-select inventory management</pre> | (Optional) Specifies the LLDP-MED TLVs to send or receive.                                      |
| Step 8  | <b>end</b><br><br><b>Example:</b><br><pre>Switch (config-if)# end</pre>                                                      | Returns to privileged EXEC mode.                                                                |
| Step 9  | <b>show lldp</b><br><br><b>Example:</b><br><pre>Switch# show lldp</pre>                                                      | Verifies the configuration.                                                                     |
| Step 10 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><pre>Switch# copy running-config startup-config</pre>    | (Optional) Saves your entries in the configuration file.                                        |

## Configuring LLDP-MED TLVs

By default, the switch only sends LLDP packets until it receives LLDP-MED packets from the end device. It then sends LLDP packets with MED TLVs, as well. When the LLDP-MED entry has been aged out, it again only sends LLDP packets.

By using the **lldp** interface configuration command, you can configure the interface not to send the TLVs listed in the following table.

**Table 16: LLDP-MED TLVs**

| LLDP-MED TLV         | Description                       |
|----------------------|-----------------------------------|
| inventory-management | LLDP-MED inventory management TLV |

| LLDP-MED TLV     | Description                   |
|------------------|-------------------------------|
| location         | LLDP-MED location TLV         |
| network-policy   | LLDP-MED network policy TLV   |
| power-management | LLDP-MED power management TLV |

Beginning in privileged EXEC mode, follow these steps to enable a TLV on an interface:

## SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **lldp med-tlv-select**
4. **end**
5. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                 | Purpose                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                             | Enters global configuration mode.                                                                             |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>interface</b><br><b>gigabitethernet2/0/1</b>    | Specifies the interface on which you are configuring an LLDP-MED TLV, and enter interface configuration mode. |
| <b>Step 3</b> | <b>lldp med-tlv-select</b><br><br><b>Example:</b><br>Switch(config-if)# <b>lldp med-tlv-select</b><br><b>inventory management</b> | Specifies the TLV to enable.                                                                                  |
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                                | Returns to privileged EXEC mode.                                                                              |

|        | Command or Action                                                                                                         | Purpose                                                  |
|--------|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 5 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br>Switch# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring Network-Policy TLV

Beginning in privileged EXEC mode, follow these steps to create a network-policy profile, configure the policy attributes, and apply it to an interface.

### SUMMARY STEPS

1. **configure terminal**
2. **network-policy profile** *profile number*
3. **{voice | voice-signaling} vlan** [*vlan-id* **{cos cvalue | dscp dvalue}**] | **[[dot1p {cos cvalue | dscp dvalue} | none | untagged]**
4. **exit**
5. **interface** *interface-id*
6. **network-policy** *profile number*
7. **lldp med-tlv-select network-policy**
8. **end**
9. **show network-policy profile**
10. **copy running-config startup-config**

### DETAILED STEPS

|        | Command or Action                                                                                                                 | Purpose                                                                                                                 |
|--------|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br><br>Switch# <b>configure terminal</b>                                         | Enters global configuration mode.                                                                                       |
| Step 2 | <b>network-policy profile</b> <i>profile number</i><br><br><b>Example:</b><br><br>Switch(config)# <b>network-policy profile 1</b> | Specifies the network-policy profile number, and enter network-policy configuration mode. The range is 1 to 4294967295. |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <p>{<b>voice</b>   <b>voice-signaling</b>} <b>vlan</b> [<i>vlan-id</i> {<b>cos</b> <i>cvalue</i>   <b>dscp</b> <i>dvalue</i>}]   [[<b>dot1p</b> {<b>cos</b> <i>cvalue</i>   <b>dscp</b> <i>dvalue</i>}]   <b>none</b>   <b>untagged</b>]</p> <p><b>Example:</b></p> <pre>Switch(config-network-policy)# <b>voice vlan</b> 100 <b>cos</b> 4</pre> | <p>Configures the policy attributes:</p> <ul style="list-style-type: none"> <li>• <b>voice</b>—Specifies the voice application type.</li> <li>• <b>voice-signaling</b>—Specifies the voice-signaling application type.</li> <li>• <b>vlan</b>—Specifies the native VLAN for voice traffic.</li> <li>• <i>vlan-id</i>—(Optional) Specifies the VLAN for voice traffic. The range is 1 to 4094.</li> <li>• <b>cos</b> <i>cvalue</i>—(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.</li> <li>• <b>dscp</b> <i>dvalue</i>—(Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.</li> <li>• <b>dot1p</b>—(Optional) Configures the telephone to use IEEE 802.1p priority tagging and use VLAN 0 (the native VLAN).</li> <li>• <b>none</b>—(Optional) Do not instruct the IP telephone about the voice VLAN. The telephone uses the configuration from the telephone key pad.</li> <li>• <b>untagged</b>—(Optional) Configures the telephone to send untagged voice traffic. This is the default for the telephone.</li> <li>• <b>untagged</b>—(Optional) Configures the telephone to send untagged voice traffic. This is the default for the telephone.</li> </ul> |
| <b>Step 4</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config)# <b>exit</b></pre>                                                                                                                                                                                                                                                                 | <p>Returns to global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 5</b> | <p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Switch (config)# <b>interface</b> gigabitethernet2/0/1</pre>                                                                                                                                                                                                             | <p>Specifies the interface on which you are configuring a network-policy profile, and enter interface configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                | Command or Action                                                                                                                | Purpose                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 7</b>  | <b>lldp med-tlv-select network-policy</b><br><br><b>Example:</b><br>Switch(config-if)# <b>lldp med-tlv-select network-policy</b> | Specifies the network-policy TLV.                        |
| <b>Step 8</b>  | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                  | Returns to privileged EXEC mode.                         |
| <b>Step 9</b>  | <b>show network-policy profile</b><br><br><b>Example:</b><br>Switch# <b>show network-policy profile</b>                          | Verifies the configuration.                              |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b>            | (Optional) Saves your entries in the configuration file. |

## Configuring Location TLV and Wired Location Service

Beginning in privileged EXEC mode, follow these steps to configure location information for an endpoint and to apply it to an interface.

## SUMMARY STEPS

1. **configure terminal**
2. **location** {**admin-tag** *string* | **civic-location identifier** {*id* | **host**} | **elin-location** *string identifier id* | **custom-location identifier** {*id* | **host**} | **geo-location identifier** {*id* | **host**}}
3. **exit**
4. **interface** *interface-id*
5. **location** {**additional-location-information** *word* | **civic-location-id** {*id* | **host**} | **elin-location-id** *id* | **custom-location-id** {*id* | **host**} | **geo-location-id** {*id* | **host**} }
6. **end**
7. Use one of the following:
  - **show location admin-tag** *string*
  - **show location civic-location identifier** *id*
  - **show location elin-location identifier** *id*
8. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Step 5 | <p><b>location</b> {<b>additional-location-information</b> <i>word</i>   <b>civic-location-id</b> {<i>id</i>   <i>host</i>}   <b>elin-location-id</b> <i>id</i>   <b>custom-location-id</b> {<i>id</i>   <i>host</i>}   <b>geo-location-id</b> {<i>id</i>   <i>host</i>} }</p> <p><b>Example:</b></p> <pre>Switch(config-if)# <b>location</b> elin-location-id 1</pre> | <p>Enters location information for an interface:</p> <ul style="list-style-type: none"> <li>• <b>additional-location-information</b>—Specifies additional information for a location or place.</li> <li>• <b>civic-location-id</b>—Specifies global civic location information for an interface.</li> <li>• <b>elin-location-id</b>—Specifies emergency location information for an interface.</li> <li>• <b>custom-location-id</b>—Specifies custom location information for an interface.</li> <li>• <b>geo-location-id</b>—Specifies geo-spatial location information for an interface.</li> <li>• <b>host</b>—Specifies the host location identifier.</li> <li>• <i>word</i>—Specifies a word or phrase with additional location information.</li> <li>• <i>id</i>—Specifies the ID for the civic, ELIN, custom, or geo location. The ID range is 1 to 4095.</li> </ul> |
| Step 6 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# <b>end</b></pre>                                                                                                                                                                                                                                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 7 | <p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>show location admin-tag</b> <i>string</i></li> <li>• <b>show location civic-location identifier</b> <i>id</i></li> <li>• <b>show location elin-location identifier</b> <i>id</i></li> </ul>                                                                                               | Verifies the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|               | Command or Action                                                                                                                                                                                          | Purpose                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch# show location admin-tag</pre> <p>OR</p> <pre>Switch# show location civic-location identifier</pre> <p>OR</p> <pre>Switch# show location elin-location identifier</pre> |                                                          |
| <b>Step 8</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>                                                                              | (Optional) Saves your entries in the configuration file. |

### Enabling Wired Location Service on the Switch

Beginning in privileged EXEC mode, follow these steps to enable wired location service on the switch.

#### SUMMARY STEPS

1. **configure terminal**
2. **nmsp notification interval {attachment | location} interval-seconds**
3. **end**
4. **show network-policy profile**
5. **copy running-config startup-config**

#### DETAILED STEPS

|               | Command or Action                                                                             | Purpose                                   |
|---------------|-----------------------------------------------------------------------------------------------|-------------------------------------------|
| <b>Step 1</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre> | Enters global configuration mode.         |
| <b>Step 2</b> | <p><b>nmsp notification interval {attachment   location} interval-seconds</b></p>             | Specifies the NMSP notification interval. |

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Switch(config)# <b>nmsp notification interval location 10</b>                                      | <b>attachment</b> —Specifies the attachment notification interval.<br><b>location</b> —Specifies the location notification interval.<br><i>interval-seconds</i> —Duration in seconds before the switch sends the MSE the location or attachment updates. The range is 1 to 30; the default is 30. |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                  |
| <b>Step 4</b> | <b>show network-policy profile</b><br><br><b>Example:</b><br>Switch# <b>show network-policy profile</b>               | Verifies the configuration.                                                                                                                                                                                                                                                                       |
| <b>Step 5</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                          |

## Configuration Examples for LLDP, LLDP-MED, and Wired Location Service

### Configuring Network-Policy TLV: Examples

This example shows how to configure VLAN 100 for voice application with CoS and to enable the network-policy profile and network-policy TLV on an interface:

```
Switch# configure terminal
Switch(config)# network-policy 1
Switch(config-network-policy)# voice vlan 100 cos 4
Switch(config-network-policy)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# network-policy profile 1
Switch(config-if)# lldp med-tlv-select network-policy
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
Switchconfig-network-policy)# voice vlan dot1p cos 4
Switchconfig-network-policy)# voice vlan dot1p dscp 34
```

## Monitoring and Maintaining LLDP, LLDP-MED, and Wired Location Service

Commands for monitoring and maintaining LLDP, LLDP-MED, and wired location service.

| Command                                                              | Description                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clear lldp counters</b>                                           | Resets the traffic counters to zero.                                                                                                                                                                                                                         |
| <b>clear lldp table</b>                                              | Deletes the LLDP neighbor information table.                                                                                                                                                                                                                 |
| <b>clear nmosp statistics</b>                                        | Clears the NMSP statistic counters.                                                                                                                                                                                                                          |
| <b>show lldp</b>                                                     | Displays global information, such as frequency of transmissions, the holdtime for packets being sent, and the delay time before LLDP initializes on an interface.                                                                                            |
| <b>show lldp entry</b> <i>entry-name</i>                             | Displays information about a specific neighbor.<br>You can enter an asterisk (*) to display all neighbors, or you can enter the neighbor name.                                                                                                               |
| <b>show lldp interface</b> [ <i>interface-id</i> ]                   | Displays information about interfaces with LLDP enabled.<br>You can limit the display to a specific interface.                                                                                                                                               |
| <b>show lldp neighbors</b> [ <i>interface-id</i> ] [ <b>detail</b> ] | Displays information about neighbors, including device type, interface type and number, holdtime settings, capabilities, and port ID.<br>You can limit the display to neighbors of a specific interface or expand the display for more detailed information. |
| <b>show lldp traffic</b>                                             | Displays LLDP counters, including the number of packets sent and received, number of packets discarded, and number of unrecognized TLVs.                                                                                                                     |
| <b>show location admin-tag</b> <i>string</i>                         | Displays the location information for the specified administrative tag or site.                                                                                                                                                                              |
| <b>show location civic-location identifier</b> <i>id</i>             | Displays the location information for a specific global civic location.                                                                                                                                                                                      |
| <b>show location elin-location identifier</b> <i>id</i>              | Displays the location information for an emergency location                                                                                                                                                                                                  |

## Configuring System MTU

---

- [Finding Feature Information, page 153](#)
- [Information about the MTU, page 153](#)
- [How to Configure MTU Sizes, page 154](#)
- [Configuration Examples for System MTU, page 157](#)
- [Additional References for System MTU, page 157](#)
- [Feature Information for System MTU, page 158](#)

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Information about the MTU

The default maximum transmission unit (MTU) size for frames received and sent on all switch interfaces is 1500 bytes. You can change the MTU size to support switched jumbo frames on all Gigabit Ethernet and 10-Gigabit Ethernet interfaces and to support routed frames on all routed ports.

#### System MTU Values

The following MTU values can be configured:

- System MTU--This value applies to switched packets on the Gigabit Ethernet and 10-Gigabit Ethernet ports of the switch. Use the **system mtu bytes** global configuration command to specify the system jumbo MTU value.

- Protocol-specific MTU--This value applies only to routed packets on all routed ports of the switch or switch stack. Use the **ip mtu bytes** or **ipv6 mtu bytes** interface configuration command to specify the protocol-specific MTU value.

## System MTU Guidelines

When configuring the system MTU values, follow these guidelines:

- The switch does not support the MTU on a per-interface basis.
- If you enter the **system mtu bytes** global configuration command, the command does not take effect on the switch. This command only affects the system MTU size on Fast Ethernet switch ports.

## System MTU Value Application

This table shows how the MTU values are applied.

**Table 17: MTU Values**

| Configuration                     | system mtu command                                                                                                                                                      | ip mtu command                                                                                                                                                                                     | ipv6 mtu command                                                                                                                                                                                            |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Standalone switch or switch stack | <p>You can enter the <b>system mtu</b> command on a switch or switch stack, but system MTU value does not take effect.</p> <p>The range is from 1500 to 9198 bytes.</p> | <p>Use the <b>ip mtu bytes</b> command.</p> <p>The range is from 68 up to the system MTU value (in bytes).</p> <p><b>Note</b> The IP MTU value is the applied value, not the configured value.</p> | <p>Use the <b>ipv6 mtu bytes</b> command.</p> <p>The range is from 1280 to the system jumbo MTU value (in bytes).</p> <p><b>Note</b> The IPv6 MTU value is the applied value, not the configured value.</p> |

The upper limit of the IP or IPv6 MTU value is based on the switch or switch stack configuration and refers to the currently applied system MTU value. For more information about setting the MTU sizes, see the **system mtu** global configuration command in the command reference for this release.

# How to Configure MTU Sizes

## Configuring the System MTU

Beginning in privileged EXEC mode, follow these steps to change the MTU size for switched packets:

## SUMMARY STEPS

1. **configure terminal**
2. **system mtu *bytes***
3. **end**
4. **copy running-config startup-config**
5. **reload**
6. **show system mtu**

## DETAILED STEPS

|               | Command or Action                                                                                                     | Purpose                                                                                                                        |
|---------------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                 | Enters global configuration mode.                                                                                              |
| <b>Step 2</b> | <b>system mtu <i>bytes</i></b><br><br><b>Example:</b><br>Switch(config)# <b>system mtu 7500</b>                       | (Optional) Changes the MTU size for all Gigabit Ethernet and 10-Gigabit Ethernet interfaces on the switch or the switch stack. |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                                                               |
| <b>Step 4</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | Saves your entries in the configuration file.                                                                                  |
| <b>Step 5</b> | <b>reload</b><br><br><b>Example:</b><br>Switch# <b>reload</b>                                                         | Reloads the operating system.                                                                                                  |
| <b>Step 6</b> | <b>show system mtu</b><br><br><b>Example:</b><br>Switch# <b>show system mtu</b>                                       | Verifies your settings.                                                                                                        |

## Configuring Protocol-Specific MTU

Beginning in privileged EXEC mode, follow these steps to change the MTU size for routed ports:

## SUMMARY STEPS

1. **configure terminal**
2. **interface *interface***
3. **ip mtu *bytes***
4. **ipv6 mtu *bytes***
5. **end**
6. **copy running-config startup-config**
7. **reload**
8. **show system mtu**

## DETAILED STEPS

|        | Command or Action                                                                                                     | Purpose                                       |
|--------|-----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                 | Enters global configuration mode.             |
| Step 2 | <b>interface <i>interface</i></b><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet0/0</b>       | Enters interface configuration mode.          |
| Step 3 | <b>ip mtu <i>bytes</i></b><br><br><b>Example:</b><br>Switch(config-if)# <b>ip mtu 68</b>                              | (Optional) Changes the IPv4 MTU size          |
| Step 4 | <b>ipv6 mtu <i>bytes</i></b><br><br><b>Example:</b><br>Switch(config-if)# <b>ipv6 mtu 1280</b>                        | (Optional) Changes the IPv6 MTU size.         |
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                    | Returns to privileged EXEC mode.              |
| Step 6 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | Saves your entries in the configuration file. |
| Step 7 | <b>reload</b><br><br><b>Example:</b><br>Switch# <b>reload</b>                                                         | Reloads the operating system.                 |

|        | Command or Action                                                               | Purpose                 |
|--------|---------------------------------------------------------------------------------|-------------------------|
| Step 8 | <b>show system mtu</b><br><br><b>Example:</b><br>Switch# <b>show system mtu</b> | Verifies your settings. |

## Configuration Examples for System MTU

This example shows how to set the maximum packet size for a Gigabit Ethernet port to 7500 bytes:

```
Switch(config)# system mtu 7500
Switch(config)#
Switch(config)# exit
```

If you enter a value that is outside the allowed range for the specific type of interface, the value is not accepted. This example shows the response when you try to set Gigabit Ethernet interfaces to an out-of-range number:

```
Switch(config)# system mtu 25000
                          ^
% Invalid input detected at '^' marker.
```

This is an example of output from the **show system mtu** command:

```
Switch# show system mtu
Global Ethernet MTU is 1500 bytes.
```

### Information About Internal Power Supplies

See the switch installation guide for information about the power supplies.

### How to Configure Internal Power Supplies

#### Configuring an Internal Power Supply

You can use the **power supply** EXEC command to configure and manage the internal power supply on the switch. The switch does not support the **no power supply** EXEC command.

#### SUMMARY STEPS

1. **power supply** *switch\_number* slot{A | B} { off | on }
2. **show environment power**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Step 2 | <p><b>show environment power</b></p> <p><b>Example:</b></p> <pre>Switch# show environment power</pre>                                                                      | Verifies your settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Monitoring Internal Power Supplies

Table 18: Show Commands for Power Supplies

| Command                                                                           | Purpose                                                                                                                                                                                           |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show environment power</b> [ <b>all</b>   <b>switch</b> <i>switch_number</i> ] | (Optional) Displays the status of the internal power supplies for each switch in the stack or for the specified switch. The range is 1 to 9, depending on the switch member numbers in the stack. |

## Configuration Examples for Internal Power Supplies

This example shows how to set the power supply in slot A to off:

```
Switch# power supply 1 slot A off
Disabling Power supply A may result in a power loss to PoE devices and/or switches ...
Continue? (yes/[no]): yes
Switch#
Jun 10 04:52:54.389: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered off
Jun 10 04:52:56.717: %PLATFORM_ENV-1-FAN_NOT_PRESENT: Fan is not present
Switch#
```

This example shows how to set the power supply in slot A to on:

```
Switch# power supply 1 slot A on
Jun 10 04:54:39.600: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered on
```

This example shows the output of the **show env power** command:

```
Switch# show env power

SW  PID                Serial#      Status          Sys Pwr  PoE Pwr  Watts
---  -
1A  PWR-C2-640WAC       DCB1705B05B OK           Good      Good      640
1B  Not Present

Switch#
```

**Table 19: show env power Status Descriptions**

| Field          | Description                                                                            |
|----------------|----------------------------------------------------------------------------------------|
| OK             | The power supply is present and power is good.                                         |
| Not Present    | No power supply is installed.                                                          |
| No Input Power | The power supply is present but there is no input power.                               |
| Disabled       | The power supply and input power are present, but power supply is switched off by CLI. |
| Not Responding | The power supply is not recognizable or is faulty.                                     |
| Failure-Fan    | The power supply fan is faulty.                                                        |

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Information about PoE

#### Power over Ethernet Ports

A PoE-capable switch port automatically supplies power to one of these connected devices if the switch senses that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
- an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also sense the real-time power consumption of the device by monitoring and policing the power usage.

## Supported Protocols and Standards

The switch uses these protocols and standards to support PoE:

- CDP with power consumption—The powered device notifies the switch of the amount of power it is consuming. The switch does not reply to the power-consumption messages. The switch can only supply power to or remove power from the PoE port.
- Cisco intelligent power management—The powered device and the switch negotiate through power-negotiation CDP messages for an agreed-upon power-consumption level. The negotiation allows a high-power Cisco powered device, which consumes more than 7 W, to operate at its highest power mode. The powered device first boots up in low-power mode, consumes less than 7 W, and negotiates to obtain enough power to operate in high-power mode. The device changes to high-power mode only when it receives confirmation from the switch.

High-power devices can operate in low-power mode on switches that do not support power-negotiation CDP.

Cisco intelligent power management is backward-compatible with CDP with power consumption; the switch responds according to the CDP message that it receives. CDP is not supported on third-party powered devices; therefore, the switch uses the IEEE classification to determine the power usage of the device.

- IEEE 802.3af—The major features of this standard are powered-device discovery, power administration, disconnect detection, and optional powered-device power classification. For more information, see the standard.
- IEEE 802.3at—The PoE+ standard increases the maximum power that can be drawn by a powered device from 15.4 W per port to 30 W per port.

## Powered-Device Detection and Initial Power Allocation

The switch detects a Cisco pre-standard or an IEEE-compliant powered device when the PoE-capable port is in the no-shutdown state, PoE is enabled (the default), and the connected device is not being powered by an AC adaptor.

After device detection, the switch determines the device power requirements based on its type:

- A Cisco prestandard powered device does not provide its power requirement when the switch detects it, so the switch allocates 15.4 W as the initial allocation for power budgeting.

The initial power allocation is the maximum amount of power that a powered device requires. The switch initially allocates this amount of power when it detects and powers the powered device. As the switch receives CDP messages from the powered device and as the powered device negotiates power levels with the switch through CDP power-negotiation messages, the initial power allocation might be adjusted.

- The switch classifies the detected IEEE device within a power consumption class. Based on the available power in the power budget, the switch determines if a port can be powered. [Table 20: IEEE Power Classifications, on page 165](#) lists these levels.

**Table 20: IEEE Power Classifications**

| Class                    | Maximum Power Level Required from the Switch   |
|--------------------------|------------------------------------------------|
| 0 (class status unknown) | 15.4 W                                         |
| 1                        | 4 W                                            |
| 2                        | 7 W                                            |
| 3                        | 15.4 W                                         |
| 4                        | 30 W (For IEEE 802.3at Type 2 powered devices) |

The switch monitors and tracks requests for power and grants power only when it is available. The switch tracks its power budget (the amount of power available on the switch for PoE). The switch performs power-accounting calculations when a port is granted or denied power to keep the power budget up to date.

After power is applied to the port, the switch uses CDP to determine the *CDP-specific* power consumption requirement of the connected Cisco powered devices, which is the amount of power to allocate based on the CDP messages. The switch adjusts the power budget accordingly. This does not apply to third-party PoE devices. The switch processes a request and either grants or denies power. If the request is granted, the switch updates the power budget. If the request is denied, the switch ensures that power to the port is turned off, generates a syslog message, and updates the LEDs. Powered devices can also negotiate with the switch for more power.

With PoE+, powered devices use IEEE 802.3at and LLDP power with media dependent interface (MDI) type, length, and value descriptions (TLVs), Power-via-MDI TLVs, for negotiating power up to 30 W. Cisco pre-standard devices and Cisco IEEE powered devices can use CDP or the IEEE 802.3at power-via-MDI power negotiation mechanism to request power levels up to 30 W.

**Note**

The initial allocation for Class 0, Class 3, and Class 4 powered devices is 15.4 W. When a device starts up and uses CDP or LLDP to send a request for more than 15.4 W, it can be allocated up to the maximum of 30 W.

**Note**

The CDP-specific power consumption requirement is referred to as the *actual* power consumption requirement in the software configuration guides and command references.

If the switch detects a fault caused by an undervoltage, overvoltage, overtemperature, oscillator-fault, or short-circuit condition, it turns off power to the port, generates a syslog message, and updates the power budget and LEDs.

The PoE feature operates the same whether or not the switch is a stack member. The power budget is per-switch and independent of any other switch in the stack. Election of a new active switch does not affect PoE operation.

The active switch keeps track of the PoE status for all switches and ports in the stack and includes the status in output displays.

## Power Management Modes

The switch supports these PoE modes:

- **auto**—The switch automatically detects if the connected device requires power. If the switch discovers a powered device connected to the port and if the switch has enough power, it grants power, updates the power budget, turns on power to the port on a first-come, first-served basis, and updates the LEDs. For LED information, see the hardware installation guide.

If the switch has enough power for all the powered devices, they all come up. If enough power is available for all powered devices connected to the switch, power is turned on to all devices. If there is not enough available PoE, or if a device is disconnected and reconnected while other devices are waiting for power, it cannot be determined which devices are granted or are denied power.

If granting power would exceed the system power budget, the switch denies power, ensures that power to the port is turned off, generates a syslog message, and updates the LEDs. After power has been denied, the switch periodically rechecks the power budget and continues to attempt to grant the request for power.

If a device being powered by the switch is then connected to wall power, the switch might continue to power the device. The switch might continue to report that it is still powering the device whether the device is being powered by the switch or receiving power from an AC power source.

If a powered device is removed, the switch automatically detects the disconnect and removes power from the port. You can connect a nonpowered device without damaging it.

You can specify the maximum wattage that is allowed on the port. If the IEEE class maximum wattage of the powered device is greater than the configured maximum value, the switch does not provide power to the port. If the switch powers a powered device, but the powered device later requests through CDP messages more than the configured maximum value, the switch removes power to the port. The power that was allocated to the powered device is reclaimed into the global power budget. If you do not specify a wattage, the switch delivers the maximum value. Use the **auto** setting on any PoE port. The auto mode is the default setting.

- **static**—The switch pre-allocates power to the port (even when no powered device is connected) and guarantees that power will be available for the port. The switch allocates the port configured maximum wattage, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed to be powered when it is connected to the static port. The port no longer participates in the first-come, first-served model.

However, if the powered-device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device is consuming more than the maximum wattage, the switch shuts down the powered device.

If you do not specify a wattage, the switch pre-allocates the maximum value. The switch powers the port only if it discovers a powered device. Use the **static** setting on a high-priority interface.

- **never**—The switch disables powered-device detection and never powers the PoE port even if an unpowered device is connected. Use this mode only when you want to make sure that power is never applied to a PoE-capable port, making the port a data-only port.

For most situations, the default configuration (auto mode) works well, providing plug-and-play operation. No further configuration is required. However, perform this task to configure a PoE port for a higher priority, to make it data only, or to specify a maximum wattage to disallow high-power powered devices on a port.

When you make PoE configuration changes, the port being configured drops power. Depending on the new configuration, the state of the other PoE ports, and the state of the power budget, the port might not be powered up again. For example, port 1 is in the auto and on state, and you configure it for static mode. The switch removes power from port 1, detects the powered device, and repowers the port. If port 1 is in the auto and on state and you configure it with a maximum wattage of 10 W, the switch removes power from the port and then redetects the powered device. The switch repowers the port only if the powered device is a class 1, class 2, or a Cisco-only powered device.

### Power Monitoring and Power Policing

When policing of the real-time power consumption is enabled, the switch takes action when a powered device consumes more power than the maximum amount allocated, also referred to as the *cutoff-power value*.

When PoE is enabled, the switch senses the real-time power consumption of the powered device. The switch monitors the real-time power consumption of the connected powered device; this is called *power monitoring* or *power sensing*. The switch also polices the power usage with the *power policing* feature.

Power monitoring is backward-compatible with Cisco intelligent power management and CDP-based power consumption. It works with these features to ensure that the PoE port can supply power to the powered device.

The switch senses the real-time power consumption of the connected device as follows:

- 1 The switch monitors the real-time power consumption on individual ports.
- 2 The switch records the power consumption, including peak power usage. The switch reports the information through the CISCO-POWER-ETHERNET-EXT-MIB.
- 3 If power policing is enabled, the switch polices power usage by comparing the real-time power consumption to the maximum power allocated to the device. The maximum power consumption is also referred to as the *cutoff power* on a PoE port.

If the device uses more than the maximum power allocation on the port, the switch can either turn off power to the port, or the switch can generate a syslog message and update the LEDs (the port LED is now blinking amber) while still providing power to the device based on the switch configuration. By default, power-usage policing is disabled on all PoE ports.

If error recovery from the PoE error-disabled state is enabled, the switch automatically takes the PoE port out of the error-disabled state after the specified amount of time.

If error recovery is disabled, you can manually re-enable the PoE port by using the **shutdown** and **no shutdown** interface configuration commands.

- 4 If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the PoE port, which could adversely affect the switch.

### Power Consumption Values

You can configure the initial power allocation and the maximum power allocation on a port. However, these values are only the configured values that determine when the switch should turn on or turn off power on the PoE port. The maximum power allocation is not the same as the actual power consumption of the powered device. The actual cutoff power value that the switch uses for power policing is not equal to the configured power value.

When power policing is enabled, the switch polices the power usage *at the switch port*, which is greater than the power consumption of the device. When you are manually set the maximum power allocation, you must

consider the power loss over the cable from the switch port to the powered device. The cutoff power is the sum of the rated power consumption of the powered device and the worst-case power loss over the cable.

We recommend that you enable power policing when PoE is enabled on your switch. For example, if policing is disabled and you set the cutoff-power value by using the **power inline auto max 6300** interface configuration command, the configured maximum power allocation on the PoE port is 6.3 W (6300 mW). The switch provides power to the connected devices on the port if the device needs up to 6.3 W. If the CDP-power negotiated value or the IEEE classification value exceeds the configured cutoff value, the switch does not provide power to the connected device. After the switch turns on power on the PoE port, the switch does not police the real-time power consumption of the device, and the device can consume more power than the maximum allocated amount, which could adversely affect the switch and the devices connected to the other PoE ports.

Because a standalone switch supports internal power supplies, the total amount of power available for the powered devices varies depending on the power supply configuration.

- If a power supply is removed and replaced by a new power supply with less power and the switch does not have enough power for the powered devices, the switch denies power to the PoE ports in auto mode in descending order of the port numbers. If the switch still does not have enough power, the switch then denies power to the PoE ports in static mode in descending order of the port numbers.
- If the new power supply supports more power than the previous one and the switch now has more power available, the switch grants power to the PoE ports in static mode in ascending order of the port numbers. If it still has power available, the switch then grants power to the PoE ports in auto mode in ascending order of the port numbers.

## How to Configure PoE

### Configuring a Power Management Mode on a PoE Port

#### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **power inline** {**auto** [**max** *max-wattage*] | **never** | **static** [**max** *max-wattage*]}
4. **end**
5. **show power inline** [*interface-id* | **module** *switch-number*]

#### DETAILED STEPS

|               | Command or Action                                                                     | Purpose                           |
|---------------|---------------------------------------------------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b> | Enters global configuration mode. |

|               | Command or Action                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br>Switch(config)# <b>interface</b><br><b>gigabitethernet2/0/1</b>                                                                                           | Specifies the physical port to be configured, and enters interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>power inline</b> { <b>auto</b> [ <b>max</b> <i>max-wattage</i> ]<br>  <b>never</b>   <b>static</b> [ <b>max</b> <i>max-wattage</i> ]}<br><br><b>Example:</b><br>Switch(config-if)# <b>power inline</b><br><b>auto</b> | Configures the PoE mode on the port. The keywords have these meanings: <ul style="list-style-type: none"> <li>• <b>auto</b>—Enables powered-device detection. If enough power is available, automatically allocates power to the PoE port after device detection. This is the default setting.</li> <li>• <b>max</b> <i>max-wattage</i>—Limits the power allowed on the port. The range for PoE+ ports is 4000 to 30000 mW. If no value is specified, the maximum is allowed.</li> <li>• <b>never</b> —Disables device detection, and disable power to the port.</li> </ul> <p><b>Note</b> If a port has a Cisco powered device connected to it, do not use the <b>power inline never</b> command to configure the port. A false link-up can occur, placing the port into the error-disabled state.</p> <ul style="list-style-type: none"> <li>• <b>static</b>—Enables powered-device detection. Pre-allocate (reserve) power for a port before the switch discovers the powered device. The switch reserves power for this port even when no device is connected and guarantees that power will be provided upon device detection.</li> </ul> <p>The switch allocates power to a port configured in static mode before it allocates power to a port configured in auto mode.</p> |
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                                                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 5</b> | <b>show power inline</b> [ <i>interface-id</i>  <br><b>module</b> <i>switch-number</i> ]<br><br><b>Example:</b><br>Switch# <b>show power inline</b>                                                                      | Displays PoE status for a switch or a switch stack, for the specified interface, or for a specified stack member.<br><br>The <b>module</b> <i>switch-number</i> keywords are supported only on stacking-capable switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Configuring Power Policing

By default, the switch monitors the real-time power consumption of connected powered devices. You can configure the switch to police the power usage. By default, policing is disabled.

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **power inline police** [action {log | errdisable}]
4. **exit**
5. Use one of the following:
  - **errdisable detect cause inline-power**
  - **errdisable recovery cause inline-power**
  - **errdisable recovery interval** *interval*
6. **exit**
7. Use one of the following:
  - **show power inline police**
  - **show errdisable recovery**

## DETAILED STEPS

|        | Command or Action                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 2 | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br>Switch(config)# <b>interface</b><br><b>gigabitethernet2/0/1</b> | Specifies the physical port to be configured, and enter interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>power inline police</b> [action {log   errdisable}]<br><br><b>Example:</b><br>Switch(config-if)# <b>power inline police</b> | <p>If the real-time power consumption exceeds the maximum power allocation on the port, configures the switch to take one of these actions:</p> <ul style="list-style-type: none"> <li>• <b>power inline police</b>—Shuts down the PoE port, turns off power to it, and puts it in the error-disabled state.</li> </ul> <p><b>Note</b> You can enable error detection for the PoE error-disabled cause by using the <b>errdisable detect cause inline-power</b> global configuration command. You can also enable the timer to recover from the PoE error-disabled state by using the <b>errdisable recovery cause inline-power interval</b> <i>interval</i> global configuration command.</p> <ul style="list-style-type: none"> <li>• <b>power inline police action errdisable</b>—Turns off power to the port if the real-time power consumption exceeds the maximum power allocation on the port.</li> </ul> |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <ul style="list-style-type: none"> <li>• <b>power inline police action log</b>—Generates a syslog message while still providing power to the port.</li> </ul> <p>If you do not enter the <b>action log</b> keywords, the default action shuts down the port and puts the port in the error-disabled state.</p>                   |
| <b>Step 4</b> | <b>exit</b><br><br><b>Example:</b><br>Switch(config-if)# <b>exit</b>                                                                                                                                                                                                                                                                                                                                                                                                 | Returns to global configuration mode.                                                                                                                                                                                                                                                                                            |
| <b>Step 5</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <b>errdisable detect cause inline-power</b></li> <li>• <b>errdisable recovery cause inline-power</b></li> <li>• <b>errdisable recovery interval <i>interval</i></b></li> </ul> <b>Example:</b><br>Switch(config)# <b>errdisable detect cause inline-power</b><br><br>Switch(config)# <b>errdisable recovery cause inline-power</b><br><br>Switch(config)# <b>errdisable recovery interval 100</b> | (Optional) Enables error recovery from the PoE error-disabled state, and configures the PoE recover mechanism variables.<br><br>By default, the recovery interval is 300 seconds.<br><br>For <b>interval <i>interval</i></b> , specifies the time in seconds to recover from the error-disabled state. The range is 30 to 86400. |
| <b>Step 6</b> | <b>exit</b><br><br><b>Example:</b><br>Switch(config)# <b>exit</b>                                                                                                                                                                                                                                                                                                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                 |
| <b>Step 7</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <b>show power inline police</b></li> <li>• <b>show errdisable recovery</b></li> </ul> <b>Example:</b><br>Switch# <b>show power inline police</b><br><br>Switch# <b>show errdisable recovery</b>                                                                                                                                                                                                   | Displays the power monitoring status, and verify the error recovery settings.                                                                                                                                                                                                                                                    |

## Monitoring Power Status

**Table 21: Show Commands for Power Status**

| Command                                                                               | Purpose                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show env power switch</b> [ <i>switch-number</i> ]                                 | (Optional) Displays the status of the internal power supplies for each switch in the stack or for the specified switch. The range is 1 to 9, depending on the switch member numbers in the stack.<br><br>These keywords are available only on stacking-capable switches. |
| <b>show power inline</b> [ <i>interface-id</i>   <b>module</b> <i>switch-number</i> ] | Displays PoE status for a switch or switch stack, for an interface, or for a specific switch in the stack.                                                                                                                                                               |
| <b>show power inline police</b>                                                       | Displays the power policing data.                                                                                                                                                                                                                                        |

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Information About EEE

#### EEE Overview

Energy Efficient Ethernet (EEE) is an IEEE 802.3az standard that is designed to reduce power consumption in Ethernet networks during idle periods.

EEE can be enabled on devices that support low power idle (LPI) mode. Such devices can save power by entering LPI mode during periods of low utilization. In LPI mode, systems on both ends of the link can save power by shutting down certain services. EEE provides the protocol needed to transition into and out of LPI mode in a way that is transparent to upper layer protocols and applications.

## Default EEE Configuration

EEE is disabled by default.

## Restrictions for EEE

EEE has the following restrictions:

- Changing the EEE configuration resets the interface because the device has to restart Layer 1 autonegotiation.
- You might want to enable the Link Layer Discovery Protocol (LLDP) for devices that require longer wakeup times before they are able to accept data on their receive paths. Doing so enables the device to negotiate for extended system wakeup times from the transmitting link partner.

## How to Configure EEE

You can enable or disable EEE on an interface that is connected to an EEE-capable link partner.

### Enabling or Disabling EEE

#### SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **power efficient-ethernet auto**
4. **no power efficient-ethernet auto**
5. **end**
6. **copy running-config startup-config**

#### DETAILED STEPS

|               | Command or Action                                                                                                    | Purpose                                                                           |
|---------------|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                | Enters global configuration mode.                                                 |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet1/0/1</b> | Specifies the interface to be configured, and enter interface configuration mode. |

|        | Command or Action                                                                                                                    | Purpose                                                                                                                        |
|--------|--------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <p><b>power efficient-ethernet auto</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# power efficient-ethernet auto</pre>       | Enables EEE on the specified interface. When EEE is enabled, the device advertises and autonegotiates EEE to its link partner. |
| Step 4 | <p><b>no power efficient-ethernet auto</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# no power efficient-ethernet auto</pre> | Disables EEE on the specified interface.                                                                                       |
| Step 5 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>                                                           | Returns to privileged EXEC mode.                                                                                               |
| Step 6 | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>        | (Optional) Saves your entries in the configuration file.                                                                       |

## Monitoring EEE

*Table 22: Commands for Displaying EEE Settings*

| Command                                                    | Purpose                                                      |
|------------------------------------------------------------|--------------------------------------------------------------|
| <b>show eee capabilities interface</b> <i>interface-id</i> | Displays EEE capabilities for the specified interface.       |
| <b>show eee status interface</b> <i>interface-id</i>       | Displays EEE status information for the specified interface. |

## Configuration Examples for Configuring EEE

This example shows how to enable EEE for an interface:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# power efficient-ethernet auto
```

This example shows how to disable EEE for an interface:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# no power efficient-ethernet auto
```

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Restrictions for Configuring IGMP

The following are the restrictions for configuring IGMP:

- The switch supports IGMP Versions 1, 2, and 3.

---

**Note** For IGMP Version 3, only IGMP Version 3 BISS (Basic IGMPv3 Snooping Support) is supported.

---

- IGMP Version 3 uses new membership report messages that might not be correctly recognized by older IGMP snooping switches.
- IGMP filtering and throttling is not supported under the WLAN.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

## Information About IGMP

To participate in IP multicasting, multicast hosts, routers, and multilayer switches must have the Internet Group Management Protocol (IGMP) operating. This protocol defines the querier and host roles:

- A querier is a network device that sends query messages to discover which network devices are members of a given multicast group.
- A host is a receiver that sends report messages (in response to query messages) to inform a querier of a host membership.

A set of queriers and hosts that receive multicast data streams from the same source is called a multicast group. Queriers and hosts use IGMP messages to join and leave multicast groups.

Any host, regardless of whether it is a member of a group, can send to a group. However, only the members of a group receive the message. Membership in a multicast group is dynamic; hosts can join and leave at any time. There is no restriction on the location or number of members in a multicast group. A host can be a member of more than one multicast group at a time. How active a multicast group is and what members it has can vary from group to group and from time to time. A multicast group can be active for a long time, or it can be very short-lived. Membership in a group can constantly change.

## IP Multicast Group Addresses

IP multicast traffic uses group addresses, which are class D addresses. The high-order bits of a Class D address are 1110. Therefore, host group addresses can be in the range 224.0.0.0 through 239.255.255.255. Multicast addresses in the range 224.0.0.0 to 224.0.0.255 are reserved for use by routing protocols and other network control traffic. The address 224.0.0.0 is guaranteed not to be assigned to any group.

IGMP packets are sent using these IP multicast group addresses:

- IGMP general queries are destined to the address 224.0.0.1 (all systems on a subnet).
- IGMP group-specific queries are destined to the group IP address for which the switch is querying.
- IGMP group membership reports are destined to the group IP address for which the switch is reporting.
- IGMP Version 2 (IGMPv2) leave messages are destined to the address 224.0.0.2 (all multicast routers on a subnet). In some old host IP stacks, leave messages might be destined to the group IP address rather than to the all-routers address.

### Related Topics

[Configuring the Switch as a Member of a Group \(CLI\), on page 192](#)

[Example: Configuring the Switch as a Member of a Multicast Group, on page 234](#)

## IGMP Versions

The switch supports IGMP version 1, IGMP version 2, and IGMP version 3. These versions are interoperable on the switch. For example, if IGMP snooping is enabled and the querier's version is IGMPv2, and the switch receives an IGMPv3 report from a host, then the switch can forward the IGMPv3 report to the multicast router.

### IGMP Version 1

IGMP version 1 (IGMPv1) primarily uses a query-response model that enables the multicast router and multilayer switch to find which multicast groups are active (have one or more hosts interested in a multicast group) on the local subnet. IGMPv1 has other processes that enable a host to join and leave a multicast group. For more information, see RFC 1112.

### IGMP Version 2

IGMPv2 extends IGMP functionality by providing such features as the IGMP leave process to reduce leave latency, group-specific queries, and an explicit maximum query response time. IGMPv2 also adds the capability for routers to elect the IGMP querier without depending on the multicast protocol to perform this task. For more information, see RFC 2236.

#### Note

---

IGMP version 2 is the default version for the switch.

---

### IGMP Version 3

The switch supports IGMP version 3. The following are considerations for the switch and IGMP version 3:

- An IGMPv3 switch supports Basic IGMPv3 Snooping Support (BISS), which includes support for the snooping features on IGMPv1 and IGMPv2 switches and for IGMPv3 membership report messages. BISS constrains the flooding of multicast traffic when your network includes IGMPv3 hosts. It constrains traffic to approximately the same set of ports as the IGMP snooping feature on IGMPv2 or IGMPv1 hosts.
- The switch supports IGMPv3 snooping based only on the destination multicast IP address. It does not support snooping based on a source IP address or proxy report.
- IGMPv3 join and leave messages are not supported on switches running IGMP filtering or Multicast VLAN registration (MVR).
- An IGMPv3 switch can receive messages from and forward messages to a device running the Source Specific Multicast (SSM) feature.

### IGMPv3 Host Signalling

In IGMPv3, hosts signal membership to last hop routers of multicast groups. Hosts can signal group membership with filtering capabilities with respect to sources. A host can either signal that it wants to receive traffic from all sources sending to a group except for some specific sources (called exclude mode), or that it wants to receive traffic only from some specific sources sending to the group (called include mode).

IGMPv3 can operate with both Internet Standard Multicast (ISM) and Source Specific Multicast (SSM). In ISM, both exclude and include mode reports are applicable. In SSM, only include mode reports are accepted by the last-hop router. Exclude mode reports are ignored.

## IGMP Snooping

Layer 2 switches can use IGMP snooping to constrain the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. As the name implies, IGMP snooping requires the LAN switch to snoop on the IGMP transmissions between the host and the router and to keep track of multicast groups and member ports. When the switch receives an IGMP report from a host for a particular multicast group, the switch adds the host port number to the forwarding table entry; when it receives an IGMP Leave Group message from a host, it removes the host port from the table entry. It also periodically deletes entries if it does not receive IGMP membership reports from the multicast clients.

### Note

For more information on IP multicast and IGMP, see RFC 1112 and RFC 2236.

The multicast router (which could be a switch with the IP services feature set on the active switch) sends out periodic general queries to all VLANs. All hosts interested in this multicast traffic send join requests and are added to the forwarding table entry. The switch creates one entry per VLAN in the IGMP snooping IP multicast forwarding table for each group from which it receives an IGMP join request.

The switch supports IP multicast group-based bridging, instead of MAC-addressed based groups. With multicast MAC address-based groups, if an IP address being configured translates (aliases) to a previously configured MAC address or to any reserved multicast MAC addresses (in the range 224.0.0.xxx), the command fails. Because the switch uses IP multicast groups, there are no address aliasing issues.

The IP multicast groups learned through IGMP snooping are dynamic. However, you can statically configure multicast groups by using the **ip igmp snooping vlan *vlan-id* static *ip\_address* interface *interface-id*** global configuration command. If you specify group membership for a multicast group address statically, your setting supersedes any automatic manipulation by IGMP snooping. Multicast group membership lists can consist of both user-defined and IGMP snooping-learned settings.

You can configure an IGMP snooping querier to support IGMP snooping in subnets without multicast interfaces because the multicast traffic does not need to be routed.

If a port spanning-tree, a port group, or a VLAN ID change occurs, the IGMP snooping-learned multicast groups from this port on the VLAN are deleted.

## Joining a Multicast Group

When a host connected to the switch wants to join an IP multicast group and it is an IGMP version 2 client, it sends an unsolicited IGMP join message, specifying the IP multicast group to join. Alternatively, when the switch receives a general query from the router, it forwards the query to all ports in the VLAN. IGMP version 1 or version 2 hosts wanting to join the multicast group respond by sending a join message to the switch. The switch CPU creates a multicast forwarding-table entry for the group if it is not already present. The CPU also

adds the interface where the join message was received to the forwarding-table entry. The host associated with that interface receives multicast traffic for that multicast group.

**Figure 6: Initial IGMP Join Message**

Router A sends a general query to the switch, which forwards the query to ports 2 through 5, which are all members of the same VLAN. Host 1 wants to join multicast group 224.1.2.3 and multicasts an IGMP membership report (IGMP join message) to the group. The switch CPU uses the information in the IGMP report to set up a forwarding-table entry that includes the port numbers connected to Host 1 and to the router.

**Table 23: IGMP Snooping Forwarding Table**

| Destination Address | Type of Packet | Ports |
|---------------------|----------------|-------|
| 224.1.2.3           | IGMP           | 1, 2  |

The switch hardware can distinguish IGMP information packets from other packets for the multicast group. The information in the table tells the switching engine to send frames addressed to the 224.1.2.3 multicast IP address that are not IGMP packets to the router and to the host that has joined the group.

If another host (for example, Host 4) sends an unsolicited IGMP join message for the same group, the CPU receives that message and adds the port number of Host 4 to the forwarding table. Because the forwarding

table directs IGMP messages only to the CPU, the message is not flooded to other ports on the switch. Any known multicast traffic is forwarded to the group and not to the CPU.

**Figure 7: Second Host Joining a Multicast Group**

**Table 24: Updated IGMP Snooping Forwarding Table**

| Destination Address | Type of Packet | Ports   |
|---------------------|----------------|---------|
| 224.1.2.3           | IGMP           | 1, 2, 5 |

[Example: Configuring the Switch as a Member of a Multicast Group, on page 234](#)

**Leaving a Multicast Group**

The router sends periodic multicast general queries, and the switch forwards these queries through all ports in the VLAN. Interested hosts respond to the queries. If at least one host in the VLAN wants to receive multicast traffic, the router continues forwarding the multicast traffic to the VLAN. The switch forwards multicast group traffic only to those hosts listed in the forwarding table for that IP multicast group maintained by IGMP snooping.

When hosts want to leave a multicast group, they can silently leave, or they can send a leave message. When the switch receives a leave message from a host, it sends a group-specific query to learn if any other devices connected to that interface are interested in traffic for the specific multicast group. The switch then updates the forwarding table for that MAC group so that only those hosts interested in receiving multicast traffic for the group are listed in the forwarding table. If the router receives no reports from a VLAN, it removes the group for the VLAN from its IGMP cache.

## Immediate Leave

The switch uses IGMP snooping Immediate Leave to remove from the forwarding table an interface that sends a leave message without the switch sending group-specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Immediate Leave ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are simultaneously in use.

Immediate Leave is only supported on IGMP version 2 hosts. IGMP version 2 is the default version for the switch.

### Note

You should only use the Immediate Leave feature on VLANs where a single host is connected to each port. If Immediate Leave is enabled in VLANs where more than one host is connected to a port, some hosts might inadvertently be dropped.

## IGMP Configurable-Leave Timer

You can configure the time that the switch waits after sending a group-specific query to determine if hosts are still interested in a specific multicast group. The IGMP leave response time can be configured from 100 to 5000 milliseconds. The timer can be set either globally or on a per-VLAN basis. The VLAN configuration of the leave time overrides the global configuration.

## IGMP Report Suppression

### Note

IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

The switch uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP report suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the switch forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers.

If the multicast router query also includes requests for IGMPv3 reports, the switch forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression, all IGMP reports are forwarded to the multicast routers.

## IGMP Snooping and Switch Stacks

IGMP snooping functions across the switch stack; that is, IGMP control information from one switch is distributed to all switches in the stack. Regardless of the stack member through which IGMP multicast data enters the stack, the data reaches the hosts that have registered for that group.

If a switch in the stack fails or is removed from the stack, only the members of the multicast group that are on that switch will not receive the multicast data. All other members of a multicast group on other switches in the stack continue to receive multicast data streams. However, multicast groups that are common for both Layer 2 and Layer 3 (IP multicast routing) might take longer to converge if the active switch is removed.

## IGMP Filtering and Throttling Overview

In some environments, for example, metropolitan or multiple-dwelling unit (MDU) installations, you might want to control the set of multicast groups to which a user on a switch port can belong. You can control the distribution of multicast services, such as IP/TV, based on some type of subscription or service plan. You might also want to limit the number of multicast groups to which a user on a switch port can belong.

With the IGMP filtering feature, you can filter multicast joins on a per-port basis by configuring IP multicast profiles and associating them with individual switch ports. An IGMP profile can contain one or more multicast groups and specifies whether access to the group is permitted or denied. If an IGMP profile denying access to a multicast group is applied to a switch port, the IGMP join report requesting the stream of IP multicast traffic is dropped, and the port is not allowed to receive IP multicast traffic from that group. If the filtering action permits access to the multicast group, the IGMP report from the port is forwarded for normal processing. You can also set the maximum number of IGMP groups that a Layer 2 interface can join.

IGMP filtering controls only group-specific query and membership reports, including join and leave reports. It does not control general IGMP queries. IGMP filtering has no relationship with the function that directs the forwarding of IP multicast traffic. The filtering feature operates in the same manner whether CGMP or MVR is used to forward the multicast traffic.

IGMP filtering applies only to the dynamic learning of IP multicast group addresses, not static configuration.

With the IGMP throttling feature, you can set the maximum number of IGMP groups that a Layer 2 interface can join. If the maximum number of IGMP groups is set, the IGMP snooping forwarding table contains the maximum number of entries, and the interface receives an IGMP join report, you can configure an interface to drop the IGMP report or to replace the randomly selected multicast entry with the received IGMP report.

### Note

---

IGMPv3 join and leave messages are not supported on switches running IGMP filtering.

| IGMP maximum number of IGMP groups | No maximum set.<br><b>Note</b> When the maximum number of groups is in the forwarding table, the default IGMP throttling action is to deny the IGMP report. |
| IGMP profiles                      | None defined.                                                                                                                                               |
| IGMP profile action                | Deny the range addresses.                                                                                                                                   |

## How to Configure IGMP

### Configuring the Switch as a Member of a Group (CLI)

You can configure the switch as a member of a multicast group and discover multicast reachability in a network. If all the multicast-capable routers and multilayer switches that you administer are members of a multicast group, pinging that group causes all of these devices to respond. The devices respond to ICMP echo-request packets addressed to a group of which they are members. Another example is the multicast trace-route tools provided in the software.

#### Caution

Performing this procedure might impact the CPU performance because the CPU will receive all data traffic for the group address.

This procedure is optional.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip igmp join-group** *group-address*
5. **end**
6. **show ip igmp interface** [*interface-id*]
7. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Switch&gt; enable</pre>                                                                | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>                                           | <p>Enters the global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/1</pre>           | <p>Specifies the Layer 3 interface on which you want to enable multicast routing, and enters interface configuration mode.</p> <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port</a>, on page 236.</li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan</b> <i>vlan-id</i> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI</a>, on page 236.</li> </ul> <p>These interfaces must have IP addresses assigned to them.</p> |
| Step 4 | <p><b>ip igmp join-group</b> <i>group-address</i></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ip igmp join-group 225.2.2.2</pre> | <p>Configures the switch to join a multicast group.</p> <p>By default, no group memberships are defined.</p> <p>For <i>group-address</i>, specify the multicast IP address in dotted decimal notation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 5 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>                                                              | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Controlling Access to IP Multicast Group (CLI)

The switch sends IGMP host-query messages to find which multicast groups have members on attached local networks. The switch then forwards to these group members all packets addressed to the multicast group. You can place a filter on each interface to restrict the multicast groups that hosts on the subnet serviced by the interface can join.

To limit the number of joins on the interface, configure the port for the filter which associates with the IGMP profile.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp profile**
4. **permit**
5. **exit**
6. **interface** *interface-id*
7. **ip igmp filter** *filter\_number*
8. **end**
9. **show ip igmp interface** [*interface-id*]

## Modifying the IGMP Host-Query Message Interval (CLI)

The switch periodically sends IGMP host-query messages to discover which multicast groups are present on attached networks. These messages are sent to the all-hosts multicast group (224.0.0.1) with a time-to-live (TTL) of 1. The switch sends host-query messages to refresh its knowledge of memberships present on the network. If, after some number of queries, the software discovers that no local hosts are members of a multicast group, the software stops forwarding multicast packets to the local network from remote origins for that group and sends a prune message upstream toward the source.

The switch elects a PIM designated router (DR) for the LAN (subnet). The DR is the router or multilayer switch with the highest IP address for IGMPv2. For IGMPv1, the DR is elected according to the multicast routing protocol that runs on the LAN. The designated router is responsible for sending IGMP host-query messages to all hosts on the LAN. In sparse mode, the designated router also sends PIM register and PIM join messages toward the RP router.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip igmp query-interval** *seconds*
5. **end**
6. **show ip igmp interface** [*interface-id*]
7. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Switch&gt; enable</pre>                                                           | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>                                      | <p>Enters the global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/1</pre>      | <p>Specifies the Layer 3 interface on which you want to enable multicast routing, and enters interface configuration mode.</p> <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port</a>, on page 236.</li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan</b> <i>vlan-id</i> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI</a>, on page 236.</li> </ul> <p>These interfaces must have IP addresses assigned to them.</p> |
| Step 4 | <p><b>ip igmp query-interval</b> <i>seconds</i></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ip igmp query-interval 75</pre> | <p>Configures the frequency at which the designated router sends IGMP host-query messages.</p> <p>By default, the designated router sends IGMP host-query messages every 60 seconds to keep the IGMP overhead very low on hosts and networks.</p> <p>The range is 1 to 65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 5 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>                                                         | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|               | Command or Action                                                                                                     | Purpose                                                  |
|---------------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 6</b> | <b>show ip igmp interface</b> [ <i>interface-id</i> ]<br><br><b>Example:</b><br>Switch# <b>show ip igmp interface</b> | Verifies your entries.                                   |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Changing the IGMP Query Timeout for IGMPv2 (CLI)

If you are using IGMPv2, you can specify the period of time before the switch takes over as the querier for the interface. By default, the switch waits twice the query interval period controlled by the **ip igmp query-interval** interface configuration command. After that time, if the switch has received no queries, it becomes the querier.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip igmp querier-timeout** *seconds*
5. **end**
6. **show ip igmp interface** [*interface-id*]
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                             | Purpose                                                                                                            |
|---------------|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>                                         | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <p><b>interface <i>interface-id</i></b></p> <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/1</pre>         | <p>Specifies the Layer 3 interface on which you want to enable multicast routing, and enters interface configuration mode.</p> <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port, on page 236</a>.</li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan <i>vlan-id</i></b> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI, on page 236</a>.</li> </ul> <p>These interfaces must have IP addresses assigned to them.</p> |
| <b>Step 4</b> | <p><b>ip igmp querier-timeout <i>seconds</i></b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ip igmp querier-timeout 120</pre> | <p>Specifies the IGMP query timeout.</p> <p>The default is 60 seconds (twice the query interval). The range is 60 to 300.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 6</b> | <p><b>show ip igmp interface [<i>interface-id</i>]</b></p> <p><b>Example:</b></p> <pre>Switch# show ip igmp interface</pre>           | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|               | Command or Action                                                                                                         | Purpose                                                  |
|---------------|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><pre>Switch# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file. |

## Changing the Maximum Query Response Time for IGMPv2 (CLI)

If you are using IGMPv2, you can change the maximum query response time advertised in IGMP queries. The maximum query response time enables the switch to quickly detect that there are no more directly connected group members on a LAN. Decreasing the value enables the switch to prune groups faster.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **ip igmp query-max-response-time *seconds***
5. **end**
6. **show ip igmp interface [*interface-id*]**
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                         | Purpose                                                                                                            |
|---------------|-------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br><pre>Switch&gt; enable</pre>                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br><pre>Switch# configure terminal</pre> | Enters the global configuration mode.                                                                              |

|        | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/1</pre>                        | <p>Specifies the Layer 3 interface on which you want to enable multicast routing, and enters interface configuration mode.</p> <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port</a>, on page 236.</li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan</b> <i>vlan-id</i> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI</a>, on page 236.</li> </ul> <p>These interfaces must have IP addresses assigned to them.</p> |
| Step 4 | <p><b>ip igmp query-max-response-time</b> <i>seconds</i></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ip igmp query-max-response-time 15</pre> | <p>Changes the maximum query response time advertised in IGMP queries. The default is 10 seconds. The range is 1 to 25.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 5 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>                                                                           | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 6 | <p><b>show ip igmp interface</b> [<i>interface-id</i>]</p> <p><b>Example:</b></p> <pre>Switch# show ip igmp interface</pre>                          | <p>Verifies your entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 7 | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>                        | <p>(Optional) Saves your entries in the configuration file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Configuring the Switch as a Statically Connected Member (CLI)

At various times, either there is not a group member on a network segment or a host that cannot report its group membership by using IGMP. However, you may want multicast traffic to be sent to that network segment. The following commands are used to pull multicast traffic down to a network segment:

- **ip igmp join-group**—The switch accepts the multicast packets in addition to forwarding them. Accepting the multicast packets prevents the switch from fast switching.
- **ip igmp static-group**—The switch does not accept the packets itself, but only forwards them. This method enables fast switching. The outgoing interface appears in the IGMP cache, but the switch itself is not a member, as evidenced by lack of an L (local) flag in the multicast route entry.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip igmp static-group** *group-address*
5. **end**
6. **show ip igmp interface** [*interface-id*]
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Step 6</b> | <p><b>show ip igmp interface</b> [<i>interface-id</i>]</p> <p><b>Example:</b></p> <pre>Switch# show ip igmp interface gigabitethernet 1/0/1</pre> | <p>Verifies your entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 7</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>                     | <p>(Optional) Saves your entries in the configuration file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Configuring IGMP Profiles (CLI)

To configure an IGMP profile, use the **ip igmp profile** global configuration command with a profile number to create an IGMP profile and to enter IGMP profile configuration mode. From this mode, you can specify the parameters of the IGMP profile to be used for filtering IGMP join requests from a port. When you are in IGMP profile configuration mode, you can create the profile by using these commands:

- deny**—Specifies that matching addresses are denied; this is the default.

- **exit**—Exits from igmp-profile configuration mode.
- **no**—Negates a command or returns to its defaults.
- **permit**—Specifies that matching addresses are permitted.
- **range**—Specifies a range of IP addresses for the profile. You can enter a single IP address or a range with a start and an end address.

The default is for the switch to have no IGMP profiles configured. When a profile is configured, if neither the **permit** nor **deny** keyword is included, the default is to deny access to the range of IP addresses.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp profile** *profile number*
4. **permit | deny**
5. **range** *ip multicast address*
6. **end**
7. **show ip igmp profile** *profile number*
8. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                               | Purpose                                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                           | Enters the global configuration mode.                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>ip igmp profile</b> <i>profile number</i><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp profile 3</b> | Assigns a number to the profile you are configuring, and enters IGMP profile configuration mode. The profile number range is 1 to 4294967295.<br><br><b>Note</b> To delete a profile, use the <b>no ip igmp profile</b> <i>profile number</i> global configuration command. |
| <b>Step 4</b> | <b>permit   deny</b><br><br><b>Example:</b><br>Switch(config-igmp-profile)# <b>permit</b>                       | (Optional) Sets the action to permit or deny access to the IP multicast address. If no action is configured, the default for the profile is to deny access.                                                                                                                 |

|        | Command or Action                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|--------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p><b>range</b> <i>ip multicast address</i></p> <p><b>Example:</b></p> <pre>Switch(config-igmp-profile)# range 229.9.9.0</pre> | <p>Enters the IP multicast address or range of IP multicast addresses to which access is being controlled. If entering a range, enter the low IP multicast address, a space, and the high IP multicast address.</p> <p>You can use the <b>range</b> command multiple times to enter multiple addresses or ranges of addresses.</p> <p><b>Note</b> To delete an IP multicast address or range of IP multicast addresses, use the <b>no range ip multicast address</b> IGMP profile configuration command.</p> |
| Step 6 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-igmp-profile)# end</pre>                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 7 | <p><b>show ip igmp profile</b> <i>profile number</i></p> <p><b>Example:</b></p> <pre>Switch# show ip igmp profile 3</pre>      | Verifies the profile configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 8 | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>  | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Applying IGMP Profiles (CLI)

To control access as defined in an IGMP profile, use the **ip igmp filter** interface configuration command to apply the profile to the appropriate interfaces. You can apply IGMP profiles only to Layer 2 access ports; you cannot apply IGMP profiles to routed ports or SVIs. You cannot apply profiles to ports that belong to an EtherChannel port group. You can apply a profile to multiple interfaces, but each interface can have only one profile applied to it.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip igmp filter** *profile number*
5. **end**
6. **show running-config interface** *interface-id*
7. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                              |

|               | <code>gigabitethernet1/0/1</code>                                                                                           |                                                          |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Setting the Maximum Number of IGMP Groups (CLI)

You can set the maximum number of IGMP groups that a Layer 2 interface can join by using the **ip igmp max-groups** interface configuration command. Use the **no** form of this command to set the maximum back to the default, which is no limit.

This restriction can be applied to Layer 2 ports only; you cannot set a maximum number of IGMP groups on routed ports or SVIs. You also can use this command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.

Beginning in privileged EXEC mode, follow these steps to set the maximum number of IGMP groups in the forwarding table:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip igmp max-groups** *number*
5. **end**
6. **show running-config interface** *interface-id*
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                   | Purpose                                                                                                            |
|---------------|---------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <code>enable</code> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|        | Command or Action                                                                                                                                              | Purpose                                                                                                                                                                                                                                                    |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                          | Enters the global configuration mode.                                                                                                                                                                                                                      |
| Step 3 | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>interface</b><br><b>gigabitethernet1/0/2</b>                                 | Specifies the interface to be configured, and enters interface configuration mode. The interface can be a Layer 2 port that does not belong to an EtherChannel group or a EtherChannel interface.                                                          |
| Step 4 | <b>ip igmp max-groups <i>number</i></b><br><br><b>Example:</b><br>Switch(config-if)# <b>ip igmp max-groups 20</b>                                              | Sets the maximum number of IGMP groups that the interface can join. The range is 0 to 4294967294. The default is to have no maximum set.<br><br><b>Note</b> The switch supports a maximum number of 4096 Layer 2 IGMP groups and 2048 Layer 3 IGMP groups. |
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                                                             | Returns to privileged EXEC mode.                                                                                                                                                                                                                           |
| Step 6 | <b>show running-config interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch# <b>show running-config interface</b><br><b>gigabitethernet1/0/1</b> | Verifies your entries.                                                                                                                                                                                                                                     |
| Step 7 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b>                                          | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                   |

## Configuring the IGMP Throttling Action (CLI)

After you set the maximum number of IGMP groups that a Layer 2 interface can join, you can configure an interface to replace the existing group with the new group for which the IGMP report was received by using the **ip igmp max-groups action replace** interface configuration command. Use the **no** form of this command to return to the default, which is to drop the IGMP join report.

Follow these guidelines when configuring the IGMP throttling action:

- This restriction can be applied only to Layer 2 ports. You can use this command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.
  - When the maximum group limitation is set to the default (no maximum), entering the **ip igmp max-groups action {deny | replace}** command has no effect.
  - If you configure the throttling action and set the maximum group limitation after an interface has added multicast entries to the forwarding table, the forwarding-table entries are either aged out or removed, depending on the throttling action.
    - If you configure the throttling action as **deny**, the entries that were previously in the forwarding table are not removed but are aged out. After these entries are aged out and the maximum number of entries is in the forwarding table, the switch drops the next IGMP report received on the interface.
    - If you configure the throttling action as **replace**, the entries that were previously in the forwarding table are removed. When the maximum number of entries is in the forwarding table, the switch replaces a randomly selected entry with the received IGMP report.
- To prevent the switch from removing the forwarding-table entries, you can configure the IGMP throttling action before an interface adds entries to the forwarding table.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip igmp max-groups action {deny | replace}**
5. **end**
6. **show running-config interface** *interface-id*
7. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                     | Purpose                                                                                                            |
|--------|---------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b> | Enters the global configuration mode.                                                                              |

|               | Command or Action                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br><pre>Switch(config)# interface gigabitethernet 1/0/1</pre>                                | Specifies the physical interface to be configured, and enters interface configuration mode. The interface can be a Layer 2 port that does not belong to an EtherChannel group or an EtherChannel interface. The interface cannot be a trunk port.                                                                                                                                                                                                                                                                 |
| <b>Step 4</b> | <b>ip igmp max-groups action {deny   replace}</b><br><br><b>Example:</b><br><pre>Switch(config-if)# ip igmp max-groups action replace</pre>              | When an interface receives an IGMP report and the maximum number of entries is in the forwarding table, specifies the action that the interface takes: <ul style="list-style-type: none"> <li>• <b>deny</b>—Drops the report.</li> <li>• <b>replace</b>—Replaces the existing group with the new group for which the IGMP report was received.</li> </ul> <p><b>Note</b> To return to the default action of dropping the report, use the <b>no ip igmp max-groups action</b> interface configuration command.</p> |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br><pre>Switch(config-if)# end</pre>                                                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 6</b> | <b>show running-config interface</b> <i>interface-id</i><br><br><b>Example:</b><br><pre>Switch# show running-config interface gigabitethernet1/0/1</pre> | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><pre>Switch# copy running-config startup-config</pre>                                | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## How to Configure IGMP Snooping

### Enabling or Disabling IGMP Snooping on a Switch (CLI)

By default, IGMP snooping is globally enabled on the switch. When globally enabled or disabled, it is also enabled or disabled in all existing VLAN interfaces. IGMP snooping is by default enabled on all VLANs, but can be enabled and disabled on a per-VLAN basis.

Global IGMP snooping overrides the VLAN IGMP snooping. If global snooping is disabled, you cannot enable VLAN snooping. If global snooping is enabled, you can enable or disable VLAN snooping.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping**
4. **end**
5. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                         | Purpose                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                             | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                     |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>     | Enters the global configuration mode.                                                                                                                                                                         |
| <b>Step 3</b> | <b>ip igmp snooping</b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp snooping</b> | Globally enables IGMP snooping in all existing VLAN interfaces.<br><br><b>Note</b> To globally disable IGMP snooping on all VLAN interfaces, use the <b>no ip igmp snooping</b> global configuration command. |
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                           | Returns to privileged EXEC mode.                                                                                                                                                                              |

|               | Command or Action                                                                                                           | Purpose                                                  |

### Setting the Snooping Method (CLI)

Multicast-capable router ports are added to the forwarding table for every Layer 2 multicast entry. The switch learns of the ports through one of these methods:

- Snooping on IGMP queries
- Statically connecting to a multicast router port using the **ip igmp snooping mrouter** global configuration command

Beginning in privileged EXEC mode, follow these steps to alter the method in which a VLAN interface accesses a multicast router:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping vlan** *vlan-id* **mrouter interface** {GigabitEthernet | Port-Channel | TenGigabitEthernet}
4. **end**
5. **show ip igmp snooping**
6. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action | Purpose                       |
|---------------|-------------------|-------------------------------|
| <b>Step 1</b> | <b>enable</b>     | Enables privileged EXEC mode. |

|               | Command or Action                                                                                                                                                                                                                           | Purpose                                                                              |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch&gt; enable</pre>                                                                                                                                                                                         | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>                                                                                                                                               | Enters the global configuration mode.                                                |
| <b>Step 3</b> | <p><b>ip igmp snooping vlan <i>vlan-id</i> mrouter interface {GigabitEthernet   Port-Channel   TenGigabitEthernet}</b></p> <p><b>Example:</b></p> <pre>Switch(config)# ip igmp snooping vlan 1 mrouter interface GigabitEthernet1/0/3</pre> | Enables IGMP snooping on a VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.    |
| <b>Step 4</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                                                                                                                                     | Returns to privileged EXEC mode.                                                     |
| <b>Step 5</b> | <p><b>show ip igmp snooping</b></p> <p><b>Example:</b></p> <pre>Switch# show ip igmp snooping</pre>                                                                                                                                         | Verifies the configuration.                                                          |
| <b>Step 6</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>                                                                                                               | (Optional) Saves your entries in the configuration file.                             |

### Configuring a Multicast Router Port (CLI)

To add a multicast router port (add a static connection to a multicast router), use the **ip igmp snooping vlan mrouter** global configuration command on the switch.

**Note**

Static connections to multicast routers are supported only on switch ports.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping vlan *vlan-id* mrouter interface *interface-id***
4. **end**
5. **show ip igmp snooping mrouter [vlan *vlan-id*]**
6. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                                             | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>ip igmp snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp snooping vlan 5 mrouter interface gigabitethernet1/0/1</b> | Specifies the multicast router VLAN ID and the interface to the multicast router. <ul style="list-style-type: none"> <li>• The VLAN ID range is 1 to 1001 and 1006 to 4094.</li> <li>• The interface can be a physical interface or a port channel. The port-channel range is 1 to 128.</li> </ul> <p><b>Note</b> To remove a multicast router port from the VLAN, use the <b>no ip igmp snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i></b> global configuration command.</p> |
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 5</b> | <b>show ip igmp snooping mrouter [vlan <i>vlan-id</i>]</b><br><br><b>Example:</b><br>Switch# <b>show ip igmp snooping mrouter vlan 5</b>                                                          | Verifies that IGMP snooping is enabled on the VLAN interface.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|        | Command or Action                                                                                                     | Purpose                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 6 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

### Configuring a Host Statically to Join a Group (CLI)

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure a host on an interface.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping vlan *vlan-id* static *ip\_address* interface *interface-id***
4. **end**
5. **show ip igmp snooping groups**
6. **copy running-config startup-config**

#### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                       |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                                                                         | Enters the global configuration mode.                                                                                                                                                                                                                                    |
| Step 3 | <b>ip igmp snooping vlan <i>vlan-id</i> static <i>ip_address</i> interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp snooping vlan 105 static 230.0.0.1 interface gigabitethernet1/0/1</b> | Statically configures a Layer 2 port as a member of a multicast group: <ul style="list-style-type: none"> <li>• <i>vlan-id</i> is the multicast group VLAN ID. The range is 1 to 1001 and 1006 to 4094.</li> <li>• <i>ip-address</i> is the group IP address.</li> </ul> |

|               | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                               | <ul style="list-style-type: none"> <li><i>interface-id</i> is the member port. It can be a physical interface or a port channel (1 to 128).</li> </ul> <p><b>Note</b> To remove the Layer 2 port from the multicast group, use the <b>no ip igmp snooping vlan <i>vlan-id</i> static <i>mac-address</i> interface <i>interface-id</i></b> global configuration command.</p> |
| <b>Step 4</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 5</b> | <p><b>show ip igmp snooping groups</b></p> <p><b>Example:</b></p> <pre>Switch# show ip igmp snooping groups</pre>             | Verifies the member port and the IP address.                                                                                                                                                                                                                                                                                                                                |
| <b>Step 6</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                    |

### Enabling IGMP Immediate Leave (CLI)

When you enable IGMP Immediate Leave, the switch immediately removes a port when it detects an IGMP Version 2 leave message on that port. You should only use the Immediate-Leave feature when there is a single receiver present on every port in the VLAN.

**Note** Immediate Leave is supported only on IGMP Version 2 hosts. IGMP Version 2 is the default version for the switch.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping vlan *vlan-id* immediate-leave**
4. **end**
5. **show ip igmp snooping vlan *vlan-id***
6. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                         | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                 | Enters the global configuration mode.                                                                                                                                                                                  |
| <b>Step 3</b> | <b>ip igmp snooping vlan <i>vlan-id</i> immediate-leave</b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp snooping vlan 21 immediate-leave</b> | Enables IGMP Immediate Leave on the VLAN interface.<br><br><b>Note</b> To disable IGMP Immediate Leave on a VLAN, use the <b>no ip igmp snooping vlan <i>vlan-id</i> immediate-leave</b> global configuration command. |
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                       |
| <b>Step 5</b> | <b>show ip igmp snooping vlan <i>vlan-id</i></b><br><br><b>Example:</b><br>Switch# <b>show ip igmp snooping vlan 21</b>                               | Verifies that Immediate Leave is enabled on the VLAN interface.                                                                                                                                                        |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b>                                 | (Optional) Saves your entries in the configuration file.                                                                                                                                                               |

**Configuring the IGMP Leave Timer (CLI)**

Follow these guidelines when configuring the IGMP leave timer:

- You can configure the leave time globally or on a per-VLAN basis.
- Configuring the leave time on a VLAN overrides the global setting.
- The default leave time is 1000 milliseconds.

- The IGMP configurable leave time is only supported on hosts running IGMP Version 2. IGMP version 2 is the default version for the switch.
- The actual leave latency in the network is usually the configured leave time. However, the leave time might vary around the configured time, depending on real-time CPU load conditions, network delays and the amount of traffic sent through the interface.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping last-member-query-interval *time***
4. **ip igmp snooping vlan *vlan-id* last-member-query-interval *time***
5. **end**
6. **show ip igmp snooping**
7. **copy running-config startup-config**

## DETAILED STEPS

### Configuring the IGMP Robustness-Variable (CLI)

Use the following procedure to configure the IGMP robustness variable on the switch.

The robustness variable is the integer used by IGMP snooping during calculations for IGMP messages. The robustness variable provides fine tuning to allow for expected packet loss.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping robustness-variable** *count*
4. **ip igmp snooping vlan** *vlan-id* **robustness-variable** *count*
5. **end**
6. **show ip igmp snooping**
7. **copy running-config startup-config**

## Configuring the IGMP Last Member Query Count (CLI)

To configure the number of times the switch sends IGMP group-specific or group-source-specific (with IGMP version 3) query messages in response to receiving a group-specific or group-source-specific leave message, use this command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping last-member-query-count** *count*
4. **ip igmp snooping vlan** *vlan-id* **last-member-query-count** *count*
5. **end**
6. **show ip igmp snooping**
7. **copy running-config startup-config**

### Configuring TCN-Related Commands

#### *Controlling the Multicast Flooding Time After a TCN Event (CLI)*

You can control the time that multicast traffic is flooded after a topology change notification (TCN) event by using the **ip igmp snooping tcn flood query count** global configuration command. This command configures the number of general queries for which multicast data traffic is flooded after a TCN event. Some examples of TCN events are when the client changed its location and the receiver is on same port that was blocked but is now forwarding, and when a port went down without sending a leave message.

If you set the TCN flood query count to 1 by using the **ip igmp snooping tcn flood query count** command, the flooding stops after receiving 1 general query. If you set the count to 7, the flooding continues until 7 general queries are received. Groups are relearned based on the general queries received during the TCN event.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping tcn flood query count** *count*
4. **end**
5. **show ip igmp snooping**
6. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                            |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                 |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                         | Enters the global configuration mode.                                                                                                                                                                                                                                                                              |
| Step 3 | <b>ip igmp snooping tcn flood query count count</b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp snooping tcn flood query count 3</b> | Specifies the number of IGMP general queries for which the multicast traffic is flooded. The range is 1 to 10. By default, the flooding query count is 2. <p><b>Note</b> To return to the default flooding query count, use the <b>no ip igmp snooping tcn flood query count</b> global configuration command.</p> |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                   |
| Step 5 | <b>show ip igmp snooping</b><br><br><b>Example:</b><br>Switch# <b>show ip igmp snooping</b>                                                   | Verifies the TCN settings.                                                                                                                                                                                                                                                                                         |
| Step 6 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b>                         | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                           |

*Recovering from Flood Mode (CLI)*

When a topology change occurs, the spanning-tree root sends a special IGMP leave message (also known as global leave) with the group multicast address 0.0.0.0. However, when you enable the **ip igmp snooping tcn query solicit** global configuration command, the switch sends the global leave message whether or not it is the spanning-tree root. When the router receives this special leave, it immediately sends general queries, which expedite the process of recovering from the flood mode during the TCN event. Leaves are always sent if the switch is the spanning-tree root regardless of this configuration command. By default, query solicitation is disabled.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping tcn query solicit**
4. **end**
5. **show ip igmp snooping**
6. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                     |
|--------|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                         | Enters the global configuration mode.                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>ip igmp snooping tcn query solicit</b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp snooping tcn query solicit</b> | Sends an IGMP leave message (global leave) to speed the process of recovering from the flood mode caused during a TCN event. By default, query solicitation is disabled.<br><br><b>Note</b> To return to the default query solicitation, use the <b>no ip igmp snooping tcn query solicit</b> global configuration command. |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                            |
| Step 5 | <b>show ip igmp snooping</b><br><br><b>Example:</b><br>Switch# <b>show ip igmp snooping</b>                                   | Verifies the TCN settings.                                                                                                                                                                                                                                                                                                  |
| Step 6 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b>         | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                    |

*Disabling Multicast Flooding During a TCN Event (CLI)*

When the switch receives a TCN, multicast traffic is flooded to all the ports until 2 general queries are received. If the switch has many ports with attached hosts that are subscribed to different multicast groups, this flooding might exceed the capacity of the link and cause packet loss. You can use the **ip igmp snooping tcn flood** interface configuration command to control this operation function.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **no ip igmp snooping tcn flood**
5. **end**
6. **show ip igmp snooping**
7. **copy running-config startup-config**

**DETAILED STEPS**

| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                            |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                  | Enters the global configuration mode.                                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet 1/0/1</b>  | Specifies the interface to be configured, and enters interface configuration mode.                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>no ip igmp snooping tcn flood</b><br><br><b>Example:</b><br>Switch(config-if)# <b>no ip igmp snooping tcn flood</b> | Disables the flooding of multicast traffic during a spanning-tree TCN event.<br><br>By default, multicast flooding is enabled on an interface.<br><br><b>Note</b> To re-enable multicast flooding on an interface, use the <b>ip igmp snooping tcn flood</b> interface configuration command. |

|        | Command or Action                                                                                                     | Purpose                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                         |
| Step 6 | <b>show ip igmp snooping</b><br><br><b>Example:</b><br>Switch# <b>show ip igmp snooping</b>                           | Verifies the TCN settings.                               |
| Step 7 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

### Configuring the IGMP Snooping Querier (CLI)

Follow these guidelines when configuring the IGMP snooping querier:

- Configure the VLAN in global configuration mode.
- Configure an IP address on the VLAN interface. When enabled, the IGMP snooping querier uses the IP address as the query source address.
- If there is no IP address configured on the VLAN interface, the IGMP snooping querier tries to use the configured global IP address for the IGMP querier. If there is no global IP address specified, the IGMP querier tries to use the VLAN switch virtual interface (SVI) IP address (if one exists). If there is no SVI IP address, the switch uses the first available IP address configured on the switch. The first IP address available appears in the output of the **show ip interface** privileged EXEC command. The IGMP snooping querier does not generate an IGMP general query if it cannot find an available IP address on the switch.
- The IGMP snooping querier supports IGMP Versions 1 and 2.
- When administratively enabled, the IGMP snooping querier moves to the nonquerier state if it detects the presence of a multicast router in the network.
- When it is administratively enabled, the IGMP snooping querier moves to the operationally disabled state under these conditions:
  - IGMP snooping is disabled in the VLAN.
  - PIM is enabled on the SVI of the corresponding VLAN.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping querier**
4. **ip igmp snooping querier address *ip\_address***
5. **ip igmp snooping querier query-interval *interval-count***
6. **ip igmp snooping querier tcn query [count *count* | interval *interval*]**
7. **ip igmp snooping querier timer expiry *timeout***
8. **ip igmp snooping querier version *version***
9. **end**
10. **show ip igmp snooping vlan *vlan-id***
11. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                   | Enters the global configuration mode.                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>ip igmp snooping querier</b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp snooping querier</b>                                               | Enables the IGMP snooping querier.                                                                                                                                                                                                                                                                                         |
| <b>Step 4</b> | <b>ip igmp snooping querier address <i>ip_address</i></b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp snooping querier address 172.16.24.1</b> | (Optional) Specifies an IP address for the IGMP snooping querier. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier.<br><br><b>Note</b> The IGMP snooping querier does not generate an IGMP general query if it cannot find an IP address on the switch. |

|                | Command or Action                                                                                                                                                                                     | Purpose                                                                                                                                          |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b>  | <p><b>ip igmp snooping querier query-interval</b><br/><i>interval-count</i></p> <p><b>Example:</b></p> <pre>Switch(config)# ip igmp snooping querier query-interval 30</pre>                          | (Optional) Sets the interval between IGMP queriers. The range is 1 to 18000 seconds.                                                             |
| <b>Step 6</b>  | <p><b>ip igmp snooping querier tcn query</b> [<i>count count</i>  <br/><i>interval interval</i>]</p> <p><b>Example:</b></p> <pre>Switch(config)# ip igmp snooping querier tcn query interval 20</pre> | (Optional) Sets the time between Topology Change Notification (TCN) queries. The count range is 1 to 10. The interval range is 1 to 255 seconds. |
| <b>Step 7</b>  | <p><b>ip igmp snooping querier timer expiry</b> <i>timeout</i></p> <p><b>Example:</b></p> <pre>Switch(config)# ip igmp snooping querier timer expiry 180</pre>                                        | (Optional) Sets the length of time until the IGMP querier expires. The range is 60 to 300 seconds.                                               |
| <b>Step 8</b>  | <p><b>ip igmp snooping querier version</b> <i>version</i></p> <p><b>Example:</b></p> <pre>Switch(config)# ip igmp snooping querier version 2</pre>                                                    | (Optional) Selects the IGMP version number that the querier feature uses. Select 1 or 2.                                                         |
| <b>Step 9</b>  | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                                                                                               | Returns to privileged EXEC mode.                                                                                                                 |
| <b>Step 10</b> | <p><b>show ip igmp snooping vlan</b> <i>vlan-id</i></p> <p><b>Example:</b></p> <pre>Switch# show ip igmp snooping vlan 30</pre>                                                                       | (Optional) Verifies that the IGMP snooping querier is enabled on the VLAN interface. The VLAN ID range is 1 to 1001 and 1006 to 4094.            |
| <b>Step 11</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>                                                                         | (Optional) Saves your entries in the configuration file.                                                                                         |

## Disabling IGMP Report Suppression (CLI)

**Note** IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

IGMP report suppression is enabled by default. When it is enabled, the switch forwards only one IGMP report per multicast router query. When report suppression is disabled, all IGMP reports are forwarded to the multicast routers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no ip igmp snooping report-suppression**
4. **end**
5. **show ip igmp snooping**
6. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                                     | Purpose                                                                                                                                                                     |

| Step 6 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Monitoring IGMP

You can display specific statistics, such as the contents of IP routing tables, caches, and databases.

### Note

This release does not support per-route statistics.

You can display information to learn resource usage and solve network problems. You can also display information about node reachability and discover the routing path that packets of your device are taking through the network.

You can use any of the privileged EXEC commands in the following table to display various routing statistics.

**Table 28: Commands for Displaying System and Network Statistics**

| Command                                                                                    | Purpose                                                                                                     |
|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>ping</b> [ <i>group-name</i>   <i>group-address</i> ]                                   | Sends an ICMP Echo Request to a multicast group address.                                                    |
| <b>show ip igmp filter</b>                                                                 | Displays IGMP filter information.                                                                           |
| <b>show ip igmp groups</b> [ <i>type-number</i>   <i>detail</i> ]                          | Displays the multicast groups that are directly connected to the switch and that were learned through IGMP. |
| <b>show ip igmp interface</b> [ <i>type number</i> ]                                       | Displays multicast-related information about an interface.                                                  |
| <b>show ip igmp membership</b> [ <i>name/group address</i>   <b>all</b>   <b>tracked</b> ] | Displays IGMP membership information for forwarding.                                                        |
| <b>show ip igmp profile</b> [ <i>profile_number</i> ]                                      | Displays IGMP profile information.                                                                          |
| <b>show ip igmp ssm-mapping</b> [ <i>hostname/IP address</i> ]                             | Displays IGMP SSM mapping information.                                                                      |

| Command                                                            | Purpose                                                        |
|--------------------------------------------------------------------|----------------------------------------------------------------|
| <b>show ip igmp static-group</b> {class-map [ interface [ type ] ] | Displays static group information.                             |
| <b>show ip igmp vrf</b>                                            | Displays the selected VPN routing/forwarding instance by name. |

## Displaying IGMP Snooping Information

You can display IGMP snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display MAC address multicast entries for a VLAN configured for IGMP snooping.

**Table 29: Commands for Displaying IGMP Snooping Information**

| Command                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip igmp snooping detail</b>                                                    | Displays the operational state information.                                                                                                                                                                                                                                                                                                                                       |
| <b>show ip igmp snooping groups</b> [ count   vlan <i>vlan-id</i> [A.B.C.D   count ] ] | Displays multicast table information for the switch or about a specific parameter: <ul style="list-style-type: none"> <li>• <b>count</b>—Displays the total number of groups.</li> <li>• <b>vlan</b>—Displays group information by VLAN ID.</li> </ul>                                                                                                                            |
| <b>show ip igmp snooping igmpv2-tracking</b>                                           | Displays the IGMP snooping tracking. <p><b>Note</b> This command displays group and IP address entries only for wireless multicast IGMP joins and not for wired IGMP joins. Wireless IP multicast must be enabled for this command to display.</p>                                                                                                                                |
| <b>show ip igmp snooping mrouter</b> [vlan <i>vlan-id</i> ]                            | Displays information on dynamically learned and manually configured multicast router interfaces. <p><b>Note</b> When you enable IGMP snooping, the switch automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces.</p> <p>(Optional) Enter <b>vlan</b> <i>vlan-id</i> to display information for a single VLAN.</p> |

| Command                                                                             | Purpose                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip igmp snooping querier</b> [ <b>detail</b>   <b>vlan</b> <i>vlan-id</i> ] | Displays information about the IP address and receiving port for the most-recently received IGMP query messages in the VLAN.<br><br>(Optional) Enter <b>detail</b> to display the detailed IGMP querier information in a VLAN.<br><br>(Optional) Enter <b>vlan</b> <i>vlan-id</i> to display information for a single VLAN. |
| <b>show ip igmp snooping</b> [ <b>vlan</b> <i>vlan-id</i> [ <b>detail</b> ] ]       | Displays the snooping configuration information for all VLANs on the switch or for a specified VLAN.<br><br>(Optional) Enter <b>vlan</b> <i>vlan-id</i> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.                                                                          |
| <b>show ip igmp snooping wireless mgid</b>                                          | Displays wireless-related events.                                                                                                                                                                                                                                                                                           |

## Displaying IGMP Filtering and Throttling Configuration

You can display IGMP profile characteristics, and you can display the IGMP profile and maximum group configuration for all interfaces on the switch or for a specified interface. You can also display the IGMP throttling configuration for all interfaces on the switch or for a specified interface.

**Table 30: Commands for Displaying IGMP Filtering and Throttling Configuration**

| Command                                                             | Purpose                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip igmp profile</b> [ <i>profile number</i> ]               | Displays the specified IGMP profile or all the IGMP profiles defined on the switch.                                                                                                                                                                     |
| <b>show running-config</b> [ <b>interface</b> <i>interface-id</i> ] | Displays the configuration of the specified interface or the configuration of all interfaces on the switch, including (if configured) the maximum number of IGMP groups to which an interface can belong and the IGMP profile applied to the interface. |

## Configuration Examples for IGMP

### Example: Configuring the Switch as a Member of a Multicast Group

This example shows how to enable the switch to join multicast group 255.2.2.2:

```
Switch(config)# interface gigabitEthernet1/0/1
Switch(config-if)# ip igmp join-group 255.2.2.2
Switch(config-if)#
```

#### Related Topics

- [Joining a Multicast Group, on page 186](#)
- [Configuring the Switch as a Member of a Group \(CLI\), on page 192](#)
- [IP Multicast Group Addresses, on page 184](#)

### Example: Controlling Access to Multicast Groups

To limit the number of joins on the interface, configure the port for filter which associates with the IGMP profile.

```
Switch# configure terminal
Switch(config)# ip igmp profile 10
Switch(config-igmp-profile)# ?

IGMP profile configuration commands:
deny matching addresses are denied
exit Exit from igmp profile configuration mode
no Negate a command or set its defaults
permit matching addresses are permitted
range add a range to the set

Switch(config-igmp-profile)# range 172.16.5.1
Switch(config-igmp-profile)# exit
Switch(config)#
Switch(config)# interface gigabitEthernet 2/0/10
Switch(config-if)# ip igmp filter 10
```

#### Related Topics

### Examples: Configuring IGMP Snooping

This example shows how to enable a static connection to a multicast router:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 200 mrouter interface gigabitEthernet1/0/2
Switch(config)# end
```

This example shows how to statically configure a host on a port:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 105 static 224.2.4.12 interface gigabitethernet1/0/1
Switch(config)# end
```

This example shows how to enable IGMP Immediate Leave on VLAN 130:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 130 immediate-leave
Switch(config)# end
```

This example shows how to set the IGMP snooping querier source address to 10.0.0.64:

```
Switch# configure terminal
Switch(config)# ip igmp snooping querier 10.0.0.64
Switch(config)# end
```

This example shows how to set the IGMP snooping querier maximum response time to 25 seconds:

```
Switch# configure terminal
Switch(config)# ip igmp snooping querier query-interval 25
Switch(config)# end
```

This example shows how to set the IGMP snooping querier timeout to 60 seconds:

```
Switch# configure terminal
Switch(config)# ip igmp snooping querier timer expiry 60
Switch(config)# end
```

This example shows how to set the IGMP snooping querier feature to Version 2:

```
Switch# configure terminal
Switch(config)# no ip igmp snooping querier version 2
Switch(config)# end
```

## Examples: Configuring Filtering and Throttling

This example shows how to create IGMP profile 4 allowing access to the single IP multicast address and how to verify the configuration. If the action was to deny (the default), it would not appear in the **show ip igmp profile** output display.

```
Switch(config)# ip igmp profile 4
Switch(config-igmp-profile)# permit
Switch(config-igmp-profile)# range 229.9.9.0
Switch(config-igmp-profile)# end
Switch# show ip igmp profile 4
IGMP Profile 4
  permit
  range 229.9.9.0 229.9.9.0
```

This example shows how to apply IGMP profile 4 to a port:

```
Switch(config)# interface gigabitEthernet1/0/2
Switch(config-if)# ip igmp filter 4
Switch(config-if)# end
```

This example shows how to limit to 25 the number of IGMP groups that a port can join:

```
Switch(config)# interface gigabitEthernet1/0/2
Switch(config-if)# ip igmp max-groups 25
Switch(config-if)# end
```

## Example: Interface Configuration as a Routed Port

This example shows how to configure an interface on the switch as a routed port. This configuration is required on the interface for several IP multicast routing configuration procedures that require running the **no switchport** command.

```
Switch configure terminal
Switch(config)# interface GigabitEthernet1/0/9
Switch(config-if)# description interface to be use as routed port
Switch(config-if)# no switchport
Switch(config-if)# ip address 20.20.20.1 255.255.255.0
Switch(config-if)# ip pim sparse-dense-mode
Switch(config-if)# ip igmp join-group 224.1.2.3 source 15.15.15.2
Switch(config-if)# end
Switch# configure terminal
Switch# show run interface gigabitEthernet 1/0/9

Current configuration : 166 bytes
!
interface GigabitEthernet1/0/9
 no switchport
 ip address 20.20.20.1 255.255.255.0
 ip pim sparse-dense-mode
 ip igmp static-group 224.1.2.3 source 15.15.15.2
end
```

## Example: Interface Configuration as an SVI

This example shows how to configure an interface on the switch as an SVI. This configuration is required on the interface for several IP multicast routing configuration procedures that require running the **no switchport** command.

```
Switch(config)# interface vlan 150
Switch(config-if)# ip address 20.20.20.1 255.255.255.0
Switch(config-if)# ip pim sparse-dense-mode
Switch(config-if)# ip igmp join-group 224.1.2.3 source 15.15.15.2
Switch(config-if)# end
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 20 static 224.1.2.3
Switch# show run interface vlan 150
```

```

Current configuration : 137 bytes
!
interface Vlan150
 ip address 20.20.20.1 255.255.255.0
 ip pim sparse-dense-mode
 ip igmp static-group 224.1.2.3 source 15.15.15.2
end

```

## Where to Go Next for IGMP

You can configure the following:

- Wireless Multicast
- PIM
- SSM
- IP Multicast Routing
- Service Discovery Gateway

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Prerequisites for Configuring Wireless Multicast

- The IP multicast routing must be enabled and the PIM version and PIM mode must be configured. The default routes should be available in the device. After performing these tasks, the device can then forward multicast packets and can populate its multicast routing table.
- To participate in IP multicasting, the multicast hosts, routers, and multilayer switches must have IGMP operating.
- When enabling multicast mode on the switch, a CAPWAP multicast group address should also be configured. Access points listen to the CAPWAP multicast group using IGMP.

## Restrictions for Configuring Wireless Multicast

The following are the restrictions for configuring IP multicast routing:

- Access points in monitor mode, sniffer mode, or rogue detector mode do not join the CAPWAP multicast group address.
- The CAPWAP multicast group configured on the switch should be different for different switches.
- Multicast routing should not be enabled for the management interface.

## Information About Wireless Multicast

If the network supports packet multicasting, the multicast method that the switch uses can be configured. The switch performs multicasting in two modes:

- Unicast mode—The switch unicasts every multicast packet to every access point associated to the switch. This mode is inefficient but might be required on networks that do not support multicasting.
- Multicast mode—The switch sends multicast packets to a CAPWAP multicast group. This method reduces overhead on the switch processor and shifts the work of packet replication to the network, which is much more efficient than the unicast method.

When the multicast mode is enabled and the switch receives a multicast packet from the wired LAN, the switch encapsulates the packet using CAPWAP and forwards the packet to the CAPWAP multicast group address. The switch always uses the management VLAN for sending multicast packets. Access points in the multicast group receive the packet and forward it to all the BSSIDs mapped to the VLAN on which clients receive multicast traffic.

The switch supports all the capabilities of v1 including Multicast Listener Discovery (MLD) v1 snooping but the v2 and v3 capabilities are limited. This feature keeps track of and delivers IPv6 multicast flows to the clients that request them. To support IPv6 multicast, global multicast mode should be enabled.

Internet Group Management Protocol (IGMP) snooping is introduced to better direct multicast packets. When this feature is enabled, the switch snooping gathers IGMP reports from the clients, processes them, creates unique multicast group IDs (MGIDs) based on the Layer 3 multicast address and the VLAN number, and sends the IGMP reports to the IGMP querier. The switch then updates the access point MGID table on the access point with the client MAC address. When the switch receives multicast traffic for a particular multicast group, it forwards it to all the access points, but only those access points that have active clients listening or subscribed to that multicast group send multicast traffic on that particular WLAN. IP packets are forwarded with an MGID that is unique for an ingress VLAN and the destination multicast group. Layer 2 multicast packets are forwarded with an MGID that is unique for the ingress VLAN.

MGID is a 14-bit value filled in the 16-bit reserved field of wireless information in CAPWAP header. The remaining 2 bits should be set to zero.

## Information About Multicast Optimization

Multicast used to be based on the group of the multicast addresses and the VLAN as one entity, MGID. With the VLAN group, duplicate packets might increase. Using the VLAN group feature, every client listens to the multicast stream on a different VLAN. As a result, the switch creates different MGIDs for each multicast address and VLAN. Therefore, in a worst case situation, the upstream router sends one copy for each VLAN, which results in as many copies as the number of VLANs in the group. Because the WLAN remains the same for all clients, multiple copies of the multicast packet are sent over the wireless network. To suppress the duplication of a multicast stream on the wireless medium between the switch and the access points, the multicast optimization feature can be used.

Multicast optimization enables you to create a multicast VLAN that can be used for multicast traffic. One of the VLANs in the switch can be configured as a multicast VLAN where multicast groups are registered. The clients are allowed to listen to a multicast stream on the multicast VLAN. The MGID is generated using the multicast VLAN and multicast IP addresses. If multiple clients on different VLANs of the same WLAN are listening to a single multicast IP address, a single MGID is generated. The switch makes sure that all multicast streams from the clients on this VLAN group always go out on the multicast VLAN to ensure that the upstream router has one entry for all the VLANs of the VLAN group. Only one multicast stream hits the VLAN group even if the clients are on different VLANs. Therefore, the multicast packets that are sent out over the network is just one stream.

| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b> | Enters global command mode.                                                                                        |

|               | Command or Action                                                                                                                                                                                                                                | Purpose                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>ipv6 mld snooping vlan <i>vlan-id</i> mrouter interface</b><br><b>Port-channel <i>port-channel-interface-number</i></b><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 mld snooping vlan 2 mrouter</b><br><b>interface Port-channel 22</b> | Configures a Layer 2 port as a Multicast router port. The VLAN is the client VLAN. |

## Configuring RA Guard (CLI)

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 nd raguard policy *policy-name***
4. **trusted-port**
5. **device-role {host | monitor | router | switch}**

### DETAILED STEPS

|               | Command or Action                                                                                                                                  | Purpose                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                              | Enters global command mode.                                                                                        |
| <b>Step 3</b> | <b>ipv6 nd raguard policy <i>policy-name</i></b><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 nd raguard policy</b><br><b>myraguardpolicy</b> | Configures a policy for RA Guard.                                                                                  |
| <b>Step 4</b> | <b>trusted-port</b><br><br><b>Example:</b><br>Switch(config-nd-raguard)# <b>trusted-port</b>                                                       | Sets up a trusted port.                                                                                            |

|               | Command or Action                                                                                                                    | Purpose                                           |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <b>Step 5</b> | <b>device-role</b> {host   monitor   router   switch}<br><br><b>Example:</b><br>Switch(config-nd-raguard)# <b>device-role router</b> | Sets the role of the device attached to the port. |

## Configuring Non-IP Wireless Multicast (CLI)

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **wireless multicast non-ip**
4. **wireless multicast non-ip** *vlanid*
5. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                               |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                                                    | Enters global command mode.                                                                                                                                                                                                           |
| <b>Step 3</b> | <b>wireless multicast non-ip</b><br><br><b>Example:</b><br>Switch(config)# <b>wireless multicast non-ip</b><br>Switch(config)# <b>no wireless multicast non-ip</b>                                       | Enables non-IP multicast in all VLANs. Default value is <b>enable</b> . Wireless multicast must be enabled for the traffic to pass. Add <b>no</b> in the command to disable the non-IP multicast in all VLANs.                        |
| <b>Step 4</b> | <b>wireless multicast non-ip</b> <i>vlanid</i><br><br><b>Example:</b><br>Switch(config)# <b>wireless multicast non-ip</b><br><b>5</b><br>Switch(config)# <b>no wireless multicast non-ip</b><br><b>5</b> | Enables non-IP multicast per VLAN. Default value is <b>enable</b> . Both wireless multicast and wireless multicast non-IP must be enabled for traffic to pass. Add <b>no</b> in the command to disable the non-IP multicast per VLAN. |

|               | Command or Action                                               | Purpose                                                                                          |
|---------------|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b> | Exits the configuration mode. Alternatively, press <b>Ctrl-Z</b> to exit the configuration mode. |

## Configuring Wireless Broadcast (CLI)

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **wireless broadcast**
4. **wireless broadcast vlan *vlanid***
5. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                  | Purpose                                                                                                                                                                                                             |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                              | Enters global command mode.                                                                                                                                                                                         |
| <b>Step 3</b> | <b>wireless broadcast</b><br><br><b>Example:</b><br>Switch(config)# <b>wireless broadcast</b><br>Switch(config)# <b>no wireless broadcast</b>                                      | Enables broadcast packets for wireless clients. Default value is disable. Enabling <b>wireless broadcast</b> enables broadcast traffic for each VLAN. Add <b>no</b> in the command to disable broadcasting packets. |
| <b>Step 4</b> | <b>wireless broadcast vlan <i>vlanid</i></b><br><br><b>Example:</b><br>Switch(config)# <b>wireless broadcast vlan 3</b><br><br>Switch(config)# <b>no wireless broadcast vlan 3</b> | Enables broadcast packets for single VLAN. Default value is <b>enable</b> . Wireless broadcast must be enabled for broadcasting. Add <b>no</b> in the command to disable the broadcast traffic for each VLAN.       |

|               | Command or Action                                               | Purpose                                                                                          |
|---------------|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b> | Exits the configuration mode. Alternatively, press <b>Ctrl-Z</b> to exit the configuration mode. |

## Configuring IP Multicast VLAN for WLAN (CLI)

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **wlan *wlan\_name***
4. **shutdown**
5. **ip multicast vlan {*wlan\_name* *wlan\_id*}**
6. **no shutdown**
7. **end**

### DETAILED STEPS

|               | Command or Action                                                                         | Purpose                                                                                                            |
|---------------|-------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>     | Enters global command mode.                                                                                        |
| <b>Step 3</b> | <b>wlan <i>wlan_name</i></b><br><br><b>Example:</b><br>Switch(config)# <b>wlan test 1</b> | Enters the configuration mode to configure various parameters in the WLAN.                                         |
| <b>Step 4</b> | <b>shutdown</b><br><br><b>Example:</b><br>Switch(config-wlan)# <b>shutdown</b>            | Disables WLAN.                                                                                                     |

|               | Command or Action                                                                                                                                                                | Purpose                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>ip multicast vlan</b> {vlan_name vlan_id}<br><br><b>Example:</b><br>Switch(config-wlan)# <b>ip multicast vlan 5</b><br><br>Switch(config-wlan)# <b>no ip multicast vlan 5</b> | Configures multicast VLAN for WLAN. Add <b>no</b> in the command to disable the multicast VLAN for WLAN. |
| <b>Step 6</b> | <b>no shutdown</b><br><br><b>Example:</b><br>Switch(config-wlan)# <b>no shutdown</b>                                                                                             | Enables the disabled WLAN.                                                                               |
| <b>Step 7</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                                  | Exits the configuration mode. Alternatively, press <b>Ctrl-Z</b> to exit the configuration mode.         |

## Monitoring Wireless Multicast

**Table 31: Commands for Monitoring Wireless Multicast**

| Commands                                                                      | Description                                                                                                                                    |
|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show wireless multicast</b>                                                | Displays the multicast status and IP multicast mode, each VLAN's broadcast and non-IP multicast status. Also displays the mDNS bridging state. |
| <b>show wireless multicast group summary</b>                                  | Displays all (Source, Group and VLAN) lists and the corresponding MGID value.                                                                  |
| <b>show wireless multicast</b> [source source] <b>group</b> group vlan vlanid | Displays details of the given (S,G,V) and shows all of the clients associated with it and their MC2UC status                                   |
| <b>show ip igmp snooping wireless mcast-spi-count</b>                         | Displays statistics of the number of multicast SPIs per MGID sent between IOS and the Wireless Controller Module.                              |
| <b>show ip igmp snooping wireless mgid</b>                                    | Displays the MGID mappings.                                                                                                                    |

| Commands                                                 | Description                                                     |
|----------------------------------------------------------|-----------------------------------------------------------------|
| <b>show ip igmp snooping igmpv2-tracking</b>             | Displays the client-to-SGV mappings and SGV-to-client mappings. |
| <b>show ip igmp snooping querier vlan <i>vlanid</i></b>  | Displays IGMP querier information for the specified VLAN.       |
| <b>show ip igmp snooping querier detail</b>              | Displays detailed IGMP querier information of all the VLANs.    |
| <b>show ipv6 mld snooping querier vlan <i>vlanid</i></b> | Displays MLD querier information for the specified VLAN.        |
| <b>show ipv6 mld snooping wireless mgid</b>              | Displays MGIDs for IPv6 multicast group.                        |

## Where to Go Next for Wireless Multicast

You can configure the following:

- IGMP
- PIM
- SSM
- IP Multicast Routing
- Service Discovery Gateway

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Prerequisites for Configuring PIM

The following are the prerequisites for configuring PIM and PIM stub routing:

- Before configuring PIM stub routing, you must have IP multicast routing configured on both the stub router and the central router. You must also have PIM mode (dense-mode, sparse-mode, or sparse-dense-mode) configured on the uplink interface of the stub router.
- Before configuring PIM stub routing, you must also configure either Enhanced Interior Gateway Routing Protocol (EIGRP) stub routing or Open Shortest Path First (OSPF) stub routing on the switch. The PIM stub router does not route the transit traffic between the distribution routers. Unicast (EIGRP) stub routing enforces this behavior. You must configure unicast stub routing to assist the PIM stub router behavior.

**Note** For information about EIGRP or OSPF configurations, see the *Catalyst 3650 Routing Configuration Guide, Release 3SE*.

## Restrictions for Configuring PIM

The following are the restrictions for configuring PIM:

- PIM
  - PIM is not supported when running the LAN Base feature set.
- PIM stub routing
  - The IP Services image contains complete multicast routing.
  - In a network using PIM stub routing, the only allowable route for IP traffic to the user is through a switch that is configured with PIM stub routing.
  - The redundant PIM stub router topology is not supported. Only the nonredundant access router topology is supported by the PIM stub feature.
  - Only directly connected multicast (IGMP) receivers and sources are allowed in the Layer 2 access domains. The PIM protocol is not supported in access domains.

## Restrictions for Configuring Auto-RP

The following are restrictions for configuring Auto-RP (if used in your network configuration):

- Auto-RP is not supported when running the LAN Base feature set.
- If you configure PIM in sparse mode or sparse-dense mode and do not configure Auto-RP, you must manually configure an RP.
- If routed interfaces are configured in sparse mode, Auto-RP can still be used if all devices are configured with a manual RP address for the Auto-RP groups.
- If routed interfaces are configured in sparse mode and you enter the **ip pim autorp listener** global configuration command, Auto-RP can still be used even if all devices are not configured with a manual RP address for the Auto-RP groups.

## Restrictions for Configuring Auto-RP and BSR

The following are restrictions for configuring Auto-RP and BSR (if used in your network configuration):

- If your network is all Cisco routers and multilayer switches, you can use either Auto-RP or BSR.
- If you have non-Cisco routers in your network, you must use BSR.
- If you have Cisco PIMv1 and PIMv2 routers and multilayer switches and non-Cisco routers, you must use both Auto-RP and BSR. If your network includes routers from other vendors, configure the Auto-RP mapping agent and the BSR on a Cisco PIMv2 device. Ensure that no PIMv1 device is located in the path a between the BSR and a non-Cisco PIMv2 device.

---

**Note** There are two approaches to using PIMv2. You can use Version 2 exclusively in your network or migrate to Version 2 by employing a mixed PIM version environment.

---

- Because bootstrap messages are sent hop-by-hop, a PIMv1 device prevents these messages from reaching all routers and multilayer switches in your network. Therefore, if your network has a PIMv1 device in it and only Cisco routers and multilayer switches, it is best to use Auto-RP.
- If you have a network that includes non-Cisco routers, configure the Auto-RP mapping agent and the BSR on a Cisco PIMv2 router or multilayer switch. Ensure that no PIMv1 device is on the path between the BSR and a non-Cisco PIMv2 router.
- If you have non-Cisco PIMv2 routers that need to interoperate with Cisco PIMv1 routers and multilayer switches, both Auto-RP and a BSR are required. We recommend that a Cisco PIMv2 device be both the Auto-RP mapping agent and the BSR.

## Information About PIM

Protocol-Independent Multicast (PIM) is called protocol-independent because regardless of the unicast routing protocols used to populate the unicast routing table, PIM uses this information to perform multicast forwarding instead of maintaining a separate multicast routing table.

PIM can leverage whichever unicast routing protocols are used to populate the unicast routing table, including EIGRP, OSPF, BGP, or static routes. PIM uses this unicast routing information to perform the multicast forwarding function, so it is IP protocol independent. Although PIM is called a multicast routing protocol, it actually uses the unicast routing table to perform the reverse path forwarding (RPF) check function instead of building up a completely independent multicast routing table. PIM does not send and receive multicast routing updates between routers as the other routing protocols do.

PIM is defined in RFC 4601, *Protocol-Independent Multicast-Sparse Mode (PIM-SM): Protocol Specification*. PIM is defined in these Internet Engineering Task Force (IETF) Internet drafts:

- *Protocol Independent Multicast (PIM): Motivation and Architecture*
- *Protocol Independent Multicast (PIM), Dense Mode Protocol Specification*
- *Protocol Independent Multicast (PIM), Sparse Mode Protocol Specification*
- *draft-ietf-idmr-igmp-v2-06.txt, Internet Group Management Protocol, Version 2*

- *draft-ietf-pim-v2-dm-03.txt, PIM Version 2 Dense Mode*

## PIM Versions

PIMv2 includes these improvements over PIMv1:

- A single, active rendezvous point (RP) exists per multicast group, with multiple backup RPs. This single RP compares to multiple active RPs for the same group in PIMv1.
- A bootstrap router (BSR) provides a fault-tolerant, automated RP discovery and distribution function that enables routers and multilayer switches to dynamically learn the group-to-RP mappings.
- Sparse mode and dense mode are properties of a group, as opposed to an interface.

---

**Note** We strongly recommend using sparse-dense mode as opposed to either sparse mode or dense mode only.

---

- PIM join and prune messages have more flexible encoding for multiple address families.
- A more flexible hello packet format replaces the query packet to encode current and future capability options.
- Register messages sent to an RP specify whether they are sent by a border router or a designated router.
- PIM packets are no longer inside IGMP packets; they are standalone packets.

## PIMv1 and PIMv2 Interoperability

To avoid misconfiguring multicast routing on your switch, review the information in this section.

The Cisco PIMv2 implementation provides interoperability and transition between Version 1 and Version 2, although there might be some minor problems.

You can upgrade to PIMv2 incrementally. PIM Versions 1 and 2 can be configured on different routers and multilayer switches within one network. Internally, all routers and multilayer switches on a shared media network must run the same PIM version. Therefore, if a PIMv2 device detects a PIMv1 device, the Version 2 device downgrades itself to Version 1 until all Version 1 devices have been shut down or upgraded.

PIMv2 uses the BSR to discover and announce RP-set information for each group prefix to all the routers and multilayer switches in a PIM domain. PIMv1, together with the Auto-RP feature, can perform the same tasks as the PIMv2 BSR. However, Auto-RP is a standalone protocol, separate from PIMv1, and is a proprietary Cisco protocol. PIMv2 is a standards track protocol in the IETF.

---

**Note** We recommend that you use PIMv2. The BSR function interoperates with Auto-RP on Cisco routers and multilayer switches.

---

When PIMv2 devices interoperate with PIMv1 devices, Auto-RP should have already been deployed. A PIMv2 BSR that is also an Auto-RP mapping agent automatically advertises the RP elected by Auto-RP. That is, Auto-RP sets its single RP on every router or multilayer switch in the group. Not all routers and switches in the domain use the PIMv2 hash function to select multiple RPs.

Dense-mode groups in a mixed PIMv1 and PIMv2 region need no special configuration; they automatically interoperate.

Sparse-mode groups in a mixed PIMv1 and PIMv2 region are possible because the Auto-RP feature in PIMv1 interoperates with the PIMv2 RP feature. Although all PIMv2 devices can also use PIMv1, we recommend that the RPs be upgraded to PIMv2. To ease the transition to PIMv2, we recommend:

- Using Auto-RP throughout the region.
- Configuring sparse-dense mode throughout the region.

If Auto-RP is not already configured in the PIMv1 regions, configure Auto-RP.

## PIM Modes

PIM can operate in dense mode (DM), sparse mode (SM), or in sparse-dense mode (PIM DM-SM), which handles both sparse groups and dense groups at the same time.

### PIM DM

PIM DM builds source-based multicast distribution trees. In dense mode, a PIM DM router or multilayer switch assumes that all other routers or multilayer switches forward multicast packets for a group. If a PIM DM device receives a multicast packet and has no directly connected members or PIM neighbors present, a prune message is sent back to the source to stop unwanted multicast traffic. Subsequent multicast packets are not flooded to this router or switch on this pruned branch because branches without receivers are pruned from the distribution tree, leaving only branches that contain receivers.

When a new receiver on a previously pruned branch of the tree joins a multicast group, the PIM DM device detects the new receiver and immediately sends a graft message up the distribution tree toward the source. When the upstream PIM DM device receives the graft message, it immediately puts the interface on which the graft was received into the forwarding state so that the multicast traffic begins flowing to the receiver.

### PIM-SM

PIM-SM uses shared trees and shortest-path-trees (SPTs) to distribute multicast traffic to multicast receivers in the network. In PIM-SM, a router or multilayer switch assumes that other routers or switches do not forward multicast packets for a group, unless there is an explicit request for the traffic (join message). When a host joins a multicast group using IGMP, its directly connected PIM-SM device sends PIM join messages toward the root, also known as the rendezvous point (RP). This join message travels router-by-router toward the root, constructing a branch of the shared tree as it goes.

The RP keeps track of multicast receivers. It also registers sources through register messages received from the source's first-hop router (designated router [DR]) to complete the shared tree path from the source to the receiver. When using a shared tree, sources must send their traffic to the RP so that the traffic reaches all receivers.

Prune messages are sent up the distribution tree to prune multicast group traffic. This action permits branches of the shared tree or SPT that were created with explicit join messages to be torn down when they are no longer needed.

When the number of PIM-enabled interfaces exceeds the hardware capacity and PIM-SM is enabled with the SPT threshold is set to **infinity**, the switch does not create (source, group (S, G) ) entries in the multicast routing table for the some directly connected interfaces if they are not already in the table. The switch might not correctly forward traffic from these interfaces.

### *Multicast Source Discovery Protocol (MSDP)*

Multicast Source Discovery Protocol (MSDP) is used for inter-domain source discovery when PIM SM is used. Each PIM administrative domain has its own RP. In order for the RP in one domain to signal new sources to the RP in the other domain, MSDP is used.

When RP in a domain receives a PIM register message for a new source, with MSDP configured it sends a new source-active (SA) message to all its MSDP peers in other domains. Each intermediate MSDP peer floods this SA message away from the originating RP. The MSDP peers install this SA message in their MSDP sa-cache. If the RPs in other domains have any join requests for the group in the SA message (indicated by the presence of a (\*,G) entry with non empty outgoing interface list), the domain is interested in the group, and the RP triggers an (S,G) join toward the source.

## **PIM Stub Routing**

The PIM stub routing feature, available in all of the switch software images, reduces resource usage by moving routed traffic closer to the end user.

The PIM stub routing feature supports multicast routing between the distribution layer and the access layer. It supports two types of PIM interfaces: uplink PIM interfaces and PIM passive interfaces. A routed interface configured with the PIM passive mode does not pass or forward PIM control traffic, it only passes and forwards IGMP traffic.

In a network using PIM stub routing, the only allowable route for IP traffic to the user is through a switch that is configured with PIM stub routing. PIM passive interfaces are connected to Layer 2 access domains, such as VLANs, or to interfaces that are connected to other Layer 2 devices. Only directly connected multicast (IGMP) receivers and sources are allowed in the Layer 2 access domains. The PIM passive interfaces do not send or process any received PIM control packets.

When using PIM stub routing, you should configure the distribution and remote routers to use IP multicast routing and configure only the switch as a PIM stub router. The switch does not route transit traffic between distribution routers. You also need to configure a routed uplink port on the switch. The switch uplink port cannot be used with SVIs. If you need PIM for an SVI uplink port, you should upgrade to the IP Services feature set.

You must also configure EIGRP stub routing when configuring PIM stub routing on the switch. For information about this procedure, refer to the *Catalyst 3850 IP Routing Configuration Guide*.

The redundant PIM stub router topology is not supported. The redundant topology exists when there is more than one PIM router forwarding multicast traffic to a single access domain. PIM messages are blocked, and the PIM asset and designated router election mechanisms are not supported on the PIM passive interfaces. Only the nonredundant access router topology is supported by the PIM stub feature. By using a nonredundant topology, the PIM passive interface assumes that it is the only interface and designated router on that access domain.

In the following figure, Switch A uplink port 25 is connected to the router and PIM stub routing is enabled on the VLAN 100 interfaces and on Host 3. This configuration allows the directly connected hosts to receive traffic from multicast source 200.1.1.3.

**Figure 8: PIM Stub Router Configuration**

### Related Topics

[Enabling PIM Stub Routing \(CLI\), on page 264](#)

[Example: Enabling PIM Stub Routing, on page 292](#)

## IGMP Helper

PIM stub routing moves routed traffic closer to the end user and reduces network traffic. You can also reduce traffic by configuring a stub router (switch) with the IGMP helper feature.

You can configure a stub router (switch) with the **ip igmp helper help-address** interface configuration command to enable the switch to send reports to the next-hop interface. Hosts that are not directly connected to a downstream router can then join a multicast group sourced from an upstream network. The IGMP packets from a host wanting to join a multicast stream are forwarded upstream to the next-hop device when this feature is configured. When the upstream central router receives the helper IGMP reports or leaves, it adds or removes the interfaces from its outgoing interface list for that group.

For complete syntax and usage information for the **ip igmp helper-address** command, see the *IP Multicast Command Reference, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)*.

## Auto-RP

The PIM-SM protocols require the presence of a rendezvous point (RP) in the network. An RP acts as the meeting place for sources and receivers of multicast data. If a static RP configuration is used, then the configuration needs to be applied on all the routers in the multicast network. To automate this process, the Auto-RP protocol was devised.

This Cisco proprietary feature eliminates the need to manually configure the RP information in every router and multilayer switch in the network. For Auto-RP to work, you configure a Cisco router or multilayer switch as the mapping agent. It uses IP multicast to learn which routers or switches in the network are possible candidate RPs to receive candidate RP announcements. Candidate RPs periodically send multicast RP-announce messages to a particular group or group range to announce their availability.

Mapping agents listen to these candidate RP announcements and use the information to create entries in their group-to-RP mapping caches. Only one mapping cache entry is created for any group-to-RP range received, even if multiple candidate RPs are sending RP announcements for the same range. As the RP-announce messages arrive, the mapping agent selects the router or switch with the highest IP address as the active RP and stores this RP address in the group-to-RP mapping cache.

Mapping agents periodically multicast the contents of their group-to-RP mapping caches. Thus, all routers and switches automatically discover which RP to use for the groups that they support. If a router or switch fails to receive RP-discovery messages and the group-to-RP mapping information expires, it changes to a statically configured RP that was defined with the **ip pim rp-address** global configuration command. If no statically configured RP exists, the router or switch changes the group to dense-mode operation.

Multiple RPs serve different group ranges or serve as hot backups of each other.

### Related Topics

[Setting Up Auto-RP in a New Internetwork \(CLI\), on page 269](#)

[Example: Configuring Auto-RP, on page 293](#)

### Auto-RP Benefits

Auto-RP uses IP multicast to automate the distribution of group-to-RP mappings to all Cisco routers and multilayer switches in a PIM network. Auto-RP has these benefits:

- Easy to use multiple RPs within a network to serve different group ranges.
- Provides load splitting among different RPs and arrangement of RPs according to the location of group participants.
- Avoids inconsistent, manual RP configurations on every router and multilayer switch in a PIM network, which can cause connectivity problems.

### PIM v2 BSR

PIMv2 BSR (Bootstrap Router) is another method to distribute group-to-RP mapping information to all PIM routers and multilayer switches in the network. It eliminates the need to manually configure RP information in every router and switch in the network. However, instead of using IP multicast to distribute group-to-RP mapping information, BSR uses hop-by-hop flooding of special BSR messages to distribute the mapping information.

The BSR is elected from a set of candidate routers and switches in the domain that have been configured to function as BSRs. The election mechanism is similar to the root-bridge election mechanism used in bridged LANs. The BSR election is based on the BSR priority of the device contained in the BSR messages that are sent hop-by-hop through the network. Each BSR device examines the message and forwards out all interfaces only the message that has either a higher BSR priority than its BSR priority or the same BSR priority, but with a higher BSR IP address. Using this method, the BSR is elected.

The elected BSR sends BSR messages with a TTL of 1. Neighboring PIMv2 routers or multilayer switches receive the BSR message and multicast it out all other interfaces (except the one on which it was received) with a TTL of 1. In this way, BSR messages travel hop-by-hop throughout the PIM domain. Because BSR messages contain the IP address of the current BSR, the flooding mechanism enables candidate RPs to automatically learn which device is the elected BSR.

Candidate RPs send candidate RP advertisements showing the group range for which they are responsible to the BSR, which stores this information in its local candidate-RP cache. The BSR periodically advertises the

contents of this cache in BSR messages to all other PIM devices in the domain. These messages travel hop-by-hop through the network to all routers and switches, which store the RP information in the BSR message in their local RP cache. The routers and switches select the same RP for a given group because they all use a common RP hashing algorithm.

[Example: Configuring Candidate BSRs, on page 294](#)

## Multicast Forwarding and Reverse Path Check

With unicast routing, routers and multilayer switches forward traffic through the network along a single path from the source to the destination host whose IP address appears in the destination address field of the IP packet. Each router and switch along the way makes a unicast forwarding decision, using the destination IP address in the packet, by looking up the destination address in the unicast routing table and forwarding the packet through the specified interface to the next hop toward the destination.

With multicasting, the source is sending traffic to an arbitrary group of hosts represented by a multicast group address in the destination address field of the IP packet. To decide whether to forward or drop an incoming multicast packet, the router or multilayer switch uses a reverse path forwarding (RPF) check on the packet as follows:

- 1 The router or multilayer switch examines the source address of the arriving multicast packet to decide whether the packet arrived on an interface that is on the reverse path back to the source.
- 2 If the packet arrives on the interface leading back to the source, the RPF check is successful and the packet is forwarded to all interfaces in the outgoing interface list (which might not be all interfaces on the router).
- 3 If the RPF check fails, the packet is discarded.

Some multicast routing protocols, such as DVMRP, maintain a separate multicast routing table and use it for the RPF check. However, PIM uses the unicast routing table to perform the RPF check.

---

**Note**

DVMRP is not supported on the switch.

---

The following figure shows port 2 receiving a multicast packet from source 151.10.3.21. The following table shows that the port on the reverse path to the source is port 1, not port 2. Because the RPF check fails, the multilayer switch discards the packet. Another multicast packet from source 151.10.3.21 is received on port

1, and the routing table shows this port is on the reverse path to the source. Because the RPF check passes, the switch forwards the packet to all port in the outgoing port list

**Figure 9: RPF Check**

**Table 32: Routing Table Example for an RPF Check**

| Network        | Port                   |
|----------------|------------------------|
| 151.10.0.0/16  | Gigabit Ethernet 1/0/1 |
| 198.14.32.0/32 | Gigabit Ethernet 1/0/3 |
| 204.1.16.0/24  | Gigabit Ethernet 1/0/4 |

PIM uses both source trees and RP-rooted shared trees to forward datagrams. The RPF check is performed differently for each:

- If a PIM router or multilayer switch has a source-tree state (that is, an (S, G) entry is present in the multicast routing table), it performs the RPF check against the IP address of the source of the multicast packet.
- If a PIM router or multilayer switch has a shared-tree state (and no explicit source-tree state), it performs the RPF check on the RP address (which is known when members join the group).

Sparse-mode PIM uses the RPF lookup function to decide where it needs to send joins and prunes:

- (S, G) joins (which are source-tree states) are sent toward the source.
- (\*,G) joins (which are shared-tree states) are sent toward the RP.

**Note** DVMRP is not supported on the switch.

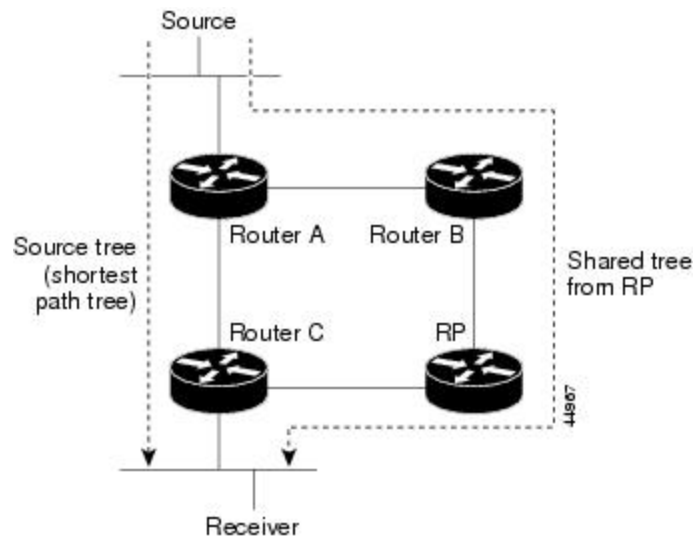

## PIM Shared Tree and Source Tree

By default, members of a group receive data from senders to the group across a single data-distribution tree rooted at the RP.

The following figure shows this type of shared-distribution tree. Data from senders is delivered to the RP for distribution to group members joined to the shared tree.

**Figure 10: Shared Tree and Source Tree (Shortest-Path Tree)**

If the data rate warrants, leaf routers (routers without any downstream connections) on the shared tree can use the data distribution tree rooted at the source. This type of distribution tree is called a shortest-path tree or source tree. By default, the software switches to a source tree upon receiving the first data packet from a source.

This process describes the move from a shared tree to a source tree:

- 1 A receiver joins a group; leaf Router C sends a join message toward the RP.
- 2 The RP puts a link to Router C in its outgoing interface list.
- 3 A source sends data; Router A encapsulates the data in a register message and sends it to the RP.
- 4 The RP forwards the data down the shared tree to Router C and sends a join message toward the source. At this point, data might arrive twice at Router C, once encapsulated and once natively.
- 5 When data arrives natively (unencapsulated) at the RP, it sends a register-stop message to Router A.
- 6 By default, reception of the first data packet prompts Router C to send a join message toward the source.
- 7 When Router C receives data on (S, G), it sends a prune message for the source up the shared tree.
- 8 The RP deletes the link to Router C from the outgoing interface of (S, G). The RP triggers a prune message toward the source.

Join and prune messages are sent for sources and RPs. They are sent hop-by-hop and are processed by each PIM device along the path to the source or RP. Register and register-stop messages are not sent hop-by-hop. They are sent by the designated router that is directly connected to a source and are received by the RP for the group.

Multiple sources sending to groups use the shared tree.

You can configure the PIM device to stay on the shared tree. You can configure the PIM device to stay on the shared tree. For more information, see [Delaying the Use of PIM Shortest-Path Tree \(CLI\)](#), on page 286.

## Default PIM Routing Configuration

This table displays the default PIM routing configuration for the switch.

**Table 33: Default Multicast Routing Configuration**

| Feature                           | Default Setting             |
|-----------------------------------|-----------------------------|
| Multicast routing                 | Disabled on all interfaces. |
| PIM version                       | Version 2.                  |
| PIM mode                          | No mode is defined.         |
| PIM stub routing                  | None configured.            |
| PIM RP address                    | None configured.            |
| PIM domain border                 | Disabled.                   |
| PIM multicast boundary            | None.                       |
| Candidate BSRs                    | Disabled.                   |
| Candidate RPs                     | Disabled.                   |
| Shortest-path tree threshold rate | 0 kb/s.                     |
| PIM router query message interval | 30 seconds.                 |

## How to Configure PIM

### Enabling PIM Stub Routing (CLI)

This procedure is optional.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **ip pim passive**
5. **end**
6. **show ip pim interface**
7. **show ip igmp groups detail**
8. **show ip mroute**
9. **show running-config**
10. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|---------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                           | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>interface</b><br><b>gigabitethernet 1/0/1</b> | Specifies the interface on which you want to enable PIM stub routing, and enters interface configuration mode. <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port, on page 236</a></li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan <i>vlan-id</i></b> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI, on page 236</a></li> </ul> |

|                | Command or Action                                                                                                     | Purpose                                                                                          |
|----------------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
|                |                                                                                                                       | These interfaces must have IP addresses assigned to them.                                        |
| <b>Step 4</b>  | <b>ip pim passive</b><br><br><b>Example:</b><br>Switch(config-if) # <b>ip pim passive</b>                             | Configures the PIM stub feature on the interface.                                                |
| <b>Step 5</b>  | <b>end</b><br><br><b>Example:</b><br>Switch(config-if) # <b>end</b>                                                   | Returns to privileged EXEC mode.                                                                 |
| <b>Step 6</b>  | <b>show ip pim interface</b><br><br><b>Example:</b><br>Switch# <b>show ip pim interface</b>                           | (Optional) Displays the PIM stub that is enabled on each interface.                              |
| <b>Step 7</b>  | <b>show ip igmp groups detail</b><br><br><b>Example:</b><br>Switch# <b>show ip igmp groups detail</b>                 | (Optional) Displays the interested clients that have joined the specific multicast source group. |
| <b>Step 8</b>  | <b>show ip mroute</b><br><br><b>Example:</b><br>Switch# <b>show ip mroute</b>                                         | (Optional) Displays the IP multicast routing table.                                              |
| <b>Step 9</b>  | <b>show running-config</b><br><br><b>Example:</b><br>Switch# <b>show running-config</b>                               | (Optional) Verifies your entries.                                                                |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.                                         |

## Configuring a Rendezvous Point

You must have a rendezvous point (RP), if the interface is in sparse-dense mode and if you want to handle the group as a sparse group. You can use several methods, as described in these sections:

- Manual assignment

For information about this procedure, see [Manually Assigning an RP to Multicast Groups \(CLI\), on page 267](#).

- As a standalone, Cisco-proprietary protocol separate from PIMv1

For information about these procedures, see the following sections:

- [Setting Up Auto-RP in a New Internetwork \(CLI\), on page 269](#)
- [Adding Auto-RP to an Existing Sparse-Mode Cloud \(CLI\), on page 272](#)
- [Preventing Join Messages to False RPs \(CLI\), on page 275](#)
- [Filtering Incoming RP Announcement Messages \(CLI\), on page 275](#)

- Using a standards track protocol in the Internet Engineering Task Force (IETF)

For information about this procedure, see [Configuring PIMv2 BSR, on page 277](#).

### Note

You can use Auto-RP, BSR, or a combination of both, depending on the PIM version that you are running and the types of routers in your network. For information about working with different PIM versions in your network, see [PIMv1 and PIMv2 Interoperability, on page 256](#).

## Manually Assigning an RP to Multicast Groups (CLI)

If the rendezvous point (RP) for a group is learned through a dynamic mechanism (such as Auto-RP or BSR), you need not perform this task for that RP.

Senders of multicast traffic announce their existence through register messages received from the source first-hop router (designated router) and forwarded to the RP. Receivers of multicast packets use RPs to join a multicast group by using explicit join messages.

### Note

RPs are not members of the multicast group; they serve as a *meeting place* for multicast sources and group members.

You can configure a single RP for multiple groups defined by an access list. If there is no RP configured for a group, the multilayer switch responds to the group as dense and uses the dense-mode PIM techniques.

This procedure is optional.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip pim rp-address** *ip-address* [*access-list-number*] [**override**]
4. **access-list** *access-list-number* {**deny** | **permit**} *source* [*source-wildcard*]
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                                                               | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                                       | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>ip pim rp-address</b> <i>ip-address</i> [ <i>access-list-number</i> ] [ <b>override</b> ]<br><br><b>Example:</b><br>Switch(config)# <b>ip pim rp-address</b> 10.1.1.1 20 <b>override</b> | Configures the address of a PIM RP.<br><br>By default, no PIM RP address is configured. You must configure the IP address of RPs on all routers and multilayer switches (including the RP).<br><br><b>Note</b> If there is no RP configured for a group, the switch treats the group as dense, using the dense-mode PIM techniques.<br>A PIM device can be an RP for more than one group. Only one RP address can be used at a time within a PIM domain. The access list conditions specify for which groups the device is an RP.<br><br><ul style="list-style-type: none"> <li>• For <i>ip-address</i>, enter the unicast address of the RP in dotted-decimal notation.</li> <li>• (Optional) For <i>access-list-number</i>, enter an IP standard access list number from 1 to 99. If no access list is configured, the RP is used for all groups.</li> <li>• (Optional) The <b>override</b> keyword indicates that if there is a conflict between the RP configured with this command and one learned by Auto-RP or BSR, the RP configured with this command prevails.</li> </ul> |
| <b>Step 4</b> | <b>access-list</b> <i>access-list-number</i> { <b>deny</b>   <b>permit</b> } <i>source</i> [ <i>source-wildcard</i> ]                                                                       | Creates a standard access list, repeating the command as many times as necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|               | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch(config)# access-list 25 permit 10.5.0.1 255.224.0.0</pre>                                  | <ul style="list-style-type: none"> <li>For <i>access-list-number</i>, enter the access list number specified in Step 2.</li> <li>The <b>deny</b> keyword denies access if the conditions are matched.</li> <li>The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>For <i>source</i>, enter the multicast group address for which the RP should be used.</li> <li>(Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul> <p>The access list is always terminated by an implicit deny statement for everything.</p> |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 6</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>                               | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 7</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### Setting Up Auto-RP in a New Internetwork (CLI)

If you are setting up Auto-RP in a new internetwork, you do not need a default RP because you configure all the interfaces for sparse-dense mode.

#### Note

Omit Step 3 in the following procedure, if you want to configure a PIM router as the RP for the local group.

## SUMMARY STEPS

1. **enable**
2. **show running-config**
3. **configure terminal**
4. **ip pim send-rp-announce** *interface-id* **scope** *tvl* **group-list** *access-list-number* **interval** *seconds*
5. **access-list** *access-list-number* {**deny** | **permit**} *source* [*source-wildcard*]
6. **ip pim send-rp-discovery** *scope* *tvl*
7. **end**
8. **show running-config**
9. **show ip pim rp mapping**
10. **show ip pim rp**
11. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 2 | <b>show running-config</b><br><br><b>Example:</b><br>Switch# <b>show running-config</b>                                                               | Verifies that a default RP is already configured on all PIM devices and the RP in the sparse-mode network. It was previously configured with the <b>ip pim rp-address</b> global configuration command.<br><br><b>Note</b> This step is not required for sparse-dense-mode environments.<br><br>The selected RP should have good connectivity and be available across the network. Use this RP for the global groups (for example, 224.x.x.x and other global groups). Do not reconfigure the group address range that this RP serves. RPs dynamically discovered through Auto-RP take precedence over statically configured RPs. Assume that it is desirable to use a second RP for the local groups. |
| Step 3 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                 | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 4 | <b>ip pim send-rp-announce</b> <i>interface-id</i> <b>scope</b> <i>tvl</i> <b>group-list</b> <i>access-list-number</i> <b>interval</b> <i>seconds</i> | Configures another PIM device to be the candidate RP for local groups. <ul style="list-style-type: none"> <li>• For <i>interface-id</i>, enter the interface type and number that identifies the RP address. Valid interfaces include physical ports, port channels, and VLANs.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                             |

|               | Command or Action                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch(config)# ip pim send-rp-announce gigabitethernet 1/0/5 scope 20 group-list 10 interval 120</pre>                                                          | <ul style="list-style-type: none"> <li>For <b>scope</b> <i>tll</i>, specify the time-to-live value in hops. Enter a hop count that is high enough so that the RP-announce messages reach all mapping agents in the network. There is no default setting. The range is 1 to 255.</li> <li>For <b>group-list</b> <i>access-list-number</i>, enter an IP standard access list number from 1 to 99. If no access list is configured, the RP is used for all groups.</li> <li>For <b>interval</b> <i>seconds</i>, specify how often the announcement messages must be sent. The default is 60 seconds. The range is 1 to 16383.</li> </ul>                                                                                                                                                                      |
| <b>Step 5</b> | <p><b>access-list</b> <i>access-list-number</i> {deny   permit} <i>source</i> [<i>source-wildcard</i>]</p> <p><b>Example:</b></p> <pre>Switch(config)# access-list 10 permit 10.10.0.0</pre> | <p>Creates a standard access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> <li>For <i>access-list-number</i>, enter the access list number specified in Step 3.</li> <li>The <b>deny</b> keyword denies access if the conditions are matched.</li> <li>The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>For <i>source</i>, enter the multicast group address range for which the RP should be used.</li> <li>(Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul> <p><b>Note</b> Recall that the access list is always terminated by an implicit deny statement for everything.</p> |
| <b>Step 6</b> | <p><b>ip pim send-rp-discovery scope</b> <i>tll</i></p> <p><b>Example:</b></p> <pre>Switch(config)# ip pim send-rp-discovery scope 50</pre>                                                  | <p>Finds a switch whose connectivity is not likely to be interrupted, and assign it the role of RP-mapping agent.</p> <p>For <b>scope</b> <i>tll</i>, specify the time-to-live value in hops to limit the RP discovery packets. All devices within the hop count from the source device receive the Auto-RP discovery messages. These messages tell other devices which group-to-RP mapping to use to avoid conflicts (such as overlapping group-to-RP ranges). There is no default setting. The range is 1 to 255.</p>                                                                                                                                                                                                                                                                                    |
| <b>Step 7</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                                                                                      | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 8</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>                                                                                              | <p>Verifies your entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 9</b> | <p><b>show ip pim rp mapping</b></p>                                                                                                                                                         | <p>Displays active RPs that are cached with associated multicast routing entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                | Command or Action                                                                                                           | Purpose                                                  |
|----------------|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | <b>Example:</b><br>Switch# <code>show ip pim rp mapping</code>                                                              |                                                          |
| <b>Step 10</b> | <b>show ip pim rp</b><br><br><b>Example:</b><br>Switch# <code>show ip pim rp</code>                                         | Displays the information cached in the routing table.    |
| <b>Step 11</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

### Adding Auto-RP to an Existing Sparse-Mode Cloud (CLI)

This section contains suggestions for the initial deployment of Auto-RP into an existing sparse-mode cloud to minimize disruption of the existing multicast infrastructure.

This procedure is optional.

### SUMMARY STEPS

1. `enable`
2. `show running-config`
3. `configure terminal`
4. `ip pim send-rp-announce interface-id scope ttl group-list access-list-number interval seconds`
5. `access-list access-list-number {deny | permit} source [source-wildcard]`
6. `ip pim send-rp-discovery scope ttl`
7. `end`
8. `show running-config`
9. `show ip pim rp mapping`
10. `show ip pim rp`
11. `copy running-config startup-config`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Switch&gt; enable</pre>                                                                                                                                                                                                                                 | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 2 | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>                                                                                                                                                                                                          | <p>Verifies that a default RP is already configured on all PIM devices and the RP in the sparse-mode network. It was previously configured with the <b>ip pim rp-address</b> global configuration command.</p> <p><b>Note</b> This step is not required for sparse-dense-mode environments.</p> <p>The selected RP should have good connectivity and be available across the network. Use this RP for the global groups (for example, 224.x.x.x and other global groups). Do not reconfigure the group address range that this RP serves. RPs dynamically discovered through Auto-RP take precedence over statically configured RPs. Assume that it is desirable to use a second RP for the local groups.</p>                                                                                                                                                                                        |
| Step 3 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>                                                                                                                                                                                                            | <p>Enters the global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 4 | <p><b>ip pim send-rp-announce</b> <i>interface-id</i><br/><b>scope</b> <i>ttl</i> <b>group-list</b> <i>access-list-number</i><br/><b>interval</b> <i>seconds</i></p> <p><b>Example:</b></p> <pre>Switch(config)# ip pim send-rp-announce gigabitethernet 1/0/5 scope 20 group-list 10 interval 120</pre> | <p>Configures another PIM device to be the candidate RP for local groups.</p> <ul style="list-style-type: none"> <li>• For <i>interface-id</i>, enter the interface type and number that identifies the RP address. Valid interfaces include physical ports, port channels, and VLANs.</li> <li>• For <b>scope</b> <i>ttl</i>, specify the time-to-live value in hops. Enter a hop count that is high enough so that the RP-announce messages reach all mapping agents in the network. There is no default setting. The range is 1 to 255.</li> <li>• For <b>group-list</b> <i>access-list-number</i>, enter an IP standard access list number from 1 to 99. If no access list is configured, the RP is used for all groups.</li> <li>• For <b>interval</b> <i>seconds</i>, specify how often the announcement messages must be sent. The default is 60 seconds. The range is 1 to 16383.</li> </ul> |
| Step 5 | <p><b>access-list</b> <i>access-list-number</i> {<b>deny</b>   <b>permit</b>} <i>source</i> [<i>source-wildcard</i>]</p> <p><b>Example:</b></p> <pre>Switch(config)# access-list 10 permit 224.0.0.0 15.255.255.255</pre>                                                                                | <p>Creates a standard access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> <li>• For <i>access-list-number</i>, enter the access list number specified in Step 3.</li> <li>• The <b>deny</b> keyword denies access if the conditions are matched.</li> <li>• The <b>permit</b> keyword permits access if the conditions are matched.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                | Command or Action                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### Preventing Join Messages to False RPs (CLI)

Determine whether the **ip pim accept-rp** command was previously configured throughout the network by using the **show running-config** privileged EXEC command. If the **ip pim accept-rp** command is not configured on any device, this problem can be addressed later. In those routers or multilayer switches already configured with the **ip pim accept-rp** command, you must enter the command again to accept the newly advertised RP.

To accept all RPs advertised with Auto-RP and reject all other RPs by default, use the **ip pim accept-rp auto-rp** global configuration command.

This procedure is optional.

### Filtering Incoming RP Announcement Messages (CLI)

You can add configuration commands to the mapping agents to prevent a maliciously configured router from masquerading as a candidate RP and causing problems.

This procedure is optional.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip pim rp-announce-filter rp-list *access-list-number* group-list *access-list-number***
4. **access-list *access-list-number* {deny | permit} source [*source-wildcard*]**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

## Configuring PIMv2 BSR

The process for configuring PIMv2 BSR may involve the following optional tasks:

- Defining the PIM domain border
- Defining the IP multicast boundary
- Configuring candidate BSRs
- Configuring candidate RPs

### Defining the PIM Domain Border (CLI)

As IP multicast becomes more widespread, the chance of one PIMv2 domain bordering another PIMv2 domain increases. Because two domains probably do not share the same set of RPs, BSR, candidate RPs, and candidate BSRs, you need to constrain PIMv2 BSR messages from flowing into or out of the domain. Allowing messages to leak across the domain borders could adversely affect the normal BSR election mechanism and elect a single BSR across all bordering domains and comingle candidate RP advertisements, resulting in the election of RPs in the wrong domain.

This figure displays how you can configure the PIM domain border by using the **ip pim bsr-border** command.

**Figure 11: Constraining PIMv2 BSR Messages**

This procedure is optional.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface interface-id**
4. **ip pim bsr-border**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

**DETAILED STEPS**

|               | Command or Action                                                                     | Purpose                                                                            |
|---------------|---------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                         | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.            |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b> | Enters the global configuration mode.                                              |
| <b>Step 3</b> | <b>interface interface-id</b>                                                         | Specifies the interface to be configured, and enters interface configuration mode. |

|               | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/1</pre>                                             | <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port</a>, on page 236</li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan vlan-id</b> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI</a>, on page 236</li> </ul> <p>These interfaces must have IP addresses assigned to them.</p> |
| <b>Step 4</b> | <p><b>ip pim bsr-border</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ip pim bsr-border</pre>                        | <p>Defines a PIM bootstrap message boundary for the PIM domain.</p> <p>Enter this command on each interface that connects to other bordering PIM domains. This command instructs the switch to neither send nor receive PIMv2 BSR messages on this interface.</p> <p><b>Note</b> To remove the PIM border, use the <b>no ip pim bsr-border</b> interface configuration command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                       | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>                               | <p>Verifies your entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 7</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre> | <p>(Optional) Saves your entries in the configuration file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Defining the IP Multicast Boundary (CLI)

You define a multicast boundary to prevent Auto-RP messages from entering the PIM domain. You create an access list to deny packets destined for 224.0.1.39 and 224.0.1.40, which carry Auto-RP information.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* **deny** *source* [*source-wildcard*]
4. **interface** *interface-id*
5. **ip multicast boundary** *access-list-number*
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Configuring the Candidate RPs (CLI)

You can configure one or more candidate RPs. Similar to BSRs, the RPs should also have good connectivity to other devices and be in the backbone portion of the network. An RP can serve the entire IP multicast address space or a portion of it. Candidate RPs send candidate RP advertisements to the BSR. When deciding which devices should be RPs, consider these options:

- In a network of Cisco routers and multilayer switches where only Auto-RP is used, any device can be configured as an RP.
- In a network that includes only Cisco PIMv2 routers and multilayer switches and with routers from other vendors, any device can be used as an RP.
- In a network of Cisco PIMv1 routers, Cisco PIMv2 routers, and routers from other vendors, configure only Cisco PIMv2 routers and multilayer switches as RPs.

This procedure is optional.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip pim rp-candidate** *interface-id* [**group-list** *access-list-number*]
4. **access-list** *access-list-number* {**deny** | **permit**} *source* [*source-wildcard*]
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Configuring Auto-RP and BSR for the Network (CLI)

If there are only Cisco devices in your network (no routers from other vendors), there is no need to configure a BSR. Configure Auto-RP in a network that is running both PIMv1 and PIMv2.

If you have non-Cisco PIMv2 routers that need to interoperate with Cisco PIMv1 routers and multilayer switches, both Auto-RP and a BSR are required. We recommend that a Cisco PIMv2 router or multilayer switch be both the Auto-RP mapping agent and the BSR.

If you must have one or more BSRs, we have these recommendations:

- Configure the candidate BSRs as the RP-mapping agents for Auto-RP. For information about these procedures, see:
  - [Configuring a Rendezvous Point, on page 267](#)
  - [Configuring Candidate BSRs \(CLI\), on page 282](#)
- For group prefixes advertised through Auto-RP, the PIMv2 BSR mechanism should not advertise a subrange of these group prefixes served by a different set of RPs. In a mixed PIMv1 and PIMv2 domain, backup RPs should serve the same group prefixes. This prevents the PIMv2 DRs from selecting a different RP from those PIMv1 DRs, due to the longest match lookup in the RP-mapping database.

## Before You Begin

Beginning in privileged EXEC mode, follow these steps to verify the consistency of group-to-RP mappings. This procedure is optional.

## SUMMARY STEPS

1. `show ip pim rp [ hostname or IP address | mapping [ hostname or IP address | elected | in-use ] | metric [ hostname or IP address ] ]`
2. `show ip pim rp-hash group`

## Delaying the Use of PIM Shortest-Path Tree (CLI)

The change from shared to source tree happens when the first data packet arrives at the last-hop router. This change occurs because the `ip pim spt-threshold` global configuration command controls that timing.

The shortest-path tree requires more memory than the shared tree but reduces delay. You might want to postpone its use. Instead of allowing the leaf router to immediately move to the shortest-path tree, you can specify that the traffic must first reach a threshold.

You can configure when a PIM leaf router should join the shortest-path tree for a specified group. If a source sends at a rate greater than or equal to the specified kbps rate, the multilayer switch triggers a PIM join message toward the source to construct a source tree (shortest-path tree). If the traffic rate from the source drops below the threshold value, the leaf router switches back to the shared tree and sends a prune message toward the source.

You can specify to which groups the shortest-path tree threshold applies by using a group list (a standard access list). If a value of 0 is specified or if the group list is not used, the threshold applies to all groups.

This procedure is optional.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* {deny | permit} *source* [*source-wildcard*]
4. **ip pim spt-threshold** {*kbps* | infinity} [**group-list** *access-list-number*]
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 3 | <b>access-list</b> <i>access-list-number</i> {deny   permit} <i>source</i> [ <i>source-wildcard</i> ]<br><br><b>Example:</b><br>Switch(config)# <b>access-list 16 permit 225.0.0.0 0.255.255.255</b> | Creates a standard access list. <ul style="list-style-type: none"> <li>• For <i>access-list-number</i>, the range is 1 to 99.</li> <li>• The <b>deny</b> keyword denies access if the conditions are matched.</li> <li>• The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>• For <i>source</i>, specify the multicast group to which the threshold will apply.</li> <li>• (Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul> <p>The access list is always terminated by an implicit deny statement for everything.</p> |
| Step 4 | <b>ip pim spt-threshold</b> { <i>kbps</i>   infinity} [ <b>group-list</b> <i>access-list-number</i> ]                                                                                                | Specifies the threshold that must be reached before moving to shortest-path tree (spt).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|               | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch(config)# ip pim spt-threshold infinity group-list 16</pre>                                 | <ul style="list-style-type: none"> <li>For <i>kbps</i>, specify the traffic rate in kilobits per second. The default is 0 kbps.</li> </ul> <p><b>Note</b> Because of switch hardware limitations, 0 kbps is the only valid entry even though the range is 0 to 4294967.</p> <ul style="list-style-type: none"> <li>Specify <b>infinity</b> if you want all sources for the specified group to use the shared tree, never switching to the source tree.</li> <li>(Optional) For <b>group-list</b> <i>access-list-number</i>, specify the access list created in Step 2. If the value is 0 or if the group list is not used, the threshold applies to all groups.</li> </ul> |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 6</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>                               | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Modifying the PIM Router-Query Message Interval (CLI)

PIM routers and multilayer switches send PIM router-query messages to find which device will be the designated router (DR) for each LAN segment (subnet). The DR is responsible for sending IGMP host-query messages to all hosts on the directly connected LAN.

With PIM DM operation, the DR has meaning only if IGMPv1 is in use. IGMPv1 does not have an IGMP querier election process, so the elected DR functions as the IGMP querier. With PIM-SM operation, the DR is the device that is directly connected to the multicast source. It sends PIM register messages to notify the RP that multicast traffic from a source needs to be forwarded down the shared tree. In this case, the DR is the device with the highest IP address.

This procedure is optional.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip pim query-interval** *seconds*
5. **end**
6. **show ip igmp interface** [*interface-id*]
7. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                           | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 3 | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br>Switch(config)# <b>interface</b><br><b>gigabitethernet</b> 1/0/1 | Specifies the interface to be configured, and enters interface configuration mode. <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port</a>, on page 236</li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan</b> <i>vlan-id</i> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI</a>, on page 236</li> </ul> <p>These interfaces must have IP addresses assigned to them.</p> |

|               | Command or Action                                                                                                        | Purpose                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>ip pim query-interval</b> <i>seconds</i><br><br><b>Example:</b><br>Switch(config-if)# <b>ip pim query-interval 45</b> | Configures the frequency at which the switch sends PIM router-query messages.<br><br>The default is 30 seconds. The range is 1 to 65535. |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                                                                         |
| <b>Step 6</b> | <b>show ip igmp interface</b> [ <i>interface-id</i> ]<br><br><b>Example:</b><br>Switch# <b>show ip igmp interface</b>    | Verifies your entries.                                                                                                                   |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b>    | (Optional) Saves your entries in the configuration file.                                                                                 |

## Monitoring PIM

Use the privileged EXEC commands in the following table to monitor your PIM configurations.

**Table 34: PIM Monitoring Commands**

| Command                                                                             | Purpose                                                                                                                      |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip pim all-vrfs tunnel</b> [ <i>tunnel tunnel_number</i>   <i>verbose</i> ] | Displays all VRFs.                                                                                                           |
| <b>show ip pim autorp</b>                                                           | Displays global auto-RP information.                                                                                         |
| <b>show ip pim boundary</b>                                                         | Displays information about mroutes filtered by administratively scoped IPv4 multicast boundaries configured on an interface. |
| <b>show ip pim interface</b>                                                        | Displays information about interfaces configured for Protocol Independent Multicast (PIM).                                   |

| Command                                                                                                                            | Purpose                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <b>show ip pim neighbor</b>                                                                                                        | Displays the PIM neighbor information.                                            |
| <b>show ip pim tunnel</b> [tunnel   verbose]                                                                                       | Displays information about Protocol Independent Multicast (PIM) tunnel interfaces |
| <b>show ip pim vrf</b> { word { all-vrfs   autorp   boundary   bsr-router   interface   mdt   neighbor   rp   rp-hash   tunnel } } | Displays the VPN routing/forwarding instance.                                     |

## Monitoring RP Mapping

Use the privileged EXEC commands in the following table to monitor RP mapping.

**Table 35: RP Mapping Monitoring Commands**

| Command                                                                                                                                                                                        | Purpose                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>show ip pim bsr</b>                                                                                                                                                                         | Displays information about the elected BSR.                                          |
| <b>show ip pim bsr-router</b>                                                                                                                                                                  | Displays information about the BSRv2.                                                |
| <b>show ip pim rp</b> [ hostname or IP address   mapping [ hostname or IP address   elected [hostname or IP address]   in-use [hostname or IP address] ]   metric [ hostname or IP address ] ] | Displays how the switch learns of the RP (through the BSR or the Auto-RP mechanism). |
| <b>show ip pim rp-hash</b> hostname or IP group address                                                                                                                                        | Displays the RP that was selected for the specified group.                           |

## Troubleshooting PIMv1 and PIMv2 Interoperability Problems

When debugging interoperability problems between PIMv1 and PIMv2, check these in the order shown:

- 1 Verify RP mapping with the **show ip pim rp-hash** privileged EXEC command, making sure that all systems agree on the same RP for the same group.
- 2 Verify interoperability between different versions of DRs and RPs. Make sure that the RPs are interacting with the DRs properly (by responding with register-stops and forwarding decapsulated data packets from registers).

## Configuration Examples for PIM

### Example: Enabling PIM Stub Routing

In this example, IP multicast routing is enabled, Switch A PIM uplink port 25 is configured as a routed uplink port with **sparse-dense-mode** enabled. PIM stub routing is enabled on the VLAN 100 interfaces and on Gigabit Ethernet port 20.

```
Switch(config)# ip multicast-routing distributed
Switch(config)# interface GigabitEthernet3/0/25
Switch(config-if)# no switchport
Switch(config-if)# ip address 3.1.1.2 255.255.255.0
Switch(config-if)# ip pim sparse-dense-mode
Switch(config-if)# exit
Switch(config)# interface vlan100
Switch(config-if)# ip pim passive
Switch(config-if)# exit
Switch(config)# interface GigabitEthernet3/0/20
Switch(config-if)# ip pim passive
Switch(config-if)# exit
Switch(config)# interface vlan100
Switch(config-if)# ip address 100.1.1.1 255.255.255.0
Switch(config-if)# ip pim passive
Switch(config-if)# exit
Switch(config)# interface GigabitEthernet3/0/20
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.1.1.1 255.255.255.0
Switch(config-if)# ip pim passive
Switch(config-if)# end
```

[PIM Stub Routing, on page 258](#)

### Example: Verifying PIM Stub Routing

To verify that PIM stub is enabled for each interface, use the **show ip pim interface** privileged EXEC command:

```
Switch# show ip pim interface
Address Interface Ver/ Nbr Query DR DR
Mode Count Intvl Prior
3.1.1.2 GigabitEthernet3/0/25 v2/SD 1 30 1 3.1.1.2
100.1.1.1 Vlan100 v2/P 0 30 1 100.1.1.1
10.1.1.1 GigabitEthernet3/0/20 v2/P 0 30 1 10.1.1.1
```

### Example: Manually Assigning an RP to Multicast Groups

This example shows how to configure the address of the RP to 147.106.6.22 for multicast group 225.2.2.2 only:

```
Switch(config)# access-list 1 permit 225.2.2.2 0.0.0.0
```

```
Switch(config)# ip pim rp-address 147.106.6.22 1
```

## Example: Configuring Auto-RP

This example shows how to send RP announcements out all PIM-enabled interfaces for a maximum of 31 hops. The IP address of port 1 is the RP. Access list 5 describes the group for which this switch serves as RP:

```
Switch(config)# ip pim send-rp-announce gigabitethernet1/0/1 scope 31 group-list 5
Switch(config)# access-list 5 permit 224.0.0.0 15.255.255.255
```

[Auto-RP, on page 259](#)

## Example: Defining the IP Multicast Boundary to Deny Auto-RP Information

This example shows a portion of an IP multicast boundary configuration that denies Auto-RP information:

```
Switch(config)# access-list 1 deny 224.0.1.39
Switch(config)# access-list 1 deny 224.0.1.40
Switch(config)# access-list 1 permit all
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip multicast boundary 1
```

### Related Topics

[Defining the IP Multicast Boundary \(CLI\), on page 280](#)

## Example: Filtering Incoming RP Announcement Messages

This example shows a sample configuration on an Auto-RP mapping agent that is used to prevent candidate RP announcements from being accepted from unauthorized candidate RPs:

```
Switch(config)# ip pim rp-announce-filter rp-list 10 group-list 20
Switch(config)# access-list 10 permit host 172.16.5.1
Switch(config)# access-list 10 permit host 172.16.2.1
Switch(config)# access-list 20 deny 239.0.0.0 0.0.255.255
Switch(config)# access-list 20 permit 224.0.0.0 15.255.255.255
```

The mapping agent accepts candidate RP announcements from only two devices, 172.16.5.1 and 172.16.2.1. The mapping agent accepts candidate RP announcements from these two devices only for multicast groups that fall in the group range of 224.0.0.0 to 239.255.255.255. The mapping agent does not accept candidate RP announcements from any other devices in the network. Furthermore, the mapping agent does not accept candidate RP announcements from 172.16.5.1 or 172.16.2.1 if the announcements are for any groups in the 239.0.0.0 through 239.255.255.255 range. This range is the administratively scoped address range.

## Example: Preventing Join Messages to False RPs

If all interfaces are in sparse mode, use a default-configured RP to support the two well-known groups 224.0.1.39 and 224.0.1.40. Auto-RP uses these two well-known groups to collect and distribute RP-mapping information. When this is the case and the **ip pim accept-rp auto-rp** command is configured, another **ip pim accept-rp** command accepting the RP must be configured as follows:

```
Switch(config)# ip pim accept-rp 172.10.20.1 1
Switch(config)# access-list 1 permit 224.0.1.39
Switch(config)# access-list 1 permit 224.0.1.40
```

### Related Topics

## Example: Configuring Candidate BSRs

This example shows how to configure a candidate BSR, which uses the IP address 172.21.24.18 on a port as the advertised BSR address, uses 30 bits as the hash-mask-length, and has a priority of 10.

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip address 172.21.24.18 255.255.255.0
Switch(config-if)# ip pim sparse-dense-mode
Switch(config-if)# ip pim bsr-candidate gigabitethernet1/0/2 30 10
```

### Related Topics

## Example: Configuring Candidate RPs

This example shows how to configure the switch to advertise itself as a candidate RP to the BSR in its PIM domain. Standard access list number 4 specifies the group prefix associated with the RP that has the address identified by a port. That RP is responsible for the groups with the prefix 239.

```
Switch(config)# ip pim rp-candidate gigabitethernet1/0/2 group-list 4
Switch(config)# access-list 4 permit 239.0.0.0 0.255.255.255
```

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Prerequisites for Configuring SSM

The following are the prerequisites for configuring source-specific multicast (SSM) and SSM mapping:

- Before you configure SSM mapping, you must perform the following tasks:
  - Enable IP multicast routing. For information about this procedure, see [Configuring Basic IP Multicast Routing \(CLI\)](#), on page 320.
  - Enable PIM sparse mode. For information about this procedure, see [How to Configure PIM](#), on page 264.
  - Configure SSM. For information about this procedure, see [Configuring SSM \(CLI\)](#), on page 304.

- Before you configure static SSM mapping, you must configure access control lists (ACLs) that define the group ranges to be mapped to source addresses.
- Before you can configure and use SSM mapping with DNS look ups, you must be able to add records to a running DNS server. If you do not already have a DNS server running, you need to install one.

---

**Note** You can use a product such as *Cisco Network Registrar* to add records to a running DNS server.

---

## Restrictions for Configuring SSM

The following are the restrictions for configuring SSM:

- To run SSM with IGMPv3, SSM must be supported in the Cisco IOS router, the host where the application is running, and the application itself.
- The SSM mapping feature does not have all the benefits of full SSM. Because SSM mapping takes a group join from a host and identifies this group with an application associated with one or more sources, it can only support one such application per group. Full SSM applications can still share the same group as in SSM mapping.
- Enable IGMPv3 carefully on the last hop router when you rely solely on SSM mapping as a transition solution for full SSM. When you enable both SSM mapping and IGMPv3 and the hosts already support IGMPv3 (but not SSM), the hosts send IGMPv3 group reports. SSM mapping does not support these IGMPv3 group reports, and the router does not correctly associate sources with these reports.
- Existing applications in a network predating SSM do not work within the SSM range unless they are modified to support (S, G) channel subscriptions. Therefore, enabling SSM in a network can cause problems for existing applications if they use addresses within the designated SSM range.
- IGMPv3 uses new membership report messages that might not be correctly recognized by older IGMP snooping switches.
- Address management is still necessary to some degree when SSM is used with Layer 2 switching mechanisms. Cisco Group Management Protocol (CGMP), IGMP snooping, or Router-Port Group Management Protocol (RGMP) support only group-specific filtering, not (S, G) channel-specific filtering. If different receivers in a switched network request different (S, G) channels sharing the same group, they do not benefit from these existing mechanisms. Instead, both receivers receive all (S, G) channel traffic and filter out the unwanted traffic on input.

Because SSM can re-use the group addresses in the SSM range for many independent applications, this situation can lead to decreased traffic filtering in a switched network. For this reason, it is important to use random IP addresses from the SSM range for an application to minimize the chance for re-use of a single address within the SSM range between different applications. For example, an application service providing a set of television channels should, even with SSM, use a different group for each television (S, G) channel. This setup guarantees that multiple receivers to different channels within the same application service never experience traffic aliasing in networks that include Layer 2 switches.

- In PIM-SSM, the last hop router continues to periodically send (S, G) join messages if appropriate (S, G) subscriptions are on the interfaces. Therefore, as long as receivers send (S, G) subscriptions, the shortest path tree (SPT) state from the receivers to the source is maintained, even if the source does not send traffic for longer periods of time (or even never).

The opposite situation occurs with PIM-SM, where (S, G) state is maintained only if the source is sending traffic and receivers are joining the group. If a source stops sending traffic for more than 3 minutes in PIM-SM, the (S, G) state is deleted and only reestablished after packets from the source arrive again through the RPT (rendezvous point tree). Because no mechanism in PIM-SSM notifies a receiver that a source is active, the network must maintain the (S, G) state in PIM-SSM as long as receivers are requesting receipt of that channel.

## Information About SSM

The source-specific multicast (SSM) feature is an extension of IP multicast in which datagram traffic is forwarded to receivers from only those multicast sources that the receivers have explicitly joined. For multicast groups configured for SSM, only SSM distribution trees (no shared trees) are created.

This section describes how to configure source-specific multicast (SSM). For a complete description of the SSM commands in this section, refer to the *IP Multicast Command Reference*. To locate documentation for other commands that appear in this chapter, use the command reference master index, or search online.

### SSM Components Overview

SSM is a datagram delivery model that best supports one-to-many applications, also known as broadcast applications. SSM is a core networking technology for the Cisco implementation of IP multicast solutions targeted for audio and video broadcast application environments. The switch supports the following components that support SSM implementation:

- Protocol independent multicast source-specific mode (PIM-SSM)

PIM-SSM is the routing protocol that supports the implementation of SSM and is derived from PIM sparse mode (PIM-SM).

- Internet Group Management Protocol version 3 (IGMPv3)

### SSM and Internet Standard Multicast (ISM)

The current IP multicast infrastructure in the Internet and many enterprise intranets is based on the PIM-SM protocol and Multicast Source Discovery Protocol (MSDP). These protocols have the limitations of the Internet Standard Multicast (ISM) service model. For example, with ISM, the network must maintain knowledge about which hosts in the network are actively sending multicast traffic.

The ISM service consists of the delivery of IP datagrams from any source to a group of receivers called the multicast host group. The datagram traffic for the multicast host group consists of datagrams with an arbitrary IP unicast source address (S) and the multicast group address (G) as the IP destination address. Systems receive this traffic by becoming members of the host group. Membership in a host group simply requires signaling the host group through IGMP version 1, 2, or 3.

In SSM, delivery of datagrams is based on (S, G) channels. In both SSM and ISM, no signaling is required to become a source. However, in SSM, receivers must subscribe or unsubscribe to (S, G) channels to receive or not receive traffic from specific sources. In other words, receivers can receive traffic only from (S, G) channels to which they are subscribed, whereas in ISM, receivers need not know the IP addresses of sources from which they receive their traffic. The proposed standard approach for channel subscription signaling uses IGMP and includes modes membership reports, which are supported only in IGMP version 3.

## SSM IP Address Range

SSM can coexist with the ISM service by applying the SSM delivery model to a configured subset of the IP multicast group address range. Cisco IOS software allows SSM configuration for the IP multicast address range of 224.0.0.0 through 239.255.255.255. When an SSM range is defined, existing IP multicast receiver applications do not receive any traffic when they try to use an address in the SSM range (unless the application is modified to use an explicit (S, G) channel subscription).

## SSM Operations

An established network, in which IP multicast service is based on PIM-SM, can support SSM services. SSM can also be deployed alone in a network without the full range of protocols required for interdomain PIM-SM (for example, MSDP, Auto-RP, or bootstrap router [BSR]) if only SSM service is needed.

If SSM is deployed in a network already configured for PIM-SM, only the last-hop routers support SSM. Routers that are not directly connected to receivers do not require support for SSM. In general, these not-last-hop routers must only run PIM-SM in the SSM range and might need additional access control configuration to suppress MSDP signalling, registering, or PIM-SM shared tree operations from occurring within the SSM range.

Use the **ip pim ssm** global configuration command to configure the SSM range and to enable SSM. This configuration has the following effects:

- For groups within the SSM range, (S, G) channel subscriptions are accepted through IGMPv3 include-mode membership reports.
- PIM operations within the SSM range of addresses change to PIM-SSM, a mode derived from PIM-SM. In this mode, only PIM (S, G) join and prune messages are generated by the router, and no (S, G) rendezvous point tree (RPT) or (\*, G) RPT messages are generated. Incoming messages related to RPT operations are ignored or rejected, and incoming PIM register messages are immediately answered with register-stop messages. PIM-SSM is backward-compatible with PIM-SM unless a router is a last-hop router. Therefore, routers that are not last-hop routers can run PIM-SM for SSM groups (for example, if they do not yet support SSM).
- No MSDP source-active (SA) messages within the SSM range are accepted, generated, or forwarded.

## SSM Mapping

In a typical set-top box (STB) deployment, each TV channel uses one separate IP multicast group and has one active server host sending the TV channel. A single server can send multiple TV channels, but each to a different group. In this network environment, if a router receives an IGMPv1 or IGMPv2 membership report for a particular group, the report addresses the well-known TV server for the TV channel associated with the multicast group.

When SSM mapping is configured, if a router receives an IGMPv1 or IGMPv2 membership report for a particular group, the router translates this report into one or more channel memberships for the well-known sources associated with this group.

When the router receives an IGMPv1 or IGMPv2 membership report for a group, the router uses SSM mapping to determine one or more source IP addresses for the group. SSM mapping then translates the membership report as an IGMPv3 report and continues as if it had received an IGMPv3 report. The router then sends PIM joins and continues to be joined to these groups as long as it continues to receive the IGMPv1 or IGMPv2 membership reports, and the SSM mapping for the group remains the same.

SSM mapping enables the last hop router to determine the source addresses either by a statically configured table on the router or through a DNS server. When the statically configured table or the DNS mapping changes, the router leaves the current sources associated with the joined groups.

### Static SSM Mapping

With static SSM mapping, you can configure the last hop router to use a static map to determine the sources that are sending to groups. Static SSM mapping requires that you configure ACLs to define group ranges. After configuring the ACLs to define group ranges, you can then map the groups permitted by those ACLs to sources by using the **ip igmp ssm-map static** global configuration command.

You can configure static SSM mapping in smaller networks when a DNS is not needed or to locally override DNS mappings. When configured, static SSM mappings take precedence over DNS mappings.

### DNS-Based SSM Mapping

You can use DNS-based SSM mapping to configure the last hop router to perform a reverse DNS lookup to determine sources sending to groups. When DNS-based SSM mapping is configured, the router constructs a domain name that includes the group address and performs a reverse lookup into the DNS. The router looks up IP address resource records and uses them as the source addresses associated with this group. SSM mapping supports up to 20 sources for each group. The router joins all sources configured for a group.

The following figure displays DNS-based SSM mapping.

**Figure 12: DNS-Based SSM Mapping**

The SSM mapping mechanism that enables the last hop router to join multiple sources for a group can provide source redundancy for a TV broadcast. In this context, the last hop router provides redundancy using SSM mapping to simultaneously join two video sources for the same TV channel. However, to prevent the last hop router from duplicating the video traffic, the video sources must use a server-side switchover mechanism. One video source is active, and the other backup video source is passive. The passive source waits until an active source failure is detected before sending the video traffic for the TV channel. Thus, the server-side switchover mechanism ensures that only one of the servers is actively sending video traffic for the TV channel.

To look up one or more source addresses for a group that includes G1, G2, G3, and G4, you must configure these DNS records on the DNS server:

```
G4.G3.G2.G1 [multicast-domain] [timeout] IN A source-address-1
IN A source-address-2
IN A source-address-n
```

See your DNS server documentation for more information about configuring DNS resource records.

## How to Configure SSM

For a complete description of the source-specific multicast (SSM) commands in this section, see the *IP Multicast Command Reference, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)*. To locate documentation for other commands that appear in this chapter, use the command reference master index, or search online.

### Configuring SSM (CLI)

This procedure is optional.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip pim ssm [default | range *access-list*]**
4. **interface *type number***
5. **ip pim {sparse-mode | sparse-dense-mode}**
6. **ip igmp version 3**

#### DETAILED STEPS

|        | Command or Action                                                 | Purpose                                                                                                                   |

| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>                                        | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 3</b> | <p><b>ip pim ssm [default   range access-list]</b></p> <p><b>Example:</b></p> <pre>Switch(config)# ip pim ssm range 20</pre>         | Defines the SSM range of IP multicast addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 4</b> | <p><b>interface type number</b></p> <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/1</pre>                | <p>Selects an interface that is connected to hosts on which IGMPv3 can be enabled, and enters the interface configuration mode.</p> <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port</a>, on page 236</li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan vlan-id</b> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI</a>, on page 236</li> </ul> <p>These interfaces must have IP addresses assigned to them.</p> |
| <b>Step 5</b> | <p><b>ip pim {sparse-mode   sparse-dense-mode}</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ip pim sparse-dense-mode</pre> | Enables PIM on an interface. You must use either sparse mode or sparse-dense mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 6</b> | <p><b>ip igmp version 3</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ip igmp version 3</pre>                               | Enables IGMPv3 on this interface. The default version of IGMP is set to Version 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Configuring Source Specific Multicast Mapping

The Source Specific Multicast (SSM) mapping feature supports SSM transition when supporting SSM on the end system is impossible or unwanted due to administrative or technical reasons. You can use SSM mapping to leverage SSM for video delivery to legacy STBs that do not support IGMPv3 or for applications that do not use the IGMPv3 host stack.

### Configuring Static SSM Mapping (CLI)

The following procedure describes how to configure static SSM mapping.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp ssm-map enable**
4. **no ip igmp ssm-map query dns**
5. **ip igmp ssm-map static *access-list source-address***
6. Repeat Step 4 to configure additional static SSM mappings, if required.
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

#### DETAILED STEPS

|               | Command or Action                                                                                     | Purpose                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                         | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>              |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                 | Enters the global configuration mode.                                                                                                  |
| <b>Step 3</b> | <b>ip igmp ssm-map enable</b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp ssm-map enable</b> | Enables SSM mapping for groups in the configured SSM range.<br><br><b>Note</b> By default, this command enables DNS-based SSM mapping. |
| <b>Step 4</b> | <b>no ip igmp ssm-map query dns</b>                                                                   | (Optional) Disables DNS-based SSM mapping.                                                                                             |

|               | Command or Action                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch(config)# no ip igmp ssm-map dns</pre>                                                                                                  | <p><b>Note</b> Disable DNS-based SSM mapping if you only want to rely on static SSM mapping. By default, the <b>ip igmp ssm-map</b> global configuration command enables DNS-based SSM mapping.</p>                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 5</b> | <p><b>ip igmp ssm-map static</b> <i>access-list</i><br/><i>source-address</i></p> <p><b>Example:</b></p> <pre>Switch(config)# ip igmp ssm-map static 11 172.16.8.11</pre> | <p>Configures static SSM mapping.</p> <p>The ACL supplied for <i>access-list</i> defines the groups to be mapped to the source IP address entered for the <i>source-address</i>.</p> <p><b>Note</b> You can configure additional static SSM mappings. If additional SSM mappings are configured and the router receives an IGMPv1 or IGMPv2 membership report for a group in the SSM range, the switch determines the source addresses associated with the group by using each configured <b>ip igmp ssm-map static</b> command. The switch associates up to 20 sources per group.</p> |
| <b>Step 6</b> | Repeat Step 4 to configure additional static SSM mappings, if required.                                                                                                   | —                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 7</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 8</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>                                                                           | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 9</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>                                             | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Configuring DNS-Based SSM Mapping (CLI)

To configure DNS-based SSM mapping, you need to create a DNS server zone or add records to an existing zone. If the routers that are using DNS-based SSM mapping are also using DNS for other purposes, you should use a normally configured DNS server. If DNS-based SSM mapping is the only DNS implementation being

used on the router, you can configure a false DNS setup with an empty root zone or a root zone that points back to itself.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp ssm-map enable**
4. **ip igmp ssm-map query dns**
5. **ip domain multicast** *domain-prefix*
6. **ip name-server** *server-address1* [*server-address2*... *server-address6*]
7. Repeat Step 5 to configure additional DNS servers for redundancy, if required.
8. **end**
9. **show running-config**
10. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                               | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                       | Enters the global configuration mode.                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>ip igmp ssm-map enable</b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp ssm-map enable</b>       | Enables SSM mapping for groups in a configured SSM range.                                                                                                                                                                                                                                                                  |
| <b>Step 4</b> | <b>ip igmp ssm-map query dns</b><br><br><b>Example:</b><br>Switch(config)# <b>ip igmp ssm-map query dns</b> | (Optional) Enables DNS-based SSM mapping.<br><br>By default, the <b>ip igmp ssm-map</b> command enables DNS-based SSM mapping. Only the <b>no</b> form of this command is saved to the running configuration.<br><br><b>Note</b> Use this command to reenables DNS-based SSM mapping if DNS-based SSM mapping is disabled. |

|                | Command or Action                                                                                                                                                                                          | Purpose                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b>  | <b>ip domain multicast</b> <i>domain-prefix</i><br><br><b>Example:</b><br><br>Switch(config)# <b>ip domain multicast</b><br><b>ssm-map.cisco.com</b>                                                       | (Optional) Changes the domain prefix used by the switch for DNS-based SSM mapping.<br><br>By default, the switch uses the <i>ip-addr.arpa</i> domain prefix. |
| <b>Step 6</b>  | <b>ip name-server</b> <i>server-address1</i> [ <i>server-address2...</i><br><i>server-address6</i> ]<br><br><b>Example:</b><br><br>Switch(config)# <b>ip name-server</b><br><b>172.16.1.111 172.16.1.2</b> | Specifies the address of one or more name servers to use for name and address resolution.                                                                    |
| <b>Step 7</b>  | Repeat Step 5 to configure additional DNS servers for redundancy, if required.                                                                                                                             | —                                                                                                                                                            |
| <b>Step 8</b>  | <b>end</b><br><br><b>Example:</b><br><br>Switch(config)# <b>end</b>                                                                                                                                        | Returns to privileged EXEC mode.                                                                                                                             |
| <b>Step 9</b>  | <b>show running-config</b><br><br><b>Example:</b><br><br>Switch# <b>show running-config</b>                                                                                                                | Verifies your entries.                                                                                                                                       |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br>Switch# <b>copy running-config</b><br><b>startup-config</b>                                                                        | (Optional) Saves your entries in the configuration file.                                                                                                     |

### Configuring Static Traffic Forwarding with SSM Mapping (CLI)

Use static traffic forwarding with SSM mapping to statically forward SSM traffic for certain groups.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip igmp static-group** *group-address* **source ssm-map**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

## DETAILED STEPS

|---------------|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 3</b> | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Switch(config)# <b>interface</b><br><b>gigabitethernet</b> 1/0/1 | Selects an interface on which to statically forward traffic for a multicast group using SSM mapping, and enters interface configuration mode. <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port</a>, on page 236</li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan</b> <i>vlan-id</i> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI</a>, on page 236</li> </ul> <p>These interfaces must have IP addresses assigned to them.</p> <p><b>Note</b> Static forwarding of traffic with SSM mapping works with either DNS-based SSM mapping or statically configured SSM mapping.</p> |

|        | Command or Action                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                  |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>ip igmp static-group <i>group-address</i> source ssm-map</b><br><br><b>Example:</b><br><br><pre>Switch(config-if)# ip igmp static-group 239.1.2.1 source ssm-map</pre> | Configures SSM mapping to statically forward a (S, G) channel from the interface.<br><br>Use this command if you want to statically forward SSM traffic for certain groups. Use DNS-based SSM mapping to determine the source addresses of the channels. |
| Step 5 | <b>end</b><br><br><b>Example:</b><br><br><pre>Switch(config-if)# end</pre>                                                                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                         |

## Monitoring SSM

Use the privileged EXEC commands in the following table to monitor SSM.

**Table 36: Commands for Monitoring SSM**

| Command                           | Purpose                                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>show ip igmp groups detail</b> | Displays the (S, G) channel subscription through IGMPv3.                                                       |
| <b>show ip mroute</b>             | Displays whether a multicast group supports SSM service or whether a source-specific host report was received. |

## Monitoring SSM Mapping

Use the privileged EXEC commands in the following table to monitor SSM mapping.

**Table 37: SSM Mapping Monitoring Commands**

| Command                                                                                                  | Purpose                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show ip igmp ssm-mapping</code>                                                                    | Displays information about SSM mapping.                                                                                                          |
| <code>show ip igmp ssm-mapping group-address</code>                                                      | Displays the sources that SSM mapping uses for a particular group.                                                                               |
| <code>show ip igmp groups [group-name   group-address   interface-type interface-number] [detail]</code> | Displays the multicast groups with receivers that are directly connected to the router and that were learned through IGMP.                       |
| <code>show host</code>                                                                                   | Displays the default domain name, the style of name lookup service, a list of name server hosts, and the cached list of hostnames and addresses. |
| <code>debug ip igmp group-address</code>                                                                 | Displays the IGMP packets received and sent and IGMP host-related events.                                                                        |

## Where to Go Next for SSM

You can configure the following:

- IGMP
- Wireless Multicast
- PIM
- IP Multicast Routing
- Service Discovery Gateway

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Prerequisites for Configuring IP Multicast Routing

The following are the prerequisites for configuring IP multicast routing:

- To use the IP multicast routing feature on the switch, the switch or active switch must be running the IP Services feature set.
- You must enable IP multicast routing and configure the PIM version and PIM mode on the switch. After performing these tasks, the switch can then forward multicast packets and can populate its multicast routing table.

- To participate in IP multicasting, the multicast hosts, routers, and multilayer switch must have IGMP operating.

## Restrictions for Configuring IP Multicast Routing

The following are the restrictions for configuring IP multicast routing:

- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

## Information About IP Multicast Routing

IP multicasting is an efficient way to use network resources, especially for bandwidth-intensive services such as audio and video. IP multicast routing enables a host (source) to send packets to a group of hosts (receivers) anywhere within the IP network by using a special form of IP address called the IP multicast group address.

The sending host inserts the multicast group address into the IP destination address field of the packet, and IP multicast routers and multilayer switches forward incoming IP multicast packets out all interfaces that lead to members of the multicast group. Any host, regardless of whether it is a member of a group, can send to a group. However, only the members of a group receive the message.

## Cisco's Implementation of IP Multicast Routing

Cisco IOS software supports the following protocols to implement IP multicast routing:

- Internet Group Management Protocol (IGMP) is used among hosts on a LAN and the routers (and multilayer switches) on that LAN to track the multicast groups of which hosts are members.
- Protocol-Independent Multicast (PIM) protocol is used among routers and multilayer switches to track which multicast packets to forward to each other and to their directly connected LANs.

---

**Note**

The switch does not support the Distance Vector Multicast Routing Protocol (DVMRP) nor the Cisco Group Management Protocol (CGMP).

---

The following figure shows where the Cisco-supported protocols for the switch operate within the IP multicast environment.

**Figure 13: IP Multicast Routing Protocols**

According to IPv4 multicast standards, the MAC destination multicast address begins with 0100:5e and is appended by the last 23 bits of the IP address. For example, if the IP destination address is 239.1.1.39, the MAC destination address is 0100:5e01:0127.

A multicast packet is unmatched when the destination IPv4 address does not match the destination MAC address. The switch forwards the unmatched packet in hardware based upon the MAC address table. If the destination MAC address is not in the MAC address table, the switch floods the packet to the all port in the same VLAN as the receiving port.

## Multicast Forwarding Information Base Overview

The switch uses the Multicast Forwarding Information Base (MFIB) architecture and the Multicast Routing Information Base (MRIB) for IP multicast.

The MFIB architecture provides both modularity and separation between the multicast control plane (Protocol Independent Multicast [PIM] and Internet Group Management Protocol [IGMP]) and the multicast forwarding plane (MFIB). This architecture is used in Cisco IOS IPv6 multicast implementations.

MFIB itself is a multicast routing protocol independent forwarding engine; that is, it does not depend on PIM or any other multicast routing protocol. It is responsible for:

- Forwarding multicast packets
- Registering with the MRIB to learn the entry and interface flags set by the control plane
- Handling data-driven events that must be sent to the control plane
- Maintaining counts, rates, and bytes of received, dropped, and forwarded multicast packets

The MRIB is the communication channel between MRIB clients. Examples of MRIB clients are PIM, IGMP, the multicast routing (mroute) table, and the MFIB.

[Configuring IP Multicast Forwarding \(CLI\)](#), on page 322

## Multicast Group Concept

Multicast is based on the concept of a group. An arbitrary group of receivers expresses an interest in receiving a particular data stream. This group does not have any physical or geographical boundaries. The hosts can be located anywhere on the Internet. Hosts that are interested in receiving data flowing to a particular group must join the group using IGMP. Hosts must be a member of the group to receive the data stream.

#### Related Topics

[Configuring an IP Multicast Boundary \(CLI\)](#), on page 329

[Example: Configuring an IP Multicast Boundary](#), on page 336

## Multicast Boundaries

Administratively-scoped boundaries can be used to limit the forwarding of multicast traffic outside of a domain or subdomain. This approach uses a special range of multicast addresses, called administratively-scoped addresses, as the boundary mechanism. If you configure an administratively-scoped boundary on a routed interface, multicast traffic whose multicast group addresses fall in this range cannot enter or exit this interface, which provides a firewall for multicast traffic in this address range.

#### Note

---

Multicast boundaries and TTL thresholds control the scoping of multicast domains; however, TTL thresholds are not supported by the switch. You should use multicast boundaries instead of TTL thresholds to limit the forwarding of multicast traffic outside of a domain or a subdomain.

---

The following figure shows that Company XYZ has an administratively-scoped boundary set for the multicast address range 239.0.0.0/8 on all routed interfaces at the perimeter of its network. This boundary prevents any multicast traffic in the range 239.0.0.0 through 239.255.255.255 from entering or leaving the network. Similarly, the engineering and marketing departments have an administratively-scoped boundary of 239.128.0.0/16

around the perimeter of their networks. This boundary prevents multicast traffic in the range of 239.128.0.0 through 239.128.255.255 from entering or leaving their respective networks.

**Figure 14: Administratively-Scoped Boundaries**

You can define an administratively-scoped boundary on a routed interface for multicast group addresses. A standard access list defines the range of addresses affected. When a boundary is defined, no multicast data packets are allowed to flow across the boundary from either direction. The boundary allows the same multicast group address to be reused in different administrative domains.

The IANA has designated the multicast address range 239.0.0.0 to 239.255.255.255 as the administratively-scoped addresses. This range of addresses can then be reused in domains administered by different organizations. The addresses would be considered local, not globally unique.

## Multicast Routing and Switch Stacks

For all multicast routing protocols, the entire stack appears as a single router to the network and operates as a single multicast router.

In a switch stack, the active switch performs these functions:

- It is responsible for completing the IP multicast routing functions of the stack. It fully initializes and runs the IP multicast routing protocols.
- It builds and maintains the multicast routing table for the entire stack.
- It is responsible for distributing the multicast routing table to all stack members.

The stack members perform these functions:

- They act as multicast routing standby devices and are ready to take over if there is a active switch failure. If the active switch fails, all stack members delete their multicast routing tables. The newly elected active switch starts building the routing tables and distributes them to the stack members.
- They do not build multicast routing tables. Instead, they use the multicast routing table that is distributed by the active switch.

## Default Multicast Routing Configuration

This table describes the default multicast routing configuration for the switch.

**Table 38: Default Multicast Routing Configuration**

| Feature           | Default Setting             |
|-------------------|-----------------------------|
| Multicast routing | Disabled on all interfaces. |

## How to Configure Basic IP Multicast Routing

### Configuring Basic IP Multicast Routing (CLI)

You must enable IP multicast routing and configure the PIM version and mode. After performing these tasks, the software can then forward multicast packets, and the switch can populate its multicast routing table.

You can configure an interface to be in PIM dense mode, sparse mode, or sparse-dense mode. The switch populates its multicast routing table and forwards multicast packets it receives from its directly connected LANs according to the mode setting. You must enable PIM in one of these modes for an interface to perform IP multicast routing.

Enabling PIM on an interface also enables IGMP operation on that interface.

#### Note

If you enable PIM on multiple interfaces, when most of these interfaces are not on the outgoing interface list, and IGMP snooping is disabled, the outgoing interface might not be able to sustain line rate for multicast traffic because of the extra replication.

In populating the multicast routing table, dense-mode interfaces are always added to the table. Sparse-mode interfaces are added to the table only when periodic join messages are received from downstream devices or when there is a directly connected member on the interface.

When forwarding from a LAN, sparse-mode operation occurs if there is a rendezvous point (RP) known for the group. An RP acts as the meeting place for sources and receivers of multicast data. If an RP exists, the packets are encapsulated and sent toward the RP. When no RP is known, the packet is flooded in a dense-mode fashion. If the multicast traffic from a specific source is sufficient, the receiver's first-hop router might send join messages toward the source to build a source-based distribution tree.

By default, multicast routing is disabled, and there is no default mode setting.

This procedure is required.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip multicast-routing**
4. **interface *interface-id***
5. **ip pim {dense-mode | sparse-mode | sparse-dense-mode}**
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|-------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Switch&gt; enable</pre>                                                      | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>                                 | <p>Enters the global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 3 | <p><b>ip multicast-routing</b></p> <p><b>Example:</b></p> <pre>Switch(config)# ip multicast-routing</pre>                     | <p>Enables IP multicast routing.</p> <p>IP multicast routing is supported with Multicast Forwarding Information Base (MFIB) and Multicast Routing Information Base (MRIB).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 4 | <p><b>interface <i>interface-id</i></b></p> <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/1</pre> | <p>Specifies the Layer 3 interface on which you want to enable multicast routing, and enters interface configuration mode.</p> <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port</a>, on page 236</li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan <i>vlan-id</i></b> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the</li> </ul> |

|               | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Configuring IP Multicast Forwarding (CLI)

You can use the following procedure to configure IPv4 Multicast Forwarding Information Base (MFIB) interrupt-level IP multicast forwarding of incoming packets or outgoing packets on the switch.

**Note**

After you have enabled IP multicast routing by using the **ip multicast-routing** command, IPv4 multicast forwarding is enabled. Because IPv4 multicast forwarding is enabled by default, you can use the **no** form of the **ip mfib** command to disable IPv4 multicast forwarding.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip mfib**
4. **exit**
5. **show running-config**
6. **copy running-config startup-config**

**DETAILED STEPS**

|               | Command or Action                                                                       | Purpose                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>   | Enters the global configuration mode.                                                                              |
| <b>Step 3</b> | <b>ip mfib</b><br><br><b>Example:</b><br>Switch(config)# <b>ip mfib</b>                 | Enables IP multicast forwarding.                                                                                   |
| <b>Step 4</b> | <b>exit</b><br><br><b>Example:</b><br>Switch(config)# <b>exit</b>                       | Returns to privileged EXEC mode.                                                                                   |
| <b>Step 5</b> | <b>show running-config</b><br><br><b>Example:</b><br>Switch# <b>show running-config</b> | Verifies your entries.                                                                                             |

|        | Command or Action                                                                                                             | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 6 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br><pre>Switch# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file. |

## Configuring a Static Multicast Route (mroute) (CLI)

You can use the following procedure to configure static mroutes. Static mroutes are similar to unicast static routes but differ in the following ways:

- Static mroutes are used to calculate RPF information, not to forward traffic.
- Static mroutes cannot be redistributed.

Static mroutes are strictly local to the switch on which they are defined. Because Protocol Independent Multicast (PIM) does not have its own routing protocol, there is no mechanism to distribute static mroutes throughout the network. Consequently, the administration of static mroutes tends to be more complicated than the administration of unicast static routes.

When static mroutes are configured, they are stored on the switch in a separate table referred to as the static mroute table. When configured, the **ip mroute** command enters a static mroute into the static mroute table for the source address or source address range specified for the source-address and mask arguments. Sources that match the source address or that fall in the source address range specified for the source-address argument will RPF to either the interface associated with the IP address specified for the *rpf-address* argument or the local interface on the switch specified for the *interface-type* and *interface-number* arguments. If an IP address is specified for the *rpf-address* argument, a recursive lookup is done from the unicast routing table on this address to find the directly connected neighbor.

If there are multiple static mroutes configured, the switch performs a longest-match lookup of the mroute table. When the mroute with the longest match (of the source-address) is found, the search terminates and the information in the matching static mroute is used. The order in which the static mroutes are configured is not important.

The administrative distance of an mroute may be specified for the optional distance argument. If a value is not specified for the distance argument, the distance of the mroute defaults to zero. If the static mroute has the same distance as another RPF source, the static mroute will take precedence. There are only two exceptions to this rule: directly connected routes and the default unicast route.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip mroute [vrf vrf-name] source-address mask { fallback-lookup {global | vrf vrf-name } [ protocol ] {rpf-address | interface-type interface-number} } [distance]**
4. **exit**
5. **show running-config**
6. **copy running-config startup-config**

| Step 3 | <b>ip mroute [vrf vrf-name] source-address mask { fallback-lookup {global   vrf vrf-name } [ protocol ] {rpf-address   interface-type interface-number} } [distance]</b><br><br><b>Example:</b><br>Switch(configure)# <b>ip mroute 10.1.1.1 255.255.255.255 10.2.2.2</b> | The source IP address 10.1.1.1 is configured to be reachable through the interface associated with IP address 10.2.2.2.   |
| Step 4 | <b>exit</b><br><br><b>Example:</b><br>Switch(config)# <b>exit</b>                                                                                                                                                                                                        | Returns to privileged EXEC mode.                                                                                          |
| Step 5 | <b>show running-config</b><br><br><b>Example:</b><br>Switch# <b>show running-config</b>                                                                                                                                                                                  | (Optional) Verifies your entries.                                                                                         |

|        | Command or Action                                                                                                             | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 6 | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br><pre>Switch# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file. |

## Configuring sdr Listener Support

The MBONE is the small subset of Internet routers and hosts that are interconnected and capable of forwarding IP multicast traffic. Other multimedia content is often broadcast over the MBONE. Before you can join a multimedia session, you need to know what multicast group address and port are being used for the session, when the session is going to be active, and what sort of applications (audio, video, and so forth) are required on your workstation. The MBONE Session Directory Version 2 (sdr) tool provides this information. This freeware application can be downloaded from several sites on the World Wide Web, one of which is <http://www.video.ja.net/mice/index.html>.

SDR is a multicast application that listens to a well-known multicast group address and port for Session Announcement Protocol (SAP) multicast packets from SAP clients, which announce their conference sessions. These SAP packets contain a session description, the time the session is active, its IP multicast group addresses, media format, contact person, and other information about the advertised multimedia session. The information in the SAP packet is displayed in the SDR Session Announcement window.

### Enabling sdr Listener Support (CLI)

By default, the switch does not listen to session directory advertisements.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **ip sap listen**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

### DETAILED STEPS

|        | Command or Action | Purpose                       |
|--------|-------------------|-------------------------------|
| Step 1 | <b>enable</b>     | Enables privileged EXEC mode. |

|               | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>                                 | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <p><b>interface <i>interface-id</i></b></p> <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/1</pre> | <p>Specifies the interface to be enabled for sdr, and enters interface configuration mode.</p> <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port</a>, on page 236</li> <li>An SVI—A VLAN interface created by using the <b>interface vlan <i>vlan-id</i></b> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI</a>, on page 236</li> </ul> <p>These interfaces must have IP addresses assigned to them.</p> |
| <b>Step 4</b> | <p><b>ip sdp listen</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ip sdp listen</pre>                                | Enables the switch software to listen to session directory announcements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 6</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>                               | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|               | Command or Action                                                                                                     | Purpose                                                  |
|---------------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

### Limiting How Long an sdr Cache Entry Exists (CLI)

By default, entries are never deleted from the sdr cache. You can limit how long the entry remains active so that if a source stops advertising SAP information, old advertisements are not unnecessarily kept.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip sap cache-timeout** *minutes*
4. **end**
5. **show running-config**
6. **show ip sap**
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                     | Purpose                                                                                                            |
|---------------|---------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b> | Enters the global configuration mode.                                                                              |

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                                          |

| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Switch> <b>enable</b>                                                                                                                                                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                                                                                                                                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>access-list</b> { <i>access-list-number 1-99</i>   <i>access-list-number 100-199</i>   <i>access-list-number 1300-1999</i>   <i>access-list-number 2000-2699</i>   <b>dynamic-extended</b>   <b>rate-limit</b> }<br><br><b>Example:</b><br>Switch(config)# <b>access-list 99 permit any</b> | Creates a standard access list, repeating the command as many times as necessary. <ul style="list-style-type: none"> <li>• For <i>access-list-number</i>, the ranges are as follows: <ul style="list-style-type: none"> <li>◦ <i>access-list-number 1—99</i> (IP standard access list)</li> <li>◦ <i>access-list-number 100—199</i> ( IP extended access list)</li> <li>◦ <i>access-list-number 1300—1999</i> (IP standard access list - expanded range)</li> <li>◦ <i>access-list-number 2000—2699</i> (IP extended access list - expanded range)</li> </ul> </li> <li>• The <b>dynamic-extended</b> keyword extends the dynamic ACL absolute timer.</li> <li>• The <b>rate-limit</b> keyword permits a simple rate-limit specific access list.</li> </ul> <p>The access list is always terminated by an implicit deny statement for everything.</p> |
| <b>Step 4</b> | <b>interface</b> <i>interface-id</i>                                                                                                                                                                                                                                                           | Specifies the interface to be configured, and enters interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|               | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitEthernet1/0/1</pre>                                                                | <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse-dense-mode on the interface, and join the interface as a statically connected member to an IGMP static group. For a configuration example, see <a href="#">Example: Interface Configuration as a Routed Port, on page 236</a></li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan <i>vlan-id</i></b> global configuration command. You will also need to enable IP PIM sparse-dense-mode on the VLAN, join the VLAN as a statically connected member to an IGMP static group, and then enable IGMP snooping on the VLAN, the IGMP static group, and physical interface. For a configuration example, see <a href="#">Example: Interface Configuration as an SVI, on page 236</a></li> </ul> <p>These interfaces must have IP addresses assigned to them.</p> |
| <b>Step 5</b> | <p><b>ip multicast boundary</b><br/><i>access-list-number</i></p> <p><b>Example:</b></p> <pre>Switch(config-if)# ip multicast boundary 99</pre> | <p>Configures the boundary, specifying the access list you created in Step 2. Additional command options include:</p> <ul style="list-style-type: none"> <li>• For <i>access-list-number</i>, the ranges are as follows: <ul style="list-style-type: none"> <li>◦ access-list-number 1—99 (IP standard access list)</li> <li>◦ access-list-number 100—199 (IP extended access list)</li> <li>◦ access-list-number 1300—1999 (IP standard access list - expanded range)</li> <li>◦ access-list-number 2000—2699 (IP extended access list - expanded range)</li> </ul> </li> <li>• <i>Word</i>—IP named access list.</li> <li>• <b>filter-autorp</b>—Filter AutoRP packet contents.</li> <li>• <b>in</b>—Restrict (s,g) creation when this interface is the RPF.</li> <li>• <b>out</b>—Restrict interface addition to outgoing list.</li> </ul>                                                                                                                                                                                                                                      |
| <b>Step 6</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>                                                                      | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 7</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Switch# show running-config</pre>                                                 | <p>Verifies your entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|               | Command or Action                                                                                                             | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br><pre>Switch# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file. |

### What to Do Next

Proceed to the other supported IP multicast routing procedures.

## Monitoring and Maintaining IP Multicast Routing

### Clearing Caches, Tables, and Databases

You can remove all contents of a particular cache, table, or database. Clearing a cache, table, or database might be necessary when the contents of the particular structure are or suspected to be invalid.

You can use any of the privileged EXEC commands in the following table to clear IP multicast caches, tables, and databases.

**Table 39: Commands for Clearing Caches, Tables, and Databases**

| Command                                                                                                | Purpose                                                                               |
|--------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>clear ip igmp group</b> {group [ hostname   IP address]   vrf name group [ hostname   IP address] } | Deletes entries from the IGMP cache.                                                  |
| <b>clear ip mfib</b> { counters [group   source]   global counters [group   source]   vrf * }          | Clears all active IPv4 Multicast Forwarding Information Base (MFIB) traffic counters. |
| <b>clear ip mrm</b> {status-report [ source] }                                                         | IP multicast routing clear commands.                                                  |
| <b>clear ip mroute</b> { *   [hostname   IP address]   vrf name group [ hostname   IP address] }       | Deletes entries from the IP multicast routing table.                                  |
| <b>clear ip msdp</b> { peer   sa-cache   statistics   vrf }                                            | Clears the Multicast Source Discovery Protocol (MSDP) cache.                          |

| Command                                                                                                                                                                                                              | Purpose                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| <b>clear ip multicast</b> { <b>limit</b>   <b>redundancy statistics</b> }                                                                                                                                            | Clears the IP multicast information.                                          |
| <b>clear ip pim</b> { <b>df</b> [ <b>int</b>   <b>rp rp address</b> ]   <b>interface</b>   <b>rp-mapping</b> [ <i>rp address</i> ]   <b>vrf</b> <i>vpn name</i> { <b>df</b>   <b>interface</b>   <b>rp-mapping</b> } | Clears the PIM cache.                                                         |
| <b>clear ip sap</b> [ <i>group-address</i>   " <i>session-name</i> "]                                                                                                                                                | Deletes the Session Directory Protocol Version 2 cache or an sdr cache entry. |

## Displaying System and Network Statistics

You can display specific statistics, such as the contents of IP routing tables, caches, and databases.

### Note

This release does not support per-route statistics.

You can display information to learn resource usage and solve network problems. You can also display information about node reachability and discover the routing path that packets of your device are taking through the network.

You can use any of the privileged EXEC commands in the following table to display various routing statistics.

**Table 40: Commands for Displaying System and Network Statistics**

| Command                                                                                    | Purpose                                                                                                     |
|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>ping</b> [ <i>group-name</i>   <i>group-address</i> ]                                   | Sends an ICMP Echo Request to a multicast group address.                                                    |
| <b>show ip igmp filter</b>                                                                 | Displays IGMP filter information.                                                                           |
| <b>show ip igmp groups</b> [ <i>type-number</i>   <i>detail</i> ]                          | Displays the multicast groups that are directly connected to the switch and that were learned through IGMP. |
| <b>show ip igmp interface</b> [ <i>type number</i> ]                                       | Displays multicast-related information about an interface.                                                  |
| <b>show ip igmp membership</b> [ <i>name/group address</i>   <b>all</b>   <b>tracked</b> ] | Displays IGMP membership information for forwarding.                                                        |
| <b>show ip igmp profile</b> [ <i>profile_number</i> ]                                      | Displays IGMP profile information.                                                                          |
| <b>show ip igmp ssm-mapping</b> [ <i>hostname/IP address</i> ]                             | Displays IGMP SSM mapping information.                                                                      |

| Command                                                                                                                                                                                   | Purpose                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>show ip igmp static-group</b> { <b>class-map</b> [ <b>interface</b> [ <i>type</i> ] ] }                                                                                                | Displays static group information.                                                                                       |
| <b>show ip igmp vrf</b>                                                                                                                                                                   | Displays the selected VPN Routing/Forwarding instance by name.                                                           |
| <b>show ip mfib</b> [ <i>type number</i> ]                                                                                                                                                | Displays the IP multicast forwarding information base.                                                                   |
| <b>show ip mrrib</b> { <b>client</b>   <b>route</b>   <b>vrf</b> }                                                                                                                        | Displays the multicast routing information base.                                                                         |
| <b>show ip mrm</b> { <b>interface</b>   <b>manager</b>   <b>status-report</b> }                                                                                                           | Displays the IP multicast routing monitor information.                                                                   |
| <b>show ip mroute</b> [ <i>group-name</i>   <i>group-address</i> ] [ <i>source</i> ] [ <b>count</b>   <b>interface</b>   <b>proxy</b>   <b>pruned</b>   <b>summary</b>   <b>verbose</b> ] | Displays the contents of the IP multicast routing table.                                                                 |
| <b>show ip msdp</b> { <b>count</b>   <b>peer</b>   <b>rpf-peer</b>   <b>sa-cache</b>   <b>summary</b>   <b>vrf</b> }                                                                      | Displays the Multicast Source Discovery Protocol (MSDP) information.                                                     |
| <b>show ip multicast</b> [ <b>interface</b>   <b>limit</b>   <b>mpls</b>   <b>redundancy</b>   <b>vrf</b> ]                                                                               | Displays global multicast information.                                                                                   |
| <b>show ip pim interface</b> [ <i>type number</i> ] [ <b>count</b>   <b>detail</b>   <b>df</b>   <b>stats</b> ]                                                                           | Displays information about interfaces configured for PIM. This command is available in all software images.              |

| Command                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip pim tunnel</b> [ <i>tunnel</i>   <i>verbose</i> ]                  | Displays the registered tunnels.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>show ip pim vrf</b> <i>name</i>                                            | Displays VPN routing and forwarding instances.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>show ip rpf</b> { <i>source-address</i>   <i>name</i> }                    | Displays how the switch is doing Reverse-Path Forwarding (that is, from the unicast routing table, DVMRP routing table, or static mroutes).<br><br>Command parameters include: <ul style="list-style-type: none"> <li>• <i>Host name</i> or <i>IP address</i>—IP name or group address.</li> <li>• <b>Select</b>—Group-based VRF select information.</li> <li>• <b>vrf</b>—Selects VPN Routing/Forwarding instance.</li> </ul> |
| <b>show ip sap</b> [ <i>group</i>   " <i>session-name</i> "   <b>detail</b> ] | Displays the Session Announcement Protocol (SAP) Version 2 cache.<br><br>Command parameters include: <ul style="list-style-type: none"> <li>• <i>A.B.C.D</i>—IP group address.</li> <li>• <i>WORD</i>—Session name (in double quotes).</li> <li>• <b>detail</b>—Session details.</li> </ul>                                                                                                                                    |

## Monitoring IP Multicast Routing

You can use the privileged EXEC commands in the following table to monitor IP multicast routers, packets, and paths.

**Table 41: Commands for Monitoring IP Multicast Routing**

| Command                                                             | Purpose                                                                                                        |
|---------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>mrinfo</b> { [ <i>hostname</i>   <i>address</i> ]   <b>vrf</b> } | Queries a multicast router or multilayer switch about which neighboring multicast devices are peering with it. |
| <b>mstat</b> { [ <i>hostname</i>   <i>address</i> ]   <b>vrf</b> }  | Displays IP multicast packet rate and loss information.                                                        |
| <b>mtrace</b> { [ <i>hostname</i>   <i>address</i> ]   <b>vrf</b> } | Traces the path from a source to a destination branch for a multicast distribution tree for a given group.     |

## Configuration Examples for IP Multicast Routing

### Example: Configuring an IP Multicast Boundary

This example shows how to set up a boundary for all administratively-scoped addresses:

```
Switch(config)# access-list 1 deny 239.0.0.0 0.255.255.255
Switch(config)# access-list 1 permit 224.0.0.0 15.255.255.255
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip multicast boundary 1
```

### Example: Responding to mriinfo Requests

The software answers mriinfo requests sent by mrouted systems and Cisco routers and multilayer switches. The software returns information about neighbors through DVMRP tunnels and all the routed interfaces. This information includes the metric (always set to 1), the configured TTL threshold, the status of the interface, and various flags. You can also use the **mriinfo** privileged EXEC command to query the router or switch itself, as in this example:

```
Switch# mriinfo
171.69.214.27 (mm1-7kd.cisco.com) [version cisco 11.1] [flags: PMS]:
171.69.214.27 -> 171.69.214.26 (mm1-r7kb.cisco.com) [1/0/pim/querier]
171.69.214.27 -> 171.69.214.25 (mm1-45a.cisco.com) [1/0/pim/querier]
171.69.214.33 -> 171.69.214.34 (mm1-45c.cisco.com) [1/0/pim]
171.69.214.137 -> 0.0.0.0 [1/0/pim/querier/down/leaf]
171.69.214.203 -> 0.0.0.0 [1/0/pim/querier/down/leaf]
171.69.214.18 -> 171.69.214.20 (mm1-45e.cisco.com) [1/0/pim]
171.69.214.18 -> 171.69.214.19 (mm1-45c.cisco.com) [1/0/pim]
171.69.214.18 -> 171.69.214.17 (mm1-45a.cisco.com) [1/0/pim]
```

## Where to Go Next for IP Multicast

You can configure the following:

- IGMP
- Wireless Multicast
- PIM
- SSM
- Service Discovery Gateway

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Restrictions for Configuring the Service Discovery Gateway

The following are restrictions for configuring the Service Discovery Gateway:

- The Service Discovery Gateway does not support topologies with multiple hops. All network segments must be connected directly to it. The Service Discovery Gateway can learn services from all connected segments to build its cache and respond to requests acting as a proxy.

# Information about the Service Discovery Gateway and mDNS

## mDNS

mDNS was defined to achieve zero configuration, with zero configuration being defined as providing the following features:

- Addressing—Allocating IP addresses to hosts
- Naming—Using names to refer to hosts instead of IP addresses
- Service discovery—Finding services automatically on the network

With mDNS, network users no longer have to assign IP addresses, assign host names, or type in names to access services on the network. Users only need to ask to see what network services are available, and choose from a list.

With mDNS, *addressing* is accomplished through the use of DHCP/DHCPv6 or IPv4 and IPv6 Link Local scoped addresses. The benefit of zero-configuration occurs when no infrastructure services such as DHCP or DNS are present and self-assigned link-local addressing can be used. The client can then select a random IPv4 address in the link-local range (169.254.0.0/24) or use its IPv6 link-local address (FE80::/10) for communication.

With mDNS, *naming* (name-to-address translation on a local network using mDNS) queries are sent over the local network using link-local scoped IP multicast. Because these DNS queries are sent to a multicast address (IPv4 address 224.0.0.251 or IPv6 address FF02::FB), no single DNS server with global knowledge is required to answer the queries. When a service or device sees a query for any service it is aware of, it provides a DNS response with the information from its cache.

With mDNS, *service discovery* is accomplished by browsing. An mDNS query is sent out for a given service type and domain, and any device that is aware of matching services replies with service information. The result is a list of available services for the user to choose from.

The mDNS protocol (mDNS-RFC), together with DNS Service Discovery (DNS-SD-RFC) achieves the zero-configuration addressing, naming, and service discovery.

## mDNS-SD

Multicast DNS Service Discovery (mDNS-SD) uses DNS protocol semantics and multicast over well-known multicast addresses to achieve zero configuration service discovery. DNS packets are sent to and received on port 5353 using a multicast address of 224.0.0.251 and its IPv6 equivalent FF02::FB.

Because mDNS uses a link-local multicast address, its scope is limited to a single physical or logical LAN. If the networking reach needs to be extended to a distributed campus or to a wide-area environment consisting of many different networking technologies, mDNS gateway is implemented. An mDNS gateway provides a transport for mDNS packets across Layer 3 boundaries by filtering, caching, and redistributing services from one Layer 3 domain to another.

### *mDNS-SD Considerations for Wireless Clients*

- mDNS packets can be sent out of Layer 3 interfaces that might not have an IP address.
- Packets with mDNS multicast IP and multicast MAC are sent on a multicast CAPWAP tunnel, if multicast-multicast mode is enabled. A multicast CAPWAP tunnel is a special CAPWAP tunnel used for reducing the number of copies of multicast packet that are required to be generated for each AP

CAPWAP tunnel. Sending packets on the multicast CAPWAP tunnel requires the outer IP header to be destined to the multicast CAPWAP tunnel's address, which all APs are subscribed to.

- All mDNS packet handling is done at a foreign switch for roamed clients. A foreign switch is the new switch that a roamed wireless client is actually attached to, which is called the point of attachment.

## Service Discovery Gateway

The Service Discovery Gateway feature enables multicast Domain Name System (mDNS) to operate across Layer 3 boundaries (different subnets). An mDNS gateway provides transport for service discovery across Layer 3 boundaries by filtering, caching, and redistributing services from one Layer 3 domain (subnet) to another. Prior to implementation of this feature, mDNS was limited in scope to within a subnet because of the use of link-local scoped multicast addresses. This feature enhances Bring Your Own Device (BYOD).

### mDNS Gateway and Subnets

You need to enable an mDNS gateway for service discovery to operate across subnets. You can enable mDNS gateway for a device or for an interface.

**Note** You need to configure service routing globally before configuring at the interface level.

After the device or interface is enabled, you can redistribute service discovery information across subnets. You can create service policies and apply filters on either incoming service discovery information (called IN-bound filtering) or outgoing service discovery information (called OUT-bound filtering).

**Note** If redistribution is enabled globally, global configuration is given higher priority than interface configuration.

For example, if the mDNS gateway functionality is enabled on the router in this figure, then service information can be sent from one subnet to another and vice-versa. For example, the printer and fax service information being advertised in the network with IP address 192.0.2.6 are redistributed to the network with IP address

198.51.100.4. The printer and fax service information in the network with IP address 192.0.2.6 is learned by mDNS-enabled hosts and devices in the other network.

**Figure 15: Sample Networking Scenario**

390019

## Filtering

After configuring the mDNS gateway and subnets, you can filter services that you want to redistribute. While creating a service list, the **permit** or **deny** command options are used:

- The **permit** command option allows you to permit or transport specific service list information.
- The **deny** option allows you to deny service list information that is available to be transported to other subnets.

You need to include a sequence number when using the **permit** or **deny** command option. The same service list name can be associated with multiple sequence numbers and each sequence number will be mapped to a rule.

### Note

If no filters are configured, then the default action is to deny service list information to be transported through the device or interface.

Query is another option provided when creating service lists. You can create queries using a service list. If you want to browse for a service, then active queries can be used. This function is helpful to keep the records refreshed in the cache.

### Note

Active queries can only be used globally and cannot be used at the interface level.

A service end-point (such as a printer or fax) sends unsolicited announcements when a service starts up. After that, it sends unsolicited announcements whenever a network change event occurs (such as an interface coming up or going down). The device always respond to queries.

After creating a service list and using the **permit** or **deny** command options, you can filter using match statements (commands) based on *service-instance*, *service-type*, or *message-type* (announcement or query).

## How to Configure the Service Discovery Gateway

### Configuring the Service List (CLI)

This procedure describes how to create a service list, apply a filter for the service list, and configure parameters for the service list name.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **service-list mdns-sd** *service-list-name* {**deny** *sequence-number* | **permit** *sequence-number* | **query**}
4. **match message-type** {**announcement** | **any** | **query**}
5. **match service-instance** { *LINE* }
6. **match service-type** {*LINE* }
7. **end**

#### DETAILED STEPS

|        | Command or Action                                                                     | Purpose                                                                                                                   |
|--------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|

| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b> | Enters the global configuration mode.                                                                                     |

|        | Command or Action                                                                                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <p><b>service-list mdns-sd</b> <i>service-list-name</i><br/> {deny <i>sequence-number</i>   permit<br/> <i>sequence-number</i>   query}</p> <p><b>Example:</b></p> <pre>Switch(config)# service-list mdns-sd sl1 permit 3</pre> <pre>Switch(config)# service-list mdns-sd sl4 query</pre> | <p>Enters mDNS service discovery service list mode. In this mode, you can:</p> <ul style="list-style-type: none"> <li>• Create a service list and apply a filter on the service list according to the <b>permit</b> or <b>deny</b> option applied to the sequence number.</li> <li>• Create a service list and associate a query for the service list name if the <b>query</b> option is used.</li> </ul> <p><b>Note</b> The sequence number sets the priority of the rule. A rule with a lower sequence number is selected first and the service announcement or query is allowed or denied accordingly. You define the sequence number as per your network requirements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 4 | <p><b>match message-type</b> {announcement<br/>   any   query}</p> <p><b>Example:</b></p> <pre>Switch(config-mdns-sd-sl)# match message-type announcement</pre>                                                                                                                           | <p>(Optional) Sets the message type to match. You can match the following message types:</p> <ul style="list-style-type: none"> <li>• announcement</li> <li>• any</li> <li>• query</li> </ul> <p>These commands configure the parameters for the service list name that is created in step 2.</p> <p>If the <b>match message-type</b> is an announcement, then the service list rule only allows service advertisements or announcements for the device. If the <b>match message-type</b> is a query, then only a query from the client for a certain service in the network is allowed.</p> <p>Multiple service maps of the same name with different sequence numbers can be created and the evaluation of the filters will be ordered on the sequence number. Service lists are an ordered sequence of individual statements, each one has a permit or deny result. Evaluation of service list consists of a list scan, in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is stopped once the first statement match is found and an action permit/deny associated with the statement match is performed. The default action after scanning through the entire list is to deny.</p> <p><b>Note</b> You cannot use the <b>match</b> command if you have used the <b>query</b> option in the previous step. The <b>match</b> command can be used only for the <b>permit</b> or <b>deny</b> option.</p> |
| Step 5 | <p><b>match service-instance</b> { <i>LINE</i> }</p> <p><b>Example:</b></p> <pre>Switch(config-mdns-sd-sl)## match service-instance servInst 1</pre>                                                                                                                                      | <p>(Optional) Sets the service instance to match.</p> <p>This command configures the parameters for the service list name that is created in step 2.</p> <p><b>Note</b> You cannot use the <b>match</b> command if you have used the <b>query</b> option in the previous step. The <b>match</b> command can be used only for the <b>permit</b> or <b>deny</b> option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 6 | <p><b>match service-type</b> { <i>LINE</i> }</p>                                                                                                                                                                                                                                          | <p>(Optional) Sets the value of the mDNS service type string to match.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|               | Command or Action                                                                         | Purpose                                                                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch(config-mdns-sd-sl)# match service-type _ipp._tcp</pre> | <p>This command configures the parameters for the service list name that is created in step 2.</p> <p><b>Note</b> You cannot use the <b>match</b> command if you have used the <b>query</b> option in the previous step. The <b>match</b> command can be used only for the <b>permit</b> or <b>deny</b> option.</p> |
| <b>Step 7</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-mdns-sd-sl)# end</pre>        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                    |

### What to Do Next

Proceed to enable the mDNS gateway and redistribution of services.

## Configuring Service List (GUI)

### SUMMARY STEPS

1. Choose **Configuration > Controller > mDNS > Service List**.
2. Click **Create Service**.
3. In the **Service List Name** text box, enter the service list name.
4. From the **Service rule** drop-down list, choose from the following options:
  - **permit**—permits the service list.
  - **deny**—denies the service list.
5. In the **Sequence number** text box, enter the priority of the rule.
6. From the **Message type** drop-down list, choose the message type to match from the following options:
  - **announcement**—The service list rule allows only service advertisements or announcements for the device.
  - **query**—The service list rule allows only a query from the client for a service in the network.
  - **any**—The service list rule allows any type of message.
7. In the **Service instance** text box, enter the service instance to match.
8. In the **Custom** text box, enter the mDNS service type string to match.
9. Click **Apply**.
10. Click **Save Configuration**.

### DETAILED STEPS

- 
- Step 1** Choose **Configuration > Controller > mDNS > Service List**.
- Step 2** Click **Create Service**.  
The **Service List > Create Service** page is displayed.
- Step 3** In the **Service List Name** text box, enter the service list name.
- Step 4** From the **Service rule** drop-down list, choose from the following options:
  - **permit**—permits the service list.
  - **deny**—denies the service list.
- Step 5** In the **Sequence number** text box, enter the priority of the rule.  
A rule with a lower sequence number is selected first and the service announcement or query is allowed or denied accordingly. You define the sequence number as per your network requirements.
- Step 6** From the **Message type** drop-down list, choose the message type to match from the following options:
  - **announcement**—The service list rule allows only service advertisements or announcements for the device.
  - **query**—The service list rule allows only a query from the client for a service in the network.

- **any**—The service list rule allows any type of message.

Multiple service maps of the same name with different sequence numbers can be created and the evaluation of the filters will be ordered on the sequence number. Service lists are an ordered sequence of individual statements, each one has a permit or deny result. Evaluation of service list consists of a list scan, in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is stopped once the first statement match is found and an action permit/deny associated with the statement match is performed. The default action after scanning through the entire list is to deny.

**Step 7** In the **Service instance** text box, enter the service instance to match.

**Step 8** In the **Custom** text box, enter the mDNS service type string to match. The **Learned Service** box shows the services that are added after enabling the learned service type configured by navigating to **Configuration > Controller > mDNS > Global**. For example, `_roap._tcp.local`. The **Selected Service** box shows the learned service that you have selected for an mDNS service.

**Step 9** Click **Apply**.

**Step 10** Click **Save Configuration**.

### What to Do Next

Proceed to enable the mDNS gateway and redistribution of services.

## Enabling mDNS Gateway and Redistributing Services (CLI)

After enabling mDNS gateway for a device, you can apply filters (apply IN-bound filtering or OUT-bound filtering) and active queries by using **service-policy** and **service-policy-query** commands, respectively. You can redistribute services and service announcements using the **redistribute mdns-sd** command, and set some part of the system memory for cache using the **cache-memory-max** command.

**Note** By default, mDNS gateway is disabled on all interfaces.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **service-routing mdns-sd**
4. **service-policy** *service-policy-name* {IN | OUT}
5. **redistribute mdns-sd**
6. **cache-memory-max** *cache-config-percentage*
7. **service-policy-query** *service-list-query-name* *service-list-query-periodicity*
8. **exit**
9. **wireless multicast**
10. **no wireless mdns-bridging**
11. **end**

## Enabling Multicast DNS Gateway (GUI)

### SUMMARY STEPS

1. Choose **Configuration > Controller > mDNS > Global**.
2. Select the **mDNS gateway** check box.
3. From the **Learn Service** drop-down list, choose from the following options:
  - **Enable**— Allows the switch to learn all the announced services. It is used to learn services by enabling all announcement/queries by using Service Policy IN of type GUI-permit-all and in Service Policy OUT of type GUI-deny-all.
  - **Disable**— Denies all the traffics IN and OUT. It is used to deny services by disabling all announcement/queries by using Service Policy IN of type GUI-deny-all and in Service Policy OUT of type GUI-deny-all.
  - **Custom**— You can set your own IN and OUT policy. It allows you to define a custom service list.
4. Click **Apply**.
5. Click **Save Configuration**.

### DETAILED STEPS

- 
- Step 1** Choose **Configuration > Controller > mDNS > Global**.  
The **Global Service Rules** page is displayed.
- Step 2** Select the **mDNS gateway** check box.
- Step 3** From the **Learn Service** drop-down list, choose from the following options:
- **Enable**— Allows the switch to learn all the announced services. It is used to learn services by enabling all announcement/queries by using Service Policy IN of type GUI-permit-all and in Service Policy OUT of type GUI-deny-all.
  - **Disable**— Denies all the traffics IN and OUT. It is used to deny services by disabling all announcement/queries by using Service Policy IN of type GUI-deny-all and in Service Policy OUT of type GUI-deny-all.
  - **Custom**— You can set your own IN and OUT policy. It allows you to define a custom service list.
- Step 4** Click **Apply**.
- Step 5** Click **Save Configuration**.
-

# Monitoring Service Discovery Gateway

| Command                                                                                                          | Purpose                                                                                                             |
|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <code>show mdns requests [detail   name record-name] type record-type [ name record-name]</code>                 | This command displays information for outstanding mDNS requests, including record name and record type information. |
| <code>show mdns cache [interface type number   name record-name [type record-type]] type record-type</code>      | This command displays mDNS cache information.                                                                       |
| <code>show mdns statistics {all   service-list list-name   service-policy {all   interface type number }}</code> | This command displays mDNS statistics.                                                                              |

## Configuration Examples

### Example: Specify Alternative Source Interface for Outgoing mDNS Packets

The following example displays how to specify an alternate source interface for outgoing mDNS packets, so its IP address can be used when there is none configured on the outgoing interface.

```
Switch(config)# service-routing mdns-sd
Switch(config-mdns)# source-interface if-name
```

## Example: Creating a Service-List, Applying a Filter and Configuring Parameters

The following example shows the creation of a service-list s11. The **permit** command option is being applied on sequence number 3 and all services with message-type announcement are filtered and available for transport across various subnets associated with the device.

```
Switch# configure terminal
Switch(config)# service-list mdns-sd s11 permit 3
Switch(config-mdns-sd-s1) #match message-type announcement
Switch(config-mdns) # exit
```

## Example: Enabling mDNS Gateway and Redistributing Services

The following example shows how to enable an mDNS gateway for a device and enable redistribution of services across subnets. IN-bound filtering is applied on the service-list serv-poll1. Twenty percent of system memory is made available for cache and service-list-query periodicity is configured at 100 seconds.

```
Switch# configure terminal
Switch# service-routing mdns-sd
Switch(config-mdns) # service-policy serv-poll1 IN
Switch(config-mdns) # redistribute mdns-sd
Switch(config-mdns) # cache-memory-max 20
Switch(config-mdns) # service-policy-query s1-query1 100
Switch(config-mdns) # exit
```

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Information About Configuring IPv6 MLD Snooping

You can use Multicast Listener Discovery (MLD) snooping to enable efficient distribution of IP Version 6 (IPv6) multicast data to clients and routers in a switched network on the switch. Unless otherwise noted, the term switch refers to a standalone switch and to a switch stack.

**Note**

To use IPv6 on a Catalyst 2960-XR switch, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Note**

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release or the Cisco IOS documentation referenced in the procedures.

## Understanding MLD Snooping

In IP Version 4 (IPv4), Layer 2 switches can use Internet Group Management Protocol (IGMP) snooping to limit the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. In IPv6, MLD snooping performs a similar function. With MLD snooping, IPv6 multicast data is selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This list is constructed by snooping IPv6 multicast control packets.

MLD is a protocol used by IPv6 multicast routers to discover the presence of multicast listeners (nodes wishing to receive IPv6 multicast packets) on the links that are directly attached to the routers and to discover which multicast packets are of interest to neighboring nodes. MLD is derived from IGMP; MLD Version 1 (MLDv1) is equivalent to IGMPv2, and MLD Version 2 (MLDv2) is equivalent to IGMPv3. MLD is a subprotocol of Internet Control Message Protocol Version 6 (ICMPv6), and MLD messages are a subset of ICMPv6 messages, identified in IPv6 packets by a preceding Next Header value of 58.

The switch supports two versions of MLD snooping:

- MLDv1 snooping detects MLDv1 control packets and sets up traffic bridging based on IPv6 destination multicast addresses.
- MLDv2 basic snooping (MBSS) uses MLDv2 control packets to set up traffic forwarding based on IPv6 destination multicast addresses.

The switch can snoop on both MLDv1 and MLDv2 protocol packets and bridge IPv6 multicast data based on destination IPv6 multicast addresses.

### Note

The switch does not support MLDv2 enhanced snooping, which sets up IPv6 source and destination multicast address-based forwarding.

MLD snooping can be enabled or disabled globally or per VLAN. When MLD snooping is enabled, a per-VLAN IPv6 multicast address table is constructed in software and hardware. The switch then performs IPv6 multicast-address based bridging in hardware.

According to IPv6 multicast standards, the switch derives the MAC multicast address by performing a logical-OR of the four low-order octets of the switch MAC address with the MAC address of 33:33:00:00:00:00. For example, the IPv6 MAC address of FF02:DEAD:BEEF:1:3 maps to the Ethernet MAC address of 33:33:00:01:00:03.

A multicast packet is unmatched when the destination IPv6 address does not match the destination MAC address. The switch forwards the unmatched packet in hardware based the MAC address table. If the destination MAC address is not in the MAC address table, the switch floods the packet to all ports in the same VLAN as the receiving port.

## MLD Messages

MLDv1 supports three types of messages:

- Listener Queries are the equivalent of IGMPv2 queries and are either General Queries or Multicast-Address-Specific Queries (MASQs).
- Multicast Listener Reports are the equivalent of IGMPv2 reports

- Multicast Listener Done messages are the equivalent of IGMPv2 leave messages.

MLDv2 supports MLDv2 queries and reports, as well as MLDv1 Report and Done messages.

Message timers and state transitions resulting from messages being sent or received are the same as those of IGMPv2 messages. MLD messages that do not have valid link-local IPv6 source addresses are ignored by MLD routers and switches.

## MLD Queries

The switch sends out MLD queries, constructs an IPv6 multicast address database, and generates MLD group-specific and MLD group-and-source-specific queries in response to MLD Done messages. The switch also supports report suppression, report proxying, Immediate-Leave functionality, and static IPv6 multicast group address configuration.

When MLD snooping is disabled, all MLD queries are flooded in the ingress VLAN.

When MLD snooping is enabled, received MLD queries are flooded in the ingress VLAN, and a copy of the query is sent to the CPU for processing. From the received query, MLD snooping builds the IPv6 multicast address database. It detects multicast router ports, maintains timers, sets report response time, learns the querier IP source address for the VLAN, learns the querier port in the VLAN, and maintains multicast-address aging.

### Note

When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the Catalyst 2960, 2960-S, 2960-C, or 2960-X switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

When a group exists in the MLD snooping database, the switch responds to a group-specific query by sending an MLDv1 report. When the group is unknown, the group-specific query is flooded to the ingress VLAN.

When a host wants to leave a multicast group, it can send out an MLD Done message (equivalent to IGMP Leave message). When the switch receives an MLDv1 Done message, if Immediate-Leave is not enabled, the switch sends an MASQ to the port from which the message was received to determine if other devices connected to the port should remain in the multicast group.

## Multicast Client Aging Robustness

You can configure port membership removal from addresses based on the number of queries. A port is removed from membership to an address only when there are no reports to the address on the port for the configured number of queries. The default number is 2.

## Multicast Router Discovery

Like IGMP snooping, MLD snooping performs multicast router discovery, with these characteristics:

- Ports configured by a user never age out.
- Dynamic port learning results from MLDv1 snooping queries and IPv6 PIMv2 packets.
- If there are multiple routers on the same Layer 2 interface, MLD snooping tracks a single multicast router on the port (the router that most recently sent a router control packet).

- Dynamic multicast router port aging is based on a default timer of 5 minutes; the multicast router is deleted from the router port list if no control packet is received on the port for 5 minutes.
- IPv6 multicast router discovery only takes place when MLD snooping is enabled on the switch.
- Received IPv6 multicast router control packets are always flooded to the ingress VLAN, whether or not MLD snooping is enabled on the switch.
- After the discovery of the first IPv6 multicast router port, unknown IPv6 multicast data is forwarded only to the discovered router ports (before that time, all IPv6 multicast data is flooded to the ingress VLAN).

## MLD Reports

The processing of MLDv1 join messages is essentially the same as with IGMPv2. When no IPv6 multicast routers are detected in a VLAN, reports are not processed or forwarded from the switch. When IPv6 multicast routers are detected and an MLDv1 report is received, an IPv6 multicast group address is entered in the VLAN MLD database. Then all IPv6 multicast traffic to the group within the VLAN is forwarded using this address. When MLD snooping is disabled, reports are flooded in the ingress VLAN.

When MLD snooping is enabled, MLD report suppression, called listener message suppression, is automatically enabled. With report suppression, the switch forwards the first MLDv1 report received by a group to IPv6 multicast routers; subsequent reports for the group are not sent to the routers. When MLD snooping is disabled, report suppression is disabled, and all MLDv1 reports are flooded to the ingress VLAN.

The switch also supports MLDv1 proxy reporting. When an MLDv1 MASQ is received, the switch responds with MLDv1 reports for the address on which the query arrived if the group exists in the switch on another port and if the port on which the query arrived is not the last member port for the address.

## MLD Done Messages and Immediate-Leave

When the Immediate-Leave feature is enabled and a host sends an MLDv1 Done message (equivalent to an IGMP leave message), the port on which the Done message was received is immediately deleted from the group. You enable Immediate-Leave on VLANs and (as with IGMP snooping), you should only use the feature on VLANs where a single host is connected to the port. If the port was the last member of a group, the group is also deleted, and the leave information is forwarded to the detected IPv6 multicast routers.

When Immediate Leave is not enabled in a VLAN (which would be the case when there are multiple clients for a group on the same port) and a Done message is received on a port, an MASQ is generated on that port. The user can control when a port membership is removed for an existing address in terms of the number of MASQs. A port is removed from membership to an address when there are no MLDv1 reports to the address on the port for the configured number of queries.

The number of MASQs generated is configured by using the **ipv6 mld snooping last-listener-query count** global configuration command. The default number is 2.

The MASQ is sent to the IPv6 multicast address for which the Done message was sent. If there are no reports sent to the IPv6 multicast address specified in the MASQ during the switch maximum response time, the port on which the MASQ was sent is deleted from the IPv6 multicast address database. The maximum response time is the time configured by using the **ipv6 mld snooping last-listener-query-interval** global configuration command. If the deleted port is the last member of the multicast address, the multicast address is also deleted, and the switch sends the address leave information to all detected multicast routers.

When Immediate Leave is not enabled and a port receives an MLD Done message, the switch generates MASQs on the port and sends them to the IPv6 multicast address for which the Done message was sent. You

can optionally configure the number of MASQs that are sent and the length of time the switch waits for a response before deleting the port from the multicast group.

When you enable MLDv1 Immediate Leave, the switch immediately removes a port from a multicast group when it detects an MLD Done message on that port. You should only use the Immediate-Leave feature when there is a single receiver present on every port in the VLAN. When there are multiple clients for a multicast group on the same port, you should not enable Immediate-Leave in a VLAN.

### Topology Change Notification Processing

When topology change notification (TCN) solicitation is enabled by using the **ipv6 mld snooping tcn query solicit** global configuration command, MLDv1 snooping sets the VLAN to flood all IPv6 multicast traffic with a configured number of MLDv1 queries before it begins sending multicast data only to selected ports. You set this value by using the **ipv6 mld snooping tcn flood query count** global configuration command. The default is to send two queries. The switch also generates MLDv1 global Done messages with valid link-local IPv6 source addresses when the switch becomes the STP root in the VLAN or when it is configured by the user. This is same as done in IGMP snooping.

### MLD Snooping in Switch Stacks

The MLD IPv6 group address databases are maintained on all switches in the stack, regardless of which switch learns of an IPv6 multicast group. Report suppression and proxy reporting are done stack-wide. During the maximum response time, only one received report for a group is forwarded to the multicast routers, regardless of which switch the report arrives on.

The election of a new stack master does not affect the learning or bridging of IPv6 multicast data; bridging of IPv6 multicast data does not stop during a stack master re-election. When a new switch is added to the stack, it synchronizes the learned IPv6 multicast information from the stack master. Until the synchronization is complete, data ingress on the newly added switch is treated as unknown multicast data.

## How to Configure IPv6 MLD Snooping

### Default MLD Snooping Configuration

*Table 43: Default MLD Snooping Configuration*

| Feature                      | Default Setting                                                                     |
|------------------------------|-------------------------------------------------------------------------------------|
| MLD snooping (Global)        | Disabled.                                                                           |
| MLD snooping (per VLAN)      | Enabled. MLD snooping must be globally enabled for VLAN MLD snooping to take place. |
| IPv6 Multicast addresses     | None configured.                                                                    |
| IPv6 Multicast router ports  | None configured.                                                                    |
| MLD snooping Immediate Leave | Disabled.                                                                           |

| Feature                          | Default Setting                                                                                                                                            |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MLD snooping robustness variable | Global: 2; Per VLAN: 0.<br><b>Note</b> The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count.              |
| Last listener query count        | Global: 2; Per VLAN: 0.<br><b>Note</b> The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count.              |
| Last listener query interval     | Global: 1000 (1 second); VLAN: 0.<br><b>Note</b> The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global interval. |
| TCN query solicit                | Disabled.                                                                                                                                                  |
| TCN query count                  | 2.                                                                                                                                                         |
| MLD listener suppression         | Disabled.                                                                                                                                                  |

## MLD Snooping Configuration Guidelines

When configuring MLD snooping, consider these guidelines:

- You can configure MLD snooping characteristics at any time, but you must globally enable MLD snooping by using the **ipv6 mld snooping** global configuration command for the configuration to take effect.
- When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.
- MLD snooping and IGMP snooping act independently of each other. You can enable both features at the same time on the switch.
- The maximum number of multicast entries allowed on the switch or switch stack is determined by the configured SDM template.
- 
- The maximum number of address entries allowed for the switch or switch stack is 4000.

## Enabling or Disabling MLD Snooping on the Switch (CLI)

By default, IPv6 MLD snooping is globally disabled on the switch and enabled on all VLANs. When MLD snooping is globally disabled, it is also disabled on all VLANs. When you globally enable MLD snooping, the VLAN configuration overrides the global configuration. That is, MLD snooping is enabled only on VLAN interfaces in the default state (enabled).

You can enable and disable MLD snooping on a per-VLAN basis or for a range of VLANs, but if you globally disable MLD snooping, it is disabled in all VLANs. If global snooping is enabled, you can enable or disable VLAN snooping.

Beginning in privileged EXEC mode, follow these steps to globally enable MLD snooping on the switch:

## DETAILED STEPS

|               | Command or Action                                                                                                                   | Purpose                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <code>configure terminal</code>                                         | Enters global configuration mode.                       |
| <b>Step 2</b> | <b>ipv6 mld snooping</b><br><br><b>Example:</b><br>Switch(config)# <code>ipv6 mld snooping</code>                                   | Enables MLD snooping on the switch.                     |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <code>end</code>                                                               | Returns to privileged EXEC mode.                        |
| <b>Step 4</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch(config)# <code>copy running-config startup-config</code> | (Optional) Save your entries in the configuration file. |
| <b>Step 5</b> | <b>reload</b><br><br><b>Example:</b><br>Switch(config)# <code>reload</code>                                                         | Reload the operating system.                            |

## Enabling or Disabling MLD Snooping on a VLAN (CLI)

Beginning in privileged EXEC mode, follow these steps to enable MLD snooping on a VLAN.

## DETAILED STEPS

|        | Command or Action                                                                                                      | Purpose                                                                                                                                                                      |
|--------|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                  | Enters global configuration mode.                                                                                                                                            |
| Step 2 | <b>ipv6 mld snooping</b><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 mld snooping</b>                            | Enables MLD snooping on the switch.                                                                                                                                          |
| Step 3 | <b>ipv6 mld snooping vlan <i>vlan-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 mld snooping vlan 1</b> | Enables MLD snooping on the VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.<br><br><b>Note</b> MLD snooping must be globally enabled for VLAN snooping to be enabled. |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 mld snooping vlan 1</b>                                   | Returns to privileged EXEC mode.                                                                                                                                             |

## Configuring a Static Multicast Group (CLI)

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure an IPv6 multicast address and member ports for a VLAN.

Beginning in privileged EXEC mode, follow these steps to add a Layer 2 port as a member of a multicast group:

## DETAILED STEPS

|        | Command or Action                                                                                                    | Purpose                                                                            |
|--------|----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                | Enters global configuration mode                                                   |
| Step 2 | <b>ipv6 mld snooping vlan <i>vlan-id</i> static<br/> <i>ipv6_multicast_address</i> interface <i>interface-id</i></b> | Configures a multicast group with a Layer 2 port as a member of a multicast group: |

|               | Command or Action                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch(config)# ipv6 mld snooping vlan 1 static FF12::3 interface gigabitethernet 0/1</pre>                                                                                                                                                                                           | <ul style="list-style-type: none"> <li>• <i>vlan-id</i> is the multicast group VLAN ID. The VLAN ID range is 1 to 1001 and 1006 to 4094.</li> <li>• <i>ipv6_multicast_address</i> is the 128-bit group IPv6 address. The address must be in the form specified in RFC 2373.</li> <li>• <i>interface-id</i> is the member port. It can be a physical interface or a port channel (1 to 48).</li> </ul> |
| <b>Step 3</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                                                                                                                                                                                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 4</b> | <p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>show ipv6 mld snooping address</b></li> <li>• <b>show ipv6 mld snooping address vlan <i>vlan-id</i></b></li> </ul> <p><b>Example:</b></p> <pre>Switch# show ipv6 mld snooping address OR Switch# show ipv6 mld snooping vlan 1</pre> | Verifies the static member port and the IPv6 address.                                                                                                                                                                                                                                                                                                                                                 |

## Configuring a Multicast Router Port (CLI)

**Note** Static connections to multicast routers are supported only on switch ports.

Beginning in privileged EXEC mode, follow these steps to add a multicast router port to a VLAN:

### DETAILED STEPS

|               | Command or Action                                                                             | Purpose                           |
|---------------|-----------------------------------------------------------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre> | Enters global configuration mode. |

|               | Command or Action                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>ipv6 mld snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 mld snooping vlan 1 mrouter interface gigabitethernet 0/2</b> | Specifies the multicast router VLAN ID, and specify the interface to the multicast router. <ul style="list-style-type: none"> <li>• The VLAN ID range is 1 to 1001 and 1006 to 4094.</li> <li>• The interface can be a physical interface or a port channel. The port-channel range is 1 to 48.</li> </ul> |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                           |
| <b>Step 4</b> | <b>show ipv6 mld snooping mrouter [ vlan <i>vlan-id</i> ]</b><br><br><b>Example:</b><br>Switch# <b>show ipv6 mld snooping mrouter vlan 1</b>                                                       | Verifies that IPv6 MLD snooping is enabled on the VLAN interface.                                                                                                                                                                                                                                          |

## Enabling MLD Immediate Leave (CLI)

Beginning in privileged EXEC mode, follow these steps to enable MLDv1 Immediate Leave:

### DETAILED STEPS

|               | Command or Action                                                                                                                                      | Purpose                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                  | Enters global configuration mode.                  |
| <b>Step 2</b> | <b>ipv6 mld snooping vlan <i>vlan-id</i> immediate-leave</b><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 mld snooping vlan 1 immediate-leave</b> | Enables MLD Immediate Leave on the VLAN interface. |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                        | Returns to privileged EXEC mode.                   |

|               | Command or Action                                                                                                        | Purpose                                                         |
|---------------|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| <b>Step 4</b> | <b>show ipv6 mld snooping vlan</b> <i>vlan-id</i><br><br><b>Example:</b><br>Switch# <b>show ipv6 mld snooping vlan 1</b> | Verifies that Immediate Leave is enabled on the VLAN interface. |

## Configuring MLD Snooping Queries (CLI)

Beginning in privileged EXEC mode, follow these steps to configure MLD snooping query characteristics for the switch or for a VLAN:

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                                   | Enters global configuration mode.                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>ipv6 mld snooping robustness-variable</b> <i>value</i><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 mld snooping robustness-variable 3</b>                                      | (Optional) Sets the number of queries that are sent before switch will delete a listener (port) that does not respond to a general query. The range is 1 to 3; the default is 2.                                                                                                                                          |
| <b>Step 3</b> | <b>ipv6 mld snooping vlan</b> <i>vlan-id</i><br><b>robustness-variable</b> <i>value</i><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 mld snooping vlan 1 robustness-variable 3</b> | (Optional) Sets the robustness variable on a VLAN basis, which determines the number of general queries that MLD snooping sends before aging out a multicast address when there is no MLD report response. The range is 1 to 3; the default is 0. When set to 0, the number used is the global robustness variable value. |
| <b>Step 4</b> | <b>ipv6 mld snooping last-listener-query-count</b> <i>count</i><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 mld snooping last-listener-query-count 7</b>                          | (Optional) Sets the number of MASQs that the switch sends before aging out an MLD client. The range is 1 to 7; the default is 2. The queries are sent 1 second apart.                                                                                                                                                     |
| <b>Step 5</b> | <b>ipv6 mld snooping vlan</b> <i>vlan-id</i><br><b>last-listener-query-count</b> <i>count</i>                                                                                           | (Optional) Sets the last-listener query count on a VLAN basis. This value overrides the value configured globally. The range is 1 to 7; the default is 0. When set to 0, the global count value is used. Queries are sent 1 second apart.                                                                                 |

|                | Command or Action                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <b>Example:</b><br><pre>Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-count 7</pre>                                                                                                                  |                                                                                                                                                                                                                                                                                     |
| <b>Step 6</b>  | <b>ipv6 mld snooping last-listener-query-interval</b> <i>interval</i><br><br><b>Example:</b><br><pre>Switch(config)# ipv6 mld snooping last-listener-query-interval 2000</pre>                                      | (Optional) Sets the maximum response time that the switch waits after sending out a MASQ before deleting a port from the multicast group. The range is 100 to 32,768 thousands of a second. The default is 1000 (1 second).                                                         |
| <b>Step 7</b>  | <b>ipv6 mld snooping vlan</b> <i>vlan-id</i><br><b>last-listener-query-interval</b> <i>interval</i><br><br><b>Example:</b><br><pre>Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-interval 2000</pre> | (Optional) Sets the last-listener query interval on a VLAN basis. This value overrides the value configured globally. The range is 0 to 32,768 thousands of a second. The default is 0. When set to 0, the global last-listener query interval is used.                             |
| <b>Step 8</b>  | <b>ipv6 mld snooping tcn query solicit</b><br><br><b>Example:</b><br><pre>Switch(config)# ipv6 mld snooping tcn query solicit</pre>                                                                                 | (Optional) Enables topology change notification (TCN) solicitation, which means that VLANs flood all IPv6 multicast traffic for the configured number of queries before sending multicast data to only those ports requesting to receive it. The default is for TCN to be disabled. |
| <b>Step 9</b>  | <b>ipv6 mld snooping tcn flood query count</b> <i>count</i><br><br><b>Example:</b><br><pre>Switch(config)# ipv6 mld snooping tcn flood query count 5</pre>                                                          | (Optional) When TCN is enabled, specifies the number of TCN queries to be sent. The range is from 1 to 10; the default is 2.                                                                                                                                                        |
| <b>Step 10</b> | <b>end</b>                                                                                                                                                                                                          | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                    |
| <b>Step 11</b> | <b>show ipv6 mld snooping querier</b> [ <i>vlan</i> <i>vlan-id</i> ]<br><br><b>Example:</b><br><pre>Switch(config)# show ipv6 mld snooping querier vlan 1</pre>                                                     | (Optional) Verifies that the MLD snooping querier information for the switch or for the VLAN.                                                                                                                                                                                       |

## Disabling MLD Listener Message Suppression (CLI)

MLD snooping listener message suppression is enabled by default. When it is enabled, the switch forwards only one MLD report per multicast router query. When message suppression is disabled, multiple MLD reports could be forwarded to the multicast routers.

Beginning in privileged EXEC mode, follow these steps to disable MLD listener message suppression:

## DETAILED STEPS

|        | Command or Action                                                                                                                                                 | Purpose                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <code>configure terminal</code>                                                                       | Enter global configuration mode.                              |
| Step 2 | <b>no ipv6 mld snooping listener-message-suppression</b><br><br><b>Example:</b><br>Switch(config)# <code>no ipv6 mld snooping listener-message-suppression</code> | Disable MLD message suppression.                              |
| Step 3 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <code>end</code>                                                                                             | Return to privileged EXEC mode.                               |
| Step 4 | <b>show ipv6 mld snooping</b><br><br><b>Example:</b><br>Switch# <code>show ipv6 mld snooping</code>                                                               | Verify that IPv6 MLD snooping report suppression is disabled. |

## Displaying MLD Snooping Information

You can display MLD snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display IPv6 group address multicast entries for a VLAN configured for MLD snooping.

**Table 44: Commands for Displaying MLD Snooping Information**

| Command                                                     | Purpose                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show ipv6 mld snooping [ vlan <i>vlan-id</i> ]</code> | Displays the MLD snooping configuration information for all VLANs on the switch or for a specified VLAN.<br><br>(Optional) Enter <code>vlan <i>vlan-id</i></code> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094. |

| Command                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ipv6 mld snooping mrouter</b> [ <b>vlan</b> <i>vlan-id</i> ]                                                 | Displays information on dynamically learned and manually configured multicast router interfaces. When you enable MLD snooping, the switch automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces.<br><br>(Optional) Enters <b>vlan</b> <i>vlan-id</i> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.                                                                                    |
| <b>show ipv6 mld snooping querier</b> [ <b>vlan</b> <i>vlan-id</i> ]                                                 | Displays information about the IPv6 address and incoming port for the most-recently received MLD query messages in the VLAN.<br><br>(Optional) Enters <b>vlan</b> <i>vlan-id</i> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.                                                                                                                                                                                                                        |
| <b>show ipv6 mld snooping address</b> [ <b>vlan</b> <i>vlan-id</i> ] [ <b>count</b>   <b>dynamic</b>   <b>user</b> ] | Displays all IPv6 multicast address information or specific IPv6 multicast address information for the switch or a VLAN.<br><br><ul style="list-style-type: none"> <li>• Enters <b>count</b> to show the group count on the switch or in a VLAN.</li> <li>• Enters <b>dynamic</b> to display MLD snooping learned group information for the switch or for a VLAN.</li> <li>• Enters <b>user</b> to display MLD snooping user-configured group information for the switch or for a VLAN.</li> </ul> |
| <b>show ipv6 mld snooping address</b> <b>vlan</b> <i>vlan-id</i> [ <i>ipv6-multicast-address</i> ]                   | Displays MLD snooping for the specified VLAN and IPv6 multicast address.                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Configuration Examples for Configuring MLD Snooping

### Configuring a Static Multicast Group: Example

This example shows how to statically configure an IPv6 multicast group:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 2 static FF12::3 interface gigabitethernet
1/0/1
Switch(config)# end
```

## Configuring a Multicast Router Port: Example

This example shows how to add a multicast router port to VLAN 200:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 200 mrouter interface gigabitethernet
                0/2
Switch(config)# exit
```

## Enabling MLD Immediate Leave: Example

This example shows how to enable MLD Immediate Leave on VLAN 130:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 130 immediate-leave
Switch(config)# exit
```

## Configuring MLD Snooping Queries: Example

This example shows how to set the MLD snooping global robustness variable to 3:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping robustness-variable 3
Switch(config)# exit
```

This example shows how to set the MLD snooping last-listener query count for a VLAN to 3:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 200 last-listener-query-count 3
Switch(config)# exit
```

This example shows how to set the MLD snooping last-listener query interval (maximum response time) to 2000 (2 seconds):

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000
Switch(config)# exit
```

## CHAPTER 20

# Configuring IPv6 Unicast Routing

- [Finding Feature Information, page 375](#)
- [Information About Configuring IPv6 Unicast Routing, page 375](#)
- [Configuring DHCP for IPv6 Address Assignment, page 398](#)
- [Configuration Examples for IPv6 Unicast Routing, page 402](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring IPv6 Unicast Routing

This chapter describes how to configure IPv6 unicast routing on the switch.

### Note

To use all IPv6 features in this chapter, the switch or stack master must be running the IP services feature set. Switches running the IP base feature set support IPv6 static routing, RIP for IPv6, and OSPF. Switches running the LAN base feature set support only IPv6 host functionality.

## Understanding IPv6

IPv4 users can move to IPv6 and receive services such as end-to-end security, quality of service (QoS), and globally unique addresses. The IPv6 address space reduces the need for private addresses and Network Address Translation (NAT) processing by border routers at network edges.

For information about how Cisco Systems implements IPv6, go to:

[http://www.cisco.com/en/US/products/ps6553/products\\_ios\\_technology\\_home.html](http://www.cisco.com/en/US/products/ps6553/products_ios_technology_home.html)

For information about IPv6 and other features in this chapter

- See the *Cisco IOS IPv6 Configuration Library*.
- Use the Search field on Cisco.com to locate the Cisco IOS software documentation. For example, if you want information about static routes, you can enter *Implementing Static Routes for IPv6* in the search field to learn about static routes.

## IPv6 Addresses

The switch supports only IPv6 unicast addresses. It does not support site-local unicast addresses, or anycast addresses.

The IPv6 128-bit addresses are represented as a series of eight 16-bit hexadecimal fields separated by colons in the format: n:n:n:n:n:n:n:n. This is an example of an IPv6 address:

```
2031:0000:130F:0000:0000:09C0:080F:130B
```

For easier implementation, leading zeros in each field are optional. This is the same address without leading zeros:

```
2031:0:130F:0:0:9C0:80F:130B
```

You can also use two colons (::) to represent successive hexadecimal fields of zeros, but you can use this short version only once in each address:

```
2031:0:130F::09C0:080F:130B
```

For more information about IPv6 address formats, address types, and the IPv6 packet header, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of *Cisco IOS IPv6 Configuration Library* on Cisco.com.

In the “Information About Implementing Basic Connectivity for IPv6” chapter, these sections apply to the switch:

- IPv6 Address Formats
- IPv6 Address Type: Unicast
- IPv6 Address Type: Multicast
- IPv6 Address Output Display
- Simplified IPv6 Packet Header

## Supported IPv6 Unicast Routing Features

The switch supports hop-by-hop extension header packets, which are routed in software.

The switch provides IPv6 routing capability over Routing Information Protocol (RIP) for IPv6, and Open Shortest Path First (OSPF) Version 3 Protocol. It supports up to 16 equal-cost routes and can simultaneously forward IPv4 and IPv6 frames at line rate.

### 128-Bit Wide Unicast Addresses

The switch supports aggregatable global unicast addresses and link-local unicast addresses. It does not support site-local unicast addresses.

- Aggregatable global unicast addresses are IPv6 addresses from the aggregatable global unicast prefix. The address structure enables strict aggregation of routing prefixes and limits the number of routing

table entries in the global routing table. These addresses are used on links that are aggregated through organizations and eventually to the Internet service provider.

These addresses are defined by a global routing prefix, a subnet ID, and an interface ID. Current global unicast address allocation uses the range of addresses that start with binary value 001 (2000::/3). Addresses with a prefix of 2000::/3(001) through E000::/3(111) must have 64-bit interface identifiers in the extended unique identifier (EUI)-64 format.

- Link local unicast addresses can be automatically configured on any interface by using the link-local prefix FE80::/10(1111 1110 10) and the interface identifier in the modified EUI format. Link-local addresses are used in the neighbor discovery protocol (NDP) and the stateless autoconfiguration process. Nodes on a local link use link-local addresses and do not require globally unique addresses to communicate. IPv6 routers do not forward packets with link-local source or destination addresses to other links.

For more information, see the section about IPv6 unicast addresses in the “Implementing IPv6 Addressing and Basic Connectivity” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### *DNS for IPv6*

IPv6 supports Domain Name System (DNS) record types in the DNS name-to-address and address-to-name lookup processes. The DNS AAAA resource record types support IPv6 addresses and are equivalent to an A address record in IPv4. The switch supports DNS resolution for IPv4 and IPv6.

### *Path MTU Discovery for IPv6 Unicast*

The switch supports advertising the system maximum transmission unit (MTU) to IPv6 nodes and path MTU discovery. Path MTU discovery allows a host to dynamically discover and adjust to differences in the MTU size of every link along a given data path. In IPv6, if a link along the path is not large enough to accommodate the packet size, the source of the packet handles the fragmentation.

### *ICMPv6*

The Internet Control Message Protocol (ICMP) in IPv6 generates error messages, such as ICMP destination unreachable messages, to report errors during processing and other diagnostic functions. In IPv6, ICMP packets are also used in the neighbor discovery protocol and path MTU discovery.

### *Neighbor Discovery*

The switch supports NDP for IPv6, a protocol running on top of ICMPv6, and static neighbor entries for IPv6 stations that do not support NDP. The IPv6 neighbor discovery process uses ICMP messages and solicited-node multicast addresses to determine the link-layer address of a neighbor on the same network (local link), to verify the reachability of the neighbor, and to keep track of neighboring routers.

The switch supports ICMPv6 redirect for routes with mask lengths less than 64 bits. ICMP redirect is not supported for host routes or for summarized routes with mask lengths greater than 64 bits.

Neighbor discovery throttling ensures that the switch CPU is not unnecessarily burdened while it is in the process of obtaining the next hop forwarding information to route an IPv6 packet. The switch drops any additional IPv6 packets whose next hop is the same neighbor that the switch is actively trying to resolve. This drop avoids further load on the CPU.

### *Default Router Preference*

The switch supports IPv6 default router preference (DRP), an extension in router advertisement messages. DRP improves the ability of a host to select an appropriate router, especially when the host is multihomed and the routers are on different links. The switch does not support the Route Information Option in RFC 4191.

An IPv6 host maintains a default router list from which it selects a router for traffic to offlink destinations. The selected router for a destination is then cached in the destination cache. NDP for IPv6 specifies that routers

that are reachable or probably reachable are preferred over routers whose reachability is unknown or suspect. For reachable or probably reachable routers, NDP can either select the same router every time or cycle through the router list. By using DRP, you can configure an IPv6 host to prefer one router over another, provided both are reachable or probably reachable.

For more information about DRP for IPv6, see the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### *IPv6 Stateless Autoconfiguration and Duplicate Address Detection*

The switch uses stateless autoconfiguration to manage link, subnet, and site addressing changes, such as management of host and mobile IP addresses. A host autonomously configures its own link-local address, and booting nodes send router solicitations to request router advertisements for configuring interfaces.

For more information about autoconfiguration and duplicate address detection, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### *IPv6 Applications*

The switch has IPv6 support for these applications:

- Ping, traceroute, Telnet, and TFTP
- Secure Shell (SSH) over an IPv6 transport
- HTTP server access over IPv6 transport
- DNS resolver for AAAA over IPv4 transport
- Cisco Discovery Protocol (CDP) support for IPv6 addresses

For more information about managing these applications, see the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### *DHCP for IPv6 Address Assignment*

DHCPv6 enables DHCP servers to pass configuration parameters, such as IPv6 network addresses, to IPv6 clients. The address assignment feature manages non-duplicate address assignment in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple prefix pools. Additional options, such as default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface, on multiple interfaces, or the server can automatically find the appropriate pool.

For more information and to configure these features, see the *Cisco IOS IPv6 Configuration Guide*.

This document describes only the DHCPv6 address assignment. For more information about configuring the DHCPv6 client, server, or relay agent functions, see the “Implementing DHCP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### *Static Routes for IPv6*

Static routes are manually configured and define an explicit route between two networking devices. Static routes are useful for smaller networks with only one path to an outside network or to provide security for certain types of traffic in a larger network.

For more information about static routes, see the “Implementing Static Routes for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### *RIP for IPv6*

Routing Information Protocol (RIP) for IPv6 is a distance-vector protocol that uses hop count as a routing metric. It includes support for IPv6 addresses and prefixes and the all-RIP-routers multicast group address FF02::9 as the destination address for RIP update messages.

For more information about RIP for IPv6, see the “Implementing RIP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### OSPF for IPv6

The switch running the IP Base feature set supports Open Shortest Path First (OSPF) for IPv6, a link-state protocol for IP. For more information, see *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### HSRP for IPv6

Switches running the IP Services and IP Base feature set support the Hot Standby Router Protocol (HSRP) for IPv6. HSRP provides routing redundancy for routing IPv6 traffic not dependent on the availability of any single router. IPv6 hosts learn of available routers through IPv6 neighbor discovery router advertisement messages. These messages are multicast periodically or are solicited by hosts.

An HSRP IPv6 group has a virtual MAC address that is derived from the HSRP group number and a virtual IPv6 link-local address that is, by default, derived from the HSRP virtual MAC address. Periodic messages are sent for the HSRP virtual IPv6 link-local address when the HSRP group is active. These messages stop after a final one is sent when the group leaves the active state.

For more information about configuring HSRP for IPv6, see the “[HSRP for IPv6](#)” section.

For more information about configuring HSRP for IPv4, see the “[Configuring HSRP](#)” section.

### EIGRP IPv6

Switches running the IP services feature set support the Enhanced Interior Gateway Routing Protocol (EIGRP) for IPv6. It is configured on the interfaces on which it runs and does not require a global IPv6 address.

#### Note

Switches running the IP base feature set do not support any IPv6 EIGRP features, including IPv6 EIGRP stub routing.

Before running, an instance of EIGRP IPv6 requires an implicit or explicit router ID. An implicit router ID is derived from a local IPv4 address, so any IPv4 node always has an available router ID. However, EIGRP IPv6 might be running in a network with only IPv6 nodes and therefore might not have an available IPv4 router ID.

For more information about EIGRP for IPv6, see the “Implementing EIGRP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### SNMP and Syslog Over IPv6

To support both IPv4 and IPv6, IPv6 network management requires both IPv6 and IPv4 transports. Syslog over IPv6 supports address data types for these transports.

SNMP and syslog over IPv6 provide these features:

- Support for both IPv4 and IPv6
- IPv6 transport for SNMP and to modify the SNMP agent to support traps for an IPv6 host
- SNMP- and syslog-related MIBs to support IPv6 addressing
- Configuration of IPv6 hosts as trap receivers

For support over IPv6, SNMP modifies the existing IP transport mapping to simultaneously support IPv4 and IPv6. These SNMP actions support IPv6 transport management:

- Opens User Datagram Protocol (UDP) SNMP socket with default settings

- Provides a new transport mechanism called *SR\_IPV6\_TRANSPORT*
- Sends SNMP notifications over IPv6 transport
- Supports SNMP-named access lists for IPv6 transport
- Supports SNMP proxy forwarding using IPv6 transport
- Verifies SNMP Manager feature works with IPv6 transport

For information on SNMP over IPv6, including configuration procedures, see the “Managing Cisco IOS Applications over IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

For information about syslog over IPv6, including configuration procedures, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### HTTP(S) Over IPv6

The HTTP client sends requests to both IPv4 and IPv6 HTTP servers, which respond to requests from both IPv4 and IPv6 HTTP clients. URLs with literal IPv6 addresses must be specified in hexadecimal using 16-bit values between colons.

The accept socket call chooses an IPv4 or IPv6 address family. The accept socket is either an IPv4 or IPv6 socket. The listening socket continues to listen for both IPv4 and IPv6 signals that indicate a connection. The IPv6 listening socket is bound to an IPv6 wildcard address.

The underlying TCP/IP stack supports a dual-stack environment. HTTP relies on the TCP/IP stack and the sockets for processing network-layer interactions.

Basic network connectivity (**ping**) must exist between the client and the server hosts before HTTP connections can be made.

For more information, see the “Managing Cisco IOS Applications over IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### Unsupported IPv6 Unicast Routing Features

The switch does not support these IPv6 features:

- IPv6 policy-based routing
- IPv6 virtual private network (VPN) routing and forwarding (VRF) table support
- Support for IPv6 routing protocols: multiprotocol Border Gateway Protocol (BGP) and Intermediate System-to-Intermediate System (IS-IS) routing
- IPv6 packets destined to site-local addresses
- Tunneling protocols, such as IPv4-to-IPv6 or IPv6-to-IPv4
- The switch as a tunnel endpoint supporting IPv4-to-IPv6 or IPv6-to-IPv4 tunneling protocols
- IPv6 unicast reverse-path forwarding
- IPv6 Web Cache Communication Protocol (WCCP)

## IPv6 Feature Limitations

Because IPv6 is implemented in switch hardware, some limitations occur due to the IPv6 compressed addresses in the hardware memory. These hardware limitations result in some loss of functionality and limits some features.

These are feature limitations.

- The switch cannot forward SNAP-encapsulated IPv6 packets in hardware. They are forwarded in software.
- The switch cannot apply QoS classification on source-routed IPv6 packets in hardware.

## IPv6 and Switch Stacks

The switch supports IPv6 forwarding across the stack and IPv6 host functionality on the stack master. The stack master runs the IPv6 unicast routing protocols and computes the routing tables. They receive the tables and create hardware IPv6 routes for forwarding. The stack master also runs all IPv6 applications.

### Note

To route IPv6 packets in a stack, all switches in the stack should be running the IP Base feature set.

If a new switch becomes the stack master, it recomputes the IPv6 routing tables and distributes them to the member switches. While the new stack master is being elected and is resetting, the switch stack does not forward IPv6 packets. The stack MAC address changes, which also changes the IPv6 address. When you specify the stack IPv6 address with an extended unique identifier (EUI) by using the **ipv6 address ipv6-prefix/prefix length eui-64** interface configuration command, the address is based on the interface MAC address. See the [Configuring IPv6 Addressing and Enabling IPv6 Routing \(CLI\)](#), on page 382.

If you configure the persistent MAC address feature on the stack and the stack master changes, the stack MAC address does not change for approximately 4 minutes.

These are the functions of IPv6 stack master and members:

- Stack master:
  - runs IPv6 routing protocols
  - generates routing tables
  - distributes routing tables to stack members that use dCEFv6
  - runs IPv6 host functionality and IPv6 applications
- Stack member (must be running the IP services feature set):
  - receives CEFv6 routing tables from the stack master
  - programs the routes into hardware

### Note

IPv6 packets are routed in hardware across the stack if the packet does not have exceptions (IPv6Options) and the switches in the stack have not run out of hardware resources.

- flushes the CEFv6 tables on master re-election

## Default IPv6 Configuration

**Table 45: Default IPv6 Configuration**

| Feature         | Default Setting                                                                      |
|-----------------|--------------------------------------------------------------------------------------|
| SDM template    | Advance desktop. Default is advanced template                                        |
| IPv6 routing    | Disabled globally and on all interfaces                                              |
| CEFv6 or dCEFv6 | <b>Note</b> When IPv6 routing is enabled, CEFv6 and dCEF6 are automatically enabled. |
| IPv6 addresses  | None configured                                                                      |

## Configuring IPv6 Addressing and Enabling IPv6 Routing (CLI)

This section describes how to assign IPv6 addresses to individual Layer 3 interfaces and to globally forward IPv6 traffic on the switch.

Before configuring IPv6 on the switch, consider these guidelines:

- Not all features discussed in this chapter are supported by the switch. See the [Unsupported IPv6 Unicast Routing Features](#), on page 380.
- 
- In the **ipv6 address** interface configuration command, you must enter the *ipv6-address* and *ipv6-prefix* variables with the address specified in hexadecimal using 16-bit values between colons. The *prefix-length* variable (preceded by a slash [/]) is a decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address).

To forward IPv6 traffic on an interface, you must configure a global IPv6 address on that interface. Configuring an IPv6 address on an interface automatically configures a link-local address and activates IPv6 for the interface. The configured interface automatically joins these required multicast groups for that link:

- solicited-node multicast group FF02:0:0:0:1:ff00::/104 for each unicast address assigned to the interface (this address is used in the neighbor discovery process.)
- all-nodes link-local multicast group FF02::1
- all-routers link-local multicast group FF02::2

To remove an IPv6 address from an interface, use the **no ipv6 address *ipv6-prefix/prefix length eui-64*** or **no ipv6 address *ipv6-address link-local*** interface configuration command. To remove all manually configured IPv6 addresses from an interface, use the **no ipv6 address** interface configuration command without arguments. To disable IPv6 processing on an interface that has not been explicitly configured with an IPv6 address, use the **no ipv6 enable** interface configuration command. To globally disable IPv6 routing, use the **no ipv6 unicast-routing** global configuration command.

For more information about configuring IPv6 routing, see the “Implementing Addressing and Basic Connectivity for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

Beginning in privileged EXEC mode, follow these steps to assign an IPv6 address to a Layer 3 interface and enable IPv6 routing:

## DETAILED STEPS

|               | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>sdm prefer dual-ipv4-and-ipv6 {advanced   vlan}</b><br><br><b>Example:</b><br>Switch(config)# <b>sdm prefer dual-ipv4-and-ipv6 default</b> | Selects an SDM template that supports IPv4 and IPv6. <ul style="list-style-type: none"> <li>• <b>advanced</b>—Sets the switch to the default template to balance system resources.</li> <li>• <b>vlan</b>—Maximizes VLAN configuration on the switch with no routing supported in hardware.</li> </ul> <p><b>Note</b> Advanced is available at all license levels. VLAN template is available only in lanbase.</p> |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 4</b> | <b>reload</b><br><br><b>Example:</b><br>Switch# <b>reload</b>                                                                                 | Reloads the operating system.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 5</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                         | Enters global configuration mode after the switch reloads.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 6</b> | <b>interface interface-id</b><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet 1/0/1</b>                                | Enters interface configuration mode, and specifies the Layer 3 interface to configure. The interface can be a physical interface, a switch virtual interface (SVI), or a Layer 3 EtherChannel.                                                                                                                                                                                                                     |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b>  | <p><b>no switchport</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# no switchport</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Removes the interface from Layer 2 configuration mode (if it is a physical interface).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 8</b>  | <p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>ipv6 address</b> <i>ipv6-prefix/prefix length eui-64</i></li> <li>• <b>ipv6 address</b> <i>ipv6-address/prefix length</i></li> <li>• <b>ipv6 address</b> <i>ipv6-address link-local</i></li> <li>• <b>ipv6 enable</b></li> <li>• <b>ipv6 address</b><i>WORD</i></li> <li>• <b>ipv6 address</b><i>autoconfig</i></li> <li>• <b>ipv6 address</b><i>dhcp</i></li> </ul> <p><b>Example:</b></p> <pre>Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64</pre> <pre>Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64</pre> <pre>Switch(config-if)# ipv6 address 2001:0DB8:c18:1:: link-local</pre> <pre>Switch(config-if)# ipv6 enable</pre> | <ul style="list-style-type: none"> <li>• Specifies a global IPv6 address with an extended unique identifier (EUI) in the low-order 64 bits of the IPv6 address. Specify only the network prefix; the last 64 bits are automatically computed from the switch MAC address. This enables IPv6 processing on the interface.</li> <li>• Manually configures an IPv6 address on the interface.</li> <li>• Specifies a link-local address on the interface to be used instead of the link-local address that is automatically configured when IPv6 is enabled on the interface. This command enables IPv6 processing on the interface.</li> <li>• Automatically configures an IPv6 link-local address on the interface, and enables the interface for IPv6 processing. The link-local address can only be used to communicate with nodes on the same link.</li> </ul> |
| <b>Step 9</b>  | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# exit</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 10</b> | <p><b>ip routing</b></p> <p><b>Example:</b></p> <pre>Switch(config)# ip routing</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Enables IP routing on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 11</b> | <p><b>ipv6 unicast-routing</b></p> <p><b>Example:</b></p> <pre>Switch(config)# ipv6 unicast-routing</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Enables forwarding of IPv6 unicast data packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                | Command or Action                                                                                                                 | Purpose                                                  |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 12</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                   | Returns to privileged EXEC mode.                         |
| <b>Step 13</b> | <b>show ipv6 interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch# <b>show ipv6 interface gigabitethernet 1/0/1</b> | Verifies your entries.                                   |
| <b>Step 14</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b>             | (Optional) Saves your entries in the configuration file. |

## Configuring IPv4 and IPv6 Protocol Stacks (CLI)

Beginning in privileged EXEC mode, follow these steps to configure a Layer 3 interface to support both IPv4 and IPv6 and to enable IPv6 routing.

**Note** To disable IPv6 processing on an interface that has not been configured with an IPv6 address, use the **no ipv6 enable** interface configuration command.

**SUMMARY STEPS**

1. **configure terminal**
2. **ip routing**
3. **ipv6 unicast-routing**
4. **interface** *interface-id*
5. **no switchport**
6. **ip address** *ip-address mask* [**secondary**]
7. Use one of the following:
  - **ipv6 address** *ipv6-prefix/prefix length eui-64*
  - **ipv6 address** *ipv6-address/prefix length*
  - **ipv6 address** *ipv6-address link-local*
  - **ipv6 enable**
  - **ipv6 address** *WORD*
  - **ipv6 address** *autoconfig*
  - **ipv6 address** *dhcp*
8. **end**
9. Use one of the following:
  - **show interface** *interface-id*
  - **show ip interface** *interface-id*
  - **show ipv6 interface** *interface-id*
10. **copy running-config startup-config**

**DETAILED STEPS**

| <b>Step 3</b> | <b>ipv6 unicast-routing</b><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 unicast-routing</b>                                                                                                                                                                                                                                                                                                   | Enables forwarding of IPv6 data packets on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <b>interface interface-id</b><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet 1/0/1</b>                                                                                                                                                                                                                                                                                      | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 5</b> | <b>no switchport</b><br><br><b>Example:</b><br>Switch(config-if)# <b>no switchport</b>                                                                                                                                                                                                                                                                                                              | Removes the interface from Layer 2 configuration mode (if it is a physical interface).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 6</b> | <b>ip address ip-address mask [secondary]</b><br><br><b>Example:</b><br>Switch(config-if)# <b>ip address 10.1.1.2.3 255.255.255</b>                                                                                                                                                                                                                                                                 | Specifies a primary or secondary IPv4 address for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 7</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <b>ipv6 address ipv6-prefix/prefix length eui-64</b></li> <li>• <b>ipv6 address ipv6-address/prefix length</b></li> <li>• <b>ipv6 address ipv6-address link-local</b></li> <li>• <b>ipv6 enable</b></li> <li>• <b>ipv6 address WORD</b></li> <li>• <b>ipv6 address autoconfig</b></li> <li>• <b>ipv6 address dhcp</b></li> </ul> | <ul style="list-style-type: none"> <li>• Specifies a global IPv6 address. Specify only the network prefix; the last 64 bits are automatically computed from the switch MAC address.</li> <li>• Specifies a link-local address on the interface to be used instead of the automatically configured link-local address when IPv6 is enabled on the interface.</li> <li>• Automatically configures an IPv6 link-local address on the interface, and enables the interface for IPv6 processing. The link-local address can only be used to communicate with nodes on the same link.</li> </ul> <p><b>Note</b> To remove all manually configured IPv6 addresses from an interface, use the <b>no ipv6 address</b> interface configuration command without arguments.</p> |
| <b>Step 8</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                                                                                                                                                                                                                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                | Command or Action                                                                                                                                                                                                                         | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 9</b>  | Use one of the following: <ul style="list-style-type: none"> <li>• <b>show interface</b> <i>interface-id</i></li> <li>• <b>show ip interface</b> <i>interface-id</i></li> <li>• <b>show ipv6 interface</b> <i>interface-id</i></li> </ul> | Verifies your entries.                                   |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b>                                                                                                                     | (Optional) Saves your entries in the configuration file. |

## Configuring Default Router Preference (CLI)

Router advertisement messages are sent with the default router preference (DRP) configured by the **ipv6 nd router-preference** interface configuration command. If no DRP is configured, RAs are sent with a medium preference.

A DRP is useful when two routers on a link might provide equivalent, but not equal-cost routing, and policy might dictate that hosts should prefer one of the routers.

For more information about configuring DRP for IPv6, see the “Implementing IPv6 Addresses and Basic Connectivity” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

Beginning in privileged EXEC mode, follow these steps to configure a DRP for a router on an interface.

### DETAILED STEPS

|               | Command or Action                                                                                                                                                  | Purpose                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                              | Enters global configuration mode.                                                                              |
| <b>Step 2</b> | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet 1/0/1</b>                                              | Enters interface configuration mode and identifies the Layer 3 interface on which you want to specify the DRP. |
| <b>Step 3</b> | <b>ipv6 nd router-preference</b> { <b>high</b>   <b>medium</b>   <b>low</b> }<br><br><b>Example:</b><br>Switch(config-if)# <b>ipv6 nd router-preference medium</b> | Specifies a DRP for the router on the switch interface.                                                        |

|               | Command or Action                                                                                                     | Purpose                                                  |
|---------------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                         |
| <b>Step 5</b> | <b>show ipv6 interface</b><br><br><b>Example:</b><br>Switch# <b>show ipv6 interface</b>                               | Verifies the configuration.                              |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring IPv6 ICMP Rate Limiting (CLI)

ICMP rate limiting is enabled by default with a default interval between error messages of 100 milliseconds and a bucket size (maximum number of tokens to be stored in a bucket) of 10.

Beginning in privileged EXEC mode, follow these steps to change the ICMP rate-limiting parameters:

### DETAILED STEPS

|               | Command or Action                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>ipv6 icmp error-interval interval [bucketsize]</b><br><br><b>Example:</b><br>Switch(config)# <b>ipv6 icmp error-interval 50 20</b> | Configures the interval and bucket size for IPv6 ICMP error messages: <ul style="list-style-type: none"> <li>• <i>interval</i>—The interval (in milliseconds) between tokens being added to the bucket. The range is from 0 to 2147483647 milliseconds.</li> <li>• <i>bucketsize</i>—(Optional) The maximum number of tokens stored in the bucket. The range is from 1 to 200.</li> </ul> |

|               | Command or Action                                                                                                                     | Purpose                                                  |

| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                       | Returns to privileged EXEC mode.                         |
| <b>Step 4</b> | <b>show ipv6 interface</b> [ <i>interface-id</i> ]<br><br><b>Example:</b><br>Switch# <b>show ipv6 interface gigabitethernet 1/0/1</b> | Verifies your entries.                                   |
| <b>Step 5</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b>                 | (Optional) Saves your entries in the configuration file. |

## Configuring CEF and dCEF for IPv6

Cisco Express Forwarding (CEF) is a Layer 3 IP switching technology to improve network performance. CEF implements an advanced IP look-up and forwarding algorithm to deliver maximum Layer 3 switching performance. It is less CPU-intensive than fast-switching route-caching, allowing more CPU processing power to be dedicated to packet forwarding. In a switch stack, the hardware uses distributed CEF (dCEF) in the stack. IPv4 CEF and dCEF are enabled by default. IPv6 CEF and dCEF are disabled by default, but automatically enabled when you configure IPv6 routing.

IPv6 CEF and dCEF are automatically disabled when IPv6 routing is unconfigured. IPv6 CEF and dCEF cannot be disabled through configuration. You can verify the IPv6 state by entering the **show ipv6 cef** privileged EXEC command.

To route IPv6 unicast packets, you must first globally configure forwarding of IPv6 unicast packets by using the **ipv6 unicast-routing** global configuration command, and you must configure an IPv6 address and IPv6 processing on an interface by using the **ipv6 address** interface configuration command.

For more information about configuring CEF and dCEF, see *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Configuring Static Routing for IPv6 (CLI)

Before configuring a static IPv6 route, you must enable routing by using the **ip routing** global configuration command, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** global configuration command, and enable IPv6 on at least one Layer 3 interface by configuring an IPv6 address on the interface.

For more information about configuring static IPv6 routing, see the “Implementing Static Routes for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>                                                                                                                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 2 | <p><b>ipv6 route</b> <i>ipv6-prefix/prefix length</i><br/> <i>{ipv6-address   interface-id</i><br/> <i>[ipv6-address]}</i> <i>[administrative distance]</i></p> <p><b>Example:</b></p> <pre>Switch(config)# ipv6 route<br/>2001:0DB8::/32 gigabitethernet2/0/1<br/>130</pre> | <p>Configures a static IPv6 route.</p> <ul style="list-style-type: none"> <li>• <i>ipv6-prefix</i>—The IPv6 network that is the destination of the static route. It can also be a hostname when static host routes are configured.</li> <li>• <i>/prefix length</i>—The length of the IPv6 prefix. A decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.</li> <li>• <i>ipv6-address</i>—The IPv6 address of the next hop that can be used to reach the specified network. The IPv6 address of the next hop need not be directly connected; recursion is done to find the IPv6 address of the directly connected next hop. The address must be in the form documented in RFC 2373, specified in hexadecimal using 16-bit values between colons.</li> <li>• <i>interface-id</i>—Specifies direct static routes from point-to-point and broadcast interfaces. With point-to-point interfaces, there is no need to specify the IPv6 address of the next hop. With broadcast interfaces, you should always specify the IPv6 address of the next hop, or ensure that the specified prefix is assigned to the link, specifying a link-local address as the next hop. You can optionally specify the IPv6 address of the next hop to which packets are sent.</li> </ul> <p><b>Note</b> You must specify an <i>interface-id</i> when using a link-local address as the next hop (the link-local next hop must also be an adjacent router).</p> <ul style="list-style-type: none"> <li>• <i>administrative distance</i>—(Optional) An administrative distance. The range is 1 to 254; the default value is 1, which gives static routes precedence over any other type of route except connected routes. To configure a floating static route, use an administrative distance greater than that of the dynamic routing protocol.</li> </ul> |
| Step 3 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                                                                                                                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 4 | <p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>show ipv6 static</b> <i>[ ipv6-address   ipv6-prefix/prefix length ]</i></li> </ul>                                                                                                             | <p>Verifies your entries by displaying the contents of the IPv6 routing table.</p> <ul style="list-style-type: none"> <li>• <b>interface</b> <i>interface-id</i>—(Optional) Displays only those static routes with the specified interface as an egress interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|               | Command or Action                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Configuring RIP for IPv6 (CLI)

Before configuring the switch to run IPv6 RIP, you must enable routing by using the **ip routing** global configuration command, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** global configuration command, and enable IPv6 on any Layer 3 interfaces on which IPv6 RIP is to be enabled.

For more information about configuring RIP routing for IPv6, see the “Implementing RIP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com,

### DETAILED STEPS

|               | Command or Action                                                                                        | Purpose                                                                                       |
|---------------|----------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <pre>configure terminal</pre> <p><b>Example:</b><br/> Switch# <b>configure terminal</b></p>              | Enters global configuration mode.                                                             |
| <b>Step 2</b> | <pre>ipv6 router rip name</pre> <p><b>Example:</b><br/> Switch(config)# <b>ipv6 router rip cisco</b></p> | Configures an IPv6 RIP routing process, and enters router configuration mode for the process. |

|               | Command or Action                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>maximum-paths</b> <i>number-paths</i><br><br><b>Example:</b><br>Switch(config-router)# <b>maximum-paths 6</b>                                                                                                            | (Optional) Define the maximum number of equal-cost routes that IPv6 RIP can support. The range is from 1 to 32, and the default is 16 routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <b>exit</b><br><br><b>Example:</b><br>Switch(config-router)# <b>exit</b>                                                                                                                                                    | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 5</b> | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br>Switch(config)# <b>interface gigabitethernet 1/0/1</b>                                                                                                       | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <b>ipv6 rip</b> <i>name</i> <b>enable</b><br><br><b>Example:</b><br>Switch(config-if)# <b>ipv6 rip cisco enable</b>                                                                                                         | Enables the specified IPv6 RIP routing process on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 7</b> | <b>ipv6 rip</b> <i>name</i> <b>default-information {only   originate}</b><br><br><b>Example:</b><br>Switch(config-if)# <b>ipv6 rip cisco default-information only</b>                                                       | (Optional) Originates the IPv6 default route (::/0) into the RIP routing process updates sent from the specified interface.<br><br><b>Note</b> To avoid routing loops after the IPv6 default route (::/0) is originated from any interface, the routing process ignores all default routes received on any interface. <ul style="list-style-type: none"> <li>• <b>only</b>—Select to originate the default route, but suppress all other routes in the updates sent on this interface.</li> <li>• <b>originate</b>—Select to originate the default route in addition to all other routes in the updates sent on this interface.</li> </ul> |
| <b>Step 8</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                                                                             | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 9</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <b>show ipv6 rip</b> [<i>name</i>] [<b>interface</b><i>interface-id</i>] [<b>database</b>] [<b>next-hops</b>]</li> <li>• <b>show ipv6 rip</b></li> </ul> | <ul style="list-style-type: none"> <li>• Displays information about current IPv6 RIP processes.</li> <li>• Displays the current contents of the IPv6 routing table.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                | Command or Action                                                                                                                                      | Purpose                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | <p><b>Example:</b><br/>Switch# <code>show ipv6 rip cisco interface gigabitethernet2/0/1</code></p> <p>or</p> <p>Switch# <code>show ipv6 rip</code></p> |                                                          |
| <b>Step 10</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b><br/>Switch# <code>copy running-config startup-config</code></p>                    | (Optional) Saves your entries in the configuration file. |

## Configuring OSPF for IPv6 (CLI)

You can customize OSPF for IPv6 for your network. However, the defaults for OSPF in IPv6 are set to meet the requirements of most customers and features.

Follow these guidelines:

- Be careful when changing the defaults for IPv6 commands. Changing the defaults might adversely affect OSPF for the IPv6 network.
- Before you enable IPv6 OSPF on an interface, you must enable routing by using the **ip routing** global configuration command, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** global configuration command, and enable IPv6 on Layer 3 interfaces on which you are enabling IPv6 OSPF.

For more information about configuring OSPF routing for IPv6, see the “Implementing OSPF for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### DETAILED STEPS

|               | Command or Action                                                                                                            | Purpose                                                                                                                                                                                                                               |
|---------------|------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>configure terminal</b></p> <p><b>Example:</b><br/>Switch# <code>configure terminal</code></p>                          | Enters global configuration mode.                                                                                                                                                                                                     |
| <b>Step 2</b> | <p><b>ipv6 router ospf <i>process-id</i></b></p> <p><b>Example:</b><br/>Switch(config)# <code>ipv6 router ospf 21</code></p> | Enables OSPF router configuration mode for the process. The process ID is the number assigned administratively when enabling the OSPF for IPv6 routing process. It is locally assigned and can be a positive integer from 1 to 65535. |

|               | Command or Action                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <p><b>area</b> <i>area-id</i> <b>range</b> {<i>ipv6-prefix/prefix length</i>} [<b>advertise</b>   <b>not-advertise</b>] [<b>cost</b> <i>cost</i>]</p> <p><b>Example:</b></p> <pre>Switch(config)# area .3 range 2001:0DB8::/32 not-advertise</pre> | <p>(Optional) Consolidates and summarizes routes at an area boundary.</p> <ul style="list-style-type: none"> <li>• <b>area-id</b>—Identifier of the area about which routes are to be summarized. It can be specified as either a decimal value or as an IPv6 prefix.</li> <li>• <b>ipv6-prefix/prefix length</b>—The destination IPv6 network and a decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark (/) must precede the decimal value.</li> <li>• <b>advertise</b>—(Optional) Sets the address range status to advertise and generate a Type 3 summary link-state advertisement (LSA).</li> <li>• <b>not-advertise</b>—(Optional) Sets the address range status to DoNotAdvertise. The Type 3 summary LSA is suppressed, and component networks remain hidden from other networks.</li> <li>• <b>cost cost</b>—(Optional) Sets the metric or cost for this summary route, which is used during OSPF SPF calculation to determine the shortest paths to the destination. The value can be 0 to 16777215.</li> </ul> |
| <b>Step 4</b> | <p><b>maximum paths</b> <i>number-paths</i></p> <p><b>Example:</b></p> <pre>Switch(config)# maximum paths 16</pre>                                                                                                                                 | <p>(Optional) Defines the maximum number of equal-cost routes to the same destination that IPv6 OSPF should enter in the routing table. The range is from 1 to 32, and the default is 16 paths.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 5</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# exit</pre>                                                                                                                                                                       | <p>Returns to global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 6</b> | <p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Switch(config)# interface gigabitethernet 1/0/1</pre>                                                                                                                      | <p>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 7</b> | <p><b>ipv6 ospf</b> <i>process-id</i> <b>area</b> <i>area-id</i> [<b>instance</b> <i>instance-id</i>]</p> <p><b>Example:</b></p> <pre>Switch(config-if)# ipv6 ospf 21 area .3</pre>                                                                | <p>Enables OSPF for IPv6 on the interface.</p> <ul style="list-style-type: none"> <li>• <b>instance instance-id</b>—(Optional) Instance identifier.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                                                                               | Purpose                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b>  | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                                                                                                                                                                                                                                                                 | Returns to privileged EXEC mode.                                                                                                                                      |
| <b>Step 9</b>  | Use one of the following: <ul style="list-style-type: none"> <li>• <b>show ipv6 ospf</b> [ <i>process-id</i> ] [ <i>area-id</i> ]<br/> <b>interface</b> [ <i>interface-id</i> ]</li> <li>• <b>show ipv6 ospf</b> [ <i>process-id</i> ] [ <i>area-id</i> ]</li> </ul> <b>Example:</b><br>Switch# <b>show ipv6 ospf 21 interface</b><br><b>gigabitethernet2/0/1</b><br><br>OR<br>Switch# <b>show ipv6 ospf 21</b> | <ul style="list-style-type: none"> <li>• Displays information about OSPF interfaces.</li> <li>• Displays general information about OSPF routing processes.</li> </ul> |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <b>copy running-config</b><br><b>startup-config</b>                                                                                                                                                                                                                                                                                 | (Optional) Saves your entries in the configuration file.                                                                                                              |

## Configuring EIGRP for IPv6

Before configuring the switch to run IPv6 EIGRP, enable routing by entering the **ip routing global configuration** command, enable the forwarding of IPv6 packets by entering the **ipv6 unicast-routing global configuration** command, and enable IPv6 on any Layer 3 interfaces on which you want to enable IPv6 EIGRP.

To set an explicit router ID, use the **show ipv6 eigrp** command to see the configured router IDs, and then use the **router-id** command.

As with EIGRP IPv4, you can use EIGRPv6 to specify your EIGRP IPv6 interfaces and to select a subset of those as passive interfaces. Use the **passive-interface** command to make an interface passive, and then use the **no passive-interface** command on selected interfaces to make them active. EIGRP IPv6 does not need to be configured on a passive interface.

For more configuration procedures, see the “Implementing EIGRP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Displaying IPv6

For complete syntax and usage information on these commands, see the Cisco IOS command reference publications.

**Table 46: Commands for Monitoring IPv6**

| Command                                              | Purpose                                           |
|------------------------------------------------------|---------------------------------------------------|
| <code>show ipv6 access-list</code>                   | Displays a summary of access lists.               |
| <code>show ipv6 cef</code>                           | Displays Cisco Express Forwarding for IPv6.       |
| <code>show ipv6 interface <i>interface-id</i></code> | Displays IPv6 interface status and configuration. |
| <code>show ipv6 mtu</code>                           | Displays IPv6 MTU per destination cache.          |
| <code>show ipv6 neighbors</code>                     | Displays IPv6 neighbor cache entries.             |
| <code>show ipv6 ospf</code>                          | Displays IPv6 OSPF information.                   |
| <code>show ipv6 prefix-list</code>                   | Displays a list of IPv6 prefix lists.             |
| <code>show ipv6 protocols</code>                     | Displays IPv6 routing protocols on the switch.    |
| <code>show ipv6 rip</code>                           | Displays IPv6 RIP routing protocol status.        |
| <code>show ipv6 route</code>                         | Displays the IPv6 route table entries.            |
| <code>show ipv6 routers</code>                       | Displays the local IPv6 routers.                  |
| <code>show ipv6 static</code>                        | Displays IPv6 static routes.                      |
| <code>show ipv6 traffic</code>                       | Displays IPv6 traffic statistics.                 |

**Table 47: Commands for Displaying EIGRP IPv6 Information**

| Command                                                          | Purpose                                                          |
|------------------------------------------------------------------|------------------------------------------------------------------|
| <code>show ipv6 eigrp [<i>as-number</i>] <i>interface</i></code> | Displays information about interfaces configured for EIGRP IPv6. |
| <code>show ipv6 eigrp [<i>as-number</i>] <i>neighbor</i></code>  | Displays the neighbors discovered by EIGRP IPv6.                 |
| <code>show ipv6 eigrp [<i>as-number</i>] <i>traffic</i></code>   | Displays the number of EIGRP IPv6 packets sent and received.     |

| Command                                                                                                                                                 | Purpose                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <code>show ipv6 eigrp topology [as-number   ipv6-address]<br/>[active   all-links   detail-links   pending   summary<br/>  zero-successors] Base</code> | Displays EIGRP entries in the IPv6 topology table. |

## Configuring DHCP for IPv6 Address Assignment

### Default DHCPv6 Address Assignment Configuration

By default, no DHCPv6 features are configured on the switch.

### DHCPv6 Address Assignment Configuration Guidelines

When configuring DHCPv6 address assignment, consider these guidelines:

- In the procedures, the specified interface must be one of these Layer 3 interfaces:
  - DHCPv6 IPv6 routing must be enabled on a Layer 3 interface.
  - SVI: a VLAN interface created by using the **interface vlan** *vlan\_id* command.
  - EtherChannel port channel in Layer 3 mode: a port-channel logical interface created by using the **interface port-channel** *port-channel-number* command.
- The switch can act as a DHCPv6 client, server, or relay agent. The DHCPv6 client, server, and relay function are mutually exclusive on an interface.
- The DHCPv6 client, server, or relay agent runs only on the master switch. When there is a stack master re-election, the new master switch retains the DHCPv6 configuration. However, the local RAM copy of the DHCP server database lease information is not retained.

### Enabling DHCPv6 Server Function (CLI)

Use the **no** form of the DHCP pool configuration mode commands to change the DHCPv6 pool characteristics. To disable the DHCPv6 server function on an interface, use the **no ipv6 dhcp server** interface configuration command.

Beginning in privileged EXEC mode, follow these steps to enable the DHCPv6 server function on an interface.

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                      |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>                                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                            |
| Step 2 | <p><b>ipv6 dhcp pool <i>poolname</i></b></p> <p><b>Example:</b></p> <pre>Switch(config)# ipv6 dhcp pool 7</pre>                                                                                                     | Enters DHCP pool configuration mode, and define the name for the IPv6 DHCP pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).                                                                                                                                                                                                     |
| Step 3 | <p><b>address prefix <i>IPv6-prefix</i> {lifetime} {<i>t1 t1</i>   infinite}</b></p> <p><b>Example:</b></p> <pre>Switch(config-dhcpv6)# address prefix 2001:1000::0/64 lifetime 3600</pre>                          | <p>(Optional) Specifies an address prefix for address assignment.</p> <p>This address must be in hexadecimal, using 16-bit values between colons.</p> <p><b>lifetime <i>t1 t1</i></b>—Specifies a time interval (in seconds) that an IPv6 address prefix remains in the valid state. The range is 5 to 4294967295 seconds. Specify <b>infinite</b> for no time interval.</p> |
| Step 4 | <p><b>link-address <i>IPv6-prefix</i></b></p> <p><b>Example:</b></p> <pre>Switch(config-dhcpv6)# link-address 2001:1002::0/64</pre>                                                                                 | <p>(Optional) Specifies a link-address IPv6 prefix.</p> <p>When an address on the incoming interface or a link-address in the packet matches the specified IPv6 prefix, the server uses the configuration information pool.</p> <p>This address must be in hexadecimal, using 16-bit values between colons.</p>                                                              |
| Step 5 | <p><b>vendor-specific <i>vendor-id</i></b></p> <p><b>Example:</b></p> <pre>Switch(config-dhcpv6)# vendor-specific 9</pre>                                                                                           | (Optional) Enters vendor-specific configuration mode and specifies a vendor-specific identification number. This number is the vendor IANA Private Enterprise Number. The range is 1 to 4294967295.                                                                                                                                                                          |
| Step 6 | <p><b>suboption <i>number</i> {address <i>IPv6-address</i>   ascii <i>ASCII-string</i>   hex <i>hex-string</i>}</b></p> <p><b>Example:</b></p> <pre>Switch(config-dhcpv6-vs)# suboption 1 address 1000:235D::</pre> | (Optional) Enters a vendor-specific suboption number. The range is 1 to 65535. Enter an IPv6 address, ASCII text, or a hex string as defined by the suboption parameters.                                                                                                                                                                                                    |
| Step 7 | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-dhcpv6-vs)# exit</pre>                                                                                                                                 | Returns to DHCP pool configuration mode.                                                                                                                                                                                                                                                                                                                                     |

|         | Command or Action                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 8  | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Switch(config-dhcpv6)# <b>exit</b></pre>                                                                                                                                                           | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 9  | <p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Switch(config)# <b>interface</b><br/>gigabitethernet 1/0/1</pre>                                                                                                          | Enters interface configuration mode, and specifies the interface to configure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 10 | <p><b>ipv6 dhcp server</b> [<i>poolname</i>   <b>automatic</b>]<br/>[<b>rapid-commit</b>] [<i>preference value</i>]<br/>[<b>allow-hint</b>]</p> <p><b>Example:</b></p> <pre>Switch(config-if)# <b>ipv6 dhcp server</b><br/><b>automatic</b></pre> | <p>Enables DHCPv6 server function on an interface.</p> <ul style="list-style-type: none"> <li>• <b>poolname</b>—(Optional) User-defined name for the IPv6 DHCP pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).</li> <li>• <b>automatic</b>—(Optional) Enables the system to automatically determine which pool to use when allocating addresses for a client.</li> <li>• <b>rapid-commit</b>—(Optional) Allows two-message exchange method.</li> <li>• <b>preference value</b>—(Optional) Configures the preference value carried in the preference option in the advertise message sent by the server. The range is from 0 to 255. The preference value default is 0.</li> <li>• <b>allow-hint</b>—(Optional) Specifies whether the server should consider client suggestions in the SOLICIT message. By default, the server ignores client hints.</li> </ul> |
| Step 11 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# <b>end</b></pre>                                                                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 12 | <p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <b>show ipv6 dhcp pool</b></li> <li>• <b>show ipv6 dhcp interface</b></li> </ul> <p><b>Example:</b></p> <pre>Switch# <b>show ipv6 dhcp pool</b></pre>                    | <ul style="list-style-type: none"> <li>• Verifies DHCPv6 pool configuration.</li> <li>• Verifies that the DHCPv6 server function is enabled on an interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                | Command or Action                                                                                                           | Purpose                                                  |
|----------------|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | or<br>Switch# <code>show ipv6 dhcp interface</code>                                                                         |                                                          |
| <b>Step 13</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>Switch# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Enabling DHCPv6 Client Function (CLI)

This task explains how to enable the DHCPv6 client on an interface.

### DETAILED STEPS

|               | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                   |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <code>configure terminal</code>                                                          | Enters global configuration mode.                                                                                                                                         |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><br><b>Example:</b><br>Switch(config)# <code>interface gigabitethernet 1/0/1</code>                          | Enters interface configuration mode, and specifies the interface to configure.                                                                                            |

| Step 5 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                   | Returns to privileged EXEC mode.                            |
| Step 6 | <p><b>show ipv6 dhcp interface</b></p> <p><b>Example:</b></p> <pre>Switch# show ipv6 dhcp interface</pre> | Verifies that the DHCPv6 client is enabled on an interface. |

## Configuration Examples for IPv6 Unicast Routing

### Configuring IPv6 Addressing and Enabling IPv6 Routing: Example

This example shows how to enable IPv6 with both a link-local address and a global address based on the IPv6 prefix 2001:0DB8:c18:1::/64. The EUI-64 interface ID is used in the low-order 64 bits of both addresses. Output from the **show ipv6 interface** EXEC command is included to show how the interface ID (20B:46FF:FE2F:D940) is appended to the link-local prefix FE80::/64 of the interface.

```
Switch(config)# ipv6 unicast-routing
Switch(config)# interface gigabitethernet1/0/11
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64
Switch(config-if)# end
Switch# show ipv6 interface gigabitethernet1/0/11
GigabitEthernet1/0/11 is up, line protocol is up
  IPv6 is enabled, link-local address is FE80::20B:46FF:FE2F:D940
  Global unicast address(es):
    2001:0DB8:c18:1:20B:46FF:FE2F:D940, subnet is 2001:0DB8:c18:1::/64 [EUI]
  Joined group address(es):
    FE02::1
    FE02::2
    FE02::1:FF2F:D940
  MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
  ND advertised reachable time is 0 milliseconds
  ND advertised retransmit interval is 0 milliseconds
  ND router advertisements are sent every 200 seconds
  ND router advertisements live for 1800 seconds
  Hosts use stateless autoconfig for addresses.
```

## Configuring Default Router Preference: Example

This example shows how to configure a DRP of *high* for the router on an interface.

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ipv6 nd router-preference high
Switch(config-if)# end
```

## Configuring IPv4 and IPv6 Protocol Stacks: Example

This example shows how to enable IPv4 and IPv6 routing on an interface.

```
Switch(config)# ip routing
Switch(config)# ipv6 unicast-routing
Switch(config)# interface fastethernet1/0/11
Switch(config-if)# no switchport
Switch(config-if)# ip address 192.168.99.1 255.255.255.0
Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64
Switch(config-if)# end
```

## Enabling DHCPv6 Server Function: Example

This example shows how to configure a pool called *engineering* with an IPv6 address prefix:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool engineering
Switch(config-dhcpv6)# address prefix 2001:1000::0/64
Switch(config-dhcpv6)# end
```

This example shows how to configure a pool called *testgroup* with three link-addresses and an IPv6 address prefix:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool testgroup
Switch(config-dhcpv6)# link-address 2001:1001::0/64
Switch(config-dhcpv6)# link-address 2001:1002::0/64
Switch(config-dhcpv6)# link-address 2001:2000::0/48
Switch(config-dhcpv6)# address prefix 2001:1003::0/64
Switch(config-dhcpv6)# end
```

This example shows how to configure a pool called *350* with vendor-specific options:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool 350
Switch(config-dhcpv6)# address prefix 2001:1005::0/48
Switch(config-dhcpv6)# vendor-specific 9
Switch(config-dhcpv6-vs)# suboption 1 address 1000:235D::1
Switch(config-dhcpv6-vs)# suboption 2 ascii "IP-Phone"
Switch(config-dhcpv6-vs)# end
```

## Enabling DHCPv6 Client Function: Example

This example shows how to acquire an IPv6 address and to enable the rapid-commit option:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ipv6 address dhcp rapid-commit
```

## Configuring IPv6 ICMP Rate Limiting: Example

This example shows how to configure an IPv6 ICMP error message interval of 50 milliseconds and a bucket size of 20 tokens.

```
Switch(config)#ipv6 icmp error-interval 50 20
```

## Configuring Static Routing for IPv6: Example

This example shows how to configure a floating static route to an interface with an administrative distance of 130:

```
Switch(config)# ipv6 route 2001:0DB8::/32 gigabitethernet2/0/1 130
```

## Configuring RIP for IPv6: Example

This example shows how to enable the RIP routing process *cisco* with a maximum of eight equal-cost routes and to enable it on an interface:

```
Switch(config)# ipv6 router rip cisco
Switch(config-router)# maximum-paths 8
Switch(config)# exit
Switch(config)# interface gigabitethernet2/0/11
Switch(config-if)# ipv6 rip cisco enable
```

## Displaying IPv6: Example

This is an example of the output from the **show ipv6 interface** privileged EXEC command:

```
Switch# show ipv6 interface
Vlan1 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::20B:46FF:FE2F:D940
Global unicast address(es):
  3FFE:C000:0:1:20B:46FF:FE2F:D940, subnet is 3FFE:C000:0:1::/64 [EUI]
Joined group address(es):
  FF02::1
  FF02::2
  FF02::1:FF2F:D940
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
```

```
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
<output truncated>
```

### Prerequisites for IPv6 Client Address Learning

Before configuring IPv6 client address learning, configure the wireless clients to support IPv6.

## Related Topics

[Configuring RA Guard Policy \(CLI\), on page 414](#)

# Information About IPv6 Client Address Learning

Client Address Learning is configured on switch to learn the wireless client's IPv4 and IPv6 address and clients transition state maintained by the switch on an association, re-association, de-authentication and timeout.

There are three ways for IPv6 client to acquire IPv6 addresses:

- Stateless Address Auto-Configuration (SLACC)
- Stateful DHCPv6
- Static Configuration

For all of these methods, the IPv6 client always sends neighbor solicitation DAD (Duplicate Address Detection) request to ensure there is no duplicate IP address on the network. The switch snoops the client's NDP and DHCPv6 packets to learn about its client IP addresses.

## SLAAC Address Assignment

The most common method for IPv6 client address assignment is Stateless Address Auto-Configuration (SLAAC). SLAAC provides simple plug-and-play connectivity where clients self-assign an address based on the IPv6 prefix. This process is achieved

Stateless Address Auto-Configuration (SLAAC) is configured as follows:

- Host sends a router solicitation message.
- Hosts waits for a Router Advertisement message.
- Hosts take the first 64 bits of the IPv6 prefix from the Router Advertisement message and combines it with the 64 bit EUI-64 address (in the case of ethernet, this is created from the MAC Address) to create a global unicast message. The host also uses the source IP address, in the IP header, of the Router Advertisement message, as its default gateway.
- Duplicate Address Detection is performed by IPv6 clients in order to ensure that random addresses that are picked do not collide with other clients.
- The choice of algorithm is up to the client and is often configurable.

The last 64 bits of the IP v6 address can be learned based on the following 2 algorithms:

- EUI-64 which is based on the MAC address of the interface, or

- Private addresses that are randomly generated.

**Figure 16: SLAAC Address Assignment**

The following Cisco IOS configuration commands from a Cisco-capable IPv6 router are used to enable SLAAC addressing and router advertisements:

```

ipv6 unicast-routing
interface Vlan20
description IPv6-SLAAC
ip address 192.168.20.1 255.255.255.0
ipv6 address FE80:DB8:0:20::1 linklocal
ipv6 address 2001:DB8:0:20::1/64
ipv6 enable
end

```

## Stateful DHCPv6 Address Assignment

**Figure 17: Stateful DHCPv6 Address Assignment**

The use of DHCPv6 is not required for IPv6 client connectivity if SLAAC is already deployed. There are two modes of operation for DHCPv6 called Stateless and Stateful.

The DHCPv6 Stateless mode is used to provide clients with additional network information that is not available in the router advertisement, but not an IPv6 address as this is already provided by SLAAC. This information can include the DNS domain name, DNS server(s), and other DHCP vendor-specific options. This interface configuration is for a Cisco IOS IPv6 router implementing stateless DHCPv6 with SLAAC enabled:

```
ipv6 unicast-routing
ipv6 dhcp pool IPV6_DHCPPPOOL
address prefix 2001:db8:5:10::/64
domain-name cisco.com
dns-server 2001:db8:6:6::1
interface Vlan20
description IPv6-DHCP-Stateless
ip address 192.168.20.1 255.255.255.0
ipv6 nd other-config-flag
ipv6 dhcp server IPV6_DHCPPPOOL
ipv6 address 2001:DB8:0:20::1/64
end
```

The DHCPv6 Stateful option, also known as managed mode, operates similarly to DHCPv4 in that it assigns unique addresses to each client instead of the client generating the last 64 bits of the address as in SLAAC. This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on a local Switch:

```
ipv6 unicast-routing
ipv6 dhcp pool IPV6_DHCPPPOOL
address prefix 2001:db8:5:10::/64
domain-name cisco.com
dns-server 2001:db8:6:6::1
interface Vlan20
description IPv6-DHCP-Stateful
ip address 192.168.20.1 255.255.255.0
ipv6 address 2001:DB8:0:20::1/64
ipv6 nd prefix 2001:DB8:0:20::/64 no-advertise
ipv6 nd managed-config-flag
ipv6 nd other-config-flag
ipv6 dhcp server IPV6_DHCPPPOOL
end
```

This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on an external DHCP server:

```
ipv6 unicast-routing
domain-name cisco.com
dns-server 2001:db8:6:6::1
interface Vlan20
description IPv6-DHCP-Stateful
ip address 192.168.20.1 255.255.255.0
ipv6 address 2001:DB8:0:20::1/64
ipv6 nd prefix 2001:DB8:0:20::/64 no-advertise
ipv6 nd managed-config-flag
ipv6 nd other-config-flag
ipv6 dhcp relay destination 2001:DB8:0:20::2
end
```

## Static IP Address Assignment

Statically configured address on a client.

## Router Solicitation

A Router Solicitation message is issued by a host controller to facilitate local routers to transmit Router Advertisement from which it can obtain information about local routing or perform Stateless Auto-configuration. Router Advertisements are transmitted periodically and the host prompts with an immediate Router Advertisement using a Router Solicitation such as - when it boots or following a restart operation.

### Related Topics

[Configuring IPv6 ND Suppress Policy \(CLI\), on page 419](#)

## Router Advertisement

A Router Advertisement message is issued periodically by a router or in response to a Router Solicitation message from a host. The information contained in these messages is used by hosts to perform Stateless Auto-configuration and to modify its routing table.

### Related Topics

[Configuring IPv6 ND Suppress Policy \(CLI\), on page 419](#)

## Neighbor Discovery

IPv6 Neighbor Discovery is a set of messages and processes that determine relationships between neighboring nodes. Neighbor Discovery replaces ARP, ICMP Router Discovery, and ICMP Redirect used in IPv4.

IPv6 Neighbor Discovery inspection analyzes neighbor discovery messages in order to build a trusted binding table database, and IPv6 neighbor discovery packets that do not comply are dropped. The neighbor binding table in the switch tracks each IPv6 address and its associated MAC address. Clients are expired from the table according to Neighbor Binding timers.

### Related Topics

[Configuring IPv6 ND Suppress Policy \(CLI\), on page 419](#)

## Neighbor Discovery Suppression

The IPv6 addresses of wireless clients are cached by the switch. When the switch receives an NS multicast looking for an IPv6 address, and if the target address is known to the switch and belongs to one of its clients, the switch will reply with an NA message on behalf of the client. The result of this process generates the equivalent of the Address Resolution Protocol (ARP) table of IPv4 but is more efficient - uses generally fewer messages.

### Note

---

The switch acts like proxy and respond with NA, only when the **ipv6 nd suppress** command is configured

---

If the switch does not have the IPv6 address of a wireless client, the switch will not respond with NA and forward the NS packet to the wireless side. To resolve this, an NS Multicast Forwarding knob is provided. If this knob is enabled, the switch gets the NS packet for the IPv6 address that it does not have (cache miss) and forwards it to the wireless side. This packet reaches the intended wireless client and the client replies with NA.

This cache miss scenario occurs rarely, and only very few clients which do not implement complete IPv6 stack may not advertise their IPv6 address during NDP.

## RA Guard

IPv6 clients configure IPv6 addresses and populate their router tables based on IPv6 router advertisement (RA) packets. The RA guard feature is similar to the RA guard feature of wired networks. RA guard increases the security of the IPv6 network by dropping the unwanted or rogue RA packets that come from wireless clients. If this feature is not configured, malicious IPv6 wireless clients announce themselves as the router for the network often with high priority, which would take higher precedence over legitimate IPv6 routers.

RA-Guard also examines the incoming RA's and decides whether to switch or block them based solely on information found in the message or in the switch configuration. The information available in the frames received is useful for RA validation:

- Port on which the frame is received
- IPv6 source address
- Prefix list

The following configuration information created on the switch is available to RA-Guard to validate against the information found in the received RA frame:

- Trusted/Untrusted ports for receiving RA-guard messages
- Trusted/Untrusted IPv6 source addresses of RA-sender
- Trusted/Untrusted Prefix list and Prefix ranges
- Router Preference

RA guard occurs at the switch. You can configure the switch to drop RA messages at the switch. All IPv6 RA messages are dropped, which protects other wireless clients and upstream wired network from malicious IPv6 clients.

```
//Create a policy for RA Guard//
ipv6 nd raguard policy raguard-router
trusted-port
device-role router
//Applying the RA Guard Policy on port/interface//
interface tengigabitethernet1/0/1 (Katana)
interface gigabitethernet1/0/1 (Edison)

ipv6 nd raguard attach-policy raguard-router
```

## RA Throttling

RA throttling allows the controller to enforce limits to RA packets headed toward the wireless network. By enabling RA throttling, routers that send many RA packets can be trimmed to a minimum frequency that will still maintain an IPv6 client connectivity. If a client sends an RS packet, an RA is sent back to the client. This RA is allowed through the controller and unicast to the client. This process ensures that the new clients or roaming clients are not affected by the RA throttling.

## Configuring IPv6 Unicast (CLI)

IPv6 unicasting must always be enabled on the switch and the controller. IPv6 unicast routing is disabled.

### Before You Begin

To enable the forwarding of IPv6 unicast datagrams, use the **ipv6 unicast-routing** command in global configuration mode. To disable the forwarding of IPv6 unicast datagrams, use the **no** form of this command.

### SUMMARY STEPS

1. **configure terminal**
2. **ipv6 unicast routing**

### DETAILED STEPS

|        | Command or Action                                                                                  | Purpose                                         |
|--------|----------------------------------------------------------------------------------------------------|-------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>              | Enters the global configuration mode.           |
| Step 2 | <b>ipv6 unicast routing</b><br><br><b>Example:</b><br>Switch (config)# <b>ipv6 unicast routing</b> | enable the forwarding of IPv6 unicast datagrams |

## Configuring RA Guard Policy (CLI)

Configure RA Guard policy on the switch to add IPv6 client addresses and populate the router table based on IPv6 router advertisement packets.

### Before You Begin

### SUMMARY STEPS

1. **configure terminal**
2. **ipv6 nd rguard policy rguard-router**
3. **trustedport**
4. **device-role router**
5. **exit**

**Configuring IPv6 ND Suppress Policy (CLI)**

The IPv6 neighbor discovery (ND) multicast suppress feature stops as many ND multicast neighbor solicit (NS) messages as possible by dropping them (and responding to solicitations on behalf of the targets) or converting them into unicast traffic. This feature runs on a layer 2 switch or a wireless controller and is used to reduce the amount of control traffic necessary for proper link operations.

When an address is inserted into the binding table, an address resolution request sent to a multicast address is intercepted, and the device either responds on behalf of the address owner or, at layer 2, converts the request into a unicast message and forwards it to its destination.

**Before You Begin****SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ipv6 nd suppress policy**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                          | <b>Purpose</b>                                                                                                            |

| <b>Step 5</b> | <code>ipv6 nd suppress</code><br><br><b>Example:</b><br><code>Switch(config-vlan)# ipv6 nd suppress</code> | Applies the IPv6 nd suppress on the interface.                          |
| <b>Step 6</b> | <code>end</code><br><br><b>Example:</b><br><code>Switch(config-vlan)# end</code>                           | Exits vlan configuration mode and enters the global configuration mode. |

## Configuring IPv6 on Switch (CLI)

Use this configuration example to configure IPv6 on an interface.

### Before You Begin

Enable IPv6 on the client and IPv6 support on the wired infrastructure.

### SUMMARY STEPS

1. **interface** vlan 1
2. **ip address** fe80::1 link-local
3. **ipv6 enable**
4. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                  | Purpose                                                               |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| Step 1 | <b>interface</b> vlan 1<br><br><b>Example:</b><br>Switch(config)# interface vlan 1                                                                                                                                                                                                                                 | Creates a interface and enters interface configuration mode.          |
| Step 2 | <b>ip address</b> fe80::1 link-local<br><br><b>Example:</b><br>Switch(config-if)# ip address 198.51.100.1 255.255.255.0<br><br>Switch(config-if)# ipv6 address fe80::1 link-local<br>Switch(config-if)# ipv6 address<br>2001:DB8:0:1:FFFF:1234::5/64<br>Switch(config-if)# ipv6 address<br>2001:DB8:0:0:E000::F/64 | Configures IPv6 address on the interface using the link-local option. |
| Step 3 | <b>ipv6 enable</b><br><br><b>Example:</b><br>Switch(config)# ipv6 enable                                                                                                                                                                                                                                           | (Optional) Enables IPv6 on the interface.                             |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# end                                                                                                                                                                                                                                                           | Exits from the interface mode.                                        |

## Configuring DHCP Pool (CLI)

### SUMMARY STEPS

1. **ipv6 dhcp pool** Vlan21
2. **address prefix** 2001:DB8:0:1:FFFF:1234::/64 **lifetime** 300 10
3. **dns-server** 2001:100:0:1::1
4. **domain-name** example.com
5. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                    | Purpose                                                                                                             |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>ipv6 dhcp pool</b> Vlan21<br><br><b>Example:</b><br>Switch(config)# ipv6 dhcp pool vlan1                                                                                          | Enters the configuration mode and configures the IPv6 DHCP pool on the Vlan.                                        |
| <b>Step 2</b> | <b>address prefix</b> 2001:DB8:0:1:FFFF:1234::/64 <b>lifetime</b> 300 10<br><br><b>Example:</b><br>Switch(config-dhcpv6)# address prefix 2001:DB8:0:1:FFFF:1234::/64 lifetime 300 10 | Enters the configuration-dhcp mode and configures the address pool and its lifetime on a Vlan.                      |
| <b>Step 3</b> | <b>dns-server</b> 2001:100:0:1::1<br><br><b>Example:</b><br>Switch(config-dhcpv6)# dns-server 2001:20:21::1                                                                          | Configures the DNS servers for the DHCP pool.                                                                       |
| <b>Step 4</b> | <b>domain-name</b> example.com<br><br><b>Example:</b><br>Switch(config-dhcpv6)# domain-name example.com                                                                              | Configures the domain name to complete unqualified host names.                                                      |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# end                                                                                                                             | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Configuring Stateful DHCP Locally (CLI)

This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on a local Switch

### Before You Begin

### SUMMARY STEPS

1. **configure terminal**
2. **ipv6 unicast-routing**
3. **ipv6 dhcp pool IPv6\_DHCPPPOOL**
4. **address prefix 2001:DB8:0:1:FFFF:1234::/64**
5. **dns-server 2001:100:0:1::1**
6. **domain-name example.com**
7. **exit**
8. **interface vlan1**
9. **description IPv6-DHCP-Stateful**
10. **ipv6 address 2001:DB8:0:20::1/64**
11. **ip address 192.168.20.1 255.255.255.0**
12. **ipv6 nd prefix 2001:db8::/64 no-advertise**
13. **ipv6 nd managed-config-flag**
14. **ipv6 nd other-config-flag**
15. **ipv6 dhcp server IPv6\_DHCPPPOOL**

## DETAILED STEPS

## Configuring Stateful DHCP Externally (CLI)

This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on an external DHCP server.

**Before You Begin****SUMMARY STEPS**

1. **configure terminal**
2. **ipv6 unicast-routing**
3. **dns-server 2001:100:0:1::1**
4. **domain-name example.com**
5. **exit**
6. **interface vlan1**
7. **description IPv6-DHCP-Stateful**
8. **ipv6 address 2001:DB8:0:20::1/64**
9. **ip address 192.168.20.1 255.255.255.0**
10. **ipv6 nd prefix 2001:db8::/64 no-advertise**
11. **ipv6 nd managed-config-flag**
12. **ipv6 nd other-config-flag**
13. **ipv6 dhcp relaydestination 2001:DB8:0:20::2**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                                                    | <b>Purpose</b>                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <code>configure terminal</code>                                 | Enters the global configuration mode.            |
| <b>Step 2</b> | <b>ipv6 unicast-routing</b><br><br><b>Example:</b><br>Switch(config)# <code>ipv6 unicast-routing</code>                     | Configures the IPv6 for unicasting.              |

## Monitoring IPv6 Clients (GUI)

To view the IPv6 clients associated with the Switch

### Before You Begin

Select **Monitor > Clients**

The Clients page is displayed. The Clients page contains the following details:

- Client MAC Address— Displays the MAC address of the client.
- AP Name— Displays the access point name to which the client is connected to.
- WLAN— Displays the WLAN associated with the client.
- State— Displays the client authentication.
- Protocol— Displays the protocol used.

To view the client related general details, click the **Client MAC Address** parameter in the Clients page. The **Client > Detail** page displays IPv6 addresses of the client under the **General** tab.

## Verifying IPv6 Address Learning Configuration

This example displays the output of the **show ipv6 dhcp pool** command. This command displays the IPv6 service configuration on the switch. The vlan 21 configured pool detail displays 6 clients that are currently using addresses from the pool.

### SUMMARY STEPS

1. **show ipv6 dhcp pool**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                   | Purpose                                                |

### Prerequisites for IPv6 WLAN Security

A client VLAN must be mapped to the WLAN configured on the switch

### Restrictions for IPv6 WLAN Security

#### **RADIUS Server Support**

- If multiple RADIUS servers are configured for redundancy, the user database must be identical in all the servers for the backup to work properly.

#### **Radius ACS Support**

- You must configure RADIUS on both your Cisco Secure Access Control Server (ACS) and your switch
- RADIUS is supported on Cisco Secure ACS version 3.2 and later releases.

## Information About IPv6 WLAN Security

### Information About RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a client/server protocol that provides centralized security for users attempting to gain management access to a network. It serves as a back-end database similar to Local EAP and provides authentication and accounting services.

- **Authentication**—The process of verifying users when they attempt to log into the switch

Users must enter a valid username and password for the switch to authenticate users to the RADIUS server. If multiple databases are configured, then specify the sequence in which the backend database must be tried.

- **Accounting**— The process of recording user actions and changes.

Whenever a user successfully executes an action, the RADIUS accounting server logs the changed attributes, the user ID of the person who made the change, the remote host where the user is logged in, the date and time when the command was executed, the authorization level of the user, and a description of the action performed and the values provided. If the RADIUS accounting server is unreachable, the users can continue their sessions uninterrupted.

**User Datagram Protocol**— RADIUS uses User Datagram Protocol (UDP) for its transport. It maintains a database and listens on UDP port 1812 for incoming authentication requests and UDP port 1813 for incoming accounting requests. The switch, which requires access control, acts as the client and requests AAA services from the server. The traffic between the switch and the server is encrypted by an algorithm defined in the protocol and a shared secret key configured on both devices.

Configures multiple RADIUS accounting and authentication servers. For example, you can have one central RADIUS authentication server but several RADIUS accounting servers in different regions. If you configure multiple servers of the same type and the first one fails or becomes unreachable, the controller automatically tries the second one, then the third one if necessary, and so on.

When RADIUS method is configured for the WLAN, the switch will use the RADIUS method configured for the WLAN. When the WLAN is configured to use local EAP, the RADIUS method configured on the WLAN points to Local. The WLAN must also be configured with the name of the local EAP profile to use.

If no RADIUS method is configured in the WLAN, the switch will use the default RADIUS method defined in global mode.

### Information About Local EAP

Local EAP is an authentication method that allows users and wireless clients to be authenticated locally. It is designed for use in remote offices that maintain connectivity to wireless clients when the back-end system is disrupted or the external authentication server goes down. When you enable local EAP, the switch serves as the authentication server and the local user database, which removes dependence on an external authentication server. Local EAP retrieves user credentials from the local user database or the LDAP back-end database to authenticate users. Local EAP supports LEAP, EAP-FAST, EAP-TLS, PEAPv0/MSCHAPv2, and PEAPv1/GTC authentication between the controller and wireless clients.

**Note**

The LDAP back-end database supports these local EAP methods: EAP-TLS, EAP-FAST/GTC, and PEAPv1/GTC. LEAP, EAP-FAST/MSCHAPv2, and PEAPv0. MSCHAPv2 is supported only if the LDAP server is set up to return a clear-text password.

**Note**

Switch support Local EAP authentication against external LDAP databases such as Microsoft Active Directory and Novell's eDirectory. For more information about configuring the controller for Local EAP authentication against Novell's eDirectory, see the Configure Unified Wireless Network for Authentication Against Novell's eDirectory Database whitepaper.

# How to Configure IPv6 WLAN Security

## Configuring Local Authentication

### Creating a Local User

**SUMMARY STEPS**

1. **configure terminal**
2. **username aaa\_test**
3. **password 0 aaa\_test**
4. **end**

**DETAILED STEPS**

|               | Command or Action                                                                                                    | Purpose                                                                                                                 |
|---------------|----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                | Enters global command mode.                                                                                             |
| <b>Step 2</b> | <b>username aaa_test</b><br><br><b>Example:</b><br>Switch(config)# <b>username aaa_test</b>                          | Creates a username.                                                                                                     |
| <b>Step 3</b> | <b>password 0 aaa_test</b><br><br><b>Example:</b><br>Switch(config)# <b>usernameaaa_test password 0<br/>aaa_test</b> | Assigns a password for the username.                                                                                    |
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                      | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

```
Switch# configure terminal
Switch(config)# username aaa_test password 0 aaa_test
Switch(config)# end
```

## Configuring a EAP Profile

### SUMMARY STEPS

1. **eap profile name**
2. **method leap**
3. **method tls**
4. **method peap**
5. **method mschapv2**
6. **method md5**
7. **method gtc**
8. **method fast profile my-fast**
9. **description my\_localeap profile**
10. **exit**
11. **eap method fast profilemyFast**
12. **authority-id [identity|information]**
13. **local-key 0 key-name**
14. **pac-password 0 password**
15. **end**

## DETAILED STEPS

|         | Command or Action                                                                                                                                                                        | Purpose                                        |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
| Step 1  | <b>eap profile</b> name<br><br><b>Example:</b><br>Switch(config)# eap profile wcm_eap_prof                                                                                               | Creates a EAP profile.                         |
| Step 2  | <b>method leap</b><br><br><b>Example:</b><br>Switch(config-eap-profile)# method leap                                                                                                     | Configures EAP-LEAP method on the profile.     |
| Step 3  | <b>method tls</b><br><br><b>Example:</b><br>Switch(config-eap-profile)# method tls                                                                                                       | Configures EAP-TLS method on the profile.      |
| Step 4  | <b>method peap</b><br><br><b>Example:</b><br>Switch(config-eap-profile)# method peap                                                                                                     | Configures PEAP method on the profile.         |
| Step 5  | <b>method mschapv2</b><br><br><b>Example:</b><br>Switch(config-eap-profile)# method mschapv2                                                                                             | Configures EAP-MSCHAPV2 method on the profile. |
| Step 6  | <b>method md5</b><br><br><b>Example:</b><br>Switch(config-eap-profile)# method md5                                                                                                       | Configures EAP-MD5 method on the profile.      |
| Step 7  | <b>method gtc</b><br><br><b>Example:</b><br>Switch(config-eap-profile)# method gtc                                                                                                       | Configures EAP-GTC method on the profile.      |
| Step 8  | <b>method fast profile</b> my-fast<br><br><b>Example:</b><br>Switch(config-eap-profile)# eap method fast profile my-fast<br>Switch (config-eap-profile)#description my_local eap profile | Creates a EAP profile named my-fast.           |
| Step 9  | <b>description</b> my_localeap profile<br><br><b>Example:</b><br>Switch (config-eap-profile)#description my_local eap profile                                                            | Provides a description for the local profile.  |
| Step 10 | <b>exit</b><br><br><b>Example:</b><br>Switch (config-eap-profile)# exit                                                                                                                  | Exits the eap-profile configuration mode.      |

|                | Command or Action                                                                                                                                                                                                            | Purpose                                                                                                                 |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Step 11</b> | <b>eap method fast profile</b> myFast<br><br><b>Example:</b><br>Switch (config)# eap method fast profile myFast                                                                                                              | Configures the EAP method profile.                                                                                      |
| <b>Step 12</b> | <b>authority-id</b> [identity information]<br><br><b>Example:</b><br>Switch(config-eap-method-profile)# authority-id<br>identity my_identity<br>Switch(config-eap-method-profile)#authority-id<br>information my_information | Configure the authority ID and information for the EAP method profile.                                                  |
| <b>Step 13</b> | <b>local-key 0</b> key-name<br><br><b>Example:</b><br>Switch(config-eap-method-profile)# local-key 0 test                                                                                                                    | Configures the local server key.                                                                                        |
| <b>Step 14</b> | <b>pac-password 0</b> password<br><br><b>Example:</b><br>Switch(config-eap-method-profile)# pac-password 0<br>test                                                                                                           | Configures the PAC password for manual PAC provisioning.                                                                |
| <b>Step 15</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# end                                                                                                                                                                     | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

Switch(config)# aaa authentication dot1x aaa_auth local
Switch(config)# aaa authorization credential-download wcm_author local
Switch(config)# aaa local authentication wcm_local authorization wcm_author
Switch(config)# aaa session-id common
Switch(config)# dot1x system-auth-control

```

## Creating a Client WLAN

### Note

This example uses 802.1x with dynamic WEP. You can use any other security mechanism supported by the wireless client and configurable on the switch

## SUMMARY STEPS

1. **configure terminal**
2. **wlan wlan name <identifier> SSID**
3. **broadcast-ssid**
4. **no security wpa**
5. **security dot1x**
6. **security dot1x authentication-list wcm-local**
7. **local-auth wcm\_eap\_prof**
8. **client vlan 137**
9. **no shutdown**
10. **end**

## DETAILED STEPS

|         | Command or Action                                                                                                                                            | Purpose                                                                                                                 |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Step 1  | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <code>configure terminal</code>                                                                  | Enters global command mode.                                                                                             |
| Step 2  | <b>wlan wlan name &lt;identifier&gt; SSID</b><br><br><b>Example:</b><br>Switch(config)# <code>wlan wlanProfileName 1 ngwcSSID</code>                         | Creates a WLAN.                                                                                                         |
| Step 3  | <b>broadcast-ssid</b><br><br><b>Example:</b><br>Switch(config-wlan)# <code>broadcast-ssid</code>                                                             | Configures to broadcast the SSID on a WLAN.                                                                             |
| Step 4  | <b>no security wpa</b><br><br><b>Example:</b><br>Switch(config-wlan)# <code>no security wpa</code>                                                           | Disables the wpa for WLAN to enable 802.1x.                                                                             |
| Step 5  | <b>security dot1x</b><br><br><b>Example:</b><br>Switch(config-wlan)# <code>security dot1x</code>                                                             | Configures the 802.1x encryption security for the WLAN.                                                                 |
| Step 6  | <b>security dot1x authentication-list wcm-local</b><br><br><b>Example:</b><br>Switch(config-wlan)# <code>security dot1x authentication-list wcm-local</code> | Configures the server group mapping to the WLAN for dot1x authentication.                                               |
| Step 7  | <b>local-auth wcm_eap_prof</b><br><br><b>Example:</b><br>Switch (config-wlan)# <code>local-auth wcm_eap_profile</code>                                       | Configures the eap profile on the WLAN for local authentication.                                                        |
| Step 8  | <b>client vlan 137</b><br><br><b>Example:</b><br>Switch(config-wlan)# <code>client vlan 137</code>                                                           | Associates the VLAN to a WLAN.                                                                                          |
| Step 9  | <b>no shutdown</b><br><br><b>Example:</b><br>Switch(config-wlan)# <code>no shutdown</code>                                                                   | Enables the WLAN.                                                                                                       |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <code>end</code>                                                                                        | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

```

Switch# config terminal
Switch(config)#wlan wlanProfileName 1 ngwcSSID
Switch(config-wlan)#broadcast-ssid
Switch(config-wlan)#no security wpa
Switch(config-wlan)#security dot1x
Switch(config-wlan)#security dot1x authentication-list wcm-local
Switch (config-wlan)# local-auth wcm_eap_prof
Switch(config-wlan)#client vlan 137
Switch(config-wlan)#no shutdown
Switch(config-wlan)#end
Switch#

```

## Configuring Local Authentication with WPA2+AES

### SUMMARY STEPS

1. **configure terminal**
2. **aaa new model**
3. **dot1x system-auth-control**
4. **aaa authentication dot1x default local**
5. **aaa local authorization credential-download default local**
6. **aaa local authentication default authorization default**
7. **eap profile wcm\_eap\_profile**
8. **method leap**
9. **end**

### DETAILED STEPS

|               | Command or Action                                                                                           | Purpose                                      |
|---------------|-------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                       | Enters global command mode.                  |
| <b>Step 2</b> | <b>aaa new model</b><br><br><b>Example:</b><br>Switch(config)# <b>aaa new-model</b>                         | Creates a AAA authentication model.          |
| <b>Step 3</b> | <b>dot1x system-auth-control</b><br><br><b>Example:</b><br>Switch(config)# <b>dot1x system-auth-control</b> | Enables dot1x system authentication control. |

|        | Command or Action                                                                                                                                              | Purpose                                                                                                                 |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>aaa authentication dot1x default local</b><br><br><b>Example:</b><br>Switch(config)# aaa authentication dot1x default local                                 | Configures the local authentication for the default dot1x method.                                                       |
| Step 5 | <b>aaa local authorization credential-download default local</b><br><br><b>Example:</b><br>Switch(config)# aaa authorization credential-download default local | Configures default database to download EAP credentials from local server.                                              |
| Step 6 | <b>aaa local authentication default authorization default</b><br><br><b>Example:</b><br>Switch(config)# aaa local authentication default authorization default | Selects the default local authentication and authorization.                                                             |
| Step 7 | <b>eap profile wcm_eap_profile</b><br><br><b>Example:</b><br>Switch(config)# eap profile <b>wcm_eap_profile</b>                                                | Creates an EAP profile.                                                                                                 |
| Step 8 | <b>method leap</b><br><br><b>Example:</b><br>Switch(config)# method leap                                                                                       | Configures EAP-LEAP method on the profile.                                                                              |
| Step 9 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

```

Switch# configure terminal
Switch(config)# aaa new-model
Switch(config)# dot1x system-auth-control
Switch(config)# aaa authentication dot1x default local
Switch(config)# aaa authorization credential-download default local
Switch(config)# aaa local authentication default authorization default
Switch(config)# eap profile wcm_eap_profile
Switch(config)# method leap
Switch(config)# end

```

### Creating Client VLAN for WPA2+AES

Create a VLAN for the WPA2+AES type of local authentication. This VLAN is later mapped to a WLAN.

**SUMMARY STEPS**

1. **configure terminal**
2. **vlan** vlan\_ID
3. **exit**
4. **interface** vlan vlan\_ID
5. **ip address**
6. **ipv6 address**
7. **exit**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                                             | <b>Purpose</b>                              |
|---------------|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                | Enters global command mode.                 |
| <b>Step 2</b> | <b>vlan</b> vlan_ID<br><br><b>Example:</b><br>Switch (config)# <b>vlan 105</b>                                       | Creates a VLAN.                             |
| <b>Step 3</b> | <b>exit</b><br><br><b>Example:</b><br>Switch (config-vlan)# <b>exit</b>                                              | Exits from the VLAN mode.                   |
| <b>Step 4</b> | <b>interface</b> vlan vlan_ID<br><br><b>Example:</b><br>Switch(config)# <b>interface vlan 105</b>                    | Associates the VLAN to the interface.       |
| <b>Step 5</b> | <b>ip address</b><br><br><b>Example:</b><br>Switch(config-if)# <b>ip address 10.8.105.10</b><br><b>255.255.255.0</b> | Assigns IP address to the VLAN interface.   |
| <b>Step 6</b> | <b>ipv6 address</b><br><br><b>Example:</b><br>Switch(config-if)# <b>ipv6 address 2001:db8::10:1/64</b>               | Assigns IPv6 address to the VLAN interface. |
| <b>Step 7</b> | <b>exit</b><br><br><b>Example:</b><br>Switch (config-if)# <b>exit</b>                                                | Exits from the interface mode.              |

```
Switch# configure terminal
Switch(config)# vlan105
Switch (config-vlan)# exit
Switch (config)# interface vlan 105
Switch(config-if)#ip address 10.8.105.10 255.255.255.0
Switch(config-if)#ipv6 address 2001:db8::10:1/64
Switch(config-if)#exit
Switch(config)#
```

| <b>Step 4</b> | <b>local-auth wcm_eap_profile</b><br><br><b>Example:</b><br>Switch(config-wlan)#local-auth wcm_eap_profile                                    | Creates and sets the EAP profile on the WLAN. |

|               | Command or Action                                                                                                                          | Purpose                                                                                                             |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>security dot1x authentication-list default</b><br><br><b>Example:</b><br>Switch(config-wlan)#security dot1x authentication-list default | Uses the default dot1x authentication list.                                                                         |
| <b>Step 6</b> | <b>no shutdown</b><br><br><b>Example:</b><br>Switch(config-wlan)#no shutdown<br>Switch(config-wlan)#                                       | Enables the WLAN.                                                                                                   |
| <b>Step 7</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                            | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

```
Switch# configure terminal
Switch(config)#wlan wpa2-aes-wlan 1 wpa2-aes-wlan
Switch(config-wlan)#client vlan 105
Switch(config-wlan)#local-auth wcm_eap_profile
Switch(config-wlan)#security dot1x authentication-list default
Switch(config-wlan)#no shutdown
Switch(config-wlan)# exit
```

## Configuring External RADIUS Server

### Configuring RADIUS Authentication Server Host

#### SUMMARY STEPS

1. **configure terminal**
2. **radius server One**
3. **address ipv4 address auth-portauth\_port\_number acct-port acct\_port\_number**
4. **address ipv6 address auth-portauth\_port\_number acct-port acct\_port\_number**
5. **key 0cisco**
- 6.

#### DETAILED STEPS

|               | Command or Action                                                                     | Purpose                     |
|---------------|---------------------------------------------------------------------------------------|-----------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b> | Enters global command mode. |

|               | Command or Action                                                                                                                                                                                   | Purpose                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>Step 2</b> | <b>radius server One</b><br><br><b>Example:</b><br>Switch (config)# radius server One                                                                                                               | Creates a radius server.                           |
| <b>Step 3</b> | <b>address ipv4 address auth-portauth_port_number acct-port acct_port_number</b><br><br><b>Example:</b><br>Switch (config-radius-server)# address ipv4 10.10.10.10 auth-port 1812 acct-port 1813    | Configures the IPv4 address for the radius server. |
| <b>Step 4</b> | <b>address ipv6 address auth-portauth_port_number acct-port acct_port_number</b><br><br><b>Example:</b><br>Switch (config-radius-server)# address ipv6 2001:db8::25:2 auth-port 1812 acct-port 1813 | Configures the IPv6 address for the radius server. |
| <b>Step 5</b> | <b>key 0cisco</b><br><br><b>Example:</b><br>Switch (config-radius-server)# key 0 cisco                                                                                                              | <b>exit</b>                                        |
| <b>Step 6</b> | <b>Example:</b><br>Switch (config-radius-server)# exit                                                                                                                                              | Exits from the radius server mode.                 |

```
Switch# configure terminal
Switch (config)# radius server One
Switch (config-radius-server)# address ipv4 10.10.10.10 auth-port 1812 acct-port 1813
Switch (config-radius-server)# address ipv6 2001:db8::25:2 auth-port 1812 acct-port 1813
Switch (config-radius-server)# key 0 cisco

## Configuring RADIUS Authentication Server Group

### SUMMARY STEPS

1. **configure terminal**
2. **aaa new-model**
3. **aaa group server radius wcm\_rad**
4. **server <ip address>auth-port1812acct-port1813**
5. **aaa authentication dot1x method\_list group wcm\_rad**
6. **dot1x system-auth-control**
7. **aaa session-idcommon**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                             |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <code>configure terminal</code>                                                                                                                                                                                                                                                  | Enters global command mode.                                                                                                         |
| <b>Step 2</b> | <b>aaa new-model</b><br><br><b>Example:</b><br>Switch(config)# <code>aaa new-model</code>                                                                                                                                                                                                                                                    | Creates a AAA authentication model.                                                                                                 |
| <b>Step 3</b> | <b>aaa group server radius wcm_rad</b><br><br><b>Example:</b><br>Switch(config)# <code>aaa group server radius wcm_rad</code><br>Switch(config-sg-radius)#                                                                                                                                                                                   | Creates an radius server-group.                                                                                                     |
| <b>Step 4</b> | <b>server &lt;ip address&gt;auth-port1812acct-port1813</b><br><br><b>Example:</b><br>Switch(config-sg-radius)# <code>server One auth-port 1812 acct-port 1813</code><br>Switch(config-sg-radius)# <code>server Two auth-port 1812 acct-port 1813</code><br>Switch(config-sg-radius)# <code>server Three auth-port 1812 acct-port 1813</code> | Adds servers to the radius group created in Step 3. Configures the UDP port for RADIUS accounting server and authentication server. |
| <b>Step 5</b> | <b>aaa authentication dot1x method_list group wcm_rad</b><br><br><b>Example:</b><br>Switch(config)# <code>aaa authentication dot1x method_list group wcm_rad</code>                                                                                                                                                                          | Maps the method list to the radius group.                                                                                           |
| <b>Step 6</b> | <b>dot1x system-auth-control</b><br><br><b>Example:</b><br>Switch(config)# <code>dot1x system-auth-control</code>                                                                                                                                                                                                                            | Enables the system authorization control for the radius group.                                                                      |
| <b>Step 7</b> | <b>aaa session-idcommon</b><br><br><b>Example:</b><br>Switch(config)# <code>aaa session-id common</code>                                                                                                                                                                                                                                     | Ensures that all session IDs information sent out, from the radius group, for a given call are identical.                           |

```
Switch# configure terminal
Switch(config)# aaa new-model
Switch(config)# aaa group server radius wcm_rad
Switch(config-sg-radius)# server One auth-port 1812 acct-port 1813
Switch(config-sg-radius)# server Two auth-port 1812 acct-port 1813
Switch(config-sg-radius)# server Three auth-port 1812 acct-port 1813
Switch(config)# aaa authentication dot1x method_list group wcm_rad
Switch(config)# dot1x system-auth-control
Switch(config)# aaa session-id common
Switch(config)#
```

### SUMMARY STEPS

1. **configure terminal**
2. **wlan ngwc-lx<ssid>ngwc-lx**
3. **broadcast-ssid**
4. **no security wpa**
5. **security dot1x**
6. **security dot1x authentication-list wcm-rad**
7. **client vlan 137**
8. **no shutdown**
9. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                    | Purpose                                       |
|---------------|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                | Enters global command mode.                   |
| <b>Step 2</b> | <b>wlan ngwc-lx&lt;ssid&gt;ngwc-lx</b><br><br><b>Example:</b><br>Switch(config)# <b>wlan ngwc_8021x 2 ngwc_8021x</b> | Creates a new WLAN for 802.1x authentication. |

|               | Command or Action                                                                                                                           | Purpose                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>broadcast-ssid</b><br><br><b>Example:</b><br>Switch(config-wlan)# broadcast-ssid                                                         | Configures to broadcast the SSID on WLAN.                                                                               |
| <b>Step 4</b> | <b>no security wpa</b><br><br><b>Example:</b><br>Switch(config-wlan)# no security wpa                                                       | Disables the WPA for WLAN to enable 802.1x.                                                                             |
| <b>Step 5</b> | <b>security dot1x</b><br><br><b>Example:</b><br>Switch(config-wlan)# security dot1x                                                         | Configures the 802.1x encryption security for the WLAN.                                                                 |
| <b>Step 6</b> | <b>security dot1x authentication-list wcm-rad</b><br><br><b>Example:</b><br>Switch(config-wlan)# security dot1x authentication-list wcm-rad | Configures the server group mapping to the WLAN for dot1x authentication.                                               |
| <b>Step 7</b> | <b>client vlan 137</b><br><br><b>Example:</b><br>Switch(config-wlan)# client vlan 137                                                       | Associates the VLAN to a WLAN.                                                                                          |
| <b>Step 8</b> | <b>no shutdown</b><br><br><b>Example:</b><br>Switch(config-wlan)# no shutdown                                                               | Enables the WLAN.                                                                                                       |
| <b>Step 9</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                             | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

```
Switch# configure terminal
Switch(config)#wlan ngwc_8021x 2 ngwc_8021x
Switch(config-wlan)# broadcast-ssid
Switch(config-wlan)# no security wpa
Switch(config-wlan)# security dot1x
Switch(config-wlan)# security dot1x authentication-list wcm-rad
Switch(config-wlan)# client vlan 137
Switch(config-wlan)# no shutdown
Switch(config-wlan)# end
```

- [Feature Information for IPv6 ACLs, page 474](#)

### Prerequisites for IPv6 ACL

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running the IP base feature set.

#### Related Topics

[Creating IPv6 ACL, on page 461](#)

### Restrictions for IPv6 ACL

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most of the Cisco IOS-supported IPv6 ACLs with some exceptions:

- The switch does not support matching on these keywords: **flowlabel**, **routing header**, and **undetermined-transport**.

- The switch does not support reflexive ACLs (the **reflect** keyword).
- The switch does not apply MAC-based ACLs on IPv6 frames.
- When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.
- If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface

## Information About IPv6 ACL

An access control list (ACL) is a set of rules used to limit access to a particular interface (for example, if you want to restrict a wireless client from pinging the management interface of the controller). ACLs are configured on the switch and applied to the management interface, the AP-manager interface, any of the dynamic interfaces, or a WLAN to control data traffic to and from wireless clients or to the controller central processing unit (CPU) to control all traffic destined for the CPU.

You can also create a preauthentication ACL for web authentication. Such an ACL is used to allow certain types of traffic before authentication is complete.

IPv6 ACLs support the same options as IPv4 ACLs including source, destination, source and destination ports.

### Note

You can enable only IPv4 traffic in your network by blocking IPv6 traffic. That is, you can configure an IPv6 ACL to deny all IPv6 traffic and apply it on specific or all WLANs.

## Understanding IPv6 ACLs

A switch supports two types of IPv6 ACLs:

- IPv6 router ACLs are supported on outbound or inbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. IPv6 router ACLs apply only to IPv6 packets that are routed.
- IPv6 port ACLs are supported on inbound traffic on Layer 2 interfaces only. IPv6 port ACLs are applied to all IPv6 packets entering the interface.

A switch running the IP base feature set supports only input router IPv6 ACLs. It does not support port ACLs or output IPv6 router ACLs.

### Note

If you configure unsupported IPv6 ACLs, an error message appears and the configuration does not take affect.

The switch does not support VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface. As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs:

- When an input router ACL and input port ACL exist in an SVI, packets received on ports to which a port ACL is applied are filtered by the port ACL. Routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACL exist in an SVI, packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IPv6 packets are filtered by the router ACL. Other packets are not filtered.

**Note**

If any port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, and any router ACLs attached to the SVI of the port VLAN are ignored.

## Types of ACL

### Per User IPv6 ACL

For the per-user ACL, the full access control entries (ACE) as the text strings are configured on the ACS.

The ACE is not configured on the Controller. The ACE is sent to the switch in the `ACCESS-Accept` attribute and applies it directly for the client. When a wireless client roams into an foreign switch, the ACEs are sent to the foreign switch as an AAA attribute in the mobility Handoff message.

### Filter ID IPv6 ACL

For the filter-Id ACL, the full ACEs and the `acl name (filter-id)` is configured on the switch and only the `filter-id` is configured on the ACS. The `filter-id` is sent to the switch in the `ACCESS-Accept` attribute, and the switch looks up the `filter-id` for the ACEs, and then applies the ACEs to the client. When the client L2 roams to the foreign switch, only the `filter-id` is sent to the foreign switch in the mobility Handoff message. The foreign switch has to configure the `filter-id` and ACEs beforehand.

### Downloadable IPv6 ACL

For the downloadable ACL(dACL), the full ACEs and the `dACL name` are all configured on the ACS only.

**Note**

The controller does not configure any ACL.

The ACS sends the `dACL name` to the switch in its `ACCESS-Accept` attribute, which takes the `dACL name` and sends the `dACL name` back to the ACS, for the ACEs, using the `access-request` attribute.

The ACS responds to the corresponding ACEs of the switch in the `access-accept` attribute. When the wireless client roams to an foreign switch, only the `dac1` name is sent to the foreign switch in the mobility Handoff message. The foreign switch contacts the ACS server with the `dac1` name to retrieve the ACEs.

## IPv6 ACLs and Switch Stacks

The stack master supports IPv6 ACLs in hardware and distributes the IPv6 ACLs to the stack members.

### Note

For full IPv6 functionality in a switch stack, all stack members must be running the IP services feature set.

If a new switch takes over as stack master, it distributes the ACL configuration to all stack members. The member switches sync up the configuration distributed by the new stack master and flush out entries that member switches sync up the configuration distributed by the new stack master and flush out entries that are not required.

When an ACL is modified, attached to, or detached from an interface, the stack master distributes the change to all stack members.

## Configuring IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

### Before You Begin

Before configuring IPv6 ACLs, you must select one of the dual IPv4 and IPv6 SDM templates.

### SUMMARY STEPS

1. Create an IPv6 ACL, and enter IPv6 access list configuration mode.
2. Configure the IPv6 ACL to block (deny) or pass (permit) traffic.
3. Apply the IPv6 ACL to the interface where the traffic needs to be filtered.
4. Apply the IPv6 ACL to an interface. For router ACLs, you must also configure an IPv6 address on the Layer 3 interface to which the ACL is applied.

### DETAILED STEPS

|        | Command or Action                                                                                                                                  | Purpose |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| Step 1 | Create an IPv6 ACL, and enter IPv6 access list configuration mode.                                                                                 |         |
| Step 2 | Configure the IPv6 ACL to block (deny) or pass (permit) traffic.                                                                                   |         |
| Step 3 | Apply the IPv6 ACL to the interface where the traffic needs to be filtered.                                                                        |         |
| Step 4 | Apply the IPv6 ACL to an interface. For router ACLs, you must also configure an IPv6 address on the Layer 3 interface to which the ACL is applied. |         |

## Default IPv6 ACL Configuration

There are no IPv6 ACLs configured or applied.

## Interaction with Other Features and Switches

- If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.
- If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.
- You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

- You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.
- If the hardware memory is full, for any additional configured ACLs, packets are dropped to the CPU, and the ACLs are applied in software. When the hardware is full a message is printed to the console indicating the ACL has been unloaded and the packets will be dropped on the interface.

---

**Note** Only packets of the same type as the ACL that could not be added (ipv4, ipv6, MAC) will be dropped on the interface.

---

## How To Configure an IPv6 ACL

### Creating IPv6 ACL

Beginning in privileged EXEC mode, follow these steps to create an IPv6 ACL:

## SUMMARY STEPS

1. **configure terminal**
2. **ipv6 access-list *acl\_name***
3. **{deny|permit} protocol**
4. **{deny|permit} tcp**
5. **{deny|permit} udp**
6. **{deny|permit} icmp**
7. **end**
8. **show ipv6 access-list**
9. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Applying an IPv6 to an Interface

This section describes how to apply IPv6 ACLs to network interfaces. You can apply an IPv6 ACL to outbound or inbound traffic on layer 2 and Layer 3 interfaces. You can apply IPv6 ACLs only to inbound management traffic on Layer 3 interfaces.

Beginning in privileged EXEC mode, follow these steps to control access to an interface:

### SUMMARY STEPS

1. **configure terminal**
2. **interface** interface\_id
3. **no switchport**
4. **ipv6 address** ipv6\_address
5. **ipv6 traffic-filter** acl\_name
6. **end**
7. **show running-config interface** tenGigabitEthernet 1/0/3
8. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                             | Purpose                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>         | Enters global configuration mode.                                                                                                                                               |
| <b>Step 2</b> | <b>interface</b> interface_id<br><br><b>Example:</b><br>Switch# <b>interface</b> interface-id | Identifies a Layer 2 interface (for port ACLs) or Layer 3 Switch Virtual interface (for router ACLs) on which to apply an access list, and enters interface configuration mode. |
| <b>Step 3</b> | <b>no switchport</b><br><br><b>Example:</b><br>Switch# <b>no switchport</b>                   | Changes the interface from Layer 2 mode (the default) to Layer 3 mode (only if applying a router ACL).                                                                          |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>ipv6 address</b> <i>ipv6_address</i><br><br><b>Example:</b><br>Switch# ipv6 address ipv6-address                                                                                                                                                                                                                                                                | Configures an IPv6 address on a Layer 3 interface (for router ACLs).<br><b>Note</b> This command is not required on Layer 2 interfaces or if the interface has already been configured with an explicit IPv6 address. |
| <b>Step 5</b> | <b>ipv6 traffic-filter</b> <i>acl_name</i><br><br><b>Example:</b><br>Switch# ipv6 traffic-filter access-list-name {in   out}                                                                                                                                                                                                                                       | Applies the access list to incoming or outgoing traffic on the interface.                                                                                                                                             |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                                                                                                                                                                                                                    | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                                   |
| <b>Step 7</b> | <b>show running-config interface tenGigabitEthernet 1/0/3</b><br><br><b>Example:</b><br>Switch# show running-config interface tenGigabitEthernet 1/0/3<br>.....<br>.....<br>Building configuration ....<br>.....<br>Current configuration : 98 bytes<br>!<br>interface TenGigabitEthernet1/0/3<br>switchport mode trunk<br>ipv6 traffic-filter MyFilter out<br>end | Shows the configuration summary.                                                                                                                                                                                      |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br>copy running-config startup-config                                                                                                                                                                                                                                                             | (Optional) Saves your entries in the configuration file.                                                                                                                                                              |

## Verifying IPv6 ACL

### Displaying IPv6 ACLs

You can display information about all configured access lists, all IPv6 access lists, or a specific access list by using one or more of the privileged EXEC commands.

## DETAILED STEPS

|               | Command or Action                                                                                                                | Purpose                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>show access-list</b><br><br><b>Example:</b><br>Switch# show access-lists                                                      | Displays all access lists configured on the switch                             |
| <b>Step 2</b> | <b>show ipv6 access-list <i>acl_name</i></b><br><br><b>Example:</b><br>Switch# show ipv6 access-list [ <i>access-list-name</i> ] | Displays all configured IPv6 access list or the access list specified by name. |

## Configuration Examples for IPv6 ACL

## Example: Creating IPv6 ACL

This example configures the IPv6 access list named CISCO. The first deny entry in the list denies all packets that have a destination TCP port number greater than 5000. The second deny entry denies packets that have a source UDP port number less than 5000. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets. The second permit entry in the list permits all other traffic. The second permit entry is necessary because an implicit deny -all condition is at the end of each IPv6 access list.

**Note** Logging is supported only on Layer 3 interfaces.

```
Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch (config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any
```

## Example: Applying IPv6 ACLs

This example shows how to apply the access list Cisco to outbound traffic on a Layer 3 interface.

```
Switch(config)# interface TenGigabitEthernet 1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter CISCO out
```

## Example: Displaying IPv6 ACLs

This is an example of the output from the **show access-lists** privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Switch #show access-lists
Extended IP access list hello
10 permit ip any any
IPv6 access list ipv6
permit ipv6 any any sequence 10
```

This is an example of the output from the **show ipv6 access-lists** privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Switch# show ipv6 access-list
IPv6 access list inbound
permit tcp any any eq bgp (8 matches) sequence 10
permit tcp any any eq telnet (15 matches) sequence 20
permit udp any any sequence 30
```

```
IPv6 access list outbound
deny udp any any sequence 10
deny tcp any any eq telnet sequence 20
```

## Example: Configuring RA Throttling and NS Suppression

This task describes how to create an RA throttle policy in order to help the power-saving wireless clients from being disturbed by frequent unsolicited periodic RA's. The unsolicited multicast RA is throttled by the controller.

### Before You Begin

Enable IPv6 on the client machine.

### SUMMARY STEPS

1. **configure terminal**
2. **ipv6 nd ra-throttler policy Mythrottle**
3. **throttle-period 20**
4. **max-through 5**
5. **allow at-least 3 at-most 5**
6. **switch (config)# vlan configuration 100**
7. **ipv6 nd suppress**
8. **ipv6 nd ra-th attach-policy attach-policy\_name**
9. **end**

### DETAILED STEPS

|        | Command or Action                                                                     | Purpose                           |
|--------|---------------------------------------------------------------------------------------|-----------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b> | Enters global configuration mode. |

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>ipv6 nd ra-throttler policy Mythrottle</b><br><br><b>Example:</b><br>Switch (config)# ipv6 nd ra-throttler policy Mythrottle                       | Creates a RA throttler policy called Mythrottle.                                                                         |
| <b>Step 3</b> | <b>throttle-period 20</b><br><br><b>Example:</b><br>Switch (config-nd-ra-throttle)# throttle-period 20                                                | Determines the time interval segment during which throttling applies.                                                    |
| <b>Step 4</b> | <b>max-through 5</b><br><br><b>Example:</b><br>Switch (config-nd-ra-throttle)# max-through 5                                                          | Determines how many initial RA's are allowed.                                                                            |
| <b>Step 5</b> | <b>allow at-least 3 at-most 5</b><br><br><b>Example:</b><br>Switch (config-nd-ra-throttle)# allow at-least 3 at-most 5                                | Determines how many RA's are allowed after the initial RAs have been transmitted, until the end of the interval segment. |
| <b>Step 6</b> | <b>switch (config)# vlan configuration 100</b><br><br><b>Example:</b><br>Switch (config)# vlan configuration 100                                      | Creates a per vlan configuration.                                                                                        |
| <b>Step 7</b> | <b>ipv6 nd suppress</b><br><br><b>Example:</b><br>Switch (config)# ipv6 nd suppress                                                                   | Disables the neighbor discovery on the Vlan.                                                                             |
| <b>Step 8</b> | <b>ipv6 nd ra-th attach-policy attach-policy_name</b><br><br><b>Example:</b><br>Switch (config)# ipv6 nd ra-throttle attach-policy attach-policy_name | Enables the router advertisement throttling.                                                                             |
| <b>Step 9</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# end                                                                                              | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.      |

## Example: Configuring RA Guard Policy

### SUMMARY STEPS

1. `ipv6 nd rguard policy MyPolicy`
2. `trusted-port`
3. `device-role router`
4. `interface tenGigabitEthernet 1/0/1`
5. `ipv6 nd rguard attach-policy MyPolicy`
6. `vlan configuration 19-21,23`
7. `ipv6 nd suppress`
8. `ipv6 snooping`
9. `ipv6 nd rguard attach-policy MyPolicy`
10. `ipv6 nd ra-throttler attach-policy MyThrottle`

### DETAILED STEPS

|        | Command or Action                                                                                                                                                        | Purpose                                                                         |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| Step 1 | <b>ipv6 nd rguard policy MyPolicy</b><br><br><b>Example:</b><br>Switch (config)# ipv6 nd rguard policy MyPolicy                                                          |                                                                                 |
| Step 2 | <b>trusted-port</b><br><br><b>Example:</b><br>Switch (config-nd-rguard)# trusted-port                                                                                    | Configures the trusted port for the policy created above.                       |
| Step 3 | <b>device-role router</b><br><br><b>Example:</b><br>Switch (config-nd-rguard)# device-role [host monitor router switch]<br>Switch (config-nd-rguard)# device-role router | Defines the trusted device that can send RAs to the trusted port created above. |
| Step 4 | <b>interface tenGigabitEthernet 1/0/1</b><br><br><b>Example:</b><br>Switch (config)# interface tenGigabitEthernet 1/0/1                                                  | Configures the interface to the trusted device.                                 |
| Step 5 | <b>ipv6 nd rguard attach-policy MyPolicy</b><br><br><b>Example:</b><br>Switch (config-if)# ipv6 nd rguard attach-policy MyPolicy                                         | Configures and attaches the policy to trust the RA's received from the port.    |
| Step 6 | <b>vlan configuration 19-21,23</b><br><br><b>Example:</b><br>Switch (config)# vlan configuration 19-21,23                                                                | Configures the wireless client vlans.                                           |

|                | Command or Action                                                                                                                                        | Purpose                                                         |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| <b>Step 7</b>  | <b>ipv6 nd suppress</b><br><br><b>Example:</b><br>Switch (config-vlan-config)# ipv6 nd suppress                                                          | Suppresses the ND messages over wireless.                       |
| <b>Step 8</b>  | <b>ipv6 snooping</b><br><br><b>Example:</b><br>Switch (config-vlan-config)# ipv6 snooping                                                                | Captures IPv6 traffic.                                          |
| <b>Step 9</b>  | <b>ipv6 nd rguard attach-policy MyPolicy</b><br><br><b>Example:</b><br>Switch (config-vlan-config)# ipv6 nd rguard attach-policy Mypolicy                | Attaches the RA Guard policy to the wireless client vlans.      |
| <b>Step 10</b> | <b>ipv6 nd ra-throttler attach-policy Mythrottle</b><br><br><b>Example:</b><br>Switch (config-vlan-config)#ipv6 nd ra-throttler attach-policy Mythrottle | Attaches the RA throttling policy to the wireless client vlans. |

## Example: Configuring IPv6 Neighbor Binding

### SUMMARY STEPS

1. **ipv6 neighbor binding [vlan ]19 2001:db8::25:4 interface tenGigabitEthernet 1/0/3 aaa.bbb.ccc**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                           | Purpose                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>ipv6 neighbor binding [vlan ]19 2001:db8::25:4 interface tenGigabitEthernet 1/0/3 aaa.bbb.ccc</b><br><br><b>Example:</b><br>Switch (config)# ipv6 neighbor binding vlan 19 2001:db8::25:4 interface tenGigabitEthernet 1/0/3 aaa.bbb.ccc | Sets and validates the neighbor 2001:db8::25: 4 only valid when transmitting on VLAN 19 through interface te1/0/3 with the source mac-address as aaa.bbb.ccc. |

### Prerequisites for IPv6 Web Authentication

The following configurations must be in place before you start with IPv6 Web Authentication:

- IPv6 Device Tracking.
- IPv6 DHCP Snooping.
- Disable security of type 802.1x on the wlan.
- Each WLAN must have a vlan associated to it.
- Change the default wlan setting from **shutdown** to **no shutdown**.

## Information About IPv6 Web Authentication

Web authentication is a Layer 3 security feature and the switch disallows IP traffic (except DHCP and DNS -related packets) from a particular client until it supplies a valid username and password. It is a simple authentication method without the need for a supplicant or client utility. Web authentication is typically used by customers who deploy a guest-access network. Traffic from both, HTTP and HTTPS, page is allowed to display the login page.

### Note

Web authentication does not provide data encryption and is typically used as simple guest access for either a hot spot or campus atmosphere, where connectivity is always a factor.

A WLAN is configured as **security webauth** for web based authentication. The switch supports the following types of web based authentication:

- Web Authentication – The client enters the credentials in a web page which is then validated by the Wlan controller.
- Web Consent – The Wlan controller presents a policy page with Accept/Deny buttons. Click Accept button to access the network.

A Wlan is typically configured for open authentication, that is without Layer 2 authentication, when web-based authentication mechanism is used.

## Web Authentication Process

The following events occur when a WLAN is configured for web authentication:

- The user opens a web browser and enters a URL address, for example, *http://www.example.com*. The client sends out a DNS request for this URL to get the IP address for the destination. The switch bypasses the DNS request to the DNS server, which in turn responds with a DNS reply that contains the IP address of the destination *www.example.com*. This, in turn, is forwarded to the wireless clients.
- The client then tries to open a TCP connection with the destination IP address. It sends out a TCP SYN packet destined to the IP address of *www.example.com*.
- The switch has rules configured for the client and cannot act as a proxy for *www.example.com*. It sends back a TCP SYN-ACK packet to the client with source as the IP address of *www.example.com*. The client sends back a TCP ACK packet in order to complete the three-way TCP handshake and the TCP connection is fully established.
- The client sends an HTTP GET packet destined to *www.example.com*. The switch intercepts this packet and sends it for redirection handling. The HTTP application gateway prepares an HTML body and sends it back as the reply to the HTTP GET requested by the client. This HTML makes the client go to the default web-page of the switch, for example, *http://<Virtual-Server-IP>/login.html*.
- The client closes the TCP connection with the IP address, for example, *www.example.com*.
- If the client wants to go to virtual IP, the client tries to open a TCP connection with the virtual IP address of the switch. It sends a TCP SYN packet for virtual IP to the switch.
- The switch responds back with a TCP SYN-ACK and the client sends back a TCP ACK to the switch in order to complete the handshake.

- The client sends an HTTP GET for `/login.html` destined to virtual IP in order to request for the login page.
- This request is allowed to the web server of the switch, and the server responds with the default login page. The client receives the login page in the browser window where the user can log in.

## How to Configure IPv6 Web Authentication

### Disabling WPA

#### Before You Begin

Disable 802.1x. A typical web authentication does not use Layer 2 security. Use this configuration to remove Layer 2 security.

#### SUMMARY STEPS

1. **configure terminal**
2. **wlan test1 2 test1**
3. **no security wpa**

#### DETAILED STEPS

|        | Command or Action                                                                             | Purpose                                  |
|--------|-----------------------------------------------------------------------------------------------|------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>         | Enters the global configuration mode.    |
| Step 2 | <b>wlan test1 2 test1</b><br><br><b>Example:</b><br>Switch(config)# <b>wlan test1 2 test1</b> | Creates a WLAN and assign an SSID to it. |

|               | Command or Action                                                                     | Purpose                            |
|---------------|---------------------------------------------------------------------------------------|------------------------------------|
| <b>Step 3</b> | <b>no security wpa</b><br><br><b>Example:</b><br>Switch(config-wlan)# no security wpa | Disables the WPA support for Wlan. |

### What to Do Next

Enable the following:

- Security Web Authentication.
- Parameter Local.
- Authentication List.

## Configuring the WLAN

### Before You Begin

- The WLAN must have a Vlan associated with it. By default, a new Wlan is always associated with Vlan 1, which can be changed as per the configuration requirements.
- Configure and enable the WLAN to *no shutdown*. By default, the Wlan is configured with the *shutdown* parameter and is disabled.

### SUMMARY STEPS

1. **wlan** *l*
2. **client vlan** *interface ID*
3. **security web-auth authentication list** webauthlistlocal
4. **security web-auth parameter-map** global
5. **no security wpa**
6. **no shutdown**
7. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                   | Purpose                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <b>Step 1</b> | <b>wlan</b> <i>l</i><br><br><b>Example:</b><br>Switch(config-wlan)# wlan 1 name vicweb ssid vicweb                                                                  | Creates a wlan and assign an SSID to it.                          |
| <b>Step 2</b> | <b>client vlan</b> <i>interface ID</i><br><br><b>Example:</b><br>Switch(config-wlan)# client vlan VLAN0136                                                          | Assigns the client to vlan interface.                             |
| <b>Step 3</b> | <b>security web-auth authentication list</b> webauthlistlocal<br><br><b>Example:</b><br>Switch(config-wlan)# security web-auth authentication-list webauthlistlocal | Configures web authentication for the wlan.                       |
| <b>Step 4</b> | <b>security web-auth parameter-map</b> global<br><br><b>Example:</b><br>Switch(config-wlan)# security web-auth parameter-map global                                 | Configures the parameter map on the wlan.                         |
| <b>Step 5</b> | <b>no security wpa</b><br><br><b>Example:</b><br>Switch(config-wlan)# no security wpa                                                                               | Configures the security policy for a wlan. This enables the wlan. |

|               | Command or Action                                                             | Purpose                                                                                                             |

## Configuring IPv6 Client Mobility

- [Prerequisites for IPv6 Client Mobility, page 487](#)
- [Restrictions For IPv6 Client Mobility, page 487](#)
- [Information About IPv6 Client Mobility, page 488](#)
- [Verifying IPv6 Client Mobility, page 491](#)
- [Monitoring IPv6 Client Mobility, page 492](#)
- [Additional References, page 492](#)
- [Feature Information For IPv6 Client Mobility, page 493](#)

### Prerequisites for IPv6 Client Mobility

To enable wireless IPv6 client connectivity, the underlying wired network must support IPv6 routing and an address assignment mechanism such as SLAAC or DHCPv6. The switch must have L2 adjacency to the IPv6 router, and the VLAN needs to be tagged when the packets enter the switch. APs do not require connectivity on an IPv6 network, as all traffic is encapsulated inside the IPv4 CAPWAP tunnel between the AP and switch.

### Restrictions For IPv6 Client Mobility

- When using the IPv6 Client Mobility, clients must support IPv6 with either static stateless auto configuration (such as Windows XP clients) or stateful DHCPv6 IP addressing (such as Windows 7 clients).
- To allow smooth operation of stateful DHCPv6 IP addressing, you must have a switch or router that supports the DHCP for IPv6 feature (such as the switch) that is configured to act like a DHCPv6 server, or you need a dedicated server such as a Windows 2008 server with a built-in DHCPv6 server. Cisco Catalyst 3850 switch and Cisco Catalyst 5700 switch can act as (internal) a DHCPv6 server.

**Note**

To load the SDM IPv6 template in the Cisco Catalyst 3850 switch, enter the **sdm prefer dual-ipv4 and v6** default command and then reset the switch.

## Information About IPv6 Client Mobility

The Switch supports IPv6 mobility for IPv6-only or dual-stack nodes. The IPv6 Client Mobility is divided into:

- Link Layer and
- Network Layer

The link layer is handled by the 802.11 protocol which enables the client to roam to any AP in the same BSS (basic service set) identified by the same SSID without losing the link layer connectivity.

However, link layer mobility is not enough to make wireless client Layer 3 applications continue to work seamlessly while roaming. Cisco IOSd's wireless mobility module uses mobility tunneling to retain seamless connectivity for the client's Layer 3 PoP (point of presence) when the client roams across different subnets on different switches.

IPv6 is the next-generation network layer Internet protocol intended to replace IPv4 in the TCP/IP suite of protocols. This new version increases the internet global address space to accommodate users and applications that require unique global IP addresses. IPv6 incorporates 128-bit source and destination addresses, which provide significantly more addresses than the 32-bit IPv4 addresses.

To support IPv6 clients across controllers, ICMPv6 messages must be dealt with specially to ensure the IPv6 client remains on the same Layer 3 network. The switch keep track of IPv6 clients by intercepting the ICMPv6 messages to provide seamless mobility and protect the network from network attacks. The NDP (neighbor discovery packets) packets are converted from multicast to unicast and delivered individually per client. This unique solution ensures that Neighbor Discovery and Router Advertisement packets are not leaked across Vlans. Clients can receive specific Neighbor Discovery and Router Advertisement packets ensuring correct IPv6 addressing and avoids unnecessary multicast traffic.

The configuration for IPv6 mobility is the same as IPv4 mobility and requires no separate software on the client side to achieve seamless roaming. The switch must be part of the same mobility group. Both IPv4 and IPv6 client mobility are enabled by default.

IPv6 client mobility is used for the following:

- Retaining the client IPv6 multiple addresses in Layer-2 and Layer-3 roaming.
- IPv6 Neighbor Discovery Protocol (NDP) packet management.
- Client IPv6 addresses learning.

## Using Router Advertisement

The Neighbor Discovery Protocol (NDP) operates in the link-layer and is responsible for the discovery of other nodes on the link. It determines the link-layer addresses of other nodes, finds the available routers, and maintains reachability information about the paths to other active neighbor nodes.

Router Advertisement (RA) is one of the IPv6 Neighbor Discovery Protocol (NDP) packets that is used by the hosts to discover available routers, acquire the network prefix to generate the IPv6 addresses, link MTU, and so on. The routers send RA on a regular basis, or in response to hosts Router Solicitation messages.

IPv6 wireless client mobility manages the IPv6 RA packet. The converged access switch forwards the link-local all-nodes multicast RA packets to the local and roaming wireless nodes mapped on same VLAN the RA was received on.

Figure 1 illustrates the link-local all-nodes mcast RA forwarding issue in the wireless node mobility.

**Figure 19: Roaming Client Receiving Invalid RA from Router 2**

334007

Figure 2 illustrates how a roaming client “MN” receives RA from VLAN 200 in a foreign switch and how it acquires a new IP address and breaks into L3 mobility’s point of presence.

**Figure 20: Roaming Client Receives Valid RA from Router 1**

334008

## RA Throttling and NS suppression

To safeguard the power-saving wireless clients from being disturbed by frequent unsolicited periodic RAs, the controller can throttle the unsolicited multicast RA.

### Related Topics

[Monitoring IPv6 Client Mobility, on page 492](#)

## IPv6 Address Learning

There are three ways for IPv6 client to acquire IPv6 addresses:

- Stateless Address Auto-Configuration (SLAAC)
- Stateful DHCPv6
- Static configuration

For these methods, the IPv6 client always sends NS DAD (duplicate address detection) to ensure that there is no duplicated IP address on the network. The switch snoops the clients NDP and DHCPv6 packets to learn about its client IP addresses and then updates the controllers database. The database then informs the controller for the clients new IP address.

### Related Topics

- [Monitoring IPv6 Client Mobility, on page 492](#)

## Handling Multiple IP Addresses

In the case when the new IP address is received after RUN state, whether an addition or removal, the controller updates the new IP addresses on its local database for display purposes. Essentially, the IPv6 uses the existing or same PEM state machine code flow as in IPv4. When the IP addresses are requested by external entities, for example, from Prime Infrastructure, the controller will include all the available IP addresses, IPv4 and IPv6, in the API/SPI interface to the external entities.

An IPv6 client can acquire multiple IP addresses from stack for different purposes. For example, a link-local address for link local traffic, and a routable unique local or global address.

When the client is in the DHCP request state and the controller receives the first IP address notification from the database for either an IPv4 or IPv6 address, the PEM moves the client into the RUN state.

When a new IP address is received after the RUN state, either for addition or removal, the controller updates the new IP addresses on its local database for display purposes.

When the IP addresses are requested by external entities, for example, from Prime Infrastructure, the controller provides the available IP addresses, both IPv4 and IPv6, to the external entities.

## IPv6 Configuration

The switch supports IPv6 client as seamlessly as the IPv4 clients. The administrator must manually configure the Vlans to enable the IPV6, IPv6's snooping and throttling functionality. This will enable the NDP packets to throttle between the switch and its various clients

### Related Topics

- [Verifying IPv6 Client Mobility, on page 491](#)
- [Monitoring IPv6 Client Mobility, on page 492](#)

## High Availability

The switch will sync with the wireless clients when the clients IP address is hard to learn. When a switchover happens, the IPv6 neighbor binding table is synced to standby state. However, the wireless client will itself disassociate and reassociate to a new active state once the switchover is complete and the neighbor binding table is updated with latest information for that client.

If, during the reassociation, the client moves to another AP then the original entry in the binding table is marked as down for sometime and will be aged-out.

For the new entries joining the switch from another AP, the new IP address is learned and notified to the controller's database.

### Note

This feature is available only for the Cisco Catalyst 3850 Switch.

- [Monitoring IPv6 Mobility, page 496](#)
- [Additional References, page 498](#)
- [Feature Information for IPv6 Mobility, page 499](#)

### Pre-requisites for IPv6 Mobility

The mobility and its related infrastructure must be configured and ready for use.

### Information About IPv6 Mobility

Mobility, or roaming, is a wireless LAN client's ability to maintain its association seamlessly from one access point to another securely and with as little latency as possible. This section explains how mobility works when switches are included in a wireless network.

When a wireless client associates and authenticates to an access point, the access point's switch places an entry for that client in its client database. This entry includes the client's MAC and IP addresses, security context and associations, quality of service (QoS) contexts, the WLAN, and the associated access point. The switch uses this information to forward frames and manage traffic to and from the wireless client.

When the wireless client moves its association from one access point to another, the switch simply updates the client database with the newly associated access point. If necessary, new security context and associations are established as well. The process becomes more complicated, however, when a client roams from an access point joined to one switch to an access point joined to a different switch. It also varies based on whether the switches are operating on the same subnet.

## Inter Controller Roaming

When the client associates to an access point joined to a new switch, the new switch exchanges mobility messages with the original switch, and the client database entry is moved to the new switch if sticky anchoring is disabled.

### Related Topics

[Monitoring IPv6 Mobility, on page 496](#)

## Intra Subnet Roaming with Sticky Anchoring, and Inter Subnet Roaming

Inter-subnet roaming is similar to inter-controller roaming in that the switch exchange mobility messages on the client roam. However, instead of moving the client database entry to the new switch, the original switch marks the client with an "Anchor" entry in its own client database. The database entry is copied to the new switch client database and marked with a "Foreign" entry in the new switch. The roam remains transparent to the wireless client, and the client maintains its original IP address.

In inter-subnet roaming, WLANs on both anchor and foreign switch need to have the same network access privileges and no source-based routing or source-based firewalls in place. Otherwise, the clients may have network connectivity issues after the handoff.

For more information on configuring mobility see, the Cisco 5700 Wireless LAN Controller Mobility Configuration Guide, Cisco IOS XE, Release 3.2SE.

- [Feature Information for IPv6 NetFlow, page 517](#)

## Prerequisites For IPv6 Netflow

The networking device must be running a Cisco IOSd release that supports Cisco IOS Flexible NetFlow.

### IPv6 Traffic

- One of the following must be enabled on your router and on any interfaces on which you want to enable Flexible NetFlow:
  - Cisco Express Forwarding IPv6 or
  - Distributed Cisco Express Forwarding IPv6.

## Restrictions For IPv6 Netflow

The following restrictions apply to IPv6 Netflow configurations:

- Locally generated traffic (traffic that is generated by the router, Cisco WLC 5760, on which the Flexible NetFlow Output Accounting feature is configured) is not counted as flow traffic for the Output Flexible NetFlow Accounting feature.

- The Flexible NetFlow Output Accounting feature counts CEF-switched packets only. Process switched transit packets are not counted.

## Information About IPv6 Netflow

NetFlow is a monitoring feature used on customer applications for network monitoring, user monitoring and profiling, network planning, security analysis, billing and accounting, and data warehousing and mining. You can use Flexible NetFlow on uplink ports to monitor user-defined flows, collect flow statistics, and perform per-flow policing. It collects and exports flow statistics to a collector device.

### Note

Flexible NetFlow is supported only on the Catalyst 3750-X and 3560-X switch running the IP base or IP services feature set and equipped with the network services module. It is not supported on switches running the NPE or the LAN base image.

### Note

Not all of the Flexible NetFlow commands in the command reference are available on the switch. Unsupported commands are either not visible or generate an error message if entered.

## Understanding Flexible Netflow

With Flexible NetFlow, traffic is processed and packets are classified into flows. New flows are inserted in the NetFlow table, and statistics are automatically updated. You must configure both ingress and egress NetFlow monitoring. The network services module supports one monitor per interface per direction.

Flexible NetFlow consists of the following components:

- Records— These are combinations of key and non-key fields assigned to monitor Flexible NetFlow monitors to define the cache used to store data.
- Flow monitors— These are applied to interfaces to perform network traffic monitoring. A flow monitor includes a user-defined record, an optional flow exporter, and a cache that is automatically created when the monitor is applied to the first interface. The switch supports normal caches that age out according to settings.
- Flow exporters— These export the data in the flow monitor cache to a remote system, such as a server running NetFlow collector.
- Flow samplers— These reduce the load that Flexible NetFlow puts on the networking device to monitor traffic by limiting the number of packets that are analyzed.

You can configure unidirectional flow (destination or source-address based flows), and flow aging. The following features are supported on the network services module:

- Configuring collection statistics for Layer 2-switched (non-routing) traffic, Layer 3 (CAPWAP) IPv4 and IPv6 traffic, and Layer 4 TCP, IGMP, and ICMP traffic.
- NetFlow counting, maintenance, troubleshooting (debugging commands).

- NetFlow analysis is performed on traffic crossing the physical interfaces on the network services module. The switch processes egress (outbound) traffic after forwarding decisions are performed. Locally switched or routed traffic is forced through service module ports by configuring private VLANs or protected ports.

The following NetFlow characteristics are not supported:

- Netflow-5 protocol
- Predefined flow records
- ISL
- Policy-based NetFlow
- Cisco TrustSec monitoring

Though other modules that can be installed in the switch have 1-Gigabit and 10-Gigabit uplink interfaces, NetFlow is supported only on the network services module.

## IPv6 Netflow

Flexible Netflow (FNF) allows the user to define a flow record (a particular set of key, non-key, counter and time-stamp fields of interest) that is optimal for a particular application by selecting the fields from a big collection of pre-defined fields, using CLI configuration commands.

The collection of the pre-defined fields includes the following fields:

- Data-link layer (L2) header fields
- IPv6 header fields
- Transport layer (L4) header fields
- Application layer (L5) header fields
- Routing attributes (generic, IPv4, IPv6)
- Interface fields
- Counter fields
- Timestamp fields

# How To Configure IPv6 Netflow

## Configuring a Customized Flow Record

You can match the following fields for the flow record:

- IPv4 or IPv6 destination address
- Datalink fields, to identify Layer 2 source and destination address and VLAN for traffic entering or leaving the interfaces, providing the MAC address of the directly connected host. Class of Service (CoS) and Ethertype datalink header fields are also available.
- Transport field source and destination ports, to identify the type of application: ICMP, IGMP, or TCP traffic.

You can collect the following fields for the flow record:

- The total number of bytes, flows or packets sent by the exporter (exporter) or the number of bytes or packets in a 64-bit counter (long). The timestamp based on system uptime from the time the first packet was sent or from the time the most recent (last) packet was seen.
- The SNMP index of the input or output interface. The interface for traffic entering or leaving the service module is based on the switch forwarding cache. This field is typically used in conjunction with datalink, IPv4, and IPv6 addresses, and provides the actual first-hop interface for directly connected hosts.
  - A value of 0 means that interface information is not available in the cache.
  - Some NetFlow collectors require this information in the flow record.

The following steps configure the customized flow record:

### SUMMARY STEPS

1. **configure terminal**
2. **flow record** recordname
3. **description** description
4. **match** {ipv4 | ipv6} {destination | hop-limit | protocol | source | traffic-class| version} **address**
5. **match datalink** [dot1q | ethertype | mac | vlan]
6. **match transport** [destination-port | icmp | source-port]
7. **match interface** [input |output]
8. **match flow direction**
9. **collect counter** {bytes [ layer2 | long] | packets [ long]}
10. **collect timestamp absolute** [first | last]
11. **collect interface** [input | output]
12. **collect transport tcp flags** {ack | cwr | ece | fin | psh | rst | syn | urg}
13. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                     | Purpose                                                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                                                 | Enters global configuration mode.                                                                                                       |

## Configuring the Flow Exporters

The following steps are used to configure the NetFlow exporter.

**Note**

The optional export-protocol flow exporter configuration command specifies the NetFlow export protocol used by the exporter. The switch supports only netflow-v9. Though visible in the CLI help, netflow-5 is not supported.

**SUMMARY STEPS**

1. **configure terminal**
2. **flow exporter** exporter-name
3. **description** description
4. **destination** {hostname | ip-address} **vrf** vrf-name
5. **dscp** <0-63>
6. **source** interface-id
7. **option** {exporter-stats | interface-table | sampler-table} **timeout** seconds]
8. **export-protocolnetflow-v9**
9. **template data timeout** seconds
10. **transport udp** udp-port
11. **tfl** seconds
12. **end**

**DETAILED STEPS**

**Configuring a Customized Flow Monitor**

The following steps are used to configure a NetFlow monitor.

**SUMMARY STEPS**

1. **configure terminal**
2. **flow monitor** monitor -name
3. **description** description
4. **record** {TestNetflowRecordName|TestRecord}
5. **cache** {timeout [active|inactive|update] (seconds) | type (normal)}
6. **cache** {timeout [active|inactive|update] (seconds) | type (normal)}
7. **exporter** TestNetFlowExporterName
8. **cache** {timeout [active|inactive|update] (seconds) | type (normal)}
9. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Applying a Flow Monitor to an Interface

The following are used to configure a NetFlow monitor to an interface.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** interface-id
3. **wlan ssid**
4. [ ip | ipv6 | datalink] **flow monitor** monitor -name **sampler** [sampler | input | output]
5. **exit**
6. Repeat steps 2 and 3
7. **end**

## Configuring and Enabling Flow Sampling

The following steps are used to configure and enable flow sampling.

### SUMMARY STEPS

1. **configure terminal**
2. **sampler sampler -name**
3. **description description**
4. **mode {deterministic|random} (<1-1> )out-of <2-1024>**
5. **end**
6. **interface interface-id**
7. **wlan ssid**
8. **{ip | ipv6 | datalink} flow monitor monitor-name sampler sampler-name {input | output}**
9. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                    | Purpose                                                                                                                                     |
|---------------|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                | Enters global configuration mode.                                                                                                           |
| <b>Step 2</b> | <b>sampler sampler -name</b><br><br><b>Example:</b><br>Switch(config)# <b>sampler SampleNameForSAMPLER</b>           | Creates a flow monitor and enters Flexible NetFlow sampler configuration mode. You can also use this command to modify an existing sampler. |
| <b>Step 3</b> | <b>description description</b><br><br><b>Example:</b><br>Switch(config-sampler)# <b>description</b><br>SamplerName_1 | (Optional) Configures a description for the sampler.                                                                                        |
| <b>Step 4</b> | <b>mode {deterministic random} (&lt;1-1&gt; )out-of &lt;2-1024&gt;</b>                                               | Specifies the mode and window size from which to select packets. The window size range is from 2 to 1024.                                   |

|               | Command or Action                                                                                                                                                                                | Purpose                                                                                                             |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Switch(config-sampler)#mode random 1 out-of 2                                                                                                                                 | <b>Note</b> Although visible in the CLI help, the mode deterministic keyword is not supported.                      |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-sampler)# end                                                                                                                                 | Returns to global configuration mode.                                                                               |
| <b>Step 6</b> | <b>interface interface-id</b><br><br><b>Example:</b><br>Switch(config)# interface tengigabitethernet 1/0/1                                                                                       | Identifies an interface and enters interface configuration mode.                                                    |
| <b>Step 7</b> | <b>wlan ssid</b><br><br><b>Example:</b><br>Switch(config)# wlan test 1 test                                                                                                                      | Configures to apply flow sampler on WLAN.                                                                           |
| <b>Step 8</b> | <b>{ip   ipv6   datalink} flow monitor monitor-name sampler sampler-name {input   output}</b><br><br><b>Example:</b><br>Switch(config-if)# ip flow monitor FLOW-MONITOR-1 sampler SAMPLE-1 input | Activates a previously created IPv4 or IPv6 flow monitor by assigning it to the interface to analyze traffic.       |
| <b>Step 9</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# end                                                                                                                                         | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

```
Switch(config)# sampler SAMPLER-1
Switch(config-sampler)# description Sample at 50
Switch(config-sampler)# mode random 1 out-of 2
Switch(config-sampler)# exit
Switch(config)# interface tengigabitethernet 1/0/1
Switch(config)# wlan test 1 test
Switch(config-if)# ip flow monitor FLOW-MONITOR-1 sampler SAMPLE-1 input
```

## Verifying IPv6 Netflow

This section describes the Netflow related **show** commands for IPv6. The following commands can be used to verify Netflow on the switch.

| Command                                                                       | Purpose                                                            |
|-------------------------------------------------------------------------------|--------------------------------------------------------------------|
| <b>show flow record</b>                                                       | Displays the status of the flow records.                           |
| <b>show flow ssid</b> <ssid_name>                                             | Displays SSID interface information.                               |
| <b>show flow monitor</b> {monitor name}<br>{cache provisioning statistics}    | Displays the flow monitor information.                             |
| <b>show flow exporter exporter-name</b>                                       | Displays the status of a flow exporter.                            |
| <b>show flow monitor monitor -name</b>                                        | Displays the current status of a flow monitor.                     |
| <b>show flow interface interface-id</b>                                       | Verifies that the Flexible NetFlow is configured on the interface. |
| <b>show flow monitor monitor -name cache format</b><br>[csv   record   table] | Displays data in the flow monitor cache.                           |
| <b>show sampler sampler -name</b>                                             | Displays the current status of a flow sampler.                     |

## Monitoring IPv6 Netflow

This section describes the Netflow commands for IPv6. The following commands can be used to monitor Netflow on the switch.

| Command                                                | Purpose                                  |
|--------------------------------------------------------|------------------------------------------|
| <b>show running-config flow record</b>                 | Displays the configured flow records.    |
| <b>show running-config flow exporter</b> exporter-name | Verifies the configured flow exporter.   |
| <b>show running-config flow monitor</b> monitor -name  | Verifies the flow monitor configuration. |

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Restrictions for STP

- An attempt to configure a switch as the root switch fails if the value necessary to be the root switch is less than 1.
- If your network consists of switches that support and do not support the extended system ID, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches running older software.
- The root switch for each spanning-tree instance should be a backbone or distribution switch. Do not configure an access switch as the spanning-tree primary root.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

## Information About Spanning Tree Protocol

### Spanning Tree Protocol

Spanning Tree Protocol (STP) is a Layer 2 link management protocol that provides path redundancy while preventing loops in the network. For a Layer 2 Ethernet network to function properly, only one active path can exist between any two stations. Multiple active paths among end stations cause loops in the network. If a loop exists in the network, end stations might receive duplicate messages. Switches might also learn end-station MAC addresses on multiple Layer 2 interfaces. These conditions result in an unstable network. Spanning-tree operation is transparent to end stations, which cannot detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.

The STP uses a spanning-tree algorithm to select one switch of a redundantly connected network as the root of the spanning tree. The algorithm calculates the best loop-free path through a switched Layer 2 network by assigning a role to each port based on the role of the port in the active topology:

- Root—A forwarding port elected for the spanning-tree topology
- Designated—A forwarding port elected for every switched LAN segment
- Alternate—A blocked port providing an alternate path to the root bridge in the spanning tree
- Backup—A blocked port in a loopback configuration

The switch that has *all* of its ports as the designated role or as the backup role is the root switch. The switch that has at least *one* of its ports in the designated role is called the designated switch.

Spanning tree forces redundant data paths into a standby (blocked) state. If a network segment in the spanning tree fails and a redundant path exists, the spanning-tree algorithm recalculates the spanning-tree topology and activates the standby path. Switches send and receive spanning-tree frames, called bridge protocol data units (BPDUs), at regular intervals. The switches do not forward these frames but use them to construct a loop-free path. BPDUs contain information about the sending switch and its ports, including switch and MAC addresses, switch priority, port priority, and path cost. Spanning tree uses this information to elect the root switch and root port for the switched network and the root port and designated port for each switched segment.

When two ports on a switch are part of a loop, the spanning-tree and path cost settings control which port is put in the forwarding state and which is put in the blocking state. The spanning-tree port priority value represents the location of a port in the network topology and how well it is located to pass traffic. The path cost value represents the media speed.

**Note**

By default, the switch sends keepalive messages (to ensure the connection is up) only on interfaces that do not have small form-factor pluggable (SFP) modules. You can change the default for an interface by entering the **[no] keepalive** interface configuration command with no keywords.

## Spanning-Tree Topology and BPDUs

The stable, active spanning-tree topology of a switched network is controlled by these elements:

- The unique bridge ID (switch priority and MAC address) associated with each VLAN on each switch. In a switch stack, all switches use the same bridge ID for a given spanning-tree instance.
- The spanning-tree path cost to the root switch.
- The port identifier (port priority and MAC address) associated with each Layer 2 interface.

When the switches in a network are powered up, each functions as the root switch. Each switch sends a configuration BPDU through all of its ports. The BPDUs communicate and compute the spanning-tree topology. Each configuration BPDU contains this information:

- The unique bridge ID of the switch that the sending switch identifies as the root switch
- The spanning-tree path cost to the root
- The bridge ID of the sending switch
- Message age
- The identifier of the sending interface
- Values for the hello, forward delay, and max-age protocol timers

When a switch receives a configuration BPDU that contains *superior* information (lower bridge ID, lower path cost, and so forth), it stores the information for that port. If this BPDU is received on the root port of the switch, the switch also forwards it with an updated message to all attached LANs for which it is the designated switch.

If a switch receives a configuration BPDU that contains *inferior* information to that currently stored for that port, it discards the BPDU. If the switch is a designated switch for the LAN from which the inferior BPDU was received, it sends that LAN a BPDU containing the up-to-date information stored for that port. In this way, inferior information is discarded, and superior information is propagated on the network.

A BPDU exchange results in these actions:

- One switch in the network is elected as the root switch (the logical center of the spanning-tree topology in a switched network). See the figure following the bullets.

For each VLAN, the switch with the highest switch priority (the lowest numerical priority value) is elected as the root switch. If all switches are configured with the default priority (32768), the switch with the lowest MAC address in the VLAN becomes the root switch. The switch priority value occupies the most significant bits of the bridge ID, as shown in the following figure.

- A root port is selected for each switch (except the root switch). This port provides the best path (lowest cost) when the switch forwards packets to the root switch.

When selecting the root port on a switch stack, spanning tree follows this sequence:

- Selects the lowest root bridge ID
- Selects the lowest path cost to the root switch
- Selects the lowest designated bridge ID
- Selects the lowest designated path cost

- Selects the lowest port ID
- Only one outgoing port on the stack root switch is selected as the root port. The remaining switches in the stack become its designated switches (Switch 2 and Switch 3) as shown in the following figure.
- The shortest distance to the root switch is calculated for each switch based on the path cost.
- A designated switch for each LAN segment is selected. The designated switch incurs the lowest path cost when forwarding packets from that LAN to the root switch. The port through which the designated switch is attached to the LAN is called the designated port.

One stack member is elected as the stack root switch. The stack root switch contains the outgoing root port (Switch 1).

**Figure 21: Spanning-Tree Port States in a Switch Stack**

All paths that are not needed to reach the root switch from anywhere in the switched network are placed in the spanning-tree blocking mode.

[Restrictions for STP, on page 521](#)

**Bridge ID, Device Priority, and Extended System ID**

The IEEE 802.1D standard requires that each switch has an unique bridge identifier (bridge ID), which controls the selection of the root switch. Because each VLAN is considered as a different *logical bridge* with PVST+

and Rapid PVST+, the same switch must have a different bridge ID for each configured VLAN. Each VLAN on the switch has a unique 8-byte bridge ID. The 2 most-significant bytes are used for the switch priority, and the remaining 6 bytes are derived from the switch MAC address.

The switch supports the IEEE 802.1t spanning-tree extensions, and some of the bits previously used for the switch priority are now used as the VLAN identifier. The result is that fewer MAC addresses are reserved for the switch, and a larger range of VLAN IDs can be supported, all while maintaining the uniqueness of the bridge ID.

The 2 bytes previously used for the switch priority are reallocated into a 4-bit priority value and a 12-bit extended system ID value equal to the VLAN ID.

**Table 50: Device Priority Value and Extended System ID**

| Priority Value |        |        |        | Extended System ID (Set Equal to the VLAN ID) |        |        |       |       |       |       |       |       |       |       |       |
|----------------|--------|--------|--------|-----------------------------------------------|--------|--------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit 16         | Bit 15 | Bit 14 | Bit 13 | Bit 12                                        | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 |
| 32768          | 16384  | 8192   | 4096   | 2048                                          | 1024   | 512    | 256   | 128   | 64    | 32    | 16    | 8     | 4     | 2     | 1     |

Spanning tree uses the extended system ID, the switch priority, and the allocated spanning-tree MAC address to make the bridge ID unique for each VLAN. Because the switch stack appears as a single switch to the rest of the network, all switches in the stack use the same bridge ID for a given spanning tree. If the stack master fails, the stack members recalculate their bridge IDs of all running spanning trees based on the new MAC address of the new stack master.

Support for the extended system ID affects how you manually configure the root switch, the secondary root switch, and the switch priority of a VLAN. For example, when you change the switch priority value, you change the probability that the switch will be elected as the root switch. Configuring a higher value decreases the probability; a lower value increases the probability.

If any root switch for the specified VLAN has a switch priority lower than 24576, the switch sets its own priority for the specified VLAN to 4096 less than the lowest switch priority. 4096 is the value of the least-significant bit of a 4-bit switch priority value as shown in the table.

### Port Priority Versus Path Cost

If a loop occurs, spanning tree uses port priority when selecting an interface to put into the forwarding state. You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

The spanning-tree path cost default value is derived from the media speed of an interface. If a loop occurs, spanning tree uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

If your switch is a member of a switch stack, you must assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last instead of adjusting its port priority. For details, see [Related Topics](#).

## Spanning-Tree Interface States

Propagation delays can occur when protocol information passes through a switched LAN. As a result, topology changes can take place at different times and at different places in a switched network. When an interface transitions directly from nonparticipation in the spanning-tree topology to the forwarding state, it can create temporary data loops. Interfaces must wait for new topology information to propagate through the switched LAN before starting to forward frames. They must allow the frame lifetime to expire for forwarded frames that have used the old topology.

Each Layer 2 interface on a switch using spanning tree exists in one of these states:

- Blocking—The interface does not participate in frame forwarding.
- Listening—The first transitional state after the blocking state when the spanning tree decides that the interface should participate in frame forwarding.
- Learning—The interface prepares to participate in frame forwarding.
- Forwarding—The interface forwards frames.
- Disabled—The interface is not participating in spanning tree because of a shutdown port, no link on the port, or no spanning-tree instance running on the port.

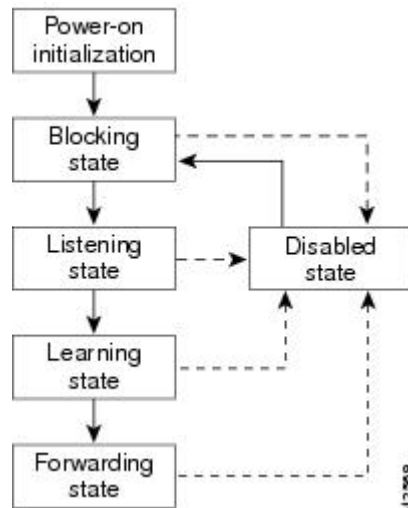

An interface moves through these states:

- From initialization to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled

An interface moves through the states.

**Figure 22: Spanning-Tree Interface States**

When you power up the switch, spanning tree is enabled by default, and every interface in the switch, VLAN, or network goes through the blocking state and the transitory states of listening and learning. Spanning tree stabilizes each interface at the forwarding or blocking state.

When the spanning-tree algorithm places a Layer 2 interface in the forwarding state, this process occurs:

- 1 The interface is in the listening state while spanning tree waits for protocol information to move the interface to the blocking state.
- 2 While spanning tree waits for the forward-delay timer to expire, it moves the interface to the learning state and resets the forward-delay timer.
- 3 In the learning state, the interface continues to block frame forwarding as the switch learns end-station location information for the forwarding database.
- 4 When the forward-delay timer expires, spanning tree moves the interface to the forwarding state, where both learning and frame forwarding are enabled.

### Blocking State

A Layer 2 interface in the blocking state does not participate in frame forwarding. After initialization, a BPDU is sent to each switch interface. A switch initially functions as the root until it exchanges BPDUs with other switches. This exchange establishes which switch in the network is the root or root switch. If there is only one switch in the network, no exchange occurs, the forward-delay timer expires, and the interface moves to the listening state. An interface always enters the blocking state after switch initialization.

An interface in the blocking state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Receives BPDUs

### *Listening State*

The listening state is the first state a Layer 2 interface enters after the blocking state. The interface enters this state when the spanning tree decides that the interface should participate in frame forwarding.

An interface in the listening state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Receives BPDUs

### *Learning State*

A Layer 2 interface in the learning state prepares to participate in frame forwarding. The interface enters the learning state from the listening state.

An interface in the learning state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Learns addresses
- Receives BPDUs

### *Forwarding State*

A Layer 2 interface in the forwarding state forwards frames. The interface enters the forwarding state from the learning state.

An interface in the forwarding state performs these functions:

- Receives and forwards frames received on the interface
- Forwards frames switched from another interface
- Learns addresses
- Receives BPDUs

### *Disabled State*

A Layer 2 interface in the disabled state does not participate in frame forwarding or in the spanning tree. An interface in the disabled state is nonoperational.

A disabled interface performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Does not receive BPDUs

## How a Switch or Port Becomes the Root Switch or Root Port

If all switches in a network are enabled with default spanning-tree settings, the switch with the lowest MAC address becomes the root switch.

Switch A is elected as the root switch because the switch priority of all the switches is set to the default (32768) and Switch A has the lowest MAC address. However, because of traffic patterns, number of forwarding interfaces, or link types, Switch A might not be the ideal root switch. By increasing the priority (lowering the numerical value) of the ideal switch so that it becomes the root switch, you force a spanning-tree recalculation to form a new topology with the ideal switch as the root.

**Figure 23: Spanning-Tree Topology**

RP = Root Port  
DP = Designated Port

When the spanning-tree topology is calculated based on default parameters, the path between source and destination end stations in a switched network might not be ideal. For instance, connecting higher-speed links to an interface that has a higher number than the root port can cause a root-port change. The goal is to make the fastest link the root port.

For example, assume that one port on Switch B is a Gigabit Ethernet link and that another port on Switch B (a 10/100 link) is the root port. Network traffic might be more efficient over the Gigabit Ethernet link. By changing the spanning-tree port priority on the Gigabit Ethernet port to a higher priority (lower numerical value) than the root port, the Gigabit Ethernet port becomes the new root port.

### Related Topics

## Spanning Tree and Redundant Connectivity

You can create a redundant backbone with spanning tree by connecting two switch interfaces to another device or to two different devices. Spanning tree automatically disables one interface but enables it if the other one fails. If one link is high-speed and the other is low-speed, the low-speed link is always disabled. If the speeds

are the same, the port priority and port ID are added together, and spanning tree disables the link with the lowest value.

**Figure 24: Spanning Tree and Redundant Connectivity**

You can also create redundant links between switches by using EtherChannel groups.

### Spanning-Tree Address Management

IEEE 802.1D specifies 17 multicast addresses, ranging from 0x00180C2000000 to 0x0180C2000010, to be used by different bridge protocols. These addresses are static addresses that cannot be removed.

Regardless of the spanning-tree state, each switch in the stack receives but does not forward packets destined for addresses between 0x0180C2000000 and 0x0180C200000F.

If spanning tree is enabled, the CPU on the switch or on each switch in the stack receives packets destined for 0x0180C2000000 and 0x0180C2000010. If spanning tree is disabled, the switch or each switch in the stack forwards those packets as unknown multicast addresses.

### Accelerated Aging to Retain Connectivity

The default for aging dynamic addresses is 5 minutes, the default setting of the **mac address-table aging-time** global configuration command. However, a spanning-tree reconfiguration can cause many station locations to change. Because these stations could be unreachable for 5 minutes or more during a reconfiguration, the address-aging time is accelerated so that station addresses can be dropped from the address table and then relearned. The accelerated aging is the same as the forward-delay parameter value (**spanning-tree vlan *vlan-id* forward-time *seconds*** global configuration command) when the spanning tree reconfigures.

Because each VLAN is a separate spanning-tree instance, the switch accelerates aging on a per-VLAN basis. A spanning-tree reconfiguration on one VLAN can cause the dynamic addresses learned on that VLAN to be subject to accelerated aging. Dynamic addresses on other VLANs can be unaffected and remain subject to the aging interval entered for the switch.

## Spanning-Tree Modes and Protocols

The switch supports these spanning-tree modes and protocols:

- **PVST+**—This spanning-tree mode is based on the IEEE 802.1D standard and Cisco proprietary extensions. It is the default spanning-tree mode used on all Ethernet port-based VLANs. The PVST+ runs on each VLAN on the switch up to the maximum supported, ensuring that each has a loop-free path through the network.

The PVST+ provides Layer 2 load-balancing for the VLAN on which it runs. You can create different logical topologies by using the VLANs on your network to ensure that all of your links are used but that no one link is oversubscribed. Each instance of PVST+ on a VLAN has a single root switch. This root switch propagates the spanning-tree information associated with that VLAN to all other switches in the network. Because each switch has the same information about the network, this process ensures that the network topology is maintained.

- **Rapid PVST+**—This spanning-tree mode is the same as PVST+ except that it uses a rapid convergence based on the IEEE 802.1w standard. To provide rapid convergence, the Rapid PVST+ immediately deletes dynamically learned MAC address entries on a per-port basis upon receiving a topology change. By contrast, PVST+ uses a short aging time for dynamically learned MAC address entries.

Rapid PVST+ uses the same configuration as PVST+ (except where noted), and the switch needs only minimal extra configuration. The benefit of Rapid PVST+ is that you can migrate a large PVST+ install base to Rapid PVST+ without having to learn the complexities of the Multiple Spanning Tree Protocol (MSTP) configuration and without having to reprovision your network. In Rapid PVST+ mode, each VLAN runs its own spanning-tree instance up to the maximum supported.

- **MSTP**—This spanning-tree mode is based on the IEEE 802.1s standard. You can map multiple VLANs to the same spanning-tree instance, which reduces the number of spanning-tree instances required to support a large number of VLANs. The MSTP runs on top of the RSTP (based on IEEE 802.1w), which provides for rapid convergence of the spanning tree by eliminating the forward delay and by quickly transitioning root ports and designated ports to the forwarding state. In a switch stack, the cross-stack rapid transition (CSRT) feature performs the same function as RSTP. You cannot run MSTP without RSTP or CSRT.

## Supported Spanning-Tree Instances

In PVST+ or Rapid PVST+ mode, the switch or switch stack supports up to 128 spanning-tree instances.

In MSTP mode, the switch or switch stack supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.

## Spanning-Tree Interoperability and Backward Compatibility

In a mixed MSTP and PVST+ network, the common spanning-tree (CST) root must be inside the MST backbone, and a PVST+ switch cannot connect to multiple MST regions.

When a network contains switches running Rapid PVST+ and switches running PVST+, we recommend that the Rapid PVST+ switches and PVST+ switches be configured for different spanning-tree instances. In the Rapid PVST+ spanning-tree instances, the root switch must be a Rapid PVST+ switch. In the PVST+ instances, the root switch must be a PVST+ switch. The PVST+ switches should be at the edge of the network.

All stack members run the same version of spanning tree (all PVST+, all Rapid PVST+, or all MSTP).

**Table 51: PVST+, MSTP, and Rapid-PVST+ Interoperability and Compatibility**

|             | PVST+                   | MSTP                    | Rapid PVST+            |
|-------------|-------------------------|-------------------------|------------------------|
| PVST+       | Yes                     | Yes (with restrictions) | Yes (reverts to PVST+) |
| MSTP        | Yes (with restrictions) | Yes                     | Yes (reverts to PVST+) |
| Rapid PVST+ | Yes (reverts to PVST+)  | Yes (reverts to PVST+)  | Yes                    |

## STP and IEEE 802.1Q Trunks

The IEEE 802.1Q standard for VLAN trunks imposes some limitations on the spanning-tree strategy for a network. The standard requires only one spanning-tree instance for *all* VLANs allowed on the trunks. However, in a network of Cisco switches connected through IEEE 802.1Q trunks, the switches maintain one spanning-tree instance for *each* VLAN allowed on the trunks.

When you connect a Cisco switch to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco switch uses PVST+ to provide spanning-tree interoperability. If Rapid PVST+ is enabled, the switch uses it instead of PVST+. The switch combines the spanning-tree instance of the IEEE 802.1Q VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q switch.

However, all PVST+ or Rapid PVST+ information is maintained by Cisco switches separated by a cloud of non-Cisco IEEE 802.1Q switches. The non-Cisco IEEE 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.

PVST+ is automatically enabled on IEEE 802.1Q trunks, and no user configuration is required. The external spanning-tree behavior on access ports and Inter-Switch Link (ISL) trunk ports is not affected by PVST+.

## VLAN-Bridge Spanning Tree

Cisco VLAN-bridge spanning tree is used with the fallback bridging feature (bridge groups), which forwards non-IP protocols such as DECnet between two or more VLAN bridge domains or routed ports. The VLAN-bridge spanning tree allows the bridge groups to form a spanning tree on top of the individual VLAN

spanning trees to prevent loops from forming if there are multiple connections among VLANs. It also prevents the individual spanning trees from the VLANs being bridged from collapsing into a single spanning tree.

To support VLAN-bridge spanning tree, some of the spanning-tree timers are increased. To use the fallback bridging feature, you must have the IP services feature set enabled on your switch.

## Spanning Tree and Switch Stacks

When the switch stack is operating in PVST+ or Rapid PVST+ mode:

- A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID for a given spanning tree. The bridge ID is derived from the MAC address of the active switch.
- When a new switch joins the stack, it sets its bridge ID to the active switch bridge ID. If the newly added switch has the lowest ID and if the root path cost is the same among all stack members, the newly added switch becomes the stack root.
- When a stack member leaves the stack, spanning-tree reconvergence occurs within the stack (and possibly outside the stack). The remaining stack member with the lowest stack port ID becomes the stack root.
- If a neighboring switch external to the switch stack fails or is powered down, normal spanning-tree processing occurs. Spanning-tree reconvergence might occur as a result of losing a switch in the active topology.
- If a new switch external to the switch stack is added to the network, normal spanning-tree processing occurs. Spanning-tree reconvergence might occur as a result of adding a switch in the network.

## Default Spanning-Tree Configuration

**Table 52: Default Spanning-Tree Configuration**

| Feature                                                             | Default Setting                              |
|---------------------------------------------------------------------|----------------------------------------------|
| Enable state                                                        | Enabled on VLAN 1.                           |
| Spanning-tree mode                                                  | PVST+. (Rapid PVST+ and MSTP are disabled.)  |

## How to Configure Spanning-Tree Features

### Changing the Spanning-Tree Mode (CLI)

The switch supports three spanning-tree modes: per-VLAN spanning tree plus (PVST+), Rapid PVST+, or multiple spanning tree protocol (MSTP). By default, the switch runs the PVST+ protocol.

If you want to enable a mode that is different from the default mode, this procedure is required.

Beginning in privileged EXEC mode, follow these steps to change the spanning-tree mode:

#### SUMMARY STEPS

1. **configure terminal**
2. **spanning-tree mode {pvst | mst | rapid-pvst}**
3. **interface *interface-id***
4. **spanning-tree link-type point-to-point**
5. **end**
6. **clear spanning-tree detected-protocols**

## DETAILED STEPS

|        | Command or Action                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                |
|--------|------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                    | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                  |
| Step 2 | <b>spanning-tree mode {pvst   mst   rapid-pvst}</b><br><br><b>Example:</b><br>Switch(config)# <b>spanning-tree mode pvst</b>             | Configures a spanning-tree mode. All stack members run the same version of spanning tree. <ul style="list-style-type: none"> <li>• Select <b>pvst</b> to enable PVST+ (the default setting).</li> <li>• Select <b>mst</b> to enable MSTP (and RSTP).</li> <li>• Select <b>rapid-pvst</b> to enable rapid PVST+.</li> </ul>                             |
| Step 3 | <b>interface interface-id</b><br><br><b>Example:</b><br>Switch(config)# <b>interface GigabitEthernet1/0/1</b>                            | (Recommended for Rapid PVST+ mode only) Specifies an interface to configure, and enters interface configuration mode. Valid interfaces include physical ports, VLANs, and port channels. The VLAN ID range is 1 to 4094. The port-channel range is 1 to 48.                                                                                            |
| Step 4 | <b>spanning-tree link-type point-to-point</b><br><br><b>Example:</b><br>Switch(config-if)# <b>spanning-tree link-type point-to-point</b> | (Recommended for Rapid PVST+ mode only) Specifies that the link type for this port is point-to-point.<br><br>If you connect this port (local port) to a remote port through a point-to-point link and the local port becomes a designated port, the switch negotiates with the remote port and rapidly changes the local port to the forwarding state. |
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                       |
| Step 6 | <b>clear spanning-tree detected-protocols</b><br><br><b>Example:</b><br>Switch# <b>clear spanning-tree detected-protocols</b>            | (Recommended for Rapid PVST+ mode only) If any port on the switch is connected to a port on a legacy IEEE 802.1D switch, this command restarts the protocol migration process on the entire switch.<br><br>This step is optional if the designated switch detects that this switch is running rapid PVST+.                                             |

## Disabling Spanning Tree (CLI)

Spanning tree is enabled by default on VLAN 1 and on all newly created VLANs up to the spanning-tree limit. Disable spanning tree only if you are sure there are no loops in the network topology.

### Caution

When spanning tree is disabled and loops are present in the topology, excessive traffic and indefinite packet duplication can drastically reduce network performance.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to disable a spanning tree:

### SUMMARY STEPS

1. **configure terminal**
2. **no spanning-tree vlan *vlan-id***
3. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                      | Purpose                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                  | Enters the global configuration mode.        |
| <b>Step 2</b> | <b>no spanning-tree vlan <i>vlan-id</i></b><br><br><b>Example:</b><br>Switch(config)# <b>no spanning-tree vlan 300</b> | For <i>vlan-id</i> , the range is 1 to 4094. |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                        | Returns to privileged EXEC mode.             |

## Configuring the Root Switch (CLI)

To configure a switch as the root for the specified VLAN, use the **spanning-tree vlan *vlan-id* root** global configuration command to modify the switch priority from the default value (32768) to a significantly lower value. When you enter this command, the software checks the switch priority of the root switches for each VLAN. Because of the extended system ID support, the switch sets its own priority for the specified VLAN to 24576 if this value will cause this switch to become the root for the specified VLAN.

Use the **diameter** keyword to specify the Layer 2 network diameter (that is, the maximum number of switch hops between any two end stations in the Layer 2 network). When you specify the network diameter, the switch automatically sets an optimal hello time, forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the **hello** keyword to override the automatically calculated hello time.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to configure a switch to become the root for the specified VLAN:

### SUMMARY STEPS

1. **configure terminal**
2. **spanning-tree vlan *vlan-id* root primary [diameter *net-diameter*]**
3. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Step 2 | <b>spanning-tree vlan <i>vlan-id</i> root primary [diameter <i>net-diameter</i>]</b><br><br><b>Example:</b><br>Switch(config)# <b>spanning-tree vlan 20-24 root primary diameter 4</b> | Configures a switch to become the root for the specified VLAN. <ul style="list-style-type: none"> <li>• For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>• (Optional) For <b>diameter <i>net-diameter</i></b>, specify the maximum number of switches between any two end stations. The range is 2 to 7.</li> </ul> |
| Step 3 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### What to Do Next

After configuring the switch as the root switch, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time through the **spanning-tree vlan *vlan-id* hello-time**, **spanning-tree vlan *vlan-id* forward-time**, and the **spanning-tree vlan *vlan-id* max-age** global configuration commands.

## Configuring a Secondary Root Device (CLI)

When you configure a switch as the secondary root, the switch priority is modified from the default value (32768) to 28672. With this priority, the switch is likely to become the root switch for the specified VLAN if the primary root switch fails. This is assuming that the other network switches use the default switch priority of 32768, and therefore, are unlikely to become the root switch.

You can execute this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello-time values that you used when you configured the primary root switch with the **spanning-tree vlan *vlan-id* root primary** global configuration command.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to configure a switch to become a secondary root for the specified VLAN:

### SUMMARY STEPS

1. **configure terminal**
2. **spanning-tree vlan *vlan-id* root secondary [*diameter net-diameter*]**
3. **end**

### DETAILED STEPS

|        | Command or Action                                                                      | Purpose                                                                  |
|--------|----------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>  | Enters the global configuration mode.                                    |
| Step 2 | <b>spanning-tree vlan <i>vlan-id</i> root secondary [<i>diameter net-diameter</i>]</b> | Configures a switch to become the secondary root for the specified VLAN. |

|               | Command or Action                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The range is 2 to 7.</li> </ul> <p>Use the same network diameter value that you used when configuring the primary root switch.</p> |
| <b>Step 3</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                              | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configuring Port Priority (CLI)

### Note

If your switch is a member of a switch stack, you must use the **spanning-tree [vlan *vlan-id*] cost *cost*** interface configuration command instead of the **spanning-tree [vlan *vlan-id*] port-priority *priority*** interface configuration command to select an interface to put in the forwarding state. Assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to configure port priority:

### SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **spanning-tree port-priority *priority***
4. **spanning-tree vlan *vlan-id* port-priority *priority***
5. **end**

| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                  | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br>Switch(config)# <b>interface</b><br><b>gigabitethernet1/0/1</b>                                         | Specifies an interface to configure, and enters interface configuration mode. Valid interfaces include physical ports and port-channel logical interfaces ( <b>port-channel</b> <i>port-channel-number</i> ).                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 3 | <b>spanning-tree cost</b> <i>cost</i><br><br><b>Example:</b><br>Switch(config-if)# <b>spanning-tree</b><br><b>cost 250</b>                                             | Configures the cost for an interface.<br><br>If a loop occurs, spanning tree uses the path cost when selecting an interface to place into the forwarding state. A lower path cost represents higher-speed transmission.<br><br>For <i>cost</i> , the range is 1 to 200000000; the default value is derived from the media speed of the interface.                                                                                                                                                                                                                                             |
| Step 4 | <b>spanning-tree vlan</b> <i>vlan-id</i> <b>cost</b> <i>cost</i><br><br><b>Example:</b><br>Switch(config-if)# <b>spanning-tree</b><br><b>vlan 10,12-15,20 cost 300</b> | Configures the cost for a VLAN.<br><br>If a loop occurs, spanning tree uses the path cost when selecting an interface to place into the forwarding state. A lower path cost represents higher-speed transmission. <ul style="list-style-type: none"> <li>• For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>• For <i>cost</i>, the range is 1 to 200000000; the default value is derived from the media speed of the interface.</li> </ul> |
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

The **show spanning-tree interface** *interface-id* privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the **show running-config** privileged EXEC command to confirm the configuration.

## Configuring the Device Priority of a VLAN (CLI)

You can configure the switch priority and make it more likely that a standalone switch or a switch in the stack will be chosen as the root switch.

### Note

Exercise care when using this command. For most situations, we recommend that you use the **spanning-tree vlan** *vlan-id* **root primary** and the **spanning-tree vlan** *vlan-id* **root secondary** global configuration commands to modify the switch priority.

This procedure is optional. Beginning in privileged EXEC mode, follow these steps to configure the switch priority of a VLAN:

### SUMMARY STEPS

1. **configure terminal**
2. **spanning-tree vlan** *vlan-id* **priority** *priority*
3. **end**

### DETAILED STEPS

The forwarding delay is the number of seconds an interface waits before changing from its spanning-tree learning and listening states to the forwarding state. <ul style="list-style-type: none"> <li>• For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>• For <i>seconds</i>, the range is 4 to 30; the default is 15.</li> </ul> |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Configuring the Maximum-Aging Time for a VLAN (CLI)

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to configure the maximum-aging time for a VLAN:

## SUMMARY STEPS

1. **configure terminal**
2. **spanning-tree vlan *vlan-id* max-age *seconds***
3. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                             | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 2 | <b>spanning-tree vlan <i>vlan-id</i> max-age <i>seconds</i></b><br><br><b>Example:</b><br>Switch(config)# <b>spanning-tree vlan 20 max-age 30</b> | Configures the maximum-aging time of a VLAN. The maximum-aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration. <ul style="list-style-type: none"> <li>• For <i>vlan-id</i>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>• For <i>seconds</i>, the range is 6 to 40; the default is 20.</li> </ul> |
| Step 3 | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Configuring the Transmit Hold-Count (CLI)

You can configure the BPDU burst size by changing the transmit hold count value.

### Note

Changing this parameter to a higher value can have a significant impact on CPU utilization, especially in Rapid PVST+ mode. Lowering this value can slow down convergence in certain scenarios. We recommend that you maintain the default setting.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to configure transmit hold-count:

## SUMMARY STEPS

1. `configure terminal`
2. `spanning-tree transmit hold-count value`
3. `end`

## DETAILED STEPS

|        | Command or Action                                                                                                                                | Purpose                                                                                                                                    |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <code>configure terminal</code>                                                      | Enters the global configuration mode.                                                                                                      |
| Step 2 | <b>spanning-tree transmit hold-count <i>value</i></b><br><br><b>Example:</b><br>Switch(config)# <code>spanning-tree transmit hold-count 6</code> | Configures the number of BPDUs that can be sent before pausing for 1 second.<br>For <i>value</i> , the range is 1 to 20; the default is 6. |
| Step 3 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <code>end</code>                                                                            | Returns to privileged EXEC mode.                                                                                                           |

## Monitoring Spanning-Tree Status

Table 53: Commands for Displaying Spanning-Tree Status

|                                                                        |                                                                          |
|------------------------------------------------------------------------|--------------------------------------------------------------------------|
| <code>show spanning-tree active</code>                                 | Displays spanning-tree information on active interfaces only.            |
| <code>show spanning-tree detail</code>                                 | Displays a detailed summary of interface information.                    |
| <code>show spanning-tree vlan <i>vlan-id</i></code>                    | Displays spanning-tree information for the specified VLAN.               |
| <code>show spanning-tree interface <i>interface-id</i></code>          | Displays spanning-tree information for the specified interface.          |
| <code>show spanning-tree interface <i>interface-id</i> portfast</code> | Displays spanning-tree portfast information for the specified interface. |

|                                            |                                                                                              |
|--------------------------------------------|----------------------------------------------------------------------------------------------|
| <b>show spanning-tree summary [totals]</b> | Displays a summary of interface states or displays the total lines of the STP state section. |
|--------------------------------------------|----------------------------------------------------------------------------------------------|

To clear spanning-tree counters, use the **clear spanning-tree [interface *interface-id*]** privileged EXEC command.

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Prerequisites for MSTP

- For two or more switches to be in the same multiple spanning tree (MST) region, they must have the same VLAN-to-instance map, the same configuration revision number, and the same name.
- For load-balancing across redundant paths in the network to work, all VLAN-to-instance mapping assignments must match; otherwise, all traffic flows on a single link. You can achieve load-balancing across a switch stack by manually configuring the path cost.
- For load-balancing between a per-VLAN spanning tree plus (PVST+) and an MST cloud or between a rapid-PVST+ and an MST cloud to work, all MST boundary ports must be forwarding. MST boundary ports are forwarding when the internal spanning tree (IST) master of the MST cloud is the root of the common spanning tree (CST). If the MST cloud consists of multiple MST regions, one of the MST

regions must contain the CST root, and all of the other MST regions must have a better path to the root contained within the MST cloud than a path through the PVST+ or rapid-PVST+ cloud. You might have to manually configure the switches in the clouds.

## Restrictions for MSTP

- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.
- The switch stack supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.
- PVST+, Rapid PVST+, and MSTP are supported, but only one version can be active at any time. (For example, all VLANs run PVST+, all VLANs run Rapid PVST+, or all VLANs run MSTP.)
- All stack members must run the same version of spanning tree (all PVST+, Rapid PVST+, or MSTP).
- VLAN Trunking Protocol (VTP) propagation of the MST configuration is not supported. However, you can manually configure the MST configuration (region name, revision number, and VLAN-to-instance mapping) on each switch within the MST region by using the command-line interface (CLI) or through the Simple Network Management Protocol (SNMP) support.
- Partitioning the network into a large number of regions is not recommended. However, if this situation is unavoidable, we recommend that you partition the switched LAN into smaller LANs interconnected by routers or non-Layer 2 devices.
- A region can have one member or multiple members with the same MST configuration; each member must be capable of processing rapid spanning tree protocol (RSTP) Bridge Protocol Data Units (BPDUs). There is no limit to the number of MST regions in a network, but each region can only support up to 65 spanning-tree instances. You can assign a VLAN to only one spanning-tree instance at a time.
- After configuring a switch as the root switch, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time through the **spanning-tree mst hello-time**, **spanning-tree mst forward-time**, and the **spanning-tree mst max-age** global configuration commands.

**Table 54: PVST+, MSTP, and Rapid PVST+ Interoperability and Compatibility**

|             | PVST+                   | MSTP                    | Rapid PVST+            |
|-------------|-------------------------|-------------------------|------------------------|
| PVST+       | Yes                     | Yes (with restrictions) | Yes (reverts to PVST+) |
| MSTP        | Yes (with restrictions) | Yes                     | Yes (reverts to PVST+) |
| Rapid PVST+ | Yes (reverts to PVST+)  | Yes (reverts to PVST+)  | Yes                    |

## Information About MSTP

### MSTP Configuration

MSTP, which uses RSTP for rapid convergence, enables multiple VLANs to be grouped into and mapped to the same spanning-tree instance, reducing the number of spanning-tree instances needed to support a large number of VLANs. The MSTP provides for multiple forwarding paths for data traffic, enables load balancing, and reduces the number of spanning-tree instances required to support a large number of VLANs. It improves the fault tolerance of the network because a failure in one instance (forwarding path) does not affect other instances (forwarding paths).

#### Note

The multiple spanning-tree (MST) implementation is based on the IEEE 802.1s standard.

The most common initial deployment of MSTP is in the backbone and distribution layers of a Layer 2 switched network. This deployment provides the highly available network required in a service-provider environment.

When the switch is in the MST mode, the RSTP, which is based on IEEE 802.1w, is automatically enabled. The RSTP provides rapid convergence of the spanning tree through explicit handshaking that eliminates the IEEE 802.1D forwarding delay and quickly transitions root ports and designated ports to the forwarding state.

Both MSTP and RSTP improve the spanning-tree operation and maintain backward compatibility with equipment that is based on the (original) IEEE 802.1D spanning tree, with existing Cisco-proprietary Multiple Instance STP (MISTP), and with existing Cisco PVST+ and rapid per-VLAN spanning-tree plus (Rapid PVST+).

A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same switch ID.

### MSTP Configuration Guidelines

- When you enable MST by using the **spanning-tree mode mst** global configuration command, RSTP is automatically enabled.
- For configuration guidelines about UplinkFast, BackboneFast, and cross-stack UplinkFast, see the relevant sections in the Related Topics section.
- When the switch is in MST mode, it uses the long path-cost calculation method (32 bits) to compute the path cost values. With the long path-cost calculation method, the following path cost values are supported:

| Speed    | Path Cost Value |
|----------|-----------------|
| 10 Mb/s  | 2,000,000       |
| 100 Mb/s | 200,000         |
| 1 Gb/s   | 20,000          |
| 10 Gb/s  | 2,000           |
| 100 Gb/s | 200             |

## Root Switch

The switch maintains a spanning-tree instance for the group of VLANs mapped to it. A switch ID, consisting of the switch priority and the switch MAC address, is associated with each instance. For a group of VLANs, the switch with the lowest switch ID becomes the root switch.

When you configure a switch as the root, you modify the switch priority from the default value (32768) to a significantly lower value so that the switch becomes the root switch for the specified spanning-tree instance. When you enter this command, the switch checks the switch priorities of the root switches. Because of the extended system ID support, the switch sets its own priority for the specified instance to 24576 if this value will cause this switches to become the root for the specified spanning-tree instance.

If any root switch for the specified instance has a switch priority lower than 24576, the switch sets its own priority to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value. For more information, select "Bridge ID, Switch Priority, and Extended System ID" link in Related Topics.

If your network consists of switches that support and do not support the extended system ID, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches running older software.

The root switch for each spanning-tree instance should be a backbone or distribution switch. Do not configure an access switch as the spanning-tree primary root.

Use the **diameter** keyword, which is available only for MST instance 0, to specify the Layer 2 network diameter (that is, the maximum number of switch hops between any two end stations in the Layer 2 network). When you specify the network diameter, the switch automatically sets an optimal hello time, forward-delay

time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the **hello** keyword to override the automatically calculated hello time.

## Multiple Spanning-Tree Regions

For switches to participate in multiple spanning-tree (MST) instances, you must consistently configure the switches with the same MST configuration information. A collection of interconnected switches that have the same MST configuration comprises an MST region.

The MST configuration controls to which MST region each switch belongs. The configuration includes the name of the region, the revision number, and the MST VLAN-to-instance assignment map. You configure the switch for a region by specifying the MST region configuration on it. You can map VLANs to an MST instance, specify the region name, and set the revision number. For instructions and an example, select the "Specifying the MST Region Configuration and Enabling MSTP" link in Related Topics.

A region can have one or multiple members with the same MST configuration. Each member must be capable of processing RSTP bridge protocol data units (BPDUs). There is no limit to the number of MST regions in a network, but each region can support up to 65 spanning-tree instances. Instances can be identified by any number in the range from 0 to 4094. You can assign a VLAN to only one spanning-tree instance at a time.

## IST, CIST, and CST

Unlike PVST+ and Rapid PVST+ in which all the spanning-tree instances are independent, the MSTP establishes and maintains two types of spanning trees:

- An internal spanning tree (IST), which is the spanning tree that runs in an MST region.

Within each MST region, the MSTP maintains multiple spanning-tree instances. Instance 0 is a special instance for a region, known as the internal spanning tree (IST). All other MST instances are numbered from 1 to 4094.

The IST is the only spanning-tree instance that sends and receives BPDUs. All of the other spanning-tree instance information is contained in M-records, which are encapsulated within MSTP BPDUs. Because the MSTP BPDU carries information for all instances, the number of BPDUs that need to be processed to support multiple spanning-tree instances is significantly reduced.

All MST instances within the same region share the same protocol timers, but each MST instance has its own topology parameters, such as root switch ID, root path cost, and so forth. By default, all VLANs are assigned to the IST.

An MST instance is local to the region; for example, MST instance 1 in region A is independent of MST instance 1 in region B, even if regions A and B are interconnected.

- A common and internal spanning tree (CIST), which is a collection of the ISTs in each MST region, and the common spanning tree (CST) that interconnects the MST regions and single spanning trees.

The spanning tree computed in a region appears as a subtree in the CST that encompasses the entire switched domain. The CIST is formed by the spanning-tree algorithm running among switches that support the IEEE 802.1w, IEEE 802.1s, and IEEE 802.1D standards. The CIST inside an MST region is the same as the CST outside a region.

### Operations Within an MST Region

The IST connects all the MSTP switches in a region. When the IST converges, the root of the IST becomes the CIST regional root (called the *IST master* before the implementation of the IEEE 802.1s standard). It is the switch within the region with the lowest switch ID and path cost to the CIST root. The CIST regional root is also the CIST root if there is only one region in the network. If the CIST root is outside the region, one of the MSTP switches at the boundary of the region is selected as the CIST regional root.

When an MSTP switch initializes, it sends BPDUs claiming itself as the root of the CIST and the CIST regional root, with both of the path costs to the CIST root and to the CIST regional root set to zero. The switch also initializes all of its MST instances and claims to be the root for all of them. If the switch receives superior MST root information (lower switch ID, lower path cost, and so forth) than currently stored for the port, it relinquishes its claim as the CIST regional root.

During initialization, a region might have many subregions, each with its own CIST regional root. As switches receive superior IST information, they leave their old subregions and join the new subregion that contains the true CIST regional root. All subregions shrink except for the one that contains the true CIST regional root.

For correct operation, all switches in the MST region must agree on the same CIST regional root. Therefore, any two switches in the region only synchronize their port roles for an MST instance if they converge to a common CIST regional root.

### Operations Between MST Regions

If there are multiple regions or legacy IEEE 802.1D switches within the network, MSTP establishes and maintains the CST, which includes all MST regions and all legacy STP switches in the network. The MST instances combine with the IST at the boundary of the region to become the CST.

The IST connects all the MSTP switches in the region and appears as a subtree in the CIST that encompasses the entire switched domain. The root of the subtree is the CIST regional root. The MST region appears as a virtual switch to adjacent STP switches and MST regions.

Only the CST instance sends and receives BPDUs, and MST instances add their spanning-tree information into the BPDUs to interact with neighboring switches and compute the final spanning-tree topology. Because of this, the spanning-tree parameters related to BPDU transmission (for example, hello time, forward time, max-age, and max-hops) are configured only on the CST instance but affect all MST instances. Parameters

related to the spanning-tree topology (for example, switch priority, port VLAN cost, and port VLAN priority) can be configured on both the CST instance and the MST instance.

MSTP switches use Version 3 RSTP BPDUs or IEEE 802.1D STP BPDUs to communicate with legacy IEEE 802.1D switches. MSTP switches use MSTP BPDUs to communicate with MSTP switches.

## IEEE 802.1s Terminology

Some MST naming conventions used in Cisco's prestandard implementation have been changed to identify some *internal* or *regional* parameters. These parameters are significant only within an MST region, as opposed to external parameters that are relevant to the whole network. Because the CIST is the only spanning-tree instance that spans the whole network, only the CIST parameters require the external rather than the internal or regional qualifiers.

- The CIST root is the root switch for the unique instance that spans the whole network, the CIST.
- The CIST external root path cost is the cost to the CIST root. This cost is left unchanged within an MST region. Remember that an MST region looks like a single switch for the CIST. The CIST external root path cost is the root path cost calculated between these virtual switches and switches that do not belong to any region.
- The CIST regional root was called the IST master in the prestandard implementation. If the CIST root is in the region, the CIST regional root is the CIST root. Otherwise, the CIST regional root is the closest switch to the CIST root in the region. The CIST regional root acts as a root switch for the IST.
- The CIST internal root path cost is the cost to the CIST regional root in a region. This cost is only relevant to the IST, instance 0.

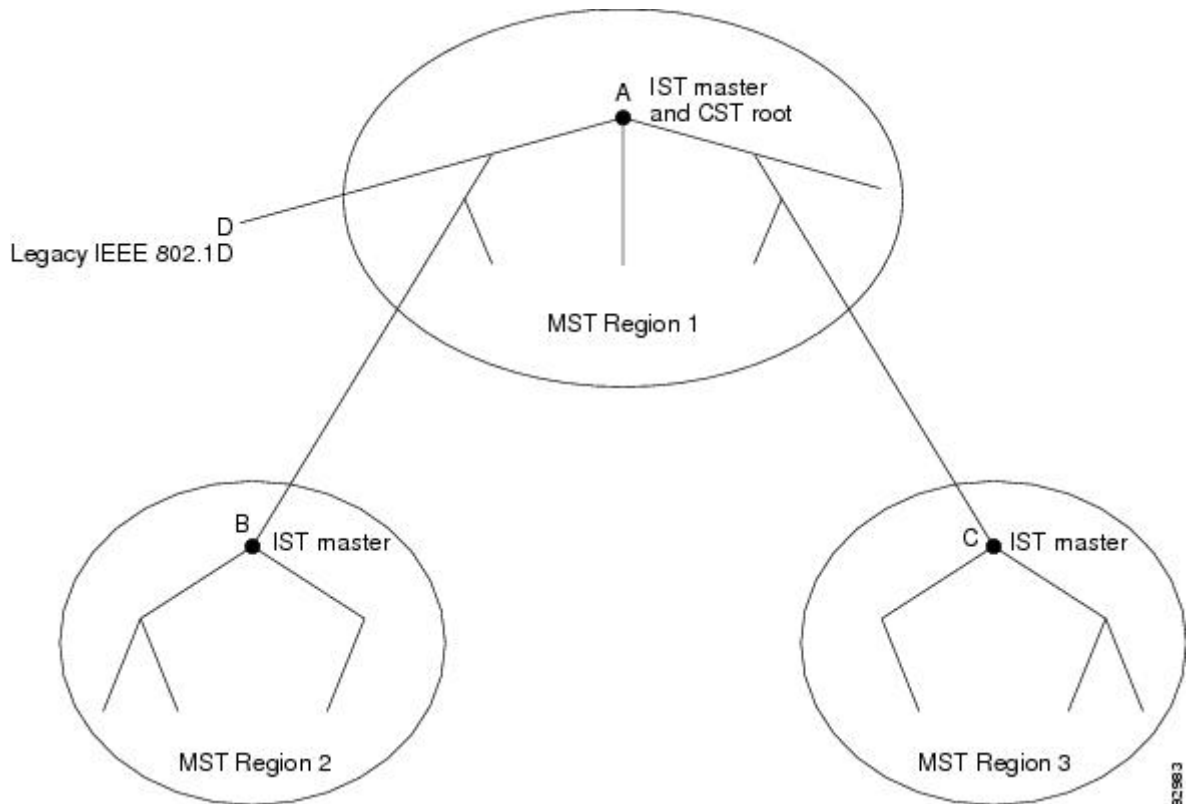

**Table 55: Prestandard and Standard Terminology**

| IEEE Standard                | Cisco Prestandard    | Cisco Standard          |
|------------------------------|----------------------|-------------------------|
| CIST regional root           | IST master           | CIST regional root      |
| CIST internal root path cost | IST master path cost | CIST internal path cost |
| CIST external root path cost | Root path cost       | Root path cost          |
| MSTI regional root           | Instance root        | Instance root           |
| MSTI internal root path cost | Root path cost       | Root path cost          |

## Illustration of MST Regions

This figure displays three MST regions and a legacy IEEE 802.1D switch (D). The CIST regional root for region 1 (A) is also the CIST root. The CIST regional root for region 2 (B) and the CIST regional root for region 3 (C) are the roots for their respective subtrees within the CIST. The RSTP runs in all regions.

## Hop Count

The IST and MST instances do not use the message-age and maximum-age information in the configuration BPDU to compute the spanning-tree topology. Instead, they use the path cost to the root and a hop-count mechanism similar to the IP time-to-live (TTL) mechanism.

By using the **spanning-tree mst max-hops** global configuration command, you can configure the maximum hops inside the region and apply it to the IST and all MST instances in that region. The hop count achieves the same result as the message-age information (triggers a reconfiguration). The root switch of the instance always sends a BPDU (or M-record) with a cost of 0 and the hop count set to the maximum value. When a

switch receives this BPDU, it decrements the received remaining hop count by one and propagates this value as the remaining hop count in the BPDUs it generates. When the count reaches zero, the switch discards the BPDU and ages the information held for the port.

The message-age and maximum-age information in the RSTP portion of the BPDU remain the same throughout the region, and the same values are propagated by the region designated ports at the boundary.

## Boundary Ports

In the Cisco prestandard implementation, a boundary port connects an MST region to a single spanning-tree region running RSTP, to a single spanning-tree region running PVST+ or rapid PVST+, or to another MST region with a different MST configuration. A boundary port also connects to a LAN, the designated switch of which is either a single spanning-tree switch or a switch with a different MST configuration.

There is no definition of a boundary port in the IEEE 802.1s standard. The IEEE 802.1Q-2002 standard identifies two kinds of messages that a port can receive:

- internal (coming from the same region)
- external (coming from another region)

When a message is internal, the CIST part is received by the CIST, and each MST instance receives its respective M-record.

When a message is external, it is received only by the CIST. If the CIST role is root or alternate, or if the external BPDU is a topology change, it could have an impact on the MST instances.

An MST region includes both switches and LANs. A segment belongs to the region of its designated port. Therefore, a port in a different region than the designated port for a segment is a boundary port. This definition allows two ports internal to a region to share a segment with a port belonging to a different region, creating the possibility of a port receiving both internal and external messages.

The primary change from the Cisco prestandard implementation is that a designated port is not defined as boundary, unless it is running in an STP-compatible mode.

### Note

If there is a legacy STP switch on the segment, messages are always considered external.

The other change from the Cisco prestandard implementation is that the CIST regional root switch ID field is now inserted where an RSTP or legacy IEEE 802.1Q switch has the sender switch ID. The whole region performs like a single virtual switch by sending a consistent sender switch ID to neighboring switches. In this example, switch C would receive a BPDU with the same consistent sender switch ID of root, whether or not A or B is designated for the segment.

## IEEE 802.1s Implementation

The Cisco implementation of the IEEE MST standard includes features required to meet the standard, as well as some of the desirable prestandard functionality that is not yet incorporated into the published standard.

## Port Role Naming Change

The boundary role is no longer in the final MST standard, but this boundary concept is maintained in Cisco's implementation. However, an MST instance port at a boundary of the region might not follow the state of the corresponding CIST port. Two boundary roles currently exist:

- The boundary port is the root port of the CIST regional root—When the CIST instance port is proposed and is in sync, it can send back an agreement and move to the forwarding state only after all the corresponding MSTI ports are in sync (and thus forwarding). The MSTI ports now have a special *master* role.
- The boundary port is not the root port of the CIST regional root—The MSTI ports follow the state and role of the CIST port. The standard provides less information, and it might be difficult to understand why an MSTI port can be alternately blocking when it receives no BPDUs (MRecords). In this case, although the boundary role no longer exists, the **show** commands identify a port as boundary in the *type* column of the output.

## Interoperation Between Legacy and Standard Switches

Because automatic detection of prestandard switches can fail, you can use an interface configuration command to identify prestandard ports. A region cannot be formed between a standard and a prestandard switch, but they can interoperate by using the CIST. Only the capability of load-balancing over different instances is lost in that particular case. The CLI displays different flags depending on the port configuration when a port receives prestandard BPDUs. A syslog message also appears the first time a switch receives a prestandard BPDU on a port that has not been configured for prestandard BPDU transmission.

Assume that A is a standard switch and B a prestandard switch, both configured to be in the same region. A is the root switch for the CIST, and B has a root port (BX) on segment X and an alternate port (BY) on segment Y. If segment Y flaps, and the port on BY becomes the alternate before sending out a single prestandard BPDU, AY cannot detect that a prestandard switch is connected to Y and continues to send standard BPDUs. The port BY is fixed in a boundary, and no load balancing is possible between A and B. The same problem exists on segment X, but B might transmit topology changes.

**Figure 26: Standard and Prestandard Switch Interoperation**

**Note**

We recommend that you minimize the interaction between standard and prestandard MST implementations.

### Detecting Unidirectional Link Failure

This feature is not yet present in the IEEE MST standard, but it is included in this Cisco IOS release. The software checks the consistency of the port role and state in the received BPDUs to detect unidirectional link failures that could cause bridging loops.

When a designated port detects a conflict, it keeps its role, but reverts to the discarding state because disrupting connectivity in case of inconsistency is preferable to opening a bridging loop.

This figure illustrates a unidirectional link failure that typically creates a bridging loop. Switch A is the root switch, and its BPDUs are lost on the link leading to switch B. RSTP and MST BPDUs include the role and state of the sending port. With this information, switch A can detect that switch B does not react to the superior BPDUs it sends and that switch B is the designated, not root switch. As a result, switch A blocks (or keeps blocking) its port, which prevents the bridging loop.

**Figure 27: Detecting Unidirectional Link Failure**

### MSTP and Switch Stacks

A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID for a given spanning tree. The bridge ID is derived from the MAC address of the active switch.

If a switch that does not support MSTP is added to a switch stack that does support MSTP or the reverse, the switch is put into a version mismatch state. If possible, the switch is automatically upgraded or downgraded to the same version of software that is running on the switch stack.

### Interoperability with IEEE 802.1D STP

A switch running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D switches. If this switch receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDUs on that port. An MSTP switch also can detect that a port is at the boundary of a region when it receives a legacy BPDU, an MSTP BPDU (Version 3) associated with a different region, or an RSTP BPDU (Version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot detect whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch might also continue to assign a boundary role to a port when the switch to which this switch is connected has joined the region. To restart the protocol migration process (force

the renegotiation with neighboring switches), use the **clear spanning-tree detected-protocols** privileged EXEC command.

If all the legacy switches on the link are RSTP switches, they can process MSTP BPDUs as if they are RSTP BPDUs. Therefore, MSTP switches send either a Version 0 configuration and TCN BPDUs or Version 3 MSTP BPDUs on a boundary port. A boundary port connects to a LAN, the designated switch of which is either a single spanning-tree switch or a switch with a different MST configuration.

## RSTP Overview

The RSTP takes advantage of point-to-point wiring and provides rapid convergence of the spanning tree. Reconfiguration of the spanning tree can occur in less than 1 second (in contrast to 50 seconds with the default settings in the IEEE 802.1D spanning tree).

### Port Roles and the Active Topology

The RSTP provides rapid convergence of the spanning tree by assigning port roles and by learning the active topology. The RSTP builds upon the IEEE 802.1D STP to select the switch with the highest switch priority (lowest numerical priority value) as the root switch. The RSTP then assigns one of these port roles to individual ports:

- Root port—Provides the best path (lowest cost) when the switch forwards packets to the root switch.
- Designated port—Connects to the designated switch, which incurs the lowest path cost when forwarding packets from that LAN to the root switch. The port through which the designated switch is attached to the LAN is called the designated port.
- Alternate port—Offers an alternate path toward the root switch to that provided by the current root port.
- Backup port—Acts as a backup for the path provided by a designated port toward the leaves of the spanning tree. A backup port can exist only when two ports are connected in a loopback by a point-to-point link or when a switch has two or more connections to a shared LAN segment.
- Disabled port—Has no role within the operation of the spanning tree.

A port with the root or a designated port role is included in the active topology. A port with the alternate or backup port role is excluded from the active topology.

In a stable topology with consistent port roles throughout the network, the RSTP ensures that every root port and designated port immediately transition to the forwarding state while all alternate and backup ports are always in the discarding state (equivalent to blocking in IEEE 802.1D). The port state controls the operation of the forwarding and learning processes.

**Table 56: Port State Comparison**

| Operational Status | STP Port State (IEEE 802.1D) | RSTP Port State | Is Port Included in the Active Topology? |
|--------------------|------------------------------|-----------------|------------------------------------------|
| Enabled            | Blocking                     | Discarding      | No                                       |
| Enabled            | Listening                    | Discarding      | No                                       |
| Enabled            | Learning                     | Learning        | Yes                                      |

| Operational Status | STP Port State (IEEE 802.1D) | RSTP Port State | Is Port Included in the Active Topology? |
|--------------------|------------------------------|-----------------|------------------------------------------|
| Enabled            | Forwarding                   | Forwarding      | Yes                                      |
| Disabled           | Disabled                     | Discarding      | No                                       |

To be consistent with Cisco STP implementations, this guide defines the port state as *blocking* instead of *discarding*. Designated ports start in the listening state.

## Rapid Convergence

The RSTP provides for rapid recovery of connectivity following the failure of a switch, a switch port, or a LAN. It provides rapid convergence for edge ports, new root ports, and ports connected through point-to-point links as follows:

- **Edge ports**—If you configure a port as an edge port on an RSTP switch by using the **spanning-tree portfast** interface configuration command, the edge port immediately transitions to the forwarding state. An edge port is the same as a Port Fast-enabled port, and you should enable it only on ports that connect to a single end station.
- **Root ports**—If the RSTP selects a new root port, it blocks the old root port and immediately transitions the new root port to the forwarding state.
- **Point-to-point links**—If you connect a port to another port through a point-to-point link and the local port becomes a designated port, it negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology.

Switch A is connected to Switch B through a point-to-point link, and all of the ports are in the blocking state. Assume that the priority of Switch A is a smaller numerical value than the priority of Switch B. Switch A sends a proposal message (a configuration BPDU with the proposal flag set) to Switch B, proposing itself as the designated switch.

After receiving the proposal message, Switch B selects as its new root port the port from which the proposal message was received, forces all nonedge ports to the blocking state, and sends an agreement message (a BPDU with the agreement flag set) through its new root port.

After receiving Switch B's agreement message, Switch A also immediately transitions its designated port to the forwarding state. No loops in the network are formed because Switch B blocked all of its nonedge ports and because there is a point-to-point link between Switches A and B.

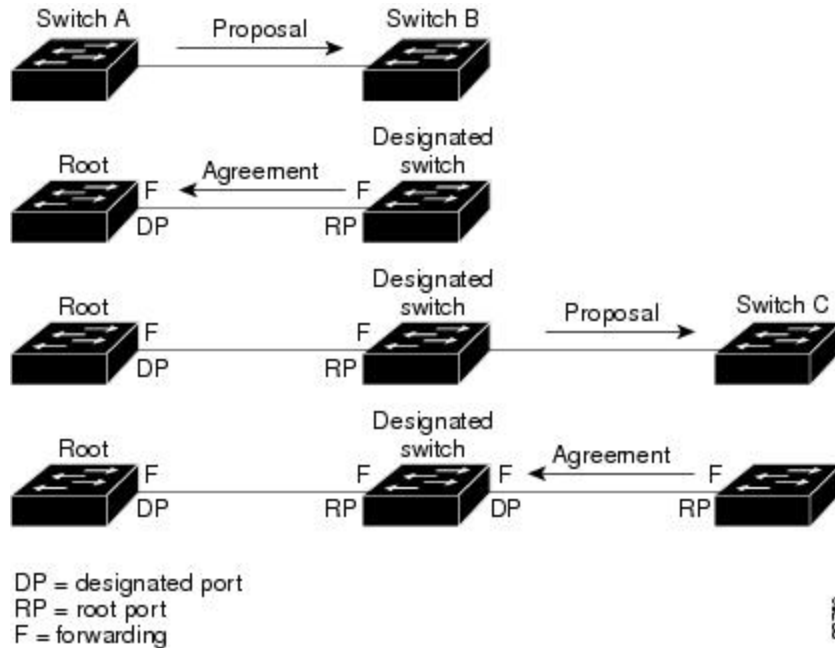

When Switch C is connected to Switch B, a similar set of handshaking messages are exchanged. Switch C selects the port connected to Switch B as its root port, and both ends immediately transition to the forwarding state. With each iteration of this handshaking process, one more switch joins the active topology. As the network converges, this proposal-agreement handshaking progresses from the root toward the leaves of the spanning tree.

In a switch stack, the cross-stack rapid transition (CSRT) feature ensures that a stack member receives acknowledgments from all stack members during the proposal-agreement handshaking before moving the port to the forwarding state. CSRT is automatically enabled when the switch is in MST mode.

The switch learns the link type from the port duplex mode: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. You can override

the default setting that is controlled by the duplex setting by using the **spanning-tree link-type** interface configuration command.

**Figure 28: Proposal and Agreement Handshaking for Rapid Convergence**

### Synchronization of Port Roles

When the switch receives a proposal message on one of its ports and that port is selected as the new root port, the RSTP forces all other ports to synchronize with the new root information.

The switch is synchronized with superior root information received on the root port if all other ports are synchronized. An individual port on the switch is synchronized if

- That port is in the blocking state.
- It is an edge port (a port configured to be at the edge of the network).

If a designated port is in the forwarding state and is not configured as an edge port, it transitions to the blocking state when the RSTP forces it to synchronize with new root information. In general, when the RSTP forces a port to synchronize with root information and the port does not satisfy any of the above conditions, its port state is set to blocking.

After ensuring that all of the ports are synchronized, the switch sends an agreement message to the designated switch corresponding to its root port. When the switches connected by a point-to-point link are in agreement about their port roles, the RSTP immediately transitions the port states to forwarding.

**Figure 29: Sequence of Events During Rapid Convergence**

## Bridge Protocol Data Unit Format and Processing

The RSTP BPDU format is the same as the IEEE 802.1D BPDU format except that the protocol version is set to 2. A new 1-byte Version 1 Length field is set to zero, which means that no version 1 protocol information is present.

**Table 57: RSTP BPDU Flags**

| Bit  | Function             |
|------|----------------------|
| 0    | Topology change (TC) |
| 1    | Proposal             |
| 2–3: | Port role:           |
| 00   | Unknown              |
| 01   | Alternate port       |
| 10   | Root port            |
| 11   | Designated port      |
| 4    | Learning             |
| 5    | Forwarding           |

| Bit | Function                              |
|-----|---------------------------------------|
| 6   | Agreement                             |
| 7   | Topology change acknowledgement (TCA) |

The sending switch sets the proposal flag in the RSTP BPDU to propose itself as the designated switch on that LAN. The port role in the proposal message is always set to the designated port.

The sending switch sets the agreement flag in the RSTP BPDU to accept the previous proposal. The port role in the agreement message is always set to the root port.

The RSTP does not have a separate topology change notification (TCN) BPDU. It uses the topology change (TC) flag to show the topology changes. However, for interoperability with IEEE 802.1D switches, the RSTP switch processes and generates TCN BPDUs.

The learning and forwarding flags are set according to the state of the sending port.

### Processing Superior BPDU Information

If a port receives superior root information (lower switch ID, lower path cost, and so forth) than currently stored for the port, the RSTP triggers a reconfiguration. If the port is proposed and is selected as the new root port, RSTP forces all the other ports to synchronize.

If the BPDU received is an RSTP BPDU with the proposal flag set, the switch sends an agreement message after all of the other ports are synchronized. If the BPDU is an IEEE 802.1D BPDU, the switch does not set the proposal flag and starts the forward-delay timer for the port. The new root port requires twice the forward-delay time to transition to the forwarding state.

If the superior information received on the port causes the port to become a backup or alternate port, RSTP sets the port to the blocking state but does not send the agreement message. The designated port continues sending BPDUs with the proposal flag set until the forward-delay timer expires, at which time the port transitions to the forwarding state.

### Processing Inferior BPDU Information

If a designated port receives an inferior BPDU (such as a higher switch ID or a higher path cost than currently stored for the port) with a designated port role, it immediately replies with its own information.

## Topology Changes

This section describes the differences between the RSTP and the IEEE 802.1D in handling spanning-tree topology changes.

- **Detection**—Unlike IEEE 802.1D in which *any* transition between the blocking and the forwarding state causes a topology change, *only* transitions from the blocking to the forwarding state cause a topology change with RSTP (only an increase in connectivity is considered a topology change). State changes on an edge port do not cause a topology change. When an RSTP switch detects a topology change, it deletes the learned information on all of its nonedge ports except on those from which it received the TC notification.
- **Notification**—Unlike IEEE 802.1D, which uses TCN BPDUs, the RSTP does not use them. However, for IEEE 802.1D interoperability, an RSTP switch processes and generates TCN BPDUs.
- **Acknowledgement**—When an RSTP switch receives a TCN message on a designated port from an IEEE 802.1D switch, it replies with an IEEE 802.1D configuration BPDU with the TCA bit set. However, if

the TC-while timer (the same as the topology-change timer in IEEE 802.1D) is active on a root port connected to an IEEE 802.1D switch and a configuration BPDU with the TCA bit set is received, the TC-while timer is reset.

This behavior is only required to support IEEE 802.1D switches. The RSTP BPDUs never have the TCA bit set.

- **Propagation**—When an RSTP switch receives a TC message from another switch through a designated or root port, it propagates the change to all of its nonedge, designated ports and to the root port (excluding the port on which it is received). The switch starts the TC-while timer for all such ports and flushes the information learned on them.
- **Protocol migration**—For backward compatibility with IEEE 802.1D switches, RSTP selectively sends IEEE 802.1D configuration BPDUs and TCN BPDUs on a per-port basis.

When a port is initialized, the migrate-delay timer is started (specifies the minimum time during which RSTP BPDUs are sent), and RSTP BPDUs are sent. While this timer is active, the switch processes all BPDUs received on that port and ignores the protocol type.

If the switch receives an IEEE 802.1D BPDU after the port migration-delay timer has expired, it assumes that it is connected to an IEEE 802.1D switch and starts using only IEEE 802.1D BPDUs. However, if the RSTP switch is using IEEE 802.1D BPDUs on a port and receives an RSTP BPDU after the timer has expired, it restarts the timer and starts using RSTP BPDUs on that port.

## Protocol Migration Process

A switch running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D switches. If this switch receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDUs on that port. An MSTP switch also can detect that a port is at the boundary of a region when it receives a legacy BPDU, an MST BPDU (Version 3) associated with a different region, or an RST BPDU (Version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot detect whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch also might continue to assign a boundary role to a port when the switch to which it is connected has joined the region.

## Configuring the Root Switch (CLI)

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to configure the root switch.

### Before You Begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID. Step 2 in the example uses 0 as the instance ID because that was the instance ID set up by the instructions listed under Related Topics.

### SUMMARY STEPS

1. **configure terminal**
2. **spanning-tree mst *instance-id* root primary**
3. **end**

### DETAILED STEPS

## Configuring a Secondary Root Switch (CLI)

When you configure a switch with the extended system ID support as the secondary root, the switch priority is modified from the default value (32768) to 28672. The switch is then likely to become the root switch for the specified instance if the primary root switch fails. This is assuming that the other network switches use the default switch priority of 32768 and therefore are unlikely to become the root switch.

You can execute this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello-time values that you used when you configured the primary root switch with the **spanning-tree mst *instance-id* root primary** global configuration command.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to configure a secondary root switch.

### Before You Begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID. This example uses 0 as the instance ID because that was the instance ID set up by the instructions listed under Related Topics.

### SUMMARY STEPS

1. **configure terminal**
2. **spanning-tree mst *instance-id* root secondary**
3. **end**

### Related Topics

[Specifying the MST Region Configuration and Enabling MSTP \(CLI\), on page 566](#)  
[Configuring the Root Switch \(CLI\), on page 569](#)

## Configuring Port Priority (CLI)

If a loop occurs, the MSTP uses the port priority when selecting an interface to put into the forwarding state. You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

### Note

If the switch is a member of a switch stack, you must use the **spanning-tree mst [instance-id] cost cost** interface configuration command instead of the **spanning-tree mst [instance-id] port-priority priority** interface configuration command to select a port to put in the forwarding state. Assign lower cost values to ports that you want selected first and higher cost values to ports that you want selected last. For more information, see the path costs topic listed under Related Topics.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to configure a different port priority for the switch.

### Before You Begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet1/0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **spanning-tree mst** *instance-id* **port-priority** *priority*
4. **end**

## Configuring the Switch Priority (CLI)

Changing the priority of a switch makes it more likely to be chosen as the root switch whether it is a standalone switch or a switch in the stack.

#### Note

Exercise care when using this command. For normal network configurations, we recommend that you use the **spanning-tree mst *instance-id* root primary** and the **spanning-tree mst *instance-id* root secondary** global configuration commands to specify a switch as the root or secondary root switch. You should modify the switch priority only in circumstances where these commands do not work.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to configure a different switch priority for the switch.

#### Before You Begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID used. This example uses 0 as the instance ID because that was the instance ID set up by the instructions listed under Related Topics.

## SUMMARY STEPS

1. **configure terminal**
2. **spanning-tree mst *instance-id* priority *priority***
3. **end**

## DETAILED STEPS

## Specifying the Link Type to Ensure Rapid Transitions (CLI)

If you connect a port to another port through a point-to-point link and the local port becomes a designated port, the RSTP negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology.

By default, the link type is controlled from the duplex mode of the interface: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. If you have a half-duplex link physically connected point-to-point to a single port on a remote switch running MSTP, you can override the default setting of the link type and enable rapid transitions to the forwarding state.

Beginning in privileged EXEC mode, follow these steps to override the default link-type setting. This procedure is optional.

### Before You Begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet1/0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.

**SUMMARY STEPS**

1. **configure terminal**
2. **interface *interface-id***
3. **spanning-tree link-type point-to-point**
4. **end**

**DETAILED STEPS**

|               | Command or Action                                                                                                                        | Purpose                                                                                                                                                                                                                               |

**Related Topics**

[Specifying the MST Region Configuration and Enabling MSTP \(CLI\), on page 566](#)

**Designating the Neighbor Type (CLI)**

A topology could contain both prestandard and IEEE 802.1s standard compliant devices. By default, ports can automatically detect prestandard devices, but they can still receive both standard and prestandard BPDUs. When there is a mismatch between a device and its neighbor, only the CIST runs on the interface.

You can choose to set a port to send only prestandard BPDUs. The prestandard flag appears in all the **show** commands, even if the port is in STP compatibility mode.

Beginning in privileged EXEC mode, follow these steps to override the default link-type setting. This procedure is optional.

### Before You Begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

## SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **spanning-tree mst pre-standard**
4. **end**

### Related Topics

[Specifying the MST Region Configuration and Enabling MSTP \(CLI\), on page 566](#)

## Restarting the Protocol Migration Process (CLI)

This procedure restarts the protocol migration process and forces renegotiation with neighboring switches. It reverts the switch to MST mode. It is needed when the switch no longer receives IEEE 802.1D BPDUs after it has been receiving them.

Beginning in privileged EXEC mode, follow these steps to restart the protocol migration process (force the renegotiation with neighboring switches) on the switch.

### Before You Begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

If you want to use the interface version of the command, you must also know the MST interface used. This example uses GigabitEthernet1/0/1 as the interface because that was the interface set up by the instructions listed under Related Topics.

### SUMMARY STEPS

1. Enter one of the following commands:
  - **clear spanning-tree detected-protocols**
  - **clear spanning-tree detected-protocols interface *interface-id***

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                       | Purpose                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <b>Step 1</b> | Enter one of the following commands: <ul style="list-style-type: none"> <li>• <b>clear spanning-tree detected-protocols</b></li> <li>• <b>clear spanning-tree detected-protocols interface <i>interface-id</i></b></li> </ul><br><b>Example:</b><br>Switch# <b>clear spanning-tree detected-protocols</b><br>OR<br>Switch# <b>clear spanning-tree detected-protocols interface GigabitEthernet1/0/1</b> | The switch reverts to the MSTP mode, and the protocol migration process restarts. |

### What to Do Next

This procedure may need to be repeated if the switch receives more legacy IEEE 802.1D configuration BPDUs (BPDUs with the protocol version set to 0).

- [Feature Information for Optional Spanning-Tree Features, page 609](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restriction for Optional Spanning-Tree Features

- PortFast minimizes the time that interfaces must wait for spanning tree to converge, so it is effective only when used on interfaces connected to end stations. If you enable PortFast on an interface connecting to another switch, you risk creating a spanning-tree loop.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

### Related Topics

## Information About Optional Spanning-Tree Features

### PortFast

PortFast immediately brings an interface configured as an access or trunk port to the forwarding state from a blocking state, bypassing the listening and learning states.

You can use PortFast on interfaces connected to a single workstation or server to allow those devices to immediately connect to the network, rather than waiting for the spanning tree to converge.

**Figure 30: PortFast-Enabled Interfaces**

Interfaces connected to a single workstation or server should not receive bridge protocol data units (BPDUs). An interface with PortFast enabled goes through the normal cycle of spanning-tree status changes when the switch is restarted.

You can enable this feature by enabling it on either the interface or on all nontrunking ports.

#### Related Topics

[Enabling PortFast \(CLI\), on page 596](#)

[Restriction for Optional Spanning-Tree Features, on page 585](#)

### BPDU Guard

The Bridge Protocol Data Unit (BPDU) guard feature can be globally enabled on the switch or can be enabled per port, but the feature operates with some differences.

When you enable BPDU guard at the global level on PortFast-enabled ports, spanning tree shuts down ports that are in a PortFast-operational state if any BPDU is received on them. In a valid configuration, PortFast-enabled ports do not receive BPDUs. Receiving a BPDU on a Port Fast-enabled port means an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the port in the error-disabled state. When this happens, the switch shuts down the entire port on which the violation occurred.

When you enable BPDU guard at the interface level on any port without also enabling the PortFast feature, and the port receives a BPDU, it is put in the error-disabled state.

The BPDU guard feature provides a secure response to invalid configurations because you must manually put the interface back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

**Related Topics**

[Enabling BPDU Guard \(CLI\), on page 598](#)

**BPDU Filtering**

The BPDU filtering feature can be globally enabled on the switch or can be enabled per interface, but the feature operates with some differences.

Enabling BPDU filtering on PortFast-enabled interfaces at the global level keeps those interfaces that are in a PortFast-operational state from sending or receiving BPDUs. The interfaces still send a few BPDUs at link-up before the switch begins to filter outbound BPDUs. You should globally enable BPDU filtering on a switch so that hosts connected to these interfaces do not receive BPDUs. If a BPDU is received on a PortFast-enabled interface, the interface loses its PortFast-operational status, and BPDU filtering is disabled.

Enabling BPDU filtering on an interface without also enabling the PortFast feature keeps the interface from sending or receiving BPDUs.

**Caution**

---

Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

---

You can enable the BPDU filtering feature for the entire switch or for an interface.

## UplinkFast

Switches in hierarchical networks can be grouped into backbone switches, distribution switches, and access switches. This complex network has distribution switches and access switches that each have at least one redundant link that spanning tree blocks to prevent loops.

**Figure 31: Switches in a Hierarchical Network**

If a switch loses connectivity, it begins using the alternate paths as soon as the spanning tree selects a new root port. You can accelerate the choice of a new root port when a link or switch fails or when the spanning tree reconfigures itself by enabling UplinkFast. The root port transitions to the forwarding state immediately without going through the listening and learning states, as it would with the normal spanning-tree procedures.

When the spanning tree reconfigures the new root port, other interfaces flood the network with multicast packets, one for each address that was learned on the interface. You can limit these bursts of multicast traffic by reducing the max-update-rate parameter (the default for this parameter is 150 packets per second). However, if you enter zero, station-learning frames are not generated, so the spanning-tree topology converges more slowly after a loss of connectivity.

### Note

UplinkFast is most useful in wiring-closet switches at the access or edge of the network. It is not appropriate for backbone devices. This feature might not be useful for other types of applications.

UplinkFast provides fast convergence after a direct link failure and achieves load-balancing between redundant Layer 2 links using uplink groups. An uplink group is a set of Layer 2 interfaces (per VLAN), only one of which is forwarding at any given time. Specifically, an uplink group consists of the root port (which is forwarding) and a set of blocked ports, except for self-looping ports. The uplink group provides an alternate path in case the currently forwarding link fails.

This topology has no link failures. Switch A, the root switch, is connected directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that is connected directly to Switch B is in a blocking state.

**Figure 32: UplinkFast Example Before Direct Link Failure**

If Switch C detects a link failure on the currently active link L2 on the root port (a direct link failure), UplinkFast unblocks the blocked interface on Switch C and transitions it to the forwarding state without going through the listening and learning states. This change takes approximately 1 to 5 seconds.

**Figure 33: UplinkFast Example After Direct Link Failure**

## Cross-Stack UplinkFast

Cross-Stack UplinkFast (CSUF) provides a fast spanning-tree transition (fast convergence in less than 1 second under normal network conditions) across a switch stack. During the fast transition, an alternate redundant link on the switch stack is placed in the forwarding state without causing temporary spanning-tree loops or loss

of connectivity to the backbone. With this feature, you can have a redundant and resilient network in some configurations. CSUF is automatically enabled when you enable the UplinkFast feature.

CSUF might not provide a fast transition all the time; in these cases, the normal spanning-tree transition occurs, completing in 30 to 40 seconds. For more information, see Related Topics.

### Related Topics

[Enabling UplinkFast for Use with Redundant Links \(CLI\), on page 601](#)

[Events That Cause Fast Convergence, on page 592](#)

## How Cross-Stack UplinkFast Works

Cross-Stack UplinkFast (CSUF) ensures that one link in the stack is elected as the path to the root.

The stack-root port on Switch 1 provides the path to the root of the spanning tree. The alternate stack-root ports on Switches 2 and 3 can provide an alternate path to the spanning-tree root if the current stack-root switch fails or if its link to the spanning-tree root fails.

Link 1, the root link, is in the spanning-tree forwarding state. Links 2 and 3 are alternate redundant links that are in the spanning-tree blocking state. If Switch 1 fails, if its stack-root port fails, or if Link 1 fails, CSUF selects either the alternate stack-root port on Switch 2 or Switch 3 and puts it into the forwarding state in less than 1 second.

Figure 34: Cross-Stack UplinkFast Topology

When certain link loss or spanning-tree events occur (described in the following topic), the Fast Uplink Transition Protocol uses the neighbor list to send fast-transition requests to stack members.

The switch sending the fast-transition request needs to do a fast transition to the forwarding state of a port that it has chosen as the root port, and it must obtain an acknowledgment from each stack switch before performing the fast transition.

Each switch in the stack decides if the sending switch is a better choice than itself to be the stack root of this spanning-tree instance by comparing the root, cost, and bridge ID. If the sending switch is the best choice as the stack root, each switch in the stack returns an acknowledgment; otherwise, it sends a fast-transition request. The sending switch then has not received acknowledgments from all stack switches.

When acknowledgments are received from all stack switches, the Fast Uplink Transition Protocol on the sending switch immediately transitions its alternate stack-root port to the forwarding state. If acknowledgments from all stack switches are not obtained by the sending switch, the normal spanning-tree transitions (blocking, listening, learning, and forwarding) take place, and the spanning-tree topology converges at its normal rate ( $2 * \text{forward-delay time} + \text{max-age time}$ ).

The Fast Uplink Transition Protocol is implemented on a per-VLAN basis and affects only one spanning-tree instance at a time.

### Related Topics

[Enabling UplinkFast for Use with Redundant Links \(CLI\)](#), on page 601

[Events That Cause Fast Convergence, on page 592](#)

## Events That Cause Fast Convergence

Depending on the network event or failure, the CSUF fast convergence might or might not occur.

Fast convergence (less than 1 second under normal network conditions) occurs under these circumstances:

- The stack-root port link fails.  
If two switches in the stack have alternate paths to the root, only one of the switches performs the fast transition.
- The failed link, which connects the stack root to the spanning-tree root, recovers.
- A network reconfiguration causes a new stack-root switch to be selected.
- A network reconfiguration causes a new port on the current stack-root switch to be chosen as the stack-root port.

---

**Note** The fast transition might not occur if multiple events occur simultaneously. For example, if a stack member is powered off, and at the same time, the link connecting the stack root to the spanning-tree root comes back up, the normal spanning-tree convergence occurs.

---

Normal spanning-tree convergence (30 to 40 seconds) occurs under these conditions:

- The stack-root switch is powered off, or the software failed.
- The stack-root switch, which was powered off or failed, is powered on.
- A new switch, which might become the stack root, is added to the stack.

[How Cross-Stack UplinkFast Works, on page 590](#)

## BackboneFast

BackboneFast detects indirect failures in the core of the backbone. BackboneFast is a complementary technology to the UplinkFast feature, which responds to failures on links directly connected to access switches.

BackboneFast optimizes the maximum-age timer, which controls the amount of time the switch stores protocol information received on an interface. When a switch receives an inferior BPDU from the designated port of another switch, the BPDU is a signal that the other switch might have lost its path to the root, and BackboneFast tries to find an alternate path to the root.

BackboneFast starts when a root port or blocked interface on a switch receives inferior BPDUs from its designated switch. An inferior BPDU identifies a switch that declares itself as both the root bridge and the designated switch. When a switch receives an inferior BPDU, it means that a link to which the switch is not directly connected (an indirect link) has failed (that is, the designated switch has lost its connection to the root).

switch). Under spanning-tree rules, the switch ignores inferior BPDUs for the maximum aging time (default is 20 seconds).

The switch tries to find if it has an alternate path to the root switch. If the inferior BPDU arrives on a blocked interface, the root port and other blocked interfaces on the switch become alternate paths to the root switch. (Self-looped ports are not considered alternate paths to the root switch.) If the inferior BPDU arrives on the root port, all blocked interfaces become alternate paths to the root switch. If the inferior BPDU arrives on the root port and there are no blocked interfaces, the switch assumes that it has lost connectivity to the root switch, causes the maximum aging time on the root port to expire, and becomes the root switch according to normal spanning-tree rules.

If the switch has alternate paths to the root switch, it uses these alternate paths to send a root link query (RLQ) request. The switch sends the RLQ request on all alternate paths to learn if any stack member has an alternate root to the root switch and waits for an RLQ reply from other switches in the network and in the stack. The switch sends the RLQ request on all alternate paths and waits for an RLQ reply from other switches in the network.

When a stack member receives an RLQ reply from a nonstack member on a blocked interface and the reply is destined for another nonstacked switch, it forwards the reply packet, regardless of the spanning-tree interface state.

When a stack member receives an RLQ reply from a nonstack member and the response is destined for the stack, the stack member forwards the reply so that all the other stack members receive it.

If the switch discovers that it still has an alternate path to the root, it expires the maximum aging time on the interface that received the inferior BPDU. If all the alternate paths to the root switch indicate that the switch has lost connectivity to the root switch, the switch expires the maximum aging time on the interface that received the RLQ reply. If one or more alternate paths can still connect to the root switch, the switch makes all interfaces on which it received an inferior BPDU its designated ports and moves them from the blocking state (if they were in the blocking state), through the listening and learning states, and into the forwarding state.

This is an example topology with no link failures. Switch A, the root switch, connects directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that connects directly to Switch B is in the blocking state.

**Figure 35: BackboneFast Example Before Indirect Link Failure**

If link L1 fails, Switch C cannot detect this failure because it is not connected directly to link L1. However, because Switch B is directly connected to the root switch over L1, it detects the failure, elects itself the root, and begins sending BPDUs to Switch C, identifying itself as the root. When Switch C receives the inferior BPDUs from Switch B, Switch C assumes that an indirect failure has occurred. At that point, BackboneFast

allows the blocked interface on Switch C to move immediately to the listening state without waiting for the maximum aging time for the interface to expire. BackboneFast then transitions the Layer 2 interface on Switch C to the forwarding state, providing a path from Switch B to Switch A. The root-switch election takes approximately 30 seconds, twice the Forward Delay time if the default Forward Delay time of 15 seconds is set. BackboneFast reconfigures the topology to account for the failure of link L1.

**Figure 36: BackboneFast Example After Indirect Link Failure**

If a new switch is introduced into a shared-medium topology, BackboneFast is not activated because the inferior BPDUs did not come from the recognized designated switch (Switch B). The new switch begins sending inferior BPDUs that indicate it is the root switch. However, the other switches ignore these inferior BPDUs, and the new switch learns that Switch B is the designated switch to Switch A, the root switch.

**Figure 37: Adding a Switch in a Shared-Medium Topology**

## EtherChannel Guard

You can use EtherChannel guard to detect an EtherChannel misconfiguration between the switch and a connected device. A misconfiguration can occur if the switch interfaces are configured in an EtherChannel, but the interfaces on the other device are not. A misconfiguration can also occur if the channel parameters are not the same at both ends of the EtherChannel.

If the switch detects a misconfiguration on the other device, EtherChannel guard places the switch interfaces in the error-disabled state, and displays an error message.

### Related Topics

[Enabling EtherChannel Guard \(CLI\), on page 604](#)

## Root Guard

The Layer 2 network of a service provider (SP) can include many connections to switches that are not owned by the SP. In such a topology, the spanning tree can reconfigure itself and select a customer switch as the root switch. You can avoid this situation by enabling root guard on SP switch interfaces that connect to switches in your customer's network. If spanning-tree calculations cause an interface in the customer network to be selected as the root port, root guard then places the interface in the root-inconsistent (blocked) state to prevent the customer's switch from becoming the root switch or being in the path to the root.

**Figure 38: Root Guard in a Service-Provider Network**

If a switch outside the SP network becomes the root switch, the interface is blocked (root-inconsistent state), and spanning tree selects a new root switch. The customer's switch does not become the root switch and is not in the path to the root.

If the switch is operating in multiple spanning-tree (MST) mode, root guard forces the interface to be a designated port. If a boundary port is blocked in an internal spanning-tree (IST) instance because of root guard, the interface also is blocked in all MST instances. A boundary port is an interface that connects to a

LAN, the designated switch of which is either an IEEE 802.1D switch or a switch with a different MST region configuration.

Root guard enabled on an interface applies to all the VLANs to which the interface belongs. VLANs can be grouped and mapped to an MST instance.

**Caution**

Misuse of the root guard feature can cause a loss of connectivity.

**Related Topics**

[Enabling Root Guard \(CLI\), on page 605](#)

## Loop Guard

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is enabled on the entire switched network. Loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

When the switch is operating in PVST+ or rapid-PVST+ mode, loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

When the switch is operating in MST mode, BPDUs are not sent on nonboundary ports only if the interface is blocked by loop guard in all MST instances. On a boundary port, loop guard blocks the interface in all MST instances.

**Related Topics**

[Enabling Loop Guard \(CLI\), on page 606](#)

# How to Configure Optional Spanning-Tree Features

## Enabling PortFast (CLI)

An interface with the PortFast feature enabled is moved directly to the spanning-tree forwarding state without waiting for the standard forward-time delay.

If you enable the voice VLAN feature, the PortFast feature is automatically enabled. When you disable voice VLAN, the PortFast feature is not automatically disabled.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

**Caution**

Use PortFast only when connecting a single end station to an access or trunk port. Enabling this feature on an interface connected to a switch or hub could prevent spanning tree from detecting and disabling loops in your network, which could cause broadcast storms and address-learning problems.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to enable PortFast on the switch.

## SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **spanning-tree portfast [trunk]**
4. **end**

## DETAILED STEPS

|               | Command or Action                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Step 3</b> | <b>spanning-tree portfast [trunk]</b><br><br><b>Example:</b><br>Switch(config-if)# <b>spanning-tree portfast trunk</b> | Enables PortFast on an access port connected to a single workstation or server. By specifying the <b>trunk</b> keyword, you can enable PortFast on a trunk port.<br><br><b>Note</b> To enable PortFast on trunk ports, you must use the <b>spanning-tree portfast trunk</b> interface configuration command. The <b>spanning-tree portfast</b> command will not work on trunk ports.<br><br>Make sure that there are no loops in the network between the trunk port and the workstation or server before you enable PortFast on a trunk port.<br><br>By default, PortFast is disabled on all interfaces. |
| <b>Step 4</b> | <b>end</b><br><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### What to Do Next

You can use the **spanning-tree portfast default** global configuration command to globally enable the PortFast feature on all nontrunking ports.

**Related Topics**[PortFast, on page 586](#)[Restriction for Optional Spanning-Tree Features, on page 585](#)**Enabling BPDU Guard (CLI)**

You can enable the BPDU guard feature if your switch is running PVST+, Rapid PVST+, or MSTP.

**Caution**

Configure PortFast only on ports that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to enable BPDU guard on the switch.

**SUMMARY STEPS**

1. **configure terminal**
2. **spanning-tree portfast bpduguard default**
3. **interface *interface-id***
4. **spanning-tree portfast**
5. **end**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                                                                  | <b>Purpose</b>                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                     | Enters the global configuration mode.                                                         |
| <b>Step 2</b> | <b>spanning-tree portfast bpduguard default</b><br><br><b>Example:</b><br>Switch(config)# <b>spanning-tree portfast bpduguard default</b> | Globally enables BPDU guard.<br>By default, BPDU guard is disabled.                           |

| Step 5 | <b>end</b><br><br><b>Example:</b><br>Switch(config-if) # <b>end</b>                                       | Returns to privileged EXEC mode. |

### What to Do Next

To prevent the port from shutting down, you can use the **errdisable detect cause bpduguard shutdown vlan** global configuration command to shut down just the offending VLAN on the port where the violation occurred.

You also can use the **spanning-tree bpduguard enable** interface configuration command to enable BPDU guard on any port without also enabling the PortFast feature. When the port receives a BPDU, it is put in the error-disabled state.

### Related Topics

## Enabling BPDU Filtering (CLI)

You can also use the **spanning-tree bpdupfilter enable** interface configuration command to enable BPDU filtering on any interface without also enabling the PortFast feature. This command prevents the interface from sending or receiving BPDUs.

#### Caution

Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

You can enable the BPDU filtering feature if your switch is running PVST+, Rapid PVST+, or MSTP.

#### Caution

Configure PortFast only on interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to enable BPDU filtering on the switch.

**SUMMARY STEPS**

1. **configure terminal**
2. **spanning-tree portfast bpdudfilter default**
3. **interface *interface-id***
4. **spanning-tree portfast**
5. **end**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                                                                      | <b>Purpose</b>                                                                                |

## Enabling UplinkFast for Use with Redundant Links (CLI)

**Note** When you enable UplinkFast, it affects all VLANs on the switch or switch stack. You cannot configure UplinkFast on an individual VLAN.

You can configure the UplinkFast or the Cross-Stack UplinkFast (CSUF) feature for Rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

This procedure is optional. Beginning in privileged EXEC mode, follow these steps to enable UplinkFast and CSUF.

### Before You Begin

UplinkFast cannot be enabled on VLANs that have been configured with a switch priority. To enable UplinkFast on a VLAN with switch priority configured, first restore the switch priority on the VLAN to the default value using the **no spanning-tree vlan *vlan-id* priority** global configuration command.

### SUMMARY STEPS

1. **configure terminal**
2. **spanning-tree uplinkfast [max-update-rate *pkts-per-second*]**
3. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                         |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                                                  | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                           |
| Step 2 | <b>spanning-tree uplinkfast [max-update-rate <i>pkts-per-second</i>]</b><br><br><b>Example:</b><br>Switch(config)# <b>spanning-tree uplinkfast max-update-rate 200</b> | Enables UplinkFast.<br>(Optional) For <i>pkts-per-second</i> , the range is 0 to 32000 packets per second; the default is 150.<br>If you set the rate to 0, station-learning frames are not generated, and the spanning-tree topology converges more slowly after a loss of connectivity.<br>When you enter this command, CSUF also is enabled on all nonstack port interfaces. |
| Step 3 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                |

When UplinkFast is enabled, the switch priority of all VLANs is set to 49152. If you change the path cost to a value less than 3000 and you enable UplinkFast or UplinkFast is already enabled, the path cost of all interfaces and VLAN trunks is increased by 3000 (if you change the path cost to 3000 or above, the path cost is not altered). The changes to the switch priority and the path cost reduce the chance that a switch will become the root switch.

When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.

When you enable the UplinkFast feature using these instructions, CSUF is automatically globally enabled on nonstack port interfaces.

## Disabling UplinkFast (CLI)

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to disable UplinkFast and Cross-Stack UplinkFast (CSUF).

### Before You Begin

UplinkFast must be enabled.

### SUMMARY STEPS

1. **configure terminal**
2. **no spanning-tree uplinkfast**
3. **end**

### DETAILED STEPS

|        | Command or Action                                                                     | Purpose                               |
|--------|---------------------------------------------------------------------------------------|---------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b> | Enters the global configuration mode. |

|        | Command or Action                                                                                               | Purpose                                                          |
|--------|-----------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| Step 2 | <b>no spanning-tree uplinkfast</b><br><br><b>Example:</b><br>Switch(config)# <b>no spanning-tree uplinkfast</b> | Disables UplinkFast and CSUF on the switch and all of its VLANs. |
| Step 3 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                 | Returns to privileged EXEC mode.                                 |

When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.

When you disable the UplinkFast feature using these instructions, CSUF is automatically globally disabled on nonstack port interfaces.

## Enabling BackboneFast (CLI)

You can enable BackboneFast to detect indirect link failures and to start the spanning-tree reconfiguration sooner.

You can configure the BackboneFast feature for Rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

This procedure is optional. Beginning in privileged EXEC mode, follow these steps to enable BackboneFast on the switch.

### Before You Begin

If you use BackboneFast, you must enable it on all switches in the network. BackboneFast is not supported on Token Ring VLANs. This feature is supported for use with third-party switches.

## SUMMARY STEPS

1. **configure terminal**
2. **spanning-tree backbonefast**
3. **end**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                                      | <b>Purpose</b>                        |

**Enabling EtherChannel Guard (CLI)**

You can enable EtherChannel guard to detect an EtherChannel misconfiguration if your switch is running PVST+, Rapid PVST+, or MSTP.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to enable EtherChannel Guard on the switch.

**SUMMARY STEPS**

1. **configure terminal**
2. **spanning-tree etherchannel guard misconfig**
3. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                             | Purpose                               |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                                         | Enters the global configuration mode. |
| Step 2 | <b>spanning-tree etherchannel guard misconfig</b><br><br><b>Example:</b><br>Switch(config)# <b>spanning-tree etherchannel guard misconfig</b> | Enables EtherChannel guard.           |
| Step 3 | <b>end</b><br><br><b>Example:</b><br>Switch(config)# <b>end</b>                                                                               | Returns to privileged EXEC mode.      |

**What to Do Next**

You can use the **show interfaces status err-disabled** privileged EXEC command to show which switch ports are disabled because of an EtherChannel misconfiguration. On the remote device, you can enter the **show etherchannel summary** privileged EXEC command to verify the EtherChannel configuration.

After the configuration is corrected, enter the **shutdown** and **no shutdown** interface configuration commands on the port-channel interfaces that were misconfigured.

**Related Topics**

[EtherChannel Guard, on page 595](#)

**Enabling Root Guard (CLI)**

Root guard enabled on an interface applies to all the VLANs to which the interface belongs. Do not enable the root guard on interfaces to be used by the UplinkFast feature. With UplinkFast, the backup interfaces (in the blocked state) replace the root port in the case of a failure. However, if root guard is also enabled, all the backup interfaces used by the UplinkFast feature are placed in the root-inconsistent state (blocked) and are prevented from reaching the forwarding state.

**Note**

You cannot enable both root guard and loop guard at the same time.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

This procedure is optional.

Beginning in privileged EXEC mode, follow these steps to enable root guard on the switch.

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **spanning-tree guard root**
4. **end**

## DETAILED STEPS

## Enabling Loop Guard (CLI)

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is configured on the entire switched network. Loop guard operates only on interfaces that are considered point-to-point by the spanning tree.

**Note** You cannot enable both loop guard and root guard at the same time.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

This procedure is optional. Beginning in privileged EXEC mode, follow these steps to enable loop guard on the switch.

## SUMMARY STEPS

1. Enter one of the following commands:
  - `show spanning-tree active`
  - `show spanning-tree mst`
2. `configure terminal`
3. `spanning-tree loopguard default`
4. `end`

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                   | Purpose                                                    |

- [Configuration Examples for Configuring EtherChannels, page 643](#)
- [Additional References for EtherChannels, page 645](#)
- [Feature Information for EtherChannels, page 646](#)

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Restrictions for EtherChannels

The following are restrictions for EtherChannels:

- All ports in an EtherChannel must be assigned to the same VLAN or they must be configured as trunk ports.
- Layer 3 EtherChannels are not supported if running the LAN Base license feature set.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

# Information About EtherChannels

## EtherChannel Overview

EtherChannel provides fault-tolerant high-speed links between switches, routers, and servers. You can use the EtherChannel to increase the bandwidth between the wiring closets and the data center, and you can deploy it anywhere in the network where bottlenecks are likely to occur. EtherChannel provides automatic recovery for the loss of a link by redistributing the load across the remaining links. If a link fails, EtherChannel redirects traffic from the failed link to the remaining links in the channel without intervention.

An EtherChannel consists of individual Ethernet links bundled into a single logical link.

**Figure 39: Typical EtherChannel Configuration**

The EtherChannel provides full-duplex bandwidth up to 8 Gb/s (Gigabit EtherChannel) or 80 Gb/s (10-Gigabit EtherChannel) between your switch and another switch or host.

Each EtherChannel can consist of up to eight compatibly configured Ethernet ports.

The number of EtherChannels is limited to 128.

The LAN Base feature set supports up to 24 EtherChannels.

All ports in each EtherChannel must be configured as either Layer 2 or Layer 3 ports. The EtherChannel Layer 3 ports are made up of routed ports. Routed ports are physical ports configured to be in Layer 3 mode by using the **no switchport** interface configuration command.

## EtherChannel Modes

You can configure an EtherChannel in one of these modes: Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or On. Configure both ends of the EtherChannel in the same mode:

- When you configure one end of an EtherChannel in either PAgP or LACP mode, the system negotiates with the other end of the channel to determine which ports should become active. If the remote port cannot negotiate an EtherChannel, the local port is put into an independent state and continues to carry data traffic as would any other single link. The port configuration does not change, but the port does not participate in the EtherChannel.
- When you configure an EtherChannel in the **on** mode, no negotiations take place. The switch forces all compatible ports to become active in the EtherChannel. The other end of the channel (on the other switch) must also be configured in the **on** mode; otherwise, packet loss can occur.

[EtherChannel Configuration Guidelines, on page 626](#)

[Default EtherChannel Configuration, on page 625](#)

[Layer 2 EtherChannel Configuration Guidelines, on page 628](#)

### EtherChannel on Switches

You can create an EtherChannel on a switch, on a single switch in the stack, or on multiple switches in the stack (known as cross-stack EtherChannel).

**Figure 40: Single-Switch EtherChannel**

**Figure 41: Cross-Stack EtherChannel**

139883

- [Default EtherChannel Configuration, on page 625](#)
- [Layer 2 EtherChannel Configuration Guidelines, on page 628](#)

### EtherChannel Link Failover

If a link within an EtherChannel fails, traffic previously carried over that failed link moves to the remaining links within the EtherChannel. If traps are enabled on the switch, a trap is sent for a failure that identifies the switch, the EtherChannel, and the failed link. Inbound broadcast and multicast packets on one link in an EtherChannel are blocked from returning on any other link of the EtherChannel.

### Channel Groups and Port-Channel Interfaces

An EtherChannel comprises a channel group and a port-channel interface. The channel group binds physical ports to the port-channel interface. Configuration changes applied to the port-channel interface apply to all the physical ports bound together in the channel group.

The **channel-group** command binds the physical port and the port-channel interface together. Each EtherChannel has a port-channel logical interface numbered from 1 to 128. This port-channel interface number corresponds to the one specified with the **channel-group** interface configuration command.

**Figure 42: Relationship of Physical Ports, Channel Group and Port-Channel Interface**

- With Layer 2 ports, use the **channel-group** interface configuration command to dynamically create the port-channel interface.

You also can use the **interface port-channel** *port-channel-number* global configuration command to manually create the port-channel interface, but then you must use the **channel-group** *channel-group-number* command to bind the logical interface to a physical port. The *channel-group-number* can be the same as the *port-channel-number*; or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

- With Layer 3 ports, you should manually create the logical interface by using the **interface port-channel** global configuration command followed by the **no switchport** interface configuration command. You then manually assign an interface to the EtherChannel by using the **channel-group** interface configuration command.
- With Layer 3 ports, use the **no switchport** interface command to configure the interface as a Layer 3 interface, and then use the **channel-group** interface configuration command to dynamically create the port-channel interface.

## Port Aggregation Protocol

The Port Aggregation Protocol (PAgP) is a Cisco-proprietary protocol that can be run only on Cisco switches and on those switches licensed by vendors to support PAgP. PAgP facilitates the automatic creation of EtherChannels by exchanging PAgP packets between Ethernet ports. PAgP can be enabled on cross-stack EtherChannels.

By using PAgP, the switch or switch stack learns the identity of partners capable of supporting PAgP and the capabilities of each port. It then dynamically groups similarly configured ports (on a single switch in the stack) into a single logical link (channel or aggregate port). Similarly configured ports are grouped based on hardware, administrative, and port parameter constraints. For example, PAgP groups the ports with the same speed, duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, PAgP adds the group to the spanning tree as a single switch port.

### PAgP Modes

PAgP modes specify whether a port can send PAgP packets, which start PAgP negotiations, or only respond to PAgP packets received.

**Table 61: EtherChannel PAgP Modes**

| Mode             | Description                                                                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>auto</b>      | Places a port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. This setting minimizes the transmission of PAgP packets.                                                          |
| <b>desirable</b> | Places a port into an active negotiating state, in which the port starts negotiations with other ports by sending PAgP packets. This mode is not supported when the EtherChannel members are from different switches in the switch stack (cross-stack EtherChannel). |

Switch ports exchange PAgP packets only with partner ports configured in the **auto** or **desirable** modes. Ports configured in the **on** mode do not exchange PAgP packets.

Both the **auto** and **desirable** modes enable ports to negotiate with partner ports to form an EtherChannel based on criteria such as port speed, and for Layer 2 EtherChannels, based on trunk state and VLAN numbers.

Ports can form an EtherChannel when they are in different PAgP modes as long as the modes are compatible. For example:

- A port in the **desirable** mode can form an EtherChannel with another port that is in the **desirable** or **auto** mode.
- A port in the **auto** mode can form an EtherChannel with another port in the **desirable** mode.

A port in the **auto** mode cannot form an EtherChannel with another port that is also in the **auto** mode because neither port starts PAgP negotiation.

### *Silent Mode*

If your switch is connected to a partner that is PAgP-capable, you can configure the switch port for nonsilent operation by using the **non-silent** keyword. If you do not specify **non-silent** with the **auto** or **desirable** mode, silent mode is assumed.

Use the silent mode when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. An example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port connected to a silent partner prevents that switch port from ever becoming operational. However, the silent setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.

### **PAgP Learn Method and Priority**

Network devices are classified as PAgP physical learners or aggregate-port learners. A device is a physical learner if it learns addresses by physical ports and directs transmissions based on that knowledge. A device is an aggregate-port learner if it learns addresses by aggregate (logical) ports. The learn method must be configured the same at both ends of the link.

When a device and its partner are both aggregate-port learners, they learn the address on the logical port-channel. The device sends packets to the source by using any of the ports in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives.

PAgP cannot automatically detect when the partner device is a physical learner and when the local device is an aggregate-port learner. Therefore, you must manually set the learning method on the local device to learn addresses by physical ports. You also must set the load-distribution method to source-based distribution, so that any given source MAC address is always sent on the same physical port.

You also can configure a single port within the group for all transmissions and use other ports for hot-standby. The unused ports in the group can be swapped into operation in just a few seconds if the selected single port loses hardware-signal detection. You can configure which port is always selected for packet transmission by changing its priority with the **pagp port-priority** interface configuration command. The higher the priority, the more likely that the port will be selected.

**Note**

The switch supports address learning only on aggregate ports even though the **physical-port** keyword is provided in the CLI. The **pagp learn-method** command and the **pagp port-priority** command have no effect on the switch hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.

When the link partner of the switch is a physical learner, we recommend that you configure the switch as a physical-port learner by using the **pagp learn-method physical-port** interface configuration command. Set the load-distribution method based on the source MAC address by using the **port-channel load-balance src-mac** global configuration command. The switch then sends packets to the physical learner using the same port in the EtherChannel from which it learned the source address. Only use the **pagp learn-method** command in this situation.

**PAgP Interaction with Other Features**

The Dynamic Trunking Protocol (DTP) and the Cisco Discovery Protocol (CDP) send and receive packets over the physical ports in the EtherChannel. Trunk ports send and receive PAgP protocol data units (PDUs) on the lowest numbered VLAN.

In Layer 2 EtherChannels, the first port in the channel that comes up provides its MAC address to the EtherChannel. If this port is removed from the bundle, one of the remaining ports in the bundle provides its MAC address to the EtherChannel. For Layer 3 EtherChannels, the MAC address is allocated by the active switch as soon as the interface is created (through the **interface port-channel** global configuration command).

PAgP sends and receives PAgP PDUs only from ports that are up and have PAgP enabled for the auto or desirable mode.

**Link Aggregation Control Protocol**

The LACP is defined in IEEE 802.3ad and enables Cisco switches to manage Ethernet channels between switches that conform to the IEEE 802.3ad protocol. LACP facilitates the automatic creation of EtherChannels by exchanging LACP packets between Ethernet ports.

By using LACP, the switch or switch stack learns the identity of partners capable of supporting LACP and the capabilities of each port. It then dynamically groups similarly configured ports into a single logical link (channel or aggregate port). Similarly configured ports are grouped based on hardware, administrative, and port parameter constraints. For example, LACP groups the ports with the same speed, duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, LACP adds the group to the spanning tree as a single switch port.

## LACP Modes

LACP modes specify whether a port can send LACP packets or only receive LACP packets.

**Table 62: EtherChannel LACP Modes**

| Mode           | Description                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>active</b>  | Places a port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.                                                                                   |
| <b>passive</b> | Places a port into a passive negotiating state in which the port responds to LACP packets that it receives, but does not start LACP packet negotiation. This setting minimizes the transmission of LACP packets. |

Both the **active** and **passive LACP** modes enable ports to negotiate with partner ports to an EtherChannel based on criteria such as port speed, and for Layer 2 EtherChannels, based on trunk state and VLAN numbers.

Ports can form an EtherChannel when they are in different LACP modes as long as the modes are compatible. For example:

- A port in the **active** mode can form an EtherChannel with another port that is in the **active** or **passive** mode.
- A port in the **passive** mode cannot form an EtherChannel with another port that is also in the **passive** mode because neither port starts LACP negotiation.

## LACP and Link Redundancy

LACP port-channel operation, bandwidth availability, and link redundancy can be further refined with the LACP port-channel min-links and the LACP max-bundle features.

The LACP port-channel min-links feature:

- Configures the minimum number of ports that must be linked up and bundled in the LACP port channel.
- Prevents a low-bandwidth LACP port channel from becoming active.

- Causes an LACP port channel to become inactive if there are too few active members ports to supply the required minimum bandwidth.

The LACP max-bundle feature:

- Defines an upper limit on the number of bundled ports in an LACP port channel.
- Allows hot-standby ports with fewer bundled ports. For example, in an LACP port channel with five ports, you can specify a max-bundle of three, and the two remaining ports are designated as hot-standby ports.

### LACP Interaction with Other Features

The DTP and the CDP send and receive packets over the physical ports in the EtherChannel. Trunk ports send and receive LACP PDUs on the lowest numbered VLAN.

In Layer 2 EtherChannels, the first port in the channel that comes up provides its MAC address to the EtherChannel. If this port is removed from the bundle, one of the remaining ports in the bundle provides its MAC address to the EtherChannel. For Layer 3 EtherChannels, the MAC address is allocated by the active switch as soon as the interface is created through the **interface port-channel** global configuration command.

LACP sends and receives LACP PDUs only from ports that are up and have LACP enabled for the active or passive mode.

### EtherChannel On Mode

EtherChannel **on** mode can be used to manually configure an EtherChannel. The **on** mode forces a port to join an EtherChannel without negotiations. The **on** mode can be useful if the remote device does not support PAGP or LACP. In the **on** mode, a usable EtherChannel exists only when the switches at both ends of the link are configured in the **on** mode.

Ports that are configured in the **on** mode in the same channel group must have compatible port characteristics, such as speed and duplex. Ports that are not compatible are suspended, even though they are configured in the **on** mode.

#### Caution

You should use care when using the **on** mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

### Load-Balancing and Forwarding Methods

EtherChannel balances the traffic load across the links in a channel by reducing part of the binary pattern formed from the addresses in the frame to a numerical value that selects one of the links in the channel. You

can specify one of several different load-balancing modes, including load distribution based on MAC addresses, IP addresses, source addresses, destination addresses, or both source and destination addresses. The selected mode applies to all EtherChannels configured on the switch.

You configure the load-balancing and forwarding method by using the **port-channel load-balance** and the **port-channel load-balance extended** global configuration commands.

## MAC Address Forwarding

With source-MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the source-MAC address of the incoming packet. Therefore, to provide load-balancing, packets from different hosts use different ports in the channel, but packets from the same host use the same port in the channel.

With destination-MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the destination host's MAC address of the incoming packet. Therefore, packets to the same destination are forwarded over the same port, and packets to a different destination are sent on a different port in the channel.

With source-and-destination MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on both the source and destination MAC addresses. This forwarding method, a combination source-MAC and destination-MAC address forwarding methods of load distribution, can be used if it is not clear whether source-MAC or destination-MAC address forwarding is better suited on a particular switch. With source-and-destination MAC-address forwarding, packets sent from host A to host B, host A to host C, and host C to host B could all use different ports in the channel.

## IP Address Forwarding

With source-IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on the source-IP address of the incoming packet. To provide load balancing, packets from different IP addresses use different ports in the channel, and packets from the same IP address use the same port in the channel.

With destination-IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on the destination-IP address of the incoming packet. To provide load balancing, packets from the same IP source address sent to different IP destination addresses could be sent on different ports in the channel. Packets sent from different source IP addresses to the same destination IP address are always sent on the same port in the channel.

With source-and-destination IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on both the source and destination IP addresses of the incoming packet. This forwarding method, a combination of source-IP and destination-IP address-based forwarding, can be used if it is not clear whether source-IP or destination-IP address-based forwarding is better suited on a particular switch. In this method, packets sent from the IP address A to IP address B, from IP address A to IP address C, and from IP address C to IP address B could all use different ports in the channel.

### Load-Balancing Advantages

Different load-balancing methods have different advantages, and the choice of a particular load-balancing method should be based on the position of the switch in the network and the kind of traffic that needs to be load-distributed.

In the following figure, an EtherChannel of four workstations communicates with a router. Because the router is a single MAC-address device, source-based forwarding on the switch EtherChannel ensures that the switch

uses all available bandwidth to the router. The router is configured for destination-based forwarding because the large number of workstations ensures that the traffic is evenly distributed from the router EtherChannel.

**Figure 43: Load Distribution and Forwarding Methods**

Use the option that provides the greatest variety in your configuration. For example, if the traffic on a channel is going only to a single MAC address, using the destination-MAC address always chooses the same link in the channel. Using source addresses or IP addresses might result in better load-balancing.

## EtherChannel and Switch Stacks

If a stack member that has ports participating in an EtherChannel fails or leaves the stack, the active switch removes the failed stack member switch ports from the EtherChannel. The remaining ports of the EtherChannel, if any, continue to provide connectivity.

When a switch is added to an existing stack, the new switch receives the running configuration from the active switch and updates itself with the EtherChannel-related stack configuration. The stack member also receives the operational information (the list of ports that are up and are members of a channel).

When two stacks merge that have EtherChannels configured between them, self-looped ports result. Spanning tree detects this condition and acts accordingly. Any PAgP or LACP configuration on a winning switch stack is not affected, but the PAgP or LACP configuration on the losing switch stack is lost after the stack reboots.

### Switch Stack and PAgP

With PAgP, if the active switch fails or leaves the stack, the standby switch becomes the new active switch. A spanning-tree reconvergence is not triggered unless there is a change in the EtherChannel bandwidth. The new active switch synchronizes the configuration of the stack members to that of the active switch. The PAgP configuration is not affected after an active switch change unless the EtherChannel has ports residing on the old active switch.

### Switch Stacks and LACP

With LACP, the system ID uses the stack MAC address from the active switch. When an active switch fails or leaves the stack and the standby switch becomes the new active switch change, the LACP system ID is unchanged. By default, the LACP configuration is not affected after the active switch changes.

## Default EtherChannel Configuration

The default EtherChannel configuration is described in this table.

**Table 63: Default EtherChannel Configuration**

| Feature                        | Default Setting                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------|
| Channel groups                 | None assigned.                                                                             |
| Port-channel logical interface | None defined.                                                                              |
| PAgP mode                      | No default.                                                                                |
| PAgP learn method              | Aggregate-port learning on all ports.                                                      |
| PAgP priority                  | 128 on all ports.                                                                          |
| LACP mode                      | No default.                                                                                |
| LACP learn method              | Aggregate-port learning on all ports.                                                      |
| LACP port priority             | 32768 on all ports.                                                                        |
| LACP system priority           | 32768.                                                                                     |
| LACP system ID                 | LACP system priority and the switch or stack MAC address.                                  |
| Load-balancing                 | Load distribution on the switch is based on the source-MAC address of the incoming packet. |

## EtherChannel Configuration Guidelines

If improperly configured, some EtherChannel ports are automatically disabled to avoid network loops and other problems. Follow these guidelines to avoid configuration problems:

- Do not try to configure more than 128 EtherChannels on the switch or switch stack.
- Configure a PAgP EtherChannel with up to eight Ethernet ports of the same type.
- Configure a LACP EtherChannel with up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.
- Configure all ports in an EtherChannel to operate at the same speeds and duplex modes.
- Enable all ports in an EtherChannel. A port in an EtherChannel that is disabled by using the **shutdown** interface configuration command is treated as a link failure, and its traffic is transferred to one of the remaining ports in the EtherChannel.

- When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, you must also make the changes to all ports in the group:
  - Allowed-VLAN list
  - Spanning-tree path cost for each VLAN
  - Spanning-tree port priority for each VLAN
  - Spanning-tree Port Fast setting
- Do not configure a port to be a member of more than one EtherChannel group.
- Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch or on different switches in the stack. Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.
- Do not configure a secure port as part of an EtherChannel or the reverse.
- Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x on an EtherChannel port, an error message appears, and IEEE 802.1x is not enabled.
- If EtherChannels are configured on switch interfaces, remove the EtherChannel configuration from the interfaces before globally enabling IEEE 802.1x on a switch by using the **dot1x system-auth-control** global configuration command.
- If cross-stack EtherChannel is configured and the switch stack partitions, loops and forwarding issues can occur.

## Layer 2 EtherChannel Configuration Guidelines

When configuring Layer 2 EtherChannels, follow these guidelines:

- Assign all ports in the EtherChannel to the same VLAN, or configure them as trunks. Ports with different native VLANs cannot form an EtherChannel.
- An EtherChannel supports the same allowed range of VLANs on all the ports in a trunking Layer 2 EtherChannel. If the allowed range of VLANs is not the same, the ports do not form an EtherChannel even when PAgP is set to the **auto** or **desirable** mode.
- Ports with different spanning-tree path costs can form an EtherChannel if they are otherwise compatibly configured. Setting different spanning-tree path costs does not, by itself, make ports incompatible for the formation of an EtherChannel.

## How to Configure EtherChannels

After you configure an EtherChannel, configuration changes applied to the port-channel interface apply to all the physical ports assigned to the port-channel interface, and configuration changes applied to the physical port affect only the port where you apply the configuration.

### Configuring Layer 2 EtherChannels (CLI)

You configure Layer 2 EtherChannels by assigning ports to a channel group with the **channel-group** interface configuration command. This command automatically creates the port-channel logical interface.

#### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **switchport mode** {access | trunk}
4. **switchport access vlan** *vlan-id*
5. **channel-group** *channel-group-number* **mode** {auto [non-silent] | desirable [non-silent] | on } | { active | passive}
6. **end**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Configuring Layer 3 EtherChannels (CLI)

Beginning in privileged EXEC mode, follow these steps to assign an Ethernet port to a Layer 3 EtherChannel. This procedure is required.

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **no ip address**
4. **no switchport**
5. **channel-group** *channel-group-number* **mode** { **auto** [ **non-silent** ] | **desirable** [ **non-silent** ] | **on** } | { **active** | **passive** }
6. **end**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                           |

This setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.</li> <li>• <b>active</b>—Enables LACP only if a LACP device is detected. It places the port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.</li> <li>• <b>passive</b>—Enables LACP on the port and places it into a passive negotiating state in which the port responds to LACP packets that it receives, but does not start LACP packet negotiation.</li> </ul> |
| <b>Step 6</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if) # end</pre>     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring EtherChannel Load-Balancing (CLI)

You can configure EtherChannel load-balancing to use one of several different forwarding methods.

This task is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **port-channel load-balance { dst-ip | dst-mac | dst-mixed-ip-port | dst-port | extended [dst-ip | dst-mac | dst-port | ipv6-label | l3-proto | src-ip | src-mac | src-port ] | src-dst-ip | src-dst-mac | src-dst-mixed-ip-port | src-dst-portsrc-ip | src-mac | src-mixed-ip-port | src-port }**
3. **end**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Configuring EtherChannel Extended Load-Balancing (CLI)

Configure EtherChannel extended load-balancing when you want to use a combination of load-balancing methods.

This task is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **port-channel load-balance extended [ dst-ip | dst-mac dst-port | ipv6-label | l3-proto | src-ip | src-mac | src-port ]**
3. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Configuring the PAgP Learn Method and Priority (CLI)

This task is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **pagp learn-method** **physical-port**
4. **pagp port-priority** *priority*
5. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                | Purpose                                                                       |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch# <b>configure terminal</b>                                            | Enters global configuration mode.                                             |
| <b>Step 2</b> | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br>Switch(config) # <b>interface</b><br><b>gigabitethernet</b> 1/0/2 | Specifies the port for transmission, and enters interface configuration mode. |
| <b>Step 3</b> | <b>pagp learn-method</b> <b>physical-port</b>                                                                                    | Selects the PAgP learning method.                                             |

|               | Command or Action                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Switch(config-if)# pagp learn-method physical port</pre>                                         | <p>By default, <b>aggregation-port learning</b> is selected, which means the switch sends packets to the source by using any of the ports in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives.</p> <p>Selects <b>physical-port</b> to connect with another switch that is a physical learner. Make sure to configure the <b>port-channel load-balance</b> global configuration command to <b>src-mac</b>.</p> <p>The learning method must be configured the same at both ends of the link.</p> |
| <b>Step 4</b> | <p><b>pagp port-priority</b> <i>priority</i></p> <p><b>Example:</b></p> <pre>Switch(config-if)# pagp port-priority 200</pre> | <p>Assigns a priority so that the selected port is chosen for packet transmission.</p> <p>For <i>priority</i>, the range is 0 to 255. The default is 128. The higher the priority, the more likely that the port will be used for PAgP transmission.</p>                                                                                                                                                                                                                                                                                                    |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>                                                   | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Configuring LACP Hot-Standby Ports

When LACP is enabled, the software, by default, tries to configure the maximum number of LACP-compatible ports in a channel, up to a maximum of 16 ports. Only eight LACP links can be active at one time; the remaining eight links are placed in hot-standby mode. If one of the active links becomes inactive, a link that is in the hot-standby mode becomes active in its place.

You can override the default behavior by specifying the maximum number of active ports in a channel, in which case, the remaining ports become hot-standby ports. For example, if you specify a maximum of five ports in a channel, up to 11 ports become hot-standby ports.

If you configure more than eight links for an EtherChannel group, the software automatically decides which of the hot-standby ports to make active based on the LACP priority. To every link between systems that operate LACP, the software assigns a unique priority made up of these elements (in priority order):

- LACP system priority
- System ID (the switch MAC address)
- LACP port priority
- Port number

In priority comparisons, numerically lower values have higher priority. The priority decides which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

Determining which ports are active and which are hot standby is a two-step procedure. First the system with a numerically lower system priority and system ID is placed in charge of the decision. Next, that system decides which ports are active and which are hot standby, based on its values for port priority and port number. The port priority and port number values for the other system are not used.

You can change the default values of the LACP system priority and the LACP port priority to affect how the software selects active and standby links.

### Configuring the LACP Max Bundle Feature (CLI)

When you specify the maximum number of bundled LACP ports allowed in a port channel, the remaining ports in the port channel are designated as hot-standby ports.

Beginning in privileged EXEC mode, follow these steps to configure the maximum number of LACP ports in a port channel. This procedure is optional.

#### SUMMARY STEPS

1. **configure terminal**
2. **interface port-channel** *channel-number*
3. **lACP max-bundle** *max-bundle-number*
4. **end**

[Configuring LACP Hot-Standby Ports: Example](#), on page 645

### Configuring the LACP System Priority (CLI)

You can configure the system priority for all the EtherChannels that are enabled for LACP by using the **lacp system-priority** global configuration command. You cannot configure a system priority for each LACP-configured channel. By changing this value from the default, you can affect how the software selects active and standby links.

You can use the **show etherchannel summary** privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag).

Beginning in privileged EXEC mode, follow these steps to configure the LACP system priority. This procedure is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **lacp system-priority** *priority*
3. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                       | Purpose                                                                                                                                                |

## Configuring the LACP Port Priority (CLI)

By default, all ports use the same port priority. If the local system has a lower value for the system priority and the system ID than the remote system, you can affect which of the hot-standby links become active first by changing the port priority of LACP EtherChannel ports to a lower value than the default. The hot-standby ports that have lower port numbers become active in the channel first. You can use the **show etherchannel summary** privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag).

**Note**

If LACP is not able to aggregate all the ports that are compatible (for example, the remote system might have more restrictive hardware limitations), all the ports that cannot be actively included in the EtherChannel are put in the hot-standby state and are used only if one of the channeled ports fails.

Beginning in privileged EXEC mode, follow these steps to configure the LACP port priority. This procedure is optional.

**SUMMARY STEPS**

1. **configure terminal**
2. **interface** *interface-id*
3. **lACP port-priority** *priority*
4. **end**

**DETAILED STEPS**

## Configuration Examples for Configuring EtherChannels

### Configuring Layer 2 EtherChannels: Examples

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two ports as static-access ports in VLAN 10 to channel 5 with the PAgP mode **desirable**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
```

```
Switch(config-if-range)# channel-group 5 mode desirable non-silent
Switch(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two ports as static-access ports in VLAN 10 to channel 5 with the LACP mode **active**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

This example shows how to configure a cross-stack EtherChannel. It uses LACP passive mode and assigns two ports on stack member 1 and one port on stack member 2 as static-access ports in VLAN 10 to channel 5:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/4 -5
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode passive
Switch(config-if-range)# exit
Switch(config)# interface gigabitethernet3/0/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 10
Switch(config-if)# channel-group 5 mode passive
Switch(config-if)# exit
```

## Configuring Layer 3 EtherChannels: Examples

This example shows how to configure a Layer 3 EtherChannel. It assigns two ports to channel 5 with the LACP mode **active**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range)# no ip address
Switch(config-if-range)# no switchport
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

This example shows how to configure a cross-stack Layer 3 EtherChannel. It assigns two ports on stack member 2 and one port on stack member 3 to channel 7 using LACP active mode:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/4 -5
Switch(config-if-range)# no ip address
Switch(config-if-range)# no switchport
Switch(config-if-range)# channel-group 7 mode active
Switch(config-if-range)# exit
Switch(config)# interface gigabitethernet3/0/3
Switch(config-if)# no ip address
Switch(config-if)# no switchport
Switch(config-if)# channel-group 7 mode active
Switch(config-if)# exit
```

## Configuring LACP Hot-Standby Ports: Example

This example shows how to configure an Etherchannel (port channel 2) that will be active when there are at least three active ports, will comprise up to seven active ports and the remaining ports (up to nine) as hot-standby ports :

```
Switch# configure terminal
Switch(config)# interface port-channel 2
Switch(config-if)# port-channel min-links 3
Switch(config-if)# lacp max-bundle 7
```

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Restrictions for Configuring Flex Links and MAC Address-Table Move Update

- Flex Links are supported only on Layer 2 ports and port channels.
- You can configure up to 16 backup links.
- You can configure only one Flex Links backup link for any active link, and it must be a different interface from the active interface.
- An interface can belong to only one Flex Links pair. An interface can be a backup link for only one active link. An active link cannot belong to another Flex Links pair.

- Neither of the links can be a port that belongs to an EtherChannel. However, you can configure two port channels (EtherChannel logical interfaces) as Flex Links, and you can configure a port channel and a physical interface as Flex Links, with either the port channel or the physical interface as the active link.
- A backup link does not have to be the same type (Gigabit Ethernet or port channel) as the active link. However, you should configure both Flex Links with similar characteristics so that there are no loops or changes in behavior if the standby link begins to forward traffic.
- STP is disabled on Flex Links ports. A Flex Links port does not participate in STP, even if the VLANs present on the port are configured for STP. When STP is not enabled, be sure that there are no loops in the configured topology.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

## Information About Flex Links and MAC Address-Table Move Update

### Flex Links

Flex Links are a pair of a Layer 2 interfaces (switch ports or port channels) where one interface is configured to act as a backup to the other. The feature provides an alternative solution to the Spanning Tree Protocol (STP). Users can disable STP and still retain basic link redundancy. Flex Links are typically configured in service provider or enterprise networks where customers do not want to run STP on the switch. If the switch is running STP, Flex Links are not necessary because STP already provides link-level redundancy or backup.

You configure Flex Links on one Layer 2 interface (the active link) by assigning another Layer 2 interface as the Flex Links or backup link. On switches, the Flex Links can be on the same switch or on another switch in the stack. When one of the links is up and forwarding traffic, the other link is in standby mode, ready to begin forwarding traffic if the other link shuts down. At any given time, only one of the interfaces is in the linkup state and forwarding traffic. If the primary link shuts down, the standby link starts forwarding traffic. When the active link comes back up, it goes into standby mode and does not forward traffic. STP is disabled on Flex Links interfaces.

[Configuring Flex Links \(CLI\), on page 654](#)

[Configuring Flex Links: Examples, on page 661](#)

## Flex Links Configuration

In the following figure, ports 1 and 2 on switch A are connected to uplink switches B and C. Because they are configured as Flex Links, only one of the interfaces is forwarding traffic; the other is in standby mode. If port 1 is the active link, it begins forwarding traffic between port 1 and switch B; the link between port 2 (the backup link) and switch C is not forwarding traffic. If port 1 goes down, port 2 comes up and starts forwarding traffic to switch C. When port 1 comes back up, it goes into standby mode and does not forward traffic; port 2 continues forwarding traffic.

You can also configure a preemption function, specifying the preferred port for forwarding traffic. For example, you can configure the Flex Links pair with preemption mode. In the scenario shown, when port 1 comes back up and has more bandwidth than port 2, port 1 begins forwarding traffic after 60 seconds. Port 2 becomes the standby port. You do this by entering the **switchport backup interface preemption mode bandwidth** and **switchport backup interface preemption delay** interface configuration commands.

**Figure 44: Flex Links Configuration Example**

If a primary (forwarding) link goes down, a trap notifies the network management stations. If the standby link goes down, a trap notifies the users.

Flex Links are supported only on Layer 2 ports and port channels, not on VLANs or on Layer 3 ports.

## VLAN Flex Links Load Balancing and Support

VLAN Flex Links load balancing allows users to configure a Flex Links pair so that both ports simultaneously forward the traffic for some mutually exclusive VLANs. For example, if Flex Links ports are configured for 1 to 100 VLANs, the traffic of the first 50 VLANs can be forwarded on one port and the rest on the other port. If one of the ports fail, the other active port forwards all the traffic. When the failed port comes back up, it resumes forwarding traffic in the preferred VLANs. In addition to providing the redundancy, this Flex Links pair can be used for load balancing. Flex Links VLAN load balancing does not impose any restrictions on uplink switches.

The following figure displays a VLAN Flex Links load-balancing configuration.

**Figure 45: VLAN Flex Links Load-Balancing Configuration Example**

## Multicast Fast Convergence with Flex Links Failover

Multicast fast convergence reduces the multicast traffic convergence time after a Flex Links failure. Multicast fast convergence is implemented by a combination of learning the backup link as an mrouter port, generating IGMP reports, and leaking IGMP reports.

### Related Topics

[Configuring Multicast Fast Convergence with Flex Links Failover: Examples](#), on page 663

### Learning the Other Flex Links Port as the mrouter Port

In a typical multicast network, there is a querier for each VLAN. A switch deployed at the edge of a network has one of its Flex Links ports receiving queries. Flex Links ports are also always forwarding at any given time.

A port that receives queries is added as an mrouter port on the switch. An mrouter port is part of all the multicast groups learned by the switch. After a changeover, queries are received by the other Flex Links port. The other Flex Links port is then learned as the mrouter port. After changeover, multicast traffic then flows through the other Flex Links port. To achieve faster convergence of traffic, both Flex Links ports are learned as mrouter ports whenever either Flex Links port is learned as the mrouter port. Both Flex Links ports are always part of multicast groups.

Although both Flex Links ports are part of the groups in normal operation mode, all traffic on the backup port is blocked. The normal multicast data flow is not affected by the addition of the backup port as an mrouter port. When the changeover happens, the backup port is unblocked, allowing the traffic to flow. In this case, the upstream multicast data flows as soon as the backup port is unblocked.

### Generating IGMP Reports

When the backup link comes up after the changeover, the upstream new distribution switch does not start forwarding multicast data, because the port on the upstream router, which is connected to the blocked Flex Links port, is not part of any multicast group. The reports for the multicast groups were not forwarded by the downstream switch because the backup link is blocked. The data does not flow on this port, until it learns the multicast groups, which occurs only after it receives reports.

The reports are sent by hosts when a general query is received, and a general query is sent within 60 seconds in normal scenarios. When the backup link starts forwarding, to achieve faster convergence of multicast data, the downstream switch immediately sends proxy reports for all the learned groups on this port without waiting for a general query.

## Leaking IGMP Reports

To achieve multicast traffic convergence with minimal loss, a redundant data path must be set up before the Flex Links active link goes down. This can be achieved by leaking only IGMP report packets on the Flex Links backup link. These leaked IGMP report messages are processed by upstream distribution routers, so multicast data traffic gets forwarded to the backup interface. Because all incoming traffic on the backup interface is dropped at the ingress of the access switch, no duplicate multicast traffic is received by the host. When the Flex Links active link fails, the access switch starts accepting traffic from the backup link immediately. The only disadvantage of this scheme is that it consumes bandwidth on the link between the distribution switches and on the backup link between the distribution and access switches. This feature is disabled by default and can be configured by using the **switchport backup interface *interface-id* multicast fast-convergence** command.

When this feature has been enabled at changeover, the switch does not generate the proxy reports on the backup port, which became the forwarding port.

## MAC Address-Table Move Update

The MAC address-table move update feature allows the switch to provide rapid bidirectional convergence when a primary (forwarding) link goes down and the standby link begins forwarding traffic.

In the following figure, switch A is an access switch, and ports 1 and 2 on switch A are connected to uplink switches B and D through a Flex Links pair. Port 1 is forwarding traffic, and port 2 is in the backup state.

Traffic from the PC to the server is forwarded from port 1 to port 3. The MAC address of the PC has been learned on port 3 of switch C. Traffic from the server to the PC is forwarded from port 3 to port 1.

**Figure 46: MAC Address-Table Move Update Example**

If the MAC address-table move update feature is not configured and port 1 goes down, port 2 starts forwarding traffic. However, for a short time, switch C keeps forwarding traffic from the server to the PC through port 3, and the PC does not get the traffic because port 1 is down. If switch C removes the MAC address of the PC on port 3 and relearns it on port 4, traffic can then be forwarded from the server to the PC through port 2.

If the MAC address-table move update feature is configured and enabled on the switches, and port 1 goes down, port 2 starts forwarding traffic from the PC to the server. The switch sends a MAC address-table move update packet from port 2. Switch C gets this packet on port 4 and immediately learns the MAC address of the PC on port 4, which reduces the reconvergence time.

You can configure the access switch, switch A, to *send* MAC address-table move update messages. You can also configure the uplink switches B, C, and D to *get* and process the MAC address-table move update messages. When switch C gets a MAC address-table move update message from switch A, switch C learns the MAC address of the PC on port 4. Switch C updates the MAC address table, including the forwarding table entry for the PC.

Switch A does not need to wait for the MAC address-table update. The switch detects a failure on port 1 and immediately starts forwarding server traffic from port 2, the new forwarding port. This change occurs in less

than 100 milliseconds (ms). The PC is directly connected to switch A, and the connection status does not change. Switch A does not need to update the PC entry in the MAC address table.

## Flex Links VLAN Load Balancing Configuration Guidelines

- For Flex Links VLAN load balancing, you must choose the preferred VLANs on the backup interface.
- You cannot configure a preemption mechanism and VLAN load balancing for the same Flex Links pair.

#### Related Topics

[Configuring VLAN Load Balancing on Flex Links \(CLI\), on page 657](#)

[Configuring VLAN Load Balancing on Flex Links: Examples, on page 661](#)

## MAC Address-Table Move Update Configuration Guidelines

- You can enable and configure this feature on the access switch to *send* the MAC address-table move updates.
- You can enable and configure this feature on the uplink switches to *get* the MAC address-table move updates.

## Default Flex Links and MAC Address-Table Move Update Configuration

- Flex Links is not configured, and there are no backup interfaces defined.
- The preemption mode is off.
- The preemption delay is 35 seconds.
- The MAC address-table move update feature is not configured on the switch.
